This product includes the Envoy SNMP Engine, developed by Epilogue Technology, an Integrated Systems Company. Copyright © 1986-1997, Epilogue Technology Corporation. All rights reserved. This program and its documentation were developed at private expense, and no part of them is in the public domain.

This product includes memory allocation software developed by Mark Moraes, copyright © 1988, 1989, 1993, University of Toronto.

This product includes FreeBSD software developed by the University of California, Berkeley, and its contributors. All of the documentation and software included in the 4.4BSD and 4.4BSD-Lite Releases is copyrighted by the Regents of the University of California. Copyright © 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992, 1993, 1994. The Regents of the University of California. All rights reserved.

GateD software copyright © 1995, the Regents of the University. All rights reserved. Gate Daemon was originated and developed through release 3.0 by Cornell University and its collaborators. Gated is based on Kirton's EGP, UC Berkeley's routing daemon (routed), and DCN's HELLO routing protocol. Development of Gated has been supported in part by the National Science Foundation. Portions of the GateD software copyright © 1988, Regents of the University of California. All rights reserved. Portions of the GateD software copyright © 1991, D. L. S. Associates.

This product includes software developed by Maker Communications, Inc., copyright © 1996, 1997, Maker Communications, Inc.

Juniper Networks, Junos, Steel-Belted Radius, NetScreen, and ScreenOS are registered trademarks of Juniper Networks, Inc. in the United States and other countries. The Juniper Networks Logo, the Junos logo, and JunosE are trademarks of Juniper Networks, Inc. All other trademarks, service marks, registered trademarks, or registered service marks are the property of their respective owners.

Juniper Networks assumes no responsibility for any inaccuracies in this document. Juniper Networks reserves the right to change, modify, transfer, or otherwise revise this publication without notice.

Products made or sold by Juniper Networks or components thereof might be covered by one or more of the following patents that are owned by or licensed to Juniper Networks: U.S. Patent Nos. 5,473,599, 5,905,725, 5,909,440, 6,192,051, 6,333,650, 6,359,479, 6,406,312, 6,429,706, 6,459,579, 6,493,347, 6,538,518, 6,538,899, 6,552,918, 6,567,902, 6,578,186, and 6,590,785.

*Complete Software Guide for Junos® OS for the QFX Series, Release 12.3*

The information in this document is current as of the date on the title page.

## YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

## END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Table of Contents

	About the Documentation . . . . .	cix
	Documentation and Release Notes . . . . .	cix
	Supported Platforms . . . . .	cix
	Using the Examples in This Manual . . . . .	cix
	Merging a Full Example . . . . .	cx
	Merging a Snippet . . . . .	cx
	Documentation Conventions . . . . .	cxi
	Documentation Feedback . . . . .	cxiii
	Requesting Technical Support . . . . .	cxiii
	Self-Help Online Tools and Resources . . . . .	cxiii
	Opening a Case with JTAC . . . . .	cxiv
<b>Part 1</b>	<b>QFX3500 Switch Overview</b>	
<b>Chapter 1</b>	<b>QFX3500 Switch Overview . . . . .</b>	<b>3</b>
	QFX3500 Device Overview . . . . .	3
	Software . . . . .	3
	Hardware . . . . .	4
	SFP+ Access Ports . . . . .	5
	QSFP+ Uplink Ports . . . . .	6
<b>Part 2</b>	<b>QFX3600 Switch Overview</b>	
<b>Chapter 2</b>	<b>QFX3600 Switch Overview . . . . .</b>	<b>9</b>
	QFX3600 Device Overview . . . . .	9
	Software . . . . .	9
	Hardware . . . . .	10
<b>Part 3</b>	<b>Junos OS Basics</b>	
<b>Chapter 3</b>	<b>Overview . . . . .</b>	<b>15</b>
	Software Overview . . . . .	15
	QFX Series Software Features Overview . . . . .	15
	Configuration File Terms . . . . .	29
	Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos	
	OS Configuration Statements . . . . .	30
	Junos OS Commit Model for Router or Switch Configuration . . . . .	31
	Junos OS Package Names . . . . .	32
	NTP Time Server and Time Services Overview . . . . .	33
	NTP Time Server and Time Services Overview (QFabric System) . . . . .	34

Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release) . . . . .	34
Understanding Autoinstallation of Configuration Files . . . . .	36
Typical Uses for Autoinstallation . . . . .	36
Autoinstallation Configuration Files and IP Addresses . . . . .	36
Typical Autoinstallation Process on a New Switch . . . . .	37
Understanding Zero Touch Provisioning . . . . .	38
Understanding DHCP Services for Switches . . . . .	39
DHCP Client/Server Model . . . . .	40
Using DHCP . . . . .	40
DHCP Relay Servers and DHCP Servers . . . . .	41
Legacy DHCP and Extended DHCP for Server Versions . . . . .	41
Configuring DHCP on a Switch . . . . .	42
How DHCP Works . . . . .	42
Understanding Software Infrastructure and Processes . . . . .	43
Routing Engine and Packet Forwarding Engine . . . . .	43
Junos OS Processes . . . . .	44
User Interfaces . . . . .	45
CLI User Interface Overview . . . . .	46
CLI Overview . . . . .	46
CLI Key Features . . . . .	46
CLI Command Modes . . . . .	47
Configuring CLI Tips . . . . .	48
Format for Specifying Filenames and URLs in Junos OS CLI Commands . . . . .	48
Junos OS Operational Mode Commands That Combine Other Commands . . . . .	50
Overview of Junos OS CLI Operational Mode Commands . . . . .	51
CLI Command Categories . . . . .	51
Commonly Used Operational Mode Commands . . . . .	52
Overview of Navigating the CLI . . . . .	53
CLI Command Hierarchy . . . . .	54
CLI Configuration Statements . . . . .	54
Moving Among Hierarchy Levels . . . . .	54
Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands . . . . .	55
Understanding Junos OS CLI Configuration Mode . . . . .	56
Configuration Mode Commands . . . . .	57
Configuration Statements and Identifiers . . . . .	58
Configuration Statement Hierarchy . . . . .	60
Licenses . . . . .	62
Junos OS Feature Licenses . . . . .	62
Software Features That Require Licenses on the QFX Series . . . . .	63
Junos OS License Keys . . . . .	64
Licensable Ports on MX5, MX10, and MX40 Routers . . . . .	64
Generating the License Keys for a Standalone QFX Series Device . . . . .	66
Generating the License Keys for a QFabric System . . . . .	67
Adding New Licenses (CLI Procedure) . . . . .	69
Deleting a License (CLI Procedure) . . . . .	70

	Saving License Keys . . . . .	71
	Verifying Junos OS License Installation . . . . .	71
	Displaying Installed Licenses . . . . .	72
	Displaying License Usage . . . . .	73
<b>Chapter 4</b>	<b>Installation . . . . .</b>	<b>75</b>
	Software Installation . . . . .	75
	Junos OS Package Names . . . . .	75
	Configuring Zero Touch Provisioning . . . . .	77
	Performing a Nonstop Software Upgrade on the QFabric System . . . . .	80
	Backing Up the Current Configuration Files . . . . .	81
	Downloading Software Files Using a Browser . . . . .	81
	Retrieving Software Files for Download . . . . .	83
	Performing a Nonstop Software Upgrade for Director Devices in a Director Group . . . . .	83
	Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components . . . . .	83
	(Optional) Creating Upgrade Groups for Node Groups . . . . .	84
	Performing a Nonstop Software Upgrade on a Node Group . . . . .	84
	Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device . . . . .	85
	Performing a QFabric System Recovery Installation on the Director Group . . . . .	87
	(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive . . . . .	88
	Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software . . . . .	89
	Recovering from a Failed Software Installation . . . . .	93
	Software Installation Overview . . . . .	94
	Upgrading Jloader Software on QFX Series Devices . . . . .	95
	Jloader Software Version 1.1.4 Guidelines . . . . .	96
	Upgrading Jloader Software on a QFX3500 Switch . . . . .	98
	Upgrading Jloader Software on a QFabric System . . . . .	101
	Upgrading Software on QFX3500 and QFX3600 Standalone Switches . . . . .	107
	Downloading Software Files with a Browser . . . . .	107
	Accessing Software Downloaded to a Remote Location . . . . .	108
	Connecting to the Console Port . . . . .	108
	Backing Up the Current Configuration Files . . . . .	108
	Installing the Software Package . . . . .	108
	Upgrading Software on a QFabric System . . . . .	109
	Backing Up the Current Configuration Files . . . . .	110
	Downloading Software Files Using a Browser . . . . .	110
	Retrieving Software Files for Download . . . . .	111
	Installing the Software Package on the Entire QFabric System . . . . .	111
	Upgrading Software Using Automatic Software Download . . . . .	114
	Verifying Autoinstallation Status . . . . .	115
	Verifying That Automatic Software Download Is Working Correctly . . . . .	115

<b>Chapter 5</b>	<b>Configuration</b>	<b>117</b>
	Initial Configuration	117
	Configuring Autoinstallation of Configuration Files (CLI Procedure)	118
	Configuring a DHCP Client (CLI Procedure)	120
	Configuring a DHCP Server on Switches (CLI Procedure)	121
	Configuring an Extended DHCP Server on a Switch	121
	Configuring a Legacy DHCP Server on a Switch (CLI Procedure)	122
	Configuring a DNS Name Server for Resolving a Hostname into Addresses	123
	Configuring the Domain Name for the Router or Switch	124
	Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains	124
	Configuring the Hostname of the Router or Switch	125
	Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types	125
	Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch	126
	Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses	126
	Configuring the Junos OS to Display a System Login Announcement	127
	Configuring the Junos OS to Display a System Login Message	127
	Configuring the Junos OS to Extend the Default Port Address Range	128
	Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages	129
	Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets	129
	Configuring NTP Authentication Keys	129
	Configuring NTP Authentication Keys (QFabric System)	130
	Configuring the NTP Time Server and Time Services	131
	Configuring the Router or Switch to Operate in Client Mode	131
	Configuring the Router or Switch to Operate in Symmetric Active Mode	132
	Configuring the Router or Switch to Operate in Broadcast Mode	132
	Configuring the Router or Switch to Operate in Server Mode	132
	Configuring the NTP Time Server and Time Services (QFabric System)	133
	Specifying the Physical Location of the Switch	134
	Configuring the Router or Switch to Listen for Broadcast Messages Using NTP	135
	Configuring the Router or Switch to Listen for Multicast Messages Using NTP	135
	Configuring System Alarms to Appear Automatically Upon Login	136
	Configuring Time-Based User Access	136
	Configuring the Timeout Value for Idle Login Sessions	137
	Configuring a QFX3500 Device as a Standalone Switch	138
	Creating an Emergency Boot Device for a QFX Series Device	140

Creating a Snapshot and Using It to Boot a QFX Series Switch . . . . .	141
Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch . . . . .	141
Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch . . . . .	142
Including the Year or Millisecond in Timestamps . . . . .	142
Mapping the Hostname of the Switch to IP Addresses . . . . .	143
Methods for Configuring Junos OS . . . . .	144
Junos OS Command-Line Interface (CLI) . . . . .	145
ASCII File . . . . .	145
J-Web Package . . . . .	145
Junos XML Management Protocol Software . . . . .	146
NETCONF XML Management Protocol Software . . . . .	146
Configuration Commit Scripts . . . . .	146
Modifying the Default Time Zone for a Router or Switch Running Junos OS . . . . .	147
Rebooting and Halting a QFX Series Product . . . . .	147
Reverting to the Default Factory Configuration . . . . .	148
Reverting to the Default Factory Configuration by Using the request system zeroize Command . . . . .	149
Reverting to the Rescue Configuration . . . . .	150
Saving Core Files Generated by Junos OS Processes . . . . .	150
Setting a Custom Time Zone on Routers or Switches Running Junos OS . . . . .	150
Importing and Installing Time Zone Files . . . . .	151
Configuring a Custom Time Zone . . . . .	152
Setting the Date and Time . . . . .	152
Specifying Access Privileges for Junos OS Operational Mode Commands . . . . .	153
Synchronizing and Coordinating Time Distribution Using NTP . . . . .	155
Configuring NTP . . . . .	155
Configuring the NTP Boot Server . . . . .	155
Specifying a Source Address for an NTP Server . . . . .	155
Viewing Core Files from Junos OS Processes . . . . .	156
Configuration Examples . . . . .	157
Example: Configuring the Domain Name for the Router or Switch . . . . .	157
Example: Configuring the Name of the Switch, IP Address, and System ID . . . . .	157
Example: Configuring NTP . . . . .	158
Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization . . . . .	160
Configuration Statements . . . . .	161

<b>Chapter 7</b>	<b>Troubleshooting . . . . .</b>	<b>1103</b>
	Troubleshooting Procedures . . . . .	1103
	Rebooting and Halting a QFX Series Product . . . . .	1103
	Recovering from a Failed Software Installation . . . . .	1104
	Recovering the Root Password . . . . .	1105
	Troubleshooting Network Interfaces . . . . .	1106
	The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down . . . . .	1106
	Troubleshooting an Aggregated Ethernet Interface . . . . .	1107
<b>Part 4</b>	<b>Configuration and File Management</b>	
<b>Chapter 8</b>	<b>Overview . . . . .</b>	<b>1111</b>
	Configuration Files Overview . . . . .	1111
	Configuration File Terms . . . . .	1111
	Software Overview . . . . .	1112
	Junos OS Commit Model for Router or Switch Configuration . . . . .	1112
	Understanding Configuration Files . . . . .	1113
	Understanding How the Junos Configuration Is Stored . . . . .	1113
<b>Chapter 9</b>	<b>Configuration . . . . .</b>	<b>1115</b>
	Configuration Tasks . . . . .	1115
	Comparing Configuration Changes with a Prior Version . . . . .	1115
	Compressing the Current Configuration File . . . . .	1117
	Creating and Returning to a Rescue Configuration . . . . .	1118
	Loading a Configuration from a File . . . . .	1119
	Loading a Previous Configuration File . . . . .	1122

Returning to the Most Recently Committed Junos Configuration . . . . .	1122
Returning to a Previously Committed Junos OS Configuration . . . . .	1123
Returning to a Configuration Prior to the One Most Recently Committed . . . . .	1123
Displaying Previous Configurations . . . . .	1123
Comparing Configuration Changes with a Prior Version . . . . .	1124
Creating and Returning to a Rescue Configuration . . . . .	1126
Saving a Configuration to a File . . . . .	1127
Reverting to the Default Factory Configuration . . . . .	1128
Reverting to the Rescue Configuration . . . . .	1128
Rolling Back Junos OS Configuration Changes . . . . .	1129
Saving a Configuration to a File . . . . .	1130
Setting or Deleting the Rescue Configuration . . . . .	1131
Uploading a Configuration File . . . . .	1131
Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site . . . . .	1133
Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive . . . . .	1133
Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site . . . . .	1134
Configuring Transfer of the Current Active Configuration When a Configuration Is Committed . . . . .	1134
Configuring Archive Sites for Transfer of Active Configuration Files . . . . .	1134

<b>Chapter 12</b>	<b>Overview . . . . .</b>	<b>1181</b>
	Software Overview . . . . .	1181
	Understanding Software Infrastructure and Processes . . . . .	1181
	Routing Engine and Packet Forwarding Engine . . . . .	1181
	Junos OS Processes . . . . .	1182
	Understanding User and Access Management Features on the QFabric System . . . . .	1183
	Access Control Overview . . . . .	1184
	Overview of Template Accounts for RADIUS and TACACS+ Authentication . . . . .	1185
	Understanding Login Authentication . . . . .	1185
	MAC RADIUS Authentication . . . . .	1185
	Understanding LLDP . . . . .	1186
	Understanding RADIUS Accounting . . . . .	1187
	Understanding VSAs on the QFX Series . . . . .	1188
	Juniper Networks Vendor-Specific RADIUS Attributes . . . . .	1188
	Juniper Networks Vendor-Specific TACACS+ Attributes . . . . .	1190
	Understanding Junos OS Access Privilege Levels . . . . .	1192
	Junos OS Login Class Permission Flags . . . . .	1192
	Allowing or Denying Individual Commands for Junos OS Login Classes . . . . .	1195
	Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication . . . . .	1196
	Using RADIUS or TACACS+ Authentication . . . . .	1196
	Using Local Password Authentication . . . . .	1197
	Order of Authentication Attempts . . . . .	1197
	Junos OS User Authentication Methods . . . . .	1201
	Junos OS User Accounts Overview . . . . .	1201
	Junos OS Login Classes Overview . . . . .	1203
	Understanding QFabric System Login Classes . . . . .	1204
	Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies . . . . .	1205
	Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands . . . . .	1206
	Special Requirements for Junos OS Plain-Text Passwords . . . . .	1207

<b>Chapter 13</b>	<b>Configuration</b>	<b>1211</b>
	Configuration Tasks	1211
	Changing the Requirements for Junos OS Plain-Text Passwords	1212
	Configuring Access Privilege Levels	1212
	Configuring CLI Tips	1212
	Configuring Junos OS User Accounts	1213
	Configuring LLDP	1214
	Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication	1214
	Configuring Local User Template Accounts for User Authentication	1215
	Configuring Management Access	1217
	Configuring RADIUS Accounting	1217
	Configuring RADIUS Authentication	1219
	Configuring RADIUS Server Details	1219
	Configuring MS-CHAPv2 for Password-Change Support	1220
	Specifying a Source Address for the Junos OS to Access External RADIUS Servers	1220
	Configuring Remote Template Accounts for User Authentication	1221
	Configuring the Root Password	1222
	Configuring SNMP	1223
	Configuring SSH Host Keys for Secure Copying of Data	1227
	Configuring SSH Known Hosts	1227
	Configuring Support for SCP File Transfer	1228
	Updating SSH Host Key Information	1228
	Configuring SSH Service for Remote Access to the Router or Switch	1229
	Configuring the Root Login Through SSH	1230
	Configuring the SSH Protocol Version	1230
	Configuring the Client Alive Mechanism	1230
	Configuring TACACS+ Authentication	1231
	Configuring TACACS+ Server Details	1231
	Specifying a Source Address for the Junos OS to Access External TACACS+ Servers	1232
	Configuring the Same Authentication Service for Multiple TACACS+ Servers	1232
	Configuring Juniper Networks Vendor-Specific TACACS+ Attributes	1233
	Configuring TACACS+ System Accounting	1233
	Specifying TACACS+ Auditing and Accounting Events	1234
	Configuring TACACS+ Server Accounting	1234
	Defining Junos OS Login Classes	1235
	Limiting the Number of User Login Attempts for SSH and Telnet Sessions	1236
	Recovering the Root Password	1237
	Specifying Access Privileges for Junos OS Configuration Mode Hierarchies	1238
	Specifying Access Privileges for Junos OS Operational Mode Commands	1239

Using Junos OS to Configure Logical System Administrators . . . . .	1241
Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands . . . . .	1242
VSA Match Conditions and Actions . . . . .	1243
Configuration Examples . . . . .	1245
Example: Configuring Access Privilege Levels . . . . .	1246
Example: Configuring Access Privileges for Operational Mode Commands . . . . .	1246
Example: Configuring a Plain-Text Password for Root Logins . . . . .	1247
Example: Configuring RADIUS Authentication . . . . .	1247
Example: Configuring RADIUS System Accounting . . . . .	1248
Example: Configuring the Root Password . . . . .	1249
Example: Configuring SSH Authentication for Root Logins . . . . .	1249
Example: Configuring User Accounts . . . . .	1250
Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication . . . . .	1251
Example: Creating Login Classes with Specific Privileges . . . . .	1252
Example: Configuring QFabric System Login Classes . . . . .	1253
Example: Configuring User Login Accounts . . . . .	1261
Example: Configuring RADIUS Template Accounts . . . . .	1261
Defining Access Privileges Using allow/deny-configuration Statements . .	1262

	Limitations of Private VLANs .....	1395
	Understanding PVLAN Traffic Flows Across Multiple Switches .....	1395
	Community VLAN Sending Untagged Traffic .....	1395
	Isolated VLAN Sending Untagged Traffic .....	1396

PVLAN Tagged Traffic Sent on a Promiscuous Port . . . . .	1397
Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS . . . . .	1399
PVLAN Port Types . . . . .	1399
Secondary VLAN Trunk Port Details . . . . .	1400
Use Cases . . . . .	1401
Understanding Egress Firewall Filters with PVLANS . . . . .	1408
Spanning Trees Overview . . . . .	1409
Overview of Spanning-Tree Protocols . . . . .	1409
Understanding Spanning Tree Protocols on a QFabric System . . . . .	1410
Understanding MSTP . . . . .	1410
Understanding RSTP . . . . .	1411
Understanding VSTP . . . . .	1412
Understanding BPDU Protection for STP, RSTP, and MSTP . . . . .	1413
Understanding Loop Protection for STP, RSTP, VSTP, and MSTP . . . . .	1414
Understanding Root Protection for STP, RSTP, VSTP, and MSTP . . . . .	1415
Q-in-Q Tunneling . . . . .	1416
Understanding Q-in-Q Tunneling and VLAN Translation . . . . .	1416
How Q-in-Q Tunneling Works . . . . .	1416
How VLAN Translation Works . . . . .	1417
Mapping C-VLANs to S-VLANs . . . . .	1417
Routed VLAN Interfaces on Q-in-Q VLANs . . . . .	1418
Constraints for Q-in-Q Tunneling and VLAN Translation . . . . .	1418
Layer 2 Protocol Tunneling . . . . .	1419
Understanding Layer 2 Protocol Tunneling . . . . .	1419
Layer 2 Protocols Supported by L2PT . . . . .	1420
How L2PT Works . . . . .	1421
L2PT Basics . . . . .	1423
Proxy ARP . . . . .	1423
Understanding Proxy ARP . . . . .	1424
What Is ARP? . . . . .	1424
Proxy ARP Overview . . . . .	1424
Best Practices for Proxy ARP . . . . .	1425
<b>Chapter 16 Configuration . . . . .</b>	<b>1427</b>
Configuration Examples . . . . .	1427
Example: Configuring Faster Convergence and Improving Network Stability with RSTP . . . . .	1428
Example: Configuring Network Regions for VLANs with MSTP . . . . .	1441
Example: Configuring Reflective Relay for Use with VEPA Technology . . . . .	1462
Example: Setting Up Basic Bridging and a VLAN on the QFX Series . . . . .	1467
Example: Setting Up Bridging with Multiple VLANs . . . . .	1476
Example: Configuring Routing Between VLANs on One Switch . . . . .	1481
Example: Connecting an Access Switch to a Distribution Switch . . . . .	1487
Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations . . . . .	1495
Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees . . . . .	1499

Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree . . . . .	1504
Example: Disabling MAC Learning . . . . .	1508
Example: Disabling MAC Learning in a VLAN . . . . .	1508
Private VLAN Configuration Examples . . . . .	1510
Example: Configuring a Private VLAN on a Single Switch . . . . .	1510
Example: Configuring a Private VLAN Spanning Multiple Switches . . . . .	1515
Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports . . . . .	1529
Q-in-Q Tunneling Configuration Example . . . . .	1541
Example: Setting Up Q-in-Q Tunneling . . . . .	1541
Configuration Tasks . . . . .	1544
Configuring the Interface Address . . . . .	1545
Configuring Interface IPv4 Addresses . . . . .	1546
Configuring Interface IPv6 Addresses . . . . .	1546
Configuring MAC Notification . . . . .	1547
Enabling MAC Notification . . . . .	1548
Disabling MAC Notification . . . . .	1548
Setting the MAC Notification Interval . . . . .	1548
Configuring MAC Table Aging . . . . .	1549
Configuring Reflective Relay . . . . .	1549
Configuring Static ARP Entries . . . . .	1550
Configuring Reflective Relay . . . . .	1550
Configuring Routed VLAN Interfaces . . . . .	1551
Configuring the Native VLAN Identifier . . . . .	1552
Configuring VLANs . . . . .	1553
Creating a Series of Tagged VLANs . . . . .	1555

**Part 12****Chapter 37****Open Shortest Path First****Overview ..... 3281**

## OSPF Overview ..... 3281

## OSPF Overview ..... 3282

## OSPF Default Route Preference Values ..... 3284

## OSPF Routing Algorithm ..... 3284

## OSPF Three-Way Handshake ..... 3285

## OSPF Version 3 ..... 3286

## OSPF Areas and Router Functionality Overview ..... 3287

## Areas ..... 3287

## Area Border Routers ..... 3287

## Backbone Areas ..... 3287

## AS Boundary Routers ..... 3288

## Backbone Router ..... 3288

## Internal Router ..... 3288

## Stub Areas ..... 3288

## Not-So-Stubby Areas ..... 3288

## Transit Areas ..... 3289

## Packets Overview ..... 3289

## OSPF Packet Header ..... 3289

## Hello Packets ..... 3290

## Database Description Packets ..... 3290

## Link-State Request Packets ..... 3290

## Link-State Update Packets ..... 3290

## Link-State Acknowledgment Packets ..... 3291

## Link-State Advertisement Packet Types ..... 3291

## OSPF External Metrics Overview ..... 3292

**Chapter 38****Configuration ..... 3293**

## Basic OSPF Area Configuration ..... 3293

## Examples: Configuring OSPF Designated Routers ..... 3293

## OSPF Designated Router Overview ..... 3293

## Example: Configuring an OSPF Router Identifier ..... 3294

## Example: Controlling OSPF Designated Router Election ..... 3296

## Examples: Configuring OSPF Areas ..... 3298

## Understanding OSPF Areas and Backbone Areas ..... 3298

## Example: Configuring a Single-Area OSPF Network ..... 3299

## Example: Configuring a Multiarea OSPF Network ..... 3301

## Advanced OSPF Area Configuration ..... 3304

## Examples: Configuring OSPF Stub and Not-So-Stubby Areas ..... 3305

## Understanding OSPF Stub Areas, Totally Stubby Areas, and

## Not-So-Stubby Areas ..... 3305

## Example: Configuring OSPF Stub and Totally Stubby Areas ..... 3306

## Example: Configuring OSPF Not-So-Stubby Areas ..... 3310

## Example: Configuring OSPF Multiarea Adjacency ..... 3315

## Multiarea Adjacency for OSPF ..... 3315

## Example: Configuring Multiarea Adjacency for OSPF ..... 3316

Example: Disabling OSPFv2 Compatibility with RFC 1583 . . . . .	3319
OSPFv2 Compatibility with RFC 1583 Overview . . . . .	3320
Example: Disabling OSPFv2 Compatibility with RFC 1583 . . . . .	3320
OSPF Interface Configuration . . . . .	3321
Examples: Configuring OSPF Interfaces . . . . .	3321
About OSPF Interfaces . . . . .	3322
Example: Configuring an Interface on a Broadcast or Point-to-Point Network . . . . .	3323
Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network . . . . .	3325
Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network . . . . .	3328
Example: Configuring OSPF Demand Circuits . . . . .	3330
Example: Configuring a Passive OSPF Interface . . . . .	3332
Example: Configuring OSPFv2 Peer interfaces . . . . .	3334
OSPF Route Control Configuration . . . . .	3336
Examples: Configuring OSPF Route Summarization . . . . .	3336
Understanding OSPF Route Summarization . . . . .	3336
Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements . . . . .	3336
Example: Limiting the Number of Prefixes Exported to OSPF . . . . .	3342
Configuring OSPF Refresh and Flooding Reduction in Stable Topologies . . . . .	3344
Examples: Configuring OSPF Traffic Control . . . . .	3345
Understanding OSPF Traffic Control . . . . .	3345
Example: Controlling the Cost of Individual OSPF Network Segments . . . . .	3347
Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth . . . . .	3351
Example: Controlling OSPF Route Preferences . . . . .	3353
Example: Configuring OSPF Overload Mode . . . . .	3355
OSPF Overload Function Overview . . . . .	3355
Example: Configuring OSPF to Make Routing Devices Appear Overloaded . . . . .	3356
OSPF Fault Detection Configuration . . . . .	3359
Example: Configuring OSPF Timers . . . . .	3359
OSPF Timers Overview . . . . .	3359
Example: Configuring OSPF Timers . . . . .	3360
Example: Configuring BFD for OSPF . . . . .	3365
BFD for OSPF Overview . . . . .	3365
Example: Configuring BFD for OSPF . . . . .	3367
Example: Configuring BFD Authentication for OSPF . . . . .	3371
BFD Authentication for OSPF Overview . . . . .	3371
Configuring BFD Authentication for OSPF . . . . .	3373

OSPF Redundancy Features Configuration . . . . .	3376
Examples: Configuring Graceful Restart for OSPF . . . . .	3376
Graceful Restart for OSPF Overview . . . . .	3376
Example: Configuring Graceful Restart for OSPF . . . . .	3378
Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart . . . . .	3382
Example: Configuring the Helper Capability Mode for OSPFv3 Graceful Restart . . . . .	3386
Example: Disabling Strict LSA Checking for OSPF Graceful Restart . . . . .	3389
OSPF Traffic Engineering Configuration . . . . .	3392
Examples: Configuring OSPF Traffic Engineering . . . . .	3392
OSPF Support for Traffic Engineering . . . . .	3392
Example: Enabling OSPF Traffic Engineering Support . . . . .	3394
Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface . . . . .	3398
Example: Configuring OSPF Passive Traffic Engineering Mode . . . . .	3400
OSPF Passive Traffic Engineering Mode . . . . .	3400
Example: Configuring OSPF Passive Traffic Engineering Mode . . . . .	3400
OSPF Database Protection Configuration . . . . .	3402
Example: Configuring OSPF Database Protection . . . . .	3403
OSPF Database Protection Overview . . . . .	3403
Configuring OSPF Database Protection . . . . .	3404
OSPF Policy Configuration . . . . .	3405
Examples: Configuring OSPF Routing Policy . . . . .	3405
Understanding OSPF Routing Policy . . . . .	3405
Example: Injecting OSPF Routes into the BGP Routing Table . . . . .	3407
Example: Redistributing Static Routes into OSPF . . . . .	3410
Example: Configuring an OSPF Import Policy . . . . .	3413
Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF . . . . .	3417
Examples: Configuring Routing Policy for Network Summaries . . . . .	3421
Import and Export Policies for Network Summaries Overview . . . . .	3421
Example: Configuring an OSPF Export Policy for Network Summaries . . . . .	3421
Example: Configuring an OSPF Import Policy for Network Summaries . . . . .	3430
OSPF Monitoring Configuration . . . . .	3438
Example: Configuring OSPF Trace Options . . . . .	3438
Tracing OSPF Protocol Traffic . . . . .	3438

	Understanding RP Mapping with Anycast RP . . . . .	3659
	Introduction to PIM Bootstrap Router . . . . .	3659
	Understanding the PIM Bootstrap Router . . . . .	3659
	Introduction to PIM Filtering . . . . .	3660
	Understanding Multicast Message Filters . . . . .	3660
	Filtering MAC Addresses . . . . .	3661
	Filtering RP and DR Register Messages . . . . .	3661

Introduction to PIM RPT and SPT Cutover . . . . .	3662
Understanding Multicast Rendezvous Points, Shared Trees, and Rendezvous-Point Trees . . . . .	3662
Building an RPT Between the RP and Receivers . . . . .	3663
PIM Sparse Mode Source Registration . . . . .	3664
Multicast Shortest-Path Tree . . . . .	3667
SPT Cutover . . . . .	3668
SPT Cutover Control . . . . .	3671
Introduction to IGMP . . . . .	3671
Understanding Group Membership Protocols . . . . .	3671
Understanding IGMP . . . . .	3672
Introduction to IGMP Snooping . . . . .	3674
IGMP Snooping Overview . . . . .	3674
How IGMP Snooping Works . . . . .	3674
How IGMP Snooping Works with Routed VLAN Interfaces . . . . .	3675
How Hosts Join and Leave Multicast Groups . . . . .	3675
IGMP Snooping Support for IGMPv3 . . . . .	3675
IGMP Snooping and Forwarding Interfaces . . . . .	3676
General Forwarding Rules . . . . .	3676
Using a Switch as an IGMP Querier . . . . .	3677
Introduction to MSDP . . . . .	3678
Understanding MSDP . . . . .	3678
Filtering MSDP SA Messages . . . . .	3679
Introduction to Source-Specific Multicast . . . . .	3679
Source-Specific Multicast Groups Overview . . . . .	3680
Understanding PIM Source-Specific Mode . . . . .	3680
PIM SSM . . . . .	3682
Introduction to Multicast VLAN Registration . . . . .	3683
Understanding Multicast VLAN Registration . . . . .	3683
How MVR Works . . . . .	3684
<b>Chapter 44 Configuration . . . . .</b>	<b>3687</b>
PIM Basics . . . . .	3687
Changing the PIM Version . . . . .	3687
Modifying the PIM Hello Interval . . . . .	3688
Preserving Multicast Performance by Disabling Response to the ping Utility . . . . .	3689
Configuring PIM Trace Options . . . . .	3690
Disabling PIM . . . . .	3692
Disabling the PIM Protocol . . . . .	3692
Disabling PIM On an Interface . . . . .	3693
Disabling PIM for a Family . . . . .	3693
Disabling PIM for a Rendezvous Point . . . . .	3694
PIM Designated Router . . . . .	3694
Configuring Interface Priority for PIM Designated Router Selection . . . . .	3694
Configuring PIM Designated Router Election on Point-to-Point Links . . . . .	3695
PIM Sparse Mode . . . . .	3696
Enabling PIM Sparse Mode . . . . .	3696
Configuring PIM Join Load Balancing . . . . .	3697

Modifying the Join State Timeout . . . . .	3700
Example: Enabling Join Suppression . . . . .	3701
Static RP . . . . .	3705
Configuring Local PIM RPs . . . . .	3705
Configuring the Static PIM RP Address on the Non-RP Routing Device . . . . .	3707
Anycast RP . . . . .	3708
Example: Configuring PIM Anycast With or Without MSDP . . . . .	3708
Configuring a PIM Anycast RP Router with MSDP . . . . .	3712
Configuring a PIM Anycast RP Router Using Only PIM . . . . .	3713
Configuring All PIM Anycast Non-RP Routers . . . . .	3714
Example: Configuring Multiple RPs in a Domain with Anycast RP . . . . .	3714
PIM Bootstrap Router . . . . .	3717
Configuring PIM Bootstrap Properties for IPv4 or IPv6 . . . . .	3717
Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain . . . . .	3718
Example: Configuring PIM BSR Filters . . . . .	3719
PIM Filtering . . . . .	3719
Configuring Interface-Level PIM Neighbor Policies . . . . .	3720
Filtering Outgoing PIM Join Messages . . . . .	3721
Filtering Incoming PIM Join Messages . . . . .	3722
Configuring Register Message Filters on a PIM RP and DR . . . . .	3723
PIM RPT and SPT Cutover . . . . .	3725
Example: Configuring the PIM Assert Timeout . . . . .	3725
Example: Configuring the PIM SPT Threshold Policy . . . . .	3728
PIM and the BFD Protocol . . . . .	3731
Configuring BFD for PIM . . . . .	3731
Configuring BFD Authentication for PIM . . . . .	3733
Configuring BFD Authentication Parameters . . . . .	3733
Viewing Authentication Information for BFD Sessions . . . . .	3734
IGMP . . . . .	3736
Configuring IGMP . . . . .	3736
Enabling IGMP . . . . .	3738
Changing the IGMP Version . . . . .	3739
Modifying the IGMP Host-Query Message Interval . . . . .	3739
Modifying the IGMP Last-Member Query Interval . . . . .	3740
Specifying Immediate-Leave Host Removal for IGMP . . . . .	3741
Filtering Unwanted IGMP Reports at the IGMP Interface Level . . . . .	3742
Accepting IGMP Messages from Remote Subnetworks . . . . .	3743
Modifying the IGMP Query Response Interval . . . . .	3744
Modifying the IGMP Robustness Variable . . . . .	3745
Limiting the Maximum IGMP Message Rate . . . . .	3746
Enabling IGMP Static Group Membership . . . . .	3746
Recording IGMP Join and Leave Events . . . . .	3753
Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces . . . . .	3754
Tracing IGMP Protocol Traffic . . . . .	3755
Disabling IGMP . . . . .	3757

IGMP Snooping .....	3757
Configuring IGMP Snooping .....	3758
Changing the IGMP Snooping Group Timeout Value .....	3759
Example: Configuring IGMP Snooping .....	3759
Configuring Multicast VLAN Registration (CLI Procedure) .....	3762
Example: Configuring Multicast VLAN Registration .....	3763
MSDP .....	3768
Configuring MSDP .....	3768
Tracing MSDP Protocol Traffic .....	3769
Configuring the Interface to Accept Traffic from a Remote Source .....	3771
Example: Configuring MSDP .....	3772
Example: Configuring MSDP with Active Source Limits and Mesh Groups ..	3773
Example: Configuring PIM Anycast With or Without MSDP .....	3779
Configuring a PIM Anycast RP Router with MSDP .....	3782
Source-Specific Multicast .....	3783
Example: Configuring PIM SSM on a Network .....	3783
Example: Configuring an SSM-Only Domain .....	3785
Example: Configuring SSM Mapping .....	3785
Example: Configuring Source-Specific Multicast Groups with Any-Source Override .....	3788
Example: Configuring SSM Maps for Different Groups to Different Sources .....	3791
Multiple SSM Maps and Groups for Interfaces .....	3791
Example: Configuring Multiple SSM Maps Per Interface .....	3792
PIM Configuration Statements .....	3795

## Part 15

### Chapter 46

## Security

<b>Overview . . . . .</b>	<b>4071</b>
Firewall Filters . . . . .	4071
Overview of Firewall Filters . . . . .	4071
Firewall Filter Types . . . . .	4072
Firewall Filter Components . . . . .	4072
Firewall Filter Processing . . . . .	4073
Understanding Filter-Based Forwarding . . . . .	4073
Understanding How Firewall Filters Are Evaluated . . . . .	4074
Understanding How Firewall Filters Control Packet Flows . . . . .	4076
Understanding Firewall Filter Match Conditions . . . . .	4077
Filter Match Conditions . . . . .	4077
Numeric Filter Match Conditions . . . . .	4077
Interface Filter Match Conditions . . . . .	4078
IP Address Filter Match Conditions . . . . .	4078
MAC Address Filter Match Conditions . . . . .	4079
Bit-Field Filter Match Conditions . . . . .	4079
Firewall Filter Match Conditions and Actions . . . . .	4080
Understanding How a Firewall Filter Tests a Protocol . . . . .	4090

Understanding Firewall Filter Planning . . . . .	4091
Planning the Number of Firewall Filters to Create . . . . .	4092
Understanding How Many Firewall Filters Are Supported . . . . .	4092
Egress Filters . . . . .	4094
Avoid Configuring too Many Filters . . . . .	4094
Understanding Firewall Filter Processing Points for Bridged and Routed Packets . . . . .	4094
Applying Firewall Filters to Interfaces . . . . .	4095
Policers . . . . .	4096
Overview of Policers . . . . .	4096
Policer Overview . . . . .	4096
Policer Types . . . . .	4097
Policer Actions . . . . .	4098
Policer Colors . . . . .	4098
Suggested Naming Convention for Policers . . . . .	4099
Policer Counters . . . . .	4099
Policer Algorithms . . . . .	4099
How Many Policers are Supported? . . . . .	4100
Understanding Policers with Link Aggregation Groups . . . . .	4100
Understanding Color-Blind Mode for Single-Rate Tricolor Marking . . . . .	4100
Understanding Color-Aware Mode for Single-Rate Tricolor Marking . . . . .	4101
Summary of PLP Changes . . . . .	4101
Understanding Color-Blind Mode for Two-Rate Tricolor Marking . . . . .	4103
Understanding Color-Aware Mode for Two-Rate Tricolor Marking . . . . .	4103
Summary of PLP Changes . . . . .	4103
Effect on Green Packets (Low PLP) . . . . .	4104
Effect on Yellow Packets (Medium PLP) . . . . .	4104
Effect on Red Packets (High PLP) . . . . .	4105
Port Security . . . . .	4105
Overview of Access Port Protection . . . . .	4105
Mitigation of Ethernet Switching Table Overflow Attacks . . . . .	4105
Mitigation of Rogue DHCP Server Attacks . . . . .	4106
Protection Against ARP Spoofing Attacks . . . . .	4106
Protection Against DHCP Snooping Database Alteration Attacks . . . . .	4107
Protection Against DHCP Starvation Attacks . . . . .	4107
Port Security Overview . . . . .	4108
Understanding DHCP Snooping for Port Security . . . . .	4110
DHCP Snooping Basics . . . . .	4110
DHCP Snooping Process . . . . .	4111
DHCP Server Access . . . . .	4112
DHCP Snooping Table . . . . .	4115
Static IP Address Additions to the DHCP Snooping Database . . . . .	4115
Snooping DHCP Packets That Have Invalid IP Addresses . . . . .	4115
Prioritizing Snooped Packets . . . . .	4116
Understanding DAI for Port Security . . . . .	4117
Address Resolution Protocol . . . . .	4117
ARP Spoofing . . . . .	4117
Dynamic ARP Inspection (DAI) . . . . .	4118
Prioritizing Inspected Packets . . . . .	4118

	Understanding MAC Limiting and MAC Move Limiting for Port Security . . .	4119
	MAC Limiting . . . . .	4119
	MAC Move Limiting . . . . .	4120
	Actions for MAC Limiting . . . . .	4120
	MAC Addresses That Exceed the MAC Limit or MAC Move Limit . . . .	4120
	Understanding Trusted and Untrusted Ports . . . . .	4121
	Understanding Trusted DHCP Servers for Port Security . . . . .	4121
	Understanding DHCP Option 82 for Port Security . . . . .	4122
	DHCP Option 82 Processing . . . . .	4122
	Suboption Components of Option 82 . . . . .	4123
	Configurations That Support Option 82 . . . . .	4123
	Understanding Static ARP Entries . . . . .	4124
	Device Security . . . . .	4125
	Understanding Storm Control . . . . .	4125
	Understanding Unknown Unicast Forwarding . . . . .	4126
<b>Chapter 47</b>	<b>Configuration . . . . .</b>	<b>4127</b>
	Firewall and Policer Configuration Examples . . . . .	4127
	Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device . . . . .	4127
	Example: Using Two-Color Policers and Prefix Lists . . . . .	4131
	Example: Using Policers to Manage Oversubscription . . . . .	4134
	Port Security Configuration Examples . . . . .	4136
	Example: Configuring Basic Port Security Features . . . . .	4136
	Example: Configuring Storm Control . . . . .	4143
	Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks . . . . .	4145
	Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks . . . . .	4148
	Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks . . . . .	4152
	Example: Configuring DHCP Snooping, DAI, and MAC Limiting on a Switch with Access to a DHCP Server Through a Second Switch . . . . .	4155
	Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks . . . . .	4162
	Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks . . . . .	4167
	Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server . . . . .	4170
	Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server . . . . .	4174
	Firewall and Policer Configuration Tasks . . . . .	4176
	Configuring Firewall Filters . . . . .	4177
	Configuring a Firewall Filter . . . . .	4177
	Applying a Firewall Filter to a Port . . . . .	4179
	Applying a Firewall Filter to a VLAN . . . . .	4179

Applying a Firewall Filter to a Layer 3 (Routed) Interface . . . . .	4179
Applying Firewall Filters to Interfaces . . . . .	4180
Assigning Forwarding Classes and Loss Priority . . . . .	4181
Configuring Color-Blind Egress Policers for Medium-Low PLP . . . . .	4182
Configuring Two-Color and Three-Color Policers to Control Traffic	
Rates . . . . .	4183
Configuring Two-Color Policers . . . . .	4183
Configuring Three-Color Policers . . . . .	4184
Specifying Policers in a Firewall Filter Configuration . . . . .	4184
Applying a Firewall Filter That Includes a Policers . . . . .	4185
Port Security Configuration Tasks . . . . .	4185
Configuring Port Security (CLI Procedure) . . . . .	4186
Enabling DHCP Snooping . . . . .	4187
Enabling Dynamic ARP Inspection (DAI) . . . . .	4187
Limiting Dynamic MAC Addresses on an Interface . . . . .	4187
Enabling Persistent MAC Learning on an Interface . . . . .	4187
Limiting MAC Address Movement . . . . .	4188
Configuring Trusted DHCP Servers on an Interface . . . . .	4188
Configuring MAC Limiting . . . . .	4188
Configuring MAC Move Limiting (CLI Procedure) . . . . .	4190
Configuring Autorecovery for MAC Limited or Storm Control Interfaces (CLI	
Procedure) . . . . .	4192
Configuring the none Action to Override a MAC Limit Applied to All Interfaces	
(CLI Procedure) . . . . .	4192
Configuring Static ARP Entries . . . . .	4193
Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI	
Procedure) . . . . .	4193
Configuring Unknown Unicast Forwarding . . . . .	4194
Enabling DHCP Snooping (CLI Procedure) . . . . .	4194
Enabling DHCP Snooping . . . . .	4196
Applying CoS Forwarding Classes to Prioritize Snooped Packets . . . . .	4196
Enabling Dynamic ARP Inspection (CLI Procedure) . . . . .	4197
Enabling DAI . . . . .	4198
Applying CoS Forwarding Classes to Prioritize Inspected Packets . . . . .	4198
Enabling a Trusted DHCP Server (CLI Procedure) . . . . .	4199
Enabling a Trusted Port for DHCP . . . . .	4200
Setting Up DHCP Option 82 on the Switch with No Relay Agent Between	
Clients and DHCP Server (CLI Procedure) . . . . .	4201
Setting Up DHCP Option 82 with the Switch as a Relay Agent Between	
Clients and DHCP Server (CLI Procedure) . . . . .	4204
Configuration Statements for Firewall Filters . . . . .	4207
family . . . . .	4207
filter . . . . .	4208
filter (Layer 2 and Layer 3 Interfaces) . . . . .	4209
filter (VLANs) . . . . .	4210
firewall . . . . .	4211

Understanding CoS Hierarchical Port Scheduling (ETS) . . . . .	4872
Hierarchical Scheduling and ETS . . . . .	4873
ETS Advertisement in DCBX . . . . .	4874
Hierarchical Scheduling Process . . . . .	4874
Strict-High Priority Queues and Hierarchical Scheduling . . . . .	4875
Default Hierarchical Scheduling . . . . .	4875
Understanding CoS Output Queue Schedulers . . . . .	4876
Output Queue Scheduling Components . . . . .	4877
Default Schedulers . . . . .	4878
Transmit Rate (Minimum Guaranteed Bandwidth) . . . . .	4879
Sharing Extra Bandwidth . . . . .	4879
Shaping Rate (Maximum Bandwidth) . . . . .	4880
Scheduling Priority . . . . .	4880
Scheduler Drop-Profile Maps . . . . .	4881
Buffer Size . . . . .	4881
Scheduler Maps . . . . .	4882
Understanding CoS Priority Group Scheduling . . . . .	4883
Priority Group Scheduling Components . . . . .	4883
Default Traffic Control Profile . . . . .	4884
Guaranteed Rate (Minimum Guaranteed Bandwidth) . . . . .	4884
Sharing Extra Bandwidth . . . . .	4884
Shaping Rate (Maximum Bandwidth) . . . . .	4885
Scheduler Maps . . . . .	4885
Understanding CoS Traffic Control Profiles . . . . .	4886
Understanding CoS Priority Group and Queue Guaranteed Rates (Minimum Bandwidth) . . . . .	4887
Guaranteeing Bandwidth Using Hierarchical Scheduling . . . . .	4887
Priority Group Guaranteed Rate (Minimum Bandwidth) . . . . .	4889
Queue Transmit Rate (Minimum Bandwidth) . . . . .	4889
Understanding CoS Priority Group Shaping and Queue Shaping (Maximum Bandwidth) . . . . .	4890
Priority Group Shaping . . . . .	4890
Queue Shaping . . . . .	4890
Shaping Maximum Bandwidth Using Hierarchical Scheduling . . . . .	4891
Understanding CoS Scheduling Behavior and Configuration	
Considerations . . . . .	4892
Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows . . . . .	4896
Default Lossless Priority Configuration . . . . .	4897
Configuring Lossless Priorities . . . . .	4899
Backward Compatibility with Junos OS Releases Earlier Than Release 12.3 . . . . .	4909
Configuration Rules and Recommendations . . . . .	4910
Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC	
Gateway . . . . .	4911
Priority Remapping Configuration . . . . .	4911
Configuration Rules . . . . .	4912
Fate Sharing . . . . .	4913

Understanding CoS Buffer Configuration . . . . .	4914
Buffer Pools . . . . .	4915
Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios . . . . .	4923
Optimizing the Buffer Configuration . . . . .	4926
Understanding CoS Tail-Drop Profiles . . . . .	4929
Drop Profile Parameters . . . . .	4929
Default Drop Profile . . . . .	4930
Packet Drop Method . . . . .	4931
Drop Profile Maps . . . . .	4932
Congestion Prevention . . . . .	4932
Understanding CoS Rewrite Rules . . . . .	4933
Understanding DCB Features and Requirements . . . . .	4934
Lossless Transport . . . . .	4935
ETS . . . . .	4936
DCBX . . . . .	4936
Understanding CoS Flow Control (Ethernet PAUSE and PFC) . . . . .	4938
Ethernet PAUSE . . . . .	4938
PFC . . . . .	4942
Lossless Transport Support . . . . .	4944
Understanding DCBX . . . . .	4946
DCBX Basics . . . . .	4946
DCBX Modes and Support . . . . .	4947
DCBX Attribute Types . . . . .	4950
DCBX Application Protocol TLV Exchange . . . . .	4951
DCBX and PFC . . . . .	4952
DCBX and ETS . . . . .	4952
Understanding DCBX Application Protocol TLV Exchange . . . . .	4955
Applications . . . . .	4955
Application Maps . . . . .	4956
Classifying and Prioritizing Application Traffic . . . . .	4957
Enabling Interfaces to Exchange Application Protocol Information . . . . .	4958
Disabling DCBX Application Protocol Exchange . . . . .	4958
<b>Chapter 59 Configuration . . . . .</b>	<b>4961</b>
Configuration Examples . . . . .	4961
Example: Configuring CoS Hierarchical Port Scheduling (ETS) . . . . .	4962
Example: Configuring CoS PFC for FCoE Traffic . . . . .	4983
Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG . . . . .	4991
Example: Configuring Unicast Classifiers . . . . .	5014
Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers . . . . .	5017
Example: Configuring Tail-Drop Profiles . . . . .	5019
Example: Configuring Drop Profile Maps . . . . .	5022
Example: Configuring Forwarding Classes . . . . .	5024
Example: Configuring Forwarding Class Sets . . . . .	5027
Example: Configuring Queue Schedulers . . . . .	5030
Example: Configuring Queue Scheduling Priority . . . . .	5035

Example: Configuring Traffic Control Profiles (Priority Group Scheduling) . . . . .	5037
Example: Configuring Minimum Guaranteed Output Bandwidth . . . . .	5040
Example: Configuring Maximum Output Bandwidth . . . . .	5044
Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) . . . . .	5048
Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface . . . . .	5056
Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces . . . . .	5065
Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) . . . . .	5078
Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway . . . . .	5094
Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic . . . . .	5103
Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic . . . . .	5109
Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic . . . . .	5114
Example: Configuring DCBX Application Protocol TLV Exchange . . . . .	5120
Configuration Tasks . . . . .	5130
Configuring CoS . . . . .	5131
Defining CoS Code-Point Aliases . . . . .	5133
Defining CoS Unicast BA Classifiers . . . . .	5133
Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers . . . . .	5135
Configuring CoS Tail-Drop Profiles . . . . .	5136
Configuring CoS Drop Profile Maps . . . . .	5137
Defining CoS Forwarding Classes . . . . .	5137
Defining CoS Forwarding Class Sets . . . . .	5139
Defining CoS Queue Schedulers . . . . .	5139
Defining CoS Queue Scheduling Priority . . . . .	5142
Changing the Host Outbound Traffic Default Queue Mapping . . . . .	5143
Defining CoS Traffic Control Profiles (Priority Group Scheduling) . . . . .	5143
Configuring CoS PFC (Congestion Notification Profiles) . . . . .	5145
Enabling and Disabling CoS Symmetric Ethernet PAUSE Flow Control . . . . .	5148
Configuring CoS Asymmetric Ethernet PAUSE Flow Control . . . . .	5149
Configuring CoS Fixed Classifier Rewrite Values for Native FC Interfaces (NP_Ports) . . . . .	5151
Configuring Global Ingress and Egress Shared Buffers . . . . .	5153
Defining CoS Rewrite Rules . . . . .	5155
Assigning CoS Components to Interfaces . . . . .	5157
Configuring the DCBX Mode . . . . .	5158
Configuring DCBX Autonegotiation . . . . .	5159
Disabling the ETS Recommendation TLV . . . . .	5162
Defining an Application for DCBX Application Protocol TLV Exchange . . . . .	5162

Configuring an Application Map for DCBX Application Protocol TLV Exchange	5164
Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange	5165

## Part 19

## Network Management and Monitoring

## Chapter 62

<b>Overview</b>	<b>5429</b>
Network Management	5429
Understanding Device and Network Management Features	5429
Understanding Network Management Implementation on the QFabric System	5432
Understanding Telnet on the QFabric System	5433
Understanding Tracing and Logging Operations	5433
Automation Scripts	5435
Understanding Automation Scripts Support	5435
How Commit Scripts Work	5436
Commit Script Input	5437
Commit Script Output	5438
Commit Scripts and the Junos OS Commit Model	5439
Avoiding Potential Conflicts When Using Multiple Commit Scripts	5441
Overview of Generating Persistent or Transient Configuration Changes	5442
Differences Between Persistent and Transient Changes	5443
Interaction of Configuration Changes and Configuration Groups	5446
Tag Elements and Templates for Generating Changes	5446
Required Boilerplate for Commit Scripts	5447
How Op Scripts Work	5448
Required Boilerplate for Op Scripts	5449
Fabric OAM	5451
Overview of Internal Fabric Monitoring	5451
Junos Space	5453
Understanding Junos Space Support	5453
Preparing the Device for Junos Space Management	5456
sFlow Technology	5456
Overview of sFlow Technology	5456
SNMP	5458
Understanding the Implementation of SNMP	5459
Understanding the Implementation of SNMP on the QFabric System	5461
Fabric Chassis MIB	5464
Utility MIB	5467
SNMPv3 Overview	5468
Minimum SNMPv3 Configuration on a Device Running Junos OS	5469
Understanding RMON	5470
RMON Overview	5470
Alarm Thresholds and Events	5471
RMON MIB Event, Alarm, Log, and History Control Tables	5472
Understanding Health Monitoring	5474
Standard SNMP MIBs	5475
Juniper Networks Enterprise-Specific MIBs	5484
MIB Objects for the QFX Series	5490
QFX3500 and QFX3600 Switches	5491
QFabric Systems	5491
QFabric System Node Devices	5491
QFabric System QFX3008-I Interconnect Device	5491

	QFabric System QFX3600-I Interconnect Device . . . . .	5492
	Virtual Chassis (Control Plane Switch) . . . . .	5492
	Standard SNMP Version 1 Traps . . . . .	5492
	Standard SNMP Version 2 Traps . . . . .	5495
	Juniper Networks Enterprise-Specific SNMP Version 1 Traps . . . . .	5498
	Juniper Networks Enterprise-Specific SNMP Version 2 Traps . . . . .	5500
	System Log Messages . . . . .	5505
	Overview of Junos OS System Log Messages . . . . .	5505
	Overview of Single-Chassis System Logging Configuration . . . . .	5505
	Understanding the Implementation of System Log Messages on the QFabric System . . . . .	5507
<b>Chapter 63</b>	<b>Configuration . . . . .</b>	<b>5509</b>
	Configuration Examples . . . . .	5509
	Examples: Configuring System Logging . . . . .	5509
	Examples: Assigning an Alternative Facility . . . . .	5511
	Example: Configuring System Log Messages . . . . .	5512
	Example: Monitoring Network Traffic Using sFlow Technology . . . . .	5514
	Example: Configuring SNMP . . . . .	5518
	Configuration Tasks for Network Management . . . . .	5521
	Configuring Console and Auxiliary Port Properties . . . . .	5521
	Configuring SSH Service for Remote Access to the Router or Switch . . . . .	5522
	Configuring the Root Login Through SSH . . . . .	5522
	Configuring the SSH Protocol Version . . . . .	5523
	Configuring the Client Alive Mechanism . . . . .	5523
	Configuring Telnet Service for Remote Access to a Switch . . . . .	5524
	Configuration Tasks for Automation Scripts . . . . .	5524
	Controlling the Execution of Commit Scripts . . . . .	5524
	Enabling Commit Scripts to Execute . . . . .	5525
	Removing Commit Scripts from the Configuration . . . . .	5525
	Deactivating Commit Scripts . . . . .	5526
	Activating Inactive Commit Scripts . . . . .	5526
	Configuration Tasks for Fabric OAM . . . . .	5527
	Configuring a Fabric Maintenance Association . . . . .	5527
	Configuring Flow Specifications . . . . .	5528
	Configuring a Unicast Ethernet Flow Specification . . . . .	5529
	Configuring a Unicast Ethernet IPv4 Flow Specification . . . . .	5530
	Configuring a Multicast IPv4 Flow Specification . . . . .	5531
	Configuring a Multicast VLAN Flood Flow Specification . . . . .	5531
	Configuration Tasks for sFlow Technology . . . . .	5532
	Configuring sFlow Technology . . . . .	5532
	Configuration Tasks for SNMP . . . . .	5533
	Configuring SNMP . . . . .	5534
	Configuring the SNMP Community String . . . . .	5537
	Configuring SNMP Trap Groups . . . . .	5538
	Adding a Group of Clients to an SNMP Community . . . . .	5539
	Configuring the Interfaces on Which SNMP Requests Can Be Accepted . . . . .	5540

Configuring MIB Views . . . . .	5541
Configuring RMON Alarms and Events . . . . .	5541
Configuring SNMP . . . . .	5542
Configuring an Event . . . . .	5542
Configuring an Alarm . . . . .	5543
Configuring Health Monitoring . . . . .	5544
Creating SNMPv3 Users . . . . .	5544
Configuring Access Privileges for a Group . . . . .	5546
Assigning a Security Name to a Group . . . . .	5547
Configuring SNMPv3 Traps on a Device Running Junos OS . . . . .	5548
Configuring SNMP Informs . . . . .	5549
Configuration Tasks for System Log Messages . . . . .	5550
Junos OS Minimum System Logging Configuration . . . . .	5551
Junos OS System Log Configuration Statements . . . . .	5551
Adding a Text String to System Log Messages . . . . .	5552
Directing System Log Messages to a Log File . . . . .	5553
Directing System Log Messages to a Remote Machine . . . . .	5554
Directing System Log Messages to a User Terminal . . . . .	5554
Directing System Log Messages to the Console . . . . .	5555
Disabling the System Logging of a Facility . . . . .	5555
Displaying a Log File from a Single-Chassis System . . . . .	5556
Including Priority Information in System Log Messages . . . . .	5557
Including the Year or Millisecond in Timestamps . . . . .	5558
Logging Messages in Structured-Data Format . . . . .	5559
Interpreting Messages Generated in Structured-Data Format . . . . .	5560
Interpreting Messages Generated in Standard Format . . . . .	5563
Specifying Log File Size, Number, and Archiving Properties . . . . .	5563
Specifying the Facility and Severity of Messages to Include in the Log . . . . .	5565
Junos OS System Logging Facilities and Message Severity Levels . . . . .	5566
System Log Default Facilities for Messages Directed to a Remote Destination . . . . .	5567
Junos OS System Log Alternate Facilities for Remote Logging . . . . .	5568
Changing the Alternative Facility Name for Remote System Log Messages . . . . .	5569
Using Regular Expressions to Refine the Set of Logged Messages . . . . .	5570
Configuration Statements for Network Management . . . . .	5573

# About the Documentation

- Documentation and Release Notes on page cix
- Supported Platforms on page cix
- Using the Examples in This Manual on page cix
- Documentation Conventions on page cxi
- Documentation Feedback on page cxiii
- Requesting Technical Support on page cxiii

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

## Supported Platforms

---

For the features described in this document, the following platforms are supported:

- [QFX Series](#)

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the CLI User Guide.

## Documentation Conventions

Table 1 on page cxi defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 2 on page cxi defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies book names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS System Basics Configuration Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
<b>Text like this</b>	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols ospf area area-id] hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Enclose optional keywords or variables.	<b>stub &lt;default-metric metric&gt;;</b>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  <i>(string1   string2   string3)</i>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Enclose a variable for which you can substitute one or more values.	<b>community name members [ community-ids ]</b>
Indentation and braces ( { } )	Identify a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
<b>J-Web GUI Conventions</b>		
<b>Bold text like this</b>	Represents J-Web graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

---

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net), or fill out the documentation feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

## Requesting Technical Support

---

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>

- Join and participate in the Juniper Networks Community Forum:  
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

## PART 1

# QFX3500 Switch Overview

- [QFX3500 Switch Overview on page 3](#)

## CHAPTER 1

# QFX3500 Switch Overview

- [QFX3500 Device Overview on page 3](#)

## QFX3500 Device Overview

---

The Juniper Networks QFX3500 device is a high-speed, multipurpose switch especially designed for next-generation data centers. Forty-eight 10-Gbps access ports in the device use small form-factor pluggable plus (SFP+) transceivers and operate by default as 10-Gigabit Ethernet interfaces. Optionally, you can choose to configure up to 12 of the ports as 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel (FC) interfaces, and up to 36 of the ports as 1-Gigabit Ethernet interfaces. When used as a standalone switch, four 40-Gbps uplink ports in the device use quad small form-factor pluggable plus (QSFP+) to four SFP+ copper breakout cables to support an additional 15 10-Gigabit Ethernet interfaces.

QFX3500 devices can function as a Fibre Channel over Ethernet (FCoE)-FC gateway or as an FCoE transit switch. FCoE is a method of supporting converged FC and Ethernet traffic on a data center bridging (DCB) network by encapsulating unmodified FC frames in Ethernet to transport the FC frames over the physical Ethernet network.

In a QFabric system, a QFX3500 device functions as a Node device, connected to a QFabric system through 40-Gbps uplink ports to a Juniper Networks QFX3008-I or QFX3600-I Interconnect device. Together, the QFX3500 Node devices and QFX3008-I or QFX3600-I Interconnect devices form a multistage, nonblocking switch fabric that provides a high-performance, low-latency, unified interconnect solution for next-generation data centers.

The QFX3500 Node devices and Interconnect devices are connected to Juniper Networks QFX3100 Director devices in an out-of-band management network through Juniper Networks EX4200 Ethernet Switches. The QFX3100 Director devices present the QFabric system devices as a single network entity, which enables simplified management of your data center using the Junos OS command-line interface (CLI).

- [Software on page 3](#)
- [Hardware on page 4](#)

## Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on the QFX3500

device's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX3500 devices also runs on all Juniper Networks EX Series switches, and J Series, M Series, MX Series, and T Series routers.

For more information about which features are supported on QFX Series devices, see [“QFX Series Software Features Overview” on page 15](#).

When the QFX3500 device is operating as a standalone switch, you manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

When a QFX Series device operates as part of a QFabric system, all the devices in the data center fabric are managed through the Administrator software installed on the QFX3100 Director devices. Each device in a QFabric system is interconnected in a single control plane and management network, using the redundant management ports on each device.

## Hardware

The compact QFX3500 device is 1 rack unit (1 U) in size and designed to fit in industry-standard 19-inch rack-mount enclosures. See [Figure 1 on page 4](#) and [Figure 2 on page 4](#) and Chassis Physical Specifications for a QFX3500 Chassis.

**Figure 1: QFX3500 Device Front**

**Figure 2: QFX3500 Device Rear**

The front panel of the QFX3500 chassis has an LCD panel that displays the device hostname and the number of active alarms. See [Front Panel of a QFX3500 Device](#). The rear panel has 48 10-Gbps access ports and 4 40-Gbps uplink ports. See [Rear Panel of a QFX3500 Device](#).

## SFP+ Access Ports

The QFX3500 device has 48 access ports (0 through 47) that support small form-factor pluggable plus (SFP+) and small form-factor pluggable (SFP) transceivers, as well as SFP+ direct attach copper cables, also known as Twinax cables. See Interface Support for the QFX3500 Device.

- Up to 48 of the access ports can be used for SFP+ transceivers or SFP+ direct attach copper cables. You can use 10-Gigabit Ethernet SFP+ transceivers and SFP+ direct attach copper cables in any access port. You can use 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel SFP+ transceivers in ports 0 through 5 and ports 42 through 47.

**NOTE:** If you use Fibre Channel SFP+ transceivers in ports 0 through 5 or ports 42 through 47, you must configure the entire block of ports as Fibre Channel ports. For example, if you use a Fibre Channel SFP+ transceiver in any of the ports 0 through 5, then ports 0 through 5 must be configured as Fibre Channel ports. If you use a Fibre Channel SFP+ transceiver in any of the ports 42 through 47, then ports 42 through 47 must be configured as Fibre Channel ports. You then cannot use 10-Gigabit Ethernet SFP+ transceivers in these ports.

- Up to 36 of the access ports can be used for SFP transceivers. Gigabit Ethernet SFP transceivers can be used in ports 6 through 41.

**CAUTION:** Do not place a copper transceiver in an access port directly above or below another copper transceiver. Internal damage to the access ports and device can occur. Because of this limitation, a maximum of 18 copper transceivers can be installed in ports 6 through 41. We recommend using only the top row of access ports for copper transceivers.

Figure 3 on page 5 shows the location of the SFP+ access ports, including the ports that can be used with Fibre Channel SFP+ transceivers and Gigabit Ethernet SFP transceivers.

**Figure 3: SFP+ Access Port Locations**

## QSFP+ Uplink Ports

The QFX3500 device has four uplink ports (**Q0** through **Q3**) that support up to four QSFP+ transceivers, as well as QSFP+ DAC or DAC breakout cables. See Interface Support for the QFX3500 Device.

When the QFX3500 device is used as part of a QFabric system, these uplink ports are used to connect the QFX3500 Node device to QFX3008-I or QFX3600-I Interconnect devices. See Connecting a QFX3500 Node Device to a QFX3008-I Interconnect Device or Connecting a QFX3500 Node Device to a QFX3600-I Interconnect Device.

When the QFX3500 device is used as a standalone switch, these uplink ports are configured by default as 15 10-Gigabit Ethernet interfaces. Port **Q0** supports only three 10-Gigabit Ethernet interfaces. Ports **Q1** through **Q3** support four 10-Gigabit Ethernet interfaces. Optionally, you can configure one or more of the ports as 40-Gigabit Ethernet interfaces. [Figure 4 on page 6](#) shows the location of the QSFP+ uplink ports and the default 10-Gigabit Ethernet interface numbering.

**NOTE:** The QSFP+ uplink ports are not supported in Junos OS Release 11.1. The QSFP+ uplink ports are supported in Junos OS Release 11.2 and later. To configure the ports as 40-Gigabit Ethernet interfaces, you must be using Junos OS Release 12.2X50-D20 or later.

- [QFX3600 Switch Overview on page 9](#)

## CHAPTER 2

# QFX3600 Switch Overview

- [QFX3600 Device Overview on page 9](#)

## QFX3600 Device Overview

---

The Juniper Networks QFX3600 device is a high-speed, multipurpose switch especially designed for next-generation data centers. Sixteen 40-Gbps ports in the device use quad small form-factor pluggable plus (QSFP+) transceivers. The small form-factor and front facing ports in the switch make it suitable for deployment in high-density server racks and container-based data center deployments.

In a QFabric system, a QFX3600 device functions as a Node device, connected to a QFabric system through 40-Gbps uplink ports to a Juniper Networks QFX3008-I or QFX3600-I Interconnect device. Together, the QFX3600 Node devices and QFX3008-I or QFX3600-I Interconnect devices form a multistage, nonblocking switch fabric that provides a high-performance, low-latency, unified interconnect solution for next-generation data centers.

The QFX3600 Node devices and QFX3008-I or QFX3600-I Interconnect devices are connected to Juniper Networks QFX3100 Director devices in a control plane and management network. The QFX3100 Director device presents the QFabric system devices as a single network entity, allowing for simplified management of your data center using the Junos OS command-line interface (CLI).

- [Software on page 9](#)
- [Hardware on page 10](#)

## Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on the QFX3600 device's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX Series devices also runs on all Juniper Networks EX Series, J Series, M Series, MX Series, and T Series devices.

For more information about which features are supported on QFX Series devices, see [“QFX Series Software Features Overview” on page 15](#).

When the QFX3600 device is operating as a standalone switch, you manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

When a QFX Series device operates as part of a QFabric system, all the devices in the data center fabric are managed through the Administrator software installed on the QFX3100 Director devices. Each device in a QFabric system is interconnected in a single control plane and management network, using the redundant management ports on each device.

## Hardware

The compact QFX3600 chassis is 1 rack unit (1 U) in size and designed to fit in industry-standard 19-inch rack-mount enclosures, as well as high-density server racks and container-based data center deployments. See [Figure 5 on page 10](#) and [Figure 6 on page 10](#) and Chassis Physical Specifications for QFX3600 and QFX3600-I Devices.

Figure 5: QFX3600 Chassis Front

1—LCD panel	4—COS 1-Gbps SFP management port
2—QSFP+ ports	5—C0 1000BASE-T RJ-45 management port
3—CIS 1-Gbps SFP management port	6—C1 1000BASE-T RJ-45 management port

Figure 6: QFX3600 Chassis Rear

1—Power supplies	2—Fan trays
------------------	-------------

The front panel of the QFX3600 chassis has an LCD panel that displays the device hostname and the number of active alarms. It also has sixteen 40-Gbps ports labeled **Q0** through **Q15** that support quad small form-factor pluggable plus (QSFP+) transceivers. See [Front Panel of a QFX3600 Device](#).

If you are using the QFX3600 device as a Node device in a QFabric system, by default, four ports (labeled **Q0** through **Q3**) are configured for uplink connections between your

QFX3600 Node device and your Interconnect device, and twelve ports (labeled **Q4** through **Q15**) support 48 10-Gigabit Ethernet or 12 40-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (labeled **Q0** through **Q7**) for uplink connections between your QFX3600 Node device and your Interconnect device and ports **Q2** through **Q15** for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks. See [Configuring the Port Type on QFX3600 Node Devices and Interface Support for the QFX3600 Device](#).

If you are using the QFX3600 device as a standalone switch, by default, all 16 QSFP+ ports (**Q0** through **Q15**) are configured as 40-Gigabit Ethernet (*xle*) ports. Optionally, you can choose to configure each port to operate as 10-Gigabit Ethernet (*xe*) ports to support up to 63 10-Gigabit Ethernet ports. See [“Configuring the Port Type on QFX3600 Standalone Switches” on page 204](#)<sup>1</sup> and [Interface Support for the QFX3600 Device](#).

The rear panel of the QFX3600 chassis has two redundant power supplies and three redundant fan trays that are field-replaceable and hot-swappable. See [Rear Panel of QFX3600 and QFX3600-I Devices](#).

QFabric system component-level access and login classes	Not applicable	Not applicable	Junos OS 11.3X30.9	Junos OS 12.2X50-D10

**Table 4: Administration Features**

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
System logging (syslog) over IPv4	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Licensing	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 5: CoS Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Class of service (CoS)—Class-based queuing with prioritization	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS—Multidestination	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS support on link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Enhanced transmission selection (ETS)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Interface-specific CoS rewrite rules	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Port shaping and queue shaping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control (PFC)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control enhancements	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Re-marking of bridged packets	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority remapping	Junos OS 12.3X50-D10	Not supported	Not supported	Not supported
Weighted random early detection (WRED) tail-drop profiles	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
802.3X Ethernet PAUSE autonegotiation enhancements	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Layer 3 ingress packet classification and egress rewrite rule class-of-service features	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported
Software buffer configurability	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 6: High Availability and Resiliency Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Graceful protocol restart for BGP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Graceful protocol restart for OSPF	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Support for 32 members in a link aggregation group (LAG)	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Multichassis link aggregation	Junos OS 12.2X50-D10	Not supported	Not supported	Not supported
Virtual Router Redundancy Protocol (VRRP)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Not supported	Not supported
Graceful restart for FIP snooping to recover gracefully from Ethernet protocol restarts and crashes	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported
Nonstop software upgrade (NSSU)	Not supported	Not supported	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 6: High Availability and Resiliency Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Layer 3 unicast and multicast support for multichassis link aggregation	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 7: Interface Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Interface ranges	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
VLAN-tagged Layer 3 logical interfaces	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 8: IP Address Management Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Static addresses	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IPv4 support for telnet	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6. For information about telnet support on this system, see <a href="#">“Understanding Telnet on the QFabric System”</a> on page 5433.	Junos OS 12.2X50-D10. For information about telnet support on this system, see <a href="#">“Understanding Telnet on the QFabric System”</a> on page 5433.
IPv6 support for neighbor discovery, SSH, Telnet, ping, traceroute, static routing, firewall filters, RADIUS, NTP, SNMP, on network Node group	Not supported	Not supported	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
IPv6 support for neighbor discovery, SSH, Telnet, ping, traceroute, static routing, firewall filters, SNMP on management interfaces	Junos OS 12.2X50-D20	Not supported	Not applicable	Not applicable

Table 8: IP Address Management Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IPv6 support for neighbor discovery, router advertisements, stateless autoconfiguration, link aggregation, SSH, Telnet, ping, traceroute, path MTU, static routing, dynamic routing (BGPv6, IS-ISv6, OSPFv3, RIPv6), graceful restart, BFD, virtual routers, firewall filters, SNMP, CoS, VRRPv3, Radius, TACACS+, AAA, NTP, syslog, on network interfaces	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10		

Table 9: Layer 2 Network Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
802.1Q VLAN tagging	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
BPDU protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10 (network Node group only)	Junos OS 12.2X50-D10 (network Node group only)
Jumbo frames on routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Link Layer Discovery Protocol (LLDP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Loop protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 9: Layer 2 Network Protocol Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Root protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
Spanning tree:	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10 (network Node group only)	Junos OS 12.2X50-D10 (network Node group only)
<ul style="list-style-type: none"> <li>Spanning Tree Protocol (STP)</li> <li>Rapid Spanning Tree Protocol (RSTP)</li> <li>Multiple Spanning Tree Protocol (MSTP)</li> <li>VLAN Spanning Tree Protocol (VSTP)</li> <li>RSTP and VSTP concurrent configuration</li> </ul>				
VLAN ranges	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Private VLANs	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Secondary VLAN trunk ports and promiscuous access ports for private VLANs	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported
Q-in-Q tunneling and VLAN translation	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Layer 2 Tunneling Protocol	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 9: Layer 2 Network Protocol Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Reflective relay	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Proxy ARP	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported

Table 10: Layer 3 Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Bidirectional Forwarding Detection (BFD)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Border Gateway Protocol (BGP)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D20
A separate software license is required for BGP. See <a href="#">“Software Features That Require Licenses on the QFX Series”</a> on page 63.				
BGPv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Intermediate System-to-Intermediate System (IS-IS)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
A separate software license is required for IS-IS. See <a href="#">“Software Features That Require Licenses on the QFX Series”</a> on page 63.				
IS-ISv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Open Shortest Path First (OSPF) v2	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D20
OSPFv3	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Per-packet load balancing (ECMP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D20
Routing Information Protocol versions 1 and 2 (RIPv1 and RIPv2)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 10: Layer 3 Protocol Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
RIPv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Routing options	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Static routes	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Virtual router routing instances for unicast protocols	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Virtual router routing instances for multicast protocols	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 11: Multicast Protocols Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IGMPv1 and v2 snooping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IGMP snooping with routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Protocol Independent Multicast sparse mode (PIM SM)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Not supported	Not supported
Protocol Independent Multicast source-specific multicast (PIM SSM)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Bidirectional Forwarding Detection (BFD) for PIM	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
IGMPv3	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 11: Multicast Protocols Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IGMPv3 snooping	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Anycast RP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Multicast Source Discovery Protocol (MSDP)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Multicast VLAN registration	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
IGMP Querier	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 12: Network Management and Monitoring Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Junos Space	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
Local port mirroring	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Remote port mirroring	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Remote port mirroring to IP address (GRE encapsulation)	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
RMON	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
sFlow monitoring technology	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Simple Network Management Protocol version 1 (SNMPv1) and SNMPv2	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Simple Network Management Protocol version 3 (SNMPv3)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 12: Network Management and Monitoring Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Juniper enterprise-specific SNMP Utility MIB	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Uplink failure detection	Junos OS 11.3R4	Junos OS 12.2X50-D20	Not supported	Not supported
Junos OS automation script support	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Debugging and diagnostics support	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Internal fabric OAM monitoring	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Juniper enterprise-specific SNMP Fabric Chassis MIB	Not applicable	Not applicable	Junos OS 12.2X50-D20	Junos OS 12.2X50-D20
DHCP relay	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
DHCP smart relay	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 13: Port Security Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Automatic recovery for port error disable conditions	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
MAC limiting	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
MAC move limiting	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Persistent MAC learning (sticky MAC)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 13: Port Security Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Static ARP support	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Storm control (broadcast, unicast, and multicast)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
DHCP snooping	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Dynamic ARP inspection (DAI)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 14: QFabric System-Specific Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Aliasing of Node devices	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
High availability of QFabric system components	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Node groups	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
QFabric system component-level access and login classes	Not applicable	Not applicable	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
Aliases for Director devices and Interconnect devices	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 15: Security

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Firewall filters and rate limiting	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 15: Security (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Firewall filters on LAGs	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Firewall filters on loopback interfaces	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Firewall filters on management interfaces	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported
Policing	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Increased numbers of supported filters and policers	Junos OS 12.2X50-D20	Junos OS 12.2X50-D20	Not supported	Not supported
Filter-based forwarding	Junos OS 12.2X50-D20	Junos OS 12.2X50-D20	Not supported	Not supported

(For a list of supported firewall filter match conditions and actions, see [“Firewall Filter Match Conditions and Actions” on page 4080](#).)

Table 16: Storage and Fibre Channel Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Data center bridging technologies	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Data Center Bridging Capability Exchange protocol (DCBX)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
FCoE Initialization Protocol (FIP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Fibre Channel fabrics	Junos OS 11.1R1	Not Supported	Junos OS 11.3X30.6 *	Junos OS 12.2X50-D10 *
Fibre Channel interfaces	Junos OS 11.1R1	Not Supported	Junos OS 11.3X30.6 *	Junos OS 12.2X50-D10 *

Table 16: Storage and Fibre Channel Features (*continued*)

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Fibre Channel over Ethernet (FCoE) to Fibre Channel gateway	Junos OS 11.1R1	Not Supported	Junos OS 11.3X30.6 *	Junos OS 12.2X50-D10 *
FCoE-FC gateway link automated load balancing	Junos OS 12.3X50-D10	Not Supported	Not Supported	Not Supported
FCoE OxID hash control	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not Supported	Not Supported

## Configuration File Terms

[Table 18 on page 30](#) lists the various configuration file terms used for the QFX Series and their definitions.

Table 18: Configuration File Terms

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

**Related Documentation**

- [Reverting to the Rescue Configuration on page 150](#)
- [Understanding Configuration Files on page 1113](#)

## Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements

Many statements in the Junos OS configuration include an option to specify an IP address or route prefix. This option is represented in one of the following ways:

- **network/prefix-length**—Network portion of the IP address, followed by a slash and the destination prefix length (previously called the subnet mask). For example, **10.0.0.1/8**.
- **network**—IP address. For example, **10.0.0.2**.
- **destination-prefix/prefix-length**—Route prefix, followed by a slash and the destination prefix length. For example, **192.168.1.10/32**.

You enter all IP addresses in classless mode. You can enter the IP address with or without a prefix length, in standard dotted notation (for example, **1.2.3.4**), or hexadecimal notation as a 32-bit number in network-byte order (for example, **0x01020304**). If you omit any octets, they are assumed to be zero. Specify the prefix length as a decimal number from 1 through 32.

- Related Documentation**
- [Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 48](#)

## Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model: that is, a candidate configuration is modified as desired and then committed to the system. Once a configuration has been committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The former active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and all other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (1–49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronize** command.

## Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

**NOTE:** A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

***package-name-m.nZx.y-domestic-signed.tgz***

where:

- ***package-name*** is the name of the package—for example, ***jinstall-qfx***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***11.1***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, ***1.5***.

A sample switch software package name is:

***jinstall-qfx-11.1R1.5-domestic-signed.tgz***

## NTP Time Server and Time Services Overview

When configuring the Network Time Protocol (NTP), you can specify which system on the network is the authoritative time source, or time server, and how time is synchronized between systems on the network. To do this, you configure the router or switch to operate in one of the following modes:

- Client mode—In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.
- Symmetric active mode—In this mode, the local router or switch and the remote system can synchronize with each other. You use this mode in a network in which either the local router or switch or the remote system might be a better source of time.

**NOTE:** Symmetric active mode can be initiated by either the local or the remote system. Only one system needs to be configured to do so. This means that the local system can synchronize with any system that offers symmetric active mode without any configuration whatsoever. However, we strongly encourage you to configure authentication to ensure that the local system synchronizes only with known time servers.

- Broadcast mode—In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the local router or switch is operating as a transmitter.
- Server mode—In this mode, the local router or switch operates as an NTP server.

**NOTE:** In NTP server mode, the Junos OS supports authentication as follows:

- If the NTP request from the client comes with an authentication key (such as a key ID and message digest sent with the packet), the request is processed and answered based on the authentication key match.
- If the NTP request from the client comes without any authentication key, the request is processed and answered without authentication.

- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 160](#)

## NTP Time Server and Time Services Overview (QFabric System)

Network Time Protocol (NTP) synchronizes the time among all of the various devices in the QFabric system to an external time server. This ensures that time-stamped events, like log entries and database transactions, can be correlated between multiple devices in the QFabric system. The QFabric system can only be in client mode.

Additionally, you can authenticate time synchronization to ensure that the QFabric system obtains its time services only from known sources. By default, network time synchronization is unauthenticated. We strongly encourage you to configure authentication of network time services.

## Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)

Before you upgrade to Junos OS Release 11.3, you must deactivate the CoS configuration if the CoS configuration includes any of the following features:

- **excess-rate** option
- **strict-high** or **high** priority queues
- Any of the Junos OS Release 11.1 or 11.2 default multidestination forwarding classes

**CAUTION:** If your CoS configuration contains any of the features listed above and you attempt to upgrade from Junos OS Release 11.1 or 11.2 to a later version without first editing the configuration, the Junos OS might not restart.

Junos OS Release 11.3 and later for QFX Series no longer supports the **excess-rate** statement, the **strict** priority option, or the default multidestination forwarding classes used in Junos OS Release 11.1 and 11.2. In addition, Junos OS Release 11.3 introduces new restrictions on how to configure and use **strict-high** priority queues.

This topic does not describe how to perform the software upgrade procedure. It describes how to deactivate your CoS configuration, edit your CoS configuration, and reactivate your CoS configuration at the appropriate times.

Use the following procedure to upgrade safely from Junos OS Release 11.1 or 11.2 to a later release:

1. Deactivate the CoS configuration *before* you upgrade the software:  
`user@switch# deactivate class-of-service`
2. Follow the upgrade procedure to Junos OS Release 11.3 or later software.

3. Make the following changes to the CoS configuration while the CoS configuration is still deactivated:
  - Remove the **excess-rate** statement from the CoS configuration if you have used it at the **[edit class-of-service schedulers]** or **[edit class-of-service traffic-control-profiles]** hierarchy level.
  - Remove the **strict-high** and **strict** priority queue configurations if you have used them at the **[edit class-of-service schedulers]** hierarchy level.
  - Remove the default multdestination forwarding classes (**mcast-be**, **mcast-af**, **mcast-ef**, and **mcast-nc**) if you have used them at the **[edit class-of-service schedulers]**, **[edit class-of-service rewrite-rules]**, **[edit class-of-service classifiers]**, **[edit class-of-service scheduler-maps]**, or **[edit class-of-service forwarding-class-sets]** hierarchy level. Alternatively, you can change the mapping of the multdestination traffic to use the new default multdestination forwarding class (**mcast**).
4. If desired, configure **strict-high** priority queues in accordance with the Junos OS Release 11.3 or later configuration rules, and map multdestination traffic to the default multdestination forwarding class (**mcast**).
5. Activate the CoS configuration:
 

```
user@switch# activate class-of-service
```
6. Commit the CoS configuration:
 

```
user@switch# commit
```

**NOTE:** If you configured the **transmit-rate** option for any queues under the **[edit class-of-service schedulers]** hierarchy level, if the rate is configured as an exact rate in Mbps, we recommend that you reconfigure the **transmit-rate** option as a percentage. This is because the scheduler converts exact rates to percentages, and when the exact rate is below 1 Gbps, some granularity may be lost in the conversion. You can avoid this potential issue by specifying the **transmit-rate** option as a percentage.

## Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

- [Typical Uses for Autoinstallation on page 36](#)
- [Autoinstallation Configuration Files and IP Addresses on page 36](#)
- [Typical Autoinstallation Process on a New Switch on page 37](#)

### Typical Uses for Autoinstallation

---

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

### Autoinstallation Configuration Files and IP Addresses

---

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- **hostname.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, **hostname** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

---

### Typical Autoinstallation Process on a New Switch

---

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.
2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
    - a. If the DHCP server specifies the host-specific configuration file **hostname.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
    - b. If the switch does not locate a **hostname.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
    - c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.
    - d. If the switch determines its hostname, it sends a TFTP request for the **hostname.conf** file.
    - e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.
  3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

## Understanding Zero Touch Provisioning

Zero Touch Provisioning allows you to provision new Juniper Networks switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default factory configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network. To make sure you have the default factory configuration loaded on the switch, issue the **request system zeroize** command on the switch you want to provision.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If you do not configure the DHCP server to provide this information, the switch boots with the preinstalled software and default factory configuration.

The Zero Touch Provisioning process will either upgrade or downgrade the Junos OS version. During an downgrade:

- On an EX Series switch, if you downgrade to a software version earlier than Junos OS Release 12.2, in which Zero Touch Provisioning is not supported, the configuration file autoinstall phase of the Zero Touch Provisioning process does not happen.
- On an EX Series switch, to downgrade to a software version that does not support resilient dual-root partitions (Junos OS Release 10.4R2 or earlier), you must perform some manual work on the switch. For more information, see [Understanding Resilient Dual-Root Partitions on Switches](#).

When you boot a switch with the default factory configuration, the following process happens:

1. If DHCP option 43, suboption 00 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.
2. If DHCP option 43, suboption 02 (a symbolic link to the software image file on the FTP, HTTP, or TFTP server), the switch compares the version of the provided software image to the version of the software installed on the switch.
  - If the Junos OS versions are different, the switch downloads the software image from the FTP, HTTP, or TFTP server, installs the Junos OS, and reboots using the default factory configuration.
  - If the software versions are the same, the switch does not upgrade the software.
3. If DHCP option 43, suboption 01 (the name of the configuration file on the FTP, TFTP, or HTTP server is configured, the switch compares the version of the provided configuration file to the version of the configuration file on the switch.

If DHCP option 43 suboption 01 is not specified, the switch uses the default factory configuration.

If the configuration file version on the FTP, HTTP, or TFTP server is newer than the configuration file on the switch, the configuration file is updated on the switch.

If both DHCP option 43 suboption 01 and suboption 2 are specified, suboption 01 is processed before suboption 02. The Junos OS is upgraded, and then the configuration file is applied.

4. If DHCP option 43, suboption 03 (the transfer mode setting) is configured, the switch accesses the FTP, HTTP, or TFTP server using the specified transfer mode setting—for example, FTP.

If DHCP option 43, suboption 03, is not configured, TFTP becomes the transfer mode automatically.

5. If either DHCP option 150 or option 66 is specified, the IP address of the FTP, HTTP, or TFTP server is configured.

**NOTE:** If both DHCP option 150 and option 66 are specified, option 150 will take precedence, and option 66 will be ignored.

6. (Optional) If DHCP option 7 is specified, you can configure one or more syslog servers.
7. (Optional) If DHCP option 42 is specified, you can configure one or more NTP servers.
8. (Optional) If DHCP option 12 is specified, you can configure the hostname of the switch.

#### Related Documentation

- [Configuring Zero Touch Provisioning on page 77](#)

## Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a Juniper Networks EX Series Ethernet Switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, router or switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

This topic describes:

- [DHCP Client/Server Model on page 40](#)
- [Using DHCP on page 40](#)
- [DHCP Relay Servers and DHCP Servers on page 41](#)
- [Legacy DHCP and Extended DHCP for Server Versions on page 41](#)
- [Configuring DHCP on a Switch on page 42](#)
- [How DHCP Works on page 42](#)

### DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See [Figure 7 on page 40](#).

Figure 7: DHCP Client/Server Model

### Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, the new software is downloaded and installed. See [“Upgrading Software Using Automatic Software Download” on page 114](#).

## DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server. For directions on configuring a DHCP relay server, see [DHCP/BOOTP Relay for Switches Overview](#).

## Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series switches and on the QFX Series. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch. See [EX Series Switch Software Features Overview](#) for a list of switches that support the extended DHCP server.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients. For details, see [High Availability Features for EX Series Switches Overview](#).
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see [Understanding Virtual Routing Instances on EX Series Switches](#).

**NOTE:** Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See [EX Series Switch Software Features Overview](#) for a list of switches that support extended DHCP (VR-aware DHCP).

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in [Table 19 on page 41](#):

**Table 19: Legacy DHCP and Extended DHCP Server Hierarchy Levels**

DHCP Service	Hierarchy
Extended DHCP server	<code>edit system services dhcp-local-server</code>
Extended DHCP address pool	<code>edit access address-assignment pool</code>
Legacy DHCP server	<code>edit system services dhcp</code>

Table 19: Legacy DHCP and Extended DHCP Server Hierarchy Levels (*continued*)

DHCP Service	Hierarchy
Legacy DHCP relay	<code>edit forwarding-options helpers bootp</code>
Extended DHCP relay	<code>edit forwarding-options dhcp-relay</code>
Legacy DHCP address pool	<code>edit system services dhcp pool</code>

DHCP clients on a switch are always configured at the hierarchy level `[edit interfaces interface-name family dhcp]`.

### Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

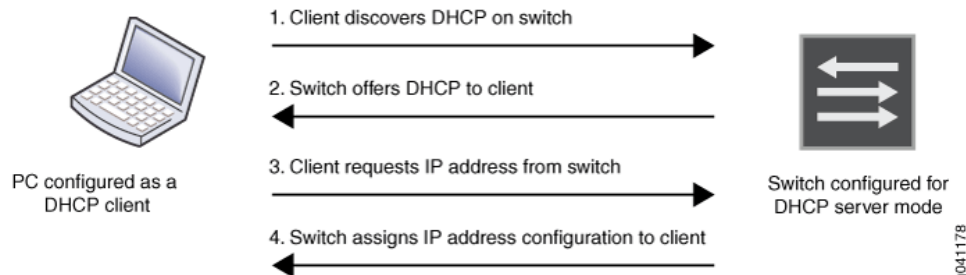

For directions for configuring either a legacy DHCP server or an extended DHCP server, see “[Configuring a DHCP Server on Switches \(CLI Procedure\)](#)” on page 121.

To configure a DHCP client, set the client’s DHCP interface address in the `[edit interfaces interface-name unit 0 family inet dhcp]` hierarchy. For directions for configuring a DHCP client on a switch, see “[Configuring a DHCP Client \(CLI Procedure\)](#)” on page 120.

### How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See [Figure 8 on page 42](#).

Figure 8: DHCP Four-Step Transfer

**NOTE:** Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

## Understanding Software Infrastructure and Processes

The QFX Series products run the Juniper Networks Junos OS. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 43](#)
- [Junos OS Processes on page 44](#)

### Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.

- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 20 on page 44 describes the primary Junos OS processes.

**Table 20: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.

Table 20: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Multicast snooping process	<del>multicast</del> snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

## CLI User Interface Overview

- [CLI Overview on page 46](#)
- [CLI Key Features on page 46](#)
- [CLI Command Modes on page 47](#)

### CLI Overview

---

The command-line interface (CLI) is the software interface you use to access, monitor, configure, troubleshoot, and manage a device running Junos OS. You can access the CLI either from the console or through a network connection. The CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel.

The CLI provides a variety of UNIX utilities, such as Emacs-style keyboard sequences, which allows you to perform the following actions:

- Move around on a command line and scroll through recently executed commands.
- Match regular expressions to locate and replace values and identifiers in a configuration.
- Filter command output.
- Log file entries.
- Store and archive device files on a UNIX-based file system.

You can exit the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage processes, and perform other tasks.

### CLI Key Features

---

The CLI commands and statements follow a hierarchical organization and have consistent syntax. The CLI provides the following features for ease of use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with the Junos OS, you can use many of the CLI commands without referring to the documentation.
- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press Tab or the Spacebar. If the

partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

## CLI Command Modes

The CLI has two modes, operational mode and configuration mode.

- Operational mode—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot Junos OS and devices and network connectivity. Operational mode is indicated by the **>** prompt—for example, **user@switch> clear**
- Configuration mode—A Junos OS device configuration is stored as a hierarchy of statements. In configuration mode, you can define all properties of the Juniper Networks Junos OS, including interfaces, VLANs, Virtual Chassis information, user access, and several system hardware properties. To enter configuration mode, enter the **configure** command. Configuration mode is indicated by the **#** prompt and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]  
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you must issue another **commit** command within the defined period of time (10 minutes by default), or the system reverts to the previous configuration.

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]  
user@switch# top  
[edit]
```

**user@switch# exit**

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (>) and the configuration mode prompt is a pound sign (#).

When you log in to the switch and type the **cli** command, you are automatically in operational mode. To switch to configuration mode, type the **configure** command or the **edit** command.

The CLI prompt changes from **user@switch>** to **user@switch#**, and a banner appears to indicate the hierarchy level.

To return to operational mode as well as commit your changes, enter **command and-quit**. To return to operational mode without committing any of your changes, enter **exit**.

To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command.

**Related  
Documentation**

- [Configuring CLI Tips on page 48](#)
- [Overview of Navigating the CLI on page 53](#)
- CLI User Guide
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 280](#)

## Configuring CLI Tips

The Junos OS CLI provides the option of configuring CLI tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

- Defining Junos OS Login Classes
- [login-tip on page 233](#)

## Format for Specifying Filenames and URLs in Junos OS CLI Commands

In some command-line interface (CLI) commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication *load-key-file***, and **request system software add**—you can include a filename.

On a routing matrix, you can include chassis information (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**) as part of the filename.

A *routing matrix* is a multichassis architecture composed of either one TX Matrix router and from one to four T640 routers connected to the TX Matrix router, or one TX Matrix Plus router and from one to four T1600 routers connected to the TX Matrix Plus router. From the perspective of the user interface, the routing matrix appears as a single router. On a routing matrix composed of the TX Matrix router and T640 routers, the TX Matrix router controls all the T640 routers. On a routing matrix composed of a TX Matrix Plus router and T1600 routers, the TX Matrix Plus router controls all the T1600 routers.

You can specify a filename or URL in one of the following ways:

- **filename**—File in the user's current directory on the local CompactFlash card (not applicable on the QFX Series). You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in Hypertext Transfer Protocol (HTTP) or FTP.

**NOTE:** Wildcards are supported only by the **file** (**compare** | **copy** | **delete** | **list** | **rename** | **show**) commands. When you issue the **file show** command with a wildcard, it must resolve to one filename.

- **path/filename**—File on the local flash disk.
- **/var/filename** or **/var/path/filename**—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:  
  

```
user@host> file delete lcc0-re0:/var/tmp/junk
```
- **a:filename** or **a:path/filename**—File on the local removable media. The default path is **/** (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- **hostname:path/filename**, **hostname:filename**, **hostname:path/filename**, or **"scp://hostname/path/filename"**—File on an **scp/ssh** client. This form is not available in the worldwide version of the Junos OS. The default path is the user's home directory on the remote system. You can also specify **hostname** as **username@hostname**.
- **ftp://hostname/path/filename**—File on an FTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. The default path is the user's home directory. To specify an absolute path, the path must start with **%2F**; for example, **ftp://hostname/%2Fpath/filename**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net/filename
file copy ftp.hostname.net: Not logged in.
```

```
user@host> file copy ftp://username:prompt@ftp.hostname.net/filename
Password for username@ftp.hostname.net:
```

- **re0:/path/filename** or **re1:/path/filename**—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> show log lcc0-re1:chassisd
```

**NOTE:** You cannot specify a URL for a file on a Hypertext Transfer Protocol (HTTP) server, because HTTP URLs are not writable.

## Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in [Figure 9 on page 50](#).

**Figure 9: Commands That Combine Other Commands**

The **request support information** command provides output from a combination of other operational commands.

```
user@host> request support information

root@host> show system uptime

Current time: 2007-02-16 13:10:08 PST
System booted: 2007-02-02 09:21:50 PST (2w0d 03:48 ago)
Protocols started: 2007-02-02 09:24:42 PST (2w0d 03:45 ago)
Last configured: 2007-02-16 03:04:58 PST (10:05:10 ago) by root

## Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 51](#)
- [Commonly Used Operational Mode Commands on page 52](#)

### CLI Command Categories

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.
  - **clear**—Clear statistics and protocol database information.
  - **mtrace**—Trace mtrace packets from source to receiver.
  - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
  - **ping**—Determine the reachability of a remote network host.
  - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
  - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
  - **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the Junos OS Operational Mode Commands.
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the Junos OS Operational Mode Commands.
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the Junos OS Operational Mode Commands.

- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the Junos OS Operational Mode Commands.
- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the Junos OS Operational Mode Commands.
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see [“Understanding Junos OS CLI Configuration Mode” on page 56](#).
- A command—**quit**—to exit the CLI. For information about this command, see the Junos OS Operational Mode Commands.
- For more information about the CLI operational mode commands, see the Junos OS Operational Mode Commands and the Junos OS Operational Mode Commands.

### Commonly Used Operational Mode Commands

Table 21 on page 52 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

**Table 21: Commonly Used Operational Mode Commands**

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	<b>show version</b>
Log files	Contents of the log files	<b>monitor</b>
	Log files and their contents and recent user logins	<b>show log</b>
Remote systems	Host reachability and network connectivity	<b>ping</b>
	Route to a network system	<b>traceroute</b>
Configuration	Current system configuration	<b>show configuration</b>
Manipulate files	List of files and directories on the router or switch	<b>file list</b>
	Contents of a file	<b>file show</b>
Interface information	Detailed information about interfaces	<b>show interfaces</b>

Table 21: Commonly Used Operational Mode Commands (*continued*)

Items to Check	Description	Command
Chassis	Chassis alarm status	<b>show chassis alarms</b>
	Information currently on craft display	<b>show chassis craft-interface</b>
	Router or switch environment information	<b>show chassis environment</b>
	Hardware inventory	<b>show chassis hardware</b>
Routing table information	Information about entries in the routing tables	<b>show route</b>
Forwarding table information	Information about data in the kernel's forwarding table	<b>show route forwarding-table</b>
IS-IS	Adjacent routers or switches	<b>show isis adjacency</b>
OSPF	Display standard information about OSPF neighbors	<b>show ospf neighbor</b>
BGP	Display information about BGP neighbors	<b>show bgp neighbor</b>
MPLS	Status of interfaces on which MPLS is running	<b>show mpls interface</b>
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	<b>show mpls lsp</b>
	Routes that form a label-switched path	<b>show route label-switched-path</b>
RSVP	Status of interfaces on which RSVP is running	<b>show rsvp interface</b>
	Currently active RSVP sessions	<b>show rsvp session</b>
	RSVP packet and error counters	<b>show rsvp statistics</b>

- [Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands on page 55](#)

## Overview of Navigating the CLI

This topic describes how to navigate the CLI.

- [CLI Command Hierarchy on page 54](#)
- [CLI Configuration Statements on page 54](#)
- [Moving Among Hierarchy Levels on page 54](#)

## CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command. Figure 10 on page 54 illustrates a portion of the **show** command hierarchy.

Figure 10: CLI Command Hierarchy

To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of your Ethernet switching options for your interfaces, use the command **show ethernet-switching-options interfaces**.

## CLI Configuration Statements

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

## Moving Among Hierarchy Levels

You can use the CLI commands to navigate the levels of the configuration statement hierarchy:

- **edit**— Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
- **exit**— Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the **edit** command. Alternatively, you can use the **quit** command. The **exit** and **quit** commands are interchangeable.
- **up**— Moves up the hierarchy one level at a time.
- **top**— Moves directly to the top level of the hierarchy.

## Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

1. Use the ? prompt to list options available for the command. For example:

```
user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>          Execute this command
brief              Display brief output
descriptions       Display interface description strings
detail             Display detailed output
extensive           Display extensive output
media              Display media information
snmp-index         SNMP index of interface
statistics         Display statistics and detailed output
terse              Display terse output
|                 Pipe through a command
```

2. Choose the option you wish to use with the command. (See [Figure 11 on page 55](#).)

Figure 11: Command Output Options

Figure 11 displays three examples of command output options for the `show interfaces fe-1/1/1` command in Junos OS operational mode.

**Command output with the **brief** option.**

```
user@host> show interfaces fe-1/1/1 brief
Physical interface: fe-1/1/1, Enabled, Physical link is Down
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
  Disabled, Source filtering: Disabled,
  Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
```

**Command output with the **terse** option.**

```
user@host> show interfaces fe-1/1/1 terse
Interface      Admin Link Proto  Local      Remote
fe-1/1/1       up    down
```

**Command output with the **extensive** option.**

```
user@host> show interfaces fe-1/1/1 extensive
Physical interface: fe-1/1/1, Enabled, Physical link is Down
  Interface index: 141, SNMP ifIndex: 33, Generation: 24
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
  Disabled, Source filtering: Disabled,
  Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues     : 4 supported, 4 maximum usable queues
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:90:69:d0:f8:9e, Hardware address: 00:90:69:d0:f8:9e
  Last flapped   : 2007-02-02 09:26:25 PST (2w0d 03:40 ago)
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes : 0          0 bps
    Output bytes : 0          0 bps
    Input packets: 0          0 pps
    Output packets: 0          0 pps
  --- (more) ---
```

  - [Controlling the Scope of an Operational Mode Command](#)

## Understanding Junos OS CLI Configuration Mode

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*, a router configuration is stored as a hierarchy of statements. In configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- [Configuration Mode Commands on page 57](#)
- [Configuration Statements and Identifiers on page 58](#)
- [Configuration Statement Hierarchy on page 60](#)

## Configuration Mode Commands

Table 22 on page 57 summarizes each CLI configuration mode command. The commands are organized alphabetically.

**Table 22: Summary of Configuration Mode Commands**

Command	Description
<b>activate</b>	Remove the <b>inactive:</b> tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the <b>commit</b> command.
<b>annotate</b>	Add comments to a configuration. You can add comments only at the current hierarchy level.
<b>commit</b>	Commit the set of changes to the database and cause the changes to take operational effect.
<b>copy</b>	Make a copy of an existing statement in the configuration.
<b>deactivate</b>	Add the <b>inactive:</b> tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the <b>commit</b> command.
<b>delete</b>	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
<b>edit</b>	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
<b>exit</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>extension</b>	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
<b>help</b>	Display help about available configuration statements.
<b>insert</b>	Insert an identifier into an existing hierarchy.
<b>load</b>	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 22: Summary of Configuration Mode Commands (*continued*)

Command	Description
<b>quit</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>rename</b>	Rename an existing configuration statement or identifier.
<b>replace</b>	Replace identifiers or values in a configuration.
<b>rollback</b>	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit configuration</b> command.
<b>run</b>	Run a top-level CLI command without exiting from configuration mode.
<b>save</b>	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
<b>set</b>	Create a statement hierarchy and set identifier values. This is similar to <b>edit</b> except that your current level in the hierarchy does not change.
<b>show</b>	Display the current configuration.
<b>status</b>	Display the users currently editing the configuration.
<b>top</b>	Return to the top level of configuration command mode, which is indicated by the <b>[edit]</b> banner.
<b>up</b>	Move up one level in the statement hierarchy.
<b>update</b>	Update a private database.
<b>wildcard</b>	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

### Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 23 on page 59 describes top-level CLI configuration mode statements.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

**Table 23: Configuration Mode Top-Level Statements**

Statement	Description
<b>access</b>	Configure the Challenge Handshake Authentication Protocol (CHAP). For information about the statements in this hierarchy, see the Junos OS System Basics Configuration Guide.
<b>accounting-options</b>	Configure accounting statistics data collection for interfaces and firewall filters. For information about the statements in this hierarchy, see the Network Management Configuration Guide.
<b>chassis</b>	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. For information about the statements in this hierarchy, see the Junos OS System Basics Configuration Guide.
<b>class-of-service</b>	Configure class-of-service parameters. For information about the statements in this hierarchy, see the Junos OS Class of Service Configuration Guide.
<b>firewall</b>	Define filters that select packets based on their contents. For information about the statements in this hierarchy, see the Routing Policy Configuration Guide.
<b>forwarding-options</b>	Define forwarding options, including traffic sampling options. For information about the statements in this hierarchy, see the Junos® OS Network Interfaces.
<b>groups</b>	Configure configuration groups. For information about statements in this hierarchy, see the Junos OS System Basics Configuration Guide.
<b>interfaces</b>	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the Junos® OS Network Interfaces.
<b>policy-options</b>	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. For information about the statements in this hierarchy, see the Routing Policy Configuration Guide.
<b>protocols</b>	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the Junos OS Routing Protocols Configuration Guide and the Junos OS MPLS Applications Configuration Guide.

Table 23: Configuration Mode Top-Level Statements (*continued*)

Statement	Description
<b>routing-instances</b>	Configure multiple routing instances. For information about the statements in this hierarchy, see the Junos OS Routing Protocols Configuration Guide.
<b>routing-options</b>	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the Junos OS Routing Protocols Configuration Guide.
<b>security</b>	Configure IP Security (IPsec) services. For information about the statements in this hierarchy see the Junos OS System Basics Configuration Guide.
<b>snmp</b>	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the Network Management Configuration Guide.
<b>system</b>	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. For information about the statements in this hierarchy, see the Junos OS System Basics Configuration Guide.

For specific information on configuration statements, see the Junos OS configuration guides.

### Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see [Figure 12 on page 60](#)). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 12: Configuration Mode Hierarchy of Statements

Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. [Figure 12 on page 60](#) illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in [Figure 12 on page 60](#) as **[edit protocols ospf area area-number interface interface-name]** and displays the configuration as follows:

```
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
      interface so-0/0/1 {
        hello-interval 5;
      }
    }
  }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain “oneliners” at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric 10** is a oneliner because the **level** container statement with identifier **1**, its child statement **metric**, and its corresponding attribute **10** all appear on a single line in the hierarchy:

```
[edit protocols]
isis {
  interface ge-0/0/0.0 {
    level 1 metric 10;
  }
}
```

Likewise, in the following example, **dynamic-profile** *dynamic-profile-name* **aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier *dynamic-profile-name*, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

### Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

- Software Feature Licenses
- [Verifying Junos OS License Installation on page 71](#)

## Software Features That Require Licenses on the QFX Series

The following Junos OS features require an Advanced Feature License (AFL) on QFX Series devices:

**NOTE:** If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- Fibre Channel support

[Table 24 on page 63](#) lists the licenses you can purchase for each QFX Series software feature.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

**Table 24: Junos OS Feature Licenses and Model Numbers for QFX Series Devices**

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP) and Intermediate System-to-Intermediate System (IS-IS)	QFX3500 switch	One per switch	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC

Table 24: Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB

## Junos OS License Keys

### Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity. [Table 25 on page 65](#) displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

**Table 25: Upgrade Licenses for Enhancing Port Capacity**

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 <ul style="list-style-type: none"> <li>• 1/MIC0</li> </ul>	f1—MX5 to MX10 upgrade	Slot 1 and 2 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> </ul>
MX10	40G	0x555	Slot 1 and 2 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> </ul>	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC1</li> <li>• First 2 ports on 0/MIC0</li> </ul>
MX40	60G	0x554	Slot 1, SSlot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> <li>• First 2 ports on 0/MIC0</li> </ul>	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC1</li> <li>• All 4 ports on 0/MIC0</li> </ul>

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
  - An f1 feature ID on an MX10 upgrade license key rejects the license.
  - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

## Generating the License Keys for a Standalone QFX Series Device

When you purchase a Junos OS software feature license for a QFX Series device, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the device's serial number) for the device, and then add the license key on the device.

Before generating the license keys for a device:

- Purchase the required licenses for the device. See “[Software Features That Require Licenses on the QFX Series](#)” on page 63.
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Determine the serial number of the device. For instructions, see [Locating the Serial Number on a QFX3500 Device or Component](#).

To generate the license keys for a device:

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

**NOTE:** To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Device** option button, and click **Continue**.

The Generate Licenses - QFX Series Product Devices page appears.

4. In the **Device Serial Number** field, enter the serial number for the device.
5. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
6. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
7. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

8. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Devices page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

9. Select the file format in which you want to obtain your new license keys.
10. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

#### Related Documentation

## Generating the License Keys for a QFabric System

When you purchase a Junos OS software feature license for a QFabric system, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the QFabric system ID ) for the QFabric system, and then add the license key on the QFabric system.

Before generating the license keys for a QFabric system:

- Purchase the required licenses for the QFabric system. See [“Software Features That Require Licenses on the QFX Series”](#) on page 63.
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Perform the initial setup of the QFabric system on the Director group. See [Performing the QFabric System Initial Setup on a QFX3100 Director Group](#).
- Log in to the QFabric system, issue the [show version](#) command, and note down the software serial number and QFabric system ID for the QFabric system.

```
user@qfabric> show version
Hostname: qfabric
Model: qfx3000-g
Serial Number: qfsn-0123456789
QFabric System ID: f158527a-f99e-11e0-9fbd-00e081c57cda
JUNOS Base Version [12.2I20111018_0215_dc-builder]
```

To generate the license keys for a QFabric system:

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

**NOTE:** To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Fabric** option button, and then click **Continue**.

The Generate Licenses - QFX Series Product Fabrics page appears.

4. In the **Software Serial No** field, enter the software serial number for the QFabric system.
5. In the **QFabric System ID** field, enter the QFabric system ID for the QFabric system.
6. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
7. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
8. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

9. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Fabrics page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

10. Select the file format in which you want to obtain your new license keys.
11. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

#### Related Documentation

- [Software Features That Require Licenses on the QFX Series on page 63](#)
- [Performing the QFabric System Initial Setup on a QFX3100 Director Group](#)
- [Adding New Licenses \(CLI Procedure\) on page 69](#)
- [show version on page 1085](#)

### Adding New Licenses (CLI Procedure)

Before adding new licenses, complete the following tasks:

- Purchase the required licenses.
- Establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your device.

To add a new license key to the device using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To add a license key from a file or URL, enter the following command, specifying the filename or the URL where the key is located:

```
user@host> request system license add filename | url
```

- To add a license key from the terminal, enter the following command:

```
user@host> request system license add terminal
```

2. When prompted, enter the license key, separating multiple license keys with a blank line.

If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit license entry mode.

**NOTE:** If the router has two Routing Engines, add the new license on each Routing Engine separately. This ensures that the license key is enabled on the backup Routing Engine during changeover of mastership between the Routing Engines.

To add a new license key to a router with dual Routing Engines:

1. After adding the new license key on the master Routing Engine, use the `request chassis routing-engine master switch` command to have the backup Routing Engine become the master Routing Engine.
2. Log in to the active Routing Engine and add the new license key, repeating the same process.

3. Go on to [“Verifying Junos OS License Installation” on page 71](#).

**NOTE:** Adding a license key to the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-adding operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

#### Related Documentation

- [Junos OS Feature Licenses on page 62](#)
- [Verifying Junos OS License Installation on page 71](#)
- [request system license add on page 336](#)

## Deleting a License (CLI Procedure)

Before deleting a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To delete a license key from a device using the CLI:

1. From the CLI operational mode, enter the following command for each license, specifying the license ID. You can delete only one license at a time.

```
user@host> request system license delete license-id
```

2. Go on to [“Verifying Junos OS License Installation” on page 71](#).

**NOTE:** Deleting a license key from the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-deleting operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

- [Saving License Keys on page 71](#)
- [Junos OS Feature Licenses on page 62](#)
- [Verifying Junos OS License Installation on page 71](#)
- [request system license delete on page 337](#)

## Saving License Keys

Before saving a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To save the licenses installed on a device to a file using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To save the installed license keys to a file or URL, enter the following command:

```
user@host> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named **license.config**:

- To save a license key from the terminal, enter the following command:

```
user@host> request system license save ftp://user@host/license.config
```

2. Go on to “[Verifying Junos OS License Installation](#)” on page 71.

#### Related Documentation

- [Adding New Licenses \(CLI Procedure\) on page 69](#)
- [Deleting a License \(CLI Procedure\) on page 70](#)

## Verifying Junos OS License Installation

To verify Junos OS license management, perform the following tasks:

- [Displaying Installed Licenses on page 72](#)
- [Displaying License Usage on page 73](#)

## Displaying Installed Licenses

**Purpose** Verify that the expected licenses are installed and active on the router or switch.

**Action** From the CLI, enter the **show system license** command.

### Sample Output

```
user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-acct	0	1	0	permanent
subscriber-auth	0	1	0	permanent
subscriber-addr	0	1	0	permanent
subscriber-vlan	0	1	0	permanent
subscriber-ip	0	1	0	permanent
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

```

Licenses installed:
License identifier: E000185416
License version: 2
Features:
  subscriber-acct - Per Subscriber Radius Accounting
                  permanent
  subscriber-auth - Per Subscriber Radius Authentication
                  permanent
  subscriber-addr - Address Pool Assignment
                  permanent
  subscriber-vlan - Dynamic Auto-sensed Vlan
                  permanent
  subscriber-ip   - Dynamic and Static IP
                  permanent

```

**Meaning** The output shows a list of the license usage and a list of the licenses installed on the router or switch. Verify the following information:

- Each license is present. Licenses are listed in ascending alphanumeric order by license ID.
- The state of each license is **permanent**.

**NOTE:** A state of **invalid** indicates that the license key is not a valid license key. Either it was entered incorrectly or it is not valid for the specific device.

- The feature for each license is the expected feature. The features enabled are listed by license. An all-inclusive license has all features listed.
- All configured features have the required licenses installed. The Licenses needed column must show that no licenses are required.

### Displaying License Usage

**Purpose** Verify that the licenses fully cover the feature configuration on the router or switch.

**Action** From the CLI, enter the **show system license usage** command.

### Sample Output

```
user@host> show system license usage
```

	Licenses	Licenses	Licenses	Expiry
Feature name	used	installed	needed	
subscriber-addr	1	0	1	29 days
scale-subscriber	0	1000	0	permanent
scale-12tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

**Meaning** The output shows any licenses installed on the router or switch and how they are used. Verify the following information:

- Any configured licenses appear in the output. The output lists features in ascending alphabetical order by license name. The number of licenses appears in the third column. Verify that you have installed the appropriate number of licenses.
- The number of licenses used matches the number of configured features. If a licensed feature is configured, the feature is considered used. The sample output shows that the subscriber address pooling feature is configured.
- A license is installed on the router or switch for each configured feature. For every feature configured that does not have a license, one license is needed.

For example, the sample output shows that the subscriber address feature is configured but that the license for the feature has not yet been installed. The license must be installed within the remaining grace period to be in compliance.

## Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

***package-name-m.nZx.y-domestic-signed.tgz***

where:

- **package-name** is the name of the package—for example, **jinstall-qfx**.
- **m.n** is the software release, with **m** representing the major release number and **n** representing the minor release number—for example, **11.1**.
- **Z** indicates the type of software release, where **R** indicates released software and **B** indicates beta-level software.
- **x.y** represents the maintenance software release, with **x** representing the maintenance software release number and **y** representing the maintenance software spin number—for example, **1.5**.

A sample switch software package name is:

`jinstall-qfx-11.1R1.5-domestic-signed.tgz`

## Configuring Zero Touch Provisioning

Zero Touch Provisioning allows you to provision new switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Control Protocol (DHCP) server to determine whether to perform these actions and to locate the necessary software image and configuration files on the network. If you do not configure the DHCP server to provide this information, the switch boots with the preinstalled software and default configuration.

**NOTE:** If you have both DHCP and ZTP enabled, the switch broadcasts a DHCP DISCOVER packet every six minutes. If a DHCP server on the network responds with a DHCP ACK packet with DHCP vendor options set with the necessary values to initiate ZTP, then ZTP proceeds.

To disable broadcasting the DHCP DISCOVER packet every six minutes, without performing the ZTP process, manually delete the `auto-image-upgrade` statement located in the `[edit chassis]` hierarchy. If ZTP completes without errors, the `auto-image-upgrade` statement is automatically deleted.

**NOTE:** For detailed information regarding the DHCP and DHCP options, refer to RFC2131 (<http://www.ietf.org/rfc/rfc2131.txt>) and RFC2132 ([www.ietf.org/rfc/rfc2132.txt](http://www.ietf.org/rfc/rfc2132.txt)). Also, this document refers to Internet Systems Consortium (ISC) DHCP version 4.2. For more information regarding this version, refer to <http://www.isc.org/software/dhcp/documentation>.

Before you begin:

- Ensure that the switch has access to the following network resources:
  - The DHCP server provides the location of the software image and configuration files on the network

Refer to your DHCP server documentation for configuration instructions.

- The File Transfer Protocol (anonymous FTP), Hypertext Transfer Protocol (HTTP), Trivial File Transfer Protocol (TFTP) server on which the software image and configuration files are stored

**NOTE:** Although TFTP is supported, we recommend that you use FTP or HTTP instead, because these transport protocols are more reliable.

- A Domain Name System (DNS) server to perform reverse DNS lookup

- (Optional) An NTP server to perform time synchronization on the network
- (Optional) A system log (syslog) server to manage system log messages and alerts
- Locate and record the MAC address printed on the switch chassis.

**CAUTION:** You cannot commit a configuration while the switch is performing the software update process. If you commit a configuration while the switch is performing the configuration file autoinstallation process, the process stops, and the configuration file is not downloaded from the network.

To configure Zero Touch Provisioning for a switch:

1. Make sure the switch has the default factory configuration installed.  
Issue the **request system zeroize** command on the switch that you want to provision.
2. Download the software image file and the configuration file to the FTP, HTTP, TFTP, server that the switch will download these files from.

You can download either one or both of these files.

3. Configure the DHCP server to provide the necessary information to the switch.

Configure IP address assignment.

You can configure dynamic or static IP address assignment for the switch's management address. To determine the switch's management MAC address for static IP address mapping, add 1 to the last byte of the switch's MAC address, which you noted before you began this procedure.

4. Define the format of the vendor-specific information for DHCP option 43 in the `dhcpd.conf` file.

Here is an example of an ISC DHCP 4.2 server `dhcpd.conf` file:

```
option space NEW_OP; option NEW_OP.image-file-name code 0 = text;
option NEW_OP.config-file-name code 1 = text;
option NEW_OP.image-file-type code 2 = text;
option NEW_OP.transfer-mode code 3 = text;
option NEW_OP-encapsulation code 43 = encapsulate NEW_OP;
```

5. Configure the following DHCP option 43 suboptions:

- Suboption 00: The name of the software image file to install

```
option NEW_OP.image-file-name
"/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
```

- Suboption 01: The name of the configuration file to install

```
option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
```

- Suboption 02: The symbolic link to the software image file to install

```
option NEW_OP.image-file-type "symlink";
```

**NOTE:** If you do not specify suboption 2, the Zero Touch Provisioning process handles the software image as a filename, not a symbolic link.

- Suboption 03: The transfer mode that the switch uses to access the TFTP/FTP/HTTP server

```
option NEW_OP.transfer-mode "ftp";
```

**NOTE:** If suboption 03 is not configured, TFTP becomes the transfer mode by default.

6.

**NOTE:** You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored.

Configure DHCP option 150 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option option-150 "10.100.31.71";
```

7. Configure DHCP option 66 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option tftp-server-name "10.100.31.71";
```

8. (Optional) Configure DHCP option 7 to specify one or more system log (syslog) servers.

```
option log-servers 10.100.31.72;
```

9. (Optional) Configure DHCP option 42 to specify one or more NTP servers.

```
option ntp-servers 10.100.31.73;
```

10. (Optional) Configure DHCP option 12 to specify the hostname of the switch.

```
option hostname "jn-switch35";
```

The following sample configuration shows the DHCP options you just configured:

```
host jn-switch35 {
  hardware ethernet ac:4b:c8:29:5d:02;
  fixed-address 10.100.31.36;
  option tftp-server-name "10.100.31.71";
  option host-name "jn-switch35";
  option log-servers 10.100.31.72;
  option ntp-servers 10.100.31.73;
  option NEW_OP.image-file-name
    "/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
  option NEW_OP.transfer-mode "ftp";
  option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
}
```

Based on the DHCP options you just configured, the following statements are appended to the Junos OS configuration file (for example, **jn-switch35.config**):

```
system {
```

```
host-name jn-switch35;
syslog {
  host 10.100.31.72 {
    any any;
  }
}
ntp {
  server 10.100.31.73;
}
}
```

11. Connect the switch to the network that includes the DHCP server and the FTP, HTTP, or TFTP, server.
12. Boot the switch with the default configuration.
13. Monitor the ZTP process by looking at the following log files:
  - /var/log/dhcp\_logfile
  - /var/log/tftp\_logfile

## Performing a Nonstop Software Upgrade on the QFabric System

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device
- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

**NOTE:** Before you install the software, we recommend that you back up your current configuration files by issuing the `request system software configuration-backup` command.

**NOTE:** Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the `request system software add component all` command.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 81](#)
- [Downloading Software Files Using a Browser on page 81](#)
- [Retrieving Software Files for Download on page 83](#)
- [Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 83](#)
- [Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components on page 83](#)
- [\(Optional\) Creating Upgrade Groups for Node Groups on page 84](#)
- [Performing a Nonstop Software Upgrade on a Node Group on page 84](#)

### Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@qfabric> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@qfabric> request system software configuration-backup/media/USB/
```

### Downloading Software Files Using a Browser

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

To download the software package:

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms Download Software page appears.

2. In the QFX Series section, select the Qfabric system for which you want to download software.

The Software Download page for the selected QFabric system appears.

3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
4. Select the **Software** tab and then select the install package you want to download in the Install Package section.

A login screen appears.

5. Select the **Software** tab and then select the complete install package you want to download in the QFabric System Install Package and Media section.

A login screen appears.

6. Enter your user ID and password and press **Enter**.
7. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
8. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@qfabric> request system software download /path/package-name
```

For example:

```
user@qfabric> request system software download
ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Director Devices in a Director Group

**NOTE:** If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade director-group
jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade fabric
jinstall-qfabric-12.2X50-D10.3.rpm
```

### (Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

**NOTE:** If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group node-group-name nssu upgrade-group upgrade-group-name node-devices** command at the [edit chassis] hierarchy.

For example:

```
user@qfabric# set chassis node-group nodegroup1 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
```

### Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

**NOTE:** You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group node-group-name package-name** command.

To perform a nonstop upgrade on one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group nodegroup1
jinstall-qfabric-12.2X50-D10.3.rpm
```

To perform a nonstop upgrade on more than one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
```

## Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device for a QFX Series Device” on page 140](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September 4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September 4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September 4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

#### Related Documentation

- [Creating an Emergency Boot Device for a QFX Series Device on page 140](#)

## Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) [Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 88](#)
- [Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 89](#)

### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

---

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The **Junos Platforms Download Software** page appears.

2. In the **QFX Series** section of the **Junos Platforms - Download Software** download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the **Release:** pull-down window to the right of the tabs on the **Download Software** page.
4. Click the **Software** tab and select the complete install media you want to download in the **QFabric System Install Media** section.

A login screen appears.

5. Enter your name and password and press **Enter**.
6. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
7. Log in and save the install media file to your UNIX workstation.
8. Use FTP to access the UNIX workstation where the install media resides.  
**ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz**
9. When prompted, enter your username and password.
10. Make sure you are in binary mode by entering **binary** at the prompt.

**binary**

11. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

**get install-media-qfabric-<version>.img.tgz**

12. Close the FTP session:

**bye**

13. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.

**tar -xvzf install-media-qfabric-11.3X30.6.img.tgz**

14. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.

15. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

**dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k**

```
250880+0 records in
250880+0 records out
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
```

16. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software” on page 89](#) to continue with the recovery installation.

### Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue?[y/n]

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the **mount** directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root    4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue?[y/n] y

Initial Configuration

You may enter the configuration manually or restore from a backup.

Specify a backup file? [y/n] : y

Please specify the full path of the configuration backup file. :  
/mnt/myusb/mybackup-20110907

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```

seconds.

```

The Director device reboots from the local disk on which the software was just installed.  
Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```

user@switch> show version component all

## Recovering from a Failed Software Installation

**Problem** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```

loader> install [- --format] [- --external] source
where:

```

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.

- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Software Installation Overview

A QFX Series product is delivered with the Junos OS preinstalled. As new features and software fixes become available, you can upgrade your software to use them.

When you power on the switch, it starts (boots) using the installed software.

You upgrade the Junos OS on a switch by copying a software package to a switch or other system on your local network and then using the CLI to install the new software on the switch. You then reboot the switch, which boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the installation package removes all files from the `/var/tmp` directory of the switch and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

If you encounter any difficulties during software installation or an upgrade, you can use the recovery installation procedure to install the Junos OS on the switch.

## Upgrading Jloader Software on QFX Series Devices

Jloader software contains a boot loader (Uboot), which is used to bring up QFX Series devices and load the Junos OS from the flash memory of these devices. You can upgrade Jloader software on QFX3500 switches, QFX3500 and QFX3600 Node devices, and QFX3600-I and QFX3008-I Interconnect devices.

**NOTE:** Before you upgrade the Jloader software, see [Table 26 on page 95](#), [Table 27 on page 95](#), and [Table 28 on page 96](#) to make sure that you are upgrading to the right version of Jloader software for the Junos OS software release running on your QFX3500 switches, or Node devices and Interconnect devices in your QFabric system.

See [Table 29 on page 96](#) to see which Uboot software versions are available and the filenames of the Jloader software packages.

**Table 26: Junos OS and Jloader Software Compatibility Matrix for the QFX3500 Switch and QFX3500 Node Device**

Junos OS Software Version	Jloader Software Version				
	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
11.3R1 and later (QFX3500 switch)	Not supported	Supported	Supported	Supported and recommended	Not supported
11.3X30.6 and later (QFX3500 Node device)	Not supported	Supported	Supported	Supported and recommended	Not supported
12.1X49-D1 and later (QFX3500 switch)	Not supported	Supported	Supported	Supported and recommended	Not supported
12.2X50-D1 and later (QFX3500 switch and QFX3500 Node device)	Not supported	Supported	Supported	Supported and recommended	Not supported

**NOTE:** An en dash means that the item is not applicable.

**Table 27: Junos OS and Jloader Software Compatibility Matrix for the QFX3008-I Interconnect Device**

Junos OS Software Version	Jloader Software Version				
	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
11.3X30.9 and later (QFX3008-I Interconnect device)	-	Supported	Supported	Supported and recommended	Not supported

**Table 27: Junos OS and Jloader Software Compatibility Matrix for the QFX3008-I Interconnect Device (continued)**

Junos OS Software Version	Jloader Software Version				
	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
11.3X30.6 and later (QFX3008-I Interconnect device)	-	Supported	Supported	Supported and recommended	Not supported
12.2X50-D1 and later (QFX3008-I Interconnect device)	-	Supported	Supported	Supported and recommended	Not supported

**NOTE:** An en dash means that the item is not applicable.

**Table 28: Junos OS and Jloader Software Compatibility Matrix for the QFX3600-I Interconnect Device and QFX3600 Node Device**

Junos OS Software Version	Jloader Software Version				
	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
12.2X50-D1 and later (QFX3600-I Interconnect Device and QFX3600 Node Device)	-	-	-	-	Supported
12.2X50-D20 and later (QFX3600 switch)	-	-	-	-	Supported

**Table 29: Uboot Software Release and Jloader Software Compatibility Matrix**

Uboot Software Release Number	Jloader Package Name
1.0.73	jloader-qfx-1_0_73.tgz
1.1.1	jloader-qfx-11.3-20110510.0-signed.tgz
1.1.2	jloader-qfx-11.3X30.9-signed.tgz
1.1.4 (11.3R3 and 11.3R2 releases only. Not supported on 11.3R1)	jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz
1.1.4 (12.1R1 release and later)	jloader-qfx-12.1-20120125_pr.0-signed.tgz
1.1.5 (12.2X50-D1 and later)	jloader-qfx-12.2X50.D10.3-signed.tgz

#### Jloader Software Version 1.1.4 Guidelines

Jloader software version 1.1.4 is compatible with Junos OS Release 11.3R3 and 11.3R2, and Junos OS Release 12.1R1 and later. Jloader software version 1.1.4 is not compatible with Junos OS

Release 11.3R1. The Jloader package names are different for versions 1.1.4 (Junos OS 11.3R3 and 11.3R2) and 1.1.4 (Junos OS 12.2R1 release and later), but the binaries are the same. Because the binaries are the same, you can upgrade or downgrade to any Junos OS release.

- If you have Junos OS Release 11.3 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-11.3I20120127\_0733\_dc-builder-signed.tgz** package.
- If you have Junos OS Release 11.3R2 installed and want to upgrade to Junos OS Release 12.1, you do not need to upgrade the Jloader software version and can continue to use Jloader version 1.1.2.
- If you have Junos OS Release 12.1 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-12.1-20120125\_pr.0-signed.tgz** package.
- If you upgrade to Junos OS Release 12.1, you can upgrade to Jloader version 1.1.4 using the **jloader-qfx-12.1-20120125\_pr.0-signed.tgz** package.

### Upgrading Jloader Software on a QFX3500 Switch

---

The Jloader software for a QFX3500 switch resides in two flash memory banks. At any time, one bank acts as the primary bank, and the QFX3500 switch boots from it. The other bank is the backup bank—if the QFX3500 switch cannot boot from the primary bank, it boots from the backup bank. When you upgrade the Jloader software, the upgraded software is installed in the backup bank, which then becomes the new primary bank. Thus the primary and backup banks alternate each time you upgrade the Jloader software, with the primary bank containing the most recently installed version of the software, and the backup bank containing the previous version. To upgrade the Jloader software on a QFX3500 switch, you must perform the upgrade twice: once for each bank. Each upgrade requires that you to reboot the QFX3500 switch.

**NOTE:** If you are running Junos OS Release 11.3R1 or Junos OS Release 11.3R2, you must use the `no-validate` option when you issue the `request system software add` command to upgrade the Jloader software. Otherwise, the installation will fail and you receive a configuration error. The `no-validate` option is not required for Junos OS Release 11.3R3 and later.

**NOTE:** After you upgrade the Jloader software on the first bank, the package is deleted after you reboot. Make sure that you have either downloaded the Jloader software to either a remote site or in a local directory on the switch, such as the `/var/tmp` directory on the QFX3500 device.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html> .  
The Junos Platforms Download Software page appears.
2. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
4. Select the Software tab and then select the install package you want to download in the Install Package section.
5. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
6. Enter your name and password and press **Enter**.
7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Open or save the `jloader-qfx-version-signed.tgz` file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

9. Log in to the QFX3500 switch and enter the shell. We recommend using a console connection.
10. Determine the version of the Jloader software package installed on the switch.

For example:

```
root@switch% ls
gres-tp krt_gencfg_filter.txt
jloader-qfx-11.3-20110510.0-signed.tgz
```

11. Determine the version of the Uboot software that is running in the bank:

For example:

```
root@switch% kenv | grep boot.version
boot.version="1.0.7"
```

12. Enter the CLI and install the Jloader package.

- To install a Jloader package that is located in the `/var/tmp` directory, issue the **request system software add /var/tmp/jloader-qfx-version.tgz no-validate** command:

For example:

```
user@switch> request system software add
/var/tmp/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

You see the following messages during the installation:

```
Verified jloader-qfx-11.3-20110510.0.tgz signed by PackageProduction_11_3_0
Adding jloader-qfx...
Installation in progress, please wait...
Mounted jloader-qfx package on /dev/md8...
Verified manifest signed by PackageProduction_11_3_0
Verified jloader-qfx-11.3-20110510.0 signed by PackageProduction_11_3_0
Registering jloader-qfx as unsupported
```

```
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3-20110510.0-signed.tgz
...
Saving state for rollback ...
```

```
juniper@qfx3500>
```

- To install a Jloader package located on a remote server using FTP, issue the **request system software add /ftp://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

For example:

```
user@switch> request system software add
/ftp://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

- To install a Jloader package located on a remote server using HTTP, issue the **request system software add /http://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

For example:

```
user@switch> request system software add
/http://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

13. When prompted, reboot the Control Board by issuing the **request system reboot** command.

For example:

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
```

14. Enter the shell and verify that the version of the Uboot software in the primary bank is the version you just installed.

For example:

```
root@switch% kenv | grep boot.version
boot.version="1.1.1"
```

15. To install the Jloader software package on the current backup bank, repeat Step 10 through Step 14.

## Upgrading Jloader Software on a QFabric System

This procedure explains how to upgrade the Jloader software on your Node devices and Interconnect devices. The example shows how to upgrade the Jloader software from version 1.1.1 to 1.1.2 on a Node device with the serial number BBAK1186.

**NOTE:** Before you upgrade the Jloader software, make sure you have the serial numbers of the Node devices, Interconnect devices, and Control Boards in the Interconnect devices you want to upgrade.

1. Issue the **show chassis hardware node-device ?** command to view the serial numbers of the Node devices.

For example:

```
user@qfabric> show chassis hardware node-device ?
<node-device>      Node device identifier
BBAK1186            Node device
BBAK3149            Node device
BBAK3177            Node device
BBAK8063            Node device
BBAK8799            Node device
P2443-C             Node device
P2515-C             Node device
P3708-C             Node device
P3885-C             Node device
P3916-C             Node device
node0               Node device
node1               Node device
node2               Node device
node3               Node device
node4               Node device
node5               Node device
node6               Node device
node7               Node device
node8               Node device
```

An example of a Node device serial number is BBAK1186.

2. Issue the **show chassis hardware interconnect-device ?** command to view the serial numbers of the Interconnect devices.

For example:

```
user@qfabric> show chassis hardware interconnect-device ?
Possible completions:
interconnect-device  Interconnect device identifier
IC-F1052             Interconnect device
IC-F3947             Interconnect device
```

The Interconnect device serial numbers are IC-F1052 and IC-F3947.

3. Issue the **show chassis hardware interconnect-device name** command to view the serial numbers of the Control Boards in the Interconnect device.

For example:

```
user@qfabric> show chassis hardware interconnect-device IC-F3947
```

## Hardware inventory:

Item	Version	Part number	Serial number	Description
Chassis	REV 10		F3947	QFXC08-3008
Midplane	REV 10	750-035835	F3947-C	QFX Midplane
CB 0 Board	REV 14	750-035855	ZJ9432	QFX Chassis Control
Routing Engine 0		BUILTIN	BUILTIN	QFX Routing Engine
CB 1 Board	REV 14	750-035855	ZJ9404	QFX Chassis Control

The Control Board serial numbers are ZJ9432 and ZJ9404.

4. Issue the **show chassis firmware node-device *name*** command to see which version of Uboot software you have installed on your Node device.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
```

Part	Type	Version
node4	U-Boot	1.1.6 (May 10 2011 - 04:52:59) 1.1.1
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.1. The loader software version appears after the timestamp for U-Boot 1.1.6.

5. Issue the **show chassis firmware interconnect-device *name*** command to see which version of Uboot software you have installed on the Routing Engines located on the Control Boards of the Interconnect device.

For example:

```
user@qfabric> show chassis firmware interconnect-device IC-F3947
```

Part	Type	Version
Routing Engine 0	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1
Routing Engine 1	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.4. The loader software version appears after the timestamp for U-Boot 1.1.6.

6. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms Download Software page appears.

7. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
8. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
9. Select the **Software** tab and then select the install package you want to download in the Install Package section.

10. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
11. Enter your username and password, and press **Enter**.
12. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
13. Open or save the **jloader-qfx-version-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
14. Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download /path/package-name** command.

For example:

```
user@qfabric> request system software download
ftp://server/files/jloader-qfx-11.3X30.9-signed.tgz
```

15. Log in to the Director device as root and enter the shell to verify that you have downloaded the Jloader software package. We recommend using a console connection. The software package is copied from where you downloaded it and is placed locally on the QFabric system in the **/pbdata/packages** directory.

For example:

```
[root@dg0] # pwd
/pbdata/packages

[root@dg0] # ls
jloader-qfx-11.3X30.9-signed.tgz
```

16. Before you copy over the Jloader software package to the Node device or Interconnect device, determine the directory that matches the serial number of the Node device or Interconnect device that you want to upgrade. View the remote logs and the Node device and Interconnect device serial numbers by issuing the **ls /pbdata/export/rlogs** command at the command line of the Director device before you copy the package over to the device.

**NOTE:** The **/pbdata/export/rlogs/node-device-serial-ID** and **/pbdata/export/rlogs/interconnect-device-serial-ID** directories on the Director device are NFS mounted as the **/tftpboot/logfiles** directories on the Node device and Interconnect device. These directories are created for all Node devices and Interconnect devices in a QFabric system. The Jloader files are stored in the **/tftpboot/logfiles** directories for each Node device and Interconnect device.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs
02de4930-828b-11e1-a319-00e081c57938 c9898afe-828b-11e1-956c-00e081c57938
04103b2a-29d5-e011-bf8a-0e6bdf3aa1e6 eeba4aac-828b-11e1-85e2-00e081c57938
1e2739e0-828b-11e1-bf74-00e081c57938 F1052
8d8a978c-828b-11e1-a833-00e081c57938 F3947
ad55b89e-828b-11e1-b70e-00e081c57938 P2443-C
BBAK1186 P2515-C
```

BBAK3149	P3708-C
BBAK3177	P3885-C
BBAK8063	P3916-C
BBAK8799	

BBAK1186 is the serial number of the Node device that needs to be upgraded.

17. Copy the Jloader software package from the `/var/tmp` directory to the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # cp jloader-qfx-11.3X30.9-signed.tgz /pbdata/export/rlogs/BBAK1186
```

18. Confirm that the Jloader software package you copied over is in the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs/BBAK1186
jloader-qfx-11.3X30.9-signed.tgz
```

19. Issue the `/root/dns.dump` command to find out the internal IP addresses of the Node device or Interconnect device.

```
[root@dg0 tmp] # /root/dns.dump
; <<>> DiG 9.3.6-P1-RedHat-9.3.6-4.P1.e15 <<>> -t axfr pkg.dcbg.juniper.net
@169.254.0.1
;; global options: printcmd
pkg.dcbg.juniper.net. 600 IN SOA ns.pkg.dcbg.juniper.net.
mail.pkg.dcbg.juniper.net. 152 3600 600 7200 3600
pkg.dcbg.juniper.net. 600 IN NS ns.pkg.dcbg.juniper.net.

169.254.128.19
dcfnode-ad55b89e-828b-11e1-b70e-00e081c57938.pkg.dcbg.juniper.net. 45 IN A
169.254.128.20
dcfnode-BBAK1186.pkg.dcbg.juniper.net. 45 IN A 169.254.128.14
```

The internal IP address for BBAK1186 is 169.254.128.14.

20. Upgrade the Jloader software on the Node device or Interconnect device.

Before you can upgrade the Jloader software, you need to use SSH to log in to the Node device or Interconnect device and verify that the software is in the `/tftpboot/logfiles` directory.

- a. Use SSH to log in to the Node device or Interconnect device.

For example:

```
[root@dg0 tmp] # ssh 160.254.128.14
root@169.254.128.14's password:
--- JUNOS 11.3X30.10 built 2012-03-11 22:55:43 UTC
At least one package installed on this device has limited support.
Run 'file show /etc/notices/unsupported.txt' for details.
root@sng3%
```

- b. Verify that the Jloader software package is in the `tftpboot/logfiles` directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /tftpboot/logfiles
.index                               jloader-qfx-11.3X30.9-signed.tgz
```

- c. Copy the Jloader software package from the **/tftpboot/logfiles** directory to the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% cp /tftpboot/logfiles/jloader-qfx-11.3X30.9-signed.tgz /var/tmp
```

- d. Verify that the Jloader software package is in the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /var/tmp
.snap                               jloader-qfx-11.3X30.9-signed.tgz
    tmp
gres-tp                            krt_gencfg_filter.txt
    vc-autoupgrade
if-rtbdb                           rtsdb
```

- e. Enter CLI mode and issue the **request system software add /var/tmp/jloader-qfx-version-signed.tgz** command.

For example:

```
root@sng3% cli
root@sng3> request system software add /var/tmp/jloader-qfx-11.3X30.9-signed.tgz

#####
#####
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3X30.9-signed.tgz ...
Saving state for rollback ...
```

Upgrade has completed successfully.  
Reboot is now required.

- f. Reboot both the Node device and Interconnect device twice, because they each contain two partitions.

For example:

```
root@sng3> request system reboot
Reboot the system ? [yes,no] (no) yes
Shutdown NOW!
[pid 37663]
```

```
root@sng3>
```

```
*** FINAL System shutdown message from root@sng3 ***
```

```
System going down IMMEDIATELY
```

- g. Verify that the Uboot software on the Node device or Interconnect device has been upgraded to the new Uboot software by logging in to the QFabric CLI and issuing either the **show chassis firmware node-device *name*** command or the **show chassis firmware interconnect-device *name*** command.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
Part          Type      Version
node4         U-Boot   1.1.6 (Nov 19 2011 - 11:42:07) 1.1.2
                                loader   FreeBSD/MIPS U-Boot bootstrap loader
0.1
```

The Uboot software version is now 1.1.2. The loader software version appears after the timestamp for U-Boot 1.1.6.

## Upgrading Software on QFX3500 and QFX3600 Standalone Switches

To upgrade Junos OS, you need to install the appropriate upgrade package on the QFX Series. Upgrading involves these tasks:

1. [Downloading Software Files with a Browser on page 107](#)
2. [Accessing Software Downloaded to a Remote Location on page 108](#)
3. [Connecting to the Console Port on page 108](#)
4. [Backing Up the Current Configuration Files on page 108](#)
5. [Installing the Software Package on page 108](#)

### Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website, go to <http://www.juniper.net/support/>.

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The **Junos Platforms Download Software** page appears.

2. In the **QFX Series** section of the **Junos Platforms Download Software** download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the **Release:** pull-down window to the right of the tabs on the **Download Software** page.
4. Select the **Software** tab and then select the install package you want to download in the **Install Package** section.

A login screen appears.

5. Enter your name and password and press **Enter**.
6. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
7. Save the **jinstall-qfx-<version>-domestic-signed.tgz** file on your computer.
8. Open or save the installation package either to the local system in the **var/tmp** directory or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

### Accessing Software Downloaded to a Remote Location

---

To access the installation package if you downloaded it to a remote location (for example, any system other than the switch):

1. From the command line, make sure you are in the **/var/tmp** directory of the switch.
2. Start the shell interface:  
`user@switch> start shell`
3. Initiate an FTP, TFTP, or scp session.

In this example, FTP is used.

- `>ftp`
4. Use FTP to access the remote location where the installation package resides.  
`ftp ftp://<hostname>/<pathname>/<package-name-m.mZx-distribution>.tgz.`  
where `<package-name-m.mZx-distribution>.tgz` is  
`jinstall-qfx-11.1R1.5-domestic-signed.tgz`
5. When prompted, enter your username and password.
6. Use the **get** command to transfer the installation package from the remote location to your **/var/tmp** directory on your switch.

`get <package-name-m.mZx-distribution>.tgz`

7. Close the FTP session:

`bye`

### Connecting to the Console Port

---

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that may occur.

### Backing Up the Current Configuration Files

---

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

`user@switch> save filename`

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

### Installing the Software Package

---

**NOTE:** Before you install the software, back up any critical files in **/var/home**. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

---

Install the software in one of two ways:

If the installation package resides locally on the switch, execute the **request system software add validate <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add validate
/var/tmp/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

If the Install Package resides remotely, execute the **request system software add validate <pathname> <source> reboot** command.

For example:

```
user@switch# request system software add validate
ftp://ftppserver/directory/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

- [Software Installation Overview on page 94](#)
- [Recovering from a Failed Software Installation on page 93](#)
- [Upgrading Jloader Software on QFX Series Devices on page 95](#)
- [request system software add on page 348](#)
- [Installation and Upgrade Guide](#)

## Upgrading Software on a QFabric System

The QFabric system software package contains software for all of the different components in the QFabric system, such as the Director group, Interconnect devices, Node devices, and other QFabric system components. You can upgrade the software on all of the QFabric components at the same time using the **request system software add package-name component all reboot** command.

**NOTE:** Downgrading software on a QFabric system is not supported.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 110](#)
- [Downloading Software Files Using a Browser on page 110](#)
- [Retrieving Software Files for Download on page 111](#)
- [Installing the Software Package on the Entire QFabric System on page 111](#)

## Backing Up the Current Configuration Files

---

To back up your current configuration files:

```
user@switch> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@switch> request system software configuration-backup /media/USB/
```

## Downloading Software Files Using a Browser

---

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

---

To download the software package:

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms - Download Software page appears.

2. In the QFX Series box, select the QFabric system for which you want to download the software.

The Software Download page for the selected QFabric system appears.

3. Click the **Software** tab and select the software release number from the **Release** list that appears to the right of the Software tab.
4. Select the complete install package you want to download in the **QFabric System Install Package** section:
  - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
  - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see [“Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device”](#) on page 85.

A login screen appears.

5. Enter your user ID and password and click **Login**.
6. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
7. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@switch> request system software download /path/package-name
```

For example:

```
user@switch> request system software download
ftp://server/files/jinstall-qfabric-11.3X30.6.rpm
```

### Installing the Software Package on the Entire QFabric System

**NOTE:** On a QFabric system, a QFX3500 Node device or QFX3600 Node device might not be able to participate as a Node device in the QFabric system if the Node device is running a different version of software from that of the Director group. This mismatch of software versions between the Node device and the Director group can occur when the Node device is introduced into the setup, and both Director devices go offline before the Node device completes its auto-upgrade process to upgrade its software version to the same software version running on the Director group. The workaround is to reboot the QFX3500 or QFX3600 Node device once the Director group comes back online. The QFX3500 or QFX3600 Node device will initiate auto-upgrade and upgrade its software version from the Director group.

1. Issue the **request system software add package-name component all reboot** command.

For example:

```
user@switch> request system software add jinstall-qfabric-11.3X30.6.rpm component all
reboot
```

**NOTE:** If you receive an error message after issuing the **request system software add package-name component all reboot** command that says that the configuration file cannot be loaded as is, you will need to enter configuration mode, make any necessary changes to the configuration file, and then commit the changes.

**NOTE:** The default value for a QFabric system software upgrade is `validate`. The validation step adds up to 10 minutes to the overall software upgrade. If the validation fails, the upgrade does not proceed and the QFabric system automatically issues the `request system software rollback` command to restore the current software image. If you upgrade more than one component (for example, by issuing the `component all` option), validation failure on one device stops the upgrade process for the other devices. If you do not want to validate the software package against the current configuration, issue the `no-validate` option.

2. After the reboot has finished, verify that the new version of software has been properly installed by issuing the `show version component all` command.

```
user@switch> show version component all

## Upgrading Software Using Automatic Software Download

The automatic software download feature uses the DHCP message exchange process to download and install software packages. You configure the automatic software download feature on switches acting as DHCP clients. You must enable automatic software download on the switch before the software upgrade can occur.

You configure a path to a software package file on the DHCP server. The server communicates the path to the software package file through DHCP server messages.

If you enable automatic software download, the DHCP client switch compares the software package name in the DHCP server message to the name of the software package that booted the switch. If the software packages are different, the DHCP client switch downloads and installs the software package specified in the DHCP server message.

Before you upgrade software using automatic software download, ensure that you have configured DHCP services for the switch, including configuring a path to a boot server and a boot file. See [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 121](#) for information about using the CLI to configure DHCP services and settings. See [Configuring DHCP Services \(J-Web Procedure\)](#) for information about using the J-Web interface to configure DHCP services and settings.

To enable automatic software download on an EX Series switch acting as a DHCP client:

```
[edit chassis]
user@switch# set auto-image-upgrade
```

After automatic software download is enabled on your DHCP client switch and after DHCP services are enabled on your network, an automatic software download can occur at any time as part of the DHCP message exchange process.

If an automatic software download occurs, you see the following message on the switch:

```
Auto-image upgrade started
On successful installation system will reboot automatically
```

The switch reboots automatically to complete the upgrade.

## Verifying Autoinstallation Status

**Purpose** Display the status of the autoinstallation feature.

**Action** From the CLI, enter the **show system autoinstallation status** command.

### Sample Output

```
user@switch> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 10.25.100.1
Interface:
  Name: ge-0/0/0
  State: Configuration Acquisition
  Acquired:
    Address: 192.168.124.75
    Hostname: host-ge-000
    Hostname source: DNS
    Configuration filename: switch-ge-000.conf
    Configuration filename server: 10.25.100.3
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
Interface:
  Name: ge-0/0/1
  State: None
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

**Meaning** The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

**Related Documentation**

- [Configuring Autoinstallation of Configuration Files \(CLI Procedure\) on page 118](#)

## Verifying That Automatic Software Download Is Working Correctly

**Purpose** Verify that the automatic software download feature is working correctly.

**Action** Use the `show system services dhcp client interface-name` command to verify that the automatic software download feature has been used to install a software package.

```
user@switch> show system services dhcp client ge-0/0/1.0
Logical Interface Name      ge-0/0/1.0
Hardware address            00:0a:12:00:12:12
Client Status               bound
Vendor Identifier           ether
Server Address              10.1.1.1
Address obtained            10.1.1.89
Lease Obtained at           2009-08-20 18:13:04 PST
Lease Expires at            2009-08-22 18:13:04 PST

DHCP Options :
Name: name-server, Value: [ 10.209.194.131, 2.2.2.2, 3.3.3.3 ]
Name: server-identifier, Value: 10.1.1.1
Name: router, Value: [ 10.1.1.80 ]
Name: boot-image,
Value: jinstall-ex-4200-9.6R1.5-domestic-signed.tgz
Name: boot-image-location,
Value: 10.1.1.25:/bootfiles/
```

**Meaning** The output from this command shows the name and location of the software package under DHCP options when automatic software download was last used to install a software package. The sample output in DHCP options shows that the last DHCP server message to arrive on the DHCP client had a boot server address of 192.168.1.165 and a boot file named jinstall-ex-4200-9.6R1.5-domestic-signed.tgz. If automatic software download was enabled on this client switch during the last DHCP message exchange, these values were used by the switch to upgrade the software.

## Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically deploy multiple devices from a central location in the network.

To specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a switch to operate as a DHCP server. For more information, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 121](#).
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
  - A host-specific file with the name **hostname.conf** for each switch undergoing autoinstallation. Replace **hostname** with the name of a switch. The **hostname.conf** file typically contains all the configuration information necessary for the switch with this hostname.
  - A default configuration file named **switch.conf** with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.
- Physically attach the switch to the network using a Gigabit Ethernet port.
- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.
- If the switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the switch.
- If you are using **hostname.conf** files for autoinstallation, you must also complete the following tasks:
  - Configure the DHCP server to provide a **hostname.conf** filename to each switch. Each switch uses its **hostname.conf** filename to request a configuration file from the TFTP server. Copy the necessary **hostname.conf** configuration files to the TFTP server.
  - Create a default configuration file named **network.conf**, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a **hostname.conf** filename to a new switch, the switch uses **network.conf** to resolve its hostname based on its IP address.

Alternatively, you can add the IP-address-to-hostname mapping entry for the switch to a DNS database file.

The switch uses the hostname to request a **hostname.conf** file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@switch# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
```

**NOTE:** You can also use an FTP address, for example, `ftp://user:password@sftpconfig.sp.com`.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

```
[edit system]
user@switch# set autoinstallation interfaces ge-0/0/0 bootp
```

## Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 121](#).

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in [Table 30 on page 120](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

**Table 30: DHCP Client Settings**

Configuration Statement	Description
<b>client-identifier</b>	Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.
<b>lease-time</b>	Ttime in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.

Table 30: DHCP Client Settings (*continued*)

Configuration Statement	Description
<code>retransmission-attempt</code>	Number of times the client attempts to retransmit a DHCP packet.
<code>retransmission-interval</code>	Time between transmission attempts.
<code>server-address</code>	IP address of the server that the client queries for an IP address.
<code>update-server</code>	TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.
<code>vendor-option</code>	Vendor class ID (CPU's manufacturer ID string) for the DHCP client.

Documentation**

- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 121](#)
- [Understanding DHCP Services for Switches on page 39](#)

## Configuring a DHCP Server on Switches (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, optional reconfiguration of default settings on DHCP clients and configuration of a DHCP server. This topic covers configuration of the DHCP server. For directions for reconfiguring a DHCP client, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 120](#).

You can configure either of two versions of a DHCP server on a switch—either the extended server version or the legacy server version. We recommend that you use the extended server configuration unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 121](#)
2. [Configuring a Legacy DHCP Server on a Switch \(CLI Procedure\) on page 122](#)

### Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before assigning them to clients.

1. Create an address pool for DHCP IP addresses:

[edit]

```
user@switch# set access address-pool address-pool
```

2. Configure addresses for DHCP dynamic assignment:

```
[edit access address-assignment]  
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface for DHCP:

```
[edit system services dhcp-local-server]  
user@switch# set group group-name interface interface-name
```

4. Optionally, process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]  
user@switch# set overrides process-inform
```

5. Optionally, redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]  
user@switch# set pool-match-order ip-address-first
```

6. Optionally, enable dynamic reconfiguration triggered by the DHCP extended server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]  
user@switch# set reconfigure  
  
[edit system services dhcp-local-server group group-name]  
user@switch# set reconfigure
```

### Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

```
[edit system services dhcp]  
user@switch# set pool (Legacy DHCP) network-range
```

**NOTE:** Step 2 through step 15 assign global values at the [edit system services dhcp] hierarchy level. You can also assign the same values to a specific pool using those same commands at the [edit system services dhcp pool network-range] hierarchy level.

2. Optionally, change the domain search list used to resolve hostnames:

```
[edit system services dhcp]  
user@switch# set domain-search [ domain-list ]
```

3. Optionally, change the domain name server (DNS) name that the DHCP server advertises to clients:

```
[edit system services dhcp]
```

```
user@switch# set name-server address
```

- Optionally, change the DHCP options:

```
[edit system services dhcp]
user@switch# set option id-number
```

- Optionally, change the devices advertised to clients:

```
[edit system services dhcp]
user@switch# set router address
```

- Optionally, change the SIP server:

```
[edit system services dhcp]
user@switch# set sip-server addresses-or-names
```

For more information, see [Configuring a DHCP SIP Server \(CLI Procedure\)](#).

- Optionally, change the DHCP client's hardware address:

```
[edit system services dhcp]
user@switch# set static-binding mac-address
```

- Optionally, change the NetBIOS name server:

```
[edit system services dhcp]
user@switch# set wins-server address
```

#### Related Documentation

## Configuring a DNS Name Server for Resolving a Hostname into Addresses

To have the router or switch resolve hostnames into addresses, you must configure one or more Domain Name System (DNS) name servers by including the **name-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
name-server {
  address;
}
```

The following example shows how to configure two DNS name servers:

```
[edit]
user@switch# set system name-server 192.168.1.253
[edit]
user@switch# set system name-server 192.168.1.254
[edit]
user@switch# show
system {
  name server {
    192.168.1.253;
    192.168.1.254;
  }
}
```

- Related Documentation**
- [name-server on page 237](#)

## Configuring the Domain Name for the Router or Switch

For each router or switch, you should configure the name of the domain in which the router or switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.

To configure the domain name, include the **domain-name** statement at the **[edit system]** hierarchy level:

```
[edit system]
domain-name domain-name;
```

The following example shows how to configure the domain name:

```
[edit]
user@host# set system domain-name company.net
[edit]
user@host# show
system {
    domain-name company.net;
}
```

- Related Documentation**
- domain-name
  - [domain-name on page 225](#)
  - [Example: Configuring the Domain Name for the Router or Switch on page 157](#)

## Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains

If your router or switch is included in several different domains, you can configure those domain names to be searched.

To configure more than one domain to be searched, include the **domain-search** statement at the **[edit system]** hierarchy level:

```
[edit system]
domain-search [ domain-list ];
```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched:

```
[edit system]
domain-search [ domainone.net domainonealternate.com ]
```

- Related Documentation**
- [Example: Configuring the Domain Name for the Router or Switch on page 157](#)
  - [Configuring a DNS Name Server for Resolving a Hostname into Addresses](#)
  - [Configuring a DNS Name Server for Resolving a Hostname into Addresses on page 123](#)

## Configuring the Hostname of the Router or Switch

To configure the name of the router or switch, include the **host-name** statement at the **[edit system]** hierarchy level:

```
[edit system]
host-name hostname;
```

The name value must be less than 256 characters.

### Related Documentation

- Example: Configuring the Name of the Router, IP Address, and System ID
- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 157](#)

- [Mapping the Hostname of the Switch to IP Addresses on page 143](#)
- [host-name on page 228](#)

## Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

**NOTE:** By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

**alarm-name** is the name of an alarm.

### Related Documentation

- System-Wide Alarms and Alarms for Each Interface Type
- Chassis Conditions That Trigger Alarms
- Silencing External Devices Connected to Alarm Relay Contacts

## Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch

By default, the router or switch sends protocol redirect messages. To disable the sending of redirect messages by the router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-redirects;
```

To reenable the sending of redirect messages on the router or switch, delete the **no-redirects** statement from the configuration.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]** hierarchy level.

### Related Documentation

- Configuring the Junos OS to Ignore ICMP Source Quench Messages
- [Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets on page 129](#)
- Junos® OS Network Interfaces

## Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record-route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

### Related Documentation

- Configuring the Junos OS to Disable the Routing Engine Response to Multicast Ping Packets

## Configuring the Junos OS to Display a System Login Announcement

By default, no login announcement is displayed. To configure a system login announcement, include the **announcement** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
announcement text;
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

**TIP:** You can use the same special characters described to format your system login announcement.

### Related Documentation

- Defining Junos OS Login Classes
- Configuring the Junos OS to Display a System Login Message

## Configuring the Junos OS to Display a System Login Message

By default, no login message is displayed on the router or switch. To configure a system login message, include the **message** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
message text;
```

If the message text contains any spaces, enclose it in quotation marks.

You can format the message using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

The following is a sample login message configuration:

```
[edit]
system {
  login {
    message "\n\n\n\tUNAUTHORIZED USE OF THIS SYSTEM\n
\tIS STRICTLY PROHIBITED!\n\n\tPlease contact
\t'company-noc@company.com\t' to gain\naccess
to this equipment if you need authorization.\n\n\n";
  }
}
```

```
}  
}
```

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet router1  
Trying 1.1.1.1...  
Connected to router1.  
Escape character is '^['.
```

```
UNAUTHORIZED USE OF THIS SYSTEM  
IS STRICTLY PROHIBITED!
```

```
Please contact 'company-noc@company.com' to gain  
access to this equipment if you need authorization.
```

```
router1 (tty0)
```

```
login:
```

A system login message appears before the user logs in. A system login announcement appears after the user logs in.

- Related Documentation**
- Defining Junos OS Login Classes
  - [message on page 235](#)

## Configuring the Junos OS to Extend the Default Port Address Range

By default, the upper range of a port address is 5000. You can increase the range from which the port number can be selected to decrease the probability that someone can determine your port number.

- To configure the Junos OS to extend the default port address range, include the **source-port** statement at the **[edit system internet-options]** hierarchy level:

```
[edit system internet-options]  
source-port upper-limit upper-limit;
```

**upper-limit *upper-limit*** is the upper limit of a source port address and can be a value from 5000 through 65,355.

- Related Documentation**
- Configuring the Junos OS to Disable TCP RFC 1323 Extensions
  - Configuring the Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses
  - [source-port on page 256](#)

## Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

To limit the rate at which ICMPv4 messages can be generated and received by the Routing Engine, include the **icmpv4-rate-limit** statement at the **[edit system internet-options]** hierarchy level:

```
icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
```

The bucket size is the number of seconds in the rate-limiting bucket. The packet rate is the rate-limiting packets earned per second. Specify a **bucket-size** from 0 through 4294967295 seconds. The default value is 5 seconds. Specify a **packet-rate** from 0 through 4,294,967,295. The default value is 1000.

**Related Documentation**

- [icmpv4-rate-limit on page 228](#)

## Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets

By default, the source address included in locally generated Transmission Control Protocol/IP (TCP/IP) packets, such as FTP traffic, and in User Datagram Protocol (UDP) and IP packets, such as Network Time Protocol (NTP) requests, is chosen as the local address for the interface on which the traffic is transmitted. This means that the local address chosen for packets to a particular destination might change from connection to connection based on the interface that the routing protocol has chosen to reach the destination when the connection is established. If multiple equal-cost next hops are present for a destination, locally generated packets use the **lo0** address as a source.

- To configure the software to select a fixed address to use as the source for locally generated IP packets, include the **default-address-selection** statement at the **[edit system]** hierarchy level:

```
[edit system]  
default-address-selection;
```

If you include the **default-address-selection** statement in the configuration, the Junos OS chooses the system default address as the source for most locally generated IP packets. The default address is usually an address configured on the **lo0** loopback interface. For example, if you specified that SSH and telnet use a particular address, but you also have **default-address selection** configured, the system default address is used.

**Related Documentation**

- [Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch on page 126](#)
- [default-address-selection on page 220](#)

## Configuring NTP Authentication Keys

Time synchronization can be authenticated to ensure that the switch obtains its time services only from known sources. By default, network time synchronization is unauthenticated. The switch will synchronize to whatever system appears to have the

most accurate time. We strongly encourage you to configure authentication of network time services.

To authenticate other time servers, include the **trusted-key** statement at the **[edit system ntp]** hierarchy level. Only time servers that transmit network time packets containing one of the specified key numbers are eligible to be synchronized. Additionally, the key needs to match the value configured for that key number. Other systems can synchronize to the local switch without being authenticated.

```
[edit system ntp]
trusted-key [ key-numbers ];
```

Each key can be any 32-bit unsigned integer except 0. Include the **key** option in the **peer**, **server**, or **broadcast** statements to transmit the specified authentication key when transmitting packets. The key is necessary if the remote system has authentication enabled so that it can synchronize to the local system.

To define the authentication keys, include the **authentication-key** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
```

**number** is the key number, **type** is the authentication type (only Message Digest 5 [MD5] is supported), and **password** is the password for this key. The key number, type, and password must match on all systems using that particular key for authentication.

- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 160](#)
- [trusted-key on page 275](#)
- authentication-key

## Configuring NTP Authentication Keys (QFabric System)

To configure the authentication keys using the CLI:

1. Configure the authentication-key number.

```
[edit system ntp]
user@switch# set authentication-key key-number
```

For example, to specify key 5:

```
user@switch# set authentication-key 5
```

2. Specify the type of authentication you want to use.

```
[edit system ntp]
user@switch# set authentication-key type type
```

**NOTE:** MD5 is the only authentication type supported.

For example, to specify **MD5**:

```
user@switch# set authentication-key type md5
```

#### Related Documentation

- [Configuring the NTP Time Server and Time Services \(QFabric System\) on page 133](#)
- [authentication-key on page 208](#)

## Configuring the NTP Time Server and Time Services

When you use NTP, configure the router or switch to operate in one of the following modes:

- Client mode
- Symmetric active mode
- Broadcast mode
- Server mode

The following topics describe how to configure these modes of operation:

1. [Configuring the Router or Switch to Operate in Client Mode on page 131](#)
2. [Configuring the Router or Switch to Operate in Symmetric Active Mode on page 132](#)
3. [Configuring the Router or Switch to Operate in Broadcast Mode on page 132](#)
4. [Configuring the Router or Switch to Operate in Server Mode on page 132](#)

### Configuring the Router or Switch to Operate in Client Mode

To configure the local router or switch to operate in client mode, include the **server** statement and other optional statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
server address <key key-number> <version value> <prefer>;
authentication-key key-number type type value password;
boot-server address;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement, as described in .

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in client mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$EgfcvX7VY4ZEcwgoHjkP5Q3CuREyv87";
boot-server 10.1.1.1;
server 10.1.1.1 key 1 prefer;
trusted-key 1;
```

---

### Configuring the Router or Switch to Operate in Symmetric Active Mode

To configure the local router or switch to operate in symmetric active mode, include the **peer** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
peer address <key key-number> <version value> <prefer>;
```

Specify the address of the remote system. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2 or 3, include the **version** option.

If you configure more than one remote system, you can mark one system preferred by including the **prefer** option:

```
peer address <key key-number> <version value> prefer;
```

---

### Configuring the Router or Switch to Operate in Broadcast Mode

To configure the local router or switch to operate in broadcast mode, include the **broadcast** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast address <key key-number> <version value> <t看 value>;
```

Specify the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2, or 3, include the **version** option.

---

### Configuring the Router or Switch to Operate in Server Mode

In server mode, the router or switch acts as an NTP server for clients when the clients are configured appropriately. The only prerequisite for "server mode" is that the router or switch must be receiving time from another NTP peer or server. No other configuration is necessary on the router or switch.

To configure the local router or switch to operate as an NTP server, include the following statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
server address <key key-number> <version value> <prefer>;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, or 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in server mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$txEruBEreWx-wtuLNdboaUjH.T3AtOESe";
server 172.17.27.46 prefer;
trusted-key 1;
```

#### Related Documentation

- [NTP Time Server and Time Services Overview on page 33](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 160](#)

## Configuring the NTP Time Server and Time Services (QFabric System)

To configure the external time server using the CLI:

1. Configure the IP address of the external time server.

```
[edit system ntp]
user@switch# set server address
```

For example, to set an IP address of 10.1.1.1 for your external time server:

```
user@switch# set server 10.1.1.1
```

2. (Optional) Configure the key number to encrypt authentication fields in packets that are sent to the external time server.

```
[edit system ntp]
user@switch# set server address key key-number
```

For example, to set a key number of 1:

```
user@switch# set server address key 1
```

3. (Optional) Specify the external time server as a preferred host. Doing this enables the switch to synchronize with the external time server.

**NOTE:** The switch can synchronize with the external time server, but the external time server cannot synchronize with the switch.

```
[edit system ntp]
```

```
user@switch# set server address prefer
```

4. (Optional) Specify the NTP version number to be used in outgoing NTP packets.

```
user@switch# set server address version
```

For example, to specify version 3:

```
user@switch# set server address version 3
```

#### Related Documentation

- [ntp on page 241](#)
- [server on page 253](#)

## Specifying the Physical Location of the Switch

To specify the physical location of the switch, specify the following options for the **location** statement at the **[edit system]** hierarchy level:

- **altitude *feet***—Number of feet above sea level.
- **building *name***—Name of the building, 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code *code***—Two-letter country code.
- **floor *number***—Floor in the building.
- **hcoord *horizontal-coordinate***—Bellcore Horizontal Coordinate.
- **lata *service-area***—Long-distance service area.
- **latitude *degrees***—Latitude in degree format.
- **longitude *degrees***—Longitude in degree format.
- **npa-nxx *number***—First six digits of the phone number (area code and exchange).
- **postal-code *postal-code***—Postal code.
- **rack *number***—Rack number.
- **vcoord *vertical-coordinate***—Bellcore Vertical Coordinate.

The following example shows how to specify the physical location of the switch:

```
[edit system]
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
```

```

lata service-area;
latitude degrees;
longitude degrees;
npa-nxx number;
postal-code postal-code;
rack number;
vcoord vertical-coordinate;
}

```

**Related  
Documentation**

- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 157](#)

## Configuring the Router or Switch to Listen for Broadcast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet by including the **broadcast-client** statement at the **[edit system ntp]** hierarchy level:

```

[edit system ntp]
broadcast-client;

```

When the router or switch detects a broadcast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *broadcast client* mode, in which it listens for, and synchronizes to, succeeding broadcast messages.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related  
Documentation**

- [Configuring the Router or Switch to Listen for Multicast Messages Using NTP on page 135](#)
- [Configuring the NTP Time Server and Time Services on page 131](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 160](#)

## Configuring the Router or Switch to Listen for Multicast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet by including the **multicast-client** statement at the **[edit system ntp]** hierarchy level:

```

[edit system ntp]
multicast-client <address>;

```

When the router or switch receives a multicast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *multicast client* mode, in which it listens for, and synchronizes to, succeeding multicast messages.

You can specify one or more IP addresses. (You must specify an address, not a hostname.) If you do, the router or switch joins those multicast groups. If you do not specify any addresses, the software uses **224.0.1.1**.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related  
Documentation**

- [Configuring the Router or Switch to Listen for Broadcast Messages Using NTP on page 135](#)
- [Configuring the NTP Time Server and Time Services on page 131](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 160](#)

## Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]
login-alarms;
```

For more information on the **show system alarms** command, see the Junos OS Operational Mode Commands.

**Related  
Documentation**

- System Alarms on J Series Routers
- [show system alarms on page 861](#)

## Configuring Time-Based User Access

The Junos OS enables you to configure time-based restrictions for user access to log in to a device. This is useful for restricting the time and duration of user logins for all users belonging to a login class. You can specify the days of the week when users can log in, the access start time, and the access end time.

- To configure user access on specific days of the week, without any restrictions on the duration of login, include the **allowed-days** statement only.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
  }
}
```

- To configure user access on all the days of the week for a specific duration, include the **access-start** and **access-end** statements only.

```
[edit system]
login {
  class class-name {
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

- To configure user access on specific days of the week for a specified duration, include the **allowed-days**, **access-start**, and **access-end** statements.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

Specify the start time and end time in **HH:MM** (24-hour) format, where **HH** represents the hours and **MM** represents the minutes.

**NOTE:** Access start time and end time that spans across 12:00 AM on a specified day results in the user having access until the next day, even if the access day is not explicitly configured. For instance, the following configuration results in the user having access until 6:00 AM on Tuesday and Thursday, although the **allowed-days** statement specifies access only on Monday and Wednesday:

```
[edit system]
login {
  class operator-night-shift {
    allowed-days [ monday wednesday ];
    access-start 2000;
    access-end 0600;
  }
}
```

#### Related Documentation

- [access-end on page 200](#)
- [access-start on page 200](#)
- [allowed-days on page 203](#)

## Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established

by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.  
Warning: session will be closed in 1 minute if there is no activity  
Warning: session will be closed in 10 seconds if there is no activity  
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

- Related Documentation**
- Defining Junos OS Login Classes
  - idle-timeout
  - [idle-timeout on page 229](#)

## Configuring a QFX3500 Device as a Standalone Switch

If you are using the QFX3500 device as a standalone switch, you must perform the initial configuration of the QFX3500 device through the console port using the command-line interface (CLI). If you are using the QFX3500 as a Node device in a QFX3000 QFabric system, you instead perform the initial setup of a QFabric system on a QFX3100 Director device (see Performing the QFabric System Initial Setup on a QFX3100 Director Group).

Before you begin connecting and configuring a QFX3500 device, set the following parameter values on the console server or PC:

- Baud Rate—9600
- Flow Control—None
- Data—8
- Parity—None
- Stop Bits—1
- DCD State—Disregard

To connect and configure the device from the console:

1. Connect the console port to a laptop or PC using the supplied RJ-45 cable and RJ-45 to DB-9 adapter. The console (**CON**) port is located on the front panel of the device.
2. Log in as **root**. There is no password. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

```
Login: root
```

3. Start the CLI.

```
root@% cli
```

4. Enter configuration mode.

```
root> configure
```

5. Add a password to the root administration user account.

```
[edit]
```

```
root@# set system root-authentication plain-text-password
```

```
New password: password
```

```
Retype new password: password
```

6. (Optional) Configure the name of the device. If the name includes spaces, enclose the name in quotation marks (" ").

```
[edit]
```

```
root@# set system host-name host-name
```

7. Configure the default gateway.

```
[edit]
```

```
root@# set routing-options static route default next-hop address
```

8. Configure the IP address and prefix length for the device management interface.

```
[edit]
```

```
root@# set interfaces me0 unit 0 family inet address address/prefix-length
```

**CAUTION:** Configuring the two management Ethernet interfaces within the same subnet is not supported.

**NOTE:** The management ports are on the front panel of the QFX3500 device. They are labeled C0 and C1 on the front panel. In the CLI they are referred to as me0 and me1.

9. (Optional) Configure the static routes to remote prefixes with access to the management port.

```
[edit]
```

```
root@# set routing-options static route remote-prefix next-hop destination-ip retain no-readvertise
```

10. Enable telnet service.

```
[edit]
```

```
root@# set system services telnet
```

**NOTE:** When Telnet is enabled, you cannot log in to a QFX3500 device through Telnet using root credentials. Root login is allowed only for SSH access.

11. Commit the configuration to activate it on the device.

```
[edit]
root@# commit
```

## Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX3500 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX3500 device:

1. Use FTP to copy the installation media image into the `/var/tmp` directory on the QFX3500 device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the `su` command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the QFX3500 device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

## Creating a Snapshot and Using It to Boot a QFX Series Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

- [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 141](#)
- [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 142](#)

### Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the QFX Series switch USB port specifications. See [USB Port Specifications for the QFX Series](#).

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

```
user@switch> request system snapshot partition
```

**NOTE:** This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.
  - To reboot the switch using the most recently created snapshot:  
`user@switch> request system reboot`
  - To reboot the switch using a snapshot in a specific partition on the USB flash drive:  
`user@switch> request system reboot slice 1`

### Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

---

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:  
`user@switch> request system snapshot partition`

**NOTE:** This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.
  - To reboot the switch using the most recently created snapshot:  
`user@switch> request system reboot`
  - To reboot the switch using a snapshot in a specific partition in internal memory:  
`user@switch> request system reboot slice 1`

#### Related Documentation

### Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

Aug 21 12:36:30

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (**401**) and the year (**2006**):

```
Aug 21 12:36:30.401 2006
```

**NOTE:** Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the **[edit system syslog file filename]** hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

- Related Documentation**
- [Single-Chassis System Logging Configuration Overview](#)
  - [Examples: Configuring System Logging](#)

## Mapping the Hostname of the Switch to IP Addresses

To map a hostname of a switch to one or more IP addresses, include the **inet** statement at the **[edit system static-host-mapping hostname]** hierarchy level:

```
[edit system]
static-host-mapping {
  hostname {
    inet [ addresses ];
    alias [ aliases ];
  }
}
```

**hostname** is the name specified by the **host-name** statement at the **[edit system]** hierarchy level.

For each host, you can specify one or more aliases.

## Methods for Configuring Junos OS

You can use any of the methods shown in [Table 31 on page 144](#) to configure Junos OS:

**Table 31: Methods for Configuring Junos OS**

Method	Description
Command-line interface (CLI)	Create the configuration for the device using the CLI. You can enter commands from a single command line, and scroll through recently executed commands.
ASCII file	Load an ASCII file containing a configuration that you created earlier, either on this system or on another system. You can then activate and run the configuration file, or you can edit it using the CLI and then activate it.
J-Web graphical user interface (GUI)	Use the J-Web graphical user interface (GUI) to configure the device. J-Web enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser. The J-Web GUI is preinstalled on J Series Services Routers and is an optional software package that can be installed on M Series and T Series routers. J-Web is not available for the QFX Series.
Junos XML management protocol (API)	Use Junos XML protocol Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the Junos XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The Junos XML management protocol is customized for Junos OS, and operations in the API are equivalent to those in the Junos OS CLI.
NETCONF application programming interface (API)	Use NETCONF Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the NETCONF XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The NETCONF XML management protocol includes features that accommodate the configuration data models of multiple vendors.
Configuration commit scripts	Create scripts that run at commit time to enforce custom configuration rules. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). Commit scripts are not available for the QFX Series.

The following sections contain complete descriptions of the methods you can use to configure Junos OS:

- [Junos OS Command-Line Interface \(CLI\) on page 145](#)
- [ASCII File on page 145](#)

- [J-Web Package on page 145](#)
- [Junos XML Management Protocol Software on page 146](#)
- [NETCONF XML Management Protocol Software on page 146](#)
- [Configuration Commit Scripts on page 146](#)

### Junos OS Command-Line Interface (CLI)

The Junos OS CLI is a straightforward command interface. You use Emacs-style keyboard sequences to move around on a command line and scroll through a buffer that contains recently executed commands. You type commands on a single line, and the commands are executed when you press the Enter key. The CLI also provides command help and command completion. For more information about the CLI, see the CLI User Guide and Junos OS Operational Mode Commands.

### ASCII File

You can load an ASCII file containing a configuration that you created earlier, either on this system or another system. You can then activate and run the configuration file as is, or you can edit it using the CLI and then activate it.

### J-Web Package

As an alternative to entering CLI commands, the Junos OS supports the J-Web graphical user interface (GUI). The J-Web user interface enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled.

The J-Web user interface is preinstalled on J Series Services Routers. It is provided as an optional, licensed software package (**jweb** package) on M Series and T Series routers. The **jweb** package is not included in **jinstall** and **jbundle** software bundles. It must be installed separately. To install the package on M Series and T Series routers, follow the procedure described in the Installation and Upgrade Guide.

J-Web supports weak (56-bit) encryption by default. This enables international customers to install J-Web and use HTTPS connections for J-Web access. Domestic customers can also install the **jcrypto** strong encryption package. This package automatically overrides the weak encryption. For more information about the J-Web GUI, see the *J-Web Interface User Guide*.

**NOTE:** Because the J-Web package is bundled separately from other packages, it is possible to have a version mismatch between J-Web and other Junos OS packages you have installed.

To check for a version mismatch, use the **show system alarms** CLI command. If the version number does not match exactly, a system alarm appears. For example, if you install the 7.4R1.2 **jroute** package and the 7.4R1.1 **jweb** package, an alarm is activated. For more information on the **show system alarms** command, see the Junos OS Operational Mode Commands.

### Junos XML Management Protocol Software

---

The Junos XML management protocol is an Extensible Markup Language (XML) application that client applications use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and operations in the API are equivalent to Junos OS CLI configuration mode commands. The Junos XML management protocol includes a set of Perl modules that enable client applications to communicate with a Junos XML protocol server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and Junos XML management protocol software, see the *Junos XML Management Protocol Guide*.

### NETCONF XML Management Protocol Software

---

The NETCONF XML management protocol is an Extensible Markup Language (XML) application that client applications can use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and includes features that accommodate the configuration data models of multiple vendors. The NETCONF XML management protocol includes a set of Perl modules that enable client applications to communicate with a NETCONF server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and NETCONF XML management protocol software, see the *NETCONF XML Management Protocol Guide*.

### Configuration Commit Scripts

---

You can create and use scripts that run at commit time to enforce custom configuration rules. If a configuration breaks the custom rules, the script can generate actions that the Junos OS performs. These actions include:

- Generating custom error messages
- Generating custom warning messages
- Generating custom system log messages
- Making changes to the configuration

Configuration commit scripts also enable you to create macros, which expand simplified custom aliases for frequently used configuration statements into standard Junos configuration statements. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). For more information, see the Junos OS Configuration and Operations Automation Guide.

#### Related Documentation

- Junos OS Configuration from External Devices

## Modifying the Default Time Zone for a Router or Switch Running Junos OS

The default local time zone on the router or switch is UTC (Coordinated Universal Time, formerly known as Greenwich Mean Time, or GMT).

- To modify the local time zone, include the **time-zone** statement at the **[edit system]** hierarchy level:

```
[edit system]
time-zone (GMT hour-offset | time-zone);
```

You can use the **GMT *hour-offset*** option to set the time zone relative to UTC (GMT) time. By default, ***hour-offset*** is 0. You can configure this to be a value from -14 to +12.

You can also specify the **time-zone** value as a string such as PDT (Pacific Daylight Time) or WET (Western European Time), or specify the continent and major city.

**NOTE:** Junos OS complies with the POSIX time-zone standard, which is counter-intuitive to the way time zones are generally indicated relative to UTC. A time zone ahead of UTC (east of the Greenwich meridian) is commonly indicated as GMT +*n*; for example, the Central European Time (CET) zone is indicated as GMT +1. However, this is not true for POSIX time zone designations. POSIX indicates CET as GMT-1. If you include the **set system time-zone GMT+1** statement for a router in the CET zone, your router time will be set to one hour behind GMT, or two hours behind the actual CET time. For this reason, you might find it easier to use the POSIX time-zone strings, which you can list by entering **set system time-zone ?**.

For the time zone change to take effect for all processes running on the router or switch, you must reboot the router or switch.

The following example shows how to change the current time zone to **America/New\_York**:

```
[edit]
user@host# set system time-zone America/New_York
[edit]
user@host# show
system {
    time-zone America/New_York;
}
```

### Related Documentation

- [Setting a Custom Time Zone on Routers or Switches Running Junos OS on page 150](#)

## Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>           Execute this command
```

at	Time at which to perform the operation
in	Number of minutes to delay before operation
media	Boot media for next boot
message	Message to display to all users
	Pipe through a command

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
at             Time at which to perform the operation
in            Number of minutes to delay before operation
media         Boot media for next boot
message       Message to display to all users
|             Pipe through a command
```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. `[edit]`  
`user@switch# load factory-default`  
`[edit]`  
`user@switch# delete system commit factory-settings`  
`[edit]`  
`user@switch# commit`

**Related Documentation**

- [Understanding Configuration Files on page 1113](#)
- [Loading a Previous Configuration File on page 1122](#)
- [Reverting to the Rescue Configuration on page 150](#)

## Reverting to the Default Factory Configuration by Using the **request system zeroize** Command

The **request system zeroize** command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the **request system zeroize media** command.

**CAUTION:** Before issuing **request system zeroize**, use the **request system snapshot** command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the **request system zeroize** command:

1. `user@switch> request system zeroize`  
`warning: System will be rebooted and may not boot without configuration`  
`Erase all data, including configuration and log files? [yes,no] (yes)`
2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch. See or [“Configuring a QFX3500 Device as a Standalone Switch” on page 138](#)

**Related Documentation**

- [request system zeroize on page 387](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

### Related Documentation

## Saving Core Files Generated by Junos OS Processes

By default, when an internal Junos OS process generates a core file, the file and associated context information are saved for debugging purposes in a compressed tar file named **/var/tmp/process-name.core.core-number.tgz**. The contextual information includes the configuration and system log message files.

- To disable the saving of core files and associated context information:

```
[edit system]
no-saved-core-context;
```

- To save the core files only:

```
[edit system]
saved-core-files number;
```

Where **number** is the number of core files to save and can be a value from 1 through 10.

- To save the core files along with the contextual information:

```
[edit system]
saved-core-context;
```

### Related Documentation

- [Viewing Core Files from Junos OS Processes on page 156](#)

## Setting a Custom Time Zone on Routers or Switches Running Junos OS

You can update the time zone database information on routers or switches running Junos OS. This feature simplifies time zone management in devices running Junos OS by allowing

for future unforeseen time zone database adjustments. You can configure your router or switch to use a custom time zone database file that you create to meet your requirements by editing an existing time zone database file.

Tasks for setting a custom time zone are:

1. [Importing and Installing Time Zone Files on page 151](#)
2. [Configuring a Custom Time Zone on page 152](#)

### Importing and Installing Time Zone Files

To import and install time zone files, follow these steps:

1. Download the time zone files archive and untar them to a temporary directory such as `/var/tmp`:

```
# mkdir -p /var/tmp/tz && cd /var/tmp/tz && rm *
# wget 'ftp://ftp.iana.org/tz/tzdata-latest.tar.gz'
# tar xvfz tzdata*.gz
africa
antarctica
asia
australasia
europe
northamerica
southamerica
pacificnew
etcetera
factory
backward
systemv
solar87
solar88
solar89
iso3166.tab
zone.tab
leapseconds
yearistype.sh
```

**NOTE:** If needed, you can edit the above untarred files to create or modify time zones.

2. Select the names of time zone files to compile and feed them to the following script. For example, to generate **northamerica** and **asia** tz files:

```
# /usr/libexec/ui/compile-tz northamerica asia
```

3. Enable the use of the generated tz files using the CLI:

```
[edit]
# set system use-imported-time-zones
[edit]
# set system time-zone ?
```

This should show the newly generated tz files in `/var/db/zoneinfo/`.

4. Set the time zone and commit the configuration:

```
[edit]
# set system time-zone <your-time-zone>
# commit
```

5. Verify that the time zone change has taken effect:

```
[edit]
# run show system uptime
```

---

### Configuring a Custom Time Zone

To use a custom time zone, follow these steps:

1. Download a time zones archive (from a known or designated source) to the router or switch. Compile the time zone archive using the *zic* time zone compiler, which generates *tz* files.
2. Using the CLI, configure the router or switch to enable the use of the generated *tz* files as follows:

```
[edit]
user@host# set system use-imported-time-zones
```

3. Display the imported time zones (saved in the directory */var/db/zoneinfo/*):

```
[edit]
user@host# set system time-zone ?
```

If you do not configure the router to use imported time zones, the Junos OS default time zones are shown (saved in the directory */usr/share/zoneinfo/*).

### Setting the Date and Time

1. Enter operational mode in the CLI.
2. Enter the following command:

```
user@switch> set date YYYYMMDDHHMM.ss source-address
```

For example, the following command sets the date and time.

```
user@switch# set date 201102151010.55
```

3. To set the date and time from an NTP server, enter the following command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from an NTP server:

```
user@switch# set date ntp 200.40.40.1
```

4. To set the date and time from more than one NTP server, enter the same command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from more than one NTP server:

```
user@switch# set date ntp 200.40.40.1 200.40.40.2
```

**Related Documentation**

- [set date](#)

## Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)"** . Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

#### Related Documentation

- [Example: Configuring Access Privileges for Operational Mode Commands on page 1246](#)

- [deny-commands](#)

## Synchronizing and Coordinating Time Distribution Using NTP

Using NTP to synchronize and coordinate time distribution in a large network involves these tasks:

1. [Configuring NTP on page 155](#)
2. [Configuring the NTP Boot Server on page 155](#)
3. [Specifying a Source Address for an NTP Server on page 155](#)

### Configuring NTP

- To configure NTP on the router or switch, include the **ntp** statement at the **[edit system]** hierarchy level:

```
[edit system]
ntp {
  authentication-key number type type value password;
  boot-server (address | hostname);
  broadcast <address> <key key-number> <version value> <ttl value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

### Configuring the NTP Boot Server

When you boot the router or switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP will not be able to synchronize to a time server if the server's time appears to be very far off of the local router's or switch's time.

- To configure the NTP boot server, include the **boot-server** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
boot-server (address | hostname);
```

Specify either the IP address or the hostname of the network server.

### Specifying a Source Address for an NTP Server

For IP version 4 (IPv4), you can specify that if the NTP server configured at the **[edit system ntp]** hierarchy level is contacted on one of the loopback interface addresses, the reply always uses a specific source address. This is useful for controlling which source address NTP uses to access your network when it is either responding to or sending an NTP client request from your network.

To configure the specific source address that the reply will always use, and the source address that requests initiated by NTP server will use, include the **source-address** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

**NOTE:** If a firewall filter is applied on the loopback interface, ensure that the source address specified for the NTP server at the **[edit system ntp]** hierarchy level is explicitly included as one of the match criteria in the firewall filter. This enables the Junos OS to accept traffic on the loopback interface from the specified source address.

The following example shows a firewall filter with the source address 10.0.10.100 specified in the **from** statement included at the **[edit firewall filter firewall-filter-name]** hierarchy:

```
[edit firewall filter Loopback-Interface-Firewall-Filter]
term Allow-NTP {
  from {
    source-address {
      172.17.27.46/32; // IP address of the NTP server
      10.0.10.100/32; // Source address specified for the NTP server
    }
  }
  then accept;
}
```

If no source address is configured for the NTP server, include the primary address of the loopback interface in the firewall filter.

## Viewing Core Files from Junos OS Processes

When an internal Junos process generates a core file, the output found at **/var/crash/** and **/var/tmp/** can now be viewed. This provides a quick method of finding core issues across large networks.

Use the CLI command **show system core-dumps** to view core files.

```
root@host> show system core-dumps
-rw----- 1 root  wheel  268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root  field   3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root  wheel   27775914 Jun 18 17:59 /var/crash/kernel.0
```

- Related Documentation**
- [Saving Core Files from Junos OS Processes](#)
  - [Saving Core Files Generated by Junos OS Processes on page 150](#)

## Configuration Examples

- [Example: Configuring the Domain Name for the Router or Switch on page 157](#)
- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 157](#)
- [Example: Configuring NTP on page 158](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 160](#)

### Example: Configuring the Domain Name for the Router or Switch

The following example shows how to configure the router or switch domain name:

```
[edit]
user@host# set system domain-name company.net
[edit]
user@host# show
system {
    domain-name company.net;
}
```

- Related Documentation**
- [domain-name on page 225](#)
  - [Configuring the Domain Name for the Router or Switch on page 124](#)

### Example: Configuring the Name of the Switch, IP Address, and System ID

The following example shows how to configure the switch name, map the name to an IP address and alias, and configure a system identifier:

```
[edit]
user@switcht# set system host-nameswitch-sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 inet 192.168.1.77
[edit]
user@switcht# set system static-host-mapping switch-sj1 alias sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 sysid 1921.6800.1077
[edit]
user@switcht# show
system {
    host-name switch-sj1;
    static-host-mapping {
        switch-sj1 {
            inet 192.168.1.77;
            alias sj1;
            sysid 1921.6800.1077;
        }
    }
}
```

```
}
```

**Related  
Documentation**

- [Configuring Basic Router or Switch Properties](#)

## Example: Configuring NTP

The Network Time Protocol (NTP) provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network. NTP uses a returnable-time design in which a distributed subnet of time servers operating in a self-organizing, hierarchical primary-secondary configuration synchronizes local clocks within the subnet and to national time standards by means of wire or radio. The servers also can redistribute reference time using local routing algorithms and time daemons.

This example shows how to configure NTP:

- [Requirements on page 158](#)
- [Overview on page 158](#)
- [Configuration on page 158](#)
- [Verification on page 159](#)

### Requirements

---

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later
- A switch connected to a network on which an NTP boot server and NTP server reside

### Overview

---

Debugging and troubleshooting are much easier when the timestamps in the log files of all switches are synchronized, because events that span a network can be correlated with synchronous entries in multiple logs. We recommend using the Network Time Protocol (NTP) to synchronize the system clocks of your switch and other network equipment.

In this example, an administrator wants to synchronize the time in a switch to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date are obtained when the router or switch boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme is used to hash the key value for authentication, which prevents the switch from synchronizing with an attacker's host that is posing as the time server.

### Configuration

---

To configure NTP:

**CLI Quick Configuration** To quickly configure NTP, copy the following commands and paste them into the switch's terminal window:

```
[edit system]
set ntp boot-server 10.1.4.1
set ntp server 10.1.4.2
set ntp authentication-key 2 type md5 value "$9$aHlj8"
```

**Step-by-Step Procedure** To configure NTP :

1. Specify the boot server:  

```
[edit system]
user@switch# set ntp boot-server 10.1.4.1
```
2. Specify the NTP server:  

```
[edit system]
user@switch# set ntp server 10.1.4.2
```
3. Specify the key number, authentication type (MD5), and key for authentication:  

```
[edit system]
user@switch# set ntp authentication-key 2 type md5 value "$9$aHlj8"
```

**Results** Check the results:

```
[edit system]
user@switch# show
ntp {
  boot-server 10.1.4.1;
  authentication-key 2 type md5 value "$9$aHlj8"; ## SECRET-DATA
  server 10.1.4.2;
}
```

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Checking the Time on page 159](#)
- [Displaying the NTP Peers on page 160](#)
- [Displaying the NTP Status on page 160](#)

### Checking the Time

**Purpose** Check the time that has been set on the switch.

**Action** Enter the **show system uptime** operational mode command to display the time.

```
user@switch> show system uptime
fpc0:
-----
Current time: 2009-06-12 12:49:03 PDT
System booted: 2009-05-15 06:24:43 PDT (4w0d 06:24 ago)
Protocols started: 2009-05-15 06:27:08 PDT (4w0d 06:21 ago)
Last configured: 2009-05-27 14:57:03 PDT (2w1d 21:52 ago) by admin1
12:49PM up 28 days, 6:24, 1 user, load averages: 0.05, 0.06, 0.01
```

**Meaning** The output shows that the current date and time are June 12, 2009 and 12:49:03 PDT. The switch booted 4 weeks, 6 hours, and 24 minutes ago, and its protocols were started

approximately 3 minutes before it booted. The switch was last configured by user **admin1** on May 27, 2009, and there is currently one user logged in to the switch.

The output also shows that the load average is 0.05 seconds for the last minute, 0.06 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

### *Displaying the NTP Peers*

**Purpose** Verify that the time has been obtained from an NTP server.

**Action** Enter the **show ntp associations** operational mode command to display the NTP server from switch obtained its time.

```
user@switch> show ntp associations
      remote      refid      st t when poll reach  delay  offset  jitter
=====
*ntp5.domain1.ne .GPS.          1 u  414 1024  377   3.435   4.002   0.765
```

**Meaning** The asterisk (\*) in front of the NTP server name, or peer, indicates that the time is synchronized and obtained from this server. The delay, offset, and jitter are displayed in milliseconds.

### *Displaying the NTP Status*

**Purpose** View the configuration of the NTP server and the status of the system.

**Action** Enter the **show ntp status** operational mode command to view the status of the NTP.

```
user@switch> show ntp status
status=0644 leap_none, sync_ntp, 4 events, event_peer/strat_chg,
version="ntpd 4.2.0-a Mon Apr 13 19:09:05 UTC 2009 (1)",
processor="powerpc", system="JUNOS9.5R1.8", leap=00, stratum=2,
precision=-18, rootdelay=2.805, rootdispersion=42.018, peer=48172,
refid=172.17.28.5,
reftime=cddd397a.60e6d7bf Fri, Jun 12 2009 13:30:50.378, poll=10,
clock=cddd3b1b.ec5a2bb4 Fri, Jun 12 2009 13:37:47.923, state=4,
offset=3.706, frequency=-23.018, jitter=1.818, stability=0.303
```

**Meaning** The output shows status information about the switch and the NTP.

## **Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization**

Debugging and troubleshooting are much easier when the timestamps in the log files of all the routers or switches are synchronized, because events that span the network can

be correlated with synchronous entries in multiple logs. We strongly recommend using the Network Time Protocol (NTP) to synchronize the system clocks of routers, switches, and other network equipment.

By default, NTP operates in an entirely unauthenticated manner. If a malicious attempt to influence the accuracy of a router or switch's clock succeeds, it could have negative effects on system logging, make troubleshooting and intrusion detection more difficult, and impede other management functions.

The following sample configuration synchronizes all the routers or switches in the network to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date is obtained when the router boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme should be used to hash the key value for authentication, which prevents the router or switch from synchronizing with an attacker's host posing as the time server.

```
[edit]
system {
  ntp {
    authentication-key 2 type md5 value "$9$aHlj8gqQ1gijyjhgiiliii"; # SECRET-DATA
    boot-server 10.1.4.1;
    server 10.1.4.2;
  }
}
```

                        source-address address;
                        retry number;
                        timeout seconds;
                    }
                }
            }
        }
        tacplus {
            server {
                server-address {
                    port port-number;
                    secret password;
                    single-connection;
                    timeout seconds;
                }
            }
        }
    }
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure audit of TACACS+ or RADIUS authentication events, configuration changes, and interactive commands.

**Options** The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring TACACS+ System Accounting on page 1233](#)

## accounting-port

---

Syntax	accounting-port <i>port-number</i> ;
Hierarchy Level	[edit system accounting destination radius server <i>server-address</i> ], [edit system radius server <i>server-address</i> ]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the accounting port number on which to contact the RADIUS server.
Options	<i>number</i> —Port number on which to contact the RADIUS server. Default: 1813
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Accounting on page 1217</a></li></ul>

## allow-commands

---

Syntax	allow-commands " <i>regular-expression</i> ";
Hierarchy Level	[edit system login class <i>class-name</i> ]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify the operational mode commands that members of a login class can use.
Default	If you omit this statement and the <b>deny-commands</b> statement, users can issue only those commands for which they have access privileges through the <b>permissions</b> statement.
Options	<i>regular-expression</i> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Specifying Access Privileges for Junos OS Operational Mode Commands on page 153</a></li><li>• <a href="#">deny-commands on page 221</a></li><li>• <a href="#">user on page 276</a></li></ul>

## allow-configuration

---

<b>Syntax</b>	<code>allow-configuration "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login class <i>class-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Explicitly allow configuration access to the specified levels in the hierarchy even if the permissions set with the <b>permissions</b> statement do not grant such access by default.
<b>Default</b>	If you omit this statement and the <b>deny-configuration</b> statement, users can edit only those commands for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1238</a></li> <li>• <a href="#">Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies on page 1205</a></li> <li>• <a href="#">deny-configuration on page 222</a></li> <li>• <a href="#">user on page 276</a></li> </ul>

## allowed-days

---

<b>Syntax</b>	<code>allowed-days [ <i>days-of-the-week</i> ];</code>
<b>Hierarchy Level</b>	[edit system <b>login</b> class <i>class-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the days of the week when users can log in.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Time-Based User Access on page 136</a></li> </ul>

## allow-transients

---

<b>Syntax</b>	allow-transients;
<b>Hierarchy Level</b>	[edit systems scripts commit]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, enable transient configuration changes to be committed.
<b>Default</b>	Transient changes are disabled by default. If you do not include the <b>allow-transients</b> statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Generating a Persistent or Transient Change</li><li>• Creating a Macro to Read the Custom Syntax and Generate Related Configuration Statements</li></ul>

## announcement

---

<b>Syntax</b>	announcement <i>text</i> ;
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a system login announcement. This announcement appears after a user logs in.
<b>Options</b>	<i>text</i> —Text of the announcement. If the text contains any spaces, enclose it in quotation marks.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring the Junos OS to Display a System Login Announcement</li><li>• <a href="#">Configuring the Junos OS to Display a System Login Message on page 127</a></li><li>• <a href="#">message on page 235</a></li></ul>

## archival

<b>Syntax</b>	<pre> archival {   configuration {     archive-sites {       file://&lt;path&gt;/&lt;filename&gt;;       ftp://username@host:&lt;port&gt;url-path password password;       http://username@host:&lt;port&gt;url-path password password;       pasvftp://username@host:&lt;port&gt;url-path password password;       scp://username@host:&lt;port&gt;url-path password password;     }     transfer-interval interval;     transfer-on-commit;   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.
	<div>  <p><b>NOTE:</b> The <code>edit system archival</code> hierarchy is not available on QFabric systems.</p> </div>
<b>Options</b>	The remaining statements are explained separately.
	<div>  <p><b>NOTE:</b> The <code>[edit system archival]</code> hierarchy is not available on QFabric systems.</p> </div>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1133</li> </ul>

## arp (System)

---

**Syntax**

```
arp {
  aging-timer minutes;
  gratuitous-arp-delay seconds;
  gratuitous-arp-on-ifup;
  interfaces {
    interface-name {
      aging-timer minutes;
    }
  }
  passive-learning;
  purging;
}
```

For EX-Series switches:

```
arp {
  aging-timer minutes;
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

For EX-Series switches, set only the time interval between ARP updates.

**Options** **aging-timer**—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

**passive-learning** (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.

**Default:** 20 minutes

**Range:** 5 to 240 minutes

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- Junos® OS Network Interfaces

- For more information about ARP updates, see the [Junos OS System Basics Configuration Guide](#).

## authentication (Login)

<b>Syntax</b>	<pre>authentication {   encrypted-password <i>password</i>;   load-key-file <i>URL</i>;   plain-text-password <i>password</i>;   remote-debug-permission (qfabric-admin   qfabric-operator   qfabric-user);   ssh-dsa "<i>public-key</i>";   ssh-rsa "<i>public-key</i>"; }</pre>
<b>Hierarchy Level</b>	[edit system login user <i>username</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.
<b>Options</b>	<p><b>encrypted-password "<i>password</i>"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file</b>—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.</p> <p><b>plain-text-password</b>—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>remote-debug-permission</b> (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.</p> <p><b>ssh-dsa "<i>public-key</i>"</b>—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "<i>public-key</i>"</b>—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS User Accounts on page 1213</a></li> <li>• <a href="#">root-authentication on page 250</a></li> </ul>

## authentication-key

---

<b>Syntax</b>	<code>authentication-key <i>key-number</i> type <i>type</i> value <i>password</i>;</code>
<b>Hierarchy Level</b>	[edit system ntp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure Network Time Protocol (NTP) authentication keys so that the router or switch can send authenticated packets. If you configure the router or switch to operate in authenticated mode, you must configure a key.</p> <p>Both the keys and the authentication scheme (MD5) must be identical between a set of peers sharing the same key number.</p>
<b>Options</b>	<p><b><i>key-number</i></b>—An integer in the range of 1 to 65533.</p> <p><b><i>type type</i></b>—Authentication type. It can only be <b>md5</b>.</p> <p><b><i>value password</i></b>—Key itself, consisting of 1 through 8 ASCII characters. If the key contains spaces, enclose it in quotation marks.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring NTP Authentication Keys (QFabric System) on page 130</a></li><li>• <a href="#">NTP Time Server and Time Services Overview (QFabric System) on page 34</a></li></ul>

## authentication-order

---

<b>Syntax</b>	<code>authentication-order [ <i>authentication-methods</i> ];</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.
<b>Default</b>	If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.
<b>Options</b>	<p><b><i>authentication-methods</i></b>—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:</p> <ul style="list-style-type: none"> <li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the [edit system login user] hierarchy level.</li> <li>• <b>radius</b>—Use RADIUS authentication services.</li> <li>• <b>tacplus</b>—Use TACACS+ authentication services.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 1214</a></li> <li>• <a href="#">authentication on page 207</a></li> </ul>

## auxiliary

---

<b>Syntax</b>	<pre>auxiliary {   disable;   insecure;   type <i>terminal-type</i>; }</pre>
<b>Hierarchy Level</b>	[edit system ports]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the characteristics of the auxiliary port.
<b>Default</b>	The auxiliary port is disabled.
<b>Options</b>	<p><b>disable</b>—Disable the port.</p> <p><b>insecure</b>—Disable superuser access or root logins to establish a terminal connection.</p> <p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port.</p> <p><b>Range:</b> ansi, vt100, small-xterm, xterm</p> <p><b>Default:</b> The terminal type is unknown, and the user is prompted for the terminal type.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Console and Auxiliary Port Properties on page 5521</a></li></ul>

## boot-server (NTP)

---

<b>Syntax</b>	<code>boot-server (address   hostname);</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the server that NTP queries when the router or switch boots to determine the local date and time.</p> <p>When you boot the router or switch, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local router's or switch's time. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the router or switch boots up.</p>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>address</b>—IP address of an NTP boot server.</li> <li>• <b>hostname</b>—Hostname of an NTP boot server.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Synchronizing and Coordinating Time Distribution Using NTP on page 155</a></li> </ul>

## broadcast

---

<b>Syntax</b>	<code>broadcast address &lt;key key-number&gt; &lt;version value&gt; &lt;tll value&gt;;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the local router or switch to operate in broadcast mode with the remote system at the specified address to send periodic broadcast messages to a client population. Normally, you include this statement only when the local router or switch is operating as a transmitter.
<b>Options</b>	<p><b>address</b>—Broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be <b>224.0.1.1</b>.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer).</p> <p><b>tll value</b>—(Optional) Time-to-live (TTL) value to use. <b>Range:</b> 1 through 255 <b>Default:</b> 1</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets. <b>Range:</b> 1 through 4 <b>Default:</b> 4</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the NTP Time Server and Time Services on page 131</a></li></ul>

## broadcast-client

---

<b>Syntax</b>	<code>broadcast-client;</code>
<b>Hierarchy Level</b>	<code>[edit system <a href="#">ntp</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Router or Switch to Listen for Broadcast Messages Using NTP on page 135</a></li> </ul>

## change-type

---

<b>Syntax</b>	<code>change-type (character-sets   set-transitions);</code>
<b>Hierarchy Level</b>	<code>[edit system login password]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set requirements for using character sets in plain-text passwords. When you combine this statement with the <b>minimum-changes</b> statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.
<b>Options</b>	Specify one of the following: <ul style="list-style-type: none"> <li>• <b>character-sets</b>—Number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.</li> <li>• <b>set-transitions</b>—Number of transitions between character sets.</li> </ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Special Requirements for Junos OS Plain-Text Passwords on page 1207</a></li> <li>• <a href="#">minimum-changes on page 235</a></li> </ul>

## checksum

---

<b>Syntax</b>	<code>checksum (md5   sha-256   sha1) <i>hash</i>;</code>
<b>Hierarchy Level</b>	[edit event-options event-script file <i>filename</i> ], [edit system scripts commit file <i>filename</i> ],
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event or commit script, the Junos OS verifies the authenticity of the script by using the configured checksum hash.
<b>Options</b>	<b>md5 <i>hash</i></b> —MD5 checksum of this script.  <b>sha-256 <i>hash</i></b> —SHA-256 checksum of this script.  <b>sha1 <i>hash</i></b> —SHA-1 checksum of this script.
<b>Required Privilege Level</b>	<b>maintenance</b> —To view this statement in the configuration. <b>maintenance-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Checksum Hashes for a Commit Script</li><li>• Configuring Checksum Hashes for an Event Script</li><li>• Configuring Checksum Hashes for an Op Script</li><li>• <a href="#">file checksum md5 on page 296</a></li><li>• <a href="#">file checksum sha-256 on page 298</a></li><li>• <a href="#">file checksum sha1 on page 297</a></li></ul>

## class (Defining Login Classes)

<b>Syntax</b>	<pre> class <i>class-name</i> {   access-end;   access-start;   allow-commands "<i>regular-expression</i>";   allow-configuration "<i>regular-expression</i>";   deny-commands "<i>regular-expression</i>";   deny-configuration "<i>regular-expression</i>";   idle-timeout <i>minutes</i>;   login-tip;   permissions [ <i>permissions</i> ]; } </pre>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define a login class.
<b>Options</b>	<p><b><i>class-name</i></b>—A name you choose for the login class.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining Junos OS Login Classes on page 1235</a></li> <li>• <a href="#">user on page 276</a></li> </ul>

## class (Assigning a Class to an Individual User)

---

<b>Syntax</b>	<pre>class <i>class-name</i> {     operator;     read-only;     super-user;     unauthorized; }</pre>
<b>Hierarchy Level</b>	[edit system login user <i>username</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a user's login class. You must configure one class for each user.
<b>Options</b>	<i>class-name</i> —One of the classes defined at the [edit system login class] hierarchy level.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Junos OS User Accounts on page 1213</a></li></ul>

## commit

<b>Syntax</b>	<pre> commit {   allow-transients;   direct-access;   file <i>filename</i> {     checksum (md5   sha-256   sha1) <i>hash</i>;     optional;     refresh;     refresh-from <i>url</i>;     sourceurl;   }   refresh;   refresh-from <i>url</i>;   traceoptions {     file &lt;<i>filename</i>&gt; &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i>;     no-remote-trace;   } } </pre>
<b>Hierarchy Level</b>	[edit system scripts]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, configure the commit-time scripting mechanism.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.

## compress-configuration-files (System)

---

<b>Syntax</b>	(compress-configuration-files   no-compress-configuration-files);
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Compress the current operational configuration file. The file is stored in the file <b>juniper.conf</b>, in the <b>/config</b> file system, along with the last three committed versions of the configuration. However, with large networks, the current configuration file might exceed the available space in the <b>/config</b> file system. Compressing the current configuration file allows the file to fit in the file system, typically reducing the size of the file by 90 percent. The current configuration file is compressed on the second commit of the configuration after the first commit is made to include the <b>compress-configuration-files</b> statement.</p>
	<div><p><b>NOTE:</b> We recommend that you enable compression of the configuration files to minimize the amount of disk space that they require.</p></div>
<b>Default</b>	The current operational configuration file is uncompressed.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Compressing the Current Configuration File on page 1117</a></li></ul>

## console (Physical Port)

<b>Syntax</b>	<pre>console {   disable;   insecure;   log-out-on-disconnect;   type <i>terminal-type</i>; }</pre>
<b>Hierarchy Level</b>	[edit system ports]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the characteristics of the console port.
<b>Default</b>	The console port is enabled and its speed is 9600 baud.
<b>Options</b>	<p><b>disable</b>—Disable console login connections.</p> <p><b>insecure</b>—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.</p> <p><b>log-out-on-disconnect</b>—Log out the session when the data carrier on the console port is lost.</p> <p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port: <b>ansi</b>, <b>vt100</b>, <b>small-xterm</b>, or <b>xterm</b>.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Console and Auxiliary Port Properties on page 5521</a></li> </ul>

## default-address-selection

---

<b>Syntax</b>	default-address-selection;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Use the loopback interface, <b>lo0</b>, as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as <b>fxp0</b>. The <b>lo0</b> interface is the interface to the switch's Routing Engine.</p>
<b>Default</b>	<p>The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:</p> <ul style="list-style-type: none"><li>• The primary address on the loopback interface <b>lo0</b> that is <i>not</i> <b>127.0.0.1</b> is used.</li><li>• The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.</li></ul> <p>By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.</p> <p>An interface's <i>primary address</i> is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's <i>preferred address</i> is the default local address used for packets sourced by the local switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.</p> <p>To configure a different primary address or preferred address, include the <b>primary</b> or <b>preferred</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] or [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] hierarchy levels.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets on page 129</a></li><li>• Junos® OS Network Interfaces</li></ul>

---

## deny-commands

---

<b>Syntax</b>	<code>deny-commands "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login class]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the <b>permissions</b> statement would allow their use.
<b>Default</b>	If you omit this statement and the <b>allow-commands</b> statement, users can issue only those commands for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	<b>admin</b> —To view this statement in the configuration. <b>admin-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Specifying Access Privileges for Junos OS Operational Mode Commands on page 153</a></li><li>• <a href="#">allow-commands on page 202</a></li><li>• <a href="#">user on page 276</a></li></ul>

## deny-configuration

---

<b>Syntax</b>	<code>deny-configuration "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login class]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Explicitly deny configuration access to the specified levels in the hierarchy even if the permissions set with the <b>permissions</b> statement grant such access by default.
<b>Default</b>	If you omit this statement and the <b>allow-configuration</b> statement, users can edit those levels in the configuration hierarchy for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Specifying Access Privileges Using allow/deny-configuration Statements</li><li>• <a href="#">allow-configuration on page 203</a></li><li>• <a href="#">user on page 276</a></li></ul>

## destination (Accounting)

```
Syntax destination {
    radius {
        server {
            server-address {
                accounting-port port-number;
                secret password;
                source-address address;
                retry number;
                timeout seconds;
            }
        }
    }
    tacplus {
        server {
            server-address {
                port port-number;
                secret password;
                single-connection;
                timeout seconds;
            }
        }
    }
}
```

**Hierarchy Level** [edit system accounting]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**radius** statement added in Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the authentication server.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

## destination-override

---

<b>Syntax</b>	<code>destination-override {   syslog host <i>ip-address</i>; }</code>
<b>Hierarchy Level</b>	[edit system tracing]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Override the system-wide configuration of the switch at the <b>[edit system tracing]</b> hierarchy level. This statement has no effect if system tracing is not configured.
<b>Options</b>	<b>syslog</b> —System process log files to send to the remote tracing host. <ul style="list-style-type: none"><li>• <b>syslog</b>—System process log files to send to the remote tracing host.</li><li>• <b>host <i>ip-address</i></b>—IP address to which to send tracing information.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Tracing and Logging Operations on page 5433</a></li><li>• <a href="#">tracing on page 274</a></li></ul>

## direct-access

---

<b>Syntax</b>	<code>direct-access;</code>
<b>Hierarchy Level</b>	[edit system scripts commit]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify that commit scripts read input configurations directly from the database when inspecting these scripts for errors.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## domain-name

---

<b>Syntax</b>	<code>domain-name <i>domain-name</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the name of the domain in which the switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.
<b>Options</b>	<i>domain-name</i> —Name of the domain.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Domain Name for the Router or Switch on page 124</a></li> <li>• <a href="#">Example: Configuring the Domain Name for the Router or Switch on page 157</a></li> </ul>

## domain-search

---

<b>Syntax</b>	<code>domain-search <i>domain-list</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a list of domains to be searched.
<b>Options</b>	<i>domain-list</i> —List of domain names to search. The list can contain up to 6 domain names, with a total of up to 256 characters.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains on page 124</a></li> </ul>

## explicit-priority

---

<b>Syntax</b>	<pre>explicit-priority {   archive &lt;files <i>number</i>&gt; &lt;size <i>size</i> &lt;start-time<i>time</i>&gt; &lt;transfer-interval     <i>interval</i>&gt;&lt;world-readable   no-world-readable&gt;;   archive-sites {     file://&lt;path&gt;/&lt;filename&gt;;     ftp://username@host:&lt;port&gt;url-path password password;     scp://username@host:&lt;port&gt;url-path password password;   }   structured-data {     brief;   } }</pre>
<b>Hierarchy Level</b>	[edit system syslog file <i>filename</i> ], [edit system syslog host]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.</p> <p>When the <b>structured-data</b> statement is also included at the <b>[edit system syslog file <i>filename</i>]</b> hierarchy level, this statement is ignored for the file.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Including Priority Information in System Log Messages on page 5557</a></li></ul>

## events

<b>Syntax</b>	<code>events [ <i>events</i> ];</code>
<b>Hierarchy Level</b>	[edit system accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the types of events to track and log.
<b>Options</b>	<p><b>events</b>—Event types; can be one or more of the following:</p> <ul style="list-style-type: none"> <li>• <b>change-log</b>—Audit configuration changes.</li> <li>• <b>interactive-commands</b>—Audit interactive commands (any command-line input).</li> <li>• <b>login</b>—Audit logins.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring TACACS+ System Accounting on page 1233</a></li> </ul>

## format

<b>Syntax</b>	<code>format (des   md5   sha1);</code>
<b>Hierarchy Level</b>	[edit system login password]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the authentication algorithm for plain-text passwords.
<b>Default</b>	For Junos OS, the default encryption format is <b>md5</b> . For Junos OS-FIPS software, the default encryption format is <b>sha1</b> .
<b>Options</b>	<p>The hash algorithm that authenticates the password can be one of three algorithms:</p> <ul style="list-style-type: none"> <li>• <b>des</b>—Has a block size of 8 bytes; its key size is 48 bits long.</li> <li>• <b>md5</b>—Produces a 128-bit digest.</li> <li>• <b>sha1</b>—Produces a 160-bit digest.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Special Requirements for Junos OS Plain-Text Passwords on page 1207</a></li> </ul>

## host-name

---

<b>Syntax</b>	<code>host-name <i>hostname</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the hostname of the switch.
<b>Options</b>	<i>hostname</i> —Name of the switch.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Hostname of the Router or Switch on page 125</a></li></ul>

## icmpv4-rate-limit

---

<b>Syntax</b>	<code>icmpv4-rate-limit {     bucket-size <i>seconds</i>;     packet-rate <i>pps</i>; }</code>
<b>Hierarchy Level</b>	[edit system internet-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure rate-limiting parameters for ICMPv4 messages sent.
<b>Options</b>	<b>bucket-size <i>seconds</i></b> —Number of seconds in the rate-limiting bucket. <b>Range:</b> 0 through 4294967295 seconds <b>Default:</b> 5  <b>packet-rate <i>pps</i></b> —Rate-limiting packets earned per second. <b>Range:</b> 0 through 4294967295 pps <b>Default:</b> 1000
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• ping</li><li>• Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages</li><li>• Configuring the Junos OS ICMPv6 Rate Limit for ICMPv6 Routing Engine Messages</li></ul>

## idle-timeout

<b>Syntax</b>	<code>idle-timeout <i>minutes</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system login class <i>class-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For a login class, configure the maximum time that a session can be idle before the user is logged off the switch. The session times out after remaining at the CLI operational mode prompt for the specified time.
<b>Default</b>	If you omit this statement, a user is never forced off the system after extended idle times.
<b>Options</b>	<i>minutes</i> —Maximum idle time. <b>Range:</b> 0 through 4294967295 minutes
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Timeout Value for Idle Login Sessions on page 137</a></li> </ul>

## internet-options

<b>Syntax</b>	<pre>internet-options {     icmpv4-rate-limit bucket-size <i>bucket-size</i> packet-rate <i>packet-rate</i>;     source-port upper-limit <i>upper-limit</i>; }</pre>
<b>Hierarchy Level</b>	<code>[edit system]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure system IP options to protect against certain types of denial-of-service (DoS) attacks.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages on page 129</a></li> <li>• <a href="#">Configuring the Junos OS to Extend the Default Port Address Range on page 128</a></li> </ul>

## load-key-file

---

<b>Syntax</b>	<code>load-key-file URL filename;</code>
<b>Hierarchy Level</b>	[edit system root-authentication], [edit system login user <i>username</i> authentication]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Load RSA (SSH version 1 and SSH version 2) and DSA or ECDSA (SSH version 2) public keys from a previously-generated named file at a specified URL location. The file contains one or more SSH keys that are copied into the configuration when the command is issued.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring the Root Password</li><li>• <a href="#">Configuring the Root Password on page 1222</a></li><li>• Configuring Junos OS User Accounts</li><li>• <a href="#">Configuring Junos OS User Accounts on page 1213</a></li></ul>

## location

<b>Syntax</b>	<pre>location {   altitude <i>feet</i>;   building <i>name</i>;   country-code <i>code</i>;   floor <i>number</i>;   hcoord <i>horizontal-coordinate</i>;   lata <i>service-area</i>;   latitude <i>degrees</i>;   longitude <i>degrees</i>;   npa-nxx <i>number</i>;   postal-code <i>postal-code</i>;   rack <i>number</i>;   vcoord <i>vertical-coordinate</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the system location.
<b>Options</b>	<p><b>altitude <i>feet</i></b>—Number of feet above sea level.</p> <p><b>building <i>name</i></b>—Name of the building. The name of the building can be 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").</p> <p><b>country-code <i>code</i></b>—Two-letter country code.</p> <p><b>floor <i>number</i></b>—Floor in the building.</p> <p><b>hcoord <i>horizontal-coordinate</i></b>—Bellcore Horizontal Coordinate.</p> <p><b>lata <i>service-area</i></b>—Long-distance service area.</p> <p><b>latitude <i>degrees</i></b>—Latitude in degree format.</p> <p><b>longitude <i>degrees</i></b>—Longitude in degree format.</p> <p><b>npa-nxx <i>number</i></b>—First six digits of the phone number (area code and exchange).</p> <p><b>postal-code <i>postal-code</i></b>—Postal code.</p> <p><b>rack <i>number</i></b>—Rack number.</p> <p><b>vcoord <i>vertical-coordinate</i></b>—Bellcore Vertical Coordinate.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Specifying the Physical Location of the Switch on page 134</a></li> </ul>

## login

```
Syntax login {
    announcement text;
    class class-name {
        access-end "regular-expression";
        access-start "regular-expression";
        allow-commands "regular-expression";
        allow-configuration "regular-expression";
        deny-commands "regular-expression";
        deny-configuration "regular-expression";
        idle-timeout minutes;
        login-tip;
        permissions [ permissions ];
    }
    message text;
    password {
        change-type (set-transitions | character-set);
        format (md5 | sha1 | des);
        maximum-length length;
        minimum-changes number;
        minimum-length length;
    }
    retry-options {
        backoff-factor seconds;
        backoff-threshold number;
        minimum-time seconds;
        tries-before-disconnect number;
    }
    user username {
        authentication authentication;
        (encrypted-password "password" | plain-text-password);
        load-key-file URL;
        remote-debug-permission (qfabric-admin | qfabric-operator | qfabric-user);
        ssh-dsa "public-key";
        ssh-rsa "public-key";
    }
    class class-name;
    full-name complete-name;
    uid uid-value;
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure user access to the switch.

**Options** The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.

## login-alarms

---

<b>Syntax</b>	login-alarms;
<b>Hierarchy Level</b>	[edit system login class <i>class-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Show system alarms automatically when an <b>admin</b> user logs in to the router or switch.
<b>Options</b>	<i>class-name</i> —Login class name.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring System Alarms to Appear Automatically Upon Login on page 136</a></li> </ul>

## login-tip

---

<b>Syntax</b>	login-tip;
<b>Hierarchy Level</b>	[edit system login class <i>class-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Enable CLI tips at login.
<b>Default</b>	Disabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring CLI Tips on page 48</a></li> </ul>

## max-configurations-on-flash

---

<b>Syntax</b>	max-configurations-on-flash <i>number</i> ;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the number of configurations stored on the internal fixed media storage (for example, USB device).
<b>Options</b>	<i>number</i> —The number of configurations stored on the CompactFlash card. <b>Range:</b> 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## maximum-length

---

<b>Syntax</b>	maximum-length <i>length</i> ;
<b>Hierarchy Level</b>	[edit system login passwords]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the maximum number of characters allowed in plain-text passwords. Newly created passwords must meet this requirement.
<b>Default</b>	For Junos OS-FIPS software, the maximum number of characters for plain-text passwords is 20. For Junos OS, no maximum is set.
<b>Options</b>	<i>length</i> —Maximum number of characters the password can include. <b>Range:</b> 1 to 64 characters
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Special Requirements for Junos OS Plain-Text Passwords on page 1207</a></li><li>• <a href="#">minimum-length on page 236</a></li></ul>

## message

---

<b>Syntax</b>	<code>message text;</code>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a system login message. This message appears before a user logs in.
<b>Options</b>	<i>text</i> —Text of the message.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Display a System Login Message on page 127</a></li> <li>• <a href="#">announcement on page 204</a></li> </ul>

## minimum-changes

---

<b>Syntax</b>	<code>minimum-changes number;</code>
<b>Hierarchy Level</b>	[edit system login passwords]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement is used in combination with the <b>change-type</b> statement. If the change type is <b>character-sets</b>, then the number of character sets included in the password is checked against the specified minimum. If the change type is <b>set-transitions</b>, then the number of character set changes in the password is checked against the specified minimum.</p>
<b>Default</b>	For Junos OS, the minimum number of changes is 1. For Junos-FIPS software, the minimum number of changes is 3.
<b>Options</b>	<i>number</i> —Minimum number of character sets (or character set changes) required for the password.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Special Requirements for Junos OS Plain-Text Passwords on page 1207</a></li> <li>• <a href="#">change-type on page 213</a></li> </ul>

## minimum-length

---

<b>Syntax</b>	minimum-length <i>length</i> ;
<b>Hierarchy Level</b>	[edit system login password]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.
<b>Default</b>	For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.
<b>Options</b>	<b>length</b> —Minimum number of characters the password must include. <b>Range:</b> 6 to 20 characters
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Special Requirements for Junos OS Plain-Text Passwords on page 1207</a></li><li>• <a href="#">maximum-length on page 234</a></li></ul>

## multicast-client

---

<b>Syntax</b>	multicast-client < <i>address</i> >;
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Network Time Protocol (NTP), configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet.
<b>Options</b>	<b>address</b> —(Optional) One or more IP addresses. If you specify addresses, the router or switch joins those multicast groups. <b>Default:</b> 224.0.1.1.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Router or Switch to Listen for Multicast Messages Using NTP on page 135</a></li></ul>

---

## name-server

---

<b>Syntax</b>	<code>name-server {     <i>address</i>; }</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure one or more Domain Name System (DNS) name servers.
<b>Options</b>	<i>address</i> —Address of the name server. To configure multiple name servers, include multiple <i>address</i> options.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## no-multicast-echo

```
Syntax  no-multicast-echo {
        arp {
            aging-timer minutes;
            gratuitous-arp-delay seconds;
            gratuitous-arp-on-ifup;
            interfaces {
                interface-name {
                    aging-timer minutes;
                }
            }
            passive-learning;
            purging;
        }
        host-name hostname;
        location {
            altitude feet;
            building name;
            country-code code;
            floor number;
            hcoord horizontal-coordinate;
            lata service-area;
            latitude degrees;
            longitude degrees;
            npa-nxx number;
            postal-code postal-code;
            rack number;
            vcoord vertical-coordinate;
        }
        license {
            autoupdate URL;
        }
        renew before-expiration (number | interval number)
    }
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 8.1.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses.

**Default** The Routing Engine responds to ICMP echo requests sent to multicast group addresses.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

|------------------------------|---|

## no-ping-record-route

---

<b>Syntax</b>	no-ping-record-route;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Junos OS to disable the reporting of the IP address in ping responses.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 126</a></li> </ul>

## no-ping-time-stamp

---

<b>Syntax</b>	no-ping-time-stamp;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Junos OS to disable the recording of timestamps in ping responses.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 126</a></li> </ul>

## no-redirects (IPv4 Traffic)

---

<b>Syntax</b>	no-redirects;
<b>Hierarchy Level</b>	[edit system], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for EX Series switches.
<b>Description</b>	<p>Stop protocol redirect messages for IPv4 traffic from being sent on the entire switch or on an interface on the router or switch.</p> <p>To disable the sending of protocol redirect messages for the entire router or switch, include the <b>no-redirects</b> statement at the [edit system] hierarchy level.</p> <p>To disable the sending of protocol redirect messages on a specific interface, include the <b>no-redirects</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>] hierarchy level.</p>
<b>Default</b>	The router or switch sends redirect messages.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch on page 126</a></li><li>• Understanding the Protocol Redirect Mechanism on EX Series Switches</li><li>• Configuring the Junos OS to Disable Sending Protocol Redirect Messages on EX-Series Switches (CLI Procedure)</li><li>• Junos® OS Network Interfaces</li></ul>

## ntp

<b>Syntax</b>	<pre>ntp {   authentication-key <i>number</i> type <i>type</i> value <i>password</i>;   boot-server <i>address</i>;   broadcast &lt;<i>address</i>&gt; &lt;<i>key key-number</i>&gt; &lt;<i>version value</i>&gt; &lt;<i>ttl value</i>&gt;;   broadcast-client;   multicast-client &lt;<i>address</i>&gt;;   peer <i>address</i> &lt;<i>key key-number</i>&gt; &lt;<i>version value</i>&gt; &lt;<i>prefer</i>&gt;;   server <i>address</i> &lt;<i>key key-number</i>&gt; &lt;<i>version value</i>&gt; &lt;<i>prefer</i>&gt;;   source-address <i>source-address</i>;   trusted-key [ <i>key-numbers</i> ]; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure Network Time Protocol (NTP) on the switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Synchronizing and Coordinating Time Distribution Using NTP on page 155</a></li> </ul>

## ntp (QFabric)

<b>Syntax</b>	<pre>ntp {   authentication-key <i>number</i> type <i>type</i> value <i>password</i>;   server <i>address</i> &lt;<i>key key-number</i>&gt; &lt;<i>version value</i>&gt; &lt;<i>prefer</i>&gt;; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure Network Time Protocol (NTP) on the switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring NTP Authentication Keys (QFabric System) on page 130</a></li> <li>• <a href="#">Configuring the NTP Time Server and Time Services (QFabric System) on page 133</a></li> <li>• <a href="#">authentication-key on page 208</a></li> <li>• <a href="#">server on page 253</a></li> </ul>

## optional

---

<b>Syntax</b>	optional;
<b>Hierarchy Level</b>	[edit system scripts commit file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the <b>file</b> statement is missing from the <b>/var/db/scripts/commit</b> directory on the router.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Controlling Execution of Commit Scripts During Commit Operations</li></ul>

## password (Login)

---

<b>Syntax</b>	<pre>password {   change-type (set-transitions   character-set);   format (md5   sha1   des);   maximum-length <i>length</i>;   minimum-changes <i>number</i>;   minimum-length <i>length</i>; }</pre>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li><a href="#">Special Requirements for Junos OS Plain-Text Passwords on page 1207</a></li></ul>

## peer

---

<b>Syntax</b>	<code>peer address &lt;key key-number&gt; &lt;version value&gt; &lt;prefer&gt;;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.
<b>Options</b>	<p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the NTP Time Server and Time Services on page 131</a></li> </ul>

## permissions

---

<b>Syntax</b>	<pre>permissions {     storage;     storage-control; }</pre>
<b>Hierarchy Level</b>	[edit system login class]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the login access privileges to be provided on the switch.
<b>Options</b>	<i>permissions</i> —Privilege type.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Access Privilege Levels on page 1212</a></li><li>• <a href="#">Table 88 on page 1192</a></li><li>• <a href="#">user on page 276</a></li></ul>

## port (TACACS+ Server)

---

<b>Syntax</b>	<pre>port <i>port-number</i>;</pre>
<b>Hierarchy Level</b>	[edit system accounting destination tacplus server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the port number on which to contact the TACACS+ server.
<b>Options</b>	<i>number</i> —Port number on which to contact the TACACS+ server. <b>Default:</b> 49
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring TACACS+ System Accounting on page 1233</a></li></ul>

## ports

<b>Syntax</b>	<pre> ports {   auxiliary {     disable;     insecure;     type <i>terminal-type</i>;   }   console {     disable;     insecure;     log-out-on-disconnect;     type <i>terminal-type</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the properties of the console and auxiliary ports. The ports are located on the craft interface.</p> <p>See the switch hardware documentation for port locations.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Console and Auxiliary Port Properties on page 5521</a></li> </ul>

## radius (System)

---

<b>Syntax</b>	<pre>radius {   server {     server-address {       accounting-port <i>port-number</i>;       secret <i>password</i>;       source-address <i>address</i>;       retry <i>number</i>;       timeout <i>seconds</i>;     }   } }</pre>
<b>Hierarchy Level</b>	[edit system accounting destination]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the RADIUS accounting server.
<b>Options</b>	<b><i>server-address</i></b> —Address of the RADIUS accounting server.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring RADIUS System Accounting</li></ul>

## refresh (Commit Scripts)

---

<b>Syntax</b>	<code>refresh;</code>
<b>Hierarchy Level</b>	<code>[edit system scripts commit],</code> <code>[edit system scripts file <i>filename</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at the source URL, as specified in the <b>source</b> statement at the same hierarchy level.
<b>Required Privilege Level</b>	<code>maintenance</code> —To view this statement in the configuration. <code>maintenance-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">refresh-from on page 247</a></li> <li>• <a href="#">source on page 255</a></li> </ul>

## refresh-from (Commit Scripts)

---

<b>Syntax</b>	<code>refresh-from url;</code>
<b>Hierarchy Level</b>	<code>[edit system scripts commit],</code> <code>[edit system scripts commit file <i>filename</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at a URL other than the URL specified in the <b>source</b> statement.
<b>Options</b>	<b>url</b> —The source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.
<b>Required Privilege Level</b>	<code>maintenance</code> —To view this statement in the configuration. <code>maintenance-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">refresh on page 247</a></li> <li>• <a href="#">source on page 255</a></li> </ul>

## retry

---

<b>Syntax</b>	<code>retry number;</code>
<b>Hierarchy Level</b>	[edit system radius server <i>server-address</i> ], [edit system accounting destination radius server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.
<b>Options</b>	<i>number</i> —Number of retries allowed for contacting a RADIUS server. <b>Range:</b> 1 through 10 <b>Default:</b> 3
<div> <b>NOTE:</b> The [edit system accounting] hierarchy is not available on QFabric systems.</div>	
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Authentication on page 1219</a></li><li>• <a href="#">Configuring RADIUS Accounting on page 1217</a></li><li>• <a href="#">timeout on page 269</a></li></ul>

## retry-options

<b>Syntax</b>	<pre> retry-options {   backoff-threshold <i>number</i>;   backoff-factor <i>seconds</i>;   maximum-time <i>seconds</i>;   minimum-time <i>seconds</i>;   tries-before-disconnect <i>number</i>; } </pre>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.
<b>Options</b>	<p><b>backoff-threshold <i>number</i></b>—Threshold for the number of failed login attempts before the user experiences a delay when attempting to reenter a password. Use the <b>backoff-factor</b> option to specify the length of delay, in seconds.</p> <p><b>Range:</b> 1 through 3</p> <p><b>Default:</b> 2</p> <p><b>backoff-factor <i>seconds</i></b>—Length of delay after each failed login attempt. The length of delay increases by this value for each subsequent login attempt after the value specified in the <b>backoff-threshold</b> option.</p> <p><b>Range:</b> 5 through 10</p> <p><b>Default:</b> 5</p> <p><b>maximum-time <i>seconds</i></b>—Maximum length of time that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured <b>maximum-time</b>, the connection is closed.</p> <p><b>Range:</b> 20 through 300</p> <p><b>Default:</b> 120</p> <p><b>minimum-time <i>seconds</i></b>—Minimum length of time that the connection remains open while the user is attempting to enter a password to log in.</p> <p><b>Range:</b> 20 through 60</p> <p><b>Default:</b> 20</p> <p><b>tries-before-disconnect <i>number</i></b>—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.</p> <p><b>Range:</b> 1 through 10</p> <p><b>Default:</b> 10</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

- Related Documentation**

---

## root-authentication

---

<b>Syntax</b>	<pre>root-authentication {     (encrypted-password "<i>password</i>"   load-key-password <i>URL</i>   plain-text-password);     ssh-dsa "<i>public-key</i>";     ssh-rsa "<i>public-key</i>"; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the authentication methods for the root-level user, whose username is <b>root</b> .
<b>Options</b>	<p><b>encrypted-password "<i>password</i>"</b>— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for the <b>encrypted-password</b> option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>plain-text-password</b>—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p> <p><b>ssh-dsa "<i>public-key</i>"</b>—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.</p> <p><b>ssh-rsa "<i>public-key</i>"</b>—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Root Password on page 1222</a></li><li>• <a href="#">authentication on page 207</a></li></ul>

## saved-core-context

---

<b>Syntax</b>	(saved-core-context   no-saved-core-context);
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure whether the switch saves core files generated by internal Junos OS processes, along with contextual information (system log files and a copy of the current configuration):</p> <ul style="list-style-type: none"> <li>• <b>saved-core-context</b>—The switch saves each core file and its associated context in a compressed tar file named <code>/var/tmp/process-name.core.core-number.tgz</code>.</li> <li>• <b>no-saved-core-context</b>—The switch does not save core files and their associated context.</li> </ul>
<b>Default</b>	The switch saves core files.
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Saving Core Files from Junos OS Processes</li> <li>• <a href="#">saved-core-files on page 251</a></li> </ul>

## saved-core-files

---

<b>Syntax</b>	saved-core-files <i>number</i> ;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Save core files generated by internal Junos OS processes, but not the associated contextual information (configuration and system log files).
<b>Options</b>	<p><i>number</i>—Maximum number of core files to save.</p> <p><b>Range:</b> 1 through 10</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Saving Core Files from Junos OS Processes</li> <li>• <a href="#">saved-core-context on page 251</a></li> </ul>

## secret

---

<b>Syntax</b>	<code>secret <i>password</i>;</code>
<b>Hierarchy Level</b>	[edit system accounting destination radius server <i>server-address</i> ], [edit system accounting destination tacplus server <i>server-address</i> ], [edit system radius-server <i>server-address</i> ], [edit system tacplus-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the password to use with the RADIUS or TACACS+ server. The secret password used by the local switch must match that used by the server.
<b>Options</b>	<i>password</i> —Password to use; can include spaces included in quotation marks.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Accounting on page 1217</a></li><li>• <a href="#">Configuring RADIUS Authentication on page 1219</a></li><li>• <a href="#">Configuring TACACS+ Authentication on page 1231</a></li><li>• <a href="#">Configuring TACACS+ System Accounting on page 1233</a></li></ul>

## server (NTP)

---

<b>Syntax</b>	<code>server address &lt;key key-number&gt; &lt;version value&gt; &lt;prefer&gt;;</code>
<b>Hierarchy Level</b>	[edit system ntp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For NTP, configure the switch to operate in client mode with the remote system at the specified server address. In this mode, the local switch can be synchronized with the remote system, but the remote system can never be synchronized with the local switch.
<b>Options</b>	<p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">ntp on page 241</a></li> </ul>

## server (RADIUS Accounting)

---

<b>Syntax</b>	<pre>server {   server-address {     accounting-port port-number;     retry number     secret password;     source-address address;     timeout seconds;   } }</pre>
<b>Hierarchy Level</b>	[edit system accounting destination radius]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure RADIUS logging.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS System Accounting</a></li></ul>

## server (TACACS+ Accounting)

---

<b>Syntax</b>	<pre>server {   server-address {     port port-number;     secret password;     single-connection;     timeout seconds;   } }</pre>
<b>Hierarchy Level</b>	[edit system accounting destination tacplus]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure TACACS+ logging.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring TACACS+ System Accounting on page 1233</a></li></ul>

## single-connection

---

<b>Syntax</b>	single-connection;
<b>Hierarchy Level</b>	[edit system accounting destination tacplus server <i>server-address</i> ], [edit system tacplus <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring TACACS+ Authentication on page 1231</a></li> <li>• <a href="#">Configuring TACACS+ System Accounting on page 1233</a></li> </ul>

## source (Commit Scripts)

---

<b>Syntax</b>	source <i>url</i> ;
<b>Hierarchy Level</b>	[edit system scripts commit file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series .
<b>Description</b>	For Junos OS commit scripts, specify the location of the source file for an enabled script located in the <code>/var/db/scripts/commit</code> directory. When you include the <b>refresh</b> statement at the same hierarchy level and commit the configuration, the local copy is overwritten by the version stored at the specified URL.
<b>Options</b>	<i>url</i> —The source specified as an HTTP URL, FTP URL, or scp-style remote file specification.
<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.

## source-address (NTP, RADIUS, System Logging, or TACACS+)

---

<b>Syntax</b>	<code>source-address <i>source-address</i>;</code>
<b>Hierarchy Level</b>	[edit system accounting destination radius server <i>server-address</i> ], [edit system accounting destination tacplus server <i>server-address</i> ], [edit system ntp], [edit system radius-server <i>server-address</i> ], [edit system syslog], [edit system tacplus-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine.
<b>Options</b>	<b><i>source-address</i></b> —Valid IP address configured on one of the switch interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all <b>host <i>hostname</i></b> statements at the [edit system syslog] hierarchy level.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Authentication on page 1219</a></li><li>• <a href="#">Synchronizing and Coordinating Time Distribution Using NTP on page 155</a></li><li>• <a href="#">Specifying an Alternative Source Address for System Log Messages</a></li></ul>

## source-port (Port Addresses)

---

<b>Syntax</b>	<code>source-port upper-limit &lt;<i>upper-limit</i>&gt;;</code>
<b>Hierarchy Level</b>	[edit system internet-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the range of port addresses.
<b>Options</b>	<b><i>upper-limit upper-limit</i></b> —(Optional) The range of port addresses and can be a value from 5000 through 65,355.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Extend the Default Port Address Range on page 128</a></li></ul>

## static-host-mapping

<b>Syntax</b>	<pre>static-host-mapping {     hostname {         alias [ <i>alias</i> ];         inet [ <i>address</i> ];         sysid <i>system-identifier</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).
<b>Options</b>	<p><b>alias <i>alias</i></b>—Alias for the hostname.</p> <p><b>hostname</b>—Fully qualified hostname.</p> <p><b>inet <i>address</i></b>—IP address. You can specify one or more IP addresses for the host.</p> <p><b>sysid <i>system-identifier</i></b>—ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address 208.197.169.18 is 2081.9716.9018 in BCD.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Hostname of the Router or Switch on page 125</a></li> </ul>

## structured-data

---

<b>Syntax</b>	structured-data { brief; }
<b>Hierarchy Level</b>	[edit system syslog file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, <i>The syslog Protocol</i> ( <a href="http://tools.ietf.org/html/draft-ietf-syslog-protocol-23">http://tools.ietf.org/html/draft-ietf-syslog-protocol-23</a> ).
<div> <b>NOTE:</b> When this statement is included, other statements that specify the format for messages written to the file are ignored (the <code>explicit-priority</code> statement at the [edit system syslog file <i>filename</i>] hierarchy level and the <code>time-format</code> statement at the [edit system syslog] hierarchy level).</div>	
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Logging Messages in Structured-Data Format</li><li><a href="#">explicit-priority on page 226</a></li><li><a href="#">time-format on page 268</a></li></ul>

## syslog (System)

```

Syntax  syslog {
        archive {
            (binary-data| no-binary-data);
            files number;
            size maximum-file-size;
            start-time "YYYY-MM-DD.hh:mm";
            transfer-interval minutes;
            (world-readable | no-world-readable);
        }
        console {
            facility severity;
        }
        file filename {
            facility severity;
            explicit-priority;
            match "regular-expression";
            archive {
                (binary-data| no-binary-data);
                files number;
                size maximum-file-size;
                start-time "YYYY-MM-DD.hh:mm";
                transfer-interval minutes;
                (world-readable | no-world-readable);
            }
            structured-data {
                brief;
            }
        }
        host (hostname | other-routing-engine | scc-master) {
            facility severity;
            explicit-priority;
            facility-override facility;
            log-prefix string;
            match "regular-expression";
            source-address source-address;
            structured-data {
                brief;
            }
            port port number;
        }
        log-rotate-frequency frequency;
        source-address source-address;
        time-format (millisecond | year | year millisecond);
        user (username | *) {
            facility severity;
            match "regular-expression";
        }
    }

```

**Hierarchy Level** [edit logical-systems *logical-system-name* system],  
[edit system]

<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Support at the <b>[edit logical-systems <i>logical-system-name</i> system]</b> hierarchy level introduced in Junos OS Release 11.4.
<b>Description</b>	Configure the types of system log messages to log to files, a remote destination, user terminals, or the system console.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Junos OS System Log Configuration Overview</li><li>• <i>Junos OS System Log Messages Reference</i></li><li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 5505</a></li></ul>

Hierarchy Level [\[edit\]](#)

<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure system management properties.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

---

## tacplus

---

**Syntax**

```
tacplus {  
  server {  
    server-address {  
      port port-number;  
      secret password;  
      single-connection;  
      timeout seconds;  
    }  
  }  
}
```

**Hierarchy Level** [edit system accounting destination]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure TACACS+.

**Options** *server-address*—Address of the TACACS+ authentication server.  
  
The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

---

## tacplus-server

---

<b>Syntax</b>	<pre>tacplus-server <i>server-address</i> {     port     secret <i>password</i>;     single-connection;     source-address <i>source-address</i>;     timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the TACACS+ server.
<b>Options</b>	<p><b><i>server-address</i></b>—Address of the TACACS+ authentication server.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring TACACS+ Authentication on page 1231</a></li></ul>

## time-format

---

<b>Syntax</b>	time-format (year   millisecond   year millisecond);
<b>Hierarchy Level</b>	[edit system syslog]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a <b>file</b> , <b>console</b> , or <b>user</b> statement at the [edit system syslog] hierarchy level, but not to destinations configured by a <b>host</b> statement.
<b>Default</b>	The timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, <b>Aug 21 12:36:30</b> .
<div> <b>NOTE:</b> When the structured-data statement is included at the [edit system syslog file <i>filename</i>] hierarchy level, this statement is ignored for the file.</div>	
<b>Options</b>	<b>millisecond</b> —Include the millisecond in the timestamp. <b>year</b> —Include the year in the timestamp.
<b>Required Privilege Level</b>	<b>system</b> —To view this statement in the configuration. <b>system-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Including the Year or Millisecond in Timestamps on page 142</a></li><li>• <a href="#">structured-data on page 258</a></li></ul>

## timeout

---

<b>Syntax</b>	<code>timeout seconds;</code>
<b>Hierarchy Level</b>	[edit system radius-server <i>server-address</i> ], [edit system tacplus-server <i>server-address</i> ], [edit system accounting destination radius server <i>server-address</i> ], [edit system accounting destination tacplus server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the length of time that the local router or switch waits to receive a response from a RADIUS or TACACS+ server.
<b>Options</b>	<b>seconds</b> —Length of time to wait. <b>Range:</b> 1 through 90 seconds <b>Default:</b> 3 seconds
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Accounting on page 1217</a></li> <li>• <a href="#">Configuring TACACS+ System Accounting on page 1233</a></li> <li>• <a href="#">retry on page 248</a></li> </ul>

## time-zone

<b>Syntax</b>	<code>time-zone (GMT <i>hour-offset</i>   <i>time-zone</i>);</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the local time zone. To have the time zone change take effect for all processes running on the switch, you must reboot the switch.
<b>Default</b>	UTC
<b>Options</b>	<p><b>GMT <i>hour-offset</i></b>—Set the time zone relative to UTC time.</p> <p><b>Range:</b> -14 through +12</p> <p><b>Default:</b> 0</p> <p><b><i>time-zone</i></b>—Specify the time zone as <b>UTC</b>, which is the default time zone, or as a string such as PDT (Pacific Daylight Time), or use one of the following continents and major cities:</p> <p>Africa/Abidjan, Africa/Accra, Africa/Addis_Ababa, Africa/Algiers, Africa/Asmera, Africa/Bamako, Africa/Bangui, Africa/Banjul, Africa/Bissau, Africa/Blantyre, Africa/Brazzaville, Africa/Bujumbura, Africa/Cairo, Africa/Casablanca, Africa/Ceuta, Africa/Conakry, Africa/Dakar, Africa/Dar_es_Salaam, Africa/Djibouti, Africa/Douala, Africa/El_Aaiun, Africa/Freetown, Africa/Gaborone, Africa/Harare, Africa/Johannesburg, Africa/Kampala, Africa/Khartoum, Africa/Kigali, Africa/Kinshasa, Africa/Lagos, Africa/Libreville, Africa/Lome, Africa/Luanda, Africa/Lubumbashi, Africa/Lusaka, Africa/Malabo, Africa/Maputo, Africa/Maseru, Africa/Mbabane, Africa/Mogadishu, Africa/Monrovia, Africa/Nairobi, Africa/Ndjamena, Africa/Niamey, Africa/Nouakchott, Africa/Ouagadougou, Africa/Porto-Novo, Africa/Sao_Tome, Africa/Timbuktu, Africa/Tripoli, Africa/Tunis, Africa/Windhoek</p> <p>America/Adak, America/Anchorage, America/Anguilla, America/Antigua, America/Aruba, America/Asuncion, America/Barbados, America/Belize, America/Bogota, America/Boise, America/Buenos_Aires, America/Caracas, America/Catamarca, America/Cayenne, America/Cayman, America/Chicago, America/Cordoba, America/Costa_Rica, America/Cuiaba, America/Curacao, America/Dawson, America/Dawson_Creek, America/Denver, America/Detroit, America/Dominica, America/Edmonton, America/El_Salvador, America/Ensenada, America/Fortaleza, America/Glace_Bay, America/Godthab, America/Goose_Bay, America/Grand_Turk, America/Grenada, America/Guadeloupe, America/Guatemala, America/Guayaquil, America/Guyana, America/Halifax, America/Havana, America/Indiana/Knox, America/Indiana/Marengo, America/Indiana/Vevay, America/Indianapolis, America/Inuvik, America/Iqaluit, America/Jamaica, America/Jujuy, America/Juneau, America/La_Paz, America/Lima, America/Los_Angeles, America/Louisville, America/Maceio, America/Managua, America/Manaus, America/Martinique, America/Mazatlan, America/Mendoza, America/Menominee, America/Mexico_City, America/Miquelon, America/Montevideo, America/Montreal, America/Montserrat, America/Nassau, America/New_York, America/Nipigon, America/Nome, America/Noronha, America/Panama, America/Pangnirtung, America/Paramaribo, America/Phoenix, America/Port-au-Prince, America/Port_of_Spain, America/Porto_Acre, America/Puerto_Rico, America/Rainy_River, America/Rankin_Inlet, America/Regina, America/Rosario, America/Santiago,</p>

## traceoptions (Commit Scripts)

---

Syntax	<pre>traceoptions {     file &lt;filename&gt; &lt;files number&gt; &lt;size size&gt; &lt;world-readable   no-world-readable&gt;;     flag flag;     no-remote-trace; }</pre>
Hierarchy Level	[edit system scripts commit],
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define tracing operations for commit or op scripts.
Default	If you do not include this statement, no script-specific tracing operations are performed.
Options	<p><b>filename</b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>. By default, commit script process tracing output is placed in the file <code>cscript.log</code> and op script process tracing is placed in the file <code>op-script.log</code>. If you include the <b>file</b> statement, you must specify a filename. To retain the default, you can specify <code>cscript.log</code> or <code>op-script.log</code> as the filename.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed and compressed to <i>trace-file.0.gz</i>. When <i>trace-file</i> again reaches its maximum size, <i>trace-file.0.gz</i> is renamed <i>trace-file.1.gz</i> and <i>trace-file</i> is renamed and compressed to <i>trace-file.0.gz</i>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Log all operations</li><li>• <b>events</b>—Log important events</li><li>• <b>input</b>—Log script input data</li><li>• <b>offline</b>—Generate data for offline development</li><li>• <b>output</b>—Log script output data</li><li>• <b>rpc</b>—Log script RPCs</li><li>• <b>xslt</b>—Log the XSLT library</li></ul> <p><b>no-world-readable</b>—Restrict file access to owner. This is the default.</p>

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed and compressed to **trace-file.0.gz**. When **trace-file** again reaches its maximum size, **trace-file.0.gz** is renamed **trace-file.1.gz** and **trace-file** is renamed and compressed to **trace-file.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—Enable unrestricted file access.

<b>Required Privilege Level</b>	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Tracing Commit Script Processing</li> </ul>

## tracing

---

<b>Syntax</b>	<pre>tracing {     destination-override syslog host <i>ip-address</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the switch to enable remote tracing to a specified host IP address.
	<div> <b>NOTE:</b> The <code>tracing</code> statement is not supported on the QFX3000 QFabric system.</div>
	<p>The following processes are supported:</p> <ul style="list-style-type: none"><li>• <b>chassisd</b>—Chassis-control process</li><li>• <b>eventd</b>—Event-processing process</li><li>• <b>cosd</b>—Class-of-service process</li></ul> <p>If you enabled remote tracing but wish to disable it for specific processes on the switch, use the <b>no-remote-trace</b> statement at the [edit system <i>process-name</i> traceoptions] hierarchy level.</p>
<b>Default</b>	Remote tracing is disabled by default.
<b>Options</b>	<b>destination-override syslog host <i>ip-address</i></b> —Overrides the global configuration for system tracing and has no effect if the <b>tracing</b> statement is not configured.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Tracing and Logging Operations on page 5433</a></li><li>• <a href="#">destination-override on page 224</a></li></ul>

## trusted-key

---

<b>Syntax</b>	<code>trusted-key [ <i>key-numbers</i> ];</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For NTP, configure the keys to use when you configure the switch to synchronize its time with other systems on the network.
<b>Options</b>	<i>key-numbers</i> —One or more key numbers. Each key can be any 32-bit unsigned integer except 0.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring NTP Authentication Keys on page 129</a></li> <li>• authentication-key</li> <li>• <a href="#">server on page 253</a></li> </ul>

## uid

---

<b>Syntax</b>	<code>uid <i>uid-value</i>;</code>
<b>Hierarchy Level</b>	[edit system login user]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a user identifier for a login account.
<b>Options</b>	<i>uid-value</i> —Number associated with the login account. This value must be unique on the router or switch. <b>Range:</b> 100 through 64000
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS User Accounts on page 1213</a></li> </ul>

## use-imported-time-zones

---

<b>Syntax</b>	use-imported-time-zones;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a custom time zone from a locally generated time zone database.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Setting a Custom Time Zone on Routers or Switches Running Junos OS on page 150</a></li></ul>

## user (Access)

---

<b>Syntax</b>	<pre>user username {   authentication {     (encrypted-password "password"   plain-text-password);     load-key-file URL;     remote-debug-permission (qfabric-admin   qfabric-operator   qfabric-user);     ssh-dsa "public-key" &lt;from hostname&gt;;     ssh-rsa "public-key" &lt;from hostname&gt;;   }   class class-name;   full-name "complete-name";   uid uid-value; }</pre>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure access permission for individual users.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Junos OS User Accounts on page 1213</a></li><li>• <a href="#">class on page 215</a></li></ul>

## CHAPTER 6

# Administration

- [Routine Monitoring on page 277](#)
- [Operational Commands on page 280](#)

### Routine Monitoring

---

- [Monitoring System Process Information on page 277](#)
- [Monitoring System Properties on page 278](#)
- [Monitoring Interface Status and Traffic on page 279](#)
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 280](#)

### Monitoring System Process Information

**Purpose** View the processes running on the QFX Series.

**Action** To view the software processes running on the QFX Series:

[edit system]

user@switch> [show system processes](#)

**Meaning** [Table 32 on page 277](#) summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

**Table 32: Summary of System Process Information Output Fields**

Field	Values
PID	Identifier of the process.
Name	Owner of the process.
State	Current state of the process.
CPU Load	Percentage of the CPU that is being used by the process.
Memory Utilization	Amount of memory that is being used by the process.

Table 32: Summary of System Process Information Output Fields (*continued*)

Field	Values
Start Time	Time of day when the process started.

- Related Documentation**
- [Monitoring System Properties on page 278](#)
  - [show system uptime on page 1017](#)

## Monitoring System Properties

**Purpose** View system properties such as the name and IP address of a QFX Series product and resource usage.

**Action** To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

**Meaning** [Table 33 on page 278](#) summarizes key output fields in the system properties display.

Table 33: Summary of Key System Properties Output Fields

Field	Values	Additional Information
<b>General Information</b>		
Serial Number	Serial number for a QFX Series product.	
Junos OS Version	Version of Junos OS active on the switch, including whether the software is for domestic or export use.	Export software is for use outside the USA and Canada.
Hostname	Name of the QFX Series product.	
IP Address	IP address of the QFX Series product.	
Loopback Address	Loopback address.	
Domain Name Server	Address of the domain name server.	
Time Zone	Time zone on the QFX Series product.	
<b>Time</b>		
Current Time	Current system time, in Coordinated Universal Time (UTC).	

Table 33: Summary of Key System Properties Output Fields (*continued*)

Field	Values	Additional Information
System Booted Time	Date and time when the QFX Series product was last booted and how long it has been running.	
Protocol Started Time	Date and time when the protocols were last started and how long they have been running.	
Last Configured Time	Date and time when a configuration was last committed. This field also shows the name of the user who issued the last <b>commit</b> command.	
Load Average	CPU load average for 1, 5, and 15 minutes.	
<b>Storage Media</b>		
Internal Flash Memory	Usage details of internal flash memory.	
External Flash Memory	Usage details of external USB flash memory.	
<b>Logged in Users Details</b>		
User	Username of any user logged in to the switch.	
Terminal	Terminal through which the user is logged in.	
From	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.	
Login Time	Time when the user logged in.	This is the <b>user@switch</b> field in <b>show system users</b> command output.
Idle Time	How long the user has been idle.	

- Related Documentation**
- [Monitoring System Process Information on page 277](#)
  - [show system processes on page 931](#)

## Monitoring Interface Status and Traffic

**Purpose** View interface status to monitor interface bandwidth utilization and traffic statistics on the QFX Series product.

- Action**
- To view interface status for all the interfaces, enter **show interfaces xe**.
  - To view status and statistics for a specific interface, enter **show interfaces xe interface-name**.

- To view status and traffic statistics for all interfaces, enter either [show interfaces xe detail](#) or [show interfaces xe extensive](#).

**Meaning** For details about output from the CLI commands, see [show interfaces xe](#).

## Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- Junos XML Management Protocol Application Programming Interface (API)—Application programmers can use the Junos XML Management Protocol API to monitor and configure Juniper Networks QFX Series products. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring the QFX Series.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF API to monitor and configure Juniper Networks QFX Series products.
- Junos OS commit scripts—You can define scripts to enforce custom configuration tasks, enforce consistency, prevent common mistakes, and more. Every time you commit a new candidate configuration, the active commit scripts are called to inspect the new candidate configuration. If a configuration violates your custom rules, the script can instruct the Junos OS to perform various actions, including making changes to the configuration and generating custom, warning, and system log messages.
- Junos OS Op scripts—You can add your own commands to the operation-mode CLI. You can use these scripts to automate troubleshooting of known network problems and correct them.
- Junos OS event scripts—You can use event scripts to diagnose and fix issues, monitor the overall status of the system, and examine errors periodically. Event scripts are similar to op scripts except that certain events on the switch will trigger these scripts.
- Junos Space—The Junos Space application design allows multiple users concurrent access to its user interface. It also includes applications for network infrastructure automation.

## Operational Commands

## commit

<b>Syntax</b>	<code>commit &lt;&lt;at &lt;"string"&gt;&gt; &lt;and-quit&gt; &lt;check&gt; &lt;comment &lt;"comment-string"&gt;&gt; &lt;confirmed&gt; &lt;display detail&gt; &lt;fast-synchronize&gt; &lt;minutes&gt; &lt;synchronize&gt;&lt;force&gt;&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <b>fast-synchronize</b> added in Junos OS Release 12.2.
<b>Description</b>	Commit the set of changes to the database and cause the changes to take operational effect.
<b>Options</b>	<p><b>at &lt;"string"&gt;</b>—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.</p> <p><b>string</b> is <b>reboot</b> or the future time to activate the configuration changes. Enclose the <b>string</b> value (including <b>reboot</b>) in quotation marks (" "). You can specify time in two formats:</p> <ul style="list-style-type: none"> <li>A time value in the form <b>hh:mm[:ss]</b> (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the <b>commit at</b> configuration command is issued. Use 24-hour time for the <b>hh</b> value; for example, <b>04:30:00</b> is 4:30:00 AM, and <b>20:00</b> is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.</li> <li>A date and time value in the form <b>yyyy-mm-dd hh:mm[:ss]</b> (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the <b>commit at</b> command is issued. Use 24-hour time for the <b>hh</b> value. For example, <b>2003-08-21 12:30:00</b> is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.</li> </ul> <p>For example, <b>commit at "18:00:00"</b>. For date and time, include both values in the same set of quotation marks. For example, <b>commit at "2005-03-10 14:00:00"</b>.</p> <p>A <i>commit check</i> is performed when you issue the <b>commit at</b> configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.</p>

**NOTE:** If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at configuration** command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see the Junos OS Operational Mode Commands.

**and-quit**—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

**check**—(Optional) Verify the syntax of the configuration, but do not activate it.

**comment** <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab"**.

**confirmed** <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is 1 through 65,535 minutes, and the default is 10 minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

**display detail**—(Optional) Monitors the commit process.

**NOTE:** In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the **more** pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

**fast-synchronize**—(Optional) Configure the commits to run in parallel on both the master and backup Routing Engines to reduce the time taken for commit synchronization.

**synchronize** <*force*>—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the

**commit synchronize** command. The Routing Engine on which you execute this command (request Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine is terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

**NOTE:** When you issue the **commit synchronize** command, you must use the **apply-groups re0** and **re1** commands. For information about how to use groups, see *Disabling Inheritance of a Junos OS Configuration Group*.

The responding Routing Engine must use Junos OS Release 5.0 or later.

#### Required Privilege Level

configure—To enter configuration mode.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

## clear log

---

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<b><i>filename</i></b> —Name of the specific log file to delete.  <b>all</b> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show log on page 837</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 286</a>
<b>Output Fields</b>	See <a href="#">file list</a> for an explanation of output fields.

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r----- 1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r----- 1 root  wheel      57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear chassis display message

<b>Syntax</b>	clear chassis display message
<b>Syntax (TX Matrix Router)</b>	clear chassis display message <lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	clear chassis display message <lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (QFabric Systems)</b>	clear chassis display message <node-device <i>name</i>   interconnect-device <i>name</i> >
<b>Release Information</b>	<p>Command introduced in Junos OS Release 7.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option for the TX Matrix Plus routers introduced in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.</p>
<b>Options</b>	<p><b>none</b>—Clear or stop a text message on the craft interface display.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear or stop a text message on the craft interface on a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear or stop a text message on the craft interface on a specific T1600 router that is connected to the TX Matrix Plus router. Replace <i>number</i> with a value from 0 through 3.</p> <p><b>node-device <i>name</i></b>—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.</p> <p><b>scc</b>—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (or switch-card chassis).</p> <p><b>sfc <i>number</i></b>—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace <i>number</i> with 0.</p>

**Required Privilege Level** clear

## clear system commit

---

<b>Syntax</b>	clear system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance (or the actual user who scheduled the commit)
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system commit on page 884</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear system commit on page 289</a> <a href="#">clear system commit (None Pending) on page 289</a> <a href="#">clear system commit (User Does Not Have Required Privilege Level) on page 289</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

<b>clear system commit</b>	user@host> clear system commit Pending commit cleared.
<b>clear system commit (None Pending)</b>	user@host> clear system commit No commit scheduled.
<b>clear system commit (User Does Not Have Required Privilege Level)</b>	user@host> clear system commit error: Permission denied

## clear system reboot

---

<b>Syntax</b>	clear system reboot <both-routing-engines>
<b>Syntax (EX Series Switches)</b>	clear system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	clear system reboot <both-routing-engines> <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	clear system reboot <both-routing-engines> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (QFX Series)</b>	clear system reboot <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 routers connected to the TX Matrix Plus router.
<b>Options</b>	<b>none</b> —Clear all pending system software reboots or halts.  <b>all-chassis</b> —(TX Matrix and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.  <b>all-lcc</b> —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.  <b>all-members</b> —(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.  <b>both-routing-engines</b> —(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix

Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

**infrastructure *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

**node-group *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

**scc**—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Required Privilege Level** maintenance

[clear system reboot \(QFX Series\) on page 292](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

### clear system reboot (TX Matrix Router)

```
user@host> clear system reboot
scc-re0:
-----
No shutdown/reboot scheduled.
lcc0-re0:
-----
No shutdown/reboot scheduled.
lcc2-re0:
-----
No shutdown/reboot scheduled.
```

### clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```

## file

<b>Syntax</b>	<code>file &lt;archive   checksum   compare   copy   delete   list   rename   show   source address   archive&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive files from the device, copy files to and from the router or switch, calculate the file checksum, compare files, delete a file from the device, list files on the device, rename a file, show file contents, or show the local address to initiate a connection.
<b>Options</b>	<p><b>archive (Optional)</b> —Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.</p> <p><b>checksum (Optional)</b> —Calculate the Message Digest 5 (MD5) checksum of a file.</p> <p><b>compare (Optional)</b> —Compare two local files and describe the differences between them in default, context, or unified output styles.</p> <p><b>copy (Optional)</b> —Copy files from one place to another on the local switch or between the local switch and a remote system.</p> <p><b>delete (Optional)</b> —Delete a file on the local switch.</p> <p><b>list (Optional)</b> —Display a list of files on the local switch.</p> <p><b>rename (Optional)</b> —Rename a file on the local switch.</p> <p><b>show (Optional)</b> —Display the contents of a file.</p> <p><b>source address (Optional)</b> —Specify the source address of the local file.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Viewing Files and Directories on a Device Running Junos OS</li> <li>Junos OS Operational Mode Commands</li> </ul>

## file archive

---

<b>Syntax</b>	<code>file archive destination <i>destination</i> source <i>source</i> &lt;compress&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
<b>Options</b>	<p><b>destination <i>destination</i></b>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none"><li>• For archived files—The suffix <b>.tar</b></li><li>• For archived and compressed files—The suffix <b>.tgz</b></li></ul> <p><b>source <i>source</i></b>—Source of the original file or files. Specify the source as a URL or filename.</p> <p><b>compress</b>—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix <b>.tgz</b>.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file archive (Multiple Files) on page 295</a> <a href="#">file archive (Single File) on page 295</a> <a href="#">file archive (with Compression) on page 295</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

---

<b>Syntax</b>	<code>file checksum md5 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Message Digest 5 (MD5) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename.  <b>filename</b> —Name of a local file for which to calculate the MD5 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum sha-256 on page 298</a></li><li>• <a href="#">file checksum sha1 on page 297</a></li><li>• op</li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum md5 on page 296</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

**file checksum md5**

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

## file checksum sha1

<b>Syntax</b>	<code>file checksum sha1 &lt;pathname&gt; filename</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
<b>Options</b>	<p><b>pathname</b>—(Optional) Path to a filename.</p> <p><b>filename</b>—Name of a local file for which to calculate the SHA-1 checksum.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <a href="#">file checksum md5 on page 296</a></li> <li>• <a href="#">file checksum sha-256 on page 298</a></li> <li>• op</li> </ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha1 on page 297</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
file checksum sha1      user@host> file checksum sha1 /var/db/scripts/opscript.slax

SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

<b>Syntax</b>	<code>file checksum sha-256 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename. <b>filename</b> —Name of a local file for which to calculate the SHA-256 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum md5 on page 296</a></li><li>• <a href="#">file checksum sha1 on page 297</a></li><li>• op</li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha-256 on page 298</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
file checksum sha-256 user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

## file compare

<b>Syntax</b>	<pre>file compare (files <i>filename filename</i>) &lt;context   unified&gt; &lt;ignore-white-space&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul>
<b>Options</b>	<p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>
<b>Required Privilege Level</b>	none
<b>List of Sample Output</b>	<p><a href="#">file compare files on page 300</a></p> <p><a href="#">file compare files context on page 300</a></p> <p><a href="#">file compare files unified on page 300</a></p> <p><a href="#">file compare files unified ignore-white-space on page 300</a></p>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<          full-name "File 1";
---
>          full-name "File 2";
102c102
<          class foo; # 'foo' is not defined
---
>          class super-user;
```

### file compare files context

## file delete

---

<b>Syntax</b>	<code>file delete <i>filename</i></code> <code>&lt;purge&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a file on the local router or switch.
<b>Options</b>	<b><i>filename</i></b> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.  <b><i>purge</i></b> —(Optional) Overwrite regular files before deleting them.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file delete on page 302</a> <a href="#">file delete (Routing Matrix) on page 302</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

### file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

## file list

---

<b>Syntax</b>	file list <detail   recursive> <filename>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of files on the local router or switch.
<b>Options</b>	<p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
<b>Additional Information</b>	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file list on page 304</a> <a href="#">file list (Routing Matrix) on page 304</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

### file list (Routing Matrix)

## file rename

---

<b>Syntax</b>	<code>file rename <i>source destination</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Rename a file on the local router or switch.
<b>Options</b>	<b><i>destination</i></b> —New name for the file.  <b><i>source</i></b> —Original name of the file. For a routing matrix, the filename must include the chassis information.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file rename on page 306</a> <a href="#">file rename (Routing Matrix) on page 306</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file rename

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz

user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

## file show

---

<b>Syntax</b>	<code>file show <i>filename</i></code> <code>&lt;encoding (base64   raw)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a file.
<b>Options</b>	<b><i>filename</i></b> —Name of a file. For a routing matrix, the filename must include the chassis information.  <b>encoding (base64   raw)</b> —(Optional) Encode file contents with base64 encoding or show raw text.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file show on page 308</a> <a href="#">file show (Routing Matrix) on page 308</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

### file show (Routing Matrix)

```
user@host> file show lcc0-re0:/var/tmp/gdbinit
lcc0-re0:
-----
#####
# Settings

define msgbuf
    printf "%s", msgbufp->msg_ptr
end
# hex dump of a block of memory
# usage: dump address length
define dump
    p $arg0, $arg1
    set $ch = $arg0
    set $j = 0
    set $n = $arg1
    while ($j < $n)
        #printf "%x %x ",&$ch[$j],$ch[$j]
        printf "%x ",$ch[$j]
        set $j = $j + 1
        if (!($j % 16))
            printf "\n"
        end
    end
end
end
```

## load

<b>Syntax</b>	load (factory-default   merge   override   patch   replace   set   update) load ( <i>filename</i>   terminal) <relative>
<b>QFX Series</b>	load (dhcp-snooping <i>filename</i> )
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs.
<b>Options</b>	<p><b>dhcp-snooping</b>—(QFX Series switches) Loads DHCP snooping entries.</p> <p><b>factory-default</b>—Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on.</p> <p>On J Series Services Routers, pressing and holding down the Config button on the router for 15 seconds causes the factory configuration to be loaded and committed. However, this operation deletes all other configurations on the router; using the <b>load factory-default</b> command does not.</p> <p><b>filename</b>—Name of the file to load. For information about specifying the filename, see Viewing Files and Directories on a Device Running Junos OS.</p> <p><b>merge</b>—Combine the configuration that is currently shown in the CLI with the configuration.</p> <p><b>override</b>—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.</p> <p><b>patch</b>—Change part of the configuration and mark only those parts as changed.</p> <p><b>replace</b>—Look for a <b>replace</b> tag in <i>filename</i>, delete the existing statement of the same name, and replace it with the configuration.</p> <p><b>set</b>—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as <b>set</b>, <b>edit</b>, <b>exit</b>, and <b>top</b>.</p> <p><b>relative</b>—(Optional) Use the <b>merge</b> or <b>replace</b> option without specifying the full hierarchy level.</p> <p><b>terminal</b>—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.</p> <p><b>update</b>—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.</p>

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

---

<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

**Release Information**    Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO\_REQUEST messages to elicit ICMP ECHO\_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

**Options** **host**—IP address or hostname of the remote system to ping.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**count requests**—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

**detail**—(Optional) Include in the output the interface on which the ping reply was received.

**do-not-fragment**—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

**NOTE:** In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

**inet**—(Optional) Ping Packet Forwarding Engine IPv4 routes.

**inet6**—(Optional) Ping Packet Forwarding Engine IPv6 routes.

**interface source-interface**—(Optional) Interface to use to send the ping requests.

**interval seconds**—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

**logical-system logical-system-name**—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system logical-system-name** command and then run the **ping** command. To return to the main router, enter the **clear cli logical-system** command.

**loose-source value**—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

**Required Privilege Level** network

**Related Documentation** • [Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages](#)

**List of Sample Output** [ping hostname on page 314](#)  
[ping hostname rapid on page 314](#)

[ping hostname size count on page 314](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes

request chassis beacon on interconnect-device fpc (QFabric System)	user@switch> request chassis beacon on interconnect-device fpc 2
FPC 2	ON

## request chassis cb

<b>Syntax</b>	<code>request chassis cb (offline   online) slot <i>slot-number</i></code>
<b>Syntax (TX Matrix Router)</b>	<code>request chassis cb (offline   online) &lt;slot <i>slot-number</i>   lcc <i>number</i> slot <i>cb-slot-number</i>   scc <i>number</i> slot <i>cb-slot-number</i>&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request chassis cb (offline   online) &lt;slot <i>slot-number</i>   lcc <i>number</i> slot <i>cb-slot-number</i>   sfc <i>number</i> slot <i>cb-slot-number</i>&gt;</code>
<b>Syntax (QFabric System)</b>	<code>request chassis cb (offline   online) interconnect-device <i>name</i> slot <i>slot-number</i> &lt;interconnect-device <i>name</i> slot <i>slot-number</i> (offline   online)&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS 9.4 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	(M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB). For information about the meaning of “CBs” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
<b>Options</b>	<p><b>offline</b>—Take the Control Board offline.</p> <div style="margin-top: 20px;">  <p><b>NOTE:</b> On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the <code>request chassis cb slot <i>backup-slot-number</i> offline</code> command.</p> </div> <div style="margin-top: 20px;">  <p><b>NOTE:</b> Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.</p> </div> <p><b>online</b>—Bring the Control Board online.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:</p> <p><b>slot <i>slot-number</i></b>—Control Board slot number:</p>

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

- M320 router—Replace **slot-number** with a value from 0 through 1.
- MX480/MX240 routers—Replace **slot-number** with a value from 0 through 1.
- MX960 router—Replace **slot-number** with a value from 0 through 2.
- MX2020 and MX2010 routers—Replace **slot-number** with 0 or 1.
- EX8208 switch—Replace **slot-number** with a value from 0 through 2.
- EX8216 switch—Replace **slot-number** with a value from 0 through 1.
- QFabric System—Replace **slot-number** with a value from 0 through 1.

**sfc number**—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

**Required Privilege Level** maintenance

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

request chassis cb

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

request chassis cb  
interconnect-device  
(QFabric System)

```
user@switch> request chassis cb interconnect-device interconnect1 offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

request chassis cb  
(MX2020 Router)

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

request chassis cb  
(MX2010 Router)

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

## request chassis fpc

---

<b>Syntax</b>	request chassis fpc (offline   online   restart) slot <i>slot-number</i>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	request chassis fpc (offline   online   restart) slot <i>slot-number</i> <lcc <i>number</i> >
<b>Syntax (MX Series Routers)</b>	request chassis fpc (offline   online   restart) slot <i>slot-number</i> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	request chassis fpc (offline   online   restart) slot <i>slot-number</i>
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	request chassis fpc (offline   online   restart) slot <i>slot-number</i>
<b>Syntax (QFabric System)</b>	request chassis fpc <interconnect-device <i>name</i> slot <i>slot-number</i> (offline   online)> <(offline   online) interconnect-device <i>name</i> slot <i>slot-number</i> > <slot <i>slot-number</i> interconnect-device <i>name</i> (offline   online)>
<b>Syntax (PTX Series Packet Transport Switches)</b>	request chassis fpc (offline   online   restart) slot <i>slot-number</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS 11.3 for QFX Series. Command introduced in Junos OS 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Switches only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
<b>Options</b>	<b>offline</b> —Take the FPC offline.  <b>online</b> —Bring the FPC online.  <b>interconnect-device <i>name</i></b> —(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

**restart**—Restart the FPC.

**slot slot-number**—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace **slot-number** with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9.
  - EX6210 switches—Replace **slot-number** with a value from 0 through 9.

**NOTE:** These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace **slot-number** with a value from 0 through 7.
- EX8216 switches—Replace **slot-number** with a value from 0 through 15.
- PTX5000 Packet Transport Switch—Replace **slot-number** with a value from 0 through 7.

**all-members**—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, control the FPC in a specified T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, control the FPC in a specified T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**Required Privilege Level**

maintenance

[request chassis fpc on page 322](#)  
[request chassis fpc \(MX Series Routers with Media Services Blade \[MSB\]\) on page 322](#)  
[request chassis fpc \(MX2020 Router\) on page 323](#)  
[request chassis fpc \(MX2010 Router\) on page 323](#)

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

**request chassis fpc**

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

**request chassis fpc  
(MX Series Routers)**

```
user@host> request chassis fpc slot 0
```

with Media Services  
Blade [MSB])

Possible completions:

offline	Take FPC offline
online	Bring FPC online
restart	Restart FPC

request chassis fpc  
(MX2020 Router)

user@host >request chassis fpc online slot 2  
FPC 2 already online

request chassis fpc  
(MX2010 Router)

user@host >request chassis fpc offline slot 5  
Offline initiated, use "show chassis fpc" to verify

## request chassis routing-engine master

<b>Syntax</b>	request chassis routing-engine master (acquire   release   switch) <force> <no-confirm>
<b>Syntax (TX Matrix Routers)</b>	request chassis routing-engine master (acquire   release   switch) (lcc <i>number</i>   scc   all-chassis) <force> <no-confirm>
<b>Syntax (TX Matrix Plus Routers)</b>	request chassis routing-engine master (acquire   release   switch) (lcc <i>number</i>   sfc   all-chassis   all-lcc) <force> <no-confirm>
<b>Syntax (MX Series Routers)</b>	request chassis routing-engine master (acquire   release   switch) <all-members> <force> <local> <member <i>member-id</i> > <no-confirm>
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	request chassis routing-engine master (acquire   release   switch <check>) <no-confirm>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	request chassis routing-engine master (acquire   release   switch <check>) <no-confirm>
<b>Syntax (QFX Series)</b>	request chassis routing-engine master (release   switch) <check> <interconnect-device <i>name</i> > <node-group <i>name</i> > <no-confirm>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. all-chassis option added in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.3 for QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing

Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all T640 routers (in a routing matrix based on the TX Matrix router) or T1600 routers (in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the Junos OS High Availability Configuration Guide.

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

**Options** **acquire**—Attempt to become the master Routing Engine.

**release**—Request that the other Routing Engine become the master.

**switch**—Toggle mastership between Routing Engines.

The **acquire**, **release**, and **switch** options have the following suboptions:

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 routers, switch mastership on all the Routing Engines in the routing matrix.

**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX240, MX480, MX960, MX2010, and MX2020 Routers only) (Optional) Available only with the **switch** option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, the T640 router (or LCC) that is connected to the TX Matrix router (or switch-card chassis). On a TX Matrix Plus router, the T1600 router (or LCC) that is connected to the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace ***member-id*** with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**force**—(Optional) Available only with the acquire option. Force the change to a new master Routing Engine.

#### Additional Information

Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (RE0) is the master and the Routing Engine in slot 1 (RE1) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the [edit chassis redundancy] hierarchy level in the configuration. For more information, see the Junos OS System Basics Configuration Guide

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

**NOTE:** Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis routing-engine on page 781</a></li> <li>• Configuring Routing Engine Redundancy</li> <li>• Switching the Global Master and Backup Roles in a Virtual Chassis Configuration</li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis routing-engine master acquire on page 327</a> <a href="#">request chassis routing-engine master switch on page 327</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request chassis routing-engine master acquire](#)

```
user@host> request chassis routing-engine master acquire
warning: Traffic will be interrupted while the PFE is re-initialized
warning: The other routing engine's file system could be corrupted
Reset other routing engine and become master ? [yes,no] (no)
```

### [request chassis routing-engine master switch](#)

```
user@host> request chassis routing-engine master switch
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.

Switch mastership back to the local Routing Engine:

user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

## request message

---

<b>Syntax</b>	<code>request message all message "text"</code> <code>request message message "text" (terminal <i>terminal-name</i>   user <i>user-name</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a message on the screens of all users who are logged in to the router or switch or on specific screens.
<b>Options</b>	<b>all</b> —Display a message on the terminal of all users who are currently logged in.  <b>message "text"</b> —Message to display.  <b>terminal <i>terminal-name</i></b> —Name of the terminal on which to display the message.  <b>user <i>user-name</i></b> —Name of the user to whom to direct the message.

## request system halt

<b>Syntax</b>	request system halt <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash   disk   removable-compact-flash   usb)> <message " <i>text</i> ">
<b>Syntax (EX Series Switches)</b>	request system halt <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external   internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine> <slice <i>slice</i> >
<b>Syntax (PTX Series)</b>	request system halt <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash   disk)> <message " <i>text</i> ">
<b>Syntax (TX Matrix Router)</b>	request system halt <all-lcc   lcc <i>number</i>   scc> <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash   disk)> <message " <i>text</i> ">
<b>Syntax (TX Matrix Plus Router)</b>	request system halt <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash   disk)> <message " <i>text</i> ">
<b>Syntax (MX Series Router)</b>	request system halt <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> >

	<pre>&lt;local&gt; &lt;media (external   internal)&gt; &lt;member <i>member-id</i>&gt; &lt;message "text"&gt; &lt;other-routing-engine&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>request system halt &lt;all-members&gt; &lt;at <i>time</i>&gt; &lt;director-device <i>director-device-id</i>&gt; &lt;in <i>minutes</i>&gt; &lt;local&gt; &lt;media &gt; &lt;member <i>member-id</i>&gt; &lt;message "text"&gt; &lt;slice <i>slice</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>other-routing-engine</b> option introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>director-device</b> option introduced for QFabric systems in Junos OS Release 12.2.</p>
<b>Description</b>	Stop the router or switch software.

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, use the **member** option from the Node group CLI. You cannot issue this command from the QFabric CLI.

<b>Options</b>	<p><b>none</b>—Stop the router or switch software immediately.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Halt all chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.</p> <p><b>at <i>time</i></b> —(Optional) Time at which to stop the software, specified in one of the following ways:</p> <ul style="list-style-type: none"><li>• <b>now</b>—Stop the software immediately. This is the default.</li><li>• <b>+<i>minutes</i></b>—Number of minutes from now to stop the software.</li></ul>
----------------	--

- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

**both-routing-engines**—(Optional) Halt both Routing Engines at the same time.

**director-device *director-device-id***—(QFabric systems only) Halt a specific Director device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

**in *minutes***—(Optional) Number of minutes from now to stop the software. This option is an alias for the **at +*minutes*** option.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.

- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix or TX Matrix Plus router, if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted. If you issue the **request system halt both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are halted.

.....

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

.....

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

### request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

### request system halt (Immediately)

```
user@host> request system halt at now
```

### request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

## request system license add

---

<b>Syntax</b>	<code>request system license add (<i>filename</i>   terminal)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Add a license key.
<b>Options</b>	<b><i>filename</i></b> —License key from a file or URL. Specify the filename or the URL where the key is located.  <b><i>terminal</i></b> —License key from the terminal.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding New Licenses (CLI Procedure) on page 69</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system license add on page 336</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
request system license add user@host> request system license add terminal
```

## request system license delete

<b>Syntax</b>	<code>request system license delete <i>license-id</i></code>
<b>Syntax (QFX Series)</b>	<code>request system license delete <i>license-identifier</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a license key. You can delete only one license at a time.
<b>Options</b>	<i>license-id</i> —License ID that uniquely identifies a license key. <i>license-identification</i> —(QFX Series) License ID that uniquely identifies a license key.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Deleting a License (CLI Procedure) on page 70</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system license delete on page 337</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
request system license delete user@host> request system license delete G03000002223
```

## request system license save

---

<b>Syntax</b>	<code>request system license save (<i>filename</i>   terminal)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Save installed license keys to a file or URL.
<b>Options</b>	<b><i>filename</i></b> —License key from a file or URL. Specify the filename or the URL where the key is located.  <b><i>terminal</i></b> —License key from the terminal.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Saving License Keys on page 71</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system license save on page 338</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`request system license save`     `user@host> request system license save ftp://user@host/license.conf`

## request system logout

<b>Syntax</b>	<code>request system logout (pid <i>pid</i>   terminal <i>terminal</i>   user <i>username</i>)</code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Log out users from the router or switch and the configuration database. If a user held the <b>configure exclusive</b> lock, this command clears the exclusive lock.
<b>Options</b>	<p><b>all</b>—(Optional) Log out all sessions owned by a particular PID, terminal session, or user. (On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.)</p> <p><b>pid <i>pid</i></b>—Log out the user session using the specified management process identifier (PID). The PID type must be management process.</p> <p><b>terminal <i>terminal</i></b>—Log out the user for the specified terminal session.</p> <p><b>user <i>username</i></b>—Log out the specified user.</p>
<b>Required Privilege Level</b>	configure
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Junos OS System Basics Configuration Guide</li> </ul>
<b>List of Sample Output</b>	<a href="#">request system logout on page 339</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`request system logout`     `user@host> request system logout user tammy all`  
 Connection closed by foreign host.

## request system power-off

---

<b>Syntax</b>	request system power-off <both-routing-engines> <other-routing-engine> <at <i>time</i> > <in <i>minutes</i> > <media (compact-flash   disk   removable-compact-flash   usb)> <message " <i>text</i> ">
<b>Syntax (EX Series Switches)</b>	request system power-off <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external   internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine> <slice <i>slice</i> >
<b>Syntax (TX Matrix Router)</b>	request system power-off <all-chassis   all-lcc   lcc <i>number</i>   scc> <both-routing-engines> <other-routing-engine> <at <i>time</i> > <in <i>minutes</i> > <media (compact-flash   disk)> <message " <i>text</i> ">
<b>Syntax (TX Matrix Plus Router)</b>	request system power-off <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <both-routing-engines> <other-routing-engine> <at <i>time</i> > <in <i>minutes</i> > <media (compact-flash   disk)> <message " <i>text</i> ">
<b>Syntax (MX Series Router)</b>	request system power-off <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external   internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine>
<b>Syntax (QFX Series)</b>	request system power-off <at <i>time</i> >

```
<in minutes>
<media (external | internal)>
<message "text">
<slice slice>
```

**Release Information** Command introduced in Junos OS Release 8.0.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Power off the software.

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the **member** option. You cannot issue this command from the QFabric CLI.

**Options** **none**—Power off the router or switch software immediately.

**all-chassis**—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.

**all-lcc**—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.

**at time**—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- **+minutes**—Number of minutes from now to power off the software.
- **yymmddhhmm**—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to power off the software.

**both-routing-engines**—(Optional) Power off both Routing Engines at the same time.

**in minutes**—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +minutes** option.

**lcc number**—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before powering off the software.

**other-routing-engine**—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

**sfc *number***—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace ***number*** with zero.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

Required Privilege Level	maintenance
List of Sample Output	<a href="#">request system power-off on page 343</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### `request system power-off`

```
user@host> request system power-off message "This router will be powered off in 30 minutes.
Please save your data and log out immediately."
warning: This command will not halt the other routing-engine.
If planning to switch off power, use the both-routing-engines option.
Power Off the system ? [yes,no] (no) yes

*** FINAL System shutdown message from remote@nutmeg ***
System going down IMMEDIATELY

This router will be powered off in 30 minutes. Please save your data and log out
immediately.

Shutdown NOW!
[pid 5177]
```

## request system reboot

---

<b>Syntax</b>	<code>request system reboot</code> <code>&lt;at time&gt;</code> <code>&lt;in minutes&gt;</code> <code>&lt;media (external   internal)&gt;</code> <code>&lt;message "text"&gt;</code> <code>&lt;routing-engine&gt;</code>
<b>Syntax (QFX Series)</b>	<code>request system reboot</code> <code>&lt;all &lt;graceful&gt;&gt;</code> <code>&lt;at time&gt;</code> <code>&lt;director-group &lt;graceful&gt;&gt;</code> <code>&lt;fabric &lt;graceful&gt;&gt;</code> <code>&lt;in minutes&gt;</code> <code>&lt;media &gt;</code> <code>&lt;message "text"&gt;</code> <code>&lt;node-group <i>name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Reboot the Junos OS.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

Reboot requests are recorded in the system log files, which you can view with the **show log** command. You can view the process names with the **show system processes** command.

- Options**
- none**—Reboots the software immediately.
  - all**—(QFabric Systems Only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.
  - at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:
    - **+minutes**—Number of minutes from now to reboot the software.
    - **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
    - **now**—Stop or reboot the software immediately. This is the default.
    - **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

**director-group**—(QFabric Systems Only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(QFabric Systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**graceful**—(QFabric Systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**media (external | internal)**—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before rebooting the software.

**node-group *name***—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

**routing-engine**—(Optional) Reboot the Routing Engine.

**Required Privilege Level** maintenance

**Related Documentation**

- [clear system reboot on page 290](#)
- [Rebooting and Halting a QFX Series Product on page 147](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

**request system reboot**     user@switch> **request system reboot**  
Reboot the system ? [yes,no] (no)

**request system reboot**     user@switch> **request system reboot at 2300 message ?Maintenance time!?**  
**(At 2300)**                    Reboot the system ? [yes,no] (no) **yes**  
  
shutdown: [pid 186]  
\*\*\* System shutdown message from root@berry.network.net \*\*\*  
System going down at 23:00

**request system reboot**     The following example, which assumes that the time is 5 PM (1700), illustrates three  
**(In 2 Hours)**                different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

**request system reboot**     user@switch> **request system reboot at now**  
**(Immediately)**

**request system reboot**     To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the  
**(At 1:20 AM)**                next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## request system snapshot

<b>Syntax</b>	<code>request system snapshot</code> <code>&lt;partition&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Copy the currently running Junos OS and configuration to alternate media. This command takes a snapshot of the contents of the <code>/</code> (root), and <code>/var</code> partitions on the media used to boot the switch and then copies the snapshot to alternate media. If the switch was booted from internal flash memory, the snapshot is copied to an external USB flash drive. If the switch was booted from an external USB flash drive, the snapshot is copied to internal flash memory.
<b>Options</b>	<p><b>none</b>—Create a snapshot on the alternate media—that is, the external media if you booted the switch using software stored on internal media or internal media if you booted the switch using software stored on external media.</p> <p><b>partition</b>—Partition the destination media before copying over the snapshot.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• show system snapshot</li> <li>• <a href="#">Creating a Snapshot and Using It to Boot a QFX Series Switch on page 141</a></li> <li>• Verifying That a System Snapshot Was Created on a QFX Series Switch</li> </ul>
<b>List of Sample Output</b>	<a href="#">request system snapshot partition on page 347</a>

### Sample Output

```
request system snapshot partition
user@switch> request system snapshot partition
Clearing current label...
Partitioning external media (da1) ...
Verifying compatibility of destination media partitions...
Running newfs (334MB) on external media / partition ...
Running newfs (404MB) on external media /config partition ...
Running newfs (222MB) on external media /var partition ...
Copying '/dev/da0s2a' to '/dev/da1s1a' .. (this may take a few minutes)
Copying '/dev/da0s3e' to '/dev/da1s3e' .. (this may take a few minutes)
Copying '/dev/da0s2f' to '/dev/da1s1f' .. (this may take a few minutes)
The following filesystems were archived: / /config /var
```

## request system software add

---

<b>Syntax</b>	<code>request system software add <i>package-name</i></code> <code>&lt;best-effort-load&gt;</code> <code>&lt;delay-restart&gt;</code> <code>&lt;force&gt;</code> <code>&lt;no-copy&gt;</code> <code>&lt;no-validate&gt;</code> <code>&lt;re0   re1&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;unlink&gt;</code> <code>&lt;validate&gt;</code>
<b>Syntax (EX Series Switches)</b>	<code>request system software add <i>package-name</i></code> <code>&lt;best-effort-load&gt;</code> <code>&lt;delay-restart&gt;</code> <code>&lt;force&gt;</code> <code>&lt;no-copy&gt;</code> <code>&lt;no-validate&gt;</code> <code>&lt;re0   re1&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;validate&gt;</code>
<b>Syntax (TX Matrix Router)</b>	<code>request system software add <i>package-name</i></code> <code>&lt;best-effort-load&gt;</code> <code>&lt;delay-restart&gt;</code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   scc&gt;</code> <code>&lt;no-copy&gt;</code> <code>&lt;no-validate&gt;</code> <code>&lt;re0   re1&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;unlink&gt;</code> <code>&lt;validate&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request system software add <i>package-name</i></code> <code>&lt;best-effort-load&gt;</code> <code>&lt;delay-restart&gt;</code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   sfc <i>number</i>&gt;</code> <code>&lt;no-copy&gt;</code> <code>&lt;no-validate&gt;</code> <code>&lt;re0   re1&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;unlink&gt;</code> <code>&lt;validate&gt;</code>
<b>Syntax (MX Series Router)</b>	<code>request system software add <i>package-name</i></code> <code>&lt;best-effort-load&gt;</code> <code>&lt;delay-restart&gt;</code>

```

<force>
<member member-id>
<no-copy>
<no-validate>
<re0 | re1>
<reboot>
<set [package-name package-name]>
<unlink>
<validate>

```

**Syntax (QFX Series)** `request system software add package-name`

```

<best-effort-load>
<component all>
<delay-restart>
<force>
<no-copy>
<no-validate>
<partition>
<reboot>
<unlink>
<validate>

```

**Release Information** Command introduced before Junos OS Release 7.4.  
**best-effort-load** and **unlink** options added in Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
**set [*package-name package-name*]** option added in Junos OS Release 11.1 for EX Series switches.  
**set [*package-name package-name*]** option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

**NOTE:** On EX Series switches, the **set [*package-name package-name*]** option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the **set [*package-name package-name*]** option allows you to install multiple software packages and software add-on packages at the same time.

**Description** Install a software package or bundle on the router or switch.

**Options** ***package-name***—Location from which the software package or bundle is to be installed.  
 For example:

- ***/var/tmp/package-name***—For a software package or bundle that is being installed from a local directory on the router or switch.
- ***protocol://hostname/pathname/package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:

- **ftp**—File Transfer Protocol.  
Use **ftp://hostname/pathname/package-name**. To specify authentication credentials, use **ftp://<username>:<password>@hostname/pathname/package-name**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
- **http**—Hypertext Transfer Protocol.  
Use **http://hostname/pathname/package-name**. To specify authentication credentials, use **http://<username>:<password>@hostname/pathname/package-name**. If a password is required and you omit it, you are prompted for it.
- **scp**—Secure copy (available only for Canada and U.S. version).  
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use **scp://<username>:<password>@hostname/pathname/package-name**.

---

**NOTE:**

- The **pathname** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the **scp** protocol in the request system software add command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support **scp**.  
Use the file copy command to copy the software package or bundle from the remote location to the **/var/tmp** directory on the hard disk:  
**file copy scp://source/package-name /var/tmp**  
Then install the software package or bundle using the request system software add command:  
**request system software add /var/tmp/package-name**
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the **unlink** option to achieve the same effect and allow the installation to be completed.

---

**best-effort-load**—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

**component all**—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

**delay-restart**—(Optional) Install a software package or bundle, but do not restart software processes.

**force**—(Optional) Force the addition of the software package or bundle (ignore warnings).

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router (or line-card chassis) that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace *number* with a value from 0 through 3.

**member *member-id***—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace *member-id* with a value of 0 or 1.

**partition**—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

**scc**—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

**no-validate**—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

**re0 | re1**—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (**re0**) or the Routing Engine in slot 1 (**re1**).

**reboot**—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

**set [*package-name package-name*]**—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

**unlink**—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the

**unlink** option to remove the software package from this directory after a successful upgrade is completed.

**validate**—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

#### Additional Information

**NOTE:** The **request system snapshot** command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, **jkern**el, last. Add the operating system package, **jkern**el, first and the routing software package, **jroute**, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel

```

By default, when you issue the **request system software add package-name** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add package-name** command on a TX Matrix Plus master Routing Engine, all the T1600 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 backup Routing Engines that are connected to it are upgraded to the same version of software.

**Required Privilege Level**    maintenance

## request system software configuration-backup

---

<b>Syntax</b>	request system software configuration-backup ( <i>path</i> )
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Save the currently active configuration and any installation-specific parameters such as a configuration that you have entered outside of the CLI, Director group IP addresses, and the default partition IP address.
<b>Options</b>	<b>path</b> —(QFabric System) Provide the path to the location of the backup configuration files. You can save the backup configuration files to either a URL, local directory, remote server, or removable drive.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request system software configuration-restore on page 357</a></li><li>• <a href="#">Performing a QFabric System Recovery Installation on the Director Group on page 87</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system software configuration-backup on page 356</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

```
request system software configuration-backup
user@switch request system software configuration-backup ftp://ftp.test.net/test
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                               Dload  Upload  Total   Spent    Left

```

## request system software configuration-restore

<b>Syntax</b>	request system software configuration-restore ( <i>path</i> )
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Restore a previously saved configuration and any installation-specific parameters, such as a configuration that you have entered outside of the CLI, Director group IP addresses, and the default partition IP address.
<b>Options</b>	<b>path</b> —(QFabric System) Provide the path to the location of the backup configuration files. The path can be to a local file, a file on an external flash drive, or an SCP or FTP destination.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system software configuration-backup on page 356</a></li> <li>• <a href="#">Performing a QFabric System Recovery Installation on the Director Group on page 87</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system software configuration-restore on page 357</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

```

request system software configuration-restore
user@switch request system software configuration-restore ftp://ftp.test.net/test
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current

```

## request system software delete

---

<b>Syntax</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Router)</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   scc&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   sfc <i>number</i>&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <b>set [<i>package-name package-name</i>]</b> added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways. Option <b>reboot</b> introduced in Junos OS Release 12.3.
<b>Description</b>	Remove a software package or bundle from the router or switch.

**CAUTION:** Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

- Options**    ***software-package***—Software package or bundle name. You can delete any or all of the following software bundles or packages:
- **jbase**—(Optional) Junos base software suite
  - **jcrypto**—(Optional, in domestic version only) Junos security software
  - **jdocs**—(Optional) Junos online documentation file
  - **jkernel**—(Optional) Junos kernel software suite
  - **jpfe**—(Optional) Junos Packet Forwarding Engine support
  - **jroute**—(Optional) Junos routing software suite
  - **junos**—(Optional) Junos base software

**NOTE:** On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

**force**—(Optional) Ignore warnings and force removal of the software.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

**scc**—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

Information for jkernel:

Comment:
JUNOS Kernel Software Suite [7.2R1.7]
...

user@host> request system software delete jdocs
Removing package 'jdocs' ...

user@host> show system software
Information for jbase:

Comment:
JUNOS Base OS Software Suite [7.2R1.7]

Information for jcrypto:

Comment:
JUNOS Crypto Software Suite [7.2R1.7]

Information for jkernel:

Comment:
JUNOS Kernel Software Suite [7.2R1.7]
...
```

## request system software download

<b>Syntax (QFabric System)</b>	<code>request system software download <i>path package-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Download a software package from a location on the Director device, mounted external USB flash drive, remote FTP or SCP location, or other location.
<b>Options</b>	<p><b><i>path</i></b>—Location where the software package is located. For example:</p> <ul style="list-style-type: none"> <li>• <b><i>/pbdata/packages/package-name</i></b>—For a software package that is being installed from a local directory on the switch.</li> <li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following: <ul style="list-style-type: none"> <li>• <b><i>ftp</i></b>—File Transfer Protocol. Use <b><i>ftp://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>. To have the system prompt you for the password, specify <b><i>prompt</i></b> in place of the password. If a password is required, and you do not specify the password or <b><i>prompt</i></b>, an error message is displayed.</li> <li>• <b><i>scp</i></b>—Secure copy (available only for Canada and U.S. version). Use <b><i>scp://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	maintenance

```

## request system software nonstop-upgrade

<b>Syntax</b>	request system software nonstop-upgrade <i>package-name</i> <fabric > <director-group> <node-group <i>name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.
<b>Options</b>	<p><b><i>package-name</i></b>—Location from which the software is to be installed. For example:</p> <ul style="list-style-type: none"> <li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following: <ul style="list-style-type: none"> <li>• <b>ftp</b>—File Transfer Protocol. Use <b>ftp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li> <li>• <b>http</b>—Hypertext Transfer Protocol. Use <b>http://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>http://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. If a password is required and you omit it, you are prompted for it.</li> <li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version). Use <b>scp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>.</li> </ul> </li> </ul>

### NOTE:

- The ***pathname*** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

**director-group**—Install software package on the Director group and Fabric managers.

**fabric**—Install software package on the Interconnect devices and Fabric controls.

**node-group *name*** —Install software package on the redundant server Node group, server Node group, or network Node group.

**Required Privilege Level** maintenance

## request system software rollback

---

<b>Syntax</b>	request system software rollback
<b>Syntax (EX Series Switches)</b>	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
<b>Syntax (TX Matrix Router)</b>	request system software rollback <lcc <i>number</i>   scc> <reboot>
<b>Syntax (TX Matrix Plus Router)</b>	request system software rollback <lcc <i>number</i>   sfc <i>number</i> > <reboot>
<b>Syntax (MX Series Router)</b>	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command behavior changed in Junos OS Release 12.1. Option <b>reboot</b> introduced in Junos OS Release 12.3.
<b>Description</b>	<p>For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful <b>request system software add</b> command.</p> <p>As of Junos OS 12.1 and greater, revert to the last known good state before the most recent <b>request system software (add   delete)</b> command. For example, using rollback in Junos OS 12.1 after using <b>request system software add</b> restores the system to a known good state prior to using the <b>add</b> command. Similarly, using rollback in Junos OS 12.1 after using <b>request system software delete</b> restores the system to a known good state prior to using the <b>delete</b> command.</p> <p>A software rollback fails if any required package (or a <b>jbundle</b> package containing the required package) cannot be found in /var/sw/pkg.</p> <p><i>Additional Information</i></p> <ul style="list-style-type: none"><li>On M Series and T Series routers, if <b>request system software add &lt;jinstall&gt; reboot</b> was used for the previous installation, then <b>request system software rollback</b> has no effect. In this case, use <b>jinstall</b> to reinstall the required package.</li></ul>

- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.

**Options** **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a T1600 router (or line-card chassis) connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

**none**—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

**scc**—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

## request system software validate

---

<b>Syntax</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Router)</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;fcc <i>number</i>   scc&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;fcc <i>number</i>   sfc <i>number</i>&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (MX Series Router)</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;member <i>member-id</i>&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. set [ <i>package-name package-name</i> ] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.
<b>Description</b>	Validate candidate software against the current configuration of the router.
<b>Options</b>	<p><b>fcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package on a specific T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace <b><i>number</i></b> with a value from 0 through 3.</p> <p><b>member <i>member-id</i></b>—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace <b><i>member-id</i></b> with a value of 0 or 1.</p> <p><b><i>package-name</i></b>—Name of the software bundle or package to test.</p> <p><b>scc</b>—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).</p> <p><b>set [<i>package-name package-name</i>]</b>—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.</p> <p><b>sfc <i>number</i></b>—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router (or switch-fabric chassis).</p>
<b>Additional Information</b>	By default, when you issue the <b>request system software validate</b> command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all

the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 backup Routing Engines that are connected to it are upgraded to the same version of software.

## request system storage cleanup

<b>Syntax</b>	request system storage cleanup <dry-run>
<b>Syntax (EX Series Switches)</b>	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
<b>Syntax (MX Series Router)</b>	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	request system storage cleanup <component ( <i>serial number</i>   <i>UUID</i>   all)> <director-group <i>name</i> > <dry-run> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <name-tag <i>name-tag</i> > <node-group <i>name</i> > <prune> <qfabric (component <i>name</i> )   dry-run   name-tag   repository> <repository (core   log)>
<b>Release Information</b>	Command introduced in Junos OS Release 7.4. <b>dry-run</b> option introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.
<b>Options</b>	<p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Delete files on all members of the Virtual Chassis configuration.</p> <p><b>component (<i>UUID</i>   <i>serial number</i>   all)</b>—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.</p> <p><b>director-group <i>name</i></b>—(QFabric systems only) (Optional) Delete files on the Director group.</p> <p><b>dry-run</b>—(Optional) List files proposed for deletion (without deleting them).</p> <p><b>infrastructure <i>name</i></b>—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.</p>

**interconnect-device *name***—(QFabric systems only) (Optional) Delete files on the Interconnect device.

**local**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**name-tag *name-tag***—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

**node-group *name***—(QFabric systems only) (Optional) Delete files on the Node group.

**prune**—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

**qfabric component *name***—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

**repository (*core* | *log*)**—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

**Additional Information** If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

**Required Privilege Level** maintenance

**List of Sample Output** [request system storage cleanup dry-run on page 380](#)  
[request system storage cleanup on page 380](#)  
[request system storage cleanup director-group \(QFabric Systems\) on page 380](#)  
[request system storage cleanup infrastructure device-name \(QFabric Systems\) on page 382](#)  
[request system storage cleanup interconnect-device device-name \(QFabric Systems\) on page 383](#)  
[request system storage cleanup node-group group-name \(QFabric Systems\) on page 384](#)  
[request system storage cleanup qfabric component device-name \(QFabric Systems\) on page 385](#)  
[request system storage cleanup qfabric component device-name repository core \(QFabric Systems\) on page 386](#)  
[request system storage cleanup qfabric component all \(QFabric Systems\) on page 386](#)

**Output Fields** [Table 34 on page 379](#) describes the output fields for the **request system storage cleanup** command. Output fields are listed in the approximate order in which they appear.

Table 34: request system storage cleanup Output Fields

Field Name	Field Description
<b>List of files to delete:</b>	Shows list of files available for deletion.
<b>Size</b>	Size of the core-dump file.
<b>Date</b>	Last core-dump file modification date and time.
<b>Name</b>	Name of the core-dump file.
<b>Directory to delete:</b>	Shows list of directories available for deletion.
<b>Repository scope:</b>	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
<b>Repository head:</b>	Name of the top-level repository location.
<b>Repository name:</b>	Name of the repository: <b>core</b> or <b>log</b> .
<b>Creating list of debug artifacts to be removed under:</b>	Shows location of files available for deletion.
<b>List of debug artifacts to be removed under:</b>	Shows list of files available for deletion.

## Sample Output

### request system storage cleanup dry-run

```
user@host> request system storage cleanup dry-run
Currently rotating log files, please wait.
This operation can take up to a minute.
```

List of files to delete:

## request system zeroize

<b>Syntax</b>	request system zeroize <media>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 9.0.</p> <p>Command introduced in Junos OS Release 11.2 for EX Series switches.</p> <p>Option <b>media</b> added in Junos OS Release 11.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.2 for MX Series devices.</p> <p>Command introduced in Junos OS Release 12.3 for the QFX Series.</p>
<b>Description</b>	<div>  <p><b>NOTE:</b> The <b>media</b> option is not available on the QFX Series.</p> </div> <p>Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.</p> <p>This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as <b>root</b> and start the Junos OS command-line interface (CLI) by typing <b>cli</b> at the prompt.</p> <p>To completely erase user-created data so that it is unrecoverable, use the <b>media</b> option.</p>
<b>Options</b>	<p><b>media</b>—(Optional) In addition to removing all configuration and log files, the <b>media</b> option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the <b>request system zeroize media</b> operation can take considerably more time than the <b>request system zeroize</b> operation. However, the critical security parameters are all removed at the beginning of the process.</p>
<b>Required Privilege Level</b>	maintenance

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.  Command introduced in Junos OS Release 9.0 for EX Series switches.  Command introduced in Junos OS Release 11.1 for the QFX Series.  Command introduced in Junos OS Release 12.2 for ACX Series routers.  Options added:</p> <ul style="list-style-type: none"> <li>• <b>dynamic-flow-capture</b> in Junos OS Release 7.4.</li> <li>• <b>dlsf</b> in Junos OS Release 7.5.</li> <li>• <b>event-processing</b> in Junos OS Release 7.5.</li> <li>• <b>ppp</b> in Junos OS Release 7.5.</li> <li>• <b>l2ald</b> in Junos OS Release 8.0.</li> <li>• <b>link-management</b> in Release 8.0.</li> <li>• <b>pgcp-service</b> in Junos OS Release 8.4.</li> <li>• <b>sbc-configuration-process</b> in Junos OS Release 9.5.</li> <li>• <b>services pgcp gateway</b> in Junos OS Release 9.6.</li> <li>• <b>sfc</b> and <b>all-sfc</b> for the TX Matrix Router in Junos OS Release 9.6.</li> </ul>
<b>Description</b>	Restart a Junos OS process.
	
<p><b>CAUTION:</b> Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.</p>	
<b>Options</b>	none—Same as <b>gracefully</b> .

- adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.
- all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.
- all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.
- all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).
- ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.
- auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.
- autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.
- captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.
- chassis-control**—(Optional) Restart the chassis management process.
- class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
- clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**— (EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**— (MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***— (MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**— (Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**— (Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**— (EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**— (Optional) Restart the MPLS Periodic Traceroute process.

**mspd**— (Optional) Restart the Multiservice process.

**multicast-snooping**— (EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**— (Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**— (J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**— (Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbcc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc number**—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway gateway-name**—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol

tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level**

reset

**List of Sample Output** [restart interfaces on page 402](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

[restart interfaces](#)

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## rollback

<b>Syntax</b>	<code>rollback &lt;number   rescue&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Return to a previously committed configuration. The software saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit</b> configuration command.</p> <p>The currently operational Junos OS configuration is stored in the file <b>juniper.conf</b>, and the last three committed configurations are stored in the files <b>juniper.conf.1</b>, <b>juniper.conf.2</b>, and <b>juniper.conf.3</b>. These four files are located in the directory <b>/config</b>, which is on the router's flash drive. The remaining 46 previous committed configurations, the files <b>juniper.conf.4</b> through <b>juniper.conf.49</b>, are stored in the directory <b>/var/db/config</b>, which is on the router's hard disk.</p> <p>During rollback, the configuration you specify is loaded from the associated file. Only objects in the rollback configuration that differ from the previously loaded configuration are marked as changed (equivalent to <b>load update</b>).</p>
<b>Options</b>	<p>none (Optional)—Return to the most recently saved configuration.</p> <p><b>number</b>—(Optional) Configuration to return to. The range of values is from <b>0</b> through <b>49</b>. The most recently saved configuration is number <b>0</b>, and the oldest saved configuration is number <b>49</b>. The default is <b>0</b>.</p> <p><b>rescue</b>—(Optional) Return to the rescue configuration.</p>
<b>Required Privilege Level</b>	rollback—To roll back to configurations other than the one most recently committed.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Returning to a Previously Committed Junos OS Configuration on page 1123</a></li> <li>• <a href="#">Creating and Returning to a Rescue Configuration on page 1118</a></li> </ul>

## save

---

**Syntax**    `save filename`

**QFX Series**    `save (dhcp-snooping filename)`

**Release Information**    Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

When saving a file to a remote system, the software uses the **scp/ssh** protocol.

**Options**    *filename*—Name of the saved file. You can specify a filename in one of the following ways:

- *filename*—File in the user's home directory (the current directory) on the local flash drive.
- *path/filename*—File on the local flash drive.
- */var/filename* or */var/path/filename*—File on the local hard disk.
- *a:filename* or *a:path/filename*—File on the local drive. The default path is */* (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- *hostname:/path/filename*, *hostname:filename*, *hostname:path/filename*, or *scp://hostname/path/filename*—File on an **scp/ssh** client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify *hostname* as *username@hostname*.
- *ftp://hostname/path/filename*—File on an FTP server. You can also specify *hostname* as *username @hostname* or *username:password @hostname*. The default path is the user's home directory. To specify an absolute path, the path must start with the string **%2F**; for example, *ftp://hostname/%2Fpath/filename*. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net//filename
file copy ftp.hostname.net: Not logged in.
user@host> file copy ftp://username:prompt@ftphostname.net//filename
```

Password for *username@ftp.hostname.net*:

- *http://hostname/path/filename*—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify *hostname* as *username@hostname* or *username:password@hostname*. If a password is required and you omit it, you are prompted for it.
- *re0:/path/filename* or *re1:/path/filename*—File on a local Routing Engine.

**Required Privilege Level**    configure—To enter configuration mode.

<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis alarms
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis alarms
<b>Syntax (QFX Series)</b>	show chassis alarms <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Syntax (PTX Series Packet Transport Switches)</b>	show chassis alarms
<b>Syntax (ACX Series Universal Access Routers)</b>	show chassis alarms
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	Display information about the conditions that have been configured to trigger alarms.
<b>Options</b>	<b>none</b> —Display information about the conditions that have been configured to trigger alarms.

**all-members**—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

**lcc *number*** — (TX Matrix and TX Matrix Plus routers only) (Optional) On the TX Matrix router, show information about a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On the TX Matrix Plus router, show information about a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

**scc**—(TX Matrix router only) (Optional) Show information about the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Show information about the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257
```

Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559

To understand what CM\_ALARM error codes mean, you need to first identify the structure of the CM\_ALARM code. A CM\_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

As per the above table, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559

First, you have to convert 559 to binary; that is **100010111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **10001011**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3

CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279
<hr/>	
<b>Chip Type: R Chip</b>	<b>Code</b>
CMALARM_RCHIP_SRAM_PARITY_ERR	512
<hr/>	
<b>Chip Type: R Chip</b>	<b>Code</b>
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602
CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608
CMALARM_ICHIP_WO_IP_INTER_ERR	609
CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630
CMALARM_ICHIP_SDRAM_BIST_ERR	631
CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM\_NCHIP\_DBUF\_CRC\_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice-versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code =  $(257-1)/2 = 128$ . Similarly, for minor alarms, Actual Error Code =  $(\text{Error Code})/2$

## show chassis ethernet-switch interconnect-device fpc

<b>Syntax</b>	show chassis ethernet-switch interconnect-device <i>name</i> fpc <detail> <port <i>number</i> > <slot <i>number</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	(QFX3000-G QFabric systems only) Display Ethernet switch information for the front card Flexible Port Concentrators (FPCs) in an Interconnect device.
<b>Options</b>	<p><b>none</b>—Display Ethernet switch information about each connected port on each online FPC in the Interconnect device.</p> <p><b>detail</b>—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot in the Interconnect device.</p> <p><b>port <i>number</i></b>—(Optional) Display Ethernet switch information about a specific port on an FPC in the Interconnect device.</p> <p><b>slot <i>number</i></b>—(Optional) Display Ethernet switch information about an FPC in a specific slot in the Interconnect device.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show chassis ethernet-switch interconnect-device fpc on page 424</a> <a href="#">show chassis ethernet-switch interconnect-device fpc detail on page 427</a> <a href="#">show chassis ethernet-switch fpc detail slot on page 434</a> <a href="#">show chassis ethernet-switch fpc interconnect-device port on page 441</a> <a href="#">show chassis ethernet-switch fpc interconnect-device detail port on page 443</a>
<b>Output Fields</b>	Table 37 on page 421 lists the output fields for the <b>show chassis ethernet-switch interconnect-device fpc</b> command. Output fields are listed in the approximate order in which they appear.

**Table 37: show chassis ethernet-switch interconnect-device fpc Output Fields**

Field Name	Field Description
Link is good on port n connected to device	Information about the link between each port on the FPC's Ethernet switch and one of the following devices: <ul style="list-style-type: none"> <li>• FWD-SWITCH-0</li> <li>• FWD-SWITCH-1</li> <li>• CB0</li> <li>• CB1</li> </ul>
Speed is	Speed at which the Ethernet link is running: <b>10 Mb</b> When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .

Table 37: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

Field Name	Field Description
Duplex is	Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ).
TX Octets	Number of octets sent.
TX Packets 64 Octets	Number of transmitted frames of size 64 octets.
TX Packets 65-127 Octets	Number of transmitted frames of size 65 through 127 octets.
TX Packets 128-255 Octets	Number of transmitted frames of size 128 through 255 octets.
TX Packets 256-511 Octets	Number of transmitted frames of size 256 through 511 octets.
TX Packets 512-1023 Octets	Number of transmitted frames of size 512 through 1023 octets.
TX Packets 1024-1518 Octets	Number of transmitted frames of size 1024 through 1518 octets.
TX Packets 1519-2047 Octets	Number of transmitted frames of size 1519 through 2047 octets.
TX Packets 2048-4095 Octets	Number of transmitted frames of size 2048 through 4095 octets.
TX Packets 4096-9216 Octets	Number of transmitted frames of size 4096 through 9216 octets.
TX Packets 9217-16383 Octets	Number of transmitted frames of size 9217 through 16383 octets.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	Number of packets sent after one collision.
TX Mult. Collision frames	Number of packets sent after multiple collisions.
TX Late Collision Frames	Number of packets aborted during sending because of collisions after 64 bytes.

Table 37: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

Field Name	Field Description
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Collision frames	Number of collision packets sent.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands sent.
TX MAC ctrl frames	Number of MAC control packets sent.
TX Frame deferred Xmns	Number of frames deferred in x milliseconds.
TX Oversize Packets	Number of oversized packets sent.
TX Jabbers	Total number of frames sent that exceed the maximum byte count and contain CRC errors .
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
RX Octets	Number of octets received.
RX Packets 64 Octets	Number of received packets of size 64 octets.
RX Packets 65-127 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 128-255 Octets	Number of received packets of size 128 through 255 octets.
RX Packets 256-511 Octets	Number of received packets of size 256 through 511 octets.
RX Packets 512-1023 Octets	Number of received packets of size 512 through 1023 octets.
RX Packets 1024-1518 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 1519-2047 Octets	Number of received packets of size 1519 through 2047 octets.
RX Packets 2048-4095 Octets	Number of received packets of size 2048 through 4095 octets.
RX Packets 4096-9216 Octets	Number of received packets of size 4096 through 9216 octets.

Table 37: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

Field Name	Field Description
RX Multicast Packets	Number of multicast packets received.
RX Broadcast Packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Align Errors	Number of incomplete octets received.
RX Fragments	Number of fragmented packets received.
RX Symbol errors	Number of symbols received that the router did not correctly decode.
RX Unsupported opcodes	Number of packets received with unsupported op codes.
RX Out of Range Length	Number of packets received with an out of range length.
RX False Carrier Errors	Number of packets received with false carrier errors.
RX Undersize Packets	Number of undersized packets received.
RX Oversize Packets	Number of oversized packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX 1519-1522 Good Vlan frms	Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.
RX MTU Exceed Counter	Number of packets received that exceed the MTU.
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX Byte Counter	Number of bytes received.

## Sample Output

**show chassis  
ethernet-switch**

```
user@qfabric> show chassis ethernet-switch interconnect-device IC-WS001 fpc
Summary for switch on FC0
Link is good on GE port 2 connected to device: FWD-SWITCH-0
```

## interconnect-device fpc

```
Speed is 1000Mb
Duplex is full
Autonegotiate is Disabled

## show chassis ethernet-switch interconnect-device cb

<b>Syntax</b>	show chassis ethernet-switch interconnect-device <i>name</i> cb <detail> <port <i>number</i> > <slot <i>number</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	(QFX3000-G QFabric systems only) Display Ethernet switch information for the Control Board (CB) ports in an Interconnect device.
<b>Options</b>	<p><b>none</b>—Display Ethernet switch information about each connected port on each online CB in the Interconnect device.</p> <p><b>detail</b>—(Optional) Display detailed status information for all CBs or for the CB in the specified slot in the Interconnect device.</p> <p><b>port <i>number</i></b>—(Optional) Display Ethernet switch information about a specific port on a CB in the Interconnect device.</p> <p><b>slot <i>number</i></b>—(Optional) Display Ethernet switch information about a CB in a specific slot in the Interconnect device.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show chassis ethernet-switch interconnect-device cb on page 452</a> <a href="#">show chassis ethernet-switch interconnect-device cb detail on page 453</a> <a href="#">show chassis ethernet-switch interconnect-device cb detail slot port on page 459</a>
<b>Output Fields</b>	Table 37 on page 421 lists the output fields for the <b>show chassis ethernet-switch interconnect-device cb</b> command. Output fields are listed in the approximate order in which they appear.

**Table 38: show chassis ethernet-switch interconnect-device fpc Output Fields**

Field Name	Field Description
Link is good on port n connected to device	Information about the link between each port on the FPC's Ethernet switch and one of the following devices: <ul style="list-style-type: none"> <li>• FWD-SWITCH-0</li> <li>• FWD-SWITCH-1</li> <li>• CB0</li> <li>• CB1</li> </ul>
Speed is	Speed at which the Ethernet link is running: <b>10 Mb</b> When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .
Duplex is	Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .

Table 38: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

Field Name	Field Description
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ).
Flow Control TX is Enabled (or Disabled)	Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.
Flow Control RX is Enabled (or Disabled)	Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.
TX Octets	Number of octets sent.
TX Packets 64 Octets	Number of transmitted packets of size 64 octets.
TX Packets 65-127 Octets	Number of transmitted frames of size 65 through 127 octets.
TX Packets 128-255 Octets	Number of transmitted frames of size 128 through 255 octets.
TX Packets 256-511 Octets	Number of transmitted frames of size 256 through 511 octets.
TX Packets 512-1023 Octets	Number of transmitted frames of size 512 through 1023 octets.
TX Packets 1024-1518 Octets	Number of transmitted frames of size 1024 through 1518 octets.
TX Packets 1519-2047 Octets	Number of transmitted frames of size 1519 through 2047 octets.
TX Packets 2048-4095 Octets	Number of transmitted frames of size 2048 through 4095 octets.
TX Packets 4096-9216 Octets	Number of transmitted frames of size 4096 through 9216 octets.
TX Packets 9217-16383 Octets	Number of transmitted frames of size 9217 through 16383 octets.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	Number of packets sent after one collision.

**Table 38: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)**

Field Name	Field Description
TX Mult. Collision frames	Number of packets sent after multiple collisions.
TX Late Collision Frames	Number of packets aborted during sending because of collisions after 64 bytes.
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Collision frames	Number of collision packets sent.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands sent.
TX MAC ctrl frames	Number of MAC control packets sent.
TX Frame deferred Xms	Number of frames deferred in x milliseconds.
TX Oversize Packets	Number of oversized packets sent.
TX Jabbers	Total number of frames sent that exceed the maximum byte count and contain CRC errors .
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
RX Octets	Number of octets received.
RX Packets 64 Octets	Number of received packets of size 64 octets.
RX Packets 65-127 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 128-255 Octets	Number of received packets of size 128 through 255 octets.
RX Packets 256-511 Octets	Number of received packets of size 256 through 511 octets.
RX Packets 512-1023 Octets	Number of received packets of size 512 through 1023 octets.
RX Packets 1024-1518 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 1519-2047 Octets	Number of received packets of size 1519 through 2047 octets.

Table 38: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

Field Name	Field Description
RX Packets 2048-4095 Octets	Number of received packets of size 2048 through 4095 octets.
RX Packets 4096-9216 Octets	Number of received packets of size 4096 through 9216 octets.
RX Multicast Packets	Number of multicast packets received.
RX Broadcast Packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Align Errors	Number of incomplete octets received.
RX Fragments	Number of fragmented packets received.
RX Symbol errors	Number of symbols received that the router did not correctly decode.
RX Unsupported opcodes	Number of packets received with unsupported op codes.
RX Out of Range Length	Number of packets received with an out of range length.
RX False Carrier Errors	Number of packets received with false carrier errors.
RX Undersize Packets	Number of undersized packets received.
RX Oversize Packets	Number of oversized packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX 1519-1522 Good Vlan frms	
RX MTU Exceed Counter	Number of packets received that exceed the MTU.
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX Byte Counter	Number of bytes received.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p><b>monitored</b> option added in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.1 for T4000 Core Routers.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p><b>pem</b> option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.</p>
Description	<p>Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.</p> <p>In addition on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.</p>

- Options** **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached T1600 routers.
- all-members**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.
- adc *adc-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace ***adc-slot-number*** with a value from 0 through 19. For MX2010 routers, replace ***adc-slot-number*** with a value from 0 through 9.
- cb *cb-slot-number***—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Switches, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace ***cb-slot*** with 0 or 1. For the EX Series switches, see EX Series Switches Hardware and CLI Terminology Mapping for information on CB slot numbering.
- cb interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.
- ccg *ccg-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace ***cb-slot*** with a value of 0 or 1.
- fpc *fpc-slot***—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Switches, QFX Series, QFX3500 switches, QFabric systems, and T Series routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace ***fpc-slot*** with a value from 0 through 9. For MX2020 routers, replace ***fpc-slot*** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see EX Series Switches Hardware and CLI Terminology Mapping for information on FPC numbering.
- fpm**—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Switches, and T Series routers only) (Optional) Display chassis environmental information for the craft interface (FPM).
- interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.
- monitored**—(MX2020 routers and PTX Series Packet Transport Switches only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display chassis environmental information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display chassis environmental information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace ***member-id*** with a value of 0 or 1. For EX Series switches, see member for member ID values.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

**pdu *pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

**pem**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

**pem *pem-slot-number***—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

**psm *psm-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace ***psm-slot-number*** with a value from 0 through 17. For MX2010 routers, replace ***psm-slot-number*** with a value from 0 through 8.

**psu *psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See EX Series Switches Hardware and CLI Terminology Mapping for detailed information.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine *re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

**scg**—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc**—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (or switch-card chassis).

**sfb *sfb-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace ***sfb-slot-number*** with a value from 0 through 7.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**sib *sib-slot-number***—(M320 routers, PTX Series Packet Transport Switches, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see `show chassis environment sib`.

**Output Fields** [Table 39 on page 472](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 39: show chassis environment Output Fields

Field Name	Field Description
<b>Class</b>	<p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> <li>• <b>Power:</b> Power information: <ul style="list-style-type: none"> <li>• (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Failed</b>, or <b>Absent</b>.</li> <li>• (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> <li>• (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> </ul> </li> <li>• <b>Temp:</b> Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.</li> <li>• <b>Pic:</b> On ACX4000 Routers, multiple temperature channels on a MIC. The status is: <b>OK</b> and the <b>Measurement</b> is in degrees Celsius (C) and Fahrenheit (F).</li> <li>• <b>Fan:</b> Fan status: <b>OK</b>, <b>Testing</b> (during initial power-on), <b>Failed</b>, or <b>Absent</b>. On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. <b>Measurement</b> indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only).</li> <li>• <b>Misc:</b> Information about other components of the chassis. <ul style="list-style-type: none"> <li>• On some routers, this field indicates the status of one or more additional components.</li> <li>• On the M40e, M160, and M320 router, <b>Misc</b> includes <b>CIP</b> (Connector Interface Panel). <b>OK</b> indicates that the CIP is present. <b>Absent</b> indicates that the CIP is not present.</li> <li>• On T Series routers, <b>Misc</b> includes <b>CIP</b> and <b>SPMB</b> (Switch Processor Mezzanine Board). <b>OK</b> indicates that the <b>CIP</b> or <b>SPMB</b> is present. <b>Absent</b> indicates that the <b>CIP</b> or <b>SPMB</b> is not present.</li> <li>• On PTX Series Packet Transport Switches, <b>Misc</b> includes the <b>SPMB</b> (Switch Processor Mezzanine Board). The SPMB is located on the control boards. <b>OK</b> indicates that the control board is present. <b>Absent</b> indicates that the control board is not present.</li> </ul> </li> </ul>
<b>Item</b>	(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).
<b>Status</b>	<p>(MX2010 and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The fans are operational.</li> <li>• <b>Testing:</b> The fans are being tested during initial power-on.</li> <li>• <b>Failed:</b> The fans have failed or the fans are not spinning.</li> <li>• <b>Absent:</b> The fan tray is not installed.</li> </ul> <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The power component is operational.</li> <li>• <b>Testing:</b> The power component is being tested during initial power-on.</li> <li>• <b>Check:</b> There is insufficient power---that is, fewer than the minimum required feeds are connected.</li> <li>• <b>Failed:</b> The inputs leads have failed.</li> <li>• <b>Absent:</b> The power component is not installed.</li> </ul>

Table 39: show chassis environment Output Fields (*continued*)

Field Name	Field Description
<b>Measurement</b>	(MX2010 and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.

## Sample Output

show chassis

<b>Release Information</b>	<p>Command introduced before Junos Release 7.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.1 for T4000 Core Routers.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos Release 9.6.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Switches only) Display environmental information about the Control Boards (CBs). For information about the meaning of “CBs” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
<b>Options</b>	<b>none</b> —Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

**interconnect-device**—(QFabric systems only) Display environmental information about the CBs on the Interconnect device.

**lcc-number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, display environmental information about the CBs in a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. For a TX Matrix Plus router, display environmental information about the CBs in a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (or switch-card chassis).

**sfc-number**—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Switches, replace **slot** with 0 or 1. On EX Series switches replace **slot** with 0, 1, or 2. On QFX Series switches, replace **slot** with 0 or 1.

**Output Fields** Table 40 on page 519 lists the output fields for the **show chassis environment cb** command. Output fields are listed in the approximate order in which they appear.

**Table 40: show chassis environment cb Output Fields**

Field Name	Field Description
<b>State</b>	<p>Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>—CB is online and running.</li> <li>• <b>Offline</b>— CB is powered down.</li> </ul> <p><b>NOTE:</b> On the EX8208 switch, the installation can include three CBs. See EX Series Switches Hardware and CLI Terminology Mapping.</p>
<b>Temperature</b>	<p>Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB.</p> <ul style="list-style-type: none"> <li>• <b>Temperature Intake</b>—Measures the temperature of the air intake to cool the power supplies.</li> <li>• <b>Temperature Exhaust</b>—Measures the temperature of the hot air exhaust.</li> </ul> <p><b>NOTE:</b> On the MX2010 and MX2020 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010 and MX2020 routers include intake and exhaust temperatures for multiple zones (<b>Intake A</b>, <b>Intake B</b>, <b>Intake C</b>, <b>Exhaust A</b>, <b>Exhaust B</b>, and <b>TCBC</b>).</p>
<b>Power</b>	<p>Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</p>
<b>BUS Revision</b>	<p>Revision level of the generic bus device. (Not on switches.)</p>
<b>FPGA Revision</b>	<p>Revision level of the field-programmable gate array (FPGA). (Not on switches.)</p>
<b>PMBus device</b> (on MX240, MX480, and MX960 routers with Enhanced MX SCB)	<p>Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB:</p> <ul style="list-style-type: none"> <li>• <b>Expected voltage</b></li> <li>• <b>Measured voltage</b></li> <li>• <b>Measured current</b></li> <li>• <b>Calculated power</b></li> </ul>

## show chassis environment fpc

<b>Syntax</b>	show chassis environment fpc <slot>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	show chassis environment fpc <fcc number> <slot>
<b>Syntax (MX Series Routers)</b>	show chassis environment fpc <slot> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis environment fpc <slot>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis environment fpc <slot>
<b>Syntax (QFX Series)</b>	show chassis environment fpc <fpc-slot> interconnect-device <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series switches only) Display environmental information about Flexible PIC Concentrators (FPCs).
<b>Options</b>	<p><b>none</b>—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached T1600 routers.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.</p> <p><b>fcc number</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display environmental information about the FPC in a T640 router (or line-card</p>

chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display environmental information about the FPC in a T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**slot or fpc-slot**—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the T1600 router by using only the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
```

```
user@host> show chassis environment fpc 9
```

- M120 router—Replace **slot** with a value from 0 through 5.
- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
  - EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotating Engine (SRE) module), or 6 through 9 (line card only).
  - EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Switch—Replace **fpc-slot** with 0 through 7.

<b>Output Fields</b>	<p><a href="#">Table 41 on page 538</a> lists the output fields for the <b>show chassis environment fpc</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 41: show chassis environment fpc Output Fields

Field Name	Field Description
<b>State</b>	<p>Status of the FPC:</p> <ul style="list-style-type: none"> <li>• <b>Unknown</b>—FPC is not detected by the router.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online.</li> <li>• <b>Ready</b>—FPC is in intermediate or transition state.</li> <li>• <b>Announce online</b>—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative.</li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Offline</b>—FPC is powered down.</li> <li>• <b>Diagnostics</b>—FPC is set to operate in diagnostics mode.</li> </ul>
<b>Temperature</b>	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
<b>PMB Temperature</b>	(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).
<b>Temperature Intake</b>	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
<b>Temperature Top</b>	(T Series routers only) Temperature of the air flowing past the top of the FPC.
<b>Temperature Exhaust</b>	<p>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.</p> <p>The PTX Series Packet Transport Switches, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (<b>Exhaust A</b> and <b>Exhaust B</b>).</p>
<b>Temperature Bottom</b>	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
<b>TL <i>n</i> Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
<b>TQ <i>n</i> Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
<b>Temperature MMBO</b>	(T640 router only) Temperature of the air flowing past the type 3 FPC.
<b>Temperature MMB1</b>	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
<b>Power</b>	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
<b>CMB Revision or BUS revision</b>	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

## Sample Output

## show chassis environment pem

<b>Syntax</b>	show chassis environment pem <slot>
<b>Syntax (ACX4000 Router)</b>	show chassis environment pem
<b>Syntax (TX Matrix Routers)</b>	show chassis environment pem <lcc number   scc> <slot>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis environment pem <lcc number   sfc number> <slot>
<b>Syntax (MX Series Router)</b>	show chassis environment pem <slot> <all-members> <local> <member member-id>
<b>Syntax (QFX Series)</b>	show chassis environment pem <slot (interconnect-device name slot )   (node-device name)>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Display Power Entry Module (PEM) environmental status information.

**NOTE:** The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

- Options**
- none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached T1600 routers.
  - all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.
  - interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display environmental information about the PEM in a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display environmental information about the PEM in a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.

**local**—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.

**scc**—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).

**slot** —(Optional) Display environmental information about an individual PEM. Replace ***slot*** with **0** or **1**.

**Output Fields** Table 42 on page 565 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

**Table 42: show chassis environment pem Output Fields**

Field Name	Field Description
<b>PEM slot status</b>	Number of the PEM slot.
<b>State</b>	Status of the PEM.
<b>Temperature</b>	Temperature of the air flowing past the PEM.
<b>AC Input</b>	Status of the AC input for the specified component
<b>AC Output</b>	Status of the AC output for the specified component.
<b>DC input</b>	Status of the DC input for the specified component.
<b>DC output</b>	Status of the DC output for the specified component.
<b>Load</b>	(Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.
<b>Voltage</b>	(M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.
<b>Current</b>	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.
<b>Power</b>	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.
<b>SCG/CB/SIB</b>	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board.
<b>FAN</b>	(T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.

## Sample Output

show chassis  
environment pem  
(M40e Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State           Online
  Temperature      OK

<b>Syntax</b>	show chassis environment routing-engine <slot>
<b>Syntax (TX Matrix Routers)</b>	show chassis environment routing-engine <lcc number   scc> <slot>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis environment routing-engine <lcc number   sfc number> <slot>
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis environment routing-engine <slot>
<b>Syntax (MX Series Routers)</b>	show chassis environment routing-engine <slot> <all-members> <local> <member member-id>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis environment routing-engine <slot>
<b>Syntax (QFX Series)</b>	show chassis environment routing-engine interconnect-device <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.1 for the T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	Display Routing Engine environmental status information.
<b>Options</b>	<b>none</b> —Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached T1600 routers.  <b>all-members</b> —(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix routers only) (Optional) On a TX Matrix router, display environmental information about the Routing Engine in a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display environmental information about the Routing Engine in a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace ***member-id*** with the value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX2020 routers, and T Series routers, replace **slot** with 0 or 1. On M5, M7i, M10, and M40 routers and on the J Series router, replace **slot** with 0. On EX3200 and EX4200 standalone switches, replace **slot** with 0. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace **slot** with 0 or 1. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Switches, replace **slot** with 0 or 1.

**Output Fields** Table 43 on page 574 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 43: show chassis environment routing-engine Output Fields**

Field Name	Field Description
Routing engine slot status	Number of the Routing Engine slot: 0 or 1.
State	Status of the Routing Engine: <ul style="list-style-type: none"> <li>• <b>Online Master</b>—Routing Engine is online, operating as Master.</li> <li>• <b>Online Standby</b>—Routing Engine is online, operating as Standby.</li> <li>• <b>Offline</b>—Routing Engine is offline.</li> </ul>
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	(PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.

## Sample Output

**show chassis

## show chassis firmware

---

<b>Syntax</b>	show chassis firmware
<b>Syntax (TX Matrix Routers)</b>	show chassis firmware <lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis firmware <lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Routers)</b>	show chassis firmware <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis firmware
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis firmware
<b>Syntax (QFX Series)</b>	show chassis firmware interconnect-device <i>name</i> node-device <i>name</i>
<b>Syntax (ACX Series Universal Access Routers)</b>	show chassis firmware
<b>Syntax (EX Series Switches)</b>	show chassis firmware <detail>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.4 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced for EX8200 switches in Junos OS Release 10.2 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.
<b>Description</b>	On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

- Options** **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the T1600 routers connected to the TX Matrix Plus router.
- all-members**—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.
- interconnect-device *name***—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.
- lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.
- local**—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.
- member *member-id***—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.
- node-device**—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.
- scc**—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (or switch-card chassis).
- sfc *number***—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.
- detail**—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

**Required Privilege Level** view

**Output Fields** Table 45 on page 590 lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

**Table 45: show chassis firmware Output Fields**

Field Name	Field Description
Part	(MX Series, MX2010, and MX2020 routers) Chassis part name.
Type	(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: <b>ROM</b> or <b>O/S</b> . On switches: <b>uboot</b> or <b>loader</b> .
Version	(MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.
FPC	( <i>detail</i> option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.
Boot	( <i>detail</i> option only) Version of the SYSPLD.
PoE	( <i>detail</i> option only) Version of the PoE firmware.

Table 45: show chassis firmware Output Fields (*continued*)

Field Name	Field Description
PFE-<number>	( <i>detail</i> option only) Version of the PFE used in the switch.
PHY-	( <i>detail</i> option only) Version of the physical layer device (PHY) used in the switch.
microcode	( <i>detail</i> option only) Microcode of the physical layer devices (PHY) used in the switch.
uboot	( <i>detail</i> option only) Version of the u-boot used in the switch.
loader	( <i>detail</i> option only) Version of the loader used in the switch.

## show chassis fpc

<b>Syntax</b>	show chassis fpc <detail <slot>>   <pic-status <slot>>
<b>Syntax (EX Series Switches)</b>	show chassis fpc <detail <fpc-slot>>   <pic-status <fpc-slot>> <fpc-slot>
<b>Syntax (T4000 Routers)</b>	show chassis fpc <detail <fpc-slot>> <pic-status <fpc-slot>>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	show chassis fpc <detail <fpc-slot>>   <pic-status <fpc-slot>> <slot>
<b>Syntax (MX Series Routers)</b>	show chassis fpc <detail <slot>>   <pic-status <slot>> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis fpc <slot> detail   <detail <slot>>   <pic-status <slot>> <fpc-slot>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis fpc < slot> detail   <detail <slot>>   <pic-status <slot>> <fpc-slot>
<b>Syntax (QFX Series)</b>	show chassis fpc <detail> <interconnect-device <i>name</i> <fpc-slot <i>fpc-slot</i> >> <node-device <i>name</i> >
<b>Syntax (PTX Series Packet Transport Switches)</b>	show chassis fpc <detail <fpc-slot>>   <pic-status <fpc-slot>> <fpc-slot>
<b>Syntax (ACX Series Universal Access Routers)</b>	show chassis fpc <detail <fpc-slot>>   <pic-status <fpc-slot>> <fpc-slot>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**Description** Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

**Options** **none**—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached T1600 routers in the routing matrix.

**NOTE:** In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
```

Utilization (%)	Temp	CPU	Utilization (%)	Memory
Slot State	(C)	Total	Interrupt	DRAM (MB) Heap
Buffer				
0 Empty				
1 Empty				
2 Empty				
3 Empty				
4 Empty				
5 Offline	---	Hard FPC error---		
6 Empty				
7 Online	26	4	0	1024 0
32				

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
4 alarms currently active
```

Alarm time	Class	Description
2011-03-24 00:52:51 UTC	Major	FPC 5 Hard errors
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:51:26 UTC	Minor	Loss of communication with Backup RE

**NOTE:** On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation the alarms.

The following sample output shows the FPC status after the **enhanced-mode** statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
```

	Temp	CPU Utilization (%)		Memory	
Utilization (%)					
Slot State	(C)	Total	Interrupt	DRAM (MB)	Heap
Buffer					
0 offline		---FPC misconfiguration---			
1 offline		---FPC misconfiguration---			
2 offline		---FPC misconfiguration---			
3 Empty					
4 Empty					
5 Online	66	50	0	2816	29
27					

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
3 alarms currently active
Alarm time          Class  Description
2011-03-24 00:52:51 PST Major  FPC 1 misconfig
2011-03-24 00:52:31 PST Major  FPC 2 misconfig
2011-03-24 00:52:31 PST Major  FPC 3 misconfig
```

**detail**—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see ***fpc-slot*** or ***slot***).

**all-members**—(MX Series routers only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

***fpc-slot***—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only)—On a TX Matrix router, if you specify the number of the T640 router (or line-card chassis) by using the ***lcc-number*** option (the recommended method), replace ***fpc-slot*** with a value from 0 through 7. Otherwise, replace ***fpc-slot*** with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router (or line-card chassis)

by using the **lcc number** option (the recommended method), replace **fpc-slot** with a value from 0 through 7. Otherwise, replace **fpc-slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace **fpc-slot** with a value from 0 through 5.
- MX80 router—Replace **fpc-slot** with a value from 0 through 1.
- MX240 router—Replace **fpc-slot** with a value from 0 through 2.
- MX480 router—Replace **fpc-slot** with a value from 0 through 5.
- MX-960 router—Replace **fpc-slot** with a value from 0 through 11.
- MX2010 router—Replace **fpc-slot-number** with a value from 0 through 9.
- MX2020 router—Replace **fpc-slot-number** with a value from 0 through 19.
- Other routers—Replace **fpc-slot** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **fpc-slot** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **fpc-slot** with a value from 0 through 9.
  - EX6210 switches—Replace **fpc-slot** with a value from 0 through 9.
  - EX8208 switches—Replace **fpc-slot** with a value from 0 through 7.
  - EX8216 switches—Replace **fpc-slot** with a value from 0 through 15.
- QFX Series:
  - QFX3500 switches—Replace **fpc-slot** with 0.
  - QFabric systems—Replace **fpc-slot** with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Switches:
  - PTX5000 Packet Transport Switch—Replace **fpc-slot** with a value from 0 through 7.
- ACX Series Universal Access Routers:
  - ACX1000 and ACX2000 Universal Access Routers—Replace **fpc-slot** with 0.

**local**—(MX Series routers only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**node-device name**—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

**pic-status**—(Optional) Display status information for all PICs or for the PIC in the specified slot (see *fpc-slot*).

**NOTE:** On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the `show chassis fpc` command with the `pic-status` option, the CLI displays the string “Not Supported” for 10x10GE(LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0   Online      E2-FPC Type 1
  PIC 0   Online      1x G/E SFP, 1000 BASE
  PIC 1   Online      Adaptive Services-II
  PIC 2   Online      1x G/E IQ, 1000 BASE
  PIC 3   Online      1x G/E IQ, 1000 BASE
Slot 1   Online      FPC Type 3-ES
  PIC 0   Present     UNUSED- Not Supported
Slot 2   Online      FPC Type 4-ES
  PIC 0   Offline     4x OC-192 SONET XFP
  PIC 1   Present     10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4   Offline     FPC Type 1-ES
Slot 5   Offline     FPC Type 2-ES
Slot 6   Online      E2-FPC Type 3
  PIC 0   Online      1x OC-192 SONET XFP
  PIC 1   Online      4x OC-48 SONET
  PIC 2   Online      4x OC-48 SONET
  PIC 3   Online      MultiServices 500
Slot 7   Online      FPC Type 4-ES
  PIC 0   Online      4x 10GE (LAN/WAN) XFP
  PIC 1   Online      4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (/var/log/messages) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr  5 08:47:36  router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
PIC 1 in FPC 2 (type 763, version 257) is not supported
```

**lcc number**—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display status information for a T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display status information for a T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace *number* with a value from 0 through 3.

**Output Fields** Table 46 on page 605 lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

**Table 46: show chassis fpc Output Fields**

Field Name	Field Description	Level of Output
<b>Slot or Slot State</b>	<p>Slot number and state. The state can be one of the following conditions:</p> <ul style="list-style-type: none"> <li>• <b>Dead</b>—Held in reset because of errors.</li> <li>• <b>Diag</b>—Slot is being ignored while the FPC is running diagnostics.</li> <li>• <b>Dormant</b>—Held in reset.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Offline</b>—(PTX Series Packet Transport Switches only) One of the following two states is displayed: <ul style="list-style-type: none"> <li>• <b>FPC offlined due to unreachable destinations</b></li> <li>• <b>FPC Offlined due to degraded FPC action</b></li> </ul> </li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either <b>Hardware Not Supported</b> or <b>Hardware Not In Right Slot</b>. The FPC is coming up but not yet online.</li> <li>• <b>Probed</b>—Probe is complete; awaiting restart of the Packet Forwarding Engine.</li> <li>• <b>Probe-wait</b>—Waiting to be probed.</li> </ul>	all levels
<b>Logical slot</b>	Slot number.	all levels
<b>Temp (C) or Temperature</b>	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels all levels

Table 46: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Temperature (PTX Series)</b>	On PTX Series Packet Transport Switches, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: <ul style="list-style-type: none"> <li>• Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC.</li> <li>• Temperature (Intake)—Temperature of the air flowing into the chassis.</li> <li>• Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</li> <li>• Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC.</li> <li>• Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC.</li> </ul>	<b>detail</b>
<b>Total CPU Utilization (%)</b>	Total percentage of CPU being used by the FPC's processor.	all levels
<b>Interrupt CPU Utilization (%)</b>	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
<b>Memory DRAM (MB)</b>	Total DRAM, in megabytes, available to the FPC's processor.	none specified
<b>Heap Utilization (%)</b>	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).  <b>NOTE:</b> On MX Series routers in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.	none specified
<b>Buffer Utilization (%)</b>	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
<b>Total CPU DRAM</b>	Amount of DRAM available to the FPC's CPU.	<b>detail</b>
<b>Total RLDRAM</b>	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	<b>detail</b>
<b>Total DDR DRAM</b>	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	<b>detail</b>
<b>Total SRAM</b>	Amount of static RAM (SRAM) used by the FPC's CPU.	<b>detail</b>
<b>Total SDRAM</b>	Total amount of memory used for storing packets and notifications.	<b>detail</b>
<b>I/O Manager ASICs information</b>	I/O Manager version number, manufacturer, and part number.	<b>detail</b>
<b>Start time</b>	Time when the Routing Engine detected that the FPC was running.	<b>detail</b>

Table 46: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Uptime</b>	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	<b>detail</b>
<b>PIC type</b>	( <b>pic-status</b> output only) Type of PIC.	none specified

## Sample Output

### show chassis fpc (EX6210 Switch)

```
user@switch> show chassis fpc
```

Slot	State	Temp (C)	CPU Total	Utilization (%) Interrupt	Memory DRAM (MB)	Utilization (%) Heap	Buffer
0	Empty						
1	Online	7	5	0	1024	0	32
2	Empty						
3	Empty						
4	Online	25	17	2	2048	0	30
5	Online	25	3	0	2048	0	24
6	Online	6	5	0	1024	0	32
7	Empty						
8	Empty						
9	Online	8	7	0	1024	0	32

### show chassis fpc (M10 Router)

```
user@host> show chassis fpc
```

FPC status:

Slot	State	Temp (C)
0	Online	27
1	Online	28

### show chassis fpc (M20 Router)

```
user@host> show chassis fpc
```

FPC status:

Slot	State	Temp (C)	CPU Total	Utilization (%) Interrupt	Memory DRAM (MB)	Utilization (%) Heap	Buffer
0	Empty	0	0	0	0	0	0
1	Online	38	0	0	8	0	4
2	Online	35	0	0	8	0	3
3	Empty	0	0	0	0	0	0

### show chassis fpc detail (M Series Routers)

```
user@host> show chassis fpc detail 1
```

Slot 1 information:

State	Online
Temperature	48 degrees C
Total CPU DRAM	32 MB
Total SRAM	4 MB
Total SDRAM	256 MB
I/O Manager ASICs information	Version 2.0, Foundry IBM, Part number 0
I/O Manager ASICs information	Version 2.0, Foundry IBM, Part number 0
Start time	2000-02-08 02:18:49 UTC
Uptime	14 hours, 41 minutes, 41 seconds

### show chassis fpc detail (MX80 Router)

```
user@host> show chassis fpc detail
```

Slot 0 information:

State	Online
Temperature	47 degrees C / 116 degrees F
Total CPU DRAM	1024 MB
Total SRAM	331 MB
Total SDRAM	1280 MB
Start time	2010-02-08 12:25:33 PST
Uptime	2 hours, 13 minutes, 19 seconds

Slot 1 information:

State	Online
Temperature	47 degrees C / 116 degrees F

```

Total CPU DRAM          1024 MB
Total SRAM              331 MB
Total SDRAM            1280 MB
Start time              2010-02-08 12:25:33 PST
Uptime                  2 hours, 13 minutes, 19 seconds

```

#### show chassis fpc (MX240 Router)

```

user@host> show chassis fpc

```

Slot	State	Temp	CPU (C)	Utilization (%) Total	Interrupt	Memory DRAM (MB)	Utilization (%) Heap	Buffer
0	Empty							
1	Online		34	6	0	1024	18	30
2	Online		33	9	0	1024	24	30

#### show chassis fpc (MX480 Router)

```

user@host> show chassis fpc

```

Slot	State	Temp (C)	CPU Total	Utilization (%) Interrupt	Memory DRAM (MB)	Utilization (%) Heap	Buffer
0	Empty

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>models</b> option introduced in Junos OS Release 8.2.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	<p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> <li>On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <b>number</b> is always 0.</li> <li>On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <b>number</b> equals the member ID, from 0 through 9.</li> <li>On EX8208 and EX8216 switches—Refers to a line card; FPC <b>number</b> equals the slot number for the line card.</li> </ul> <p>On a QFX3500 standalone switch, both the FPC and FPC <b>number</b> are always 0.</p> <p>On Type 5 FPC on T4000 routers, there are no <b>top temperature sensor</b> or <b>bottom temperature sensor</b> parameters. Instead, <b>fan intake temperature sensor</b> and <b>fan exhaust temperature sensors</b> parameters are displayed.</p>
<b>Options</b>	<p><b>none</b>—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached T1600 routers.</p> <p><b>clei-models</b>—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).</p> <p><b>detail</b>—(Optional) Include RAM and disk information in output.</p> <p><b>extensive</b>—(Optional) Display ID EEPROM information.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.</p>

**interconnect-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member *member-id***—(MX Series routers only) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

**Table 47: Routing Engines Displaying DIMM Information**

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

**Output Fields** [Table 48 on page 633](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 48: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
<b>Item</b>	<p>Chassis component:</p> <ul style="list-style-type: none"> <li>(EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See EX Series Switches Hardware and CLI Terminology Mapping.</li> <li>(MX Series routers)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB).</li> <li>(M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller.</li> <li>(M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB.</li> <li>(QFX Series)—Information about the chassis, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs).</li> <li>(PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal).</li> <li>(MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.</li> </ul>	All levels
<b>Version</b>	Revision level of the chassis component.	All levels
<b>Part number</b>	Part number of the chassis component.	All levels
<b>Serial number</b>	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
<b>Assb ID or Assembly ID</b>	( <b>extensive</b> keyword only) Identification number that describes the FRU hardware.	<b>extensive</b>

Table 48: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Assembly Version</b>	( <b>extensive</b> keyword only) Version number of the FRU hardware.	<b>extensive</b>
<b>Assembly Flags</b>	( <b>extensive</b> keyword only) Flags.	<b>extensive</b>
<b>FRU model number</b>	( <b>clei-models</b> , <b>extensive</b> , and <b>models</b> keyword only) Model number of the FRU hardware component.	none specified
<b>CLEI code</b>	( <b>clei-models</b> and <b>extensive</b> keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
<b>EEPROM Version</b>	ID EEPROM version used by the hardware component: <b>0x00</b> (version 0), <b>0x01</b> (version 1), or <b>0x02</b> (version 2).	<b>extensive</b>
<b>Description</b>	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> <li>• Type of power supply.</li> <li>• Type of PIC. If the PIC type is not supported on the current software release, the output states <b>Hardware Not Supported</b>.</li> <li>• Type of FPC: <b>FPC Type 1</b>, <b>FPC Type 2</b>, <b>FPC Type 3</b>, <b>FPC Type 4</b>, or <b>FPC TypeOC192</b>.</li> </ul> <p>On EX Series switches, a brief description of the FPC.</p> <p>On the J Series routers, the FPC type corresponds to the Physical Interface Module (PIM). The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> <li>• <b>2x FE</b>—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM</li> <li>• <b>4x FE</b>—4-port Fast Ethernet ePIM</li> <li>• <b>1x GE Copper</b>—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port)</li> <li>• <b>1x GE SFP</b>—SFP Gigabit Ethernet ePIM (one fiber port)</li> <li>• <b>4x GE Base PIC</b>—Four built-in Gigabit Ethernet ports on a J4350 or J6350 chassis (fixed PIM)</li> <li>• <b>2x Serial</b>—Dual-port serial PIM</li> <li>• <b>2x T1</b>—Dual-port T1 PIM</li> <li>• <b>2x E1</b>—Dual-port E1 PIM</li> <li>• <b>2x CTIE1</b>—Dual-port channelized T1/E1 PIM</li> <li>• <b>1x T3</b>—T3 PIM (one port)</li> <li>• <b>1x E3</b>—E3 PIM (one port)</li> <li>• <b>4x BRI S/T</b>—4-port ISDN BRI S/T PIM</li> <li>• <b>4x BRI U</b>—4-port ISDN BRI U PIM</li> <li>• <b>1x ADSL Annex A</b>—ADSL 2/2+ Annex A PIM (one port, for POTS)</li> <li>• <b>1x ADSL Annex B</b>—ADSL 2/2+ Annex B PIM (one port, for ISDN)</li> <li>• <b>2x SHDSL (ATM)</b>—G SHDSL PIM (2-port two-wire module or 1-port four-wire module)</li> </ul>	All levels

Table 48: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> <li>• <b>1x TGM550</b>—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog <b>LINE</b> ports, and two analog <b>TRUNK</b> ports)</li> <li>• <b>1x DS1 TIM510</b>—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup)</li> <li>• <b>4x FXS, 4x FXO, TIM514</b>—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog <b>LINE</b> ports and four analog <b>TRUNK</b> ports)</li> <li>• <b>4x BRI TIM521</b>—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports)</li> <li>• <b>Crypto Accelerator Module</b>—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services</li> <li>• <b>MPC M16x10GE</b>—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.)</li> <li>• For hosts, the Routing Engine type.</li> <li>• For small form-factor pluggable transceiver (SFP) modules, the type of fiber: <b>LX</b>, <b>SX</b>, <b>LH</b>, or <b>T</b>.</li> <li>• LCD description for EX Series switches (except EX2200 switches).</li> <li>• <b>MPC2</b>—1-port MPC2 that supports two separate slots for MICs.</li> <li>• <b>MPC3E</b>—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs.</li> <li>• 100GBASE-LR4, pluggable CFP optics</li> <li>• Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy.</li> <li>• Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs).</li> <li>• <b>MPC4E</b>—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE) on MX2020, MX960, MX480, and MX240 routers.</li> <li>• LCD description for MX Series routers</li> </ul>	

## Sample Output

## show chassis lcd

show chassis lcd (EX Series)	<pre>show chassis lcd &lt;fpc-slot &lt;fpc-slot-number&gt;&gt; &lt;menu &lt;(all-members   local   member member-id)&gt;&gt;</pre>
show chassis lcd (QFX Series)	<pre>show chassis lcd &lt;fpc-slot &lt;fpc-slot-number&gt;&gt; &lt;interconnect-device name&gt; &lt;node-device name&gt;</pre>
Release Information	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>menu</b> option introduced in Junos OS Release 10.2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	<p>Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, and the QFX Series. Display the status of the currently selected port parameter of the Status LED for each network port on the device.</p>
Options	<p><b>none</b>—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.</p> <p><b>fpc-slot &lt;fpc-slot-number&gt;</b>—(Optional) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no <b>fpc-slot-number</b> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <b>fpc-slot-number</b>. Output for these options is the same as for the <b>none</b> option.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <b>fpc-slot-number</b> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <b>fpc-slot-number</b> value is specified (it equals the <b>member-id</b> value), display the information for the specified member.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the <b>fpc-slot-number</b> value.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p>

**interconnect-device *name***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

**menu**—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

**menu all-members**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

**menu local**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

**menu member *member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

**node-device *name***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

**Output Fields**

[Table 49 on page 737](#) lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

Table 49: show chassis lcd Output Fields

Field Name	Field Description
<b>member</b> <i>number</i> (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
<b>Front panel contents for slot</b>  <b>Front panel contents</b> (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	<p>FPC slot number of the switch whose content is being displayed. The number is always <b>0</b>, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.</p> <p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the <b>member</b> <i>number</i> field for each member device in the EX8200 Virtual Chassis.</p>
<b>LCD screen</b>	<p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays <b>RE</b> and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet (EX3200 and EX4200 switches only)</li> </ul>
<b>LEDs status</b>	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
<b>Interface</b>	Names of the interfaces on the switch.
<b>LED (ADM/SPD/DPX/POE)</b>	<p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> The XRE200 External Routing Engine always displays the <b>NA</b> parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>NA</b>—Not applicable.</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>fpcx</b>	On standalone EX Series switches and the QFX3500 switch, always <b>0</b> . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

## show chassis led

show chassis led (EX Series)	show chassis led <fpc-slot < <i>fpc-slot-number</i> >>
show chassis led (QFX Series)	show chassis led <fpc-slot < <i>fpc-slot-number</i> >> interconnect-device <i>name</i> node-device <i>name</i>
Release Information	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.
Options	<p><b>none</b>—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) (Not on EX2200 switches) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches) Display the status of the chassis status LEDs for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.</li> <li>(EX4200 switches in a Virtual Chassis with two or more members) If no <i>fpc-slot-number</i> value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the status of the chassis status LEDs for the specified member.</li> <li>(EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li> </ul> <p><b>interconnect-device <i>name</i></b>—</p> <p>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.</p> <p><b>node-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.</p>
Required Privilege Level	view

**Output Fields**

Table 36 on page 419 lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

**Table 50: show chassis led Output Fields**

Field Name	Field Description
<b>Front panel contents for slot</b>	FPC slot number of the device whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
<b>Front panel contents</b> (EX8200 Switches)	
<b>Front Panel Module Information</b> (QFabric system QFX3008-I Interconnect device)	On EX8200 switches, no slot number is displayed.
<b>Front panel contents for</b> (QFabric system Node devices and QFX3600-I Interconnect devices)	On QFabric system Node devices, the name of the Node device whose content is being displayed.
<b>Alarms LED</b>	(EX Series switches only) Displays status of the ALM LED: <ul style="list-style-type: none"> <li>• Off—No alarm has been configured.</li> <li>• Green—No alarm has been triggered.</li> <li>• Red—Major alarm.</li> <li>• Yellow—Minor alarm</li> </ul>

Table 50: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>System LED</b>	<p>(EX Series switches only) Displays status of the SYS LED:</p> <ul style="list-style-type: none"> <li>• Off—Switch is powered off.</li> <li>• Green—Switch is operating normally.</li> <li>• Yellow—Switch is booting.</li> </ul>
<b>Master LED:</b>	<p>Displays status of the MST LED (on EX3200, EX4200, and EX8200 switches):</p> <ul style="list-style-type: none"> <li>• Green—On an EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational.</li> <li>• Off <ul style="list-style-type: none"> <li>• On an EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration.</li> <li>• On EX3200, standalone EX4200, and EX8200 switches, indicates that the Routing Engine is not operational.</li> </ul> </li> </ul>
<b>Mode LED:</b>	<p>(EX Series switches only) On an EX2200 switch only, displays the currently selected port parameter of the Status LED:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>Status/Beacon LED</b>	<p>(QFX Series only) Displays the system status as indicated by the Status LED on the chassis. For more information, see:</p> <ul style="list-style-type: none"> <li>• Chassis Status LEDs on a QFX3500 Device</li> <li>• Chassis Status LEDs in the QFX3600 and QFX3600-I Device</li> </ul>
<b>LINK/SPEED LED</b>	<p>(QFX Series only) Displays the link status and speed of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• Management Port LEDs on a QFX3500 Device</li> <li>• Management Port LEDs in the QFX3600 and QFX3600-I Device</li> </ul>
<b>ACTIVITY LED</b>	<p>(QFX Series only) Displays the activity status of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• Management Port LEDs on a QFX3500 Device</li> <li>• Management Port LEDs in the QFX3600 and QFX3600-I Device</li> </ul>
<b>STATUS LED</b>	<p>(QFX Series only) Displays the link status of an interface as indicated by the ST LED. For more information, see:</p> <ul style="list-style-type: none"> <li>• Control Board LEDs on a QFX3008-I Interconnect Device</li> <li>• Access Port and Uplink Port LEDs on a QFX3500 Device</li> <li>• Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</li> </ul>

Table 50: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>LINK/ACTIVITY LED</b>	<p>(QFX Series only) Displays link activity or faults on an interface as indicated by the LA LED. For more information, see:</p> <ul style="list-style-type: none"> <li>Access Port and Uplink Port LEDs on a QFX3500 Device</li> <li>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</li> </ul>
<b>Status LED</b>	<p>(QFX3008-I Interconnect device only)</p> <ul style="list-style-type: none"> <li>Displays the system status as indicated by the STATUS LED on the front panel of the chassis. For more information, see Chassis Status LEDs on a QFX3008-I Interconnect Device.</li> <li>Displays the status of a Control Board as indicated by the STATUS LED on the Control Board. For more information, see Control Board LEDs on a QFX3008-I Interconnect Device.</li> </ul>
<b>Power LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of system power on the device. For more information, see Chassis Status LEDs on a QFX3008-I Interconnect Device.</p>
<b>Major Alarm LED</b>	<p>(QFX3008-I Interconnect device only) Displays whether a critical error condition that requires immediate action exists on the device. For more information, see Chassis Status LEDs on a QFX3008-I Interconnect Device.</p>
<b>Minor Alarm LED</b>	<p>(QFX3008-I Interconnect device only) Displays whether a noncritical condition that requires monitoring or maintenance exists on the device. For more information, see Chassis Status LEDs on a QFX3008-I Interconnect Device.</p>
<b>Fan 0 LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of fan trays on the device. For more information, see Chassis Status LEDs on a QFX3008-I Interconnect Device.</p>
<b>Fan 1 LED</b>	
<b>Fan 2 LED</b>	
<b>Fan 3 LED</b>	
<b>Fan 4 LED</b>	
<b>Fan 5 LED</b>	
<b>Fan 6 LED</b>	
<b>Fan 7 LED</b>	
<b>Fan 8 LED</b>	
<b>PEM 0 LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of power supplies on the device. For more information, see Chassis Status LEDs on a QFX3008-I Interconnect Device.</p>
<b>PEM 1 LED</b>	
<b>PEM 2 LED</b>	
<b>PEM 3 LED</b>	
<b>PEM 4 LED</b>	

Table 50: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>LED info for</b>	(QFX3008-I Interconnect device only) Displays the LED information for a Control Board.
<b>Mastership LED</b>	(QFX3008-I Interconnect device only) Displays status of the MASTER LED on a Control Board. For more information, see Control Board LEDs on a QFX3008-I Interconnect Device.
<b>Interface</b>	Names of the interfaces on the device.
<b>LED (ADM/SPD/DPX/POE)</b>	<p>(EX Series switches only) State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> EX4500 and EX8200 switches do not have the POE port parameter.</p> <ul style="list-style-type: none"><li>• <b>ADM</b>—Administrative</li><li>• <b>SPD</b>—Speed</li><li>• <b>DPX</b>—Duplex</li><li>• <b>POE</b>—Power over Ethernet</li></ul>

## show chassis location

<b>Syntax</b>	show chassis location
<b>Syntax (TX Matrix Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc <i>number</i> lcc <i>number</i> )   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc <i>number</i> lcc <i>number</i> )   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show chassis location <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
<b>Options</b>	<p><b>none</b>—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached T1600 routers.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.</p> <p><b>fpc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.</p> <p><b>interface by-name <i>name</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (or line-card chassis) number associated with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and T1600 router (or line-card chassis) number associated with the specified interface.</p> <p><b>interface by-slot fpc <i>number</i> lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by</p>

specifying its local FPC number and T640 router (or line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and T1600 router (or line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace **number** with a value from **0** through **7**.
- For **lcc**, replace **number** with a value from **0** through **3**.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace **number** with a value from **0** through **3**.

**local**—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of **0** or **1**.

**node-device name**—(QFabric systems only) (Optional) Display the physical location of the Node device.

**scc**—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level** view

<b>Output Fields</b>	<a href="#">Table 53 on page 767</a> lists the output fields for the <b>show chassis nonstop-upgrade node-group</b> command. Output fields are listed in the approximate order in which they appear.

**Table 53: show chassis nonstop-upgrade node-group Output Fields**

Field Name	Field Description
<b>Item</b>	Node device slot number.
<b>Status</b>	State of Node device: <ul style="list-style-type: none"> <li>• <b>Error</b>—Node device is in an error state.</li> <li>• <b>Offline</b>—Node device is powered down.</li> <li>• <b>Online</b>—Node device is online and running.</li> </ul>
<b>Reason</b>	Reason for the state (if the line card is offline).

## Sample Output

**show chassis  
nonstop-upgrade  
node-group**

```
user@qfabric> show chassis nonstop-upgrade node-group NW-NG-0
Item           Status      Reason
P1550-C       Online
```

## show chassis pic

<b>Syntax</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> &lt;fcc <i>number</i>&gt;</code>
<b>Syntax (MX Series Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> &lt;all-members&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt;</code>
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (QFX Series)</b>	<code>show chassis pic &lt;interconnect-device <i>name</i> (fpc-slot <i>slot-number</i>   pic-slot <i>slot-number</i>)&gt; &lt;node-device <i>name</i> pic-slot <i>slot-number</i>&gt;</code>
<b>Syntax (ACX Series Universal Access Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
<b>Options</b>	<p><b>fpc-slot <i>slot-number</i></b>—Display information about the PIC in this particular FPC slot:</p> <ul style="list-style-type: none"> <li>On a TX Matrix router, if you specify the number of the T640 router by using the <b>fcc <i>number</i></b> option (the recommended method), replace <b><i>slot-number</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot-number</i></b> with a value from 0 through 31.</li> </ul> <p>Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the <b>fcc <i>number</i></b> option (the recommended method), replace <b><i>slot-number</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot-number</i></b> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host&gt; show chassis pic fpc-slot 1 fcc 1 pic-slot 1 user@host&gt; show chassis pic fpc-slot 9 pic-slot 1 </pre>

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display PIC information for the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace ***slot-number*** with a value from 0 through 3. For EX3200 and EX4200 switches, replace ***slot-number*** with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace ***slot-number*** with 0. For the QFX3500 standalone switch and the QFabric system, replace ***slot-number*** with 0 or 1.

**Output Fields** Table 54 on page 771 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

**Table 54: show chassis pic Output Fields**

Field Name	Field Description
Type	PIC type.  <b>NOTE:</b> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as <b>MIC-3D-1STM64-XFP</b> and with the SONET framing mode, the type is displayed as <b>MIC-3D-1OC192-XFP</b> . By default, the 1-port OC192/STM64 MICs displays the type as <b>MIC-3D-1OC192-XFP</b> .
ASIC type	Type of ASIC on the PIC.
State	Status of the PIC. State is displayed only when a PIC is in the slot. <ul style="list-style-type: none"> <li>• <b>Online</b>— PIC is online and running.</li> <li>• <b>Offline</b>—PIC is powered down.</li> </ul>
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: <b>Layer-2</b> or <b>Layer-3</b> .
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: <b>LH</b> , <b>LX</b> , or <b>SX</b> .
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	Port-level information for the PIC. <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of optical transceiver installed.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction</li> </ul>

Table 54: show chassis pic Output Fields (*continued*)

Field Name	Field Description
<b>PIC Port Information (MX960 Router Bidirectional Optics )</b>	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> <li>• BX10-10-km bidirectional optics.</li> <li>• BX40-40-km bidirectional optics.</li> <li>• SFP-LX-40-km SFP optics.</li> </ul> </li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.</li> </ul>
<b>PIC Port Information (Next-Generation SONET/SDH SFP)</b>	<p>Port-level information for the next-generation SONET/SDH SFP PIC.</p> <ul style="list-style-type: none"> <li>• Port—Port number.</li> <li>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed.</li> <li>• Fiber type—Type of fiber: <b>SM</b> (single-mode) or <b>MM</b> (multimode).</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.</li> </ul>
<b>Multirate Mode</b>	Rate-selectability status for the MIC: <b>Enabled</b> or <b>Disabled</b> .
<b>Channelization</b>	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

## Sample Output

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	Display the status of the Routing Engine.

**Options** **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached T1600 routers.

**all-members**—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

**bios**—(Optional) Display the (BIOS) firmware version.

**interconnect-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.

**local**—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace ***member-id*** with a value of **0** or **1**.

**node-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

**scc**—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with **0**.

**slot**—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace ***slot*** with **0** or **1**. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

**Output Fields** [Table 55 on page 783](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 55: show chassis routing-engine Output Fields**

Field Name	Field Description
<b>Slot</b>	(Systems with single and multiple Routing Engines) Slot number.
<b>Current state</b>	(Systems with multiple Routing Engines) Current state of the Routing Engine: <b>Master</b> , <b>Backup</b> , or <b>Disabled</b> .
<b>Election priority</b>	(Systems with multiple Routing Engines) Election priority for the Routing Engine: <b>Master</b> or <b>Backup</b> .
<b>Temperature</b>	Temperature of the air flowing past the Routing Engine.
<b>CPU Temperature</b>	Temperature of the CPU.
<b>DRAM</b>	Total DRAM available to the Routing Engine's processor.
<b>Memory utilization</b>	Percentage of Routing Engine memory being used.

Table 55: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
<b>CPU utilization</b>	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"><li>• <b>User</b>—Percentage of CPU time being used by user processes.</li><li>• <b>Background</b>—Percentage of CPU time being used by background processes.</li><li>• <b>Kernel</b>—Percentage of CPU time being used by kernel processes.</li><li>• <b>Interrupt</b>—Percentage of CPU time being used by interrupts.</li><li>• <b>Idle</b>—Percentage of CPU time that is idle.</li></ul>
<b>Model</b>	Routing Engine model number.
<b>Serial ID</b>	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
<b>Start time</b>	Time at which the Routing Engine started running.
<b>Uptime</b>	How long the Routing Engine has been running.
Routing Engine BIOS Version	BIOS version being run by the Routing Engine.

Table 55: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Last reboot reason	<p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> <li>• <b>power cycle/failure</b>—Halt of the Routing Engine using the <b>halt</b> command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the <b>request system halt</b> command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard.</li> <li>• <b>watchdog</b>—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered.</li> <li>• <b>reset-button reset</b>—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine.</li> <li>• <b>power-button hard power off</b>—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the <b>request system power-off</b> command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software.</li> <li>• <b>misc hardware reason</b>—Reboot due to miscellaneous hardware reasons.</li> <li>• <b>thermal shutdown</b>—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations.</li> <li>• <b>hard disk failure</b>—Reboot due to a hard disk or solid-state drive (SSD) failure.</li> <li>• <b>reset from debugger</b>—Reboot due to reset from the debugger.</li> <li>• <b>chassis control reset</b>—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the <b>restart chassis-control</b> command.</li> <li>• <b>bios auto recovery reset</b>—Reboot due to a BIOS auto-recovery reset.</li> <li>• <b>could not be determined</b>—Reboot due to an undetermined reason.</li> <li>• <b>Router rebooted after a normal shutdown</b>—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the <b>request system reboot</b> command. You can enter this command to reboot the chassis or specific Routing Engines.</li> </ul>
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

## Sample Output

### show chassis routing-engine (M5 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
  Temperature                25 degrees C / 77 degrees F
  DRAM                       768 MB
  Memory utilization          21 percent
  CPU utilization:
    User                      0 percent
    Background                0 percent
    Kernel                    0 percent
    Interrupt                 0 percent
    Idle                      100 percent
  Model                       RE-2.0
  Serial ID                   31000007349bf701
  Start time                  2003-12-04 09:42:17 PST
  Uptime                      26 days, 1 hour, 12 minutes, 27 seconds
  Last reboot reason          Router rebooted after a normal shutdown
  Load averages:             1 minute   5 minute   15 minute

**Output Fields**

[Table 56 on page 803](#) lists the output fields for the **show chassis temperature-thresholds** command. Output fields are listed in the approximate order in which they appear.

Table 56: show chassis temperature-thresholds Output Fields

Field name	Field Description
<b>Item</b>	Chassis component. If per FRU per slot thresholds are configured, the components about which information is displayed include the chassis, the Routing Engines, FPCs, and FEBs. If per FRU per slot thresholds are not configured, the components about which information is displayed include the chassis and the Routing Engines.
<b>Fan speed</b>	<p><b>NOTE:</b> On the QFX3500 switch and QFX3600 switch, there are four fan speeds: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, and <b>high</b>. The fan speed changes at the threshold when going from a low speed to a higher speed. When the fan speed changes from a higher speed to a lower speed, the temperature changes two degrees below the threshold.</p> <p>Temperature threshold settings, in degrees Celsius, for the fans to operate at normal and high speeds.</p> <ul style="list-style-type: none"> <li>• <b>Normal</b>—The fans operate at normal speed if the component is at or below this temperature and all the fans are present and functioning normally.</li> <li>• <b>High</b>—The fans operate at high speed if the component has exceeded this temperature or a fan has failed or is missing.</li> </ul> <p><b>NOTE:</b> For MX480 Routers, there are three fan speeds: <b>Low</b>, <b>Medium</b>, and <b>High</b>.</p> <p>An alarm is not triggered until the temperature exceeds the threshold settings for a yellow alarm or a red alarm.</p>
<b>Yellow alarm</b>	<p>Temperature threshold settings, in degrees Celsius, that trigger a yellow alarm.</p> <ul style="list-style-type: none"> <li>• <b>Normal</b>—The temperature that must be exceeded on the component to trigger a yellow alarm when the fans are running at full speed.</li> <li>• <b>Bad fan</b>—The temperature that must be exceeded on the component to trigger a yellow alarm when one or more fans have failed or are missing.</li> </ul>
<b>Red alarm</b>	<p>Temperature threshold settings, in degrees Celsius, that trigger a red alarm.</p> <ul style="list-style-type: none"> <li>• <b>Normal</b>—The temperature that must be exceeded on the component to trigger a red alarm when the fans are running at full speed.</li> <li>• <b>Bad fan</b>—The temperature that must be exceeded on the component to trigger a red alarm when one or more fans have failed or are missing.</li> </ul>
<b>Fire Shutdown</b>	(T4000 routers and PTX Series Packet Transport Switches only)—Temperature threshold settings, in degrees Celsius, for the network device to shut down.

## show chassis zones

<b>Syntax</b>	show chassis zones <detail>
<b>Syntax (QFX Series)</b>	show chassis zones <detail> <interconnect-device <i>name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays. On MX2010 and MX2020 routers, display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.
<b>Options</b>	<p><b>detail</b>—(MX2010 and MX2020 routers only) (Optional) Display detailed status of the cooling system zones.</p> <p><b>detail <i>device-name</i></b>— (QFabric systems only) (Optional) Display detailed status of the two cooling systems on the Interconnect device.</p> <p><b>interconnect-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the cooling zones on the Interconnect device.</p>

<b>Output Fields</b>	<a href="#">Table 36 on page 419</a> lists the output fields for the <b>show chassis zones</b> command. Output fields are listed in the approximate order in which they appear.

Table 57: show chassis zones Output Fields

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0.
Beacon State	Status of the beacon state: <ul style="list-style-type: none"> <li>Off—The beacon is <b>OFF</b>.</li> <li>On—The beacon is <b>ON</b>.</li> </ul>
show chassis zones command output fields for MX2020 and MX2010 routers:	
Driving FRU	Field replacable unit (FRU).
Temperature	Temperature of the specified FRU in degrees Celsius and degrees Fahrenheit.
Condition	Condition of the specified FRU. Condition can be <b>HIGH TEMP</b> , <b>WARM TEMP</b> , <b>OK</b> , and <b>Offline</b> .
Num Fans Missing	Number of fans or fan trays missing.
Num Fans Failed	Number of fans or fan trays that have failed.
Fan Duty Cycle	Fan duty cycle value.
show chassis zones detail command output fields for MX2020 and MX2010 routers:	
Item	Chassis component: <ul style="list-style-type: none"> <li>Information about the chassis, Routing Engines, Control Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</li> </ul>
Measurement	Fan tray speed utilization in percentage.
Status	Status of the specified item. Status can be <b>OK</b> , <b>Absent</b> , or <b>Offline</b> .

## show cli

<b>Syntax</b>	show cli
<b>Syntax (QFX Series)</b>	show cli <authorization> <directory> <history <i>count</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display configured CLI settings.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli on page 823</a>
<b>Output Fields</b>	<a href="#">Table 58 on page 822</a> lists the output fields for the <b>show cli</b> command. Output fields are listed in the approximate order in which they appear.

**Table 58: show cli Output Fields**

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: <b>on</b> or <b>off</b> .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is <b>disabled</b> .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: <b>on</b> or <b>off</b> .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: <b>enhanced</b> .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is <b>disabled</b> .
CLI working directory	Pathname of the working directory.

## Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

## show cli authorization

<b>Syntax</b>	show cli authorization
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the permissions for the current user.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli authorization on page 826</a>
<b>Output Fields</b>	<a href="#">Table 59 on page 824</a> lists the output fields for the <b>show cli authorization</b> command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

**Table 59: show cli authorization Output Fields**

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 59: show cli authorization Output Fields (*continued*)

Field Name	Field Description
<b>flow-tap-control</b>	Can configure flow-tap configuration information.
<b>idp-profiler-operation</b>	Can configure Profiler data.
<b>interface</b>	Can view interface configuration information.
<b>interface-control</b>	Can modify interface configuration information.
<b>maintenance</b>	Can perform system maintenance.
<b>network</b>	Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>pgcp-session-mirroring</b>	Can view Packet Gateway Control Protocol session mirroring configuration.
<b>pgcp-session-mirroring-control</b>	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
<b>reset</b>	Can reset or restart interfaces and system processes.
<b>rollback</b>	Can roll back to previous configurations.
<b>routing</b>	Can view routing configuration information.
<b>routing-control</b>	Can modify routing configuration information.
<b>secret</b>	Can view passwords and authentication keys in the configuration.
<b>secret-control</b>	Can modify passwords and authentication keys in the configuration.
<b>security</b>	Can view security configuration information.
<b>security-control</b>	Can modify security configuration information.
<b>shell</b>	Can start a local shell.
<b>snmp</b>	Can view SNMP configuration information.
<b>snmp-control</b>	Can modify SNMP configuration information.
<b>system</b>	Can view system configuration information.
<b>system-control</b>	Can modify system configuration information.
<b>trace</b>	Can view trace file settings information.

Table 59: show cli authorization Output Fields (*continued*)

Field Name	Field Description
<b>trace-control</b>	Can modify trace file settings information.
<b>view</b>	Can view current values and statistics.
<b>view-configuration</b>	Can view all configuration information (not including secrets).

## Sample Output

### show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network information
  configure  -- Can enter configuration mode
  control    -- Can modify any configuration
  edit       -- Can edit full files
  field      -- Special for field (debug) support
  floppy     -- Can read and write from the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret configuration
  secret-control-- Can modify secret configuration
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration
  access     -- Can view access configuration
  access-control-- Can modify access configuration
  view-configuration-- Can view all configuration (not including secrets)
  flow-tap   -- Can view flow-tap configuration
  flow-tap-control-- Can configure flow-tap service
Individual command authorization:
  Allow regular expression: none
  Deny regular expression: none
  Allow configuration regular expression: none
  Deny configuration regular expression: none

```

<b>show cli directory</b>	user@host> show cli directory Current directory: /var/home/regress
---------------------------	---

## show cli history

<b>Syntax</b>	<code>show cli history</code> <code>&lt;count&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of previous CLI commands.
<b>Options</b>	<b>none</b> —Display all previous CLI commands.  <b>count</b> —(Optional) Maximum number of commands to display.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli history on page 828</a>
<b>Output Fields</b>	<a href="#">Table 61 on page 828</a> lists the output fields for the <b>show cli history</b> command. Output fields are listed in the approximate order in which they appear.

**Table 61: show cli history Output Fields**

Field Name	Field Description
<i>timestamp</i>	Time at which the command was entered.
<i>command-syntax</i>	Command that was entered.

## Sample Output

```

show cli history
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history

```

---

## show host

---

<b>Syntax</b>	<code>show host <i>hostname</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Domain Name System (DNS) hostname information.
<b>Options</b>	<i>hostname</i> —Hostname or address.
<b>Additional Information</b>	The <code>show host</code> command displays the raw data received from the DNS server.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show host on page 829</a>

### Sample Output

```
show host
user@host> show host snark
snark.boojum.net has address 192.168.1.254

user@host> show host 192.168.1.254
Name: snark.boojum.net
Address: 192.168.1.254
Aliases:
```

## show interfaces diagnostics optics

<b>Syntax</b>	<code>show interfaces diagnostics optics <i>interface-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Display diagnostics data and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, and QSFP+ optical transceivers installed in a QFX Series product. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p>
<b>Options</b>	<i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring Interface Status and Traffic on page 279</a></li> <li>• Installing a Transceiver in a QFX Series Device</li> <li>• Removing a Transceiver from a QFX Series Device</li> <li>• Junos® OS Network Interfaces</li> </ul>
<b>List of Sample Output</b>	<a href="#">show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver) on page 834</a> <a href="#">show interfaces diagnostics optics node1:xe-0/0/1 (SFP+ Transceiver) on page 835</a>
<b>Output Fields</b>	lists the output fields for the <code>show interfaces diagnostics optics</code> command. Output fields are listed in the approximate order in which they appear.

**Table 62: show interfaces diagnostics optics Output Fields**

Field Name	Field Description
Physical interface	Displays the name of the physical interface.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage	Displays the voltage, in volts.
(Not available for XFP transceivers)	

Table 62: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
<b>Laser rx power</b> (Not available for SFP and SFP+ transceivers)	Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
<b>Receiver signal average optical power</b> (Not available for XFP transceivers)	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
<b>Laser bias current high alarm</b>	Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .
<b>Laser bias current low alarm</b>	Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .
<b>Laser bias current high warning</b>	Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .
<b>Laser bias current low warning</b>	Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .
<b>Laser output power high alarm</b>	Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .
<b>Laser output power low alarm</b>	Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .
<b>Laser output power high warning</b>	Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .
<b>Laser output power low warning</b>	Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .
<b>Module temperature high alarm</b>	Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .
<b>Module temperature low alarm</b>	Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .
<b>Module temperature high warning</b>	Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> .
<b>Module temperature low warning</b>	Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .
<b>Module voltage high alarm</b> (Not available for XFP transceivers)	Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .
<b>Module voltage low alarm</b> (Not available for XFP transceivers)	Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .
<b>Module voltage high warning</b> (Not available for XFP transceivers)	Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .
<b>Module voltage low warning</b> (Not available for XFP transceivers)	Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .
<b>Laser rx power high alarm</b>	Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .

Table 62: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power low alarm	Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .
Laser rx power high warning	Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .
Laser rx power low warning	Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Module not ready alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault.
Module power down alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module is in a limited power mode, low for normal operation.
Tx data not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .
Tx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .
Tx laser fault alarm (Not available for SFP and SFP+ transceivers)	Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .
Tx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .
Rx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .
Rx loss of signal alarm (Not available for SFP and SFP+ transceivers)	Receive loss of signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> .
Rx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.

Table 62: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high warning.
Module voltage low warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser Rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser Rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser Rx power high warning.

Table 62: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser Rx power low warning.

## Sample Output

show interfaces  
diagnostics optics

## show ntp associations

<b>Syntax</b>	<code>show ntp associations</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Network Time Protocol (NTP) peers and their state.
<b>Options</b>	<b>none</b> —Display NTP peers and their state. <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show ntp status on page 842</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp associations on page 841</a>
<b>Output Fields</b>	<a href="#">Table 63 on page 840</a> describes the output fields for the <b>show ntp associations</b> command. Output fields are listed in the approximate order in which they appear.

**Table 63: show ntp associations Output Fields**

Field Name	Field Description
<b>remote</b>	Address or name of the remote NTP peer.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of <b>0.0.0.0</b> .
<b>st</b>	Stratum of the remote peer.
<b>t</b>	Type of peer: <b>b</b> (broadcast), <b>l</b> (local), <b>m</b> (multicast), or <b>u</b> (unicast).
<b>when</b>	When the last packet from the peer was received.
<b>poll</b>	Polling interval, in seconds.
<b>reach</b>	Reachability register, in octal.
<b>delay</b>	Current estimated delay of the peer, in milliseconds.
<b>offset</b>	Current estimated offset of the peer, in milliseconds.
<b>disp</b>	Current estimated dispersion of the peer, in milliseconds.

Table 63: show ntp associations Output Fields (*continued*)

Field Name	Field Description
<i>peer-name</i>	<p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> <li>• space—Discarded because of a high stratum value or failed sanity checks.</li> <li>• x—Designated "falseticker" by the intersection algorithm.</li> <li>• .—Culled from the end of the candidate list.</li> <li>• — —Discarded by the clustering algorithm.</li> <li>• +—Included in the final selection set.</li> <li>• #—Selected for synchronization, but the distance exceeds the maximum.</li> <li>• *—Selected for synchronization.</li> <li>• o—Selected for synchronization, but the packets-per-second (pps) signal is in use.</li> </ul>

<b>List of Sample Output</b>	<a href="#">show ntp status on page 843</a>
<b>Output Fields</b>	<a href="#">Table 64 on page 842</a> describes the output fields for the <b>show ntp status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 64: show ntp status Output Fields**

Field Name	Field Description
<b>status</b>	System status word, a code representing the status items listed.
<b>leap_none</b>	Indicates a normal synchronized state with no leap seconds imminent. Other options could be <b>leap_add_sec</b> , <b>leap_del_sec</b> , or <b>leap_alarm</b> , indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
<b>sync_ntp</b>	Indicates the current synchronization source, in this case, an NTP server. Other options include <b>sync_alarm</b> and <b>sync_unspec</b> , both indicating that the router has not been synched.
<b>x events</b>	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
<b>event_peer/strat_chg</b>	Describes the most recent event, in this case, the stratum of the peer server changed.
<b>version</b>	A detailed description of the version of NTP being used.
<b>processor</b>	Indicates the current hardware platform and version of the processor.
<b>system</b>	Detailed description of the name and version of the operating system in use.
<b>leap</b>	The number of leap seconds in use.

Table 64: show ntp status Output Fields (*continued*)

Field Name	Field Description
<b>stratum</b>	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
<b>precision</b>	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
<b>rootdelay</b>	The total roundtrip delay to the primary reference source, in seconds.
<b>rootdispersion</b>	The maximum error relative to the primary reference source, in seconds.
<b>peer</b>	An identification number of the peer in use.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.
<b>reftime</b>	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
<b>poll</b>	The NTP broadcast message polling interval, in seconds.
<b>clock</b>	The current time on the local router clock.
<b>state</b>	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
<b>offset</b>	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
<b>frequency</b>	The frequency of the clock.
<b>jitter</b>	Indicates the magnitude of jitter, in milliseconds, between several time queries.
<b>stability</b>	A measure of how well this clock can maintain a constant frequency.

## Sample Output

### show ntp status

```

user@host> show ntp status
assID=0 status=0544 leap_none, sync_local_proto, 4 events, event_peer/strat_chg,
version="ntpd 4.2.2p1@1.1570-o Tue May 19 13:57:55 UTC 2009 (1)",
processor="x86_64", system="Linux/2.6.18-164.el5", leap=00, stratum=4,
precision=-10, rootdelay=0.000, rootdispersion=11.974, peer=59475,
refid=LOCAL(0),
reftime=d495c32c.0e71eaf2 Mon, Jan 7 2013 13:57:00.056, poll=10,
clock=d495c32c.cebd43bd Mon, Jan 7 2013 13:57:00.807, state=4,
offset=0.000, frequency=0.000, jitter=0.977, noise=0.977,
stability=0.000, tai=0

```

## show subscribers

---

**Syntax**    `show subscribers`  
              `<detail | extensive | terse>`  
              `<aci-interface-set-name aci-interface-set-name>`  
              `<address address>`  
              `<agent-circuit-identifier agent-circuit-identifier-substring>`  
              `<client-type client-type>`  
              `<count>`  
              `<interface interface>`  
              `<logical-system logical-system>`  
              `<mac-address mac-address>`  
              `<physical-interface physical-interface-name>`  
              `<profile-name profile-name>`  
              `<routing-instance routing-instance>`  
              `<stacked-vlan-id stacked-vlan-id>`  
              `<subscriber-state subscriber-state>`  
              `<user-name user-name>`  
              `<vlan-id vlan-id>`

**Release Information**    Command introduced in Junos OS Release 9.3.  
                              Command introduced in Junos OS Release 9.3 for EX Series switches.  
                              **client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
                              **count** option usage with other options introduced in Junos OS Release 10.2.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
                              The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.

**Description**            Display information for active subscribers.

**Options**                **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as `aci-1003-ge-1/0/0.4001`, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, `192.168.17.1`). If you specify the IP address as a prefix with a netmask (for example, `192.168.17.1/32`), the router displays a message that the IP address is invalid, and rejects the command.

**agent-circuit-identifier-substring**—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

**client-type**—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

**count**—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the **count** option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, or **vlan-id** options.

**id**—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the **show subscribers extensive** or the **show subscribers interface extensive** commands.

**interface**—(Optional) Display subscribers whose interface matches the specified interface.

**logical-system**—(Optional) Display subscribers whose logical system matches the specified logical system.

**mac-address**—(Optional) Display subscribers whose MAC address matches the specified MAC address.

**physical-interface-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

**profile-name**—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

**routing-instance**—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**subscriber-state**—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

**user-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

**vlan-id**—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

**stacked-vlan-id**—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

**NOTE:** Due to display limitations, logical system and routing instance output values are truncated when necessary.

**Output Fields** [Table 65 on page 846](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

**Table 65: show subscribers Output Fields**

Field Name	Field Description
User Name	Name of subscriber.
Type	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
IP Address	Subscriber IPv4 address.
IP Netmask	Subscriber IP netmask.
Primary DNS Address	IP address of primary DNS server.

Table 65: show subscribers Output Fields (*continued*)

Field Name	Field Description
Secondary DNS Address	IP address of secondary DNS server.
Primary WINS Address	IP address of primary WINS server.
Secondary WINS Address	IP address of secondary WINS server.
IPv6 Address	Subscriber IPv6 address, or multiple addresses.
IPv6 Prefix	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
IPv6 User Prefix	IPv6 prefix obtained through ND/RA.
IPv6 Address Pool	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
IPv6 Network Prefix Length	Length of the network portion of the IPv6 address.
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.
Interface	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.
Interface Type	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .
Interface Set	Internally generated name of the dynamic ACI interface set used by the subscriber session.
Interface Set Type	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
Interface Set Session ID	Identifier of the dynamic ACI interface set entry in the session database.
Underlying Interface	Name of the underlying interface for the subscriber session.
Dynamic Profile Name	Dynamic profile used for the subscriber.
Dynamic Profile Version	Version number of the dynamic profile used for the subscriber.
MAC Address	MAC address associated with the subscriber.
State	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).

Table 65: show subscribers Output Fields (*continued*)

Field Name	Field Description
VLAN Id	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
Agent Remote ID	Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
DHCP Relay IP Address	IP address used by the DHCP relay agent.
Login Time	Date and time at which the subscriber logged in.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.
IPv6 Interface Address	Address assigned by the Framed-Ipv6-Prefix AAA attribute.

Table 65: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>IPv6 Framed Interface Id</b>	Interface ID assigned by the Framed-Interface-Id AAA attribute.
<b>ADF IPv4 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).

## show system alarms

<b>Syntax</b>	show system alarms
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display active system alarms.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	System alarms are preset. They include a <b>configuration</b> alarm that appears when no rescue configuration alarm is set and a <b>license</b> alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the Junos OS System Basics Configuration Guide.  In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.
<b>Required Privilege Level</b>	admin
<b>List of Sample Output</b>	<a href="#">show system alarms on page 861</a> <a href="#">show system alarms (Fan Tray) on page 861</a> <a href="#">show system alarms (QFX Series) on page 861</a>

## Sample Output

<b>show system alarms</b>	<pre> user@host&gt; show system alarms 2 alarms currently active Alarm time          Class    Description 2005-02-24 17:29:34 UTC  Minor    IPsec VPN tunneling usage requires a license 2005-02-24 17:29:34 UTC  Minor    Rescue configuration is not sent </pre>
<b>show system alarms (Fan Tray)</b>	<pre> user@host&gt; show system alarms 4 alarms currently active Alarm time          Class    Description 2010-11-11 20:27:38 UTC  Major    Side Fan Tray 7 Failure 2010-11-11 20:27:13 UTC  Minor    Side Fan Tray 7 Overspeed 2010-11-11 20:27:13 UTC  Major    Side Fan Tray 5 Failure 2010-11-11 20:27:13 UTC  Major    Side Fan Tray 0 Failure </pre>
<b>show system alarms (QFX Series)</b>	<pre> user@switches&gt; show system alarms 2 alarms currently active Alarm time Class Description 2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent </pre>

## show system audit

<b>Syntax</b>	show system audit <root-only>
<b>Syntax (EX Series Switch and MX Series Router)</b>	show system audit <all-members> <local> <member <i>member-id</i> > <root-only>
<b>Syntax (TX Matrix Router)</b>	show system audit <all-lcc   lcc <i>number</i>   scc> <root-only>
<b>Syntax (TX Matrix Plus Router)</b>	show system audit <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <root-only>
<b>Syntax (QFX Series)</b>	show system audit <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the state and checksum values for file systems.
<b>Options</b>	<p><b>none</b>—Display the state and checksum values for all file systems.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.</p> <p><b>infrastructure <i>name</i></b>—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.</p>

**local**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

**member *member-id***—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

**root-only**—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

**scc**—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** To redirect the output to a file, issue the following command:

```
ssh device-name 'show system audit root-only' > output-file
```

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. If you issue the command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** admin

**List of Sample Output** [show system audit root-only on page 864](#)  
[show system audit lcc \(TX Matrix Router\) on page 864](#)  
[show system audit lcc \(TX Matrix Plus Router\) on page 866](#)  
[show system audit root-only \(QFX3500 Switch\) on page 868](#)

## show system boot-messages

<b>Syntax</b>	show system boot-messages
<b>Syntax (EX Series Switches)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system boot-messages infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
<b>Options</b>	<p><b>none</b>—Display all boot time messages.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers (or line-card chassis) connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all T1600 routers (or line-card chassis) connected to a TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.</p> <p><b>infrastructure <i>name</i></b>—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix</p>

router. On a TX Matrix Plus router, display boot time messages for a specific T1600 router connected to a TX Matrix Plus router. Replace **number** with a value from **0** through **3**.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

**node-group name**—(QFabric systems only) (Optional) Display boot time messages on the Node group.

**scc**—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**Additional Information** By default, when you issue the **show system boot-messages** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) master Routing Engines or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) backup Routing Engines or T1600 (routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** view

**List of Sample Output** [show system boot-messages \(TX Matrix Router\) on page 871](#)  
[show system boot-messages lcc \(TX Matrix Router\) on page 872](#)  
[show system boot-messages \(TX Matrix Plus Router\) on page 873](#)  
[show system boot-messages \(QFX3500 Switch\) on page 873](#)

## Sample Output

show system  
boot-messages (TX  
Matrix Router)

```
user@host> show system boot-messages

## show system buffers

---

<b>Syntax</b>	show system buffers
<b>Syntax (EX Series)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system buffers <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only (infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
<b>Options</b>	<b>none</b> —Show all buffer statistics.  <b>all-lcc</b> —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.  <b>all-chassis</b> —(TX Matrix and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.  <b>infrastructure <i>name</i></b> —(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show buffer statistics for the Node group

**sfc**—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** By default, when you issue the **show system buffers** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) master Routing Engines or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) backup Routing Engines or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

**Required Privilege Level** view

**List of Sample Output** [show system buffers on page 879](#)  
[show system buffers scc \(TX Matrix Router\) on page 879](#)  
[show system buffers sfc \(TX Matrix Plus Router\) on page 879](#)  
[show system buffers all-chassis \(TX Matrix Plus Router\) on page 879](#)  
[show system buffers node-group \(QFabric System\) on page 881](#)

**Output Fields** [Table 66 on page 878](#) describes the output fields for the **show system buffers** command. Output fields are listed in the approximate order in which they appear.

Table 66: show system buffers Output Fields

Field Name	Field Description
<b>mbufs in use</b>	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
<b>mbufs allocated to packet headers</b>	Number of memory buffers currently holding packet headers
<b>mbufs allocated to control blocks</b>	Number of memory buffers currently holding the state for sockets.
<b>mbufs allocated to send data</b>	Number of memory buffers currently holding socket send data.
<b>mbufs allocated to pfe refill data</b>	Number of memory buffers currently holding Packet Forwarding Engine refill data.
<b>mbufs allocated to fxp data</b>	Number of memory buffers currently holding fxp data.
<b>mbufs allocated to socket names and addresses</b>	Number of memory buffers currently holding addresses for sockets.
<b>mbuf clusters in use</b>	Allocation statistics for memory buffer clusters.
<b>allocated to network</b>	Total amount of memory in use by the networking and interprocess communication (IPC) code.
<b>requests for memory denied</b>	Number of times a memory allocation request within the IPC and networking code failed.
<b>requests for memory delayed</b>	Number of times a memory allocation request within the IPC and networking code was postponed.
<b>calls to protocol drain routines</b>	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

## Sample Output

```

## show system certificate

<b>Syntax</b>	show system certificate <certificate-id>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series, T Series routers, and QFX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority.
<b>Options</b>	<b>none</b> —Display all installed certificates signed by the Juniper Networks certificate authority. <b>certificate-id</b> —(Optional) Display the details of a particular certificate.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system certificate on page 883</a> <a href="#">show system certificate (QFX Series) on page 883</a>
<b>Output Fields</b>	<a href="#">Table 67 on page 882</a> lists the output fields for the <b>show system certificate</b> command. Output fields are listed in the approximate order in which they appear.

**Table 67: show system certificate Output Fields**

Field Name	Field Description
<b>Certificate identifier</b>	Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.
<b>Issuer</b> <b>Subject</b>	Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> <li>• <b>Organization</b>—Name of the owner's organization.</li> <li>• <b>Organizational unit</b>—Name of the owner's department.</li> <li>• <b>Country</b>—Two-character country code in which the owner's system is located.</li> <li>• <b>State</b>—State in the USA in which the owner is using the certificate.</li> <li>• <b>Locality</b>—City in which the owner's system is located.</li> <li>• <b>Common name</b>—Name of the owner of the certificate.</li> <li>• <b>E-mail address</b>—E-mail address of the owner of the certificate.</li> </ul>
<b>Validity</b>	When a certificate is valid.
<b>Signature algorithm</b>	Encryption algorithm applied to the installed certificate.
<b>Public key algorithm</b>	Encryption algorithm applied to the public key.

## Sample Output

### show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
  Issuer:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
    E-mail address:ca@juniper.net
  Subject:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
    E-mail address:ca@juniper.net
  Validity:
    Not before: Mar 13 03:23:25 2004 GMT
    Not after: Mar 24 03:23:25 2014 GMT
  Signature algorithm: sha1WithRSAEncryption
  Public key algorithm: dsaEncryption
```

### show system certificate (QFX Series)

```
user@host> show system certificate
Certificate identifier: Dallas-v3
  Issuer:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
    E-mail address:ca@juniper.net
  Subject:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
    E-mail address:ca@juniper.net
  Validity:
    Not before: Mar 13 03:23:25 2004 GMT
    Not after: Mar 24 03:23:25 2014 GMT
  Signature algorithm: sha1WithRSAEncryption
  Public key algorithm: dsaEncryption
```

## show system commit

<b>Syntax</b>	show system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the system commit history and any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear system commit on page 289</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system commit on page 885</a> <a href="#">show system commit (At a Particular Time) on page 885</a> <a href="#">show system commit (At the Next Reboot) on page 885</a> <a href="#">show system commit (Rollback Pending) on page 885</a> <a href="#">show system commit (QFX Series) on page 885</a>
<b>Output Fields</b>	<a href="#">Table 68 on page 884</a> describes the output fields for the <b>show system commit</b> command. Output fields are listed in the approximate order in which they appear.

**Table 68: show system commit Output Fields**

Field Name	Field Description
<b>Commit history</b>	Displays the last 50 commit operations listed, most recent to first. The identifier <b>rescue</b> designates a configuration created for recovery using the <b>request system configuration rescue save</b> command.
<b>Timestamp</b>	Date and time of the commit operation.
<b>Username</b>	User who executed the commit operation.
<b>Commit method</b>	Method used to execute the commit operation: <ul style="list-style-type: none"> <li>• <b>cli</b>—CLI interactive user performed the commit operation.</li> <li>• <b>Junos XML protocol</b>—Junos XML protocol client performed the commit operation.</li> <li>• <b>synchronize</b>—The <b>commit synchronize</b> command was performed on the other Routing Engine.</li> <li>• <b>snmp</b>—An SNMP <b>set</b> request caused the commit operation.</li> <li>• <b>button</b>—A button on the router or switch was pressed to commit a rescue configuration for recovery.</li> <li>• <b>autoinstall</b>—A configuration obtained through autoinstallation was committed.</li> <li>• <b>other</b>—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.</li> </ul>

## Sample Output

```

```

## show system configuration archival

---

**Syntax**    show system configuration archival

**Release Information**    Introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display directory and number of files queued for archival transfer.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**List of Sample Output**    [show system configuration archival on page 886](#)

### Sample Output

```
show system configuration archival    user@host> show system configuration archival  
/var/transfer/config/:  
total 8
```

---

## show system configuration rescue

---

**Syntax**    show system configuration rescue

**Release Information**    Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display a rescue configuration, if one exists.

.....  
**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.  
.....

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**Related Documentation**    • [show system configuration archival on page 886](#)

**List of Sample Output**    [show system configuration rescue on page 888](#)

## Sample Output

**show system  
configuration rescue**

```
user@switch> show system configuration rescue
version "7.3"; groups {
  global {
    system {
      host-name router1;
      domain-name customer.net;
      domain-search [ customer.net ];

      }
    }
  }
}
....
```

## show system connections

<b>Syntax</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   scc&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (EX Series)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-members&gt; &lt;inet   inet6&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (TX Matrix Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   scc&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (TX Matrix Plus Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i>&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-members&gt; &lt;inet   inet6&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>show system connections &lt;extensive&gt; &lt;inet&gt; &lt;infrastructure <i>name</i>&gt; &lt;interconnect-device <i>name</i>&gt; &lt;node-group <i>name</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.</p>

- Options** **none**—Display information about all active IP sockets on the Routing Engine.
- extensive**—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.
- all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.
- all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router
- all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.
- inet | inet6**—(Optional) Display IPv4 connections or IPv6 connections, respectively.
- infrastructure *name***—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.
- interconnect-device *name***—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.
- lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.
- local**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.
- member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.
- node-group *name***—(QFabric systems only) (Optional) Display system connection activity for the Node group.
- scc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).
- sfc**—(TX Matrix Plus routers only) (Optional) Display system connection activity for the TX Matrix Plus router (or switch-fabric chassis).
- show-routing-instances**—(Optional) Display routing instances.

**Additional Information** By default, when you issue the **show system connections** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) master Routing Engines or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Output Fields** [Table 69 on page 891](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

**Table 69: show system connections Output Fields**

Field Name	Field Description
<b>Proto</b>	Protocol of the socket: <b>IP</b> , <b>TCP</b> , or <b>UDP</b> for IPv4 or IPv6.
<b>Recv-Q</b>	Number of input packets received by the protocol and waiting to be processed by the application.
<b>Send-Q</b>	Number of output packets sent by the application and waiting to be processed by the protocol.
<b>Local Address</b>	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
<b>Foreign Address</b>	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.
<b>Routing Instance</b>	(Displayed only when the <b>show-routing-instance</b> option is used.) Routing instances associated with active IP sockets on the Routing Engine.
<b>(state)</b>	For TCP, the protocol state of the socket.

## Sample Output

### show system connections

```

## show system core-dumps

<b>Syntax</b>	show system core-dumps <brief   detail> <core-filename> <core-file-info>
<b>Syntax (EX Series Switches)</b>	show system core-dumps <all-members> <brief   detail> <core-filename> <core-file-info> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system core-dumps <all-chassis   all-lcc   lcc <i>number</i>   scc> <brief   detail> <core-filename> <core-file-info>
<b>Syntax (TX Matrix Plus Router)</b>	show system core-dumps <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <brief   detail> <core-filename> <core-file-info>
<b>Syntax (QFX Series)</b>	show system core-dumps <brief   detail> <component ( <i>UUID</i>   <i>serial number</i>   all)> <core-file-info component ( <i>UUID</i>   <i>serial number</i> ) core-file-name> <display-period ( <i>hours</i>   <i>minutes</i>   <i>seconds</i> )> <display-order> <kernel-crashinfo component ( <i>UUID</i>   <i>serial number</i> )> <repository (core   log)>
<b>Release Information</b>	Command introduced before Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Show core files on all routers or switches running Junos OS. You can use the <b>show system core-dumps</b> command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.  You can use the option <b>core-filename</b> and its options <b>core-file-info</b> , <b>brief</b> , and <b>detail</b> to display more information about the specified core-dump files.
<b>Options</b>	<b>none</b> —Display a list of all existing core-dump files.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

**<all-lcc | lcc number>**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc number** option, replace **number** with a value from 0 through 3.

**NOTE:** The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

**all-members**—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

**brief**—(Optional) View details of a binary file.

**component (UUID | serial number | all)**—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

**core-file-info**—(Optional) Display the stack trace of a core file.

**core-filename**—(Optional) Name of a specific core file to display.

**detail**—(Optional) View stack trace with details of the binary file.

**display-order (timestamp-sort | alphanumeric-sort)**—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

**display-period (hours | minutes | seconds)**—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

**kernel-crashinfo component (UUID | serial number)**—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

**local**—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**repository (core | log)**—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

**scc**—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

**Output Fields**

[Table 70 on page 911](#) describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

**Table 70: show system core-dumps Output Fields**

Field Name	Field Description
<i>Permissions</i>	Read/write permissions for the file named.
<i>Links</i>	Number of links to the file.
<i>Owner</i>	Name of the file owner.
<i>Group</i>	Name of the group with file access.
<i>File size</i>	File size in bytes.
<i>Modified</i>	Last file modification date and time.

Table 70: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
<i>Path/filename</i>	File path where the file resides and the filename.
<b>Repository scope:</b>	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
<b>Repository head:</b>	Path to the top-level repository location.
<b>Repository name:</b>	Name of the repository: <b>core</b> or <b>log</b> .
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>Node Group</b>	Name of the QFabric system device.
<b>Node Identifier</b>	UUID or serial number of the QFabric system device.
<b>Num</b>	Number of core-dump and log files.
<b>Model</b>	Model number of the QFabric system device.
<b>Usage</b>	Usage of the repository in megabytes.
<b>Total usage of core repository:</b>	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
<b>Total usage of log repository:</b>	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>List of nodes for log repository:</b>	List of log files associated with a particular QFabric system device located in the log repository.
<b>Filename</b>	Name of the core-dump file.
<b>Date</b>	Last core-dump file modification date and time.
<b>Size</b>	Size of the core-dump file.
<b>Core filename</b>	Filename of the core-dump file.
<b>Process name</b>	Name of the process that is generating a core-dump file or log file.

Table 70: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
<b>Release</b>	Junos OS release.
<b>Build server</b>	Junos OS build server.
<b>Build date</b>	Junos OS build date.
<b>Stack trace</b>	Stack trace of the core-dump file.

## Sample Output

### show system core-dumps

This example shows the command output if core files exist.

```
user@switcht> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

### show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

### show system core-dumps (TX Matrix Plus Router)

```
user@host> show system core-dumps
