- (EX4200 switches in a Virtual Chassis with two or more members) If no ***fpc-slot-number*** value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the **none** option. If the ***fpc-slot-number*** value is specified (it equals the ***member-id*** value), display the status of the chassis status LEDs for the specified member.
- (EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the ***fpc-slot-number*** value.

interconnect-device *name*—

— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.

node-device *name*— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.

Output Fields Table 51 on page 464 lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

Table 65: show chassis led Output Fields

Field Name	Field Description
Front panel contents for slot **Front panel contents** (EX8200 Switches) **Front Panel Module Information** (QFabric system QFX3008-I Interconnect device) **Front panel contents for** (QFabric system Node devices and QFX3600-I Interconnect devices)	FPC slot number of the device whose content is being displayed. The number is always **0**, except for EX4200 switches in a Virtual Chassis, where it is the member ID value. On EX8200 switches, no slot number is displayed. On QFabric system Node devices, the name of the Node device whose content is being displayed.

Table 65: show chassis led Output Fields *(continued)*

Field Name	Field Description
Alarms LED	(EX Series switches only) Displays status of the ALM LED: • Off—No alarm has been configured. • Green—No alarm has been triggered. • Red—Major alarm. • Yellow—Minor alarm
System LED	(EX Series switches only) Displays status of the SYS LED: • Off—Switch is powered off. • Green—Switch is operating normally. • Yellow—Switch is booting.

Master LED:	Displays status of the MST LED (on EX3200, EX4200, and EX8200 switches):
	• Green—On an EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational.
	• Off
	  ◦ On an EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration.
	  ◦ On EX3200, standalone EX4200, and EX8200 switches, indicates that the Routing Engine is not operational.

Mode LED:	(EX Series switches only) On an EX2200 switch only, displays the currently selected port parameter of the Status LED: • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet
Status/Beacon LED	(QFX Series only) Displays the system status as indicated by the Status LED on the chassis. For more information, see: • *Chassis Status LEDs on a QFX3500 Device* • *Chassis Status LEDs in the QFX3600 and QFX3600-I Device*
LINK/SPEED LED	(QFX Series only) Displays the link status and speed of a management port. For more information, see: • *Management Port LEDs on a QFX3500 Device* • *Management Port LEDs in the QFX3600 and QFX3600-I Device*
ACTIVITY LED	(QFX Series only) Displays the activity status of a management port. For more information, see: • *Management Port LEDs on a QFX3500 Device* • *Management Port LEDs in the QFX3600 and QFX3600-I Device*

Table 65: show chassis led Output Fields *(continued)*

Field Name	Field Description
STATUS LED	(QFX Series only) Displays the link status of an interface as indicated by the ST LED. For more information, see: • *Control Board LEDs on a QFX3008-I Interconnect Device* • *Access Port and Uplink Port LEDs on a QFX3500 Device* • *Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device*
LINK/ACTIVITY LED	(QFX Series only) Displays link activity or faults on an interface as indicated by the LA LED. For more information, see: • *Access Port and Uplink Port LEDs on a QFX3500 Device* • *Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device*
Status LED	(QFX3008-I Interconnect device only) • Displays the system status as indicated by the STATUS LED on the front panel of the chassis. For more information, see *Chassis Status LEDs on a QFX3008-I Interconnect Device*. • Displays the status of a Control Board as indicated by the STATUS LED on the Control Board. For more information, see *Control Board LEDs on a QFX3008-I Interconnect Device*.
Power LED	(QFX3008-I Interconnect device only) Displays the status of system power on the device. For more information, see *Chassis Status LEDs on a QFX3008-I Interconnect Device*.
Major Alarm LED	(QFX3008-I Interconnect device only) Displays whether a critical error condition that requires immediate action exists on the device. For more information, see *Chassis Status LEDs on a QFX3008-I Interconnect Device*.
Minor Alarm LED	(QFX3008-I Interconnect device only) Displays whether a noncritical condition that requires monitoring or maintenance exists on the device. For more information, see *Chassis Status LEDs on a QFX3008-I Interconnect Device*.
Fan 0 LED **Fan 1 LED** **Fan 2 LED** **Fan 3 LED** **Fan 4 LED** **Fan 5 LED** **Fan 6 LED** **Fan 7 LED** **Fan 8 LED**	(QFX3008-I Interconnect device only) Displays the status of fan trays on the device. For more information, see *Chassis Status LEDs on a QFX3008-I Interconnect Device*.

Table 65: show chassis led Output Fields *(continued)*

Field Name	Field Description
PEM 0 LED **PEM 1 LED** **PEM 2 LED** **PEM 3 LED** **PEM 4 LED**	(QFX3008-I Interconnect device only) Displays the status of power supplies on the device. For more information, see *Chassis Status LEDs on a QFX3008-I Interconnect Device*.
LED info for	(QFX3008-I Interconnect device only) Displays the LED information for a Control Board.
Mastership LED	(QFX3008-I Interconnect device only) Displays status of the MASTER LED on a Control Board. For more information, see *Control Board LEDs on a QFX3008-I Interconnect Device*.
Interface	Names of the interfaces on the device.
LED (ADM/SPD/DPX/POE)	(EX Series switches only) State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are: NOTE: EX4500 and EX8200 switches do not have the POE port parameter. • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the physical location of the chassis. This command can only be used on the master Routing Engine.

Options

none—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.

fpc—(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).

interconnect-device *name*—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.

interface by-name *name*—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated

with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.

interface by-slot fpc *number* lcc *number*—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace ***number*** with a value from **0** through **7**.
- For **lcc**, replace ***number*** with a value from **0** through **7**.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router , display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display the physical location of the Node device.

scc—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

Output Fields Table 66 on page 810 lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

Table 66: show chassis location Output Fields

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is **0** through **31**. On TX Matrix Plus router with 3D SIBs the value is **0** through **63**.
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.

Release Information

Command introduced before JUNOS Release 7.4.
Command introduced in JUNOS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

Display the media access control (MAC) addresses for the router, switch chassis, or switch.

Options

none—(TX Matrix, TX Matrix Plus routers, and the QFX Series) Display the MAC addresses for the router chassis or switch. On a TX Matrix router, display MAC addresses on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display MAC addresses on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display the MAC addresses for all the member routers of the Virtual Chassis configuration.

interconnect-device ***name***—(QFabric systems only) (Optional) Display the MAC addresses for the Interconnect device.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display MAC addresses for a specified T640 router (line-card chassis) that is connected to the TX Matrix Plus router. On a TX Matrix Plus router, display MAC addresses for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the MAC addresses for the local Virtual Chassis member.

member ***member-id***—(MX Series routers only) (Optional) Display the MAC addresses for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-group ***name***—(QFabric systems only) (Optional) Display the MAC addresses for the specified Node group.

scc—(TX Matrix routers only) (Optional) Display MAC addresses for the TX Matrix router (switch-card chassis).

sfc ***number***—(TX Matrix Plus routers only) (Optional) Display MAC addresses for the TX Matrix Plus router (or switch-fabric chassis).

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

Options

fpc-slot *slot-number*—Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc *number*** option (the recommended method), replace ***slot-number*** with a value from **0** through **7**. Otherwise, replace ***slot-number*** with a value from **0** through **31**.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc** ***number*** option (the recommended method), replace ***slot-number*** with a value from **0** through **7**. Otherwise, replace ***slot-number*** with a value from **0** through **31**. For example, the following commands have the same result:

```
user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1
```

- M120 routers only—Replace ***slot-number*** with a value from **0** through **5**.
- MX80 routers only—Replace ***slot-number*** with a value from **0** through **1**.
- MX240 routers only—Replace ***slot-number*** with a value from **0** through **2**.
- MX480 routers only—Replace ***slot-number*** with a value from **0** through **5**.
- MX960 routers only—Replace ***slot-number*** with a value from **0** through **11**.
- MX2020 routers only—Replace ***slot-number*** with a value from **0** through **19**.
- Other routers—Replace ***slot-number*** with a value from **0** through **7**.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace ***slot-number*** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace ***slot-number*** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace ***slot-number*** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace ***slot-number*** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 switches—Replace ***slot-number*** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace ***slot-number*** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

all-members—(MX Series routers only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

interconnect-device ***name***—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display PIC information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot *slot-number*—Display information about the PIC in this particular PIC slot. For routers, replace ***slot-number*** with a value from **0** through **3**. For EX3200 and EX4200 switches, replace ***slot-number*** with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace ***slot-number*** with 0. For the QFX3500 standalone switch and the QFabric system, replace ***slot-number*** with 0 or 1.

show chassis pic FPC slot 1, PIC slot 2 (MX Routers with Media Services Blade [MSB]) on page 829

Output Fields Table 69 on page 821 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 69: show chassis pic Output Fields

Field Name	Field Description
Type	PIC type. NOTE: On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as **MIC-3D-1STM64-XFP** and with the SONET framing mode, the type is displayed as **MIC-3D-1OC192-XFP**. By default, the 1-port OC192/STM64 MICs displays the type as **MIC-3D-1OC192-XFP**.
ASIC type	Type of ASIC on the PIC.
State	Status of the PIC. State is displayed only when a PIC is in the slot. • **Online**— PIC is online and running. • **Offline**—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.

Table 69: show chassis pic Output Fields *(continued)*

Field Name	Field Description
Package	(Multiservices PICs only) Services package supported: **Layer-2** or **Layer-3**.
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: **LH**, **LX**, or **SX.**
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	Port-level information for the PIC. • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction

PIC Port Information (MX960 Router Bidirectional Optics)	Port-level information for the PIC.
	• Port—Port number
	• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.
	• Fiber type—Type of fiber. SM is single-mode.
	• Xcvr vendor—Transceiver vendor name.
	• Xcvr vendor part number—Transceiver vendor part number.
	  ◦ BX10-10-km bidirectional optics.
	  ◦ BX40-40-km bidirectional optics.
	  ◦ SFP-LX-40-km SFP optics.
	• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.

PIC Port Information (Next-Generation SONET/SDH SFP)	Port-level information for the next-generation SONET/SDH SFP PIC. • Port—Port number. • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. • Fiber type—Type of fiber: **SM** (single-mode) or **MM** (multimode). • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.
Multirate Mode	Rate-selectabilty status for the MIC: **Enabled** or **Disabled**.

Table 69: show chassis pic Output Fields *(continued)*

Field Name	Field Description
Channelization	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

Sample Output

show chassis pic fpc-slot pic-slot

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description Display the status of the Routing Engine.

Options **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

bios—(Optional) Display the (BIOS) firmware version.

interconnect-device ***number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

member ***member-id***—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-device ***number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

scc—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

slot—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace ***slot*** with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

Output Fields

Table 70 on page 834 lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 70: show chassis routing-engine Output Fields

Field Name	Field Description
Slot	(Systems with single and multiple Routing Engines) Slot number.
Current state	(Systems with multiple Routing Engines) Current state of the Routing Engine: **Master**, **Backup**, or **Disabled**.
Election priority	(Systems with multiple Routing Engines) Election priority for the Routing Engine: **Master** or **Backup**.
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	Temperature of the CPU.
DRAM	Total DRAM available to the Routing Engine's processor. Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.
Memory utilization	Percentage of Routing Engine memory being used.
CPU utilization	Information about the Routing Engine's CPU utilization: • **User**—Percentage of CPU time being used by user processes. • **Background**—Percentage of CPU time being used by background processes. • **Kernel**—Percentage of CPU time being used by kernel processes. • **Interrupt**—Percentage of CPU time being used by interrupts. • **Idle**—Percentage of CPU time that is idle.
Model	Routing Engine model number.
Serial ID	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
Start time	Time at which the Routing Engine started running.
Uptime	How long the Routing Engine has been running.
Routing Engine BIOS Version	BIOS version being run by the Routing Engine.

Table 70: show chassis routing-engine Output Fields *(continued)*

Field Name	Field Description
Last reboot reason	Reason for last reboot, including: • **power cycle/failure**—Halt of the Routing Engine using the **halt** command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the **request system halt** command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard. • **watchdog**—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered. • **reset-button reset**—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine. • **power-button hard power off**—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the **request system power-off** command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software. • **misc hardware reason**—Reboot due to miscellaneous hardware reasons. • **thermal shutdown**—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations. • **hard disk failure**—Reboot due to a hard disk or solid-state drive (SSD) failure. • **reset from debugger**—Reboot due to reset from the debugger. • **chassis control reset**—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the **restart chassis-control** command. • **bios auto recovery reset**—Reboot due to a BIOS auto-recovery reset. • **could not be determined**—Reboot due to an undetermined reason. • **Router rebooted after a normal shutdown**—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the **request system reboot** command. You can enter this command to reboot the chassis or specific Routing Engines.
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

Sample Output

show chassis routing-engine (M5 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
    Temperature                25 degrees C / 77 degrees F
    DRAM                      768 MB
    Memory utilization         21 percent
    CPU utilization:
      User                      0 percent
      Background                0 percent
      Kernel                    0 percent
      Interrupt                 0 percent
```

```
    Idle                      100 percent
  Model                         RE-2.0
  Serial ID                     31000007349bf701
  Start time                    2003-12-04 09:42:17 PST
  Uptime                        26 days, 1 hour, 12 minutes, 27 seconds
  Last reboot reason            Router rebooted after a normal shutdown
  Load averages:                1 minute   5 minute  15 minute
                                    0.00       0.01       0.00
```

show chassis routing-engine (M10 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
    Temperature                25 degrees C / 77 degrees F
    DRAM                      768 MB
    Memory utilization         21 percent
    CPU utilization:

Release Information

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc command introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

Display chassis temperature threshold settings, in degrees Celsius.

Options

none—Display the temperature threshold details.

all-members—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of all member routers in the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the temperature threshold details of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the temperature threshold details of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Node device.

scc—(TX Matrix routers only) (Optional) Display the temperature threshold details of the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) On TX Matrix Plus routers, display the temperature threshold details of the TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* with **0**.

Output Fields Table 71 on page 854 lists the output fields for the **show chassis temperature-thresholds** command. Output fields are listed in the approximate order in which they appear.

Table 71: show chassis temperature-thresholds Output Fields

Field name	Field Description
Item	Chassis component. If per FRU per slot thresholds are configured, the components about which information is displayed include the chassis, the Routing Engines, FPCs, and FEBs. If per FRU per slot thresholds are not configured, the components about which information is displayed include the chassis and the Routing Engines.
Fan speed	NOTE: On the QFX3500 switch and QFX3600 switch, there are four fan speeds: **low**, **medium-low**, **medium-high**, and **high**. The fan speed changes at the threshold when going from a low speed to a higher speed. When the fan speed changes from a higher speed to a lower speed, the temperature changes two degrees below the threshold. Temperature threshold settings, in degrees Celsius, for the fans to operate at normal and high speeds. • **Normal**—The fans operate at normal speed if the component is at or below this temperature and all the fans are present and functioning normally. NOTE: On a TX Matrix Plus router with 3D SIBs, the threshold temperature at the XF junction is set to 70°C for **Normal** fan speed, which is less than or equal to 4800 RPM. • **High**—The fans operate at high speed if the component has exceeded this temperature or a fan has failed or is missing. NOTE: On a TX Matrix Plus router with 3D SIBs, the threshold temperature at the XF junction is set to 75°C for **High** fan speed, which is greater than or equal to 5000 RPM. NOTE: For MX480 Routers, there are three fan speeds: **Low**, **Medium**, and **High**. An alarm is not triggered until the temperature exceeds the threshold settings for a yellow alarm or a red alarm.
Yellow alarm	Temperature threshold settings, in degrees Celsius, that trigger a yellow alarm. • **Normal**—The temperature that must be exceeded on the component to trigger a yellow alarm when the fans are running at full speed. • **Bad fan**—The temperature that must be exceeded on the component to trigger a yellow alarm when one or more fans have failed or are missing.

Table 71: show chassis temperature-thresholds Output Fields *(continued)*

Field name	Field Description
Red alarm	Temperature threshold settings, in degrees Celsius, that trigger a red alarm. • **Normal**—The temperature that must be exceeded on the component to trigger a red alarm when the fans are running at full speed. • **Bad fan**—The temperature that must be exceeded on the component to trigger a red alarm when one or more fans have failed or are missing.
Fire Shutdown	(T4000 routers, TX Matrix Plus router with 3D SIBs, and PTX Series Packet Transport Switches only)—Temperature threshold settings, in degrees Celsius, for the network device to shut down.

Release Information
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description
(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays. On MX2010 and MX2020 routers, display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.

Options
detail—(MX2010 and MX2020 routers only) (Optional) Display detailed status of the cooling system zones.

detail *device-name*— (QFabric systems only) (Optional) Display detailed status of the two cooling systems on the Interconnect device.

interconnect-device *name*— (QFabric systems only) (Optional) Display the status of the cooling zones on the Interconnect device.

Output Fields Table 51 on page 464 lists the output fields for the **show chassis zones** command. Output fields are listed in the approximate order in which they appear.

Table 72: show chassis zones Output Fields

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always **0**.
Beacon State	Status of the beacon state: • Off—The beacon is **OFF**. • On—The beacon is **ON**.
show chassis zones command output fields for MX2020 and MX2010 routers:	
Driving FRU	Field replacable unit (FRU).
Temperature	Temperature of the specified FRU in degrees Celsius and degrees Fahrenheit.
Condition	Condition of the specified FRU. Condition can be **HIGH TEMP**, **WARM TEMP**, **OK**, and **Offline**.
Num Fans Missing	Number of fans or fan trays missing.
Num Fans Failed	Number of fans or fan trays that have failed.
Fan Duty Cycle	Fan duty cycle value.
show chassis zones detail command output fields for MX2020 and MX2010 routers:	
Item	Chassis component: • Information about the chassis, Routing Engines, Control Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).
Measurement	Fan tray speed utilization in percentage.
Status	Status of the specified item. Status can be **OK**, **Absent**, or **Offline**.

List of Sample Output
show cli on page 875

Output Fields
Table 73 on page 874 lists the output fields for the **show cli** command. Output fields are listed in the approximate order in which they appear.

Table 73: show cli Output Fields

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: **on** or **off**.
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is **disabled**.
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: **on** or **off**.
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: **enhanced**.
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is **disabled**.
CLI working directory	Pathname of the working directory.

Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

show cli authorization

Syntax show cli authorization

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the permissions for the current user.

Options This command has no options.

Required Privilege Level view

List of Sample Output show cli authorization on page 878

Output Fields Table 74 on page 876 lists the output fields for the **show cli authorization** command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

Table 74: show cli authorization Output Fields

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 74: show cli authorization Output Fields *(continued)*

Field Name	Field Description
flow-tap-control	Can configure flow-tap configuration information.
idp-profiler-operation	Can configure Profiler data.
interface	Can view interface configuration information.
interface-control	Can modify interface configuration information.
maintenance	Can perform system maintenance.
network	Can access the network by entering the **ping**, **ssh**, **telnet**, and **traceroute** commands.
pgcp-session-mirroring	Can view Packet Gateway Control Protocol session mirroring configuration.
pgcp-session-mirroring-control	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
reset	Can reset or restart interfaces and system processes.
rollback	Can roll back to previous configurations.
routing	Can view routing configuration information.
routing-control	Can modify routing configuration information.
secret	Can view passwords and authentication keys in the configuration.
secret-control	Can modify passwords and authentication keys in the configuration.
security	Can view security configuration information.
security-control	Can modify security configuration information.
shell	Can start a local shell.
snmp	Can view SNMP configuration information.
snmp-control	Can modify SNMP configuration information.
system	Can view system configuration information.
system-control	Can modify system configuration information.
trace	Can view trace file settings information.

Table 74: show cli authorization Output Fields *(continued)*

Field Name	Field Description
trace-control	Can modify trace file settings information.
view	Can view current values and statistics.
view-configuration	Can view all configuration information (not including secrets).

Sample Output

show cli authorization

```
user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
    admin       -- Can view user accounts
    admin-control-- Can modify user accounts
    clear       -- Can clear learned network information
    configure   -- Can enter configuration mode
    control     -- Can modify any configuration
    edit        -- Can edit full files
    field       -- Special for field (debug) support
    floppy      -- Can read and write from the floppy
    interface   -- Can view interface configuration
    interface-control-- Can modify interface configuration
    network     -- Can access the network
    reset       -- Can reset/restart interfaces and daemons
    routing     -- Can view routing configuration
    routing-control-- Can modify routing configuration
    shell       -- Can start a local shell
    snmp        -- Can view SNMP configuration
    snmp-control-- Can modify SNMP configuration
    system      -- Can view system configuration
    system-control-- Can modify system configuration
    trace       -- Can view trace file settings
    trace-control-- Can modify trace file settings
    view        -- Can view current values and statistics
    maintenance -- Can become the super-user
    firewall    -- Can view firewall configuration
    firewall-control-- Can modify firewall configuration
    secret      -- Can view secret configuration
    secret-control-- Can modify secret configuration
    rollback    -- Can rollback to previous configurations
    security    -- Can view security configuration
    security-control-- Can modify security configuration
    access      -- Can view access configuration
    access-control-- Can modify access configuration
    view-configuration-- Can view all configuration (not including secrets)
    flow-tap    -- Can view flow-tap configuration
    flow-tap-control-- Can configure flow-tap service
Individual command authorization:
    Allow regular expression: none
    Deny regular expression: none
    Allow configuration regular expression: none
    Deny configuration regular expression: none
```

show cli directory

Syntax show cli directory

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the current working directory.

Options This command has no options.

Required Privilege Level view

List of Sample Output show cli directory on page 880

Output Fields Table 75 on page 880 lists the output fields for the **show cli directory** command. Output fields are listed in the approximate order in which they appear.

Table 75: show cli directory Output Fields

Field Name	Field Description
Current directory	Pathname of the current working directory.

Sample Output

show cli directory

```
user@host> show cli directory
Current directory: /var/home/regress
```

show cli history

Syntax show cli history
<count>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display a list of previous CLI commands.

Options **none**—Display all previous CLI commands.

count—(Optional) Maximum number of commands to display.

Required Privilege Level view

List of Sample Output show cli history on page 881

Output Fields Table 76 on page 881 lists the output fields for the **show cli history** command. Output fields are listed in the approximate order in which they appear.

Table 76: show cli history Output Fields

Field Name	Field Description
timestamp	Time at which the command was entered.
command-syntax	Command that was entered.

Sample Output

show cli history

```
user@host> show cli history
  11:14:14 -- show arp
  11:22:10 -- show cli authorization
  11:27:12 -- show cli history
```

show host

Syntax show host *hostname*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display Domain Name System (DNS) hostname information.

Options *hostname*—Hostname or address.

Additional Information The **show host** command displays the raw data received from the DNS server.

Required Privilege Level view

List of Sample Output show host on page 882

Sample Output

show host

```
user@host> show host snark
snark.boojum.net has address 192.168.1.254

user@host> show host 192.168.1.254
Name: snark.boojum.net
Address: 192.168.1.254
Aliases:
```

show interfaces diagnostics optics

Syntax show interfaces diagnostics optics *interface-name*

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display diagnostics data and alarms for Gigabit Ethernet, 10-Gibabit Ethernet, and QSFP+ optical transceivers installed in a QFX Series product. The information provided by this command is known as digital optical monitoring (DOM) information.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.

Options ***interface-name***—Name of the interface associated with the port in which the transceiver is installed.

Required Privilege Level view

show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver) on page 887
show interfaces diagnostics optics node1:xe-0/0/1 (SFP+ Transceiver) on page 888

Output Fields lists the output fields for the **show interfaces diagnostics optics** command. Output fields are listed in the approximate order in which they appear.

Table 77: show interfaces diagnostics optics Output Fields

Field Name	Field Description
Physical interface	Displays the name of the physical interface.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage (Not available for XFP transceivers)	Displays the voltage, in volts.

Table 77: show interfaces diagnostics optics Output Fields *(continued)*

Field Name	Field Description
Laser rx power (Not available for SFP and SFP+ transceivers)	Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Receiver signal average optical power (Not available for XFP transceivers)	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Laser bias current high alarm	Displays whether the laser bias power setting high alarm is **On** or **Off**.
Laser bias current low alarm	Displays whether the laser bias power setting low alarm is **On** or **Off**.
Laser bias current high warning	Displays whether the laser bias power setting high warning is **On** or **Off**.
Laser bias current low warning	Displays whether the laser bias power setting low warning is **On** or **Off**.
Laser output power high alarm	Displays whether the laser output power high alarm is **On** or **Off**.
Laser output power low alarm	Displays whether the laser output power low alarm is **On** or **Off**.
Laser output power high warning	Displays whether the laser output power high warning is **On** or **Off**.
Laser output power low warning	Displays whether the laser output power low warning is **On** or **Off**.
Module temperature high alarm	Displays whether the module temperature high alarm is **On** or **Off**.
Module temperature low alarm	Displays whether the module temperature low alarm is **On** or **Off**.
Module temperature high warning	Displays whether the module temperature high warning is **On** or **Off**.
Module temperature low warning	Displays whether the module temperature low warning is **On** or **Off**.
Module voltage high alarm (Not available for XFP transceivers)	Displays whether the module voltage high alarm is **On** or **Off**.
Module voltage low alarm (Not available for XFP transceivers)	Displays whether the module voltage low alarm is **On** or **Off**.
Module voltage high warning (Not available for XFP transceivers)	Displays whether the module voltage high warning is **On** or **Off**.
Module voltage low warning (Not available for XFP transceivers)	Displays whether the module voltage low warning is **On** or **Off**.
Laser rx power high alarm	Displays whether the receive laser power high alarm is **On** or **Off**.

Table 77: show interfaces diagnostics optics Output Fields *(continued)*

Field Name	Field Description
Laser rx power low alarm	Displays whether the receive laser power low alarm is **On** or **Off**.
Laser rx power high warning	Displays whether the receive laser power high warning is **On** or **Off**.
Laser rx power low warning	Displays whether the receive laser power low warning is **On** or **Off**.
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Module not ready alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module not ready alarm is **On** or **Off**. When the output is **On**, the module has an operational fault.
Module power down alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module power down alarm is **On** or **Off**. When the output is **On**, the module is in a limited power mode, low for normal operation.
Tx data not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is **On** or **Off**.
Tx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is **On** or **Off**.
Tx laser fault alarm (Not available for SFP and SFP+ transceivers)	Laser fault condition. Displays whether the Tx laser fault alarm is **On** or **Off**.
Tx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is **On** or **Off**.
Rx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is **On** or **Off**.
Rx loss of signal alarm (Not available for SFP and SFP+ transceivers)	Receive loss of signal alarm. When **on**, indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is **On** or **Off**.
Rx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is **On** or **Off**.
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.

Table 77: show interfaces diagnostics optics Output Fields *(continued)*

Field Name	Field Description
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high warning.
Module voltage low warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser Rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser Rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser Rx power high warning.

Table 77: show interfaces diagnostics optics Output Fields *(continued)*

Field Name	Field Description
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser Rx power low warning.

Sample Output

show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver)

```
user@host> show interfaces diagnostics optics xe-0/0/1
Physical interface: xe-0/0/1
    Laser bias current                         :  4.968 mA
    Laser output power                         :  0.4940 mW / -3.06 dBm

Syntax (QFabric System)

show log *filename*
<*device-type (device-id* | *device-alias*)>

Syntax (TX Matrix Routers)

show log
<all-lcc | lcc *number* | scc>
<*filename* | user <*username*>>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option *device-type (device-id* | *device-alias*) is introduced in Junos OS Release 13.1 for the QFX Series.

Description

List log files, display log file contents, or display information about users who have logged in to the router or switch.

Options

none—List all log files.

<all-lcc | lcc *number* | scc>—(TX Matrix routers only)(Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace ***number*** with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(*device-id* | *device-alias*)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

user <*username*>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include ***username***, display logging information about the specified user.

List of Sample Output show ntp associations on page 893

Output Fields Table 78 on page 892 describes the output fields for the **show ntp associations** command. Output fields are listed in the approximate order in which they appear.

Table 78: show ntp associations Output Fields

Field Name	Field Description
remote	Address or name of the remote NTP peer.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of **0.0.0.0**.
st	Stratum of the remote peer.
t	Type of peer: **b** (broadcast), **l** (local), **m** (multicast), or **u** (unicast).
when	When the last packet from the peer was received.
poll	Polling interval, in seconds.
reach	Reachability register, in octal.
delay	Current estimated delay of the peer, in milliseconds.
offset	Current estimated offset of the peer, in milliseconds.
disp	Current estimated dispersion of the peer, in milliseconds.

Table 78: show ntp associations Output Fields *(continued)*

Field Name	Field Description
peer-name	Peer name and status of the peer in the clock selection process: • space—Discarded because of a high stratum value or failed sanity checks. • **x**—Designated "falseticker" by the intersection algorithm. • **.**—Culled from the end of the candidate list. • **-** —Discarded by the clustering algorithm. • **+**—Included in the final selection set. • **#**—Selected for synchronization, but the distance exceeds the maximum. • ***—Selected for synchronization. • **o**—Selected for synchronization, but the packets-per-second (pps) signal is in use.

Output Fields
Table 79 on page 894 describes the output fields for the **show ntp status** command. Output fields are listed in the approximate order in which they appear.

Table 79: show ntp status Output Fields

Field Name	Field Description
status	System status word, a code representing the status items listed.
leap_none	Indicates a normal synchronized state with no leap seconds imminent. Other options could be **leap_add_sec**, **leap_del_sec**, or **leap_alarm**, indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
sync_ntp	Indicates the current synchronization source, in this case, an NTP server. Other options include **sync_alarm** and **sync_unspec**, both indicating that the router has not been synched.
x events	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
event_peer/strat_chg	Describes the most recent event, in this case, the stratum of the peer server changed.
version	A detailed description of the version of NTP being used.
processor	Indicates the current hardware platform and version of the processor.
system	Detailed description of the name and version of the operating system in use.
leap	The number of leap seconds in use.

Table 79: show ntp status Output Fields *(continued)*

Field Name	Field Description
stratum	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
precision	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
rootdelay	The total roundtrip delay to the primary reference source, in seconds.
rootdispersion	The maximum error relative to the primary reference source, in seconds.
peer	An identification number of the peer in use.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of **0.0.0.0**.
reftime	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
poll	The NTP broadcast message polling interval, in seconds.
clock	The current time on the local router clock.
state	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
offset	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
frequency	The frequency of the clock.
jitter	Indicates the magnitude of jitter, in milliseconds, between several time queries.
stability	A measure of how well this clock can maintain a constant frequency.

<detail | extensive |terse>
<aci-interface-set-name *aci-interface-set-name*>
<address *address*>
<agent-circuit-identifier *agent-circuit-identifier-substring*>
<client-type *client-type*>
<count>
<interface *interface*>
<logical-system *logical-system*>
<mac-address *mac-address*>
<physical-interface *physical-interface-name*>
<profile-name *profile-name*>
<routing-instance *routing-instance*>
<stacked-vlan-id *stacked-vlan-id*>
<subscriber-state *subscriber-state*>
<user-name *user-name*>
<vlan-id *vlan-id*>

Release Information

Command introduced in Junos OS Release 9.3.
Command introduced in Junos OS Release 9.3 for EX Series switches.
client-type, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.
count option usage with other options introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.
The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.

Description

Display information for active subscribers.

Options

detail | extensive | terse—(Optional) Display the specified level of output.

aci-interface-set-name—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

address—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, 192.168.17.1). If you specify the IP address as a prefix with a netmask (for example, 192.168.17.1/32), the router displays a message that the IP address is invalid, and rejects the command.

agent-circuit-identifier-substring—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

client-type—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

count—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the **count** option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, or **vlan-id** options.

id—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the **show subscribers extensive** or the **show subscribers interface extensive** commands.

interface—(Optional) Display subscribers whose interface matches the specified interface.

logical-system—(Optional) Display subscribers whose logical system matches the specified logical system.

mac-address—(Optional) Display subscribers whose MAC address matches the specified MAC address.

physical-interface-name—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

profile-name—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

routing-instance—(Optional) Display subscribers whose routing instance matches the specified routing instance.

subscriber-state—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

user-name—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

vlan-id—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

stacked-vlan-id—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

NOTE: Due to display limitations, logical system and routing instance output values are truncated when necessary.

Output Fields Table 80 on page 899 lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

Table 80: show subscribers Output Fields

Field Name	Field Description
User Name	Name of subscriber.
Type	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
IP Address	Subscriber IPv4 address.
IP Netmask	Subscriber IP netmask.

Table 80: show subscribers Output Fields *(continued)*

Field Name	Field Description
Primary DNS Address	IP address of primary DNS server.
Secondary DNS Address	IP address of secondary DNS server.
Primary WINS Address	IP address of primary WINS server.
Secondary WINS Address	IP address of secondary WINS server.
IPv6 Address	Subscriber IPv6 address, or multiple addresses.
IPv6 Prefix	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
IPv6 User Prefix	IPv6 prefix obtained through ND/RA.
IPv6 Address Pool	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
IPv6 Network Prefix Length	Length of the network portion of the IPv6 address.
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.
Interface	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface. The * character indicates a continuation of addresses for the same session.
Interface Type	Whether the subscriber interface is **Static** or **Dynamic**.
Interface Set	Internally generated name of the dynamic ACI interface set used by the subscriber session.
Interface Set Type	Interface type of the ACI interface set: **Dynamic**. This is the only ACI interface set type currently supported.
Interface Set Session ID	Identifier of the dynamic ACI interface set entry in the session database.
Underlying Interface	Name of the underlying interface for the subscriber session.
Dynamic Profile Name	Dynamic profile used for the subscriber.
Dynamic Profile Version	Version number of the dynamic profile used for the subscriber.
MAC Address	MAC address associated with the subscriber.

Table 80: show subscribers Output Fields *(continued)*

Field Name	Field Description
State	Current state of the subscriber session (**Init**, **Configured**, **Active**, **Terminating**, **Tunneled**).
VLAN Id	VLAN ID associated with the subscriber in the form *tpid.vlan-id*.
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form *tpid.vlan-id*.
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
Agent Remote ID	Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
DHCP Relay IP Address	IP address used by the DHCP relay agent.
Login Time	Date and time at which the subscriber logged in.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	**len** = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.
IPv6 Interface Address	Address assigned by the Framed-Ipv6-Prefix AAA attribute.

Table 80: show subscribers Output Fields *(continued)*

Field Name	Field Description
IPv6 Framed Interface Id	Interface ID assigned by the Framed-Interface-Id AAA attribute.
ADF IPv4 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv4 Output Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv6 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv6 Output Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
Family	Family that is active for the subscriber session—inet, inet6 or both inet and inet6.
IPv4 Input Filter Name	Name assigned to the IPv4 input filter (client or service session).
IPv4 Output Filter Name	Name assigned to the IPv4 output filter (client or service session).
IPv6 Input Filter Name	Name assigned to the IPv6 input filter (client or service session).
IPv6 Output Filter Name	Name assigned to the IPv6 output filter (client or service session).
IFL Input Filter Name	Name assigned to the logical interface input filter (client or service session).
IFL Output Filter Name	Name assigned to the logical interface output filter (client or service session).

show system alarms

Syntax show system alarms

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display active system alarms.

Options This command has no options.

Additional Information System alarms are preset. They include a **configuration** alarm that appears when no rescue configuration alarm is set and a **license** alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the *Junos OS System Basics Configuration Guide*.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

Required Privilege Level admin

List of Sample Output
show system alarms on page 914
show system alarms (Fan Tray) on page 914
show system alarms (QFX Series) on page 914

Sample Output

show system alarms

```
user@host> show system alarms
2 alarms currently active
Alarm time                    Class     Description
2005-02-24 17:29:34 UTC       Minor     IPsec VPN tunneling usage requires a
license
2005-02-24 17:29:34 UTC       Minor     Rescue configuration is not sent
```

show system alarms (Fan Tray)

```
user@host> show system alarms
4 alarms currently active
Alarm time               Class  Description
2010-11-11 20:27:38 UTC  Major  Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC  Minor  Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC  Major  Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC  Major  Side Fan Tray 0 Failure
```

show system alarms (QFX Series)

```
user@switches> show system alarms
2 alarms currently active
Alarm time Class Description
2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent
```

<all-chassis | all-lcc | lcc *number* | sfc *number*>
<root-only>

Syntax (QFX Series)

show system audit
<infrastructure *name* | interconnect-device *name* | node-group *name* | root-only>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the state and checksum values for file systems.

Options

none—Display the state and checksum values for all file systems.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.

all-members—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router

that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

infrastructure *name*—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

local—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

member *member-id*—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

root-only—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

scc—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with **0**.

Additional Information To redirect the output to a file, issue the following command:

ssh *device-name* 'show system audit root-only' > *output-file*

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Required Privilege Level admin

List of Sample Output

show system audit root-only on page 917
show system audit lcc (TX Matrix Router) on page 918
show system audit lcc (TX Matrix Plus Router) on page 919
show system audit root-only (QFX3500 Switch) on page 921

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display initial messages generated by the system kernel upon startup. These messages are the contents of **/var/run/dmesg.boot**.

Options

none—Display all boot time messages.

all-chassis—(TX Matrix routers andTX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.

infrastructure ***name***—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.

interconnect-device ***name***—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

member ***member-id***—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group ***name***—(QFabric systems only) (Optional) Display boot time messages on the Node group.

scc—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

sfc ***number***—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with **0**.

Additional Information

By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).

Options

none—Show all buffer statistics.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.

all-members—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.

infrastructure *name*—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Show buffer statistics for the Node group

sfc—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace ***number*** with **0**.

Additional Information

By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

Output Fields Table 81 on page 933 describes the output fields for the **show system buffers** command. Output fields are listed in the approximate order in which they appear.

Table 81: show system buffers Output Fields

Field Name	Field Description
mbufs in use	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
mbufs allocated to packet headers	Number of memory buffers currently holding packet headers
mbufs allocated to control blocks	Number of memory buffers currently holding the state for sockets.
mbufs allocated to send data	Number of memory buffers currently holding socket send data.
mbufs allocated to pfe refill data	Number of memory buffers currently holding Packet Forwarding Engine refill data.
mbufs allocated to fxp data	Number of memory buffers currently holding fxp data.
mbufs allocated to socket names and addresses	Number of memory buffers currently holding addresses for sockets.
mbuf clusters in use	Allocation statistics for memory buffer clusters.
allocated to network	Total amount of memory in use by the networking and interprocess communication (IPC) code.
requests for memory denied	Number of times a memory allocation request within the IPC and networking code failed.
requests for memory delayed	Number of times a memory allocation request within the IPC and networking code was postponed.
calls to protocol drain routines	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

Sample Output

show system buffers

```
user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)
395/331/726/30000 mbuf clusters in use (current/cache/total/max)

show system certificate

Syntax
show system certificate
<certificate-id>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
(Encryption interface on M Series, T Series routers, and QFX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority.

Options
none—Display all installed certificates signed by the Juniper Networks certificate authority.

certificate-id—(Optional) Display the details of a particular certificate.

Required Privilege Level
maintenance

List of Sample Output
show system certificate on page 938
show system certificate (QFX Series) on page 938

Output Fields
Table 82 on page 937 lists the output fields for the **show system certificate** command. Output fields are listed in the approximate order in which they appear.

Table 82: show system certificate Output Fields

Field Name	Field Description
Certificate identifier	Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.
Issuer **Subject**	Information about the certificate issuer and the distinguished name (**DN**) of the issuer, respectively: • **Organization**—Name of the owner's organization. • **Organizational unit**—Name of the owner's department. • **Country**—Two-character country code in which the owner's system is located. • **State**—State in the USA in which the owner is using the certificate. • **Locality**—City in which the owner's system is located. • **Common name**—Name of the owner of the certificate. • **E-mail address**—E-mail address of the owner of the certificate.
Validity	When a certificate is valid.
Signature algorithm	Encryption algorithm applied to the installed certificate.
Public key algorithm	Encryption algorithm applied to the public key.

Sample Output

show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
  Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country:  US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
  Subject:
  Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
E-mail address:ca@juniper.net
Validity:
 Not before: Mar 13 03:23:25 2004 GMT
  Not after: Mar 24 03:23:25 2014 GMT
Signature algorithm: sha1WithRSAEncryption
Public key algorithm: dsaEncryption
```

show system certificate (QFX Series)

```
user@host> show system certificate
Certificate identifier: Dallas-v3
  Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country:  US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
  Subject:
  Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
E-mail address:ca@juniper.net
Validity:
 Not before: Mar 13 03:23:25 2004 GMT
  Not after: Mar 24 03:23:25 2014 GMT
Signature algorithm: sha1WithRSAEncryption
Public key algorithm: dsaEncryption
```

show system commit

Syntax show system commit

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the system commit history and any pending commit operation.

Options This command has no options.

Required Privilege Level view

Related Documentation
- clear system commit on page 331

List of Sample Output
show system commit on page 940
show system commit (At a Particular Time) on page 940
show system commit (At the Next Reboot) on page 940
show system commit (Rollback Pending) on page 940
show system commit (QFX Series) on page 940

Output Fields Table 83 on page 939 describes the output fields for the **show system commit** command. Output fields are listed in the approximate order in which they appear.

Table 83: show system commit Output Fields

Field Name	Field Description
Junos XML protocol	Displays the last 50 commit operations listed, most recent to first. The identifier **Junos XML protocol** designates a configuration created for recovery using the **request system configuration rescue save** command.
Junos XML protocol	Date and time of the commit operation.
Junos XML protocol	User who executed the commit operation.
Junos XML protocol	Method used to execute the commit operation: • **Junos XML protocol**—CLI interactive user performed the commit operation. • **Junos XML protocol**—Junos XML protocol client performed the commit operation. • **synchronize**—The **commit synchronize** command was performed on the other Routing Engine. • **snmp**—An SNMP **set** request caused the commit operation. • **button**—A button on the router or switch was pressed to commit a rescue configuration for recovery. • **autoinstall**—A configuration obtained through autoinstallation was committed. • **other**—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.

Sample Output

show system commit

```
user@host> show system commit
0   2003-07-28 19:14:04 PDT by root via other
1   2003-07-25 22:01:36 PDT by regress via cli
2   2003-07-25 22:01:32 PDT by regress via cli
3   2003-07-25 21:30:13 PDT by root via button
4   2003-07-25 13:46:48 PDT by regress via cli
5   2003-07-25 05:33:21 PDT by root via autoinstall

```

show system commit (QFX Series)

```
user@switch> show system commit
0   2011-11-25 19:17:49 PST by root via cli
```

show system configuration archival

Syntax show system configuration archival

Release Information Introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display directory and number of files queued for archival transfer.

NOTE: The **[edit system configuration]** hierarchy is not available on QFabric systems.

Options This command has no options.

Required Privilege Level maintenance

List of Sample Output show system configuration archival on page 941

Sample Output

show system configuration archival

```
user@host> show system configuration archival

/var/transfer/config/:
total 8
```

show system configuration rescue

Syntax show system configuration rescue

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display a rescue configuration, if one exists.

NOTE: The **[edit system configuration]** hierarchy is not available on QFabric systems.

Options This command has no options.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.

Options **none**—Display information about all active IP sockets on the Routing Engine.

extensive—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.

inet | inet6—(Optional) Display IPv4 connections or IPv6 connections, respectively.

infrastructure ***name***—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device ***name***—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router.
Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display system connection activity for the Node group.

scc—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

show-routing-instances—(Optional) Display routing instances.

Additional Information

By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields

Table 84 on page 946 describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

Table 84: show system connections Output Fields

Field Name	Field Description
Proto	Protocol of the socket: **IP**, **TCP**, or **UDP** for IPv4 or IPv6.
Recv-Q	Number of input packets received by the protocol and waiting to be processed by the application.
Send-Q	Number of output packets sent by the application and waiting to be processed by the protocol.

Table 84: show system connections Output Fields *(continued)*

Field Name	Field Description
Local Address	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
Foreign Address	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.
Routing Instance	(Displayed only when the **show-routing-instance** option is used.) Routing instances associated with active IP sockets on the Routing Engine.
(state)	For TCP, the protocol state of the socket.

Sample Output

Release Information

Command introduced before Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Show core files on all routers or switches running Junos OS. You can use the **show system core-dumps** command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and

path and filename. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.

You can use the option ***core-filename*** and its options **core-file-info**, **brief**, and **detail** to display more information about the specified core-dump files.

Options

none—Display a list of all existing core-dump files.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

<all-lcc | lcc *number*>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc *number*** option, replace ***number*** with a value from **0** through **3**.

NOTE: **The all-chassis option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the all-lcc option only displays system core files for the LCCs in the routing matrix.**

all-members—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

brief—(Optional) View details of a binary file.

component (*UUID* | *serial number* |*all*)—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

core-file-info—(Optional) Display the stack trace of a core file.

core-filename—(Optional) Name of a specific core file to display.

detail—(Optional) View stack trace with details of the binary file.

display-order (timestamp-sort | alphanumeric-sort)—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example,

within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

display-period (*hours* | *minutes* | *seconds*)—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

kernel-crashinfo component (*UUID* | *serial number*)—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

local—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

repository (core | log)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

scc—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

Output Fields Table 85 on page 965 describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

Table 85: show system core-dumps Output Fields

Field Name	Field Description
Permissions	Read/write permissions for the file named.

Table 85: show system core-dumps Output Fields *(continued)*

Field Name	Field Description
Links	Number of links to the file.
Owner	Name of the file owner.
Group	Name of the group with file access.
File size	File size in bytes.
Modified	Last file modification date and time.
Path/filename	File path where the file resides and the filename.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the **core** repository, and the log files are located in the **log** repository. The default **Repository scope** is shared since both the **core** and **log** repositories are shared by all of the QFabric system devices.
Repository head:	Path to the top-level repository location.
Repository name:	Name of the repository: **core** or **log**.
List of nodes for core repository:	List of core-dump files associated with a particular QFabric system device located in the core repository.
Node Group	Name of the QFabric system device.
Node Identifier	UUID or serial number of the QFabric system device.
Num	Number of core-dump and log files.
Model	Model number of the QFabric system device.
Usage	Usage of the repository in megabytes.
Total usage of core repository:	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
Total usage of log repository:	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
List of nodes for core repository:	List of core-dump files associated with a particular QFabric system device located in the core repository.
List of nodes for log repository:	List of log files associated with a particular QFabric system device located in the log repository.

Table 85: show system core-dumps Output Fields *(continued)*

Field Name	Field Description
Filename	Name of the core-dump file.
Date	Last core-dump file modification date and time.
Size	Size of the core-dump file.
Core filename	Filename of the core-dump file.
Process name	Name of the process that is generating a core-dump file or log file.
Release	Junos OS release.
Build server	Junos OS build server.
Build date	Junos OS build date.
Stack trace	Stack trace of the core-dump file.

Sample Output

show system core-dumps

This example shows the command output if core files exist.

```
user@switcht> show system core-dumps
-rw------- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

show system core-dumps

This example shows the command output if core files do not exist.

```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display directory usage information.

Options

none—Display all directory usage information.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

depth ***number***—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

infrastructure ***name***— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

interconnect-device ***name***— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

node-group ***name***— (QFabric systems only) (Optional) Display directory information for the Node group.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

member ***member-id***—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

path—(Optional) Path or root directory to traverse.

scc—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with **0**.

```

show system license

Syntax show system license
<installed | keys | usage>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display licenses and information about how they are used.

Options **none**—Display all license information.

installed—(Optional) Display installed licenses only.

keys—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.

usage—(Optional) Display the state of licensed features.

Required Privilege Level maintenance

List of Sample Output
show system license on page 981
show system license installed on page 981
show system license keys on page 982
show system license usage on page 982
show system license (QFX Series) on page 982

Output Fields Table 87 on page 980 lists the output fields for the **show system license** command. Output fields are listed in the approximate order in which they appear.

Table 87: show system license Output Fields

Field Name	Field Description
Feature name	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
Licenses used	Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used. NOTE: In Junos OS Release 10.1 and later, the **Licenses used** column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (**scale-subscriber**), L2TP (**scale-l2tp**), Mobile IP (**scale-mobile-ip**), and so on.

Table 87: show system license Output Fields *(continued)*

Field Name	Field Description
Licenses installed	Information about the installed license key: • **License identifier**—Identifier associated with a license key. • **State**—State of the license key:**valid** or **invalid**. An **invalid** state indicates that the key was entered incorrectly or is not valid for the specific device. • **License version**—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key. • **Valid for device**—Device that can use a license key. • **Group defined**—Group membership of a device. • **Features**—Feature associated with a license, such as data link switching (DLSw).
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

Sample Output

show system license

```
user@host> show system license

License usage:
                                Licenses     Licenses    Licenses    Expiry

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display information about software processes that are running on the router or switch and that have controlling terminals.

Options

none—Display standard information about system processes.

brief | detail | extensive | summary—(Optional) Display the specified level of detail.

adaptive-services—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

alarm-control—(Optional) Display the process to configure the system alarm.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.

ancpd-service—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

application-identification —Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

audit-process—(Optional) Display the RADIUS accounting process.

auto-configuration—Display the Interface Auto-Configuration process.

bootp—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.

captive-portal-content-delivery—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

ce-l2tp-service—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

cfm—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

chassis-control—(Optional) Display the chassis management process.

class-of-service—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

craft-control—Display the process for the I/O of the craft interface.

database-replication—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

datapath-trace-service—Display the packet path tracing process.

dhcp-service—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

diameter-service—(Optional) Display the diameter process.

disk-monitoring—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

dynamic-flow-capture—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management— Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

event-processing—(Optional) Display the event process (eventd).

firewall—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Display the general authentication process.

health (pid *process-identifer* | process-name *process-name*)—(Optional) Display process health information, either by process id (PID) or by process name.

iccp-service—Display the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—Display the intrusion detection and prevention (IDP) protocol process.

ilmi—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

inet-process—Display the IP multicast family process.

init—Display the process that initializes the USB modem.

interface-control—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

kernel-replication—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Display the Layer 2 address flooding and learning process.

l2cpd-service—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

lacp—(Optional) Display the Link Aggregation Control Protocol (LACP)process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

local-policy-decision-function—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

logical-system-mux—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

mac-validation—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

mib-process—(Optional) Display the MIB II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

mountd-service—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

mpls-traceroute—(Optional) Display the MPLS Periodic Traceroute process.

mspd—(Optional) Display the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

neighbor-liveness—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

nfsd-service—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

ntp—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

packet-triggered-subscribers—Display the packet-triggered subcribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Display the Peer Selection Service process.

periodic-packet-services—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

pfe—Display the Packet Forwarding Engine management process.

pgcp-service—(Optional) Display the pgcpd service process running on the Routing Engine.

pgm—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

pic-services-logging—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

ppp—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

pppoe—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

process-monitor—Display the process health monitor process (pmond).

providers—(Optional) Display provider processes.

redundancy-interface-process—(Optional) Display the ASP redundancy process.

remote-operations—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

resource-cleanup—Display the resource cleanup process.

resource-limits (brief | detail) ***process-name***—(Optional) Display process resource limits.

routing—(Optional) Display the routing protocol process.

sampling—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—Display the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

sdk-service—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

send—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

service-deployment—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace ***number*** with 0.

snmp—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

sonet-aps—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

static-subscribers—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

tunnel-oamd—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

vrrp—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

watchdog—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

wide—(Optional) Display process information that might be wider than 80 columns.

Additional Information By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise,

if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields Table 88 on page 990 describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

Table 88: show system processes Output Fields

Field Name	Field Description	Level of Output
last pid	Last process identifier assigned to the process.	**brief extensive summary**
load averages	Three load averages followed by the current time.	**brief extensive summary**
processes	Number of existing processes and the number of processes in each state (**sleeping, running, starting, zombies**, and **stopped**).	**brief extensive summary**
Mem	Information about physical and virtual memory allocation.	**brief extensive summary**
Swap	Information about physical and virtual memory allocation.	**brief extensive summary**
PID	Process identifier.	**detail extensive summary**
TT	Control terminal name.	none **detail**

Table 88: show system processes Output Fields *(continued)*

Field Name	Field Description	Level of Output
STAT	Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process: • **D**—In disk or other short-term, uninterruptible wait • **I**—Idle (sleeping longer than about 20 seconds) • **R**—Runnable • **S**—Sleeping for less than 20 seconds • **T**—Stopped • **Z**—Dead (zombie) • **+** —The process is in the foreground process group of its control terminal. • **<**—The process has raised CPU scheduling priority. • **>**—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped. • **A**—The process requested random page replacement. • **E**—The process is trying to exit. • **L**—The process has pages locked in core. • **N**—The process has reduced CPU scheduling priority. • **S**—The process requested first-in, first-out (FIFO) page replacement. • **s**—The process is a session leader. • **V**—The process is temporarily suspended. • **W**—The process is swapped out. • **X**—The process is being traced or debugged.	none **detail**
UID	User identifier.	**detail**
USERNAME	Process owner.	**extensive summary**
PPID	Parent process identifier.	**detail**
CPU	(D)—Short-term CPU usage. (E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.	**detail extensive summary**
RSS	Resident set size.	**detail**
WCHAN	Symbolic name of the wait channel.	**detail**
STARTED	Local time when the process started running.	**detail**
PRI	Current priority of the process. A lower number indicates a higher priority.	**detail extensive summary**
NI or NICE	UNIX "niceness" value. A lower number indicates a higher priority.	**detail extensive summary**
SIZE	Total size of the process (text, data, and stack), in kilobytes.	**extensive summary**

Table 88: show system processes Output Fields *(continued)*

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	**extensive summary**
STATE	Current state of the process (for example, **sleep**, **wait**, **run**, **idle**, **zombie**, or **stop**).	**extensive summary**
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.	**detail extensive summary**
WCPU	Weighted CPU usage.	**extensive summary**
COMMAND	Command that is currently running.	**detail extensive summary**

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display pending system reboots or halts.

Options

none—Display pending reboots or halts on the active Routing Engine.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

all-lcc—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

infrastructure *name*—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display reboot request information on the Node group.

scc—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

Additional Information By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

List of Sample Output
show system reboot on page 1012
show system reboot all-lcc (TX Matrix Router) on page 1012
show system reboot sfc (TX Matrix Plus Router) on page 1012
show system reboot (QFX3500 Switch) on page 1012

Sample Output

show system reboot

```
user@host> show system reboot
reboot requested by root at Wed Feb 10 17:40:46 1999
[process id 17885]
```

show system reboot all-lcc (TX Matrix Router)

```
user@host> show system reboot all-lcc
lcc0-re0:
--------------------------------------------------------------------------
No shutdown/reboot scheduled.

lcc2-re0:
--------------------------------------------------------------------------
No shutdown/reboot scheduled.
```

show system reboot sfc (TX Matrix Plus Router)

```
user@host> show system sfc 0
No shutdown/reboot scheduled.
```

show system reboot (QFX3500 Switch)

```
user@switch> show system reboot
No shutdown/reboot scheduled.
```

show system resource-cleanup processes

Syntax

show system resource-cleanup processes
<detail>
<pid *number*>
<process-name *name*>

Release Information

Command introduced in Junos OS Release 9.3.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the list of processes that have been registered for resource cleanup services.

Options

detail—(Optional) Display the list of processes that have been registered for resource cleanup services, along with the resources that have been requested for cleanup.

pid *number*—(Optional) Display a process that has been registered for resource cleanup services by specifying the Process Identifier number.

process-name *name*—(Optional) Display a process that has been registered for resource cleanup services by name of the process.

Required Privilege Level

view

List of Sample Output

show system resource-cleanup processes on page 1013
show system resource-cleanup processes detail on page 1013

Output Fields

For a description of the output fields, see Table 89 on page 1013. Output fields are listed in the approximate order in which they appear.

Table 89: show system resource-cleanup processes Output Fields

Field Name	Field Description
PID	Process ID, a number that identifies a process.
Process name	String that identifies the process.
Resources to clean	Resources that have been registered to be cleaned up.

Sample Output

show system resource-cleanup processes

```
user@host> show system resource-cleanup processes
PID     Process name          Resources to clean
420     jnx-exampled          GENCFG, SYSV shared memory
```

show system resource-cleanup processes detail

```
user@host> show system resource-cleanup processes detail
PID     Process name          Resources to clean
420     jnx-exampled          GENCFG blob major ID 0x8000, minor ID 0x0000
```

```
SYSV shared memory ID 65536, key 1108955839
SYSV shared memory ID 65537, key 1108955837
```

show system rollback

Syntax show system rollback *number*
<compare *number*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

NOTE: The show system rollback command is a purely operational mode command and cannot be issued with run from the configuration mode.

Options ***number***—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

compare *number* —(Optional) Number of another previously committed (rollback) configuration to compare to rollback ***number***. The output displays the differences between the two configurations. The range of values is 0 through 49.

Required Privilege Level view

List of Sample Output show system rollback compare on page 1015

Sample Output

show system rollback compare

```
user@host> show system rollback 3 compare 1

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the Junos OS extensions loaded on your router or switch.

Options

none—Display standard information about all loaded Junos OS extensions.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the routers (TX Matrix Plus Router) in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers connected to the

TX Matrix router. On a TX Matrix Plus router, display system software information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.

backup—(J Series routers only) (Optional) Display the status of old system software packages only.

detail—(Optional) Display detailed information about available Junos OS extensions.

infrastructure *name*—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

node-group *name*—(QFabric systems only) (Optional) Display the system software running on the Node group.

scc—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router.

Release Information

Command introduced before JUNOS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display system-wide protocol-related statistics.

Options

none—Display system statistics for all the following protocols:

- **arp**—Address Resolution Protocol
- **bridge**—IEEE 802.1 Bridging
- **clns**—Connectionless Network Service
- **esis**—End System-to-Intermediate System
- **ethoamcfm**—Ethernet OAM protocol for connectivity fault management
- **ethoamlfm**—Ethernet OAM protocol for link fault management
- **icmp**—Internet Control Message Protocol
- **icmp6**—Internet Control Message Protocol version 6
- **igmp**—Internet Group Management Protocol

- **ip**—Internet Protocol version 4
- **ip6**—Internet Protocol version 6
- **mpls**—Multiprotocol Label Switching
- **rdp**—Reliable Datagram Protocol
- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all routers (line-card chassis) connected to the TX Matrix Plus router

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

member ***member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis

configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

Additional Information

By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

show system statistics (TX Matrix Router) on page 1044
show system statistics (QFX Series) on page 1051

Sample Output

show system statistics

```
user@host> show system statistics
ip:
        3682087 total packets received
        0 bad header checksums
        0 with size smaller than minimum
        0 with data size < data length
        0 with header length < data size
        0 with data length < header length
        0 with incorrect version number
        0 packets destined to dead next hop
        0 fragments received
        0 fragments dropped (dup or out of space)
        0 fragments dropped (queue overflow)
        0 fragments dropped after timeout
        0 fragments dropped due to over limit
        0 packets reassembled ok
        3664774 packets for this host
        17316 packets for unknown/unsupported protocol
        0 packets forwarded
        0 packets not forwardable
        0 redirects sent
        6528 packets sent from this host
        0 packets sent with fabricated ip header
        0 output packets dropped due to no bufs
        0 output packets discarded due to no route
```

```
        0 output datagrams fragmented
        0 fragments created
        0 datagrams that can't be fragmented
        0 packets with bad options
        1123 packets with options handled without error
        0 strict source and record route options
        0 loose source and record route options
        0 record route options
        0 timestamp options
        0 timestamp and address options
        0 timestamp and prespecified address options
        0 option packets dropped due to rate limit
        1123 router alert options
        0 multicast packets dropped (no iflist)
        0 packets dropped (src and int don't match)
icmp:
        0 drops due to rate limit
        0 calls to icmp_error
        0 errors not generated because old message was icmp
        Output histogram:
                echo reply: 75
        0 messages with bad code fields
        0 messages less than the minimum length
        0 messages with bad checksum
        0 messages with bad source address
        0 messages with bad length
        0 echo drops with broadcast or multicast destination address
        0 timestamp drops with broadcast or multicast destination address
        Input histogram:
                echo: 75
                router advertisement: 130
        75 message responses generated
tcp:
        3844 packets sent
                3618 data packets (1055596 bytes)
                0 data packets (0 bytes) retransmitted
                0 resends initiated by MTU discovery
                205 ack-only packets (148 packets delayed)
                0 URG only packets
                0 window probe packets
                0 window update packets
                1079 control packets
        5815 packets received
                3377 acks (for 1055657 bytes)
                24 duplicate acks
                0 acks for unsent data
                2655 packets (15004 bytes) received in-sequence
                1 completely duplicate packet  (0 bytes)
                0 old duplicate packets
                0 packets with some dup. data (0 bytes duped)
                0 out-of-order packets (0 bytes)
                0 packets (0 bytes) of data after window
                0 window probes
                7 window update packets
                0 packets received after close
                0 discarded for bad checksums
                0 discarded for bad header offset fields
                0 discarded because packet too short
        1 connection request
        32 connection accepts
        0 bad connection attempts
```

```
        0 listen queue overflows
        33 connections established (including accepts)
        30 connections closed (including 0 drops)
                27 connections updated cached RTT on close
                27 connections updated cached RTT variance on close
                0 connections updated cached ssthresh on close
        0 embryonic connections dropped
        3374 segments updated rtt (of 3220 attempts)
        0 retransmit timeouts
                0 connections dropped by rexmit timeout
        0 persist timeouts
                0 connections dropped by persist timeout
        344 keepalive timeouts
                0 keepalive probes sent
                0 connections dropped by keepalive
        1096 correct ACK header predictions
        1314 correct data packet header predictions
        32 syncache entries added
                0 retransmitted
                0 dupsyn
                0 dropped
                32 completed
                0 bucket overflow
                0 cache overflow
                0 reset
                0 stale
                0 aborted
                0 badack
                0 unreach
                0 zone failures
        0 cookies sent
        0 cookies received
        0 ACKs sent in response to in-window but not exact RSTs
        0 ACKs sent in response to in-window SYNs on established connections
        0 rcv packets dropped by TCP due to bad address
        0 out-of-sequence segment drops due to insufficient memory
        1058 RST packets
        0 ICMP packets ignored by TCP
        0 send packets dropped by TCP due to auth errors
        0 rcv packets dropped by TCP due to auth errors
udp:
        3658884 datagrams received
        0 with incomplete header
        0 with bad data length field
        0 with bad checksum
        3657342 dropped due to no socket
        3657342 broadcast/multicast datagrams dropped due to no socket
        0 dropped due to full socket buffers
        0 not for hashed pcb
        4291311496 delivered
        1551 datagrams output
ipsec:
        0 inbound packets processed successfully
        0 inbound packets violated process security policy
        0 inbound packets with no SA available
        0 invalid inbound packets
        0 inbound packets failed due to insufficient memory
        0 inbound packets failed getting SPI
        0 inbound packets failed on AH replay check
        0 inbound packets failed on ESP replay check
        0 inbound AH packets considered authentic
```

```
        0 inbound AH packets failed on authentication
        0 inbound ESP packets considered authentic
        0 inbound ESP packets failed on authentication
        0 outbound packets processed successfully
        0 outbound packets violated process security policy
        0 outbound packets with no SA available
        0 invalid outbound packets
        0 outbound packets failed due to insufficient memory
        0 outbound packets with no route
igmp:
        17186 messages received
        0 messages received with too few bytes
        0 messages received with bad checksum
        0 membership queries received
        0 membership queries received with invalid field(s)
        0 membership reports received
        0 membership reports received with invalid field(s)
        0 membership reports received for groups to which we belong
        0 membership reports sent
arp:
        44181302 datagrams received
        2 ARP requests received
        2028 ARP replies received
        3156 resolution requests received
        0 unrestricted proxy requests
        0 received proxy requests
        0 proxy requests not proxied
        0 with bogus interface
        787 with incorrect length
        712 for non-IP protocol
        0 with unsupported op code
        0 with bad protocol address length
        0 with bad hardware address length
        0 with multicast source address
        7611 with multicast target address
        0 with my own hardware address
        14241699 for an address not on the interface
        0 with a broadcast source address
        0 with source address duplicate to mine
        29929250 which were not for me
        0 packets discarded waiting for resolution
        6 packets sent after waiting for resolution
        17812 ARP requests sent
        2 ARP replies sent
        0 requests for memory denied
        0 requests dropped on entry
        0 requests dropped during retry
ip6:
        0 total packets received
        0 with size smaller than minimum
        0 with data size < data length
        0 with bad options
        0 with incorrect version number
        0 fragments received
        0 fragments dropped (dup or out of space)
        0 fragments dropped after timeout
        0 fragments that exceeded limit
        0 packets reassembled ok
        0 packets for this host
        0 packets forwarded
        0 packets not forwardable
```

```
        0 redirects sent
        0 packets sent from this host
        0 packets sent with fabricated ip header
        0 output packets dropped due to no bufs, etc.
        0 output packets discarded due to no route
        0 output datagrams fragmented
        0 fragments created
        0 datagrams that can't be fragmented
        0 packets that violated scope rules
        0 multicast packets which we don't join
        Mbuf statistics:
        0 packets whose headers are not continuous
        0 tunneling packets that can't find gif
        0 packets discarded due to too may headers
        0 failures of source address selection

0 Packets sent
0 Packets sent while unconnected
0 Packets sent while interface down
0 Packets sent couldn't get buffer
0 Packets sent couldn't find neighbor
0 L2 packets received
0 Unknown L3 packets received
0 IPv4 L3 packets received
0 MPLS L3 packets received
0 MPLS->IPV4 L3 packets received
0 IPv4->MPLS L3 packets received
0 IPv6 L3 packets received
0 ARP L3 packets received
0 CLNP L3 packets received
0 TNP L3 packets received
0 NULL L3 packets received
0 Cyclotron cycle L3 packets received
0 Cyclotron send L3 packets received
0 Packets received while unconnected
0 Packets received from unknown ifl
0 Input packets couldn't get buffer
0 Input packets with bad type
0 Input packets with discard type
0 Input packets with too many tlvs
0 Input packets with bad tlv header
70633 Input packets with bad tlv type
68877 Input packets dropped based on tlv result0 Input packets for which rt lookup
 is bypassed
mpls:
0 Total MPLS packets received
0 Packets forwarded
0 Packets dropped
0 Packets with header too small
0 After tagging, packets can't fit link MTU
0 Packets with IPv4 explicit NULL tag
0 Packets with IPv4 explicit NULL cksum errors
0 Packets with router alert tag
0 LSP ping packets (ttl-expired/router alert)
0 Packets with ttl expired
0 Packets with tag encoding error
0 Packets discarded due to no route
0 Packets used first nexthop in ecmp unilist
vpls:
0 Total packets received
0 Packets with size smaller than minimum
0 Packets with incorrect version number
0 Packets for this host
0 Packets with no logical interface
0 Packets with no family
0 Packets with no route table
582 Copyright © 2010, Juniper Networks, Inc.

0 MAC routes moved
0 Requests to move static route
0 MAC route aging requests
0 MAC routes aged
0 Bogus address in aging requests
0 Requests to age static route
0 Requests to re-ageout aged route
0 Requests involving multiple peer FEs
0 Aging acks from PFE
0 Aging non-acks from PFE
0 Aging requests timed out waiting on FEs
0 Aging requests over max-rate
0 Errors finding peer FEs
0 Unsupported platform
0 Packets dropped due to no l3 route table
0 Packets dropped due to no local ifl
0 Packets punted
0 Packets dropped due to no socket
bridge:
Input:
0 packets received
0 packets forwarded
0 packets failed to forward
0 packets dropped
0 packets with vmember lookup failures
0 packets with vlan lookup failures
0 packets with stp state lookup failures
0 packets dropped due to stp blocked/listening
0 packets dropped due to stp learning
0 packets with src MAC learning failures
0 packets with input control processing failures
Forward:
0 packets sent successfully
0 packets with send failures
0 packets forwarded to l3 interface
0 packets with l3 send failures
0 packets discarded
0 packets with l2ifl store failures
0 packets with ifl mismatch failures
0 packets with packet duplication failures
0 packets with tag lookup failures
0 packets with no route for DMAC
0 packets with no route table
0 packets with no nexthop
0 packets with dead nexthop
0 packets with eof reached error
Learning:
0 MACs learned
0 packets sent to l3 interface
0 packets with l3 send failures
0 packets hit holdq while learning
0 MAC moves
0 packets discarded
0 packets with no route for SMAC
0 packets with no nexthop
0 packets with dead nexthop
0 packets dropped due to no resolve route
0 packets with l3 ifd lookup failures
0 packets with l3 ifl lookup failures
0 packets with l3 invalid rnh
0 packets with no route for SMAC in clone learning
```

```
0 packets with no nexhop in clone learning
0 packets with dead nexthop in clone learning
0 packets dropped due to no resolve nh in clone learning
Output:
0 packets forwarded
0 packets failed to forward
0 packets with vmember lookup failures
0 packets with vlan lookup failures
0 packets with input control processing failures
Send:
0 packets sent successfully
0 packets with send failures
0 packets dropped due to interface down
0 packets with dev output failures
0 blocked ifl discards
0 packets with tag lookup failures
0 packets with stp state lookup failures
0 packets with tag insertion failures
0 packets with tag removal failures
Flood:
0 packets flooded
0 flood failures
IGMP:
0 packets sent successfully
0 packets with send failures
0 packets forwarded
0 packets failed to forward
0 packets with mpull failures
0 packets with vmember lookup failures
0 packets with vlan lookup failures
0 packets with ifl lookup failures
0 packets with tag lookup failures
Misc:
0 packets with size smaller than minimum
0 packets with double tags
0 packets with no ifl
0 packets with no family
0 packets with no route table
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display statistics about the amount of free disk space in the router's or switch's file systems.

Options

none—Display standard information about the amount of free disk space in the router's or switch's file systems.

detail—(Optional) Display detailed output.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

infrastructure *name*—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

scc—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

List of Sample Output
show system storage on page 1063
show system storage (TX Matrix Plus Router) on page 1064
show system storage (QFX3500 Switch) on page 1066

Output Fields Table 91 on page 1063 describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

Table 91: show system storage Output Fields

Field Name	Field Description
Filesystem	Name of the filesystem.
Size	Size of the filesystem.
Used	Amount of space used in the filesystem.
Avail	Amount of space available in the filesystem.
Capacity	Percentage of the filesystem space that is being used.
Mounted on	Directory in which the filesystem is mounted.

Sample Output

show system storage

```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.

Options

none—Show time since the system rebooted and processes started.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus

router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

director-group ***name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

infrastructure ***name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device ***name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

invoke-on—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

member ***member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group ***name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

scc—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

Additional Information

By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields

Table 92 on page 1069 describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

Table 92: show system uptime Output Fields

Field Name	Field Description
Current time	Current system time in UTC.
System booted	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
Protocols started	Date and time when the routing protocols were last started and how long they have been running.
Last configured	Date and time when a configuration was last committed. Also shows the name of the user who issued the last **commit** command.
***time* and up**	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

List information about the users who are currently logged in to the router or switch.

NOTE: The **show system users** command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

Options

none—List information about the users who are currently logged in to the router or switch.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.

all-members—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

no-resolve—(Optional) Do not attempt to resolve IP addresses to hostnames.

scc—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routersonly) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information

By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields Table 93 on page 1074 describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

Table 93: show system users Output Fields

Field Name	Field Description
time **and up**	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
USER	Username.
TTY	Terminal through which the user is logged in.
FROM	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
LOGIN@	Time when the user logged in.
IDLE	How long the user has been idle.
WHAT	Processes that the user is running.

Sample Output

show system users

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the **show system virtual-memory** command for troubleshooting with Juniper Networks Customer Support.

Options

none—Display kernel dynamic memory usage information.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

infrastructure ***name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device ***name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

member ***member-id***—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group ***name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

scc—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

sfc ***number***—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information

By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix

or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

NOTE: The **show system virtual-memory** command with the **| display XML** pipe option now displays XML output for the command in the parent tags: **<vmstat-memstat-malloc>**, **<vmstat-memstat-zone>**, **<vmstat-sumstat>**, **<vmstat-intr>**, and **<vmstat-kernel-state>** with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the **| display XML** option for this command does not have an XML API element and the entire output is displayed in a single **<output>** tag element.

Output Fields Table 94 on page 1080 lists the output fields for the **show system virtual-memory** command. Output fields are listed in the approximate order in which they appear.

Table 94: show system virtual-memory Output Fields

Field Name	Field Description
Memory statistics by bucket size	
Size	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
In Use	Number of memory blocks of this size that are in use (bytes).
Free	Number of memory blocks of this size that are free (bytes).
Requests	Number of memory allocation requests made.
HighWater	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
Couldfree	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
Memory usage type by bucket size	
Size	Memory block size (bytes).
Type(s)	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
Memory statistics by type	
Type	Kernel module that is using dynamic memory.
InUse	Number of memory blocks used by this type. The number is rounded up.
MemUse	Amount of memory in use, in kilobytes (KB).
HighUse	Maximum memory ever used by this type.
Limit	Maximum memory that can be allocated to this type.
Requests	Total number of dynamic memory allocation requests this type has made.
Type Limit	Number of times requests were blocked for reaching the maximum limit.
Kern Limit	Number of times requests were blocked for the kernel map.
Size(s)	Memory block sizes this type is using.
Memory Totals	
In Use	Total kernel dynamic memory in use (bytes, rounded up).
Free	Total kernel dynamic memory free (bytes, rounded up).

Table 94: show system virtual-memory Output Fields *(continued)*

Field Name	Field Description
Requests	Total number of memory allocation requests.
ITEM	Kernel module that is using memory.
Size	Memory block size (bytes).
LImit	Maximum memory that can be allocated to this type.
Used	Number of memory blocks used by this type. The number is rounded up.
Free	Number of memory blocks available to this type.
Requests	Total number of memory allocation requests this type has made.
interrupt	Timer events and scheduling interruptions.
total	Total number of interruptions for each type.
rate	Interruption rate.
Total	Total for all interruptions.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the hostname and version information about the software running on the router or switch.

Options

none—Display standard information about the hostname and version of the software running on the router or switch.

brief | detail—(Optional) Display the specified level of output.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.

component all—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.

component *component-name*—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace *component-name* with the name of the QFabric system component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

local—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information

By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same

command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

Required Privilege Level view

List of Sample Output

show version on page 1138
show version (TX Matrix Plus Router) on page 1138
show version (TX Matrix Plus Router with 3D SIBs) on page 1141
show version (MX Series Router) on page 1144
show version (QFX3500 Switch) on page 1144
show version (QFabric System) on page 1145
show version component all (QFabric System) on page 1145

start shell

Syntax start shell (csh | sh)
<user *username*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type **exit** from the shell.

NOTE:

- To issue this command, the user must have the required login access privileges configured by including the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.
- UNIX wheel group membership or permissions are no longer required to issue this command.

Options **csh**—Create a UNIX C shell.

sh—Create a UNIX Bourne shell.

user *username*—(Optional) Start the shell as another user.

Additional Information When you are in the shell, the shell prompt has the following format:

username@hostname%

An example of the prompt is:

root@host%

Required Privilege Level shell and maintenance

List of Sample Output start shell csh on page 1148

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

start shell csh

```
user@host> start shell csh
%

exit
%
```

```
username@hostname% start shell sh
%

exit
user@host>
```

test configuration

Syntax test configuration *filename*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found.

Options ***filename***—Name of the configuration file.

syntax-only—Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.

Required Privilege Level view

List of Sample Output test configuration on page 1150

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

test configuration

```
user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
  [edit system]
    'paris-23;'
      syntax error
terminal:4:(11) statement must contain additional statements: ;
  [edit system login]
    'login ;'
      statement must contain additional statements
configuration syntax failed
```

traceroute

List of Syntax

Syntax on page 1151
Syntax (QFX Series) on page 1151

Syntax

traceroute *host*
<as-number-lookup>
<bypass-routing>
<clns>
<gateway *address*>
<inet | inet6>
<interface *interface-name*>
<logical system *logical-system-name*>
<monitor *host*>
<mpls (ldp *FEC address* | rsvp *label-switched-path-name*)>
<no-resolve>
<propagate-ttl>
<routing-instance *routing-instance-name*>
<source *source-address*>
<tos *value*>
<ttl *value*>
<wait *seconds*>

Syntax (QFX Series)

traceroute *host*
<as-number-lookup>
<bypass-routing>
<gateway *address*>
<inet>
<interface *interface-name*>
<monitor *host*>
<no-resolve>
<routing-instance *routing-instance-name*>
<source *source-address*>
<tos *value*>
<ttl *value*>
<wait *seconds*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
mpls option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.1 for the QFX Series.
propagate-ttl option introduced in Junos OS Release 12.1.

Description

Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

Options

host—IP address or name of remote host.

as-number-lookup—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

bypass-routing—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached

network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

clns—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

gateway ***address***—(Optional) Address of a router or switch through which the route transits.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interface ***interface-name***—(Optional) Name of the interface over which to send packets.

logical-system ***logical-system-name***—(Optional) Perform this operation on all logical systems or on a particular logical system.

monitor ***host***—(Optional) Display real-time monitoring information for the specified host.

mpls (ldp ***FEC address*** **| rsvp** ***label-switched-path name*****)**—(Optional) See ***traceroute mpls ldp*** and ***traceroute mpls rsvp***.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

propagate-ttl—(Optional) On the PE router, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-proagate-ttl** configuration statement.

NOTE: Using propagate-ttl with traceroute on the CE router does not show hop-by-hop information.

routing-instance ***routing-instance-name***—(Optional) Name of the routing instance for the traceroute attempt.

source ***source-address***—(Optional) Source address of the outgoing traceroute packets.

tos ***value***—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is **0** through **255**.

ttl ***value***—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is **0** through **128**.

wait ***seconds***—(Optional) Maximum time to wait for a response to the traceroute request.

Required Privilege Level

network

Output Fields

Table 95 on page 1153 describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

Table 95: traceroute Output Fields

Field Name	Field Description
traceroute to	IP address of the receiver.
hops max	Maximum number of hops allowed.
byte packets	Size of packets being sent.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
Round trip time	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```
user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1  blue23 (10.168.1.254)    2.370 ms  2.853 ms  0.367 ms
 2  red14  (10.168.255.250)  0.778 ms  2.937 ms  0.446 ms

traceroute monitor

List of Syntax
Syntax on page 1155
Syntax (QFX Series) on page 1155

Syntax

traceroute monitor *host*
<count *value*>
<inet | inet 6>
<interval *seconds*>
<no resolve>
<size *value*>
<source *source-address*>
<summary>

Syntax (QFX Series)

traceroute monitor *host*
<count *value*>
<inet>
<interval *seconds*>
<no resolve>
<size *value*>
<source *source-address*>
<summary>

Release Information

Command introduced in Junos OS Release 8.0
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.

Options

host—IP address or name of remote host.

count *value*—Number of ping requests, in packets, to send in summary mode. The default value is **10**.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interval *seconds*—(Optional) Number of seconds to wait before sending ping requests. The default value is **1**.

no resolve—(Optional) Do not attempt to display addresses symbolically.

size *value*—(Optional) Receive the specified number of bytes for each packet. The range is **0** through **65468** bytes. The default value is **64**.

source *source-address*—(Optional) Source address of the outgoing ping packets.

summary—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.

Required Privilege Level

network

List of Sample Output
traceroute monitor on page 1156

Output Fields Table 96 on page 1156 describes the output fields for the **traceroute monitor** command. Output fields are listed in the approximate order in which they appear.

Table 96: traceroute monitor Output Fields

Field Name	Field Description
Host	Hostname or IP address of the router at each hop.
Loss%	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
Snt	Number of ping requests sent to the routerat this hop.
Last	Most recent round-trip time, in milliseconds, to the router at this hop.
Avg	Average round-trip time, in milliseconds, to the router at this hop.
Best	Shortest round-trip time, in milliseconds, to the router at this hop.
Wrst	Longest round-trip time, in milliseconds, to the router at this hop.
StDev	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

Sample Output

traceroute monitor

```
user@host> traceroute monitor 10.16.0.1

                                 Loss%   Snt   Last   Avg  Best  Wrst StDev
Host
1. 10.17.41.254                  0.0%    17    0.7   1.0   0.6   5.4   1.2

Troubleshooting Procedures

- Rebooting and Halting a QFX Series Product on page 1157
- Recovering from a Failed Software Installation on page 1158
- Recovering the Root Password on page 1159
- Troubleshooting Network Interfaces on page 1160
- Troubleshooting an Aggregated Ethernet Interface on page 1161

Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
  <[Enter]>            Execute this command
  at                   Time at which to perform the operation
  in                   Number of minutes to delay before operation
  media                Boot media for next boot
  message              Message to display to all users
  |                    Pipe through a command
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
  <[Enter]>            Execute this command
  at                   Time at which to perform the operation
  in                   Number of minutes to delay before operation
  media                Boot media for next boot
  message              Message to display to all users
  |                    Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says "Hardware-based members will halt, Virtual Junos Routing Engines will reboot." If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Recovering from a Failed Software Installation

Problem **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

   Hit [Enter] to boot immediately, or space bar for command prompt.

   Press the Spacebar to enter the manual loader. The **loader>** prompt appears.
3. Enter the following command:

   `loader>` **install [– –format] [– –external]** ***source***
   where:

   - **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
   - **external**—Installs the installation package onto external media (a USB stick, for example).

- ***source***—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**).

The installation now proceeds normally and ends with a login prompt.

Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: **The root password cannot be recovered on a QFabric system.**

NOTE: **You need console access to the switch to recover the root password.**

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45–to–DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45–to–DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None

- Stop bits: 1
- Flow control: None

9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

   The terminal emulation screen on your management device displays the switch's boot sequence.

10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

    ```
    Hit [Enter] to boot immediately, or space bar for command prompt.
    Booting [kernel] in 9 seconds...
    ```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

    ```
    ok boot -s
    ```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

    ```
    Enter full pathname of shell or 'recovery' for root password recovery or RETURN
    for /bin/sh: recovery
    ```

13. Enter configuration mode in the CLI.
14. Set the root password. For example:

    ```
    user@switch# set system root-authentication plain-text-password
    ```

15. At the following prompt, enter the new root password. For example:

    ```
    New password: juniper1
    Retype new password:
    ```

16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

    ```
    root@host# commit
    commit complete
    ```

18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.

    ```
    Reboot the system? [y/n] y
    ```

Troubleshooting Network Interfaces

The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

Problem **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

Symptoms: When you check the status with the CLI command **show interfaces** ***interface-name*** , the disabled port is not listed.

Cause By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

Solution Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

Troubleshooting an Aggregated Ethernet Interface

Problem **Description:** The **show interfaces terse** command shows that the LAG is down.

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

QFabric System Overview

The architecture of legacy data centers contrasts significantly with the revolutionary Juniper Networks data center solution.

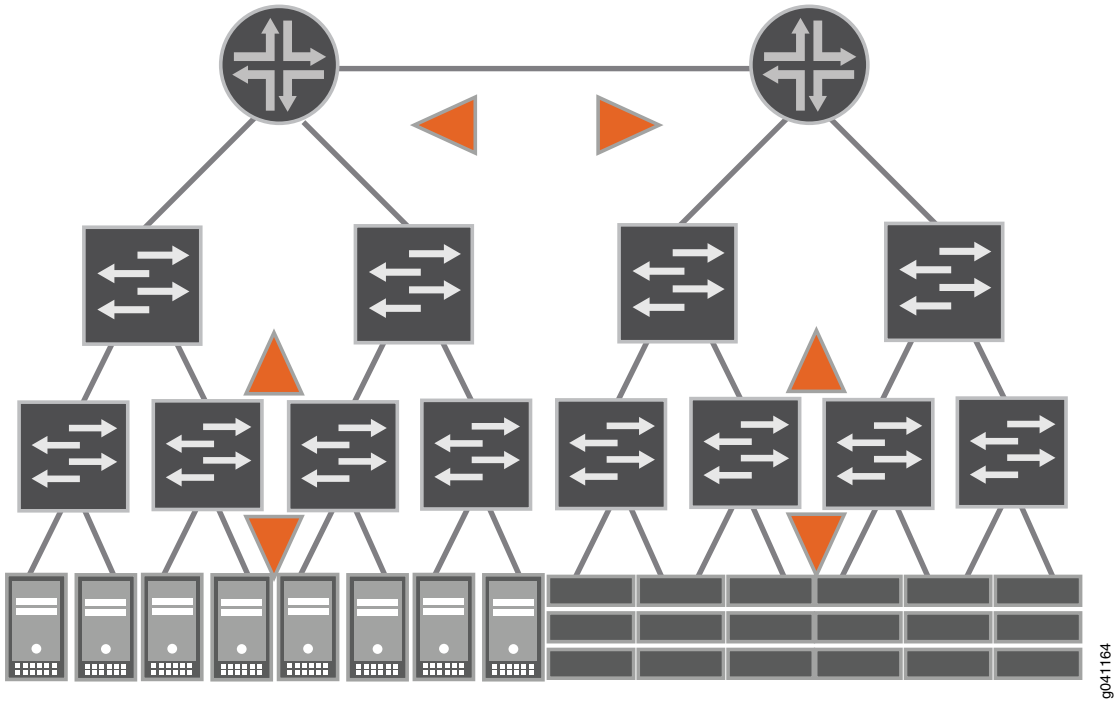
This topic covers:

- Legacy Data Center Architecture on page 1165
- QFX Series QFabric System Architecture on page 1167

Legacy Data Center Architecture

Service providers and companies that support data centers are familiar with legacy multi-tiered architectures, as seen in Figure 13 on page 1166.

Figure 13: Legacy Data Center Architecture



The *access layer* connects servers and other devices to a Layer 2 switch and provides an entry point into the data center. Several access switches are in turn connected to intermediate Layer 2 switches at the *aggregation layer* (sometimes referred to as the *distribution layer*) to consolidate traffic. A *core layer* interconnects the aggregation layer switches. Finally, the core switches are connected to Layer 3 routers in the *routing layer* to send the aggregated data center traffic to other data centers or a wide area network (WAN), receive external traffic destined for the data center, and interconnect different Layer 2 broadcast domains within the data center.

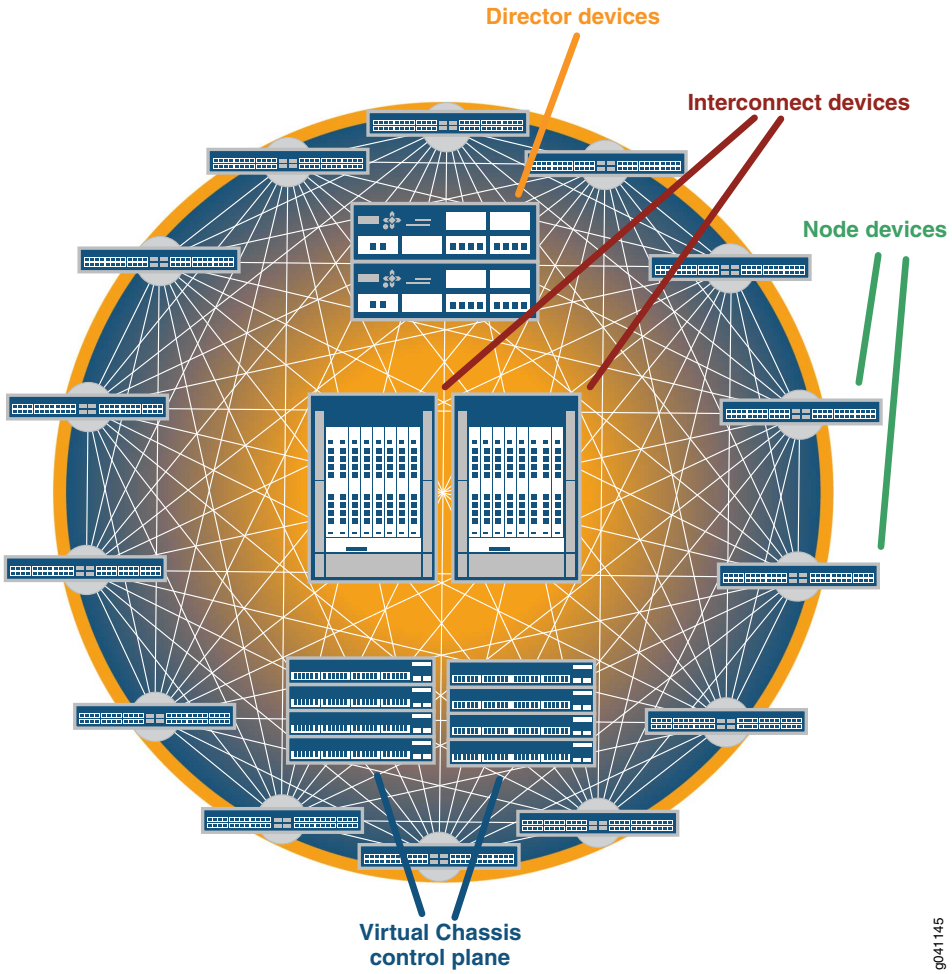
The problems that exist with the multi-tiered data center architecture include:

- **Limited scalability**—The demands for electrical power, cooling, cabling, rack space, and port density increase exponentially as the traditional data center expands, which prohibits growth after minimal thresholds are met.
- **Inefficient resource usage**—Up to 50 percent of switch ports in a legacy data center are used to interconnect different tiers rather than support server and storage connections. In addition, traffic that ideally should move horizontally between servers within a data center often must also be sent vertically up through the tiers to reach a router and down through the tiers to reach the required destination server.
- **Increased latency**—By requiring the devices at each tier level to perform multiple iterations of packet and frame processing, the data plane traffic takes significantly longer to reach its destination than if the sending and receiving devices were directly connected. This processing overhead results in potentially poor performance for time-sensitive applications, such as voice, video, or financial transactions.

QFX Series QFabric System Architecture

In contrast to legacy multi-tiered data center architectures, the Juniper Networks QFX Series QFabric System architecture provides a simplified networking environment that solves the most challenging issues faced by data center operators. A fabric is a set of devices that act in concert to behave as a single switch. It is a highly scalable, distributed, Layer 2 and Layer 3 networking architecture that provides a high-performance, low-latency, and unified interconnect solution for next-generation data centers as seen in Figure 14 on page 1167.

Figure 14: QFX Series QFabric System Architecture



A QFabric system collapses the traditional multi-tiered data center model into a single tier where all access layer devices (known in the QFabric system model as *Node devices*) are essentially directly connected to all other access layer devices across a very large scale fabric backplane (known in the QFabric system model as the *Interconnect device*). Such an architecture enables the consolidation of data center endpoints (such as servers, storage devices, memory, appliances, and routers) and provides better scaling and network virtualization capabilities than traditional data centers.

Essentially, a QFabric system can be viewed as a single, nonblocking, low-latency switch that supports thousands of 10-Gigabit Ethernet ports or 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel ports to interconnect servers, storage, and the Internet across a high-speed, high-performance fabric. The entire QFabric system is managed as a single entity through a *Director group*, containing redundant hardware and software components that can be expanded and scaled as the QFabric system grows in size. In addition, the Director group automatically senses when devices are added or removed from the QFabric system and dynamically adjusts the amount of processing resources required to support the system. Such intelligence helps the QFabric system use the minimum amount of power to run the system efficiently, but not waste energy on unused components.

As a result of the QFabric system architecture, data center operators are now realizing the benefits of this next-generation architecture, including:

- **Low latency**—Because of its inherent advantages in this area, the QFabric system provides an excellent foundation for mission-critical applications such as financial transactions and stock trades, as well as time-sensitive applications such as voice and video.
- **Enhanced scalability**—The QFabric system can be managed as a single entity and provides support for thousands of data center devices. As Internet traffic continues to grow exponentially with the increase in high-quality video transmissions and rise in the number of mobile devices used worldwide, the QFabric system can keep pace with the demands for bandwidth, applications, and services offered by the data center.
- **Virtualization-enabled**—The QFabric system was designed to work seamlessly with virtual servers, virtual appliances, and other virtual devices, allowing for even greater scalability, expandability, and rapid deployment of new services than ever before. Migrating to virtual devices also results in significant costs savings, fueled by reduced space requirements, decreased needs for power and cooling, and increased processing capabilities.
- **Simplicity**—Although the QFabric system can scale to hundreds of devices and thousands of ports, you can still manage the QFabric system as a single system.
- **Flexibility**—You can deploy the QFabric system as an entire system or in stages.
- **Convergence**—Because the congestion-free fabric is lossless, all traffic in a QFabric system can be converged onto a single network. As a result, the QFabric system supports Ethernet, Fibre Channel over Ethernet, and native Fibre Channel packets and frames.

Flat, nonblocking, and lossless, the network fabric offered by the QFabric system has the scale and flexibility to meet the needs of small, medium, and large-sized data centers for years to come.

Understanding QFabric System Terminology

To understand the QFabric system environment and its components, you should become familiar with the terms defined in Table 97 on page 1169.

Table 97: QFabric System Terms

Term	Definition
Clos network fabric	Three-stage switching network in which switch elements in the middle stages are connected to all switch elements in the ingress and egress stages. In the case of QFabric system components, the three stages are represented by an ingress chipset, a midplane chipset, and an egress chipset in an Interconnect device (such as a QFX3008-I Interconnect device). In Clos networks, which are well known for their nonblocking properties, a connection can be made from any idle input port to any idle output port, regardless of the traffic load in the rest of the system.
Director device	Hardware component that processes fundamental QFabric system applications and services, such as startup, maintenance, and inter-QFabric system device communication. A set of Director devices with hard drives can be joined to form a *Director group*, which provides redundancy and high availability by way of additional memory and processing power. (See also *Director group*.)
Director group	Set of Director devices that host and load-balance internal processes for the QFabric system. The Director group handles tasks such as QFabric system network topology discovery, Node and Interconnect device configuration, startup, and DNS, DHCP, and NFS services. Operating a Director group is a minimum requirement to manage a QFabric system. The Director group runs the Director software for management applications and runs dual processes in active/standby mode for maximum redundancy and high availability. (See also *Director software* and *Director device*.)
Director software	Software that handles QFabric system administration tasks, such as fabric management and configuration. The Junos OS-based Director software runs on the *Director group*, provides a single, consolidated view of the QFabric system, and enables the main QFabric system administrator to configure, manage, monitor, and troubleshoot QFabric system components from a centralized location. To access the Director software, log in to the default partition. (See also *Director device* and *Director group*.)
fabric control Routing Engine	Virtual Junos OS Routing Engine instance used to control the exchange of routes and flow of data between QFabric system hardware components within a partition. The fabric control Routing Engine runs on the Director group.
fabric manager Routing Engine	Virtual Junos OS Routing Engine instance used to control the initialization and maintenance of QFabric system hardware components belonging to the default partition. The fabric manager Routing Engine runs on the Director group.
infrastructure	QFabric system services processed by the virtual Junos Routing Engines operating within the Director group. These services, such as fabric management and fabric control, support QFabric system functionality and high availability.

Table 97: QFabric System Terms *(continued)*

Term	Definition
Interconnect device	QFabric system component that acts as the primary fabric for data plane traffic traversing the QFabric system between Node devices. An example of an Interconnect device is a QFX3008-I Interconnect device. (See also *Node device*.)
Junos Space	Carrier-class network management system for provisioning, monitoring, and diagnosing Juniper Networks routing, switching, security, and data center platforms.
network Node group	Set of one to eight Node devices that connects to an external network.
network Node group Routing Engine	Virtual Junos OS Routing Engine instance that handles routing processes for a network Node group. The network Node group Routing Engine runs on the Director group.
Node device	Routing and switching device that connects to endpoints (such as servers or storage devices) or external network peers, and is connected to the QFabric system through an Interconnect device. You can deploy Node devices similarly to the way a top-of-rack switch is implemented. An example of a Node device is the QFX3500 Node device. (See also *Interconnect device* and *network Node group*.)
partition	Collection of physical or logical QFabric system hardware components (such as Node devices) that provides fault isolation, separation, and security. In their initial state, all QFabric system components belong to a *default partition*.
QFabric system	Highly scalable, distributed, Layer 2 and Layer 3 networking architecture that provides a high-performance, low-latency, and unified interconnect solution for next-generation data centers. A QFabric system collapses the traditional multi-tier data center model, enables the consolidation of data center endpoints (such as servers, storage devices, memory, appliances, and routers), and provides better scaling and network virtualization capabilities than traditional data centers. Essentially, a QFabric system can be viewed as a single, nonblocking, low-latency switch that supports thousands of 10-Gigabit Ethernet ports or 2-Gbps, 4-Gbps or 8-Gbps Fibre Channel ports to interconnect servers, storage, and the Internet across a high-speed, high-performance fabric. The QFabric system must have sufficient resources and devices allocated to handle the *Director group*, *Node device*, and *Interconnect device* functions and capabilities.

Table 97: QFabric System Terms *(continued)*

Term	Definition
QFabric system control plane	Internal network connection that carries control traffic between QFabric system components. The QFabric system control plane includes management connections between the following QFabric system hardware and software components: • *Node devices*, such as the QFX3500 Node device. • *Interconnect devices*, such as the QFX3008-I Interconnect device. • *Director group* processes, such as management applications, provisioning, and topology discovery. • *Control plane Ethernet switches* to provide interconnections to all QFabric system devices and processes. For example, you can use EX Series EX4200 switches running in Virtual Chassis mode for this purpose. To maintain high availability, the QFabric system control plane uses a different network than the QFabric system data plane, and uses a fabric provisioning protocol and a fabric management protocol to establish and maintain the QFabric system.
QFabric system data plane	Redundant, high-performance, and scalable data plane that carries QFabric system data traffic. The QFabric system data plane includes the following high-speed data connections: • 10-Gigabit Ethernet connections between QFabric system endpoints (such as servers or storage devices) and Node devices. • 40-Gbps quad small form-factor pluggable plus (QSFP+) connections between Node devices and Interconnect devices. • 10-Gigabit Ethernet connections between external networks and a Node device acting as a network Node group. To maintain high availability, the QFabric system data plane is separate from the QFabric system control plane.
QFabric system endpoint	Device connected to a Node device port, such as a server, a storage device, memory, an appliance, a switch, or a router.
QFabric system fabric	Distributed, multistage network that consists of a queuing and scheduling system that is implemented in the Node device, and a distributed cross-connect system that is implemented in Interconnect devices. The QFabric system fabric is part of the QFabric system data plane.
QFX3500 Node device	Node device that connects to either endpoint systems (such as servers and storage devices) or external networks in a QFabric system. It is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. The QFX3500 Node device provides up to 48 10-Gigabit Ethernet interfaces to connect to the endpoints. Twelve of these 48 interfaces can be configured to support 2-Gbps, 4-Gbps or 8-Gbps Fibre Channel, and 36 of the interfaces can be configured to support Gigabit Ethernet. Also, there are four uplink connections to connect to Interconnect devices in a QFabric system. These uplinks use 40-Gbps quad small form-factor pluggable plus (QSFP+) interfaces. (See also *QFX3500 switch*.)

Table 97: QFabric System Terms *(continued)*

Term	Definition
QFX3500 switch	Standalone data center switch with 10-Gigabit Ethernet access ports and 40-Gbps quad, small form-factor pluggable plus (QSFP+) uplink interfaces. You can (optionally) configure some of the access ports as 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel ports or Gigabit Ethernet ports. The QFX3500 switch can be converted to a QFabric system Node device as part of a complete QFabric system. The switch is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. (See also *QFX3500 Node device*.)
QFX3600 Node device	Node device that connects to either endpoint systems (such as servers and storage devices) or external networks in a QFabric system. It is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. The QFX3600 Node device provides 16 40-Gbps QSFP+ ports. By default, 4 ports (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect device, and 12 ports (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (**Q0** through **Q7**) for uplink connections between your Node device and your Interconnect device, and ports **Q2** through **Q15** for 10-Gigabit Ethernet connections to either endpoint systems or external networks. (See also *QFX3600 switch*.)
QFX3600 switch	Standalone data center switch with 16 40-Gbps quad, small form-factor pluggable plus (QSFP+) interfaces. By default, all the 16 ports operate as 40-Gigabit Ethernet ports. Optionally, you can choose to configure the 40-Gbps ports to operate as four 10-Gigabit Ethernet ports. You can use QSFP+ to four SFP+ breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. The QFX3600 switch can be converted to a QFabric system Node device as part of a complete QFabric system. The switch is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. (See also *QFX3600 Node device*.)
redundant server Node group	Set of two Node devices that connect to servers or storage devices. Link aggregation group (LAG) interfaces can span the Node devices within a redundant server Node group.
rolling upgrade	Method used in the QFabric system to upgrade the software for components in a systematic, low-impact way. A rolling upgrade begins with the Director group, proceeds to the fabric (Interconnect devices), and finishes with the Node groups.
Routing Engine	Juniper Networks-proprietary processing entity that implements QFabric system control plane functions, routing protocols, system management, and user access. Routing Engines can be either physical or virtual entities. The Routing Engine functions in a QFabric system are sometimes handled by Node devices (when connected to endpoints), but mostly implemented by the Director group (to provide support for QFabric system establishment, maintenance, and other tasks).

Table 97: QFabric System Terms *(continued)*

Term	Definition
routing instance	Private collection of routing tables, interfaces, and routing protocol parameters unique to a specific customer. The set of interfaces is contained in the routing tables, and the routing protocol parameters control the information in the routing tables. (See also *virtual private network*.)
server Node group	Set of one or more Node devices that connect to servers or storage devices.
virtual LAN (VLAN)	Unique Layer 2 broadcast domain for a set of ports selected from the components available in a partition. VLANs allow manual segmentation of larger Layer 2 networks and help to restrict access to network resources. To interconnect VLANs, Layer 3 routing is required.
virtual private network (VPN)	Layer 3 routing domain within a partition. VPNs maintain privacy with a tunneling protocol, encryption, and security procedures. In a QFabric system, a Layer 3 VPN is configured as a *routing instance*.

Understanding Interfaces on the QFabric System

This topic describes:

- Four-Level Interface Naming Convention on page 1173
- QSFP+ Interfaces on page 1174
- Link Aggregation on page 1176

Four-Level Interface Naming Convention

When you configure an interface on the QFabric system, the interface name needs to follow a four-level naming convention that enables you to identify an interface as part of either a Node device or a Node group. Include the name of the network or server Node group at the beginning of the interface name.

The four-level interface naming convention is:
device-name:*type-fpc/pic/port*
where *device-name* is the name of the Node device or Node group. The remainder of the naming convention elements are the same as those in the QFX3500 switch interface naming convention.

An example of a four-level interface name is:
node2:xe-0/0/2

QSFP+ Interfaces

The QFX3500 Node device provides four 40-Gbps QSFP+ (quad small form-factor pluggable plus) interfaces (labeled **Q0** through **Q3**) for uplink connections between your Node device and your Interconnect devices.

The QFX3600 Node device provides 16 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 12 interfaces (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight interfaces (Q0 through Q7) for uplink connections between your Node device and your Interconnect devices, and interfaces Q2 through Q15 for 10-Gigabit Ethernet connections to either endpoint systems or external networks (see "Configuring the Port Type on QFX3600 Node Devices" on page 1367). Table 98 on page 1174 shows the port mappings for QFX3600 Node devices.

Table 98: QFX3600 Node Device Port Mappings

Link Aggregation

Link aggregation enables you to create link aggregation groups across Node devices within a network Node group or redundant server Node group. You can include up to 32 Ethernet interfaces in a LAG. You can have up to 48 LAGs within a redundant server Node group, and 128 LAGs in a network Node group. To configure a LAG, include the **aggregated-devices** statement at the **[edit chassis node-group** ***node-group-name*****]** hierarchy level and the **device-count** statement at the **[edit chassis node-group** ***node-group-name*** **aggregated-devices ethernet]** hierarchy level. Additionally, include any aggregated Ethernet options (**minimum-links** and **link-speed**) at the **[edit interfaces** ***interface-name*** **aggregated-ether-options]** hierarchy level and the **802.3ad** statement at the **[edit interfaces** ***interface-name*** **ether-options]** hierarchy level. To configure the Link Aggregation Control Protocol (LACP), include the **lacp** statement at the **[edit interfaces aggregated-ether-options]** hierarchy level.

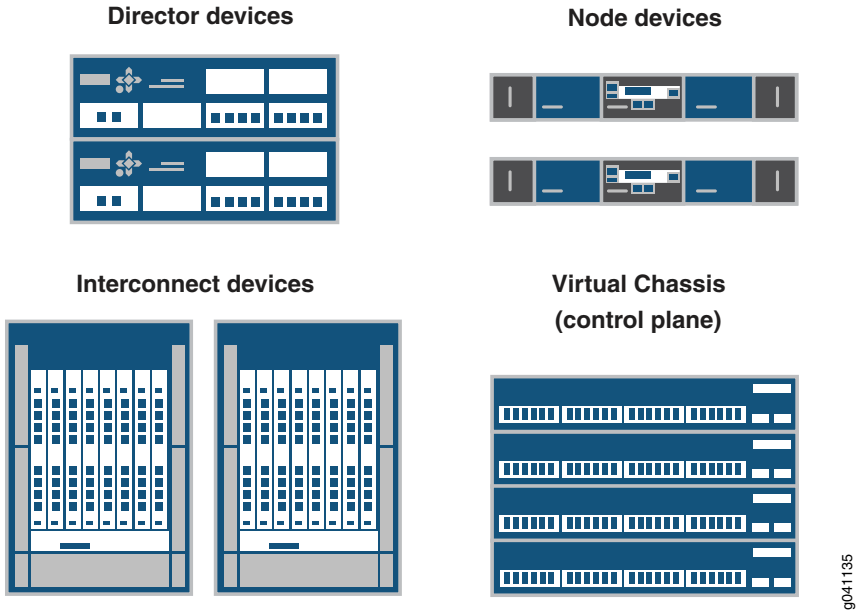
QFabric System Hardware Architecture Overview

The QFabric system is a single-layer networking tier that connects servers and storage devices to one another across a high-speed, unified core fabric. You can view the QFabric system as a single, extremely large, nonblocking, high-performance Layer 2 and Layer 3 switching system. The reason you can consider the QFabric system as a single system is that the Director software running on the Director group allows the main QFabric system administrator to access and configure every device and port in the QFabric system from a single location. Although you configure the system as a single entity, the fabric contains four major hardware components. The hardware components can be chassis-based, group-based, or a hybrid of the two. As a result, it is important to understand the four types of generic QFabric system components and their functions, regardless of which hardware environment you decide to implement. A representation of these components is shown in Figure 15 on page 1178.

Figure 15: QFabric System Hardware Architecture



The four major QFabric system components include the following:

- **Director group**—The *Director group* is a management platform that establishes, monitors, and maintains all components in the QFabric system. It is a set of Director devices that run the Junos operating system (Junos OS) on top of a CentOS foundation. The Director group handles tasks such as QFabric system network topology discovery, Node and Interconnect device configuration and startup, and Domain Name System (DNS), Dynamic Host Configuration Protocol (DHCP), and Network File System (NFS) services. The Director group also runs the software for management applications, hosts and load-balances internal processes for the QFabric system, and starts additional QFabric system processes as requested.
- **Node devices**—A *Node device* is a hardware system located on the ingress of the QFabric system that connects to endpoints (such as servers or storage devices) or external networks, and is connected to the heart of the QFabric system through an Interconnect device. A Node device can be used in a manner similar to how a top-of-rack switch is implemented. By default, Node devices connect to servers or storage devices. However, when you group Node devices together to connect to a network that is external to the QFabric system, the formation is known as a *network Node group*.
- **Interconnect devices**—An *Interconnect device* acts as the primary fabric for data plane traffic traversing the QFabric system between Node devices. To reduce latency to a minimum, the Interconnect device implements multistage Clos switching to provide nonblocking interconnections between any of the Node devices in the system.
- **Control plane network**—The *control plane network* is an out-of-band Gigabit Ethernet management network that connects all QFabric system components. For example, you can use a group of EX4200 Ethernet switches configured as a Virtual Chassis to enable the control plane network. The control plane network connects the Director

group to the management ports of the Node and Interconnect devices. By keeping the control plane network separate from the data plane, the QFabric system can scale to support thousands of servers and storage devices.

The four major QFabric system components can be assembled from a variety of hardware options. Currently supported hardware configurations are shown in Table 99 on page 1179.

Table 99: Supported QFabric System Hardware Configurations

QFabric System Configuration	Director Group	Node Device	Interconnect Device	Control Plane Device
QFX3000-G QFabric system	QFX3100 Director group	QFX3500 and QFX3600 Node device NOTE: There can be a maximum of 128 Node devices in the QFX3000-G QFabric system.	QFX3008-I Interconnect device NOTE: There can be a maximum of four Interconnect devices in the QFX3000-G QFabric system.	Two Virtual Chassis composed of four EX4200 switches each
QFX3000-M QFabric system	QFX3100 Director group NOTE: For a copper-based QFX3000-M QFabric system control plane network, use QFX3100 Director devices with RJ-45 network modules installed. For a fiber-based control plane network, use QFX3100 Director devices with SFP network modules installed.	QFX3500 and QFX3600 Node device NOTE: • There can be a maximum of 16 Node devices in the QFX3000-M QFabric system. • For a copper-based QFX3000-M QFabric system control plane network, use QFX3500 Node devices with a 1000BASE-T management board installed. For a fiber-based control plane network, use QFX3500 Node devices with an SFP management board installed.	QFX3600-I Interconnect device NOTE: There can be a maximum of four Interconnect devices in the QFX3000-M QFabric system.	Two EX4200 Ethernet switches NOTE: For a copper-based QFX3000-M QFabric system control plane network, use EX4200-24T switches with an SFP+ uplink module installed. For a fiber-based control plane network, use EX4200-24F switches with an SFP+ uplink module installed.

To complete the system, external Routing Engines (such as the fabric manager Routing Engines, network Node group Routing Engines, and fabric control Routing Engines) run on the Director group and implement QFabric system control plane functions. The control plane network provides the control plane connections between the Node devices, the Interconnect devices, and the Routing Engines running on the Director group.

QFX3000-G QFabric System Features

A QFX3000-G QFabric system provides the following key features:

- Support for up to 128 Node devices and 4 Interconnect devices, which provides a maximum of 6144 10-Gigabit Ethernet ports.
- Low port-to-port latencies that scale as the system size grows from 48 to 6144 10-Gigabit Ethernet ports.
- Support for up to 384,000 total ingress queues at each Node device to the QFabric system Interconnect backplane.
- Support for Converged Enhanced Ethernet (CEE) traffic.

QFX3000-M QFabric System Features

A QFX3000-M QFabric system provides the following key features:

- Support for up to 16 Node devices and 4 Interconnect devices, which provides a maximum of 768 10-Gigabit Ethernet ports.
- Low port-to-port latencies that scale as the system size grows from 48 to 768 10-Gigabit Ethernet ports.

Understanding the Director Group

Because the Director group provides management services for the QFabric system, it is important to understand the components of the cluster and how the Director group supports the needs of the greater fabric.

- Director Group Components on page 1180
- Director Group Services on page 1181

Director Group Components

When you build a Director group, consider the following elements and concepts.

- **Director device**—A single management device for the QFabric system. Director devices with a hard drive provide full processing services and are used to build the Director group.
- **Director group**—A set of Director devices. The Director group is essential to the QFabric system, which cannot operate properly without it. The Director group shares and load-balances processing tasks for the QFabric system, performs topology discovery, assigns identifiers to QFabric system components, and manages interfabric communication. The primary devices in a Director group are Director devices that contain hard drives. The Director devices run dual processes in active or standby mode for maximum redundancy.

  When you add additional Director devices to the group, the Director group coordinates their activities and distributes processing loads across all available Director devices. The additional Director devices provide the Director group with additional memory and processing power. Supplementing the Director group with extra Director devices allows the group to scale efficiently and serve the needs of the entire QFabric system as it grows.

Director Group Services

The Director group is a management platform that establishes, monitors, and maintains all components in the QFabric system. It is a set of Director devices that run the Junos operating system (Junos OS) on top of a CentOS foundation. The Director group handles tasks such as QFabric system network topology discovery, Node and Interconnect device configuration and startup, and Domain Name System (DNS), Dynamic Host Configuration Protocol (DHCP), and Network File System (NFS) services. The Director group also runs the software for management applications, hosts and load-balances internal processes for the QFabric system, maintains configuration and topology databases, and starts additional QFabric system processes as requested.

Another critical role provided by the Director group is the hosting of the virtual Junos Routing Engines. These Routing Engines provide services for the QFabric system to keep it operating smoothly.

Understanding Routing Engines in the QFabric System

Routing Engines perform many important processing tasks in the QFabric system. Knowing where the Routing Engines are located and what services they provide enables you to troubleshoot the QFabric system and ensure that it is running the way it should.

This topic covers:

- Hardware-Based Routing Engines on page 1182
- Software-Based External Routing Engines on page 1182

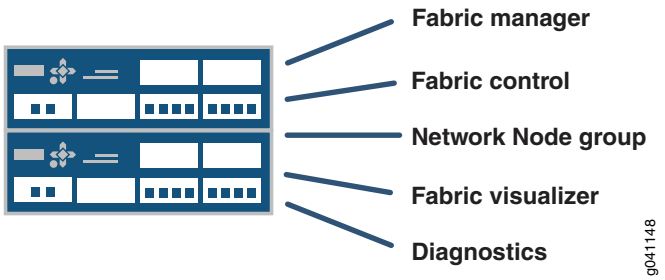
Hardware-Based Routing Engines

A traditional Juniper Networks Routing Engine is a hardware field-replaceable unit that runs routing protocols, builds the routing and switching tables, sends routing information to the Packet Forwarding Engine, and handles several software processes for the device (such as interface control, chassis component monitoring, system management, and user access). Node devices that are part of server Node groups in the QFabric system that connect to servers or storage devices implement Routing Engine functions locally using this traditional hardware method.

Software-Based External Routing Engines

The QFabric system also uses external Routing Engines that run in software on the Director group. In contrast with traditional Routing Engines, the functions and processes provided by software-based Routing Engines are segmented, specialized, and distributed across multiple Routing Engine instances running on the Director group. Such separation provides redundancy for these functions and enables the QFabric system to scale.
Figure 16 on page 1182 shows the external Routing Engine types.

Figure 16: External Routing Engine Types



These special-purpose external Routing Engine instances running on the Director group provide the following major services for the QFabric system:

- **Fabric manager Routing Engine**—Provides services to all devices in the QFabric system, such as system initialization, topology discovery, internal IP address and ID assignment, and interdevice communication. The fabric manager Routing Engine authenticates Interconnect and Node devices, and maintains a database for system components. A single fabric manager Routing Engine instance is generated to manage the entire QFabric system.
- **Fabric control Routing Engine**—Runs the fabric control protocol to share route information between available devices in a partition. A pair of redundant route distribution Routing Engine instances is generated for every partition in the QFabric system, and both instances are active.
- **Diagnostic Routing Engine**—Gathers operational information that allows QFabric system administrators to monitor the health of the QFabric system. A single Routing Engine instance is generated for the entire QFabric system.
- **Network Node group Routing Engine**—Provides Routing Engine functionality for groups of Node devices bundled together as a single Layer 3 routing device, which is used to

connect to external networks. A pair of redundant Routing Engine instances is generated for every network Node group in the QFabric system.

Understanding Interconnect Devices

Interconnect devices in a QFabric system provide a way for the Node devices to connect with one another over a high-speed backplane. By understanding the role of Interconnect devices, you can harness the benefits of low latency, superb scalability, and minimum packet processing offered by a single-tier data center architecture.

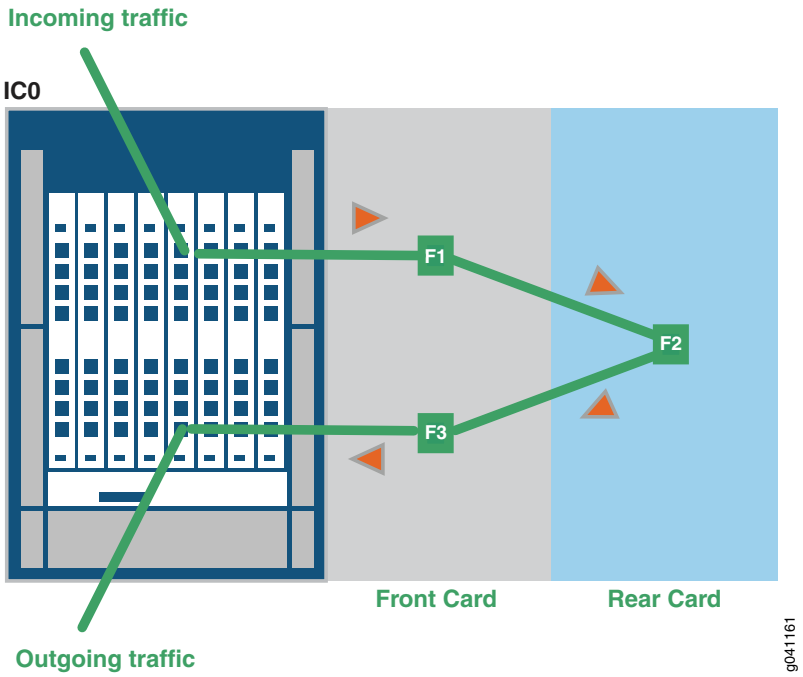
This topic covers:

- Interconnect Device Introduction on page 1183
- QFX3008-I Interconnect Devices on page 1184
- QFX3600-I Interconnect Devices on page 1185

Interconnect Device Introduction

Interconnect devices act as the primary fabric for data plane traffic traversing the QFabric system between Node devices. The main task for the Interconnect devices is to transfer traffic between the Node devices as quickly as possible across a high-speed, available path backplane. To reduce latency to a minimum, larger Interconnect devices (such as the QFX3008-I Interconnect device) implement multistage Clos switching to provide nonblocking connections between any of the Node devices in the system.
Figure 17 on page 1184 shows an example of how Clos switching works in the QFX3008-I Interconnect device.

Figure 17: Clos Switching for QFX3008-I Interconnect Devices

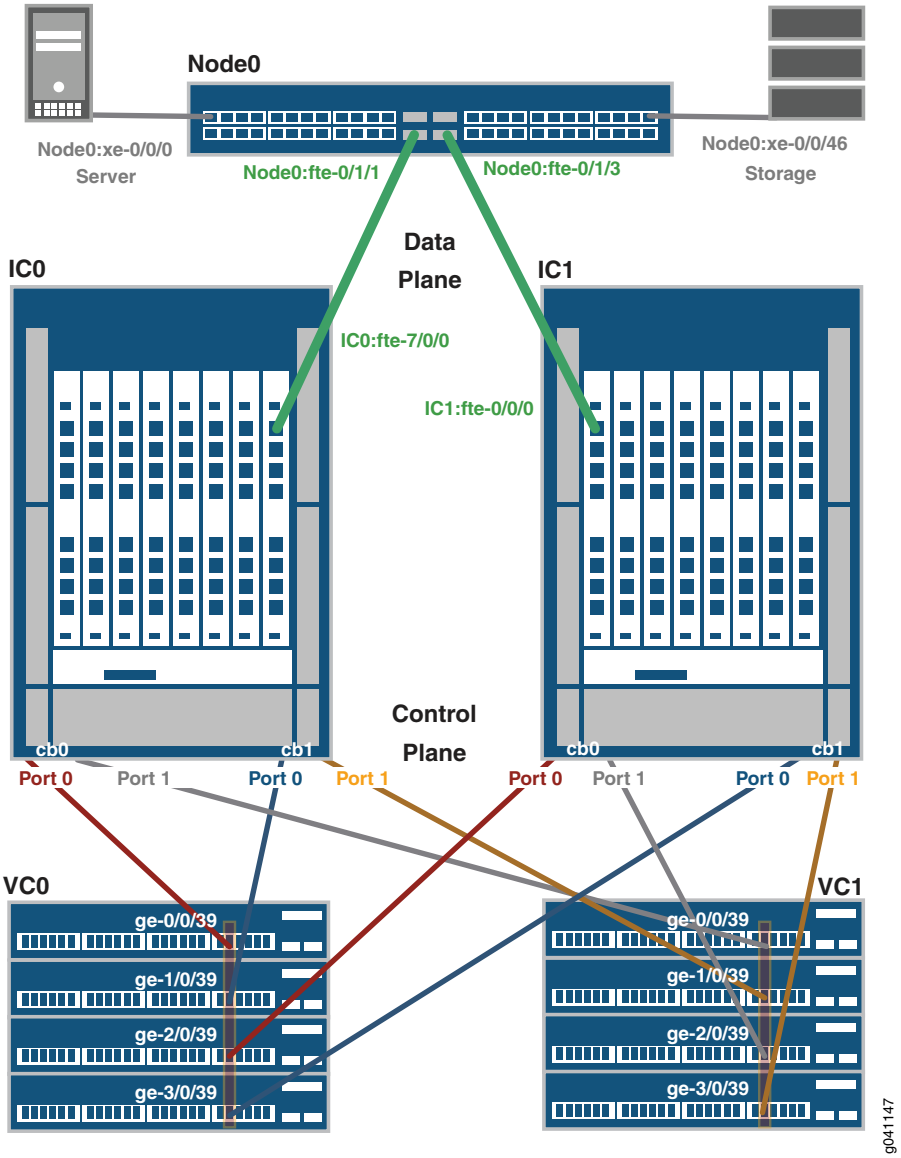


Traffic enters a QSFP+ port from a Node device, and an ingress chipset provides stage F1 processing. For the F2 stage, the frame is sent to a rear card and processed by a midplane chipset. Lastly, an egress chipset on the front card QSFP+ port handles processing tasks for the F3 stage. At each of the three Clos stages, a switching table chooses the best path and determines where to send the frame to reach the next stage. The F1 and F3 stages can be handled by the same front card or different front cards, depending on the best path selected by the fabric. After the frame traverses the Interconnect device backplane, the Interconnect device sends the frame to the egress Node device.

QFX3008-I Interconnect Devices

The QFX3008-I Interconnect device contains eight slots in the front of the chassis. In each slot, you can install a front card containing 16 40-Gbps quad small form-factor pluggable plus (QSFP+) ports. A fully configured system offers a total capacity of 128 QSFP+ connections. These front card ports attach to the high-speed backplane to reach the eight slots in the rear of the chassis, which provide the heavy-duty interconnections for the entire QFX3000-G QFabric system. In addition, four interfaces (two per Control Board) provide Gigabit Ethernet access to the control plane management network. Figure 18 on page 1185 shows an example of the data plane and control plane connections for QFX3008-I Interconnect devices.

Figure 18: QFX3008-I Data Plane and Control Plane Connections



QFX3600-I Interconnect Devices

The QFX3600-I Interconnect device has 16 40-Gbps quad small form-factor pluggable plus (QSFP+) ports that provide interconnections for the entire QFX3000-M QFabric system. In addition, two management ports provide Gigabit Ethernet access to the control plane management network. Figure 19 on page 1186 shows an example of the data plane and control plane connections for a QFX3600-I Interconnect device.

Figure 19: QFX3600-I Data Plane and Control Plane Connections

Understanding Node Devices

Node devices in a QFabric system provide a way for servers, storage devices, and external networks to connect to the QFabric system. By understanding the role of Node devices, you can design your QFabric system topology to take advantage of the unique benefits offered by a single-tier data center architecture.

This topic covers:

- Node Device Introduction on page 1186
- QFX3500 Node Devices on page 1187
- QFX3600 Node Devices on page 1188

Node Device Introduction

A *Node device* in the QFabric system connects either endpoint systems (such as application servers and storage devices) or external networks to Interconnect devices. It can be used similarly to the way a top-of-rack switch is implemented in a data center. Node devices provide an access point to the QFabric system, allowing data to flow into and out of the QFabric system. Because all Node devices in the QFabric system connect through a backplane of Interconnect devices, in essence all Node devices are connected

to one another. This directly connected design model eliminates multiple tiers of aggregation and core devices and provides minimum latency, maximum scalability, and rapid transport of server-to-server traffic and QFabric system-to-external network traffic.

Sets of Node devices can be bundled together into *Node groups*, in which each group operates as a single virtual entity. Node groups that connect to servers and storage devices are known as *server Node groups*, and Node groups that connect to external networks are known as *network Node groups*.

QFX3500 Node Devices

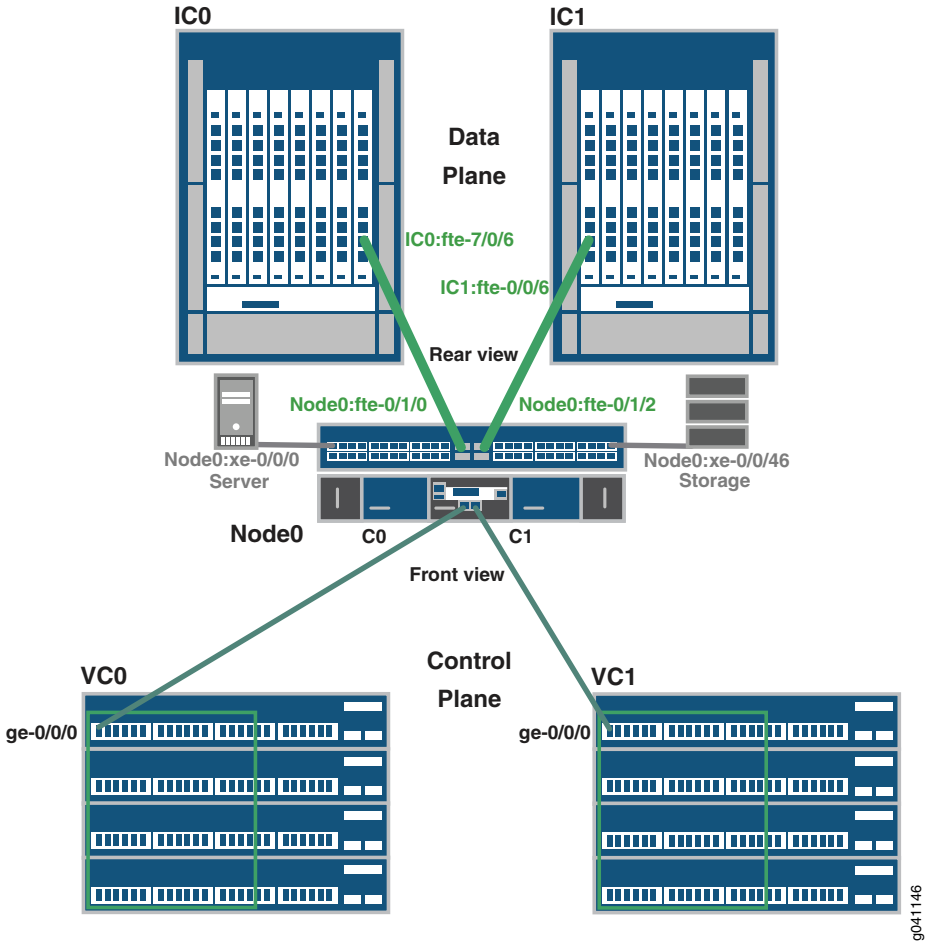
The QFX3500 Node device works as part of a QFabric system. A QFX3500 chassis provides up to 48 10-Gigabit Ethernet interfaces to connect to endpoints or external networks. You can configure 12 of these 48 interfaces to support 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel. You can also configure the remaining 36 interfaces with Gigabit Ethernet.

NOTE: **You can configure interface ports 0 through 47 as 10-Gigabit Ethernet ports, 0 through 5 and 42 through 47 as Fibre Channel over Ethernet ports, and 6 through 41 as Gigabit Ethernet ports. However, you cannot configure any Fibre Channel over Ethernet ports as Gigabit Ethernet ports or vice versa.**

In addition to these server and network interfaces, there are four uplink interfaces to connect the QFX3500 Node device to Interconnect devices in a QFabric system. These uplinks use 40-Gbps quad small form-factor pluggable plus (QSFP+) interfaces.

The control plane requires two management ports on the QFX3500 chassis to connect the Node device to the control plane network. Figure 20 on page 1188 shows an example of the data plane and control plane connections for a QFX3500 Node device.

Figure 20: QFX3500 Data Plane and Control Plane Connections



QFX3600 Node Devices

The QFX3600 Node device works as part of a QFabric system. A QFX3600 chassis provides 16 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your QFX3600 Node device and your Interconnect device, and 12 interfaces (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems or external networks. Optionally, you can choose to configure the first eight interfaces (**Q0** through **Q7**) for uplink connections between your Node device and your Interconnect devices, and interfaces **Q2** through **Q15** for 10-Gigabit Ethernet connections to either endpoint systems or external networks.

The control plane requires two management ports on the QFX3600 chassis to connect the Node device to the control plane network. Figure 21 on page 1189 shows an example of the data plane and control plane connections for a QFX3600 Node device.

Figure 21: QFX3600 Data Plane and Control Plane Connections

Understanding Node Groups

Node groups help you combine multiple Node devices into a single virtual entity within the QFabric system to enable redundancy and scalability at the edge of the data center.

This topic covers:

- Network Node Groups on page 1190
- Server Node Groups on page 1190

Network Node Groups

A set of one or more Node devices that connect to an external network is called a *network Node group*. The network Node group also relies on two external Routing Engines running on the Director group. These redundant *network Node group Routing Engines* run the routing protocols required to support the connections from the network Node group to external networks.

When configured, the Node devices within a network Node group and the network Node group Routing Engines work together in tandem as a single entity. By default, network Node group Routing Engines are part of the **NW-NG-0** network Node group but no Node devices are included in the group. As a result, you must configure Node devices to be part of a network Node group.

In a QFabric system deployment that requires connectivity to external networks, you can modify the automatically generated network Node group by including its preset name **NW-NG-0** in the Node group configuration. Within a network Node group, you can include a minimum of one Node device up to a maximum of eight Node devices. By adding more Node devices to the group, you provide enhanced scalability and redundancy for your network Node group.

NOTE: The QFabric system creates a single **NW-NG-0** network Node group for the default partition. You cannot configure a second network Node group inside the default partition. The remaining Node devices within the default partition are reserved to connect to servers, storage, or other endpoints internal to the QFabric system. These Node devices either can be retained in the automatically generated server Node groups or can be configured as part of a redundant server Node group.

Server Node Groups

A *server Node group* is a set of one or more Node devices that connect to servers or storage devices. Unlike Node devices that are part of a network Node group and rely on an external Routing Engine, a Node device within a server Node group connects directly to endpoints and implements the Routing Engine functions locally, using the local CPU built into the Node device itself.

By default, each Node device is placed in its own self-named autogenerated server Node group to connect to servers and storage. You can override the default assignment by

manually configuring a redundant server Node group that contains a maximum of two Node devices. You can use a redundant server Node group to provide multihoming services to servers and storage, as well as configure aggregated LAG connections that span the two Node devices.

NOTE: The Node devices in a redundant server Node group must be of the same type, either a QFX3500 Node device or a QFX3600 Node device. You cannot add a QFX3500 and a QFX3600 Node device to the same redundant server Node group.

Understanding Port Oversubscription on Node Devices

Each Node device in a QFabric system can have a different port oversubscription configuration. For example, you can have a Node device with 3:1 port oversubscription, another with 6:1 oversubscription, and yet another with 1:1 oversubscription.

The port oversubscription ratio on a Node device is based on the number of uplink connections from the Node device to Interconnect devices. For example, you can configure 1:1 port oversubscription on your QFX3600 Node device by connecting the eight uplink ports (labeled Q0 through Q7) on the Node device to Interconnect devices.

Table 100 on page 1191 shows the oversubscription ratio for ports on Node devices based on the number of Interconnect devices and the number of connections from each Node device to each Interconnect device.

Table 100: Oversubscription Ratio on Node Devices

Number of Interconnect Devices	Number of Connections from Each Node Device to Each Interconnect Device	Oversubscription Ratio on Node Device
2	1	6:1
2	2	3:1
2	4	1:1 (Supported on QFX3600 Node devices only)
4	1	3:1
4	2	1:1 (Supported on QFX3600 Node devices only)

Understanding the QFabric System Software Architecture

The software architecture for the QFabric system environment has been designed to provide a high-speed, low-latency, nonblocking fabric for data center traffic. This topic explores how the software architecture for a QFabric system supports these goals.

Key components of the QFabric system software architecture include:

- A single administrative view of all QFabric system components provides unified management, configuration, monitoring, and troubleshooting of the QFabric system. This view is provided by the QFX Series Director software running on the Director group. A primary administrator can access the unified view through the default partition.
- A fabric control protocol enables rapid transport of data traffic between QFabric system components. This unique feature of the software architecture distributes route information for each device within the QFabric system, and removes the need to run spanning-tree protocols inside the QFabric system network.
- A fabric management protocol provides rapid transport of control traffic between QFabric system components. This protocol helps identify and initialize QFabric system resources, supports device redundancy, and supports management communication throughout the QFabric system.
- A control plane network that is separate from the data plane network provides high availability for the QFabric system.

The software also provides access to relevant features in the Junos operating system (Junos OS) that support QFabric system functionality. Support is available for most switching features available on EX Series Ethernet switches and many routing features available on M Series, MX Series, and T Series routing platforms.

Understanding the Director Software

The Director software provides a single view into the QFabric system so that it can be managed as a single entity. This topic explains how the Director software interacts with the components of the QFabric system to maintain operations from a central location.

Because the QFabric system consists of multiple Director, Node, and Interconnect devices, the architects of the QFabric system determined that it would be useful to manage the entire system as a single logical entity. As a result, the Director software handles administration tasks for the entire QFabric system, such as fabric management and configuration. The Director software runs on the *Director group*, provides a single consolidated view of the QFabric system, and enables the main QFabric system administrator to configure, manage, monitor, and troubleshoot QFabric system components from a centralized location. In the Junos operating system (Junos OS) command-line interface (CLI), you can access the Director software by logging in to the default partition.

The Director software handles the following major tasks for the QFabric system:

- Provides command-line interface (CLI) access to all QFabric system components that you have permission to manage or view.
- Evaluates configuration statements and operational mode commands for their scope and sends requests to the applicable Director, Node, and Interconnect devices. (This operation is sometimes referred to as *scattering*.)
- Consolidates responses from Director, Node, and Interconnect devices, and displays output from the devices in a unified, centralized manner. (This operation is sometimes referred to as *gathering*.)
- Coordinates configuration and operational efforts with a database housed in the Director group to store and retrieve configurations, software images, event logs, and system log messages.
- Facilitates control plane communication between the Node devices, the Routing Engine services running on the Director group, and the Interconnect devices.
- Runs parallel processes on the Director group devices to provide high availability for the QFabric system.
- Coordinates interactions with QFabric system components to provide load balancing of processing tasks across the Director group devices.
- Manages user access and privileges.
- Enables you to configure, manage, monitor, and troubleshoot QFabric system components that are assigned to you.
- Gathers QFabric system inventory and topology details.

- Offers a way to manage Director group devices, including the ability to add and delete Director devices in the group, set and switch mastership in the Director group, and monitor Director group status.
- Provides a centralized way to coordinate software upgrades for QFabric system components.

The Director software provides a backbone of functionality that supports the entire QFabric system. It is an essential component of the QFabric system that enables you to implement the system in a logical and efficient way.

Understanding Partitions

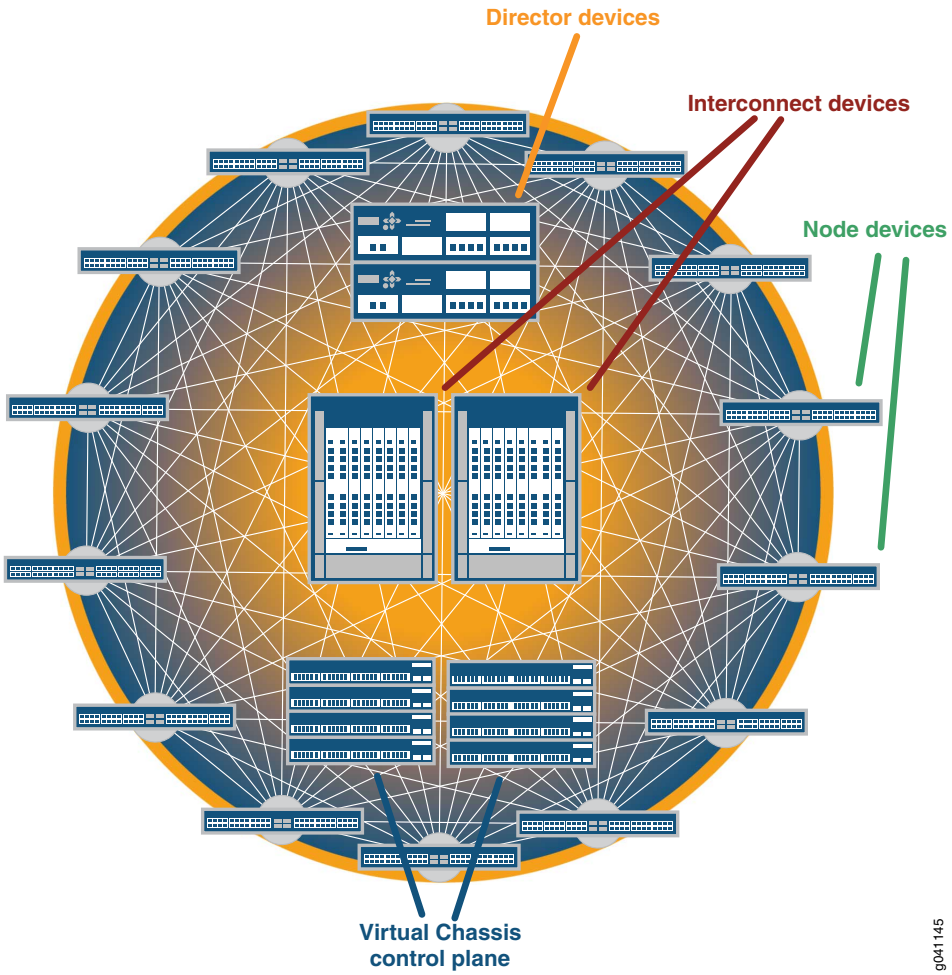
Partitions provide a way to allocate specified virtual and physical resources within your QFabric system. This topic covers:

- QFabric System Default Partition on page 1194

QFabric System Default Partition

By default, all equipment and virtual resources in the QFabric system belong to the *default partition*. As a result, the QFabric system in its initial state has a single broadcast domain that is administered by a single main administrator. Figure 22 on page 1195 shows a topology with the default settings—a single collection that contains all the devices in the QFabric system.

Figure 22: QFabric System Topology - Default Partition



NOTE: The initial release of the QFabric system supports a single default partition. All equipment and resources belong to the default partition.

A partition provides the following functions:

- Fault isolation and separation from other partitions at the control plane level.
- A separate configuration domain for the Node devices within the partition.
- A Layer 2 domain in which MAC learning takes place, and members of the same VLAN can communicate with each other. To provide network connectivity between partitions, you need to enable Layer 3 routing by way of a routed VLAN interface (RVI).

Understanding the QFabric System Control Plane

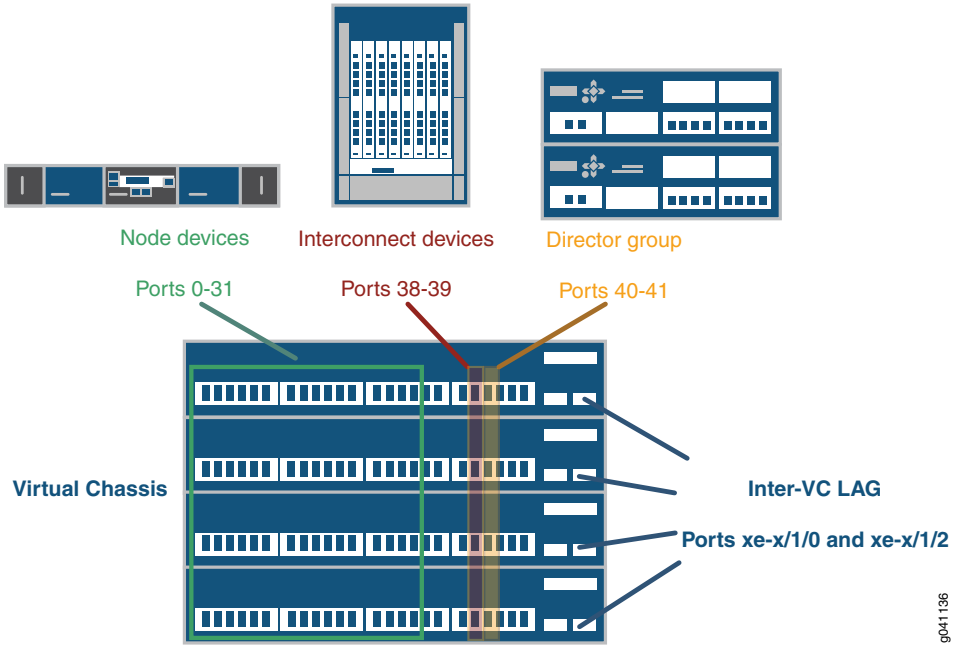
The control plane in the QFabric system transports management traffic between QFabric system components to facilitate system operations, configuration, and maintenance. This topic covers:

- Control Plane Elements on page 1197
- Control Plane Services on page 1199

Control Plane Elements

Control traffic within a QFabric system is carried across a redundant, scalable, out-of-band, Ethernet switching network called the *control plane* network. To maintain high availability, the QFabric system control plane is separated from the QFabric system data plane. Figure 23 on page 1197 shows a diagram of the QFabric system devices that compose the control plane network.

Figure 23: QFabric System Control Plane Network



The control plane consists of the following elements:

- **Control plane switches**—Provide connectivity to the management interfaces of all QFabric system components in the control plane network, including the Node devices, the Interconnect devices, and the Director group. When you interconnect all QFabric system devices to the control plane switches, the Director group can manage the entire system. Depending on the size and scale of your QFabric system, the control plane switches might be standalone switches or might be groups of switches bundled into a Virtual Chassis (See the Example topics in the Related Documentation section of this topic to learn more about the control plane switch configuration required for your QFabric system.)

  For example, the control plane switch for the QFX3000-G QFabric system requires two Virtual Chassis containing four EX4200 switch members each. The two Virtual Chassis connect to each other across a 10-Gigabit Ethernet LAG link to provide maximum resiliency for the QFabric system control plane.

- **Connections between the management interfaces of the Node devices and the control plane switches**—Enable control plane connectivity from the Node devices to the rest of the QFabric system. You must connect two management interfaces from

each Node device to the control plane switches. Connect each interface to a different control plane switch to provide system resiliency.

For the most current guidance on the QFabric control plane configuration and cabling recommendations, see:

- Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane on page 1263
- Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane on page 1309

- **Connections between the management interfaces of the Interconnect devices and the control plane switches**—Enable control plane connectivity from the Interconnect devices to the rest of the QFabric system. You must connect the interfaces in each Interconnect device to the control plane switches. Connect each interface to a different control plane switch to provide system resiliency.

  For example, on QFX3008-I Interconnect devices, there are two Control Boards and two interfaces per Control Board, for a total of four connections per Interconnect device. To provide system resiliency, connect one interface from each Control Board to the first Virtual Chassis, and connect the second interface from each Control Board to the second Virtual Chassis.

  For the most current guidance on the QFabric control plane configuration and cabling recommendations, see:

  - Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane on page 1263
  - Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane on page 1309

- **Connections between the network module interfaces of the Director group and the control plane switches**—Enable control plane connectivity from the Director group to the rest of the QFabric system. You must connect some interfaces from the first network module in a Director device to one control plane switch, and connect some interfaces from the second network module in a Director device to the second control plane switch. Also, you must connect the ports from the first network module to the primary control plane switch for each Director device (which may vary depending on the configuration of your Director group).

  For the most current guidance on the QFabric control plane configuration and cabling recommendations, see:

  - Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane on page 1263
  - Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane on page 1309

- **Routing Engines**—Although they are automatically provisioned, specialized Routing Engines implement services such as default QFabric system infrastructure, device

management, route sharing, and diagnostics to support the QFabric system. Routing Engines for control plane functions are virtual entities that run on the Director group.

- **Fabric management protocol**—A link-state protocol runs on the control plane network to identify and initialize QFabric system resources, support device redundancy, and support management communication throughout the QFabric system. The protocol is enabled by default.

Control Plane Services

The QFabric system control plane provides the infrastructure to support the following services for the QFabric system:

- System initialization
- Topology discovery
- Internal IP address and unique ID assignment
- Route information sharing
- Configuration delivery to Node devices
- Interdevice communication between Node devices, Interconnect devices, and the Director group

Many of these services are provided by the external Routing Engines that run in software on the Director group.

Understanding the QFabric System Data Plane

The data plane in the QFabric system transfers application traffic between QFabric system components rapidly and efficiently. This topic covers:

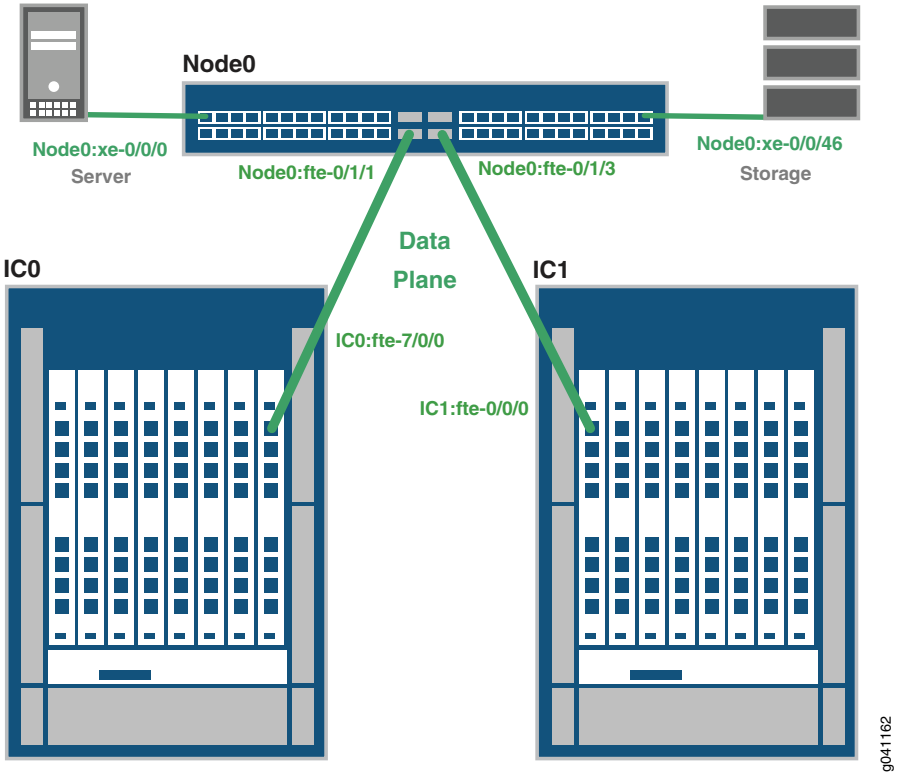
- Data Plane Components on page 1199
- QFabric System Fabric on page 1200

Data Plane Components

Data traffic within a QFabric system is carried across a redundant, high-performance, and scalable *data plane*. To maintain high availability, the QFabric system data plane is separated physically from the QFabric system control plane and uses a different network.

Figure 24 on page 1200 shows an example diagram of the QFabric system data plane network.

Figure 24: QFabric System Data Plane Network



The QFabric system data plane includes the following high-speed data connections and elements:

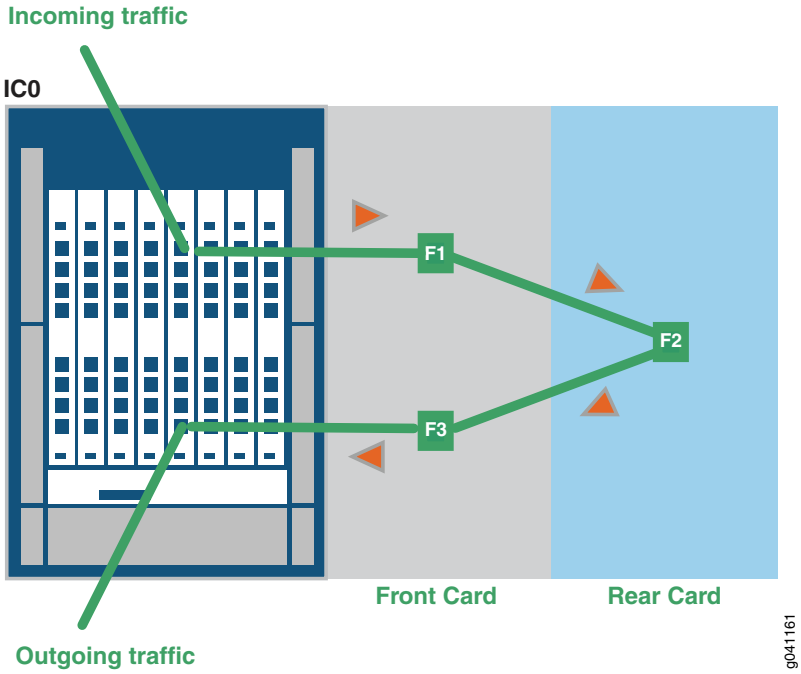
- 10-Gigabit Ethernet or 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel connections between QFabric system endpoints (such as servers or storage devices) and the Node devices.
- 40-Gbps quad, small form-factor pluggable plus (QSFP+) connections between the Node devices and the Interconnect devices.
- 10-Gigabit Ethernet connections between external networks and the Node devices contained in the network Node group.
- A fabric control protocol, used to distribute route information to all devices connected to the QFabric system data plane.

QFabric System Fabric

Unlike traditional data centers that employ a multi-tiered hierarchy of switches, a QFabric system contains a single tier of Node devices connected to one another across a backplane of Interconnect devices. The QFabric system fabric is a distributed, multistage network that consists of a fabric queuing and scheduling system implemented in the Node devices, and a distributed cross-connect system implemented in the Interconnect devices. The

cross-connect system for the QFX3008-I Interconnect device is shown as an example in Figure 25 on page 1201.

Figure 25: QFX3008-I Interconnect Device Cross-Connect System



The design of the cross-connect system provides multistage Clos switching, which results in nonblocking paths for data traffic and any-to-any connectivity for the Node devices. Because all Node devices are connected through the Interconnect device, the QFabric system offers very low port-to-port latencies. In addition, dynamic load balancing and low-latency packet flows provide for scaling the port count and bandwidth capacity of a QFabric system.

NOTE: The command-line interface (CLI) on the QFX Series might display configuration statements that are not supported. However, configuring an unsupported statement on a device has no effect on the operation of the device. See "QFX Series CLI Hierarchy" on page 192 to see which statements are supported on the QFX Series.

Table 101: Access Control Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
MAC RADIUS authentication	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
TACACS+	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
QFabric system component-level access and login classes	Not applicable	Not applicable	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
SSH authentication keys	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15

Table 102: Administration Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
System logging (syslog) over IPv4	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Licensing	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 103: CoS Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabri System
Class of service (CoS)—Class-based queuing with prioritization	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS—Multidestination	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS support on link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Enhanced transmission selection (ETS)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Interface-specific CoS rewrite rules	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 103: CoS Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Port shaping and queue shaping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control (PFC)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control enhancements	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Re-marking of bridged packets	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority remapping	Junos OS 12.3X50-D10	Not supported	Not supported	Not supported
Weighted random early detection (WRED) tail-drop profiles	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
802.3X Ethernet PAUSE autonegotiation enhancements	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Layer 3 ingress packet classification and egress rewrite rule class-of-service features	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Software buffer configurability	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 104: High Availability and Resiliency Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Graceful protocol restart for BGP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Graceful protocol restart for OSPF	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 104: High Availability and Resiliency Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Support for 32 members in a link aggregation group (LAG)	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Multichassis link aggregation	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10	Not supported	Not supported
Virtual Router Redundancy Protocol (VRRP)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Graceful restart for FIP snooping to recover gracefully from Ethernet protocol restarts and crashes	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Nonstop software upgrade (NSSU)	Not supported	Not supported	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Layer 3 unicast and multicast support for multichassis link aggregation	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 105: Interface Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Interface ranges	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 105: Interface Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
VLAN-tagged Layer 3 logical interfaces	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 106: IP Address Management Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Static addresses	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IPv4 support for telnet	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6. For information about Telnet support on this system, see "Understanding Telnet on the QFabric System" on page 6081.	Junos OS 12.2X50-D10. Fo information about Telnet support on this system, se "Understanding Telnet on QFabric System" on page 6
IPv6 support for neighbor discovery, SSH, Telnet, ping, traceroute, static routing, virtual routing instances, firewall filters, RADIUS, NTP, and SNMP, on network Node group	Not supported	Not supported	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
IPv6 support for neighbor discovery, SSH, Telnet, ping, traceroute, static routing, firewall filters, and SNMP on management interfaces	Junos OS 12.2X50-D20	Not supported	Not applicable	Not applicable

Table 106: IP Address Management Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IPv6 support for neighbor discovery, router advertisements, stateless autoconfiguration, link aggregation, SSH, Telnet, ping, traceroute, path MTU, static routing, dynamic routing (BGPv6, IS-ISv6, OSPFv3, RIPv6), graceful restart, BFD, virtual routers, firewall filters, SNMP, CoS, VRRPv3, Radius, TACACS+, AAA, NTP, and syslog, on network interfaces	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not applicable	Not applicable

Table 107: Layer 2 Network Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
802.1Q VLAN tagging	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
BPDU protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10 (network Node group only)	Junos OS 12.2X50-D10 (network Node group only)
Jumbo frames on routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Link Layer Discovery Protocol (LLDP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Loop protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 107: Layer 2 Network Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Root protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
Spanning tree: • Spanning Tree Protocol (STP) • Rapid Spanning Tree Protocol (RSTP) • Multiple Spanning Tree Protocol (MSTP) • VLAN Spanning Tree Protocol (VSTP) • RSTP and VSTP concurrent configuration	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10 (network Node group only)	Junos OS 12.2X50-D10 (network Node group only)
Multiple VLAN Registration Protocol (MVRP)	Not supported	Not supported	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15
VLAN ranges	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Private VLANs	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Secondary VLAN trunk ports and promiscuous access ports for private VLANs	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Q-in-Q tunneling	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15

Table 107: Layer 2 Network Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
VLAN translation	Junos OS 12.1X49-D1	Junos OS 12.1X49-D1	Not supported	Not supported
Layer 2 Tunneling Protocol	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Reflective relay	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Proxy ARP	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported

Table 108: Layer 3 Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFab System
Bidirectional Forwarding Detection (BFD)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Border Gateway Protocol (BGP) A separate software license is required for BGP. See "Software Features That Require Licenses on the QFX Series" on page 87.	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
BGPv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Intermediate System-to-Intermediate System (IS-IS) A separate software license is required for IS-IS. See "Software Features That Require Licenses on the QFX Series" on page 87.	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
IS-ISv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Open Shortest Path First (OSPF) v2	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
OSPFv3	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 108: Layer 3 Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFab System
Per-packet load balancing (ECMP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Routing Information Protocol versions 1 and 2 (RIPv1 and RIPv2)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
RIPv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Routing options	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Static routes	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Virtual router routing instances for unicast protocols	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Virtual router routing instances for multicast protocols	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 109: Multicast Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IGMPv1 and v2	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
IGMPv3	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
IGMPv1 and v2 snooping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IGMP snooping with routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IGMP querier	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
IGMP filtering	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10

Table 109: Multicast Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Protocol Independent Multicast sparse mode (PIM SM)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Protocol Independent Multicast source-specific multicast (PIM SSM)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Bidirectional Forwarding Detection (BFD) for PIM	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Static RP	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Anycast RP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Multicast Source Discovery Protocol (MSDP)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Multicast VLAN registration	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 110: Network Management and Monitoring Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Junos Space	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
Local port mirroring	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Remote port mirroring	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Remote port mirroring to IP address (GRE encapsulation)	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 110: Network Management and Monitoring Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Increased numbers of port-mirroring sessions	Not supported	Not supported	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
RMON	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
sFlow monitoring technology	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Simple Network Management Protocol version 1 (SNMPv1) and SNMPv2	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Simple Network Management Protocol version 3 (SNMPv3)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
Juniper enterprise-specific SNMP Utility MIB	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Juniper enterprise-specific SNMP Fabric Chassis MIB	Not applicable	Not applicable	Junos OS 12.2X50-D20 Junos OS 13.1X50-D10 (Added Director device information)	Junos OS 12.2X50-D20 Junos OS 13.1X50-D10 (Ad Director device informatio
Juniper Class-of-Service MIB	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Uplink failure detection	Junos OS 11.3R4	Junos OS 12.2X50-D20	Not supported	Not supported
Junos OS automation script support	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
QFabric system control plane debugging and diagnostics support	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Internal fabric OAM monitoring	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
DHCP smart relay	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 111: Port Security Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Automatic recovery for port error disable conditions	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
MAC limiting	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
MAC move limiting	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Persistent MAC learning (sticky MAC)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Static ARP support	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Storm control (broadcast, unicast, and multicast)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
DHCP snooping	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Dynamic ARP inspection (DAI)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 112: QFabric System-Specific Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Aliasing of Node devices	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
High availability of QFabric system components	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Node groups	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 112: QFabric System-Specific Features *(continued)*

Understanding Software Upgrade on the QFabric System

The QFabric system software package contains software for the QFabric system infrastructure and for all of the different component devices in the QFabric system: Director group, Interconnect devices, and Node devices.

- Operational Software Commands on page 1217
- Operational Reboot Commands on page 1218

Operational Software Commands

The **request system software download** CLI command enables you to download the software package to various locations: for example, USB device, remote server, or FTP site.

The following CLI commands enable you to install the software for the Director group, Interconnect devices, Node devices, and the QFabric system infrastructure. You may need to specify the **reboot** option depending on which devices or QFabric infrastructure you are installing the software. The **reboot** option works differently depending on whether you install the software on the QFabric system infrastructure or on a particular device in the QFabric system.

- **request system software add component all**

  This command installs software for the Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect devices, and network and server Node groups.

- **request system software add component director-group**

This command installs software for the Director group and the default partition, which is where you access the QFabric system CLI.

- **request system software add component fabric**

  This command installs the software for the fabric control Routing Engines and the Interconnect devices.

- **request system software add component *node-group-name***

  This command installs software for a server Node group or a network Node group.

Additionally, you can back up your current QFabric configuration file and installation-specific parameters using the **request system software configuration-backup** command. We recommend that you save this file to an external location, like an FTP site or USB device, but you can save it locally.

Operational Reboot Commands

The following commands enable you to reboot the entire QFabric system, various Node devices, or the QFabric system infrastructure:

- **request system reboot all**

  This command reboots the Director group, fabric control Routing Engines, fabric manager Routing Engine, Interconnect devices, and network and server Node groups.

- **request system reboot director-group**

  This command reboots the Director group and the default partition, which is where you access the QFabric system CLI.

- **request system reboot fabric**

  This command reboots the fabric control Routing Engines and the Interconnect devices.

- **request system reboot node-group**

  This command reboots a server Node group or a network node group.

Understanding Nonstop Software Upgrade for QFabric Systems

The framework that underlies a nonstop software upgrade in a QFabric system enables you to upgrade the system in a step-by-step manner and minimize the impact to the continuous operation of the system. This topic explains how a nonstop software upgrade works in a QFabric system, the steps that are involved, and the procedures that you need to implement to experience the benefits of this style of software upgrade.

Nonstop software upgrade enables some QFabric system components to continue operating while similar components in the system are being upgraded. In general, the QFabric system upgrades redundant components in stages so that some components remain operational and continue forwarding traffic while their equivalent counterparts upgrade to a new version of software.

TIP: Use the following guidelines to decide when to implement a nonstop software upgrade:

- If you need to upgrade all components of the system in the shortest amount of time (approximately one hour) and you do not need to retain the forwarding resiliency of the data plane, issue the **request system software add component all** command to perform a standard software upgrade. All components of the QFabric system upgrade simultaneously and expediently, but this type of upgrade does not provide resiliency or switchover capabilities.
- If you need to minimize service impact, preserve the forwarding operations of the data plane during the upgrade, and are willing to take the extra time required for component switchovers (in many cases, several hours), issue the three nonstop software upgrade commands (**request system software nonstop-upgrade (director-group | fabric | node-group)** described in this topic in the correct order.

NOTE:

- Before you begin a nonstop software upgrade, issue the **request system software download** command to copy the software to the QFabric system.
- Each of the 3 nonstop software upgrade steps must be considered parts of the whole process. You must complete all 3 steps of a nonstop software upgrade in the correct order to ensure the proper operation of the QFabric system.
- Open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected. For more information on verification of the upgrade, see "Verifying Nonstop Software Upgrade for QFabric Systems" on page 1410.
- Issue the **show fabric administration inventory** command to verify that all upgraded components are operational at the end of a step before beginning the next step.
- Once you start the nonstop software upgrade process, we strongly recommend that you complete all 3 steps within 12 hours.

The three steps to a successful nonstop software upgrade must be performed in the following order:

- Director group—The first step upgrades the Director devices, the fabric manager Routing Engine, and the diagnostic Routing Engine. To perform the first step, issue the **request system software nonstop-upgrade director-group** command. The key actions that occur during a Director group upgrade are:

1. Connecting to the QFabric system by way of an SSH connection. This action establishes a load-balanced CLI session on one of the Director devices in the Director group.
2. The QFabric system downloads and installs the new software in both Director devices.
3. The Director device hosting the CLI session becomes the master for all QFabric system processes running on the Director group, such as the fabric manager and network Node group Routing Engines.
4. The QFabric system installs the new software for the backup fabric manager Routing Engine on the backup Director device.
5. The backup Director device reboots to activate the new software.
6. The master Director device begins a 15 minute sequence that includes a temporary suspension of QFabric services and a QFabric database transfer. You cannot issue operational mode commands in the QFabric CLI during this period.
7. The QFabric system installs the new software for the fabric manager and diagnostic Routing Engines on the Director group master.
8. The QFabric system switches mastership of all QFabric processes from the master Director device to the backup Director device.
9. The master Director device reboots to activate the new software.
10. The CLI session terminates, and logging back in to the QFabric system with a new SSH connection establishes the session on the new master Director device (the original backup).
11. The previous master Director device resumes operation as a backup and the associated processes (such as the fabric manager and network Node group Routing Engines) become backup as well. The fabric control Routing Engine associated with this Director device returns to active status.

NOTE: After the Director group nonstop software upgrade completes, any Interconnect device or Node device that reboots will automatically download the new software, install it, and reboot again. As a result, try not to restart any QFabric system devices before you complete the rest of the nonstop software upgrade steps.

TIP:

- To enable BGP and OSPF to continue operating on the network Node group during a Director group nonstop service upgrade, we recommend that you configure graceful restart for these routing protocols. For more information on graceful restart, see "Configuring Graceful Restart for QFabric Systems" on page 1375.
- Wait 15 minutes after the second Director device returns to service and hosts Routing Engine processes before proceeding to step 2—the fabric

upgrade. You can verify the operational status of both Director devices by issuing the **show fabric administration inventory director-group status** command. Also, issue the **show fabric administration inventory infrastructure** command to verify when the Routing Engine processes become load balanced (typically, there will be three to four Routing Engines running on each Director device).

- Fabric—The second step upgrades the Interconnect devices and the fabric control Routing Engines. To perform the second step, issue the **request system software nonstop-upgrade fabric** command. The key actions that occur during a fabric upgrade are:

  1. The QFabric system downloads, validates, and installs the new software in all Interconnect devices and fabric control Routing Engines (FC-0 and FC-1).
  2. One fabric control Routing Engine reboots and comes back online.
  3. The other fabric control Routing Engine reboots and comes back online.
  4. The first Interconnect device reboots, comes back online, and resumes the forwarding of traffic.
  5. Subsequent Interconnect devices reboot one at a time, come back online, and return to service.

  

  NOTE:
  - If the software does not load properly on any one of the fabric components, all components revert back to the original software version.
  - If one of the components in a fabric upgrade does not reboot successfully, issue the **request system reboot fabric** command to reattempt the rebooting process for this fabric component and activate the new software.

- Node group—The third and final step upgrades Node groups. You can choose to upgrade a network Node group, a redundant server Node group, or individual server Node groups. You can upgrade the Node groups one at a time or in groups (known as upgrade groups). However, you must upgrade all Node groups in your QFabric system before you can complete the nonstop software upgrade process. To perform the third step, issue the **request system software nonstop-upgrade node-group** command.

  The key actions that occur during a network Node group upgrade are:

  1. The QFabric system copies the new software to each Node device one at a time.
  2. The QFabric system validates and then installs the new software in all Node devices simultaneously.
  3. The system copies the software to the network Node group Routing Engines.
  4. The QFabric system validates and then installs the software in the network Node group Routing Engines one at a time -- first the backup, then the master.

5. The backup network Node group Routing Engine reboots and comes back online.
6. The supporting Node devices reboot and come back online one at a time.

NOTE: To reduce the total upgrade duration, configure an upgrade group. All Node devices within the upgrade group reboot at the same time.

7. The master network Node group Routing Engine relinquishes mastership to the backup, reboots, and comes back online.

The key actions that occur during a redundant server Node group upgrade are:

1. The QFabric system copies the new software to the backup Node device, then the master Node device.
2. The QFabric system validates and then installs the new software on the backup Node device, then the master Node device.
3. The backup Node device reboots, comes back online, and becomes the master Node device.
4. The previous master Node device reboots and comes back online as a backup Node device.

NOTE: For redundant server Node groups, both Node devices must be online before the upgrade will proceed. If one of the devices is no longer available, remove the Node device from the Node group configuration before you issue the nonstop software upgrade command.

The key actions that occur during a server Node group upgrade for a Node group that contains one member are:

1. The Node device downloads the software package and validates the software.
2. The Node device installs the software and reboots.

NOTE: Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade.

Understanding Statements and Commands on the QFabric System

- Chassis Statements on page 1223
- Chassis Commands on page 1223

Chassis Statements

The following chassis statements enable you to configure various options for your Interconnect devices, Node groups (network and server), and Node devices:

- **interconnect-device**
- **node-group**
- **node-device**

Chassis Commands

The Junos OS CLI contains additions to the existing chassis commands. These additions reflect new options as a result of adding the **interconnect-device**, **node-group**, and **node-device** chassis statements at the **[edit chassis]** hierarchy level.

The following chassis commands enable you to monitor and configure the QFabric system hardware and software options at various hierarchy levels:

- **clear chassis display message**
- **request chassis beacon**
- **request chassis cb** (QFX3000-G QFabric systems only)
- **request chassis fabric** (QFX3000-G QFabric systems only)
- **request chassis fpc**
- **request chassis routing-engine master**
- **set chassis aggregated-devices**
- **set chassis alarm**
- **set chassis container-devices**
- **set chassis craft-lockout**
- **set chassis display**
- **set chassis fpc**
- **set chassis routing-engine**
- **show chassis alarms**
- **show chassis beacon**
- **show chassis environment**
- **show chassis fan** (QFX3000-G QFabric systems only)
- **show chassis fabric**

- **show chassis firmware**
- **show chassis fpc**
- **show chassis hardware**
- **show chassis lcd**
- **show chassis led**
- **show chassis location**
- **show chassis mac-addresses**
- **show chassis nonstop-upgrade**
- **show chassis pic**
- **show chassis routing-engine**
- **show chassis temperature-thresholds**
- **show chassis zones**

Understanding NTP on the QFabric System

Network Time Protocol (NTP) enables you to synchronize the time across the network. This is especially helpful for correlating log events and replicating databases and file systems. The QFabric system synchronizes time with servers that are external to the system and operates in client mode only.

To configure NTP, include the **server address** and **authentication-key** statements at the **[edit system ntp]** hierarchy level.

Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log *filename*** operational mode command to view messages.
- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.

- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

NOTE: Do not install Junos Space and AIS on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

Understanding the Implementation of SNMP on the QFabric System

SNMP monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

NOTE: In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device does. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your **mibwalk** command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

NOTE: Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)
  - RFC 1215, *A Convention for Defining Traps for use with the SNMP*
  - RFC 1901, *Introduction to Community-based SNMPv2*
  - RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
  - RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*
  - RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*
  - RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2*
  - RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*
  - RFC 2233, *The Interfaces Group MIB Using SMIv2*
  - RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access) (excluding SNMPv3)
  - RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access) (excluding SNMPv3)
  - RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
  - RFC 2578, *Structure of Management Information Version 2 (SMIv2)*

Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log (syslog) messages as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers

(hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log *filename*** operational mode command to view the messages.

NOTE: On the QFabric system, a syslog file named **messages** with a size of 100 MB is configured by default. If you do not configure a filename, you can use the default filename **messages** with the **show log *filename*** command.

All messages with a severity level of **notice** or higher are logged. Messages with a facility level of **interactive-commands** on Node devices are not logged.

The QFabric system supports the following system log message features:

- The **file *filename*** and **host *hostname*** statements at the **[edit system syslog]** hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the **show log *filename*** command by configuring the **file *filename* archive *maximum-file-size*** statement.
- You can specify that one or more system log message servers receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.
- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- The unit of time is is measured and displayed in seconds, and not milliseconds. If you attempt to configure the **time-format** option in milliseconds, the log output displays **000**.

Starting in Junos OS Release 13.1, the QFabric system supports these additional syslog features:

- You can filter the output of the **show log *filename*** operational mode command by device type and device ID or device alias when you specify the ***device-type* (*device-id* | *device-alias*)** optional parameters. Device types include **director-device**, **infrastructure-device**, **interconnect-device**, and **node-device**.
- You can specify the syslog structured data output format when you configure the **structured-data** statement at the **[edit system syslog file *filename*]** and **[edit system syslog host *hostname*]** hierarchy levels.

NOTE: Information displayed in the structured data output for system logs originating from the Director software may not be complete.

- You can filter the types of logs that the Director group collects from a component device when you configure the **filter all *facility severity*** or **filter all match "*regular-expression*"** statements at the **[edit system syslog]** hierarchy level.

Unsupported syslog features include:

- File access to syslog messages
- Monitoring of syslog messages

Understanding User and Access Management Features on the QFabric System

The QFabric system supports the following user and access management features:

- User authentication
- RADIUS
- Link Layer Discovery Protocol (LLDP)
- SSH
- TACACS+
- Access privilege management

The specific functionality, features, options, syntax, and hierarchy levels of some of the user and access management commands and configuration statements implemented on the QFabric system may differ somewhat from the same commands and configuration statements on standard Junos OS. See the configuration statement or command topic in the documentation set for additional information, and use the help (**?**) command-line function to display specific information as needed.

Some user and access management features are not yet fully supported in the full QFabric architecture, although full support is planned for future releases. The user and access management features currently unsupported on the QFabric system include:

- Full RADIUS server support, including RADIUS accounting
- **accounting-options** configuration statement hierarchy
- **tacplus-options** configuration statement

Understanding QFabric System Login Classes

In some cases (such as device-level troubleshooting), it is useful to log in to individual QFabric system components so you can view and manage issues on a per-device basis. This topic explains the login classes that provide individual component access within a QFabric system.

NOTE: Under normal operating conditions, you should manage the QFabric system as a single entity by using the QFabric system default partition command-line interface (CLI). The default partition CLI provides you with the ability to configure and monitor your entire QFabric system from a central location and should be used as the primary way to manage the system.

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system:

- **qfabric-admin**—Provides the ability to log in to individual QFabric system components and manage them. This class is equivalent to setting the following permissions: **access**, **admin**, **clear**, **firewall**, **interface**, **maintenance**, **network**, **reset**, **routing**, **secret**, **security**, **snmp**, **system**, **trace**, and **view**. The *qfabric-admin* class also enables you issue all operational mode commands except **configure**. To provide QFabric system component-level login and management privileges, include the **qfabric-admin** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-operator**—Provides the privilege to log in to individual QFabric system components and view component operations and configurations. This class is equivalent to setting the following permissions: **trace** and **view**. The *qfabric-operator* class also enables you issue the **monitor** and **show log messages** operational mode commands. To provide limited QFabric system component-level access, include the **qfabric-operator** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-user**—Prevents access to individual QFabric system components. This class is the default setting for all QFabric system users and is equivalent to the preset Junos OS class of **unauthorized**. To prevent a user from accessing individual QFabric system components, include the **qfabric-user** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

When you perform the initial setup for the Director group, you must specify a username and password for QFabric components. Once configured, this information is stored in the QFabric system and mapped to the QFabric system login classes. Such mapping allows users with the proper login class (**qfabric-admin** or **qfabric-operator**) to log in automatically to a component without being prompted for the username and password.

After you assign the **qfabric-admin** or **qfabric-operator** class to a user, the user can log in to an individual QFabric system component by issuing the **request component login *component-name*** command. You can access Node devices, Interconnect devices, and virtual Junos Routing Engines (diagnostics, fabric control, and fabric manager) one at a

time when you issue this command. To leave the CLI prompt of a component and return to the QFabric system default partition CLI, issue the **exit** command from the component's operational mode CLI prompt.

Understanding Interfaces on the QFabric System

This topic describes:

- Four-Level Interface Naming Convention on page 1231
- QSFP+ Interfaces on page 1231
- Link Aggregation on page 1234

Four-Level Interface Naming Convention

When you configure an interface on the QFabric system, the interface name needs to follow a four-level naming convention that enables you to identify an interface as part of either a Node device or a Node group. Include the name of the network or server Node group at the beginning of the interface name.

The four-level interface naming convention is:
device-name:*type-fpc/pic/port*
where *device-name* is the name of the Node device or Node group. The remainder of the naming convention elements are the same as those in the QFX3500 switch interface naming convention.

An example of a four-level interface name is:
node2:xe-0/0/2

QSFP+ Interfaces

The QFX3500 Node device provides four 40-Gbps QSFP+ (quad small form-factor pluggable plus) interfaces (labeled **Q0** through **Q3**) for uplink connections between your Node device and your Interconnect devices.

The QFX3600 Node device provides 16 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 12 interfaces (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight interfaces (Q0 through Q7) for uplink connections between your Node device and your Interconnect devices, and interfaces Q2 through Q15 for 10-Gigabit Ethernet connections to either endpoint systems or external

networks (see "Configuring the Port Type on QFX3600 Node Devices" on page 1367). Table 98 on page 1174 shows the port mappings for QFX3600 Node devices.

Table 116: QFX3600 Node Device Port Mappings

Port Number	40-Gigabit Data Plane Uplink Interfaces	10-Gigabit Ethernet Interfaces

Link Aggregation

Link aggregation enables you to create link aggregation groups across Node devices within a network Node group or redundant server Node group. You can include up to 32 Ethernet interfaces in a LAG. You can have up to 48 LAGs within a redundant server Node group, and 128 LAGs in a network Node group. To configure a LAG, include the **aggregated-devices** statement at the **[edit chassis node-group *node-group-name*]** hierarchy level and the **device-count** statement at the **[edit chassis node-group *node-group-name* aggregated-devices ethernet]** hierarchy level. Additionally, include any aggregated Ethernet options (**minimum-links** and **link-speed**) at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level and the **802.3ad** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level. To configure the Link Aggregation Control Protocol (LACP), include the **lacp** statement at the **[edit interfaces aggregated-ether-options]** hierarchy level.

Understanding Layer 3 Features on the QFabric System

The QFabric system supports the following Layer 3 features:

- Static routes, which enable you to manually configure and enter routes directly into the routing table.
- Routed VLAN Interfaces, which are a special type of Layer 3 virtual interface that enable you to forward packets between VLANs without using a router to connect the VLANs. Using this approach to connect VLANs reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.
- Routing protocols for routing traffic. The following routing protocols are supported on QFabric systems:
  - Border Gateway Protocol (BGP), which is an exterior gateway protocol (EGP) for routing traffic between autonomous systems (ASs).
  - Open Shortest Path First (OSPF) protocol, which is an interior gateway protocol (IGP) for routing traffic within an autonomous system (AS). QFabric systems support OSPFv1 and OSPFv2.

NOTE:

- When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.
- You can configure routing protocols by including statements at the **[edit protocols]** hierarchy level. If you want to isolate customer traffic on your network, you can configure virtual router routing instances at the **[edit routing-instances]** hierarchy level, and configure routing protocols for each virtual router routing instance by including statements at the **[edit routing-instances *routing-instance-name* protocols]** hierarchy level.

Related Documentation

- Understanding Virtual Router Routing Instances on page 2822

Understanding Security Features on the QFabric System

The QFabric system supports the following security features:

- Firewall filters provide rules that define whether to accept or discard packets that are transiting an interface. If a packet is accepted, you can configure additional actions to perform on the packet, such as class-of-service (CoS) marking (grouping similar types of traffic together and treating each type of traffic as a class with its own level of service priority) and traffic policing (controlling the maximum rate of traffic sent or received).
- Policing (rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service. You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.
- MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on Layer 2 interfaces (ports). MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface or on all the Layer 2 access interfaces on the switch. Junos OS provides two MAC limiting methods:
  - Maximum number of MAC addresses—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
  - Allowed MAC—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN.

If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

- Storm control causes a switch to monitor traffic levels and take a specified action when a specified traffic level—called the storm control level—is exceeded, thus preventing packets from proliferating and degrading service. You can configure switches to drop broadcast and unknown unicast packets, shut down interfaces, or temporarily disable interfaces when the storm control level is exceeded.

Understanding Port Mirroring on the QFabric System

Port mirroring copies unicast packets entering or exiting a port or entering a VLAN and sends the copies to a local interface for monitoring. Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on.

Understanding Fibre Channel Fabrics on the QFabric System

A Fibre Channel (FC) fabric on a QFabric system is a construct that you configure on a QFX3500 Node device when the Node device is in FCoE-FC gateway mode. The FC fabric on a QFabric Node device is not the same as an FC fabric on a storage area network (SAN). The FC fabric on a QFabric Node device is local to that particular node device. We call the FC fabric on a QFabric Node device a *local FC fabric* to differentiate it from an FC fabric on the SAN.

NOTE: **The QFX3600 Node device does not support FC or FCoE features.**

A local FC fabric does not span Node devices and does not span the fabric Interconnect device. Local FC fabrics are entirely contained on a single Node device. A local FC fabric creates associations that connect FCoE devices that have converged network adapters (CNAs) on the Ethernet network to an FC switch or FCoE forwarder (FCF) on the FC network. A local FC fabric consists of:

- A unique fabric name.
- A unique fabric ID.
- One or more FCoE VLAN interfaces that include one or more 10-Gigabit Ethernet interfaces connected to FCoE devices. The FCoE VLANs transport traffic between the FCoE servers and the FCoE-FC gateway. Each FCoE VLAN must carry only FCoE traffic. You cannot mix FCoE traffic and standard Ethernet traffic on the same VLAN.

  The 10-Gigabit Ethernet interfaces that connect to FCoE devices must include a native VLAN to transport FIP traffic because FIP VLAN discovery and notification frames are exchanged as untagged packets.

  Each FCoE VLAN interface can present multiple VF_Port interfaces to the FCoE network.
- One or more native FC interfaces. The native FC interfaces transport traffic between the gateway and the FC switch or FCF.

TIP: If the network does not use a dual-rail architecture for redundancy, configure more than one native FC interface for each local FC fabric to create redundant connections between the FCoE devices and the FC network. If one physical link goes down, any sessions it carried can log in again and connect to the FC network on a different interface.

All of the FC and FCoE traffic that belongs to a local FC fabric on a Node device must enter and exit that Node device. This means that the FC switch or FCF and the FCoE devices in the Ethernet network must be connected to the same Node device. The interfaces that connect to the FC switch and the interfaces that connect to the FCoE devices must be included in the local FC fabric. You cannot configure a local FC fabric that spans more than one Node device.

Traffic flows from FC and FCoE devices that are not in the same local FC fabric remain separate and cannot communicate with each other through the FCoE-FC gateway.

NOTE: The QFabric system enforces commit checks to ensure that local FC fabrics and FCoE VLANs on FCoE-FC gateways do not span more than one Node device.

Understanding CoS Fabric Forwarding Class Sets

Fabric forwarding class sets (fabric fc-sets) are similar to the fc-sets (priority groups) you configure on Node devices. The major differences are:

1. Fabric fc-sets group traffic for transport across the QFX3008-I or QFX3600-I Interconnect device (the fabric). Node device fc-sets group traffic on a Node device for transport across that Node device.
2. Fabric fc-sets are global. They apply to the entire fabric. Node device fc-sets apply only to the Node device on which they are configured.
3. You can configure class of service (CoS) scheduling for Node device fc-sets, but you cannot configure CoS for fabric fc-sets.
4. Fabric fc-sets map to Interconnect device fabric output queues statically—you cannot configure the mapping of fabric fc-sets to fabric output queues. All traffic in a fabric fc-set maps to the same output queue.

   Node device fc-sets include forwarding classes that map to Node device output queues, and you can configure the mapping of forwarding classes to output queues (or you can use the default mapping). Because output queues are mapped to forwarding classes, different classes of traffic in a Node device fc-set can be mapped to different output queues.

Node device fc-sets consist of forwarding classes containing traffic that requires similar CoS treatment. (Forwarding classes are default forwarding classes or user-defined forwarding classes.) You can configure CoS for each fc-set to determine how the traffic of its forwarding classes is scheduled on a Node device.

When traffic exits a Node device interface and enters an Interconnect device fabric interface, the Interconnect device uses the same forwarding classes to group traffic. The forwarding classes are mapped to global fabric fc-sets for transport across the fabric. Like fc-sets on a Node device, fabric fc-sets also contain traffic that requires similar CoS treatment. Unlike fc-sets on a Node device, you cannot configure CoS on fabric fc-sets.

Fabric fc-sets reside on the Interconnect device and are global to the QFabric system. Fabric fc-sets apply to all traffic that traverses the fabric. The mapping of forwarding classes to fabric fc-sets is global and applies to all forwarding classes with traffic that traverses the fabric from all connected Node devices. You can change the mapping of forwarding classes to fabric fc-sets. All mapping changes you make are global. For example, if you change the fabric fc-set to forwarding class mapping of the default best-effort forwarding class, then every Node device's best-effort forwarding class traffic that traverses the fabric is mapped to that fabric fc-set.

This topic describes:

- Default Fabric Forwarding Class Sets on page 1239
- Fabric Forwarding Class Set Configuration and Implementation on page 1242
- Fabric Forwarding Class Set Scheduling (CoS) on page 1244
- Support for Flow Control and Lossless Transport Across the Fabric on page 1246

- Viewing Fabric Forwarding Class Set Information on page 1248
- Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences on page 1250

Default Fabric Forwarding Class Sets

Interconnect devices have 12 default fabric fc-sets, including five visible default fabric fc-sets, four for unicast traffic and one for multidestination (multicast, broadcast, and destination lookup failure) traffic.

There are also seven hidden default fabric fc-sets. There are three hidden default fabric fc-sets for multidestination traffic that you can use if you want to map different multidestination forwarding classes to different multidestination fabric fc-sets. There are four hidden default fabric fc-sets for lossless traffic that you can use to map different lossless forwarding classes (priorities) to different lossless fabric fc-sets.
Table 117 on page 1239 shows the default fabric fc-sets:

Table 117: Default Fabric Forwarding Class Sets

Fabric Forwarding Class Set Name	Characteristics
fabric_fcset_be	Transports best-effort unicast traffic across the fabric.
fabric_fcset_strict_high	Transports unicast traffic that has been configured with **strict-high** priority and in the **network-control** forwarding class across the fabric. This fabric fc-set receives as much bandwidth across the fabric as it needs to service the traffic in the group up to the entire fabric interface bandwidth. For this reason, exercise caution when mapping traffic to this fabric fc-set to avoid starving other traffic.
fabric_fcset_noloss1	Transports unicast traffic in the default **fcoe** forwarding class across the fabric.
fabric_fcset_noloss2	Transports unicast traffic in the default **no-loss** forwarding class across the fabric.
fabric_fcset_noloss3	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.
fabric_fcset_noloss4	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.
fabric_fcset_noloss5	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.

Table 117: Default Fabric Forwarding Class Sets *(continued)*

Fabric Forwarding Class Set Name	Characteristics
fabric_fcset_noloss6	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.
fabric_fcset_multicast1	Transports multidestination traffic in the **mcast** forwarding class across the fabric. This fabric fc-set is valid only for multidestination forwarding classes.
fabric_fcset_multicast2	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multidestination forwarding classes.
fabric_fcset_multicast3	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multidestination forwarding classes.
fabric_fcset_multicast4	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multidestination forwarding classes.

The five default forwarding classes (**best-effort**, **fcoe**, **no-loss**, **network-control**, and **mcast**) are mapped to the fabric fc-sets by default as shown in Table 118 on page 1240.

Table 118: Default Forwarding Class to Fabric Forwarding Class Set Mapping

Forwarding Class	Fabric Forwarding Class Set	Fabric Output Queue	Maximum MTU Supported for Lossless Operation
best-effort	fabric_fcset_be	0	NA
network-control	fabric_fcset_strict_high	7	NA
fcoe	fabric_fcset_noloss1	1	9K
no-loss	fabric_fcset_noloss2	2	9K
mcast	fabric_fcset_multicast1	8	NA
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss3	3	9k

Table 118: Default Forwarding Class to Fabric Forwarding Class Set Mapping *(continued)*

Forwarding Class	Fabric Forwarding Class Set	Fabric Output Queue	Maximum MTU Supported for Lossless Operation
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss4	4	9k
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss5	5	9k
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss6	6	9k
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_multicast2	9	NA
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_multicast3	10	NA
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_multicast4	11	NA

The maximum fiber cable length between the QFabric system Node device and the QFabric system Interconnect device is 150 meters.

TIP: If you explicitly configure lossless forwarding classes, we recommend that you map each user-configured lossless forwarding class to an unused fabric fc-set (fabric_fcset_noloss3 through fabric_fcset_noloss6) on a one-to-one basis: one lossless forwarding class mapped to one lossless fabric fc-set.

The reason for one-to-one mapping is to avoid fate sharing of lossless flows. Because each fabric fc-set is mapped statically to an output queue, when you map more than one forwarding class to a fabric fc-set, all of the traffic in all of the forwarding classes that belong to the fabric fc-set uses the same output queue. If that output queue becomes congested due to congestion caused by one of the flows, the other flows are also affected. (They share fate because the flow that congests the output queue affects flows that are not experiencing congestion.)

However, it is important to understand that fabric_fcset_noloss1 and fabric_fcset_noloss2 have a scheduling weight of 35, while the other fabric fc-sets have a scheduling weight of 1. The scheduling weights mean that fabric_fcset_noloss1 and fabric_fcset_noloss2 receive most of the bandwidth available to lossless fabric fc-sets if the amount of traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2 requires the bandwidth.

If you believe that the traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2 will consume most of that bandwidth, then you should place all lossless traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2. If you believe that the traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2 will <emphasis>not</emphasis> consume most of that bandwidth, then you can map lossless forwarding classes in a one-to-one manner to lossless fabric fc-sets to avoid fate sharing.

If you want to map different multidestination forwarding classes to different multidestination fabric fc-sets, use one or more of the hidden multidestination fabric fc-sets.

NOTE: The global mapping of forwarding classes to fabric fc-sets is independent of the mapping of forwarding classes to Node device fc-sets. Global mapping of forwarding classes to fabric fc-sets occurs only on the Interconnect device. The Node device mapping of forwarding classes to fc-sets does not affect the global mapping of forwarding classes to fabric fc-sets on the Interconnect device, and vice versa.

When you define new forwarding classes on a Node device, you explicitly map those forwarding classes to Node device fc-sets. However, new (user-created) forwarding classes are mapped by default to fabric fc-sets. (You can override the default mapping if you want to configure the forwarding class to fabric fc-set mapping explicitly, as described in the next section.)

By default:

- All best-effort traffic forwarding classes that you create are mapped to the **fabric_fcset_be** fabric fc-set.
- All lossless traffic forwarding classes that you create are mapped to the **fabric_fcset_noloss1** or **fabric_fcset_noloss2** fabric fc-set.
- All multidestination traffic forwarding classes that you create are mapped to the **fabric_fcset_multicast1** fabric fc-set.
- All **strict-high** priority traffic and **network-control** forwarding classes that you create are mapped to the **fabric_fcset_strict_high** fabric fc-set.

Fabric Forwarding Class Set Configuration and Implementation

You can map forwarding classes to fabric fc-sets, but no other attributes of fabric fc-sets are user-configurable, including CoS. This section describes:

- Mapping Forwarding Classes to Fabric Forwarding Class Sets on page 1243
- Fabric Forwarding Class Set Implementation on page 1243

Mapping Forwarding Classes to Fabric Forwarding Class Sets

If you do not want to use the default mapping of forwarding classes to fabric fc-sets, you can map forwarding classes to fabric fc-sets the same way as you map forwarding classes to Node device fc-sets. To do this, use exactly the same statement that you use to map forwarding classes to fc-sets, but instead of specifying a Node device fc-set name, specify a fabric fc-set name.

NOTE: The global mapping of forwarding classes to fabric fc-sets does not affect the mapping of forwarding classes to Node device fc-sets. The global forwarding class mapping to fabric fc-sets pertains to the traffic only when it enters, traverses, and exits the fabric. The forwarding class mapping to fc-sets on a Node device is valid within that Node device.

Mapping forwarding classes to fabric fc-sets does not affect the scheduling configuration of the forwarding classes or fc-sets on Node devices. Fabric fc-set scheduling (which is not user-configurable) pertains to traffic only when it enters, traverses, and exits the Interconnect device fabric.

If you change the mapping of a forwarding class to a fabric fc-set, the new mapping is global and applies to all traffic in that forwarding class, regardless of which Node device forwards the traffic to the Interconnect device.

- To assign one or more forwarding classes to a fabric fc-set:

  ```
  [edit class-of-service]
  user@switch# set forwarding-class-sets fabric-forwarding-class-set-name class forwarding-class-name
  ```

  For example, to map a user-defined forwarding class named **best-effort-2** to the fabric fc-set **fabric_fcset_be**:

  ```
  [edit class-of-service]
  user@switch# set forwarding-class-sets fabric_fcset_be class best-effort-2
  ```

NOTE: Because fabric fc-set configuration is global, in this example all forwarding classes with the name **best-effort-2** on all of the Node devices attached to the fabric use the **fabric_fcset_be** fabric fc-set to transport traffic across the fabric.

Fabric Forwarding Class Set Implementation

The following rules apply to fabric fc-sets:

- You cannot create new fabric fc-sets. Only the twelve default fabric fc-sets are available.
- You cannot delete a default fabric fc-set.
- You cannot attach a fabric fc-set to a Node device interface. Fabric fc-sets are used only on the Interconnect device fabric, not on Node devices.

- You can map only multidestination forwarding classes to multidestination fabric fc-sets.
- You cannot map multidestination forwarding classes to unicast fabric fc-sets.
- You cannot map unicast forwarding classes to multidestination fabric fc-sets.
- You cannot configure CoS for fabric fc-sets. (However, default CoS scheduling properties are applied to traffic on the fabric, and the fabric interfaces use link layer flow control (LLFC) for flow control.)

Fabric Forwarding Class Set Scheduling (CoS)

Although fabric fc-set CoS is not user-configurable, CoS is applied to traffic on the fabric. (In addition, fabric interfaces use LLFC to ensure lossless transport for lossless traffic flows.) This section describes how the fabric applies CoS scheduling to traffic:

- Class Groups for Fabric Forwarding Class Sets on page 1244
- Class Group Scheduling on page 1244
- QFabric System CoS on page 1246

Class Groups for Fabric Forwarding Class Sets

To transport traffic across the fabric, the QFabric system organizes the fabric fc-sets into three classes called *class groups*. The three class groups are:

- **Strict-high priority**—All traffic in the fabric fc-set **fabric_fcset_strict_high**. This class group includes the traffic in **strict-high** priority and **network-control** forwarding classes and in any forwarding classes you create on a Node device that consist of **strict-high** priority or **network-control** forwarding class traffic.
- **Unicast**—All traffic in the fabric fc-sets **fabric_fcset_be**, **fabric_fcset_noloss1**, and **fabric_fcset_noloss2**. This class group includes the traffic in the **best-effort**, **fcoe**, and **no-loss** forwarding classes and in any forwarding classes you create on a Node device that consist of best-effort or lossless traffic. If you use any of the hidden no loss fabric fc-sets (**fabric_fcset_noloss3**, **fabric_fcset_noloss4**, **fabric_fcset_noloss5**, or **fabric_fcset_noloss6**), that traffic is part of this class group.
- **Multidestination**—All traffic in the fabric fc-set **fabric_fcset_multicast1**. This class group includes the traffic in the **mcast** forwarding class and in any forwarding classes you create on a Node device that consist of multidestination traffic. If you use any of the hidden multidestination fabric fc-sets (**fabric_fcset_multicast2**, **fabric_fcset_multicast3**, or **fabric_fcset_multicast4**), that traffic is also classified as part of this class group.

Class Group Scheduling

You cannot configure CoS for class groups or for fabric fc-sets (that is, you cannot attach a traffic control profile to a fabric fc-set—you attach traffic control profiles to Node device fc-sets to apply scheduling to the traffic that belongs to the Node device fc-set). By default, the fabric uses weighted round-robin (WRR) scheduling in which each class group receives a portion of the total available fabric bandwidth based on its type of traffic, as shown in Table 119 on page 1245:

Table 119: Class Group Scheduling Properties and Membership

Class Group	Fabric fc-sets	Forwarding Classes (Default Mapping)	Class Group Scheduling Properties (Weight)
Strict-high priority	**fabric_fcset_strict_high**	• All **strict-high** priority forwarding classes • **network-control**	Traffic in the strict-high priority class group is served first. This class group receives all of the bandwidth it needs to empty its queues and therefore can starve other types of traffic during periods of high-volume strict-high priority traffic. Plan carefully and use caution when determining how much traffic to configure as strict-high priority traffic.
Unicast	• **fabric_fcset_be** • **fabric_fcset_noloss1** • **fabric_fcset_noloss2** Includes the hidden lossless fabric fc-sets if used: • **fabric_fcset_noloss3** • **fabric_fcset_noloss4** • **fabric_fcset_noloss5** • **fabric_fcset_noloss6**	• **best-effort** • **fcoe** • **no-loss** NOTE: No forwarding classes are mapped to the hidden lossless fabric_fcsets by default.	Traffic in the unicast class group receives an 80% weight in the WRR calculations. After the strict-high priority class group has been served, the unicast class group receives 80% of the remaining fabric bandwidth. (If more bandwidth is available, the unicast class group can use more bandwidth.)
Multidestination	**fabric_fcset_multicast1** Includes the hidden multidestination fabric fc-sets if used: • **fabric_fcset_multicast2** • **fabric_fcset_multicast3** • **fabric_fcset_multicast4**	• **mcast** NOTE: No forwarding classes are mapped to the hidden multidestination fabric_fcsets by default.	Traffic in the multidestination class group receives a 20% weight in the WRR calculations. After the strict-high priority class group has been served, the multidestination class group receives 20% of the remaining fabric bandwidth. (If more bandwidth is available, the multidestination class group can use more bandwidth.)

The fabric fc-sets within each class group are weighted equally and receive bandwidth using round-robin scheduling. For example:

- If the unicast class group has three member fabric fc-sets, **fabric_fcset_be**, **fabric_fcset_noloss1**, and **fabric_fcset_noloss2**, then each of the three fabric fc-sets receives one-third of the bandwidth available to the unicast class group.
- If the multidestination class group has one member fc-set, **fabric_fcset_multicast1**, then that fc-set receives all of the bandwidth available to the multidestination class group.
- If the multidestination class group has two member fc-sets, **fabric_fcset_multicast1** and **fabric_fcset_multicast2**, then each of the two fabric fc-sets receives one-half of the bandwidth available to the multidestination class group.

QFabric System CoS

When traffic enters and exits the same Node device, CoS works the same as it works on a standalone QFX3500 switch.

However, when traffic enters a Node device, crosses the Interconnect device, and then exits a different Node device, CoS is applied differently:

1. Traffic entering the ingress Node device receives the CoS configured at the Node ingress (packet classification, congestion notification profile for PFC).
2. When traffic goes from the ingress Node device to the Interconnect device, the fabric fc-set CoS is applied as described in the discussion of fabric forwarding class set scheduling.
3. When traffic goes from the Interconnect device to the egress Node device, the egress Node device applies CoS at the egress port (egress queue scheduling, WRED, IEEE 802.1p or DSCP code-point rewrite).

Support for Flow Control and Lossless Transport Across the Fabric

The Interconnect device incorporates flow control mechanisms to support lossless transport during periods of congestion on the fabric. To support the priority-based flow control (PFC) feature on the Node devices, the fabric interfaces use LLFC to support lossless transport for up to six IEEE 802.1p priorities when the following two configuration constraints are met:

1. The IEEE 802.1p priority used for the traffic that requires lossless transport is mapped to a lossless forwarding class on the Node devices.
2. The lossless forwarding class must be mapped to a lossless fabric fc-set on the Interconnect device (**fabric_fcset_noloss1**, **fabric_fcset_noloss2**, **fabric_fcset_noloss3**, **fabric_fcset_noloss4**, **fabric_fcset_noloss5**, or **fabric_fcset_noloss6**).

When traffic meets the two configuration constraints, the fabric propagates the back pressure from the egress Node device across the fabric to the ingress Node device during periods of congestion. However, to achieve end-to-end lossless transport across the switch, you must also configure a congestion notification profile to enable PFC on the Node device ingress ports.

For all other combinations of IEEE 802.1p priority to forwarding class mapping and all other combinations of forwarding class to fabric fc-set mapping, the congestion control mechanism is normal packet drop. For example:

- **Case 1**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 2**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.

- **Case 3**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_noloss2** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 4**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 5**—If the IEEE 802.1p priority **5** is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 6**—If the IEEE 802.1p priority **5** is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is packet drop.

NOTE: Lossless transport across the fabric also must meet the following two conditions:

1. The maximum cable length between the Node device and the Interconnect device is a 150 meters of fiber cable.
2. The maximum frame size is 9216 bytes.

If the MTU is 9216 KB, in some cases the QFabric system supports only five lossless forwarding classes instead of six lossless forwarding classes because of headroom buffer limitations.

The number of IEEE 802.1p priorities (forwarding classes) the QFabric system can support for lossless transport across the Interconnect device fabric depends on several factors:

- Approximate fiber cable length—The longer the fiber cable that connects Node device fabric (FTE) ports to the Interconnect device fabric ports, the more data the connected ports need to buffer when a pause is asserted. (The longer the fiber cable, the more frames are traversing the cable when a pause is asserted. Each port must be able to store all of the “in transit” frames in the buffer to preserve lossless behavior and avoid dropping frames.)
- MTU size—The larger the maximum frame sizes the buffer must hold, the fewer frames the buffer can hold. The larger the MTU size, the more buffer space each frame consumes.
- Total number of Node device fabric ports connected to the Interconnect device—The higher the number of connected fabric ports, the more headroom buffer space the Node device needs on those fabric ports to support the lossless flows that traverse the Interconnect device. Because more buffer space is used on the Node device fabric ports, less buffer space is available for the Node device access ports, and a lower total number of lossless flows are supported.

The QFabric system supports six lossless priorities (forwarding classes) under most conditions. The priority group headroom that remains after allocating headroom to lossless flows is sufficient to support best-effort and multidestination traffic.

Table 120 on page 1248 shows how many lossless priorities the QFabric system supports under different conditions (fiber cable lengths and MTUs) in cases when the QFabric system supports fewer than six lossless priorities. The number of lossless priorities is the same regardless of how many Node device FTE ports are connected to the Interconnect device. However, the higher the number of FTE ports connected to the Interconnect device, the lower the number of total lossless flows supported. In all cases that are not shown in Table 120 on page 1248, the QFabric system supports six lossless priorities.

NOTE: The system does not perform a configuration commit check that compares available system resources with the number of lossless forwarding classes configured. If you commit a configuration with more lossless forwarding classes than the system resources can support, frames in lossless forwarding classes might be dropped.

Table 120: Lossless Priority (Forwarding Class) Support for QFX3500 and QFX3600 Node Devices When Fewer than Six Lossless Priorities Are Supported

MTU in Bytes	Fiber Cable Length in Meters (Approximate)	Maximum Number of Lossless Priorities (Forwarding Classes) on the Node Device
9216 (9K)	100	5
9216 (9K)	150	5

NOTE: The total number of lossless flows decreases as resource consumption increases. For a Node device, the higher the number of FTE ports connected to the Interconnect device, the larger the MTU, and the longer the fiber cable length, the fewer total lossless flows the QFabric system can support.

Viewing Fabric Forwarding Class Set Information

You can display information about fabric fc-sets using the same CLI command you use to display information about Node device fc-sets:

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: fabric_fcset_be, Type: fabric-type, Forwarding class set
index: 1
  Forwarding class                        Index
  best-effort                               0

Forwarding class set: fabric_fcset_mcast1, Type: fabric-type, Forwarding class
set index: 5
  Forwarding class                        Index
  mcast                                     8
```

```
Forwarding class set: fabric_fcset_mcast2, Type: fabric-type, Forwarding class
set index: 6

Forwarding class set: fabric_fcset_mcast3, Type: fabric-type, Forwarding class
set index: 7

Forwarding class set: fabric_fcset_mcast4, Type: fabric-type, Forwarding class
set index: 8

Forwarding class set: fabric_fcset_noloss1, Type: fabric-type, Forwarding class
set index: 2
  Forwarding class                      Index
  fcoe                                    1

Forwarding class set: fabric_fcset_noloss2, Type: fabric-type, Forwarding class
set index: 3
  Forwarding class                      Index
  no-loss                                 2

Forwarding class set: fabric_fcset_noloss3, Type: fabric-type, Forwarding class
set index: 9

Forwarding class set: fabric_fcset_noloss4, Type: fabric-type, Forwarding class
set index: 10

Forwarding class set: fabric_fcset_noloss5, Type: fabric-type, Forwarding class
set index: 11

Forwarding class set: fabric_fcset_noloss6, Type: fabric-type, Forwarding class
set index: 12

Forwarding class set: fabric_fcset_strict_high, Type: fabric-type, Forwarding
class set index: 4
  Forwarding class                      Index
  network-control                         3
```

Table 121 on page 1249 describes the meaning of the **show class-of-service forwarding-class-set** output fields when you display fabric fc-set information.

Table 121: show class-of-service forwarding-class-set Command Output Fields

Field Name	Field Description
Forwarding class set	Name of the fabric forwarding class set.
Type	Type of forwarding class set: • Fabric-type—Fabric fc-set • Normal-type—Node device fc-set
Forwarding class set index	Index of this forwarding class set.
Forwarding class	Name of a forwarding class.
Index	Index of the forwarding class.

Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences

Table 122 on page 1250 summarizes the differences between fabric fc-sets and Node device fc-sets:

Table 122: Summary of Differences Between Fabric fc-sets and Node Device fc-sets

Characteristic	Fabric fc-set	Node device fc-set
Location	QFX3008-I or QFX3600-I Interconnect device (the fabric).	QFabric system Node device.
Global or Node-device specific	Global, valid for the entire fabric.	Local to the Node device on which the fc-set is configured.
Ability to create (define) a new fc-set	No. Use the 12 default fabric fc-sets provided.	Yes.
Ability to configure CoS	Default CoS settings only. CoS is not user-configurable.	User-configurable using traffic control profiles.
Ability to map forwarding classes to an fc-set	Yes. Mapping is global and applies to all forwarding classes across Interconnect device fabric (traffic from all connected Node devices).	Yes. Mapping is local to a Node device and applies only to the forwarding classes on the Node device.

Licenses

- Junos OS Feature Licenses on page 1250
- Software Features That Require Licenses on the QFX Series on page 1251
- Junos OS License Keys on page 1253

Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that

corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

Software Features That Require Licenses on the QFX Series

The following Junos OS features require an Advanced Feature License (AFL) on QFX Series devices:

NOTE: If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- Multiprotocol Label Switching (MPLS)
- Fibre Channel support

Table 39 on page 87 lists the licenses you can purchase for each QFX Series software feature.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

Table 123: Junos OS Feature Licenses and Model Numbers for QFX Series Devices

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multiprotocol Label Switching (MPLS)	QFX3500, QFX3600, and QFX5100 switch	One per switch	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB

Junos OS License Keys

Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity. Table 40 on page 89 displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

Table 124: Upgrade Licenses for Enhancing Port Capacity

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 • 1/MIC0	f1—MX5 to MX10 upgrade	Slot 1 and 2 • 1/MIC0 • 1/MIC1
MX10	40G	0x555	Slot 1 and 2 • 1/MIC0 • 1/MIC1	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 • 1/MIC1 • First 2 ports on 0/MIC0
MX40	60G	0x554	Slot 1, SLot 2 and first 2 ports on Slot 0 • 1/MIC0 • 1/MIC1 • First 2 ports on 0/MIC0	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 • 1/MIC1 • All 4 ports on 0/MIC0

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
  - An f1 feature ID on an MX10 upgrade license key rejects the license.
  - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

QFabric System Initial and Default Configuration Information

Once you install the hardware for the QFabric system, you can configure the Junos operating system (Junos OS) to begin using the system. This topic discusses which setup activities you need to perform and which activities are handled automatically by the QFabric system.

The fabric manager Routing Engine in the Director group automatically handles some of the initial setup activities, including:

- Assignment of IP addresses and unique identifiers to each QFabric system component by way of the management control plane
- Inclusion of all QFabric system devices within the default partition
- Establishment of interdevice communication and connectivity through the use of a fabric provisioning protocol and a fabric management protocol

The initial configuration tasks you need to perform to bring up the QFabric system and make it operational include:

- Converting any standalone devices, such as QFX3500 and QFX3600 devices, to Node device mode (see "Converting the Device Mode for a QFabric System Component" on page 1258)
- Setting up the QFabric system control plane cabling, topology, and configuration
  - To set up the control plane cabling, topology, and configuration for the QFX3000-G QFabric system, see "Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane" on page 1263.
  - To set up a copper or fiber-based control plane cabling, topology, and configuration for the QFX3000-M QFabric system, see "Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane" on page 1309.
- Accessing the Director group through a console connection, turning on the devices, and running through the initial setup script (see "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335), which prompts you to:
  - Set IP addresses for the Director devices in the Director group.
  - Set an IP address for the default partition.
  - Add the software serial number for your QFabric system. (Review the e-mail containing the software serial number that you received from Juniper Networks when you purchased your QFabric system.)
  - Set the starting MAC address and the range of MAC addresses for the QFabric system. (See "Generating the MAC Address Range for a QFabric System" on page 1334 for this information.)
  - Set a root password for the Director devices.
  - Set a root password for the QFabric system components, such as Node devices, Interconnect devices, and infrastructure.
- Logging into the default partition by using the IP address you configured when you ran the Director group initial setup script (See "Gaining Access to the QFabric System Through the Default Partition" on page 1344)
- Configuring basic system settings for the default partition, such as time, location, and default gateways

NOTE: **Unlike other Juniper Networks devices that run Junos OS, a QFabric system does not have a default factory configuration (containing the basic configuration settings for system logging, interfaces, protocols, and so on) that is loaded when you first install and power on the Director devices. Therefore, you must configure all the settings required for your QFabric system through the default partition CLI.**

- Configuring aliases for Node devices (see "Configuring Aliases for the QFabric System" on page 1353)

- Configuring VLANs and interfaces for the QFabric system devices
- Configuring redundant server Node groups to provide resiliency for server and storage connections (see "Configuring Node Groups for the QFabric System" on page 1363)
- Configuring a network Node group to connect the QFabric system to external networks (see "Configuring Node Groups for the QFabric System" on page 1363)
- Configuring the port type on QFX3600 Node devices (see "Configuring the Port Type on QFX3600 Node Devices" on page 1367)
- Configuring routing protocols to run on the network Node group interfaces and reach external networks

NOTE: **When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.**

- Generating and adding the license keys for the QFabric system (see "Generating the License Keys for a QFabric System" on page 91 and "Adding New Licenses (CLI Procedure)" on page 93)

Converting the Device Mode for a QFabric System Component

You can configure some devices to act as a standalone switch or participate in a QFabric system in a particular role. To change the role of your device, you must set the device mode. Table 125 on page 1258 shows the device modes available for various devices.

Table 125: Support for device mode options

Device mode	QFX3500	QFX3600
Interconnect device	N/A	•
Node device	•	•
Standalone	•	•

To convert a device to a different mode, issue the **request chassis device-mode** command and specify the desired device mode. You verify the current and future device mode with the **show chassis device-mode** command.

When you convert a device from standalone mode to either Node device or Interconnect device mode, the software prepares the device to be configured automatically by the QFabric system. However, changing the device mode erases all configuration data on the device.

NOTE: The QFX3600 switch requires Jloader Release 1.1.8 before you can convert the switch to Interconnect device mode. For more information, see: Jloader 1.1.8 Release for QFX-Series Platforms.

CAUTION: We recommend that you back up your device configuration to an external location before converting a device to a different device mode.

The following procedures illustrate the conversion options available when you modify a device mode:

- Convert from standalone switch mode to Node device mode
- Convert from Node device mode to Interconnect device mode
- Convert from Interconnect device mode to Node device mode
- Convert from Node device mode or Interconnect device mode to standalone switch mode

Standalone Switch to Node Device

To convert your device from standalone mode to Node device mode, follow these steps:

1. Connect to your standalone device through the console port and log in as the root user.
2. Upgrade the software on your standalone device to a QFabric system Node and Interconnect device software package that matches the QFabric system complete software package used by your QFabric system. For example, if the complete software package for your QFabric system is named **jinstall-qfabric-11.3X30.6.rpm**, you need to install the **jinstall-qfx-11.3X30.6-domestic-signed.tgz** package on your standalone device. Matching the two software packages ensures a smooth and successful addition of the device to the QFabric system inventory.

   ```
   root@switch# request system software add software-package-name reboot
   ```
3. Back up your device configuration to an external location.

   ```
   root@switch# save configuration-name external-path
   ```
4. Check the current device mode by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Standalone
   Future device-mode after reboot : Standalone
   ```
5. Issue the **request chassis device-mode** command and select the desired device mode.

   ```
   root@switch> request chassis device-mode node-device
   Device mode set to 'node-device' mode.
   Please reboot the system to complete the process.
   ```
6. Verify the future device mode by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Standalone
   Future device-mode after reboot : Node-device
   ```
7. Reboot the device.

   ```
   root@switch> request system reboot
   Reboot the system ? [yes,no] (no) yes

   Shutdown NOW!
   [pid 34992]

   root@switch>

   *** FINAL System shutdown message from root@switch ***
   System going down IMMEDIATELY
   ```
8. Verify that the new device mode has been enabled by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Node-device
   Future device-mode after reboot : Node-device
   ```
9. To enable a converted device to participate in the QFabric system, locate the applicable network cables for your device and connect the device ports to the control plane and data plane.
10. (Optional) If you change the device back from Node device mode to standalone mode, restore the saved backup configuration from your external location.

```
root@switch# load configuration-name external-path
```

Node Device to Interconnect Device

To convert your device from Node device mode to Interconnect device mode, follow these steps:

1. From the default partition CLI prompt, back up your QFabric system configuration to an external location.

   ```
   user@qfabric# save configuration-name external-path
   ```

2. Connect to your device through the console port and log in as the root user.
3. Check the current device mode by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Node-device
   Future device-mode after reboot : Node-device
   ```

4. Issue the **request chassis device-mode** command and select the desired device mode.

   ```
   root@switch> request chassis device-mode interconnect-device
   Device mode set to 'interconnect-device' mode.
   Please reboot the system to complete the process.
   ```

5. Verify the future device mode by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Node-device
   Future device-mode after reboot : Interconnect-device
   ```

6. Reboot the device.

   ```
   root@switch> request system reboot
   Reboot the system ? [yes,no] (no) yes

   Shutdown NOW!
   [pid 34992]

   root@switch>

   *** FINAL System shutdown message from root@switch ***
   System going down IMMEDIATELY
   ```

7. Verify that the new device mode has been enabled by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Interconnect-device
   Future device-mode after reboot : Interconnect-device
   ```

8. To enable a converted device to participate in the QFabric system in its new role, move the device to a different rack (as needed), locate the applicable network cables for your device, connect the device ports to the control plane and data plane per the design for your specific QFabric system, and reconfigure any aliases for the device at the QFabric default partition CLI prompt.

Interconnect Device to Node Device

To convert your device from Interconnect device mode to Node device mode, follow these steps:

1. From the default partition CLI prompt, back up your QFabric system configuration to an external location.

   ```
   user@qfabric# save configuration-name external-path
   ```

2. Connect to your device through the console port and log in as the root user.
3. Check the current device mode by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Interconnect-device
   Future device-mode after reboot : Interconnect-device
   ```

4. Issue the **request chassis device-mode** command and select the desired device mode.

   ```
   root@switch> request chassis device-mode node-device
   Device mode set to 'node-device' mode.
   Please reboot the system to complete the process.
   ```

5. Verify the future device mode by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Interconnect-device
   Future device-mode after reboot : Node-device
   ```

6. Reboot the device.

   ```
   root@switch> request system reboot
   Reboot the system ? [yes,no] (no) yes

   Shutdown NOW!
   [pid 34992]

   root@switch>

   *** FINAL System shutdown message from root@switch ***
   System going down IMMEDIATELY
   ```

7. Verify that the new device mode has been enabled by issuing the **show chassis device-mode** command.

   ```
   root@switch> show chassis device-mode
   Current device-mode : Node-device
   Future device-mode after reboot : Node-device
   ```

8. To enable a converted device to participate in the QFabric system in its new role, move the device to a different rack (as needed), locate the applicable network cables for your device, connect the device ports to the control plane and data plane per the design for your specific QFabric system, and reconfigure any aliases for the device at the QFabric default partition CLI prompt.

QFabric Component (Interconnect or Node Device) to Standalone Switch

To convert your QFabric component from either Interconnect device mode or Node device mode to standalone switch mode, follow these steps:

1. From the default partition CLI prompt, back up your QFabric system configuration to an external location.

   ```
   user@qfabric# save configuration-name external-path
   ```

2. Connect to the desired QFabric component through the console port of the device and log in as the root user.

3. Check the current device mode by issuing the **show chassis device-mode** command.

   ```
   root@node1> show chassis device-mode
   Current device-mode : Node-device
   Future device-mode after reboot : Node-device
   ```

4. Issue the **request chassis device-mode standalone** command to convert the component to standalone switch mode, while the component is still connected to the QFabric system.

   ```
   root@node1> request chassis device-mode standalone
   Device mode set to 'standalone' mode.
   Please reboot the system to complete the process.
   ```

   

   NOTE: Always convert the device mode to standalone before you remove the component from the QFabric system. If you remove the component from the QFabric system before converting the device mode to standalone, the switch might not operate properly. For example, the output of the show chassis hardware command might display no FPCs or interfaces for the switch.

5. Verify the future device mode by issuing the **show chassis device-mode** command.

   ```
   root@node1> show chassis device-mode
   Current device-mode : Node-device
   Future device-mode after reboot : Standalone
   ```

6. Reboot the component to complete the conversion process.

   ```
   root@node1> request system reboot
   Reboot the system ? [yes,no] (no) yes

   Shutdown NOW!
   [pid 34992]

   root@node1>

   *** FINAL System shutdown message from root@node1 ***
   System going down IMMEDIATELY
   ```

7. Disconnect and remove the component from the QFabric system. You may now operate the device as a standalone switch.

Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane

This example shows you how to connect QFabric system components and configure the Virtual Chassis used by the QFX3000-G QFabric system control plane network. Proper wiring of Director devices, Interconnect devices, and Node devices to the Virtual Chassis, combined with a standard configuration, enables you to bring up the internal QFabric system management network and prepare your QFabric system for full operation.

- Verification on page 1291

Requirements

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
- Eight EX4200-48T switches, used to make two redundant Virtual Chassis with four members apiece

- Junos OS Release 12.1R1.10 for the EX Series switches used in the Virtual Chassis
- Junos OS Release 12.2 for the QFX Series

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3008-I Interconnect Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your Virtual Chassis hardware (EX4200 switches). For more information, see *Installing and Connecting an EX4200 Switch*.
- Create two Virtual Chassis of four members each. For more information, see *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*.

Overview

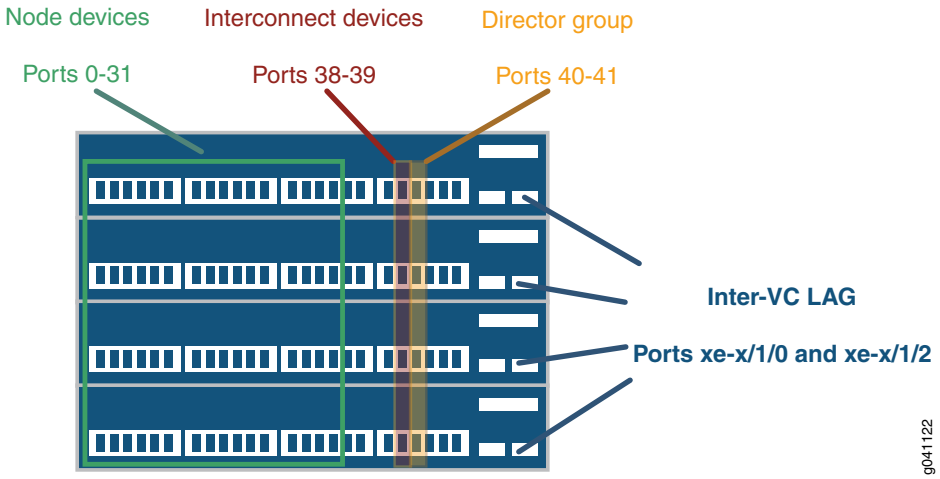
The QFX3000-G QFabric system control plane network connects the Director group, Interconnect devices, and Node devices in a QFabric system across a pair of redundant Virtual Chassis. By separating the management control plane from the data plane, the QFabric system can scale efficiently. The control plane network uses Gigabit Ethernet cabling and connections between components, and a 10-Gigabit Ethernet backbone between the redundant Virtual Chassis.

Specific ports have been reserved on the Virtual Chassis to connect to each of the QFabric system device types. Such design simplifies installation and facilitates timely deployment of a QFabric system. It also permits the use of a standard Virtual Chassis configuration included as part of this example. The standard configuration can scale from the minimum topology of eight Node devices shown in this example to the maximum of 128 Node devices for a fully implemented QFX3000-G QFabric system.

Topology

Figure 26 on page 1265 shows the general port ranges where QFabric system devices must be connected to the Virtual Chassis. For each Virtual Chassis member, connect ports 0 through 31 to Node devices, ports 38 and 39 to Interconnect devices, and ports 40 and 41 to Director devices. Table 126 on page 1265 shows the details of the QFabric system device-to-Virtual Chassis port mappings.

Figure 26: QFX3000-G QFabric System Control Plane—Virtual Chassis Port Ranges



CAUTION:

- The control plane network within a QFabric system should be considered a critical component of the system that should not be shared with other network traffic. In order to scale efficiently, the control plane network must be reserved for the QFabric system and its components. As a result, the ports of the QFabric system control plane must never be used for any purpose other than to transport QFabric system control plane traffic, and we neither recommend nor support the connection of other devices to the QFabric system control plane network.
- Do not install Junos Space and AI-Scripts (AIS) on the control plane network Virtual Chassis in a QFX3000-G QFabric system.

NOTE: Not all port numbers are represented in Table 126 on page 1265, and ports 32 through 37 and ports 42 through 47 are reserved for future uses.

Table 126 on page 1265 shows the specific mappings of QFabric system control plane network ports from the Virtual Chassis to the QFabric system components.

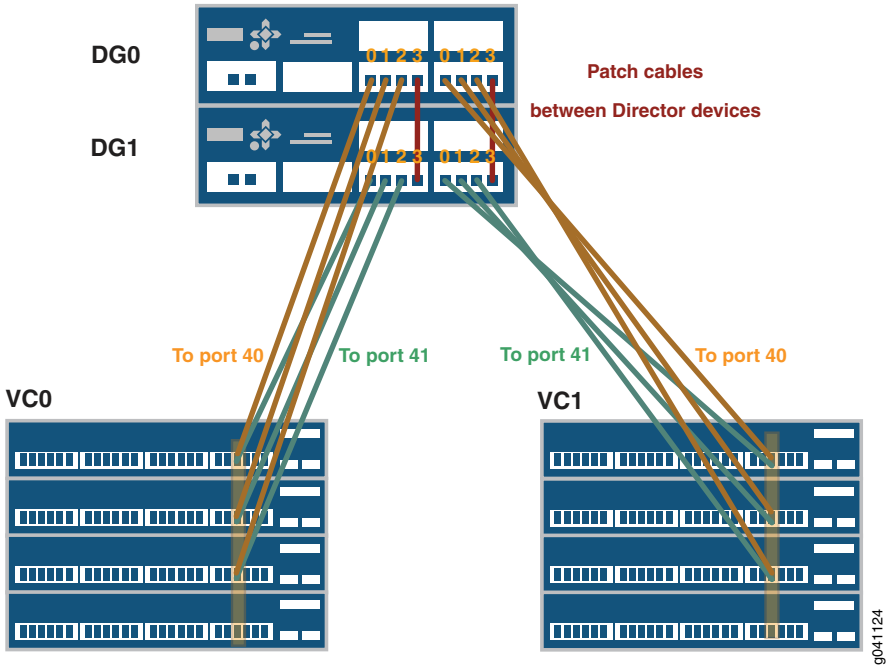
Next, connect the Director devices to the Virtual Chassis. In general, you want to accomplish the following:

- Connect three ports from one network module in a Director device to the first Virtual Chassis, and three ports from the second network module to the second Virtual Chassis. You need to repeat these connections from the second Director device to both Virtual Chassis to provide resiliency for the system.
- Connect the Director devices to each other and create a Director group. You can use either straight-through RJ-45 patch cables or crossover cables, because the Director devices contain autosensing modules. Connect one port from each network module on the first Director device to one port in each network module on the second Director device.

Figure 27 on page 1270 shows the specific ports on the Director group that you must connect to the Virtual Chassis and interconnect between the Director devices.

Figure 27: QFX3000-G QFabric System Control Plane—Director Group to Virtual Chassis Connections



In this specific example, connect ports 0, 1, and 2 from module 0 on Director device DG0 to port 40 on Virtual Chassis VC0 (ge-0/0/40, ge-1/0/40, and ge-2/0/40), and connect ports 0, 1, and 2 from module 1 to port 40 on Virtual Chassis VC1 (ge-0/0/40, ge-1/0/40, and ge-2/0/40).

For Director device DG1, connect ports 0, 1, and 2 from module 0 to port 41 on Virtual Chassis VC0 (ge-0/0/41, ge-1/0/41, and ge-2/0/41), and connect ports 0, 1, and 2 from module 1 to port 41 on Virtual Chassis VC1 (ge-0/0/41, ge-1/0/41, and ge-2/0/41).

To form the Director group, connect module 0, port 3 on Director device DG0 to module 0, port 3 on Director device DG1. Similarly, connect module 1, port 3 on Director device DG0 to module 1, port 3 on Director device DG1. Table 127 on page 1270 shows the port mappings for the Director group in this example.

Table 127: Director Group Port Mappings

Director Device	Virtual Chassis VC0	Virtual Chassis VC1
DG0	• Module 0, port 0 to ge-0/0/40 on VC0 • Module 0, port 1 to ge-1/0/40 on VC0 • Module 0, port 2 to ge-2/0/40 on VC0 • Module 0, port 3 to module 0, port 3 on DG1	• Module 1, port 0 to ge-0/0/40 on VC1 • Module 1, port 1 to ge-1/0/40 on VC1 • Module 1, port 2 to ge-2/0/40 on VC1 • Module 1, port 3 to module 1, port 3 on DG1

Table 127: Director Group Port Mappings *(continued)*

Director Device	Virtual Chassis VC0	Virtual Chassis VC1
DG1	• Module 0, port 0 to ge-0/0/41 on VC0 • Module 0, port 1 to ge-1/0/41 on VC0 • Module 0, port 2 to ge-2/0/41 on VC0 • Module 0, port 3 to module 0, port 3 on DG0	• Module 1, port 0 to ge-0/0/41 on VC1 • Module 1, port 1 to ge-1/0/41 on VC1 • Module 1, port 2 to ge-2/0/41 on VC1 • Module 1, port 3 to module 1, port 3 on DG0

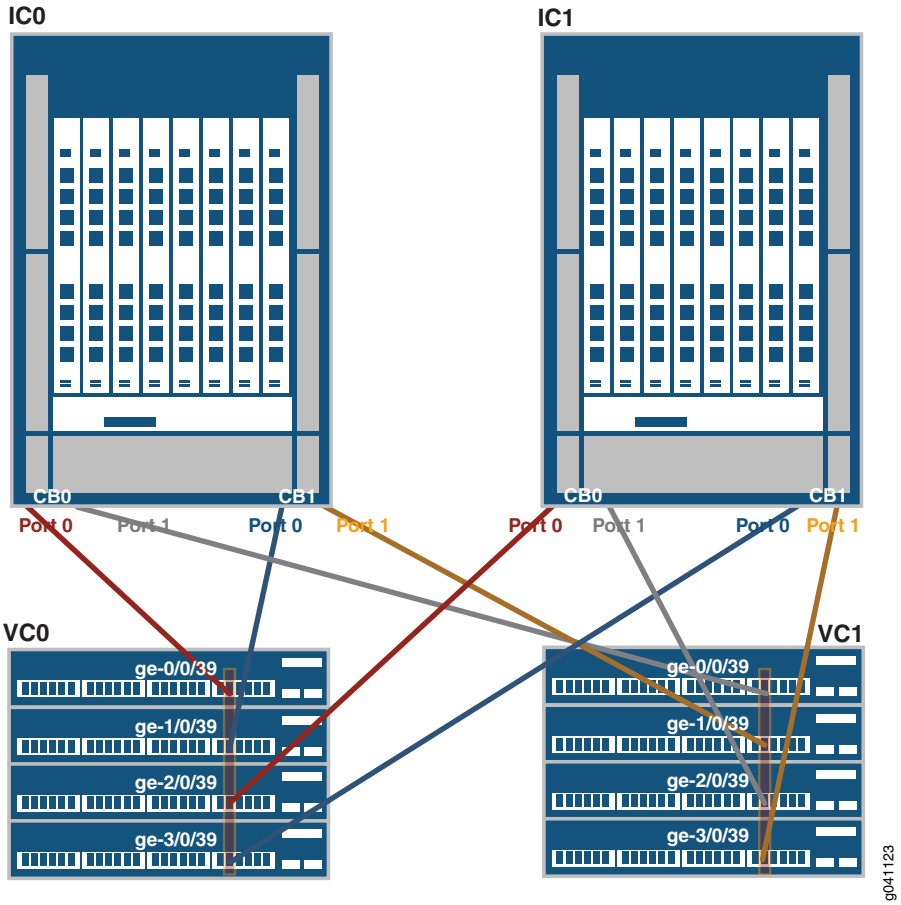
In the software, the ports of each network module are reversed, numbered from right to left, and incremented sequentially across modules. If you issue interface operational commands directly on the Director device, please note the following port mappings as shown in Table 128 on page 1271:

Table 128: Hardware to Software Port Mappings for Director Device Network Modules

Network Module	Port 0	Port 1	Port 2	Port 3
Module 0	eth5	eth4	eth3	eth2
Module 1	eth9	eth8	eth7	eth6

Figure 28 on page 1272 shows the specific ports on the Interconnect devices that you must connect to the Virtual Chassis. In general, connect one port from each Control Board module in an Interconnect device to the first Virtual Chassis, and a second port from each Control Board module to the second Virtual Chassis.

Figure 28: QFX3000-G QFabric System Control Plane—Interconnect Device to Virtual Chassis Connections



In this specific example, for both Interconnect devices IC0 and IC1, connect port 0 from CB0 and CB1 to Virtual Chassis VC0 and port 1 from CB0 and CB1 to Virtual Chassis VC1. Connect the port 0 cables to port 39 on Virtual Chassis VC0 (ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39), and connect the port 1 cables to port 39 on Virtual Chassis VC1 (ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39). Table 129 on page 1272 shows the port mappings for the Interconnect devices in this example.

Table 129: Interconnect Device Port Mappings

Interconnect Device	Virtual Chassis VC0	Virtual Chassis VC1
IC0	• CB0, port 0 to ge-0/0/39 • CB1, port 0 to ge-1/0/39	• CB0, port 1 to ge-0/0/39 • CB1, port 1 to ge-1/0/39
IC1	• CB0, port 0 to ge-2/0/39 • CB1, port 0 to ge-3/0/39	• CB0, port 1 to ge-2/0/39 • CB1, port 1 to ge-3/0/39

As required, you can extend the number of Interconnect devices from two to four. For additional Interconnect devices IC2 and IC3, connect port 0 from CB0 and CB1 to Virtual

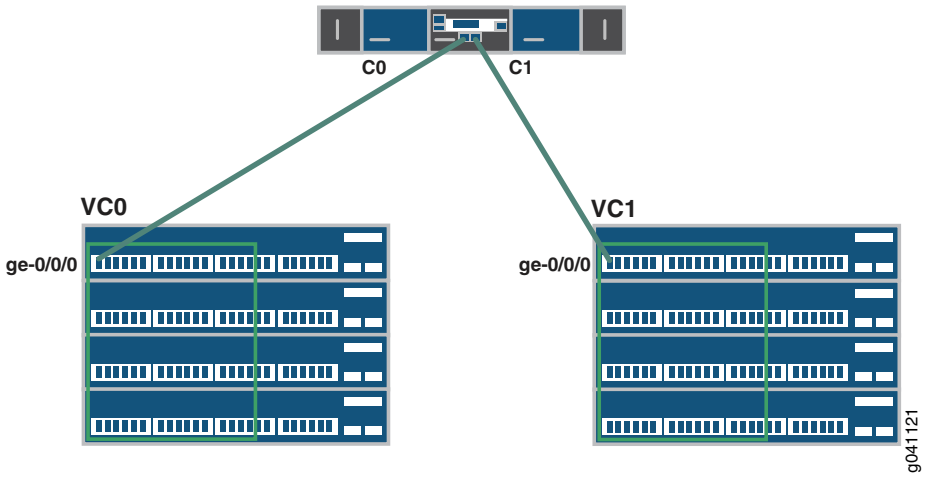
Chassis VC0 and port 1 from CB0 and CB1 to Virtual Chassis VC1. Connect the port 0 cables to port 38 on Virtual Chassis VC0 (ge-0/0/38, ge-1/0/38, ge-2/0/38, and ge-3/0/38), and connect the port 1 cables to port 38 on Virtual Chassis VC1 (ge-0/0/38, ge-1/0/38, ge-2/0/38, and ge-3/0/38). Table 130 on page 1273 shows the port mappings needed to extend the number of Interconnect devices in this example to four devices.

Table 130: Interconnect Device Port Mappings for Two Additional Devices

Interconnect Device	Virtual Chassis VC0	Virtual Chassis VC1
IC2	• CB0, port 0 to ge-0/0/38 • CB1, port 0 to ge-1/0/38	• CB0, port 1 to ge-0/0/38 • CB1, port 1 to ge-1/0/38
IC3	• CB0, port 0 to ge-2/0/38 • CB1, port 0 to ge-3/0/38	• CB0, port 1 to ge-2/0/38 • CB1, port 1 to ge-3/0/38

Figure 29 on page 1273 shows the specific ports on the Node devices that you must connect to the Virtual Chassis. In general, connect the first management port from a Node device to the first Virtual Chassis, and the second management port to the second Virtual Chassis.

Figure 29: QFX3000-G QFabric System Control Plane—Node Device to Virtual Chassis Connections



In this specific example, for Node device Node0, connect port C0 (also known as me0) to Virtual Chassis VC0 port ge-0/0/0, and connect port C1 (also known as me1) to Virtual Chassis VC1 port ge-0/0/0.

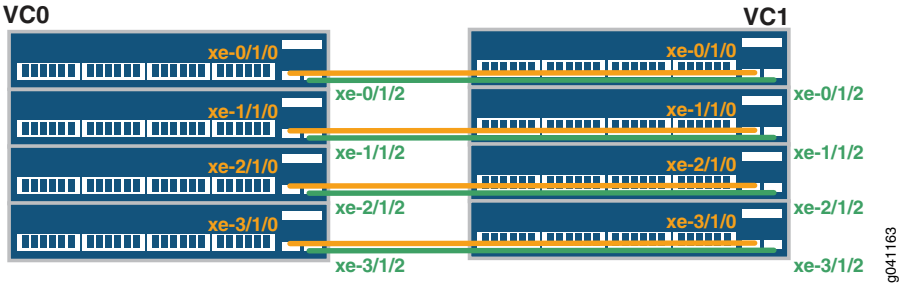
For the remaining seven Node devices, connect port C0 to the ge-0/0/*X* port on Virtual Chassis VC0 that matches the Node device number. Similarly, connect port C1 to the port on Virtual Chassis VC1 that matches the Node device number. For example, you would connect Node device Node5 to port ge-0/0/5. Table 131 on page 1274 shows the full set of port mappings for the Node devices in this example.

Table 131: Node Device Port Mappings

Node Device	Virtual Chassis VC0	Virtual Chassis VC1
Node0	C0 to ge-0/0/0	C1 to ge-0/0/0
Node1	C0 to ge-0/0/1	C1 to ge-0/0/1
Node2	C0 to ge-0/0/2	C1 to ge-0/0/2
Node3	C0 to ge-0/0/3	C1 to ge-0/0/3
Node4	C0 to ge-0/0/4	C1 to ge-0/0/4
Node5	C0 to ge-0/0/5	C1 to ge-0/0/5
Node6	C0 to ge-0/0/6	C1 to ge-0/0/6
Node7	C0 to ge-0/0/7	C1 to ge-0/0/7

Figure 30 on page 1274 shows the specific ports on the members of the first Virtual Chassis that you must connect to the members of the second Virtual Chassis. These connections create a link aggregation bundle (LAG) that provides redundancy and resiliency for the Virtual Chassis portion of the control plane. In general, connect each 10-Gigabit Ethernet uplink port from the first Virtual Chassis to the corresponding 10-Gigabit Ethernet uplink port on the second Virtual Chassis.

Figure 30: QFX3000-G QFabric System Control Plane—Inter-Virtual Chassis LAG Connections



In this specific example, for Virtual Chassis VC0, connect port xe-0/1/0 to Virtual Chassis VC1 port xe-0/1/0. For the remaining seven 10-Gigabit Ethernet uplink ports, connect each port from VC0 to the corresponding port on VC1. For example, you would connect the xe-2/1/2 port on VC0 to port xe-2/1/2 on VC1, and so on.

Table 132 on page 1275 shows the full set of port mappings for the Virtual Chassis LAG connections in this example.

Table 132: Virtual Chassis LAG Port Mappings

VC0 and VC1	Member 0	Member 1	Member 2	Member 3
Uplink port 0	xe-0/1/0 to xe-0/1/0	xe-1/1/0 to xe-1/1/0	xe-2/1/0 to xe-2/1/0	xe-3/1/0 to xe-3/1/0
Uplink port 2	xe-0/1/2 to xe-0/1/2	xe-1/1/2 to xe-1/1/2	xe-2/1/2 to xe-2/1/2	xe-3/1/2 to xe-3/1/2

Configuration

CLI Quick Configuration

To quickly configure the QFabric system control plane Virtual Chassis, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

NOTE: The configuration files for a QFabric system control plane network are also available for download from the QFX Series section of the Junos OS software download page at https://www.juniper.net/support/downloads/junos.html .

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a Virtual Chassis for the QFabric system control plane network:

1. Create a configuration group to define global QFabric system control plane properties. Enable commit synchronization and graceful switchover, set up the number of aggregated Ethernet devices, configure alarm and LCD management, activate loop prevention, nonstop bridging, and storm control, configure Link Layer Discovery Protocol (LLDP), specify a global VLAN (VLAN100) and 802.1q tunneling, define options for aggregated Ethernet interfaces, and enable the uplink module for 10-Gigabit Ethernet operation.

   Enable class of service (CoS) for the QFabric system control plane network. Establish forwarding classes, priorities, scheduler maps, classifiers, and queues for three types of traffic: control traffic, interdevice traffic, and best-effort traffic. Apply the qfabric group settings to the configuration.

```

2. Configure interfaces for the QFabric system control plane network. Set the interface ranges where Node devices (0 through 31), Interconnect devices (38 and 39), and Director devices (40 and 41) connect to the control plane network through the Virtual Chassis. Configure the inter-Virtual Chassis LAG connections for the ae8 interface and apply the ae-interfaces configuration group to the remaining aggregated Ethernet interfaces (ae0 through ae7).

```

3. Configure settings to enable the Virtual Chassis to interoperate with your management network. Set a hostname, system services (such as Telnet), system log thresholds, management interface parameters, default routes, Virtual Chassis preprovisioning, and any additional preferences you might have.

```
[edit]
user@switch# set system host-name qfabric-control-plane

```

Results To view the configuration, issue the **show** command in configuration mode or the **show configuration** command in operational mode. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

The following configuration is the standard configuration that applies universally to both Virtual Chassis in your QFabric system control plane network.

```

To verify the syntax of your configuration before committing it, enter **commit check** from configuration mode. If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the Virtual Chassis configuration is working properly.

- Verifying the QFabric System Control Plane—Virtual Chassis VC0 on page 1291
- Verifying the QFabric System Control Plane—Virtual Chassis VC1 on page 1299

Verifying the QFabric System Control Plane—Virtual Chassis VC0

Purpose Verify that your first Virtual Chassis is operational.

Action Connect to the Junos OS CLI of Virtual Chassis VC0, either from your management network or from the console port of the master Virtual Chassis member. In operational mode, enter the **show virtual-chassis status** and **show interfaces terse** commands.

Sample Output

```
{master:0}
user@vc0> show virtual-chassis status

Virtual Chassis ID: c809.2c5d.9f7b

Meaning In the output of the **show virtual-chassis status** command, if all four members appear, the Virtual Chassis is operational.

In the output of the **show interfaces terse** command, if all interfaces that connect to the QFabric system devices are listed as up (such as ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39 for the Interconnect devices; ge-0/0/40, ge-1/0/40, and ge-2/0/40 for the Director devices; ge-0/0/0 through ge-0/0/7 for the Node devices; and xe-0/1/0, xe-0/1/2, xe-1/1/0, xe-1/1/2, xe-2/1/0, xe-2/1/2, xe-3/1/0, and xe-3/1/2 for the inter-Virtual Chassis connections), the control plane is properly connected.

Verifying the QFabric System Control Plane—Virtual Chassis VC1

Purpose Verify that your second Virtual Chassis is operational.

Action Connect to the Junos OS CLI of Virtual Chassis VC1, either from your management network or from the console port of the master Virtual Chassis member. In operational mode, enter the **show virtual-chassis status** and **show interfaces terse** commands.

Sample Output

```
{master:0}
user@vc1> show virtual-chassis status

Virtual Chassis ID: c809.2c5d.9f8a

Meaning In the output of the **show virtual-chassis status** command, if all four members appear, the Virtual Chassis is operational.

In the output of the **show interfaces terse** command, if all interfaces that connect to the QFabric system devices are listed as up (such as ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39 for the Interconnect devices; ge-0/0/40, ge-1/0/40, and ge-2/0/40 for the Director devices; ge-0/0/0 through ge-0/0/7 for the Node devices; and xe-0/1/0, xe-0/1/2, xe-1/1/0, xe-1/1/2, xe-2/1/0, xe-2/1/2, xe-3/1/0, and xe-3/1/2 for the inter-Virtual Chassis connections), the control plane is properly connected.

Importing a QFX3000-G QFabric System Control Plane Virtual Chassis Configuration with a USB Flash Drive

There are two methods of importing the configuration file to the QFabric control plane Virtual Chassis. You can load the configuration file onto a USB flash drive from the Juniper Networks software download site before inserting the USB flash drive into the Virtual Chassis USB port, or you can copy and paste the configuration from the following example (see "Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane" on page 1263).

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3008-I Interconnect Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your Virtual Chassis hardware (EX4200 switches). For more information, see *Installing and Connecting an EX4200 Switch*.
- Create two Virtual Chassis of four members each. For more information, see *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*
- Select a USB flash drive that meets the QFabric control plane Virtual Chassis USB port specifications. See *USB Port Specifications for an EX Series Switch*.
- Use a computer or other device to load the configuration file from the Internet and copy it to the USB flash drive.

To import the Virtual Chassis configuration file into a USB flash drive:

1. In a browser, go to http://www.juniper.net/support/downloads/junos.html .

   The Junos Platforms Download Software page appears.

   NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

2. Click **QFX3100** in the **QFX Series** section.

   The QFX3100 Download Software page appears.

3. From the **Release** list, select the number of the software version for which you want to download the Virtual Chassis configuration file.

4. Select the **Software** tab and then click **QFX3000-G QFabric System - Control Plane Virtual Chassis Configuration** in the **QFabric System Install Package and Media** section.

   A login page appears.

5. Enter your user ID and password and press **Enter**.

6. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
7. Save the Virtual Chassis configuration file onto the USB flash drive using your computer or other device.
8. Remove the USB flash drive from the computer or other device.
9. Insert the USB flash drive into the USB port on the EX4200 switch.
10. Save the file to */var/home/username* .
11. Load the configuration file into the switch.

    user@switch# load override *filename*

12. Commit the configuration.

    user@switch# commit
    Load complete

13. Remove the USB flash drive from the switch.

Related Documentation

- Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane on page 1263

Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane

This example shows you how to connect QFabric system components and configure the EX4200 switches used for the copper-based QFX3000-M QFabric system control plane network. Proper wiring of Director devices, Interconnect devices, and Node devices to the EX4200 switches, combined with a standard configuration, enables you to bring up the internal QFabric system management network and prepare your QFabric system for full operation.

NOTE: The EX4200 switch configuration is the same for both the copper-based and fiber-based QFX3000-M QFabric system control plane networks. Hence, a separate example for configuring EX4200 switches for the fiber-based control plane network is not provided. However, before you use this example to configure a fiber-based control plane network, ensure that you have installed and wired the QFabric system hardware and EX4200 switches as required for a fiber-based control plane network (see *QFX3000-M QFabric System Installation Overview*).

- Requirements on page 1310
- Overview on page 1310
- Configuration on page 1317
- Verification on page 1329

Requirements

This example uses the following hardware and software components:

- One QFX3000-M QFabric system containing:
  - Two QFX3100 Director devices with 1000BASE-T network modules installed
  - Two QFX3600-I Interconnect devices
  - Eight QFX3500 Node devices with a 1000BASE-T management board installed
- Two EX4200-24T switches with SFP+ uplink module installed
- Junos OS Release 12.2 for the QFabric system
- Junos OS Release 12.1R1.10 for the EX Series switches

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3600 or QFX3600-I Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your EX4200 switches. For more information, see *Installing and Connecting an EX4200 Switch*.

Overview

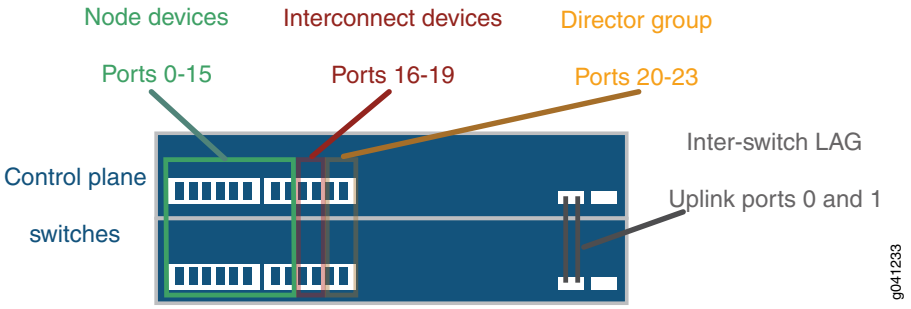
The QFX3000-M QFabric system control plane network connects the Director group, Interconnect devices, and Node devices in a QFabric system across a pair of redundant EX4200 switches. By separating the management control plane from the data plane, the QFabric system can scale efficiently. The copper-based control plane network uses Gigabit Ethernet cabling and connections between components, and two 1-Gigabit Ethernet connections configured in a link aggregation group (LAG) between the redundant EX4200 switches.

Specific ports have been reserved on the EX4200 switches to connect to each of the QFabric system device types. Such design simplifies installation and facilitates timely deployment of a QFabric system. It also permits the use of a standard EX4200 switch configuration included as part of this example. The standard configuration can scale from the 8 Node devices shown in this example to a maximum of 16 Node devices.

Topology

Figure 31 on page 1311 shows the general port ranges where QFabric system devices must be connected to the EX4200 switches. For each EX4200 switch, connect ports **0** through **15** to Node devices, ports **16** through **19** to Interconnect devices, and ports **20** through **23** to Director devices. Table 133 on page 1311 shows the details of the QFabric system component-to-EX4200 switch port mappings.

Figure 31: QFX3000-M QFabric System Control Plane—EX4200 Switch Port Ranges



CAUTION:

- The control plane network within a QFabric system is a critical component of the system that should not be shared with other network traffic. In order to scale efficiently, the control plane network must be reserved for the QFabric system and its components. As a result, the ports of the QFabric system control plane must never be used for any purpose other than to transport QFabric system control plane traffic, and we neither recommend nor support the connection of other devices to the QFabric system control plane network.
- Do not install Junos Space and AI-Scripts (AIS) on the control plane network EX4200 switches in a QFX3000-M QFabric system.

Table 133 on page 1311 shows the specific mappings of QFabric system control plane network ports from the QFabric system components to the EX4200 switches.

NOTE: The uplink ports 2 and 3 on the EX4200 switches are reserved for future use.

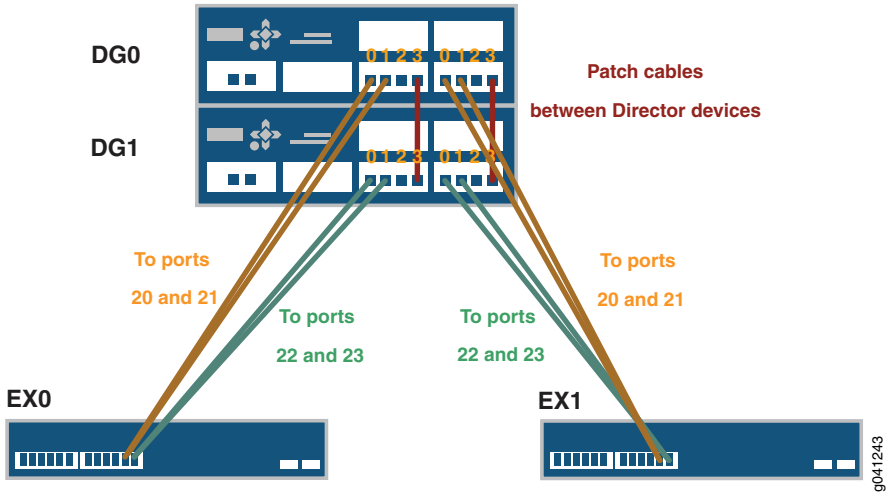
Reserved Uplink port **3** (ge-0/1/3)	Reserved Uplink port **3** (ge-0/1/3)	Future use

Next, connect the Director devices to the EX4200 switches. In general, you want to accomplish the following:

- Connect two ports from one network module in a Director device to the first EX4200 switch, and two ports from the second network module to the second EX4200 switch.
- Connect the Director devices to each other and create a Director group. You can use either straight-through RJ-45 patch cables or crossover cables, because the Director devices contain autosensing modules. Connect one port from each network module on the first Director device to one port in each network module on the second Director device.

Figure 32 on page 1314 shows the specific ports on the Director group that you must connect to the EX4200 switches and interconnect between the Director devices.

Figure 32: QFX3000-M QFabric System Control Plane—Director Group to EX4200 Switch Connections



In this specific example, connect ports **0** and **1** from module 0 on Director device DG0 to ports **20** and **21** on EX4200 switch EX0 (ge-0/0/20 and ge-0/0/21), and connect ports **0** and **1** from module 1 to ports **20** and **21** on the *second* EX4200 switch EX1 (ge-0/0/20 and ge-0/0/21).

For Director device DG1, connect ports **0** and **1** from module 0 to ports **22** and **23** on EX4200 switch EX0 (ge-0/0/22 and ge-0/0/23), and connect ports **0** and **1** from module 1 to ports **22** and **23** on the *second* EX4200 switch EX1 (ge-0/0/22 and ge-0/0/23).

To form the Director group, connect port **3** on module 0 on Director device DG0 to port **3** on module 0 on Director device DG1. Similarly, connect port **3** on module 1 on Director device DG0 to port **3** on module 1 on Director device DG1. Table 134 on page 1314 shows the port mappings for the Director group in this example.

Table 134: Director Group Port Mappings

Director Device	EX4200 Switch EX0	EX4200 Switch EX1
DG0	• DG0 module 0, port **0** to port **20** on EX0 (ge-0/0/20) • DG0 module 0, port **1** to port **21** on EX0 (ge-0/0/21) • DG0 module 0, port **3** to module 0, port **3** on DG1	• DG0 module 1, port **0** to port **20** on EX1 (ge-0/0/20) • DG0 module 1, port **1** to port **21** on EX1 (ge-0/0/21) • DG0 module 1, port **3** to module 1, port **3** on DG1
DG1	• DG1 module 0, port **0** to port **22** on EX0 (ge-0/0/22) • DG1 module 0, port **1** to port **23** on EX0 (ge-0/0/23) • DG1 module 0, port **3** to module 0, port **3** on DG0	• DG1 module 1, port **0** to port **22** on EX1 (ge-0/0/22) • DG1 module 1, port **1** to port **23** on EX1 (ge-0/0/23) • DG1 module 1, port **3** to module 1, port **3** on DG0

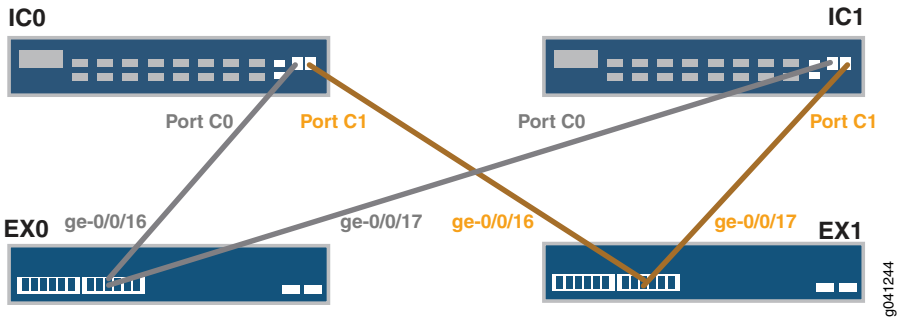
In the software, the ports of each network module on a Director device are reversed, numbered from right to left, and incremented sequentially across modules. If you issue interface operational commands directly on the Director device, note the following port mappings as shown in Table 128 on page 1271:

Table 135: Hardware to Software Port Mappings for Director Device Network Modules

Network Module	Port 0	Port 1	Port 2	Port 3
Module 0	eth5	eth4	eth3	eth2
Module 1	eth9	eth8	eth7	eth6

Figure 33 on page 1315 shows the specific ports on the QFX3600-I Interconnect devices that you must connect to the EX4200 switches. In general, connect the first management port in an Interconnect device to the first EX4200 switch, and the second management port to the second EX4200 switch.

Figure 33: QFX3000-M QFabric System Control Plane—Interconnect Device to EX4200 Switch Connections



In this specific example, for both Interconnect devices IC0 and IC1, connect management port **C0** to EX4200 switches EX0 and EX1 and management port **C1** to EX4200 switches EX0 and EX1. Connect the management port **C0** cables to port **16** on EX4200 switches EX0 and EX1 (ge-0/0/16), and connect the management port **C1** cables to port **17** on EX4200 switches EX0 and EX1 (ge-0/0/17). Table 136 on page 1315 shows the port mappings for the Node devices in this example.

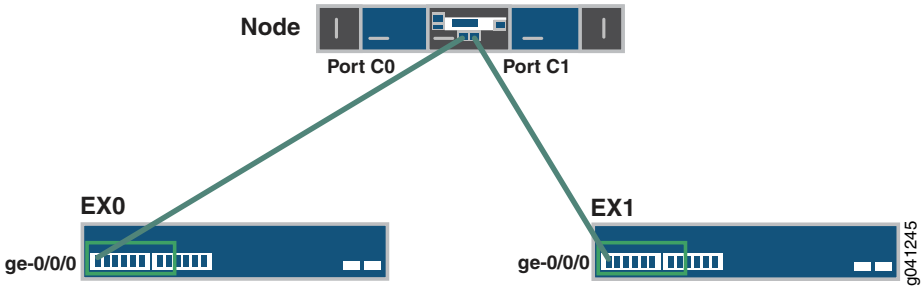
Table 136: Interconnect Device Port Mappings

Interconnect Device	EX4200 Switch EX0	EX4200 Switch EX1
IC0	IC0, management port **C0** to port **16** (ge-0/0/16)	IC0, management port **C1** to port **16** (ge-0/0/16)
IC1	IC1, management port **C0** to port **17** (ge-0/0/17)	IC1, management port **C1** to port **17** (ge-0/0/17)

Figure 34 on page 1316 shows the specific ports on the Node devices that you must connect to the EX4200 switches. In general, connect the first management port from a Node

device to the first EX4200 switch, and the second management port to the second EX4200 switch.

Figure 34: QFX3000-M QFabric System Control Plane—Node Device to EX4200 Switch Connections



In this specific example, for Node device Node0, connect management port **C0** (also known as me5) to EX4200 switch EX0 port **0** (ge-0/0/0), and connect management port **C1** (also known as me6) to the *second* EX4200 switch EX1 port **0** (ge-0/0/0).

For the remaining seven Node devices, connect management port **C0** to the *ge-0/0/X* port on EX4200 switch EX0 that matches the Node device number. Similarly, connect management port **C1** to the port on the *second* EX4200 switch EX1 that matches the Node device number. For example, you would connect Node device Node5 to port **5** (ge-0/0/5). Table 131 on page 1274 shows the full set of port mappings for the Node devices in this example.

Table 137: Node Device to EX4200 Switch Port Mappings

Node Device	EX4200 Switch EX0	EX4200 Switch EX1
Node0	Node0, management port **C0** to port **0** (ge-0/0/0)	Node0, management port **C1** to port **0** (ge-0/0/0)
Node1	Node1, management port **C0** to port **1** (ge-0/0/1)	Node1, management port **C1** to port **1** (ge-0/0/1)
Node2	Node2, management port **C0** to port **2** (ge-0/0/2)	Node2, management port **C1** to port **2** (ge-0/0/2)
Node3	Node3, management port **C0** to port **3** (ge-0/0/3)	Node3, management port **C1** to port **3** (ge-0/0/3)
Node4	Node4, management port **C0** to port **4** (ge-0/0/4)	Node4, management port **C1** to port **4** (ge-0/0/4)
Node5	Node5, management port **C0** to port **5** (ge-0/0/5)	Node5, management port **C1** to port **5** (ge-0/0/5)
Node6	Node6, management port **C0** to port **6** (ge-0/0/6)	Node6, management port **C1** to port **6** (ge-0/0/6)

Table 137: Node Device to EX4200 Switch Port Mappings *(continued)*

Node Device	EX4200 Switch EX0	EX4200 Switch EX1
Node7	Node7, management port **C0** to port **7** (ge-0/0/7)	Node7, management port **C1** to port **7** (ge-0/0/7)

Figure 30 on page 1274 shows the specific uplink ports on the first EX4200 switch that you must connect to the second EX4200 switch. These connections create a link aggregation group (LAG) that provides redundancy and resiliency for the EX4200 switch portion of the control plane. In general, connect each 1-Gigabit Ethernet uplink port from the first EX4200 switch to the corresponding 1-Gigabit Ethernet uplink port on the second EX4200 switch.

Figure 35: QFX3000-M QFabric System Control Plane—Inter-EX4200 Switch LAG Connections

In this specific example, for EX4200 switch EX0, connect uplink port **0** (ge-0/1/0) to EX4200 switch EX1 uplink port **0** (ge-0/1/0). Then connect uplink port **1** (ge-0/1/1) on EX4200 switch EX0 to uplink port **1** (ge-0/1/1) on EX4200 switch EX1.

Table 132 on page 1275 shows the port mappings for the EX4200 switch LAG connections in this example.

Table 138: EX4200 Switch LAG Port Mappings

EX0 and EX1	EX0	EX1
Uplink port **0**	ge-0/1/0 to ge-0/1/0	ge-0/1/0 to ge-0/1/0
Uplink port **1**	ge-0/1/1 to ge-0/1/1	ge-0/1/1 to ge-0/1/1

Configuration

CLI Quick Configuration

To configure the QFX3000-M QFabric system control plane EX4200 switches quickly, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network, and then copy and paste the commands into the EX4200 switch CLI at the **[edit]** hierarchy level.

```
set groups qfabric chassis aggregated-devices ethernet device-count 3
set groups qfabric chassis alarm management-ethernet link-down ignore
set groups qfabric chassis lcd-menu fpc 0 menu-item maintenance-menu disable
set groups qfabric protocols rstp interface ae2.0 mode point-to-point
set groups qfabric protocols rstp interface all edge
set groups qfabric protocols rstp interface all no-root-port
set groups qfabric protocols rstp bpdu-block-on-edge

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a EX4200 switch for the QFX3000-M QFabric system control plane network:

1. Create a configuration group called qfabric to define global QFabric system control plane properties. Set up the number of aggregated Ethernet devices, configure alarm and LCD management, activate loop prevention and storm control, specify a global VLAN (VLAN 100) and 802.1q tunneling, define options for aggregated Ethernet interfaces, and apply the qfabric group settings to the configuration.

   ```
   [edit]
   user@switch# set groups qfabric chassis aggregated-devices ethernet device-count
     3
   user@switch# set groups qfabric chassis alarm management-ethernet link-down
     ignore
   user@switch# set groups qfabric chassis lcd-menu fpc 0 menu-item
     maintenance-menu disable
   user@switch# set groups qfabric protocols rstp interface ae2.0 mode point-to-point
   user@switch# set groups qfabric protocols rstp interface all edge
   user@switch# set groups qfabric protocols rstp interface all no-root-port
   user@switch# set groups qfabric protocols rstp bpdu-block-on-edge
   user@switch# set groups qfabric protocols lldp interface all
   user@switch# set groups qfabric ethernet-switching-options storm-control interface
     all bandwidth 10000
   user@switch# set groups qfabric vlans qfabric vlan-id 100
   user@switch# set groups qfabric vlans qfabric dot1q-tunneling
   user@switch# set groups qfabric-int interfaces <*> mtu 9216
   user@switch# set groups qfabric-int interfaces <*> unit 0 family ethernet-switching
     port-mode access
   user@switch# set groups qfabric-int interfaces <*> unit 0 family ethernet-switching
     vlan members qfabric
   user@switch# set groups qfabric-ae interfaces <*> aggregated-ether-options
     link-speed 1g
   user@switch# set groups qfabric-ae interfaces <*> aggregated-ether-options lacp
     active
   user@switch# set apply-groups qfabric
   ```

2. Configure interfaces for the QFabric system control plane network. Enable the EX4200 switch SFP+ uplink module for 1-Gigabit Ethernet operation. Set the interface ranges where Node devices (0 through 15), Interconnect devices (16 and

17), and Director devices (20 through 23) connect to the control plane network through the EX4200 switches. Configure the inter-EX4200 switch LAG connections for the ae2 interface and apply the qfabric-int and qfabric-ae configuration groups to the aggregated Ethernet interfaces (ae0 and ae1) for the Director devices.

```

```

4. Configure settings to enable the EX4200 switches to interoperate with your management network. Set a hostname, system services (such as Telnet), system log thresholds, management interface parameters, default routes, and any additional preferences you might have.

```
[edit]
user@switch# set system host-name qfabric-control-plane
user@switch# set system services ssh
user@switch# set system services telnet
user@switch# set system services web-management http

```

Results To view the configuration, issue the **show** command in configuration mode or the **show configuration** command in operational mode. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

The following configuration is the standard configuration that applies universally to both EX4200 switches in your QFabric system control plane network.

```

To verify the syntax of your configuration prior to committing it, enter **commit check** from configuration mode. If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the EX4200 switch configuration is working properly.

- Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX0 on page 1329
- Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX1 on page 1331

Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX0

Purpose Verify that the control plane is properly connected on your first EX4200 switch.

Action Connect to the Junos OS CLI of EX4200 switch EX0, either from your management network or from the console port of the switch. In operational mode, enter the **show interfaces terse** command.

Sample Output

```
user@ex0> show interfaces terse
Interface               Admin Link   Proto    Local                 Remote

```

Meaning In the output of the **show interfaces terse** command, if all interfaces that connect to the QFabric system devices are listed as **up** (such as ge-0/0/16 and ge-0/0/17 for the Interconnect devices; ge-0/0/20 through ge-0/0/23 for the Director devices; ge-0/0/0

through ge-0/0/7 for the Node devices; and ge-0/1/0 and ge-0/1/1 for the inter-EX4200 switch connections), the control plane is properly connected.

Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX1

Purpose Verify that the control plane is properly connected on your second EX4200 switch.

Action Connect to the Junos OS CLI of EX4200 switch EX1, either from your management network or from the console port of the switch. In operational mode, enter the **show interfaces terse** command.

Sample Output

```
user@ex1> show interfaces terse
Interface               Admin Link   Proto    Local                 Remote

Importing a QFX3000-M QFabric System Control Plane EX4200 Switch Configuration with a USB Flash Drive

There are two methods of importing the configuration file to the QFX3000-M QFabric system control plane EX4200 switches.

- Download the configuration file onto a USB flash drive from the Juniper Networks software download site before inserting the USB flash drive into the EX4200 switch USB port
- Copy and paste the configuration from "Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane" on page 1309.

NOTE: **The EX4200 switch configuration is the same for both the copper-based and fiber-based QFX3000-M QFabric system control plane networks.**

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3600 or QFX3600-I Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your EX4200 switches for the QFabric system control plane. For more information, see *Installing and Connecting an EX4200 Switch*.
- Select a USB flash drive that meets the EX4200 switch USB port specifications. See *USB Port Specifications for an EX Series Switch*.
- Use a computer or other device to download the configuration file from the Internet and copy it to the USB flash drive.

To import the control plane EX4200 switch configuration file onto a USB flash drive:

1. In a browser, go to http://www.juniper.net/support/downloads/junos.html .

   The Junos Platforms - Download Software page appears.

   

   NOTE: **To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website** https://www.juniper.net/registration/Register.jsp .

2. In the QFX Series box, select **QFX3000-M QFabric System**.

   The QFX3000-M QFabric System - Download Software page appears.

3. Click the **Software** tab and select the software release number from the **Release** list that appears to the right of the Software tab.

A login screen appears.

4. In the QFabric System Control Plane Network section, select **QFX3000-M Control Plane Network Configuration**.

   A login screen appears.

5. Enter your user ID and password and click **Login**.
6. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
7. Save the configuration file onto the USB flash drive using your computer or other device.
8. Insert the USB flash drive into the USB port on the EX4200 switch.
9. Save the file to the **/var/home/*username*** directory on the EX4200 switch.
10. Load the configuration file into the switch.

    user@switch# load override *filename*

11. Commit the configuration.

    user@switch# commit
    Load complete

12. Remove the USB flash drive from the switch.

Generating the MAC Address Range for a QFabric System

Each QFabric system requires a range of reserved MAC addresses that is assigned by Juniper Networks. You must specify the MAC address range when you perform the initial setup of the QFX3100 Director group (see "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335). Additionally, refer to Activate Your QFabric System for more information.

When you purchase a QFabric system, you receive an e-mail containing a software serial number from Juniper Networks. You can use the software serial number to generate the MAC address range for your QFabric system.

To generate the MAC address range for a QFabric system:

1. In a browser, log in to the Juniper Networks License Management System at https://www.juniper.net/lcrs/license.do.

   The Manage Product Licenses page appears.

   NOTE: To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

   The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Fabric** option button, and click **Continue**.

   The Generate Licenses - QFX Series Product Fabrics page appears.

4. In the **Software Serial No** field, enter the software serial number for your QFabric system, and press the Tab key.

   The starting MAC address and number of MAC addresses for your QFabric system are displayed.

5. (Optional) Click **Download/Email MAC Address** to download or e-mail the MAC address range.

   The Download/Email MAC Address page appears.

   To download the MAC address range:

   - Select the **Download to this computer** option button, and click **OK**.

   To e-mail the MAC address range:

   - Select the **Send e-mail to *e-mail ID*** option button, and click **OK**.

Related Documentation

- Performing the QFabric System Initial Setup on a QFX3100 Director Group on page 1335

Performing the QFabric System Initial Setup on a QFX3100 Director Group

You must perform the initial setup of the QFX3100 Director group through the console port. (Before configuring the QFX3100 Director group, see *Installing and Connecting a QFX3100 Director Device*.)

Before you begin connecting and configuring a QFX3100 Director group, set the following parameter values on the console server or PC:

- Baud Rate—9600
- Flow Control—None

- Data—8
- Parity—None
- Stop Bits—1
- DCD State—Disregard

NOTE: When you use the SecureCRT client to connect to a Director device for the initial setup of a QFabric system, the backspace key does not work. As a workaround, use the Shift+Delete key combination in SecureCRT as a backspace key equivalent or use a different UNIX client to support the backspace key natively.

The initial setup requires that you specify certain values for your QFabric system. These include:

- Software serial number for your QFabric system (found in the e-mail containing the software serial number that you received from Juniper Networks when you purchased your QFabric system)
- IP addresses and a default gateway IP address for your QFabric system default partition
- IP addresses for your Director group device management ports
- Range of reserved MAC addresses for your QFabric system (see "Generating the MAC Address Range for a QFabric System" on page 1334 or Activate Your QFabric System for this information)
- Root password for your Director group
- Root password for the QFabric system components such as the Node devices, Interconnect devices, and infrastructure

- Performing an Initial Setup on page 1336
- Restoring a Backup Configuration on page 1339

Performing an Initial Setup

The initial setup can be performed either manually or by using a previously saved backup configuration.

To connect and configure the QFX3100 Director group manually from the console:

1. Connect the console port of one of the Director devices to a laptop or PC using an RJ-45 to DB-9 rollover cable. An RJ-45 to DB-9 rollover cable is supplied with each QFX3100 Director device. The console (**CONSOLE**) port is located on the front panel of the device.
2. Log in as **root**. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

   ```
   dg0 login: root
   ```

NOTE: The prompt is either dg0 login or dg1 login depending on the Director device to which you connected your cable.

3. For manual configuration or for initial installation, enter **no** when prompted to specify the backup file. The current Director device configuration is displayed.

```
Initial Configuration
Before you can access the QFabric system, you must complete the initial setup
of the Director group by using the steps that follow. If the initial setup
procedure does not complete successfully, log out of the Director device and
then log back in to restart this setup menu.
Continue? [y/n]: y
You may enter the configuration manually or restore from a backup.
Specify a backup file? [y/n]: n
Existing local configuration:
```

4. Enter the IP addresses and prefixes for both Director devices.

NOTE: The Director group devices and QFabric system default partition IP addresses must be on the same subnet as your management network.

```
Please enter the Director Group 0 IP address and prefix: ip address/prefix
Please enter the Director Group 1 IP address and prefix: ip address/prefix
Please enter the Director Group Subnet Mask: subnet mask
```

5. Enter the gateway IP address for the Director group.

```
Please enter the Director Group gateway IP address: gateway ip address
```

6. Enter the default partition IP address. (You will use this address to log in to the QFabric system on subsequent connections.)

```
Please enter the QFabric default partition IP address: ip address
```

7. 

NOTE: On a QFabric system, even though the option to assign IPv6 addresses to a QFabric management network is visible, this feature is not currently supported.

(Optional) Enter the IPv6 addresses for both Director devices and the gateway IPv6 address for the Director group.

```
Would you like to input IPv6 addresses for Director Group nodes? (y/n): n
```

8. Enter the MAC address information.

```
Please enter the starting MAC address: mac address
Please enter the number of MAC addresses: number of mac addresses
```

NOTE: The minimum number of MAC addresses accepted is 4000.

9. Enter the QFabric system software serial number.

```
Please enter the QFabric serial ID: serial id
```

10. Create the Director device root password.

```
Please enter a Director device root password: director-device-password
```

```
Please re-enter password: director-device password
```

11. Create a password for the QFabric system components.

NOTE: If you need to change the component password after the QFabric system is operational, issue the **device-authentication** statement at the **[edit system]** hierarchy level in the QFabric default partition CLI.

```
Please enter a password for QFabric components (Node devices, Interconnect
devices, and infrastructure): component-password
Please re-enter password: component-password
Note: please record your passwords for recovery purposes.
```

CAUTION: Carefully save your passwords for future reference, because some cannot be recovered on a QFabric system.

12. Enter the QFabric system platform type.

```
Supported platform types:
1. QFX3000-G
2. QFX3000-M
Please select product type: number corresponding to platform type
```

13. Confirm the initial configuration. Ensure that the information is accurate before proceeding.

```
Does the following configuration appear correct?
    Director Group 0 IP/Prefix              [10.49.214.74/24]
    Director Group 1 IP/Prefix              [10.49.214.75/24]
    Director Group Gateway                  [10.49.214.254]
    Starting MAC address                    [00:11:00:00:00:00]
    Number of MAC addresses                 [4000]
    QFabric Default Partition IP            [10.49.214.150]
    QFabric serial ID                       [qfsn-123456789]
    Director Device Password                [********]
    QFabric component Password              [********]
    Product Type:                           [QFX3000-G]
```

14. Confirm the initial setup.

```
[y/n]: y
```

CAUTION: Resetting this initial configuration requires assistance from Juniper Networks customer support or "Performing a QFabric System Recovery Installation on the Director Group" on page 112. As a result, make sure you are certain the values you entered are correct before you enter **yes**.

15. The director device displays the configuration.

```

```

```
Configuring QFabric software with an initial pool of 4000 MAC addresses
[00:11:00:00:00:00 - 00:11:00:00:0f:3b]
Configuring QFabric address [10.49.214.150]
Reconfiguring QFabric software static configuration
Applying the new Director device password
Applying the QFabric component password
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.
```

Restoring a Backup Configuration

Before you restore a backup configuration for the Director group:

- You must have a backup configuration file. You create the backup file with the request system software configuration-backup command and save it on an external USB flash drive.
- If you need to reinstall the system software, perform that operation first (see "Performing a QFabric System Recovery Installation on the Director Group" on page 112).

To connect and configure the Director group with a backup configuration:

1. Log in as **root**. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

   ```
   dg0 login: root
   ```

   NOTE: The prompt is either dg0 login or dg1 login depending on the Director device to which you connected your cable.

2. To use a previously saved backup configuration, enter **yes** when prompted to specify the backup file and then enter the path and filename of the backup configuration.

   ```
   Specify a back up file? [y/n]: y
   Please specify the full path of the configuration backup file: path/filename
   ```

3. Confirm the restoration of the configuration from the backup. Ensure that the information is accurate before proceeding.

   ```
   Does the following configuration appear correct?
       Director Group 0 IP/Prefix              [10.49.214.74/24]
       Director Group 1 IP/Prefix              [10.49.214.75/24]
       Director Group Gateway                  [10.49.214.254]
       Starting MAC address                    [00:11:00:00:00:00]
       Number of MAC addresses                 [4000]
       QFabric Default Partition IP            [10.49.214.150]
       QFabric serial ID                       [qfsn-123456789]
       Director Device Password                [********]
       QFabric component Password              [********]
       Product Type:                           [QFX3000-G]
   ```

4. Confirm the backup restoration.

   ```
   [y/n]: y
   ```

   The Director device displays the configuration.

   ```
   Saving temporary configuration...
   ```

```
Configuring peer...
Configuring local interfaces...
Configuring interface eth0 with [10.49.214.74/24:10.49.214.254]
Configured interface eth0 with [10.49.214.74/24:10.49.214.254]
Configuring QFabric software with an initial pool of 4000 MAC addresses
[00:11:00:00:00:00 - 00:11:00:00:0f:3b]
Configuring QFabric address [10.49.214.150]
Reconfiguring QFabric software static configuration
Applying the new Director device password
Applying the QFabric component password
Configuration complete. Director Group services will auto start within 30
seconds.
```

Understanding QFabric System Administration Tasks and Utilities

The following items describe QFabric system components, common administration tasks that you perform on the QFabric system, or utilities that help you to manage the QFabric system and its components.

- **Converting the device mode (QFX3500 and QFX3600 devices)**—Enables you to convert a QFX3500 or QFX3600 device into a Node device so it can be deployed within a QFabric system. By default, QFX3500 and QFX3600 devices operate in *standalone* mode. Before the devices can participate within a QFabric system environment, you must change the device mode for the switch to *node-device* mode. To convert a QFX3500 or QFX3600 device from standalone mode to Node device mode, connect to the console port of the device, issue the **request chassis device-mode node-device** command, verify the future device mode with the **show chassis device-mode** command, connect the management port of the device to the QFabric system control plane, and reboot the device.

  

  NOTE:
  - Before you convert the device mode, you must upgrade the software on your standalone device to a QFabric system Node and Interconnect device software package that matches the QFabric system complete software package used by your QFabric system. For example, if the complete software package for your QFabric system is named **jinstall-qfabric-11.3X30.6.rpm**, you need to install the **jinstall-qfx-11.3X30.6-domestic-signed.tgz** package on your standalone device. Matching the two software packages ensures a smooth and successful addition of the device to the QFabric system inventory.
  - Converting the device mode erases the switch configuration. We recommend that you save your configuration to an external server or USB flash drive before executing the device mode conversion commands and rebooting the switch.

- **QFabric system control plane Ethernet network (EX4200 switches to support the QFabric system)**—Provides a separate control plane network within the QFabric system to handle management traffic. This design enables the data plane network to focus on efficient, low-latency delivery of data, voice, and video traffic.
  - The QFX3000-G QFabric system control plane uses two sets of four EX4200 switches each, configured as a pair of Virtual Chassis to connect all components within the QFabric system. The dual Virtual Chassis architecture provides redundancy and high availability to ensure reliable QFabric system operation for the Director group, the Interconnect devices, and the Node devices.
  - The QFX3000-M QFabric system control plane uses two EX4200 switches to connect all components within the QFabric system. The two EX4200 switches provide redundancy and high availability to ensure reliable QFabric system operation for the Director group, the Interconnect devices, and the Node devices.

  Because the level of detail necessary to fully understand the control plane connections, cabling, topology, and configuration is beyond the scope of this topic, see:

  - "Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane" on page 1263 for information about a QFX3000-G QFabric system with a copper-based control plane

  - "Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane" on page 1309 for information about a QFX3000-M QFabric system with a copper or fiber-based control plane

- **QFabric system data plane network**—Provides a separate network to handle rapid delivery of data plane traffic. The data plane uses QSFP+ interfaces and fiber-optic cabling to connect QFabric system components at speeds of 40 Gbps. By creating a redundant set of connections between the Node devices and the backplane-like Interconnect devices, the data plane enables the Node devices to appear as if they are directly connected to one another in a single tier. To view the connection status of the QFabric system data plane, issue the **show chassis fabric connectivity** command.

- **Director group (QFX3100 Director devices within a QFabric system)**—Provides a redundant, resilient platform that manages the QFabric system components. Two QFX3100 Director devices work together to ensure high availability of the system and load-balance system processes, such as the command-line interface (CLI) and shared storage. To configure the Director group for operation, install and cable two Director devices as a Director group, connect to the console port of one of the Director devices, and perform the initial setup. The setup script starts automatically the first time you power on the Director device. For more information, see "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335. To monitor the status of the Director group, log in to the QFabric system default partition and issue the **show fabric administration inventory director-group status** command.

- **Automatic detection and configuration of QFabric system components**—Enables QFabric system components to join the QFabric system automatically. When you install the QFabric system, activate the control plane and Director group, and power on the Node and Interconnect devices, the Director group recognizes these devices, sends each device its own portion of the Junos OS configuration, and adds them to the QFabric system inventory. By default, each individual Node device is placed into a unique server Node group that contains only that single Node device. No configuration is required for the default assignments. The default settings can be overridden when you add Node devices into a redundant server Node group (containing a pair of Node devices) or a network Node group (that can contain up to eight Node devices, run routing protocols, and connect to external networks).

- **QFabric system Routing Engines**—Support the QFabric system by providing virtual, redundant instances of Junos OS that run on the Director group. The Routing Engines perform fabric management tasks, maintain control of the fabric, and host the operation of routing protocols for network Node groups. Because they are generated in pairs, the Routing Engines provide additional high availability for the QFabric system. No configuration is required. To view the status of the QFabric system Routing Engines, issue the **show fabric administration inventory infrastructure** command.

- **QFabric system command-line interface**—Enables you to configure all components of the QFabric system from a single location by using the Junos OS CLI. To access this central location, you need to log in to the QFabric system default partition (an IP address you specify during the initial setup of the Director group). For more information, see "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335.

Most existing Junos OS configuration statements and operational mode commands are supported (for example, interfaces, VLANs, protocols, and firewall filters).

To view QFabric system components and check connectivity of the system, issue the **show fabric administration inventory** commands.

- **Alias configuration for Director devices, Interconnect devices, and Node devices**—Enables you to set user-defined aliases for QFabric system Director devices, Interconnect devices, and Node devices to facilitate usability of the QFabric system as it scales. Aliased names appear in the output of many QFabric system operational commands, such as **show fabric administration inventory**. To map the hardware serial number of a Director device, Interconnect device or Node device to a user-defined name, see "Configuring Aliases for the QFabric System" on page 1353.
- **Node group configuration**—Enables you to cluster several Node devices together to provide redundancy, resiliency, and high availability at the ingress and egress points of the QFabric system. There are two types of Node groups you can configure:
  - **Redundant server Node group**—Enables the grouped Node devices to connect the QFabric system to local servers and storage devices. A redundant server Node group can contain a maximum of two Node devices and supports LAG connections that can span both devices.

    NOTE: The Node devices in a redundant server Node group must be of the same type, either a QFX3500 Node or a QFX3600 Node. You cannot add a QFX3500 and a QFX3600 Node device to the same redundant server Node group.

  - **Network Node group**—Enables the grouped Node devices to connect the QFabric system to external networks and run routing protocols such as BGP and OSPF. A network Node group can contain up to eight Node devices and supports LAG connections.

    NOTE:
    - The name of the network Node group in the default partition, *NW-NG-0*, is preset. You must use this name when adding Node devices to the network Node group. You cannot specify a different name.
    - When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.

To configure a redundant server Node group, include two Node devices with the **node-device** *node-device-name* statement at the **[edit fabric resources node-group** *node-group-name***]** hierarchy level.

To configure a network Node group, include the **network-domain** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level. In addition, include between

two and eight Node devices with the **node-device** ***node-device-name*** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level.

Gaining Access to the QFabric System Through the Default Partition

This topic explains how to log in to the QFabric system default partition so you can access the Junos OS command-line interface (CLI) and configure the system.

Before you access the QFabric system default partition:

- Install the QFabric system hardware components, including connecting the network and power cables.
- Convert any QFX3500 and QFX3600 standalone devices to *node-device* mode.
- Connect all components to the control plane Ethernet network.
- Turn on the Director group and run the initial setup script. Remember to write down the IP address of the default partition, which must be on the same subnetwork as your management network.

To access the default partition:

1. Open an SSH connection to the QFabric default partition. Use the IP address you set for the default partition as part of the QFabric initial setup procedure. In your network, you can simplify access to the QFabric system by mapping the default partition IP address to a name.

```
[root@customer ~]# ssh root@192.168.1.49
Last login: Fri Sep  2 21:34:54 2011 from customer
Juniper QFabric Director 11.3.5043 2011-08-26 18:05:21 UTC

RUNNING ON DIRECTOR DEVICE : dg1
root@qfabric>
```

NOTE: The QFabric system is load balanced, so the CLI session might be hosted on either Director device DG0 or DG1.

2. Enter configuration mode (the default mode in the QFabric system is **configure private**), configure a root password and hostname for the default partition, and assign QFabric administrator privileges to the root user.

```
root@qfabric> configure
warning: Using private edit on QF/Director
warning: uncommitted changes will be discarded on exit
Entering configuration mode

[edit]

root@qfabric# set system root-authentication plain-text-password
New password: My-Password
Retype new password: My-Password

root@qfabric# set system root-authentication remote-debug-permission qfabric-admin
root@qfabric# set system host-name my-qfabric

[edit]

root@qfabric# commit
commit complete

[edit]
root@my-qfabric#
```

3. Configure your QFabric system as needed. You can configure routing protocols, interfaces, VLANs, and other features as needed. Keep in mind that interfaces require the four-level interface naming convention (device-name:*fpc/pic/port*).

- QFabric System Initial and Default Configuration Information on page 1255
- Understanding Interfaces on the QFabric System on page 1173
-

Example: Configuring QFabric System Login Classes

This example shows you how to assign the correct login class to users so they can access components within a QFabric system.

- Requirements on page 1346
- Overview on page 1346
- Configuration on page 1347
- Verification on page 1349

Requirements

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
  - Junos OS Release 12.2 for these QFX Series components
- Eight EX4200 switches, used to make two redundant Virtual Chassis with four members apiece
- Junos OS Release 12.1R1.9 for the EX Series switches used in the Virtual Chassis

Before you begin:

- Perform the initial setup of the QFabric system on the Director group, which includes the creation of a username and password for the QFabric system components. See "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335.

Overview

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system (such as Node devices and Interconnect devices). The *qfabric-admin* class provides the ability to log in to individual QFabric system components and manage them. The *qfabric-operator* class enables the user to log in to individual components and view component-level operations and configurations. The *qfabric-user* class prevents access to individual QFabric system components.

You include these classes in your configuration at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level. The key task is to decide which class you should apply to users based on their need to access QFabric system components.

NOTE: **To set QFabric system login classes for a root user, include the remote-debug-permission statement at the [edit system root-authentication] hierarchy level and specify the qfabric-admin class.**

If you assign the qfabric-admin or the qfabric-operator class to a user, the QFabric system maps the user to a list of authorized users who are permitted to access components. To facilitate ease of use, the QFabric system uses the component password you specified during the initial setup of the Director group. When users assigned the qfabric-admin or the qfabric-operator class log in to a component by issuing the **request component login** operational mode command, the QFabric system verifies the class and sends the

username and password to the component. The component accepts these credentials and permits access.

NOTE:

- The three QFabric system login classes give access to the components only. To provide access to the QFabric system as a whole through the default partition command-line interface (CLI), you must configure the usual Junos OS login classes or permissions (such as the *super-user* class). For more information about login classes, see "Junos OS Login Classes Overview" on page 1683.
- If you have completed the QFabric system initial setup and the system is operational, you can change the component password by issuing the **device-authentication** statement at the **[edit system]** hierarchy level in the QFabric default partition CLI.

Topology

This example defines three users: Adam, Oscar, and Ulf. Adam needs to manage QFabric system components, Oscar needs limited access, and Ulf should not have any access to the components. As a result, assign the qfabric-admin class to Adam, the qfabric-operator class to Oscar, and the qfabric-user class to Ulf. However, all three users should have all permissions to access the QFabric system CLI.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login class all-qfabric permissions all
set system login user Adam class all-qfabric
set system login user Adam authentication encrypted-password
  "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
set system login user Adam authentication remote-debug-permission qfabric-admin
set system login user Oscar class all-qfabric
set system login user Oscar authentication encrypted-password
  "$1$3e.3wJQ8$31SrzV0.efdRbk.ZJncKm0"
set system login user Oscar authentication remote-debug-permission qfabric-operator
set system login user Ulf class all-qfabric
set system login user Ulf authentication encrypted-password
  "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
set system login user Ulf authentication remote-debug-permission qfabric-user
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To provide the same access to the QFabric system CLI for all users, but different QFabric system component-level access to different users:

1. Define and provide all-qfabric access and passwords to all three users. This administrator-defined class provides full permissions, enabling the users to log in to the QFabric system default partition and use the CLI. Alternatively, you can assign the super-user class to these users to accomplish the same goal.

```
[edit]
user@qfabric# set system login class all-qfabric permissions all
user@qfabric# set system login user Adam class all-qfabric
user@qfabric# set system login user Adam authentication encrypted-password
  "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
user@qfabric# set system login user Oscar class all-qfabric
user@qfabric# set system login user Oscar authentication encrypted-password
  "$1$3e.3wJQ8$31SrzV0.efdRbk.ZJncKm0"
user@qfabric# set system login user Ulf class all-qfabric
user@qfabric# set system login user Ulf authentication encrypted-password
  "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
```

2. Provide qfabric-admin component access to Adam so he can manage QFabric system components.

```
[edit]
user@qfabric# set system login user Adam authentication remote-debug-permission
  qfabric-admin
```

3. Provide qfabric-operator component access to Oscar so he can view the CLI at the QFabric system components.

```
[edit]
user@qfabric# set system login user Oscar authentication remote-debug-permission
  qfabric-operator
```

4. Assign qfabric-user component restrictions to Ulf to prevent him from accessing the QFabric system components.

```
[edit]
user@qfabric# set system login user Ulf authentication remote-debug-permission
  qfabric-user
```

Results

From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example.

```
[edit]
system {
  login {
    class all-qfabric {
```

```
        permissions all;
      }
      user Adam {
        class all-qfabric;
        authentication {
          encrypted-password "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."; ##
            SECRET-DATA
          remote-debug-permission qfabric-admin;
        }
      }
      user Oscar {
        class all-qfabric;
        authentication {
          encrypted-password "$1$3e.3wJQ8$31SrzV0.efdRbk.ZJncKm0"; ## SECRET-DATA
          remote-debug-permission qfabric-operator;
        }
      }
      user Ulf {
        class all-qfabric;
        authentication {
          encrypted-password "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"; ##
            SECRET-DATA
          remote-debug-permission qfabric-user;
        }
      }
    }
  }
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the QFabric system and component-level access configuration is working properly for all three users. Adam, Oscar, and Ulf should have equivalent, full-permission access to the QFabric system CLI. Adam should have management-level access to components. Oscar should have read-only access to components. Ulf should have no component-level access.

- Verifying qfabric-admin Access on page 1349
- Verifying qfabric-operator Access on page 1351
- Verifying qfabric-user Access on page 1352

Verifying qfabric-admin Access

Purpose Verify that Adam can access the QFabric system CLI at the default partition and manage QFabric system components.

Action From a management station on your network, issue the **ssh** *user*@**qfabric** command and enter the password to open an SSH session for Adam to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Adam has permission to use on the QFabric system default partition.

```
> ssh Adam@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
```

```
Adam@qfabric.network.net's password:
Last login: Sun Nov 20 14:12:29 2011 from 192.168.28.19

  WS001/RE0            Interconnect device control board
  WS001/RE1            Interconnect device control board
  |                    Pipe through a command

Adam@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Adam has the permission to use on the Node device. Notice that the CLI prompt now indicates Adam's component access level (**qfabric-admin**) as the username and the Node device identifier (**EE3093**) as the host.

```
qfabric-admin@EE3093> ?
Possible completions:
  clear                Clear information in the system
```

```
  file                Perform file operations
  help                Provide help information
  load                Load information from file
  monitor             Show real-time debugging information
  mtrace              Trace multicast path from source to receiver
  op                  Invoke an operation script
  ping                Ping remote target
  quit                Exit the management session
  request             Make system-level requests
  restart             Restart software process
  save                Save information to file
  set                 Set CLI properties, date/time, craft interface message
  show                Show system information
  ssh                 Start secure shell on another host
  start               Start shell
  telnet              Telnet to another host
  test                Perform diagnostic debugging
  traceroute          Trace route to remote host
```

Meaning The output shows that Adam has received the proper permissions to access the QFabric system CLI and log in to individual components with management-level access.

Verifying qfabric-operator Access

Purpose Verify that Oscar can access the QFabric system CLI at the default partition and view the CLI on the QFabric system components.

Action From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Oscar to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam.

```
> ssh Oscar@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Oscar@qfabric.network.net's password:
Last login: Sun Nov 19 19:21:29 2011 from 192.168.28.14

  restart             Restart software process
  save                Save information to file
  set                 Set CLI properties, date/time, craft interface message
  show                Show system information
```

```
  telnet               Telnet to another host
  test                 Perform diagnostic debugging
  traceroute           Trace route to remote host
```

Issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Oscar@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the Node device. Notice that the CLI prompt now indicates Oscar's component access level (**qfabric-operator**) as the username and the Node device identifier (**EE3093**) as the host. Additionally, Oscar has fewer CLI commands available than Adam because of Oscar's read-only qfabric-operator login class.

```
qfabric-operator@EE3093> ?
Possible completions:
  file                 Perform file operations
  help                 Provide help information
  load                 Load information from file
  op                   Invoke an operation script
  quit                 Exit the management session
  request              Make system-level requests
  save                 Save information to file
  set                  Set CLI properties, date/time, craft interface message
  show                 Show system information
  start                Start shell
  test                 Perform diagnostic debugging
```

Meaning The output shows that Oscar has full permissions to access the QFabric system CLI, but only read-only access when he logs in to individual components. Oscar's permissions on the QFabric system are the same as Adam's, but Oscar has fewer permissions than Adam on the Node device.

Verifying qfabric-user Access

Purpose Verify that Ulf has full access to the QFabric system CLI at the default partition but cannot access the QFabric system components.

Action From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Ulf to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Ulf has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam and Oscar.

```
> ssh Ulf@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Ulf@qfabric.network.net's password:

  ping                 Ping remote target
  quit                 Exit the management session
  request              Make system-level requests
  restart              Restart software process
  save                 Save information to file
  set                  Set CLI properties, date/time, craft interface message
  show                 Show system information
  telnet               Telnet to another host
  test                 Perform diagnostic debugging
  traceroute           Trace route to remote host
```

When Ulf issues the **request component login *component-name*** command, the Node device denies his access attempt.

```
Ulf@qfabric> request component login EE3093
error: User Ulf does not have sufficient permissions to login to device EE3093
```

Meaning The output shows that Ulf has full permissions to access the QFabric system CLI in the same way as Adam and Oscar. However, unlike Adam and Oscar, Ulf cannot access individual components because of the qfabric-user login class assigned to him.

Configuring Aliases for the QFabric System

This topic explains how to configure aliases for components of the QFabric system, such as Director devices, Interconnect devices, and Node devices. Aliases replace the hardware serial numbers of components, making it easier to identify system devices and simplify configuration tasks.

Before you create aliases in a QFabric system:

- Issue one of the **show fabric administration inventory** commands to view the components that are available for aliasing and their hardware serial numbers.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as an alias name.

To create an alias for a Node device:

1. Discover the serial number of the Node device you wish to rename by issuing the **set fabric aliases node-device ?** context-sensitive help command.

```
root@qfabric# set fabric aliases node-device ?
Possible completions:
  <aliasable-item-name>   The name of the item to be aliased
  BBAK8309             Node device
  BBAK8283             Node device
  BBAK8891             Node device
  BBAK8868             Node device
  BBAK8276             Node device
  BBAK8273             Node device
[edit]
```

   As an alternate way to discover the serial number for a Node device, issue the **show fabric administration inventory node-devices** command. In this case, the serial numbers for the Node devices are **BBAK8309BBAK8283BBAK8891BBAK8868BBAK8276** and **BBAK8273**.

```
root@qfabric> show fabric administration inventory node-devices
Item                    Identifier              Connection      Configuration
Node device
  BBAK8309                                      Connected
  BBAK8283                                      Connected
  BBAK8891                                      Connected
  BBAK8868                                      Connected
  BBAK8276                                      Connected
  BBAK8273                                      Connected
```

2. Specify the serial number of the Node device and the desired alias name by including the **node-device** statement at the **[edit fabric aliases]** hierarchy level.

```
[edit fabric aliases]
root@qfabric# set node-device BBAK8309 Node0
root@qfabric# set node-device BBAK8283 Node1
root@qfabric# set node-device BBAK8891 Node2
root@qfabric# set node-device BBAK8868 Node3
root@qfabric# set node-device BBAK8276 Node4
root@qfabric# set node-device BBAK8273 Node5
```

3. Review your configuration and issue the **commit** command.

```
[edit]
root@qfabric# show fabric
aliases {
    node-device BBAK8309 {
        Node0;
    }
    node-device BBAK8283 {
        Node1;
    }
    node-device BBAK8891 {
        Node2;
    }
    node-device BBAK8868 {
        Node3;
    }
    node-device BBAK8276 {
        Node4;
    }
    node-device BBAK8273 {
        Node5;
    }
}
```

```
[edit]
root@qfabric# commit
commit complete
```

4. To view that your aliases are operational, issue the **show fabric administration inventory node-devices** command.

```
root@qfabric> show fabric administration inventory node-devices
Item                    Identifier              Connection      Configuration
Node device
  node0                 BBAK8309                Connected
  node1                 BBAK8283                Connected
  node2                 BBAK8891                Connected
  node3                 BBAK8868                Connected
  node4                 BBAK8276                Connected
  node5                 BBAK8273                Connected
```

NOTE: If you attempt to commit all configuration settings for a new Node group (such as the Node group itself, aliasing, and other features) at the same time, the commit operation might appear to succeed when it actually has failed. For this reason, we recommend configuring and verifying Node groups and aliases first, followed by configuring and verifying other features. Establishing the Node groups and aliases first enables the QFabric system to reject any potentially unsupported configuration. The resulting commit errors indicate where the configuration problem lies. To verify the establishment of Node groups and aliases before configuring other features, issue the **show fabric administration inventory** command.

To create an alias for a Node group:

- Specify a name for the Node group when you include the **node-group** statement at the **[edit fabric resources]** hierarchy level.

NOTE: You cannot use the **aliases** statement at the **[edit fabric]** hierarchy level to create an aliased name for a Node group.

To create an alias for a Director device:

1. Discover the serial number of the Director device you wish to rename by issuing the **set fabric aliases director-device ?** context-sensitive help command.

```
root@qfabric# set fabric aliases director-device ?
Possible completions:
  <aliasable-item-name>   The name of the item to be aliased
  0281052011000001     Director device
  0281052011000032     Director device
[edit]
```

As an alternate way to discover the serial number for a Director device, issue the **show fabric administration inventory director-group status** command. In this case, the serial number for Director device DG0 is **0281052011000001** and the serial number for Director device DG1 is **0281052011000032**.

```

To create an alias for an Interconnect device:

1. Discover the serial number of the Interconnect device you wish to rename by issuing the **set fabric aliases interconnect-device ?** context-sensitive help command.

```
root@qfabric# set fabric aliases interconnect-device ?
Possible completions:
  <aliasable-item-name>   The name of the item to be aliased
  IC-F1249             Interconnect device
  IC-F4912             Interconnect device
[edit]
```

   As an alternate way to discover the serial number for an Interconnect device, issue the **show fabric administration inventory interconnect-devices** command. In this case, the serial numbers for the Interconnect devices are **IC-F1249** and **IC-F4912**.

```
root@qfabric> show fabric administration inventory interconnect-devices
Item                  Identifier              Connection      Configuration
Interconnect device
  IC-F1249                                    Connected       Configured

    F1249/RE0                                 Connected

  IC-F4912                                    Connected       Configured

    F4912/RE0                                 Connected
```

2. Specify the serial number of the Interconnect device and the desired alias name by including the **interconnect-device** statement at the **[edit fabric aliases]** hierarchy level.

```
[edit fabric aliases]
root@qfabric# set interconnect-device IC-F1249 Interconnect0
root@qfabric# set interconnect-device IC-F4912 Interconnect1
```

3. Review your configuration and issue the **commit** command.

```
[edit]
root@qfabric# show fabric
aliases {
    interconnect-device IC-F1249 {
        Interconnect0;
    }
    interconnect-device IC-F4912 {
        Interconnect1;
    }
}
```

```
[edit]
root@qfabric# commit
commit complete
```

4. To view that your aliases are operational, issue the **show fabric administration inventory interconnect-devices** command.

```
root@qfabric> show fabric administration inventory interconnect-devices
Item                  Identifier              Connection      Configuration
Interconnect device
  Interconnect0       IC-F1249                Connected       Configured
    F1249/RE0                                 Connected
  Interconnect1       IC-F4912                Connected       Configured
    F4912/RE0                                 Connected
```

Configuring Node Groups for the QFabric System

This topic explains how to configure Node groups for Node devices within the QFabric system. Node groups provide redundancy for Node devices and make your QFabric system more resilient.

There are three types of Node groups in a QFabric system:

- **Automatically generated server Node groups**—By default, every Node device that joins the QFabric system is placed within an automatically generated server Node group that contains one Node device (the device itself). Server Node groups connect to servers and storage devices.
- **Network Node groups**—You can assign up to eight Node devices to a network Node group. When grouped together, the Node devices within a network Node group connect to other routers running routing protocols such as OSPF and BGP.
- **Redundant server Node groups**—You can assign two Node devices to a redundant server Node group. When grouped together, you can create link aggregation groups (LAGs) that span the interfaces on both Node devices to provide resiliency and redundancy.

Before you create Node groups in a QFabric system:

- Make sure your QFabric system is operational.
- Issue the **show fabric administration inventory node-devices** command to display the Node devices that are available to add to a Node group.
- Issue the **show fabric administration inventory node-groups** command to display the existing Node groups.

NOTE: The following rules apply to QFabric Node group naming:

- Node group names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of a Node group name is 30 characters.
- Node group names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as a Node group name.

NOTE: If you attempt to commit all configuration settings for a new Node group (such as the Node group itself, aliasing, and other features) at the same time, the commit operation might appear to succeed when it actually has failed. For this reason, we recommend configuring and verifying Node groups and aliases first, followed by configuring and verifying other features. Establishing the Node groups and aliases first enables the QFabric system to reject any potentially unsupported configuration. The resulting commit errors indicate where the configuration problem lies. To verify the establishment of Node groups and aliases before configuring other features, issue the **show fabric administration inventory** command.

To display an automatically generated server Node group:

- Issue the **show fabric administration inventory node-groups** command and look for Node groups containing a single Node device that has the same name or serial number as the server Node group.

```
root@qfabric> show fabric administration inventory node-groups
Item                    Identifier              Connection      Configuration
Node group
  BBAK8281                                      Connected       Configured
    BBAK8281                                    Connected
  BBAK8835                                      Connected       Configured
    BBAK8835                                    Connected
  NW-NG-0                                       Connected       Configured
    Node0               BBAK8309                Connected
    Node1               BBAK8283                Connected
  S1                                            Connected       Configured
    Node2               BBAK8891                Connected
    Node3               BBAK8868                Connected
```

To create a network Node group:

1. Specify the Node devices you wish to add to the network Node group by including the **node-device** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level.

NOTE:

- The network Node group must use the predefined name NW-NG-0. You must use this name when adding Node devices to the network Node group. You cannot specify a different name. Also, you can configure only one network Node group per partition.
- When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.

```
[edit]

root@qfabric# set fabric resources node-group NW-NG-0 node-device Node0
root@qfabric# set fabric resources node-group NW-NG-0 node-device Node1
```

2. To designate the Node group as a network Node group, include the **network-domain** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level.

```
[edit]

root@qfabric#  set fabric resources node-group NW-NG-0 network-domain
```

3. Review your configuration and issue the **commit** command.

```
[edit]

root@qfabric# show fabric
resources {
    node-group NW-NG-0 {
        network-domain;
        node-device Node0;
        node-device Node1;
    }
}

[edit]

root@qfabric# commit
commit complete
```

NOTE: When you add or delete Node devices from a Node group configuration, the corresponding Node devices reboot when you commit the configuration change.

4. To determine if your network Node group is operational, issue the **show fabric administration inventory node-groups** command in operational mode.

```
root@qfabric>show fabric administration inventory node-groups NW-NG-0
Item                    Identifier              Connection      Configuration
Node group
```

```
NW-NG-0                                          Connected       Configured
  Node0                 BBAK8309                 Connected
  Node1                 BBAK8283                 Connected
```

To create a redundant server Node group:

1. Specify the two Node devices you wish to add to the redundant server Node group by including the **node-device** statement at the **[edit fabric resources node-group *node-group-name*]** hierarchy level.

   NOTE: Ensure that the two Node devices are of the same type, either a QFX3500 Node or a QFX3600 Node. You cannot add a QFX3500 and a QFX3600 Node device to the same redundant server Node group.

   ```
   [edit]

   root@qfabric# set fabric resources node-group S1 node-device Node2
   root@qfabric# set fabric resources node-group S1 node-device Node3
   ```

2. Review your configuration and issue the **commit** command.

   ```
   [edit]

   root@qfabric# show fabric
   resources {
       node-group S1 {
           node-device Node2;
           node-device Node3;
       }
   }

   [edit]

   root@qfabric# commit
   commit complete
   ```

   NOTE: When you add or delete Node devices from a Node group configuration, the corresponding Node devices reboot when you commit the configuration change.

3. To determine if your redundant server Node groups are operational, issue the **show fabric administration inventory node-groups *redundant-server-node-group-name*** command in operational mode.

```
root@qfabric> show fabric administration inventory node-groups S1
Item                    Identifier              Connection      Configuration
Node group
  S1                                            Connected       Configured
    Node2               BBAK8891                Connected
    Node3               BBAK8868                Connected
```

Configuring the Port Type on QFX3600 Node Devices

The QFX3600 Node device provides 16 40-Gbps QSFP+ ports. By default, four ports (labeled **Q0** through **Q3**) operate as 40-gigabit data plane (*fte*) uplink ports for uplink connections between your Node device and your Interconnect devices. Twelve ports (labeled **Q4** through **Q15**) operate as 10-Gigabit Ethernet (*xe*) ports to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems or external networks. Optionally, you can choose to configure ports Q0 through Q7 to operate as 40-gigabit data plane uplink ports, and ports Q2 through Q15 to operate as 10-Gigabit Ethernet ports.

NOTE: You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other devices.

NOTE: When you delete the port type configuration for an individual port or a block of ports, the ports return to operating in their default port type.

This topic explains how to configure the port type on QFX3600 Node devices.

Before you configure the port type on QFX3600 Node devices:

- Make sure your QFabric system is operational.
- Issue the **show fabric administration inventory node-groups** command to display the existing Node groups and the Node devices in each Node group.

NOTE:

- Only ports Q0 through Q7 can be configured to operate as 40-gigabit data plane (fte) uplink ports.
- Only ports Q2 through Q15 can be configured to operate as 10-Gigabit Ethernet (xe) ports.

CAUTION: The Packet Forwarding Engine on the QFX3600 Node device is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the Node device.

The following message may be displayed in the system log file when the Packet Forwarding Engine is restarted. You can ignore this message.

Pipe write error: Broken pipe

flush operation failed

The following steps describe how to configure either a block of ports or an individual port to operate as 40-gigabit data plane uplink (fte) ports, as well as how to delete a 40-gigabit data plane uplink (fte) port configuration.

1. To configure a block of ports to operate as 40-gigabit data plane uplink (fte) ports, specify a port range:

   ```
   [edit chassis node-group name node-device name pic 1]
   root@qfabric# set fte port-range port-range-low port-range-high
   ```

   For example, to configure ports Q4 through Q7 to operate as 40-gigabit data plane uplink ports:

   ```
   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
   root@qfabric# set fte port-range 4 7
   ```

2. To configure an individual port to operate as a 40-gigabit data plane uplink (fte) port, specify a port number:

   ```
   [edit chassis node-group name node-device name pic 1]
   root@qfabric# set fte port port-number
   ```

   For example, to configure port Q4 to operate as a 40-gigabit data plane uplink port:

   ```
   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
   root@qfabric# set fte port 4
   ```

3. Review your configuration and issue the **commit** command.

   ```
   [edit]
   root@qfabric# commit
   commit complete
   ```

4. To delete the 40-gigabit data plane uplink (fte) port configuration for a block of ports, specify a port range:

   ```
   [edit chassis node-group name node-device name pic 1]
   root@qfabric# delete fte port-range port-range-low port-range-high
   ```

   For example, to delete the 40-gigabit data plane uplink port configuration for ports Q4 through Q7:

   ```
   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
   root@qfabric# delete fte port-range 4 7
   ```

5. To delete the 40-gigabit data plane uplink (fte) port configuration for an individual port, specify a port number:

   ```
   [edit chassis node-group name node-device name pic 1]
   root@qfabric# delete fte port port-number
   ```

   For example, to delete the 40-gigabit data plane uplink port configuration for port Q4:

   ```
   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
   root@qfabric# delete fte port 4
   ```

The following steps describe how to configure either a block of ports or an individual port to operate as 10-Gigabit Ethernet (xe) ports, as well as how to delete a 10-Gigabit Ethernet (xe) port configuration.

1. To configure a block of ports to operate as 10-Gigabit Ethernet (xe) ports, specify a port range:

   [edit chassis node-group *name* node-device *name* pic 0]
   root@qfabric# **set xe port-range *port-range-low port-range-high***

   For example, to configure ports Q4 through Q7 to operate as 10-Gigabit Ethernet ports:

   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
   root@qfabric# **set xe port-range 4 7**

2. To configure an individual port to operate as a 10-Gigabit Ethernet port, specify a port number:

   [edit chassis node-group *name* node-device *name* pic 0]
   root@qfabric# **set xe port *port-number***

   For example, to configure port Q4 to operate as a 10-Gigabit Ethernet port:

   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
   root@qfabric# **set xe port 4**

3. Review your configuration and issue the **commit** command.

   [edit]
   root@qfabric# **commit**
   commit complete

4. To delete the 10-Gigabit Ethernet (xe) port configuration for a block of ports, specify a port range:

   [edit chassis node-group *name* node-device *name* pic 0]
   root@qfabric# **delete xe port-range *port-range-low port-range-high***

   For example, to delete the 10-Gigabit Ethernet port configuration for ports Q4 through Q7:

   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
   root@qfabric# **delete xe port-range 4 7**

5. To delete the 10-Gigabit Ethernet (xe) port configuration for an individual port, specify a port number:

   [edit chassis node-group *name* node-device *name* pic 0]
   root@qfabric# **delete xe port *port-number***

   For example, to delete the 10-Gigabit Ethernet port configuration for port Q4:

   [edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
   root@qfabric# **delete xe port 4**

Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- Requirements on page 1370
- Overview on page 1370
- Configuration on page 1370

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name “snmp qfabric” description “qfabric0 switch”
set snmp location “Lab 4 Row 11” contact “qfabric-admin@qfabric0”
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group “qf-traps” destination-port 155 targets 192.168.0.100
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

NOTE: If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

   ```
   [edit snmp]
   user@switch# set name “snmp qfabric”
   ```

2. Specify a description.

   ```
   [edit snmp]
   user@switch# set description “qfabric0 system”
   ```

   This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

   ```
   [edit snmp]
   user@switch# set location “Lab 4 Row 11”
   ```

   This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

   ```
   [edit snmp]
   user@switch# set contact “qfabric-admin@qfabric0”
   ```

   This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

   

   NOTE: The read-write option is not supported on the QFabric system.

   ```
   [edit snmp]
   user@switch# set community public authorization read-only
   ```

6. Create a client list with a set of IP addresses that can use the SNMP community.

   ```
   [edit snmp]
   user@switch# set client-list list0 192.168.0.0/24
   user@switch# set community public client-list-name list0
   ```

7. Specify IP addresses of clients that are restricted from using the community.

   ```
   [edit snmp]
   user@switch# set community public clients 192.170.0.0/24 restrict
   ```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group “qf-traps” destination-port 155 targets 192.168.0.100
```

NOTE: You do not need to include the destination-port statement if you use the default port 162.

The trap group qf-traps is configured to send traps to 192.168.0.100.

Results From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
  snmp {
    name "snmp qfabric";
    description "qfabric0 system";
    location "Lab 4 Row 11";
    contact "qfabric-admin@qfabric0";
    client-list list0 {
      192.168.0.0/24;
    }
    community public {
      authorization read-only;
      clients {
        197.170.0.0/24 restrict;
      }
    }
    trap-group qf-traps {
      destination-port 155;
      targets {
        192.168.0.100;
      }
    }
  }
```

If you are done configuring the device, enter **commit** from configuration mode.

Related Documentation

- Understanding the Implementation of SNMP on the QFabric System on page 1225
- snmp on page 1810

Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- Requirements on page 1373
- Overview on page 1373
- Configuration on page 1373

Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.1
- QFabric system
- External servers that can be configured as system log message hosts

Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

NOTE: You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

NOTE: On the QFabric system, a syslog file named messages is configured implicitly with facility and severity levels of any any and a file size of 100 MBs.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

Results From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
    archive {
      size 1g;
    }
    structured-data {
      brief;
    }
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Graceful Restart for QFabric Systems

When you configure graceful restart in the QFabric CLI, the QFabric system applies the configuration to the network Node group to participate in graceful restart operations with devices external to the QFabric system. Such configuration preserves routing table state and helps neighboring routing devices to resume routing operations more quickly after a system restart. This also enables the network Node group to resume routing operations rapidly if there is a restart in the QFabric system (such as a software upgrade). As a result, we recommend enabling graceful restart for routing protocols in the QFabric CLI.

NOTE: The QFabric system also uses graceful restart internally within the fabric to facilitate interfabric resiliency and recovery. This internal feature is enabled by default with no configuration required.

- Enabling Graceful Restart on page 1375
- Configuring Graceful Restart Options for BGP on page 1376
- Configuring Graceful Restart Options for OSPF and OSPFv3 on page 1377
- Tracking Graceful Restart Events on page 1378

Enabling Graceful Restart

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {
  graceful-restart;
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

NOTE: Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```
[edit]
routing-options {
  graceful-restart {
    disable;
    restart-duration seconds;
  }
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

NOTE: If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

Configuring Graceful Restart Options for BGP

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]
protocols {
   bgp {
      graceful-restart {
         disable;
         restart-time seconds;
         stale-routes-time seconds;
      }
   }
}
routing-options {
   graceful-restart;
}
```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

NOTE: To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group *group-name* graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group *group-name* neighbor *ip-address* graceful-restart]** hierarchy level.

NOTE: Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  ospf | ospfv3{
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
  graceful-restart {
    helper-disable <both | restart-signaling | standard>
  }
```

To reenable the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restarthelper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the helper-disable statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

TIP: You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospf3)]** hierarchy level. For more information, see "Tracking Graceful Restart Events" on page 1378.

NOTE: If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols *protocol* traceoptions flag]** hierarchy level:

```
[edit protocols]
isis {
   traceoptions {
      flag graceful-restart;
   }
}
(ospf | ospf3) {
   traceoptions {
      flag graceful-restart;
   }
}
```

aliases

Syntax

```
aliases {
  director-device director-device-name {
    assigned-director-device-name;
  }
  interconnect-device interconnect-device-name {
    assigned-interconnect-device-name;
  }
  node-device node-device-name {
    assigned-node-device-name;
  }
```

Hierarchy Level [edit fabric]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.
Options **director-group** and **interconnect-device** introduced in Junos OS Release 12.2 for the QFX Series.

Description (QFabric systems only) Specify the mapping of user defined names to QFabric system components. You can reassign names for Director devices, Interconnect devices, and Node devices.

The remaining statements are explained separately.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as an alias name.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

archive (QFabric System)

Syntax

```
archive {
  size size;
}
```

Hierarchy Level [edit system syslog file *filename*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the archiving properties for the system message log file.

Options

size *size*—Maximum amount of system log message data that the QFabric system stores in the log file.

Syntax: *x*k to specify the number of kilobytes, *x*m for the number of megabytes, or *x*g for the number of gigabytes

Range: 65 KB through 1 GB

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

      interface-type {
        link-down (ignore | red | yellow);
      }
    }
    container-devices {
      device-count number;
    }
    node-device name {
```

```
        fibre-channel {
          port-range {
            port-range-low port-range-high;
          }
        }
        pic pic-number {
          fte {
            port port-number;
            port-range port-range-low port-range-high;
          }
          xe {
            port port-number;
            port-range port-range-low port-range-high;
          }
        }
      }
      routing-engine {
        on-disk-failure {
          disk-failure-action (halt | reboot);
        }
      }
    }
}
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure chassis-specific properties for the switch.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

director-device (Aliases)

Syntax

```
director-device director-device-name {
    assigned-director-device-name;
}
```

Hierarchy Level [edit fabric aliases]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description (QFabric systems only) Specify the mapping of user-defined names to QFabric system Director devices.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names all, fabric, or director-group as an alias name.

Options *director-device-name*—Specify a user-defined name for a QFabric system Director device.

assigned-director-device-name—Specify the Director device identifier or name that has been provided. Identifiers are usually auto-generated by the Director software, and names are usually provided by the administrator of the default partition.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

file (QFabric System)

Syntax

```
file filename {
  archive {
    size maximum-file-size;
  }
  explicit-priority;
  facility severity;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the logging of system messages to a file.

NOTE: On the QFabric system, a syslog file named messages is configured implicitly with facility and severity levels of any any and a size of 100 MBs.

Options

facility—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements.

filename—Filename that you specify with the **show log** command.

Default: Filename **messages**

severity—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities at the specified level and higher are logged.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

graceful-restart (Enabling Globally)

Syntax

```
graceful-restart {
  disable;
  helper-disable;
  maximum-helper-recovery-time seconds;
  maximum-helper-restart-time seconds;
  notify-duration seconds;
  recovery-time seconds;
  restart-duration seconds;
  stale-routes-time seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* routing-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit routing-options],
[edit routing-instances *routing-instance-name* routing-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally.

For VPNs, the **graceful-restart** statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.

For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

Default

Graceful restart is disabled by default.

Options

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit protocols bgp group *group-name* neighbor *address*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Enable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

NOTE: If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

Configure graceful restart globally at the **[edit routing-options]** or **[edit routing-instances *instance-name* routing-options]** hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

graceful-restart (Protocols OSPF)

Syntax

```
graceful-restart {
  disable;
  helper-disable (standard | restart-signaling | both);
  no-strict-lsa-checking;
  notify-duration seconds;
  restart-duration seconds;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* protocols (ospf | ospf3)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3)],
[edit protocols (ospf | ospf3)],
[edit routing-instances *routing-instance-name* protocols ospf]

Release Information

Statement introduced before Junos OS Release 7.4.
Support for the **no-strict-lsa-checking** statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the helper mode **standard**, **restart-signaling**, and **both** options introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description

Configure graceful restart for OSPF.

Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the **[edit routing-options]** hierarchy level.

Options

disable—Disable graceful restart for OSPF.

helper-disable (standard | restart-signaling| both)—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The **standard**, **restart-signaling**, and **both** options are only supported for OSPFv2. Specify **standard** to disable helper mode for standard graceful restart (based on RFC 3623). Specify **restart-signaling** to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify **both** to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.

Default: Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.

no-strict-lsa-checking—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.

NOTE: The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the **show protocols (ospf | ospf3)** command.

notify-duration ***seconds***—Estimated time needed to send out purged grace LSAs over all the interfaces.

Range: 1 through 3600 seconds

Default: 30 seconds

restart-duration ***seconds***—Estimated time needed to reacquire a full OSPF neighbor from each area.

Range: 1 through 3600 seconds

Default: 180 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interconnect-device (Chassis)

Syntax

```
interconnect-device {
  alarm {
    (ethernet | management-ethernet) {
      link-down (red | yellow | ignore);
    }
  }
  container-devices {
    device-count number;
  }
  craft-lockout {
    alarm {
      interface-type {
        link-down (red | yellow | ignore);
      }
    }
    container-devices {
      device-count number;
    }
    fpc slot {
      power (on | off);
    }
    routing-engine {
      on-disk-failure {
        disk-failure-action (halt | reboot);
      }
    }
  }
  fpc slot {
    power (on | off);
  }
  routing-engine {
    on-disk-failure {
      disk-failure-action (halt | reboot);
    }
  }
}
```

Hierarchy Level [edit chassis]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure properties specific to a QFabric system Interconnect device.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Understanding Interconnect Devices on page 1183

interconnect-device (Aliases)

Syntax

```
interconnect-device interconnect-device-name {
    assigned-interconnect-device-name;
}
```

Hierarchy Level [edit fabric aliases]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description (QFabric systems only) Specify the mapping of user-defined names to QFabric system Interconnect devices.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names all, fabric, or director-group as an alias name.

Options

interconnect-device-name—Specify a user-defined name for a QFabric system Interconnect device.

assigned-interconnect-device-name—Specify the Interconnect device identifier or name that has been provided. Identifiers are usually auto-generated by the Interconnect software, and names are usually provided by the administrator of the default partition.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

multicast (QFabric Routing Options)

Syntax

```
multicast {
  fabric-optimized-distribution
  no-make-before-break;
}
```

Hierarchy Level [edit fabric routing-options]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description (QFabric systems only) Set multicast routing options in a QFabric system, such as no-make-before-break.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Understanding the QFabric System Data Plane on page 1199

network-domain

Syntax network-domain;

Hierarchy Level [edit fabric resources node-group *node-group-name*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Designate a Node group to become a *network Node group*, which is used to route traffic between a QFabric system and external networks. The absence of the **network-domain** configuration statement implies that the Node group is a *server Node group*, which is used to group sets of Node devices that are connected to servers or storage devices.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Node Groups for the QFabric System on page 1363
- Understanding Node Groups on page 1190

no-make-before-break

Syntax no-make-before-break;

Hierarchy Level [edit fabric routing-options multicast]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description (QFabric systems only) Disable the default *make-before-break* multicast feature on QFabric systems to prevent the duplication of system traffic. This feature increases the speed of data plane traffic, but carries the risk of minor traffic losses when compared with the default make-before-break method of creating new multicast fabric paths before tearing down the old paths. The absence of the **no-make-before-break** configuration statement implies that the make-before-break default system behavior is in effect.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Understanding the QFabric System Data Plane on page 1199

node-device (Aliases)

Syntax

```
node-device node-device-name {
  assigned-node-device-name;
}
```

Hierarchy Level [edit fabric aliases]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Specify the mapping of user-defined names to QFabric system Node devices.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as an alias name.

Options ***node-device-name***—Specify a user-defined name for a QFabric system Node device.

assigned-node-device-name—Specify the Node device identifier or name that has been provided. Identifiers are usually autogenerated by the Director software, and names are usually provided by the administrator of the default partition.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

node-group (Chassis)

Syntax

```
node-group name {
  aggregated-devices {
    ethernet {
      device-count number;
    }
  }
  alarm {
    interface-type {
      link-down (ignore | red | yellow);
    }
  }
  container-devices {
    device-count number;
  }
  node-device name {
    fibre-channel {
      port-range {
        port-range-low port-range-high;
      }
    }
  }
  pic pic-number {
    fte {
      port port-number;
      port-range port-range-low port-range-high;
    }
    xe {
      port port-number;
      port-range port-range-low port-range-high;
    }
  }
  routing-engine {
    on-disk-failure {
      disk-failure-action (halt | reboot);
    }
  }
}
```

Hierarchy Level [edit chassis]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure properties specific to a Node group.

The remaining statements are explained separately.

node-group (Resources)

Syntax

```
node-group node-group-name {
  network-domain;
  node-device node-device-name;
}
```

Hierarchy Level [edit fabric resources]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Define Node groups within a QFabric system.

NOTE: The following rules apply to QFabric Node group naming:

- The network Node group must use the predefined name *NW-NG-0*. You must use this name when adding Node devices to the network Node group. You cannot specify a different name. Also, you can configure only one network Node group per partition.
- Node group names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of a Node group name is 30 characters.
- Node group names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as a Node group name.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

pic (Port)

Syntax

```
pic pic-number {
  fte {
    (port port-number | port-range port-range-low port-range-high);
  }
  xe {
    (port port-number | port-range port-range-low port-range-high);
  }
}
```

Hierarchy Level [edit chassis interconnect-device *name* fpc *slot*]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description (QFX3600 Node device only) Configure port types on QFX3600 Node devices.

CAUTION: The Packet Forwarding Engine on the QFX3600 Node device is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the Node device.

Options

pic *pic-number*—Number of the physical interface card (PIC) on which you want to configure port types. Specify **0** to configure *xe* (10-Gigabit Ethernet) type ports. Specify **1** to configure *fte* (40-gigabit data plane uplink) type ports.

fte—Configure a specific port or a range of ports to operate as 40-gigabit data plane uplink ports.

xe—Configure a specific port or a range of ports to operate as four 10-Gigabit Ethernet ports.

port-number—Port number on which you want to configure the port type. Valid values are 0 through 7 if the port type is **fte**, and 2 through 15 if the port type is **xe**.

port-range-low—Lowest-numbered port in the range of ports. The lowest possible value is 0 if the port type is **fte**. The lowest possible value is 2 if the port type is **xe**.

port-range-high—Highest-numbered port in the range of ports. The highest possible value is 7 if the port type is **fte**. The highest possible value is 15 if the port type is **xe**.

NOTE:

- By default, ports Q0 through Q3 operate as fte type ports, and ports Q4 through Q15 operate as xe type ports.
- Only ports Q0 through Q7 can be configured as fte type ports.
- Only ports Q2 through Q15 can be configured as xe type ports.

NOTE: When you delete the port type configuration for an individual port or a block of ports, the ports return to operating in their default port type.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

remote-debug-permission

Syntax remote-debug-permission (qfabric-admin | qfabric-operator | qfabric-user);

Hierarchy Level [edit system login user *username* authentication]
[edit system root-authentication]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Configure authentication classes that permit or deny user access to individual components of the QFabric system.

Default qfabric-user

Options
qfabric-admin—Permits a user to log in to individual QFabric system components, view operations, and change component configurations.

qfabric-operator—Permits a user to log in to individual QFabric system components and view component operations.

qfabric-user—Prevents a user from logging in to individual QFabric system components.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

- Performing System Backup and Recovery for a QFabric System on page 1435

Performing a Nonstop Software Upgrade on the QFabric System

NOTE: Before you can perform a nonstop software upgrade to Junos OS Release 13.1X50-D10, you must have Junos OS Release 12.2X50-D42 or later installed. You cannot perform a nonstop software upgrade with Junos OS Release 12.2X50-D41 or earlier. Contact the Juniper Technical Assistance Center for information on how to download Junos OS Release 12.2X50-D42. Performing a standard software upgrade (that is, issuing the **request system software add component all** command) does not require that you that you upgrade to an intermediate Junos OS software release.

To perform a nonstop software upgrade to Junos OS Release 13.1X50-D10:

1. First perform a nonstop software upgrade to Junos OS Release 12.2X50-D42.
2. Then perform a nonstop software upgrade to Junos OS Release 13.1X50-D10.

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device
- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

NOTE: Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

NOTE: Before you install the software, we recommend that you back up your current configuration files by issuing the **request system software configuration-backup** command.

NOTE: Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the **request system software add component all** command.

This topic describes the following tasks:

- Backing Up the Current Configuration Files on page 1407
- Downloading Software Files Using a Browser on page 1407
- Retrieving Software Files for Download on page 1408
- Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 1408
- Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components on page 1408
- (Optional) Creating Upgrade Groups for Node Groups on page 1409
- Performing a Nonstop Software Upgrade on a Node Group on page 1410

Backing Up the Current Configuration Files

To back up your current configuration files:

`user@qfabric>` **request system software configuration-backup** ***path***

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

`user@qfabric>` **request system software configuration-backup/media/USB/**

Downloading Software Files Using a Browser

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install package you want to download in the **QFabric System Install Package** section:
   - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
   - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see "Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device" on page 111.

   A login screen appears.
7. Enter your user ID and password and press **Enter**.
8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-*version*.rpm** file on your computer.

Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

  ```
  user@qfabric> request system software download /path/package-name
  ```

  For example:

  ```
  user@qfabric> request system software download
  ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
  ```

Performing a Nonstop Software Upgrade for Director Devices in a Director Group

NOTE: If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group** *package-name* command.

  For example:

  ```
  user@qfabric> request system software nonstop-upgrade director-group
  jinstall-qfabric-12.2X50-D10.3.rpm
  ```

Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To do verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric** *package-name* command.

  For example:

  ```
  user@qfabric> request system software nonstop-upgrade fabric
  jinstall-qfabric-12.2X50-D10.3.rpm
  ```

(Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

NOTE:

- Upgrade groups work best when you build in redundancy so that not all the Node devices within the Node group restart at the same time. We suggest using the upgrade group feature for Node groups that have at least 2 pairs of Node devices (4 or more members), such as the network Node group.
- If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group** *node-group-name* **nssu upgrade-group** *upgrade-group-name* **node-devices** command at the **[edit chassis]** hierarchy.

  For example:

```
user@qfabric# set chassis node-group NW-NG-0 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
user@qfabric# set chassis node-group NW-NG-0 nssu upgrade-group upgrade2 node-devices
[ node3 node4 ]
```

Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

NOTE: You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group *node-group-name package-name*** command.

  To perform a nonstop upgrade on one Node group:

  ```
  user@qfabric> request system software nonstop-upgrade node-group nodegroup1
  jinstall-qfabric-12.2X50-D10.3.rpm
  ```

  To perform a nonstop upgrade on more than one Node group:

  ```
  user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
  nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
  ```

Verifying Nonstop Software Upgrade for QFabric Systems

This topic discusses how you can monitor the progress of each of the three steps in a nonstop software upgrade. By identifying the key actions and events that define this process, you can track the status of the upgrade with confidence.

TIP: When performing a nonstop software upgrade, open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a

second session to verify that the QFabric system components respond to operational mode commands as expected.

- Verifying a Director Group Nonstop Software Upgrade on page 1411
- Verifying a Fabric Nonstop Software Upgrade on page 1423
- Verifying a Redundant Server Node Group Nonstop Software Upgrade on page 1425
- Verifying a Network Node Group Nonstop Software Upgrade on page 1428

Verifying a Director Group Nonstop Software Upgrade

Purpose During the Director group portion of a nonstop software upgrade, you should expect to see the Director device that hosts the CLI session selected as the master device. When mastership of all processes moves to the master, the QFabric system upgrades the backup Director device and this Director device reboots. After the backup Director device comes back online, the master Director device suspends CLI operations for 15 minutes, upgrades itself, and reboots. At this point, the backup becomes the new master Director device and you can issue CLI operational commands. Finally, the former master comes back online as a backup and both devices are operational once again. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

Action

1. In one SSH session to the QFabric CLI, verify the current status of the QFabric system by issuing the **show fabric administration inventory**, **show fabric administration inventory director-group status**, and **show fabric session-host** commands. In this case, Director device DG0 is the master device but DG1 hosts the CLI session.

```
session1@qfabric>  show fabric administration inventory
Item                    Identifier              Connection      Configuration

5. When the system upgrades and reboots the backup Director device DG0, notice how this device is not displayed in the output of the **show fabric administration inventory director-group status** command. Because Director device DG1 appears, this means that the DG1 is operational and acts as the master device.

NOTE: If your second SSH session is being hosted by the rebooting Director device, your session terminates and you need to log back in to establish a new session running on the active Director device.

```
session1@qfabric> show fabric administration inventory director-group status

Verifying a Fabric Nonstop Software Upgrade

Purpose During the fabric portion of a nonstop software upgrade, you should expect to see both fabric control Routing Engines upgrade first, followed by the upgrade of each Interconnect

device one at a time. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

Action

1. In an SSH session to the QFabric CLI, issue the request for the fabric nonstop software upgrade.

```
root@qfabric>  request system software nonstop-upgrade fabric
jinstall-qfabric-12.2X50-D10.3.rpm

Verifying a Network Node Group Nonstop Software Upgrade

Purpose During the network Node group portion of a nonstop software upgrade, you should expect to see the backup network Node group Routing Engine upgrade first, followed by the Node devices within the network Node group upgrading one at a time, and ending with the upgrade of the master network Node group Routing Engine. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

NOTE: If you configure an upgrade group for Node groups containing 2 or more Node devices, all Node devices within the upgrade group reboot at the same time.

Action 1. In an SSH session to the QFabric CLI, issue the request for the network Node group nonstop software upgrade.

```
root@qfabric>  request system software nonstop-upgrade node-group NW-NG-0
jinstall-qfabric-12.2X50-D10.3.rpm
Upgrading target(s): NW-NG-0

[NW-NG-0  2012-06-01 09:45:06]: Starting with package

[Status   2012-06-01 10:18:58]: Upgrade completed with 0 errors
Success
```

2. Issue the **show system software upgrade status** command to view the status of the upgrade.

```
root@qfabric>  show system software upgrade status
Wed Jan 16 22:06:02 2013 Software nonstop upgrade on:
                         NW-NG-0 in progress
```

3. Verify the progress of the upgrade by issuing the **show chassis nonstop-upgrade node-group**, **show fabric administration inventory**, **show fabric administration inventory infrastructure**, and **show fabric administration inventory node-groups NW-NG-0** commands. You should see the backup network Node group Routing Engine reboot first, followed by each Node device within the network Node group, and ending with the reboot of master network Node group Routing Engine. Restarting devices appear as **Disconnected** in the output of the **show fabric administration inventory** command and restarting Routing Engines do not appear in output of the **show fabric administration inventory infrastructure** command until they return to service.

Upgrading Software on a QFabric System

The QFabric system software package contains software for all of the different components in the QFabric system, such as the Director group, Interconnect devices, Node devices, and other QFabric system components. You can upgrade the software on all of the QFabric components at the same time using the **request system software add *package-name* component all reboot** command.

NOTE: **Downgrading software on a QFabric system is not supported.**

This topic describes the following tasks:

- Backing Up the Current Configuration Files on page 1430
- Downloading Software Files Using a Browser on page 1431
- Retrieving Software Files for Download on page 1432
- Installing the Software Package on the Entire QFabric System on page 1432

Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@switch> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@switch> request system software configuration-backup /media/USB/
```

Downloading Software Files Using a Browser

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install package you want to download in the **QFabric System Install Package** section:
   - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
   - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see "Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device" on page 111.

   A login screen appears.
7. Enter your user ID and password and click **Login**.
8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-*version*.rpm** file on your computer.

Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

  ```
  user@switch> request system software download /path/package-name
  ```

  For example:

  ```
  user@switch> request system software download
  ftp://server/files/jinstall-qfabric-11.3X30.6.rpm
  ```

Installing the Software Package on the Entire QFabric System

NOTE: On a QFabric system, a QFX3500 Node device or QFX3600 Node device might not be able to participate as a Node device in the QFabric system if the Node device is running a different version of software from that of the Director group. This mismatch of software versions between the Node device and the Director group can occur when the Node device is introduced into the setup, and both Director devices go offline before the Node device completes its auto-upgrade process to upgrade its software version to the same software version running on the Director group. The workaround is to reboot the QFX3500 or QFX3600 Node device once the Director group comes back online. The QFX3500 or QFX3600 Node device will initiate auto-upgrade and upgrade its software version from the Director group.

1. Issue the **request system software add** *package-name* **component all reboot** command.

   For example:

   ```
   user@switch> request system software add jinstall-qfabric-11.3X30.6.rpm component all
   reboot
   ```

NOTE: If you receive an error message after issuing the **request system software add** *package-name* **component all reboot** command that says that the configuration file cannot be loaded as is, you will need to enter configuration mode, make any necessary changes to the configuration file, and then commit the changes.

NOTE: The default value for a QFabric system software upgrade is **validate**. The validation step adds up to 10 minutes to the overall software upgrade. If the validation fails, the upgrade does not proceed and the QFabric system automatically issues the **request system software rollback** command to restore the current software image. If you upgrade more than one component (for example, by issuing the **component all** option), validation failure on one device stops the upgrade process for the other devices. If you do not want to validate the software package against the current configuration, issue the **no-validate** option.

2. After the reboot has finished, verify that the new version of software has been properly installed by issuing the **show version component all** command.

```
user@switch> show version component all

Performing System Backup and Recovery for a QFabric System

Many routers and switches require an administrator to recover the software package and the configuration file for the device separately. In the case of a device failure, this means the administrator might need to perform two separate tasks (if neither the software package nor the configuration file can be recovered).

In contrast, the QFabric system uses a unique mechanism that saves the backup and recovery files for both the Junos OS software and the system configuration into a single collection. The following QFabric system backup and recovery mechanism simplifies and streamlines the recovery process so you can return to normal operations as quickly as possible.

To backup and recover your QFabric system:

1. (First time only) Implement the following one-time procedure to prepare your QFabric system to use the system backup and recovery feature:
   - Insert a Juniper Networks software installation USB flash drive into the master Director device. (This drive was provided to you as one of the components of your QFabric system shipment.)
   - Issue the **request system software format-qfabric-backup** command. The contents and format of the USB flash drive are copied to the Director group shared directory and are used as the basis for all future backup and recovery operations.

     ```
     user@qfabric> request system software format-qfabric-backup
     Copying QFabric USB template image from /dev/sdb(Unigen,PQS4000,4009 MB)......
     ```

   - Remove the Juniper Networks software installation USB drive from the master Director device.
2. Issue the **request system software system-backup** command to backup the software package and configuration file. This command saves the current files necessary to recover the QFabric system. The files are saved to a shared memory directory in the Director group.

   NOTE: As you upgrade your system with new software and change the system configuration over time, remember to reissue this command periodically to save the newest files for recovery purposes.

   ```
   user@qfabric> request system software system-backup
   ```

```
user@qfabric>
```

3. Insert a 4 GB or larger USB flash drive into the master Director device for your Director group, and issue the **request system software system-backup usb-create** command. This command copies the recovery files that have been backed up in the Director group and transfers them to the USB flash drive to create a recovery USB drive.

   NOTE: Issuing this command overwrites the contents of the USB flash drive with the QFabric system recovery files.

```
user@qfabric> request system software system-backup usb-create /dev/sdb
Issuing this command will overwrite the contents of the USB drive.
Continue? [yes,no] (no) yes

This operation will access the USB drive on 0281042010000013.
Are you sure you want to continue? [yes,no] (no) yes

Copying QFabric recovery media to /dev/sdb...
Successfully copied QFabric recovery media to /dev/sdb
```

4. Remove the recovery USB drive from the Director device, and store it securely in a known location that you will remember when you need to use the recovery USB drive.
5. If the QFabric system fails, power off the Director group, insert the recovery USB drive into the master Director device of your Director group, turn on power to the Director device, and follow the prompts to recover your system. This step restores the software package and the configuration file for your QFabric system.

QFabric System Operational Mode Commands

Table 139 on page 1437 summarizes the command line interface (CLI) commands that you can use to monitor and troubleshoot the QFabric system operations.

Table 139: QFabric System Operational Mode Commands

Task	Command
Select the operating mode for the device.	request chassis device-mode
Set the Interconnect device Flexible PIC Concentrator (FPC) offline or online for the QFabric system.	request chassis fabric fpc
Log in to individual QFabric system components for device level troubleshooting.	request component login
Select a Director device to become the new primary device within a Director group.	request fabric administration director-group change-master
Remove a disconnected component from the QFabric system inventory.	request fabric administration remove

Table 139: QFabric System Operational Mode Commands *(continued)*

Task	Command
Add a MAC range to the MAC pool assigned to the QFabric system.	request fabric administration system mac-pool add
Delete a MAC range from the MAC block assigned to the QFabric system.	request fabric administration system mac-pool delete
Halt a Director device.	request system halt director-device
Reboot QFabric system components.	request system reboot
Upgrade the software version of the QFabric system by using the nonstop software upgrade method (which preserves forwarding functionality during the upgrade and enables components to upgrade on a rotating basis).	request system software nonstop-upgrade
Save the software package and system configuration files to be able to recover the QFabric system in the case of a system failure.	request system software system-backup
Specify information to be displayed on the LCD panel of a QFabric system device.	set chassis display message
Display information about the operating mode of the device.	show chassis device-mode
Display the status of Ethernet switching in the Control Board of an Interconnect device.	show chassis ethernet-switch interconnect-device cb
Display the status of Ethernet switching in the Flexible PIC Controller (FPC) of an Interconnect device.	show chassis ethernet-switch interconnect-device fpc
Display the status of the data plane connections in the QFabric system.	show chassis fabric connectivity
Display the fabric management status of devices in your QFabric system.	show chassis fabric device
Display information shown on the LCD screen of a QFabric system device.	show chassis lcd
Display the status of a nonstop software upgrade for a Node group.	show chassis nonstop-upgrade node-group
Display all devices that belong to the QFabric system.	show fabric administration inventory
Display the Director devices that belong to a QFabric system Director group.	show fabric administration inventory director-group status
Display the services running on the Director group for the QFabric system.	show fabric administration inventory infrastructure

Table 139: QFabric System Operational Mode Commands *(continued)*

Task	Command
Display the Interconnect devices that belong to a QFabric system.	show fabric administration inventory interconnect-devices
Display the Node devices that belong to the QFabric system.	show fabric administration inventory node-devices
Display the Node groups and the corresponding Node devices that belong to the QFabric system.	show fabric administration inventory node-groups
Display all devices that belong to the QFabric system.	show fabric inventory
Display the MAC addresses that belong to a QFabric system Director group.	show fabric administration system mac-pool
Display the Director device that hosts the QFabric CLI session.	show fabric session-host
Display the system log messages in the specified file.	show log
Display the status of a QFabric system software upgrade.	show system software upgrade status

Filtering Operational Mode Command Output in a QFabric System

When you issue an operational mode command in a QFabric system, the output generated can be fairly extensive because of the number of components contained within the system. To make the output more accessible, you can filter the output by appending the **| filter** option to the end of most Junos OS commands.

1. To filter operational mode command output and limit it to a Node group, include the **| filter node-group** *node-group-name* option at the end of your Junos OS operational mode command.

   root@qfabric> show interfaces terse | filter node-group NW-NG-0

```
Interface               Admin Link Proto    Local                 Remote
NW-NG-0:dsc             up    up
NW-NG-0:em0             up    up
NW-NG-0:em1             up    up
NW-NG-0:gre             up    up
NW-NG-0:ipip            up    up
NW-NG-0:lo0             up    up
NW-NG-0:lo0.16384       up    up   inet     127.0.0.1           --> 0/0
NW-NG-0:lo0.16385       up    up   inet
NW-NG-0:lsi             up    up
NW-NG-0:mtun            up    up
NW-NG-0:pimd            up    up
NW-NG-0:pime            up    up
NW-NG-0:tap             up    up
Node01:ge-0/0/10        up    up
Node01:ge-0/0/40        up    up
```

```
Node01:ge-0/0/41          up    up
vlan                      up    up
```

2. To filter operational mode command output and limit it to a set of Node groups, include the **| filter node-group** option at the end of your Junos OS operational mode command and specify the list of Node group names in brackets.

```
root@qfabric>  show ethernet-switching interfaces | filter node-group [NW-NG-0 RSNG-1]
Interface    State  VLAN members        Tag   Tagging  Blocking
NW-NG-0:ae0.0 up    v200                200   tagged   unblocked

request chassis device-mode

Syntax request chassis device-mode (node-device | standalone)

Release Information Command introduced in Junos OS Release 11.2 for the QFX Series.

Description Select the operating mode for the device. For example, a QFX3500 or QFX3600 device can operate either as a single switch in *standalone* mode or as a QFabric system Node device in *node-device* mode.

NOTE:

- Issue the request chassis device-mode command only when your management station is connected directly to the device over a console port connection.
- Changing the device mode erases all configuration data on the device. When you convert a device from standalone to Node device mode, we recommend that you back up your device configuration to an external location before issuing the request chassis device-mode command.

Options

node-device—Set the device to operate as a Node device within a QFabric system. To complete the Node device mode conversion process, you must connect the device to the QFabric system management control plane and reboot the device.

standalone—Set the device to operate as a standalone switch. If the device is in Node device mode, you must reboot the device to return to standalone mode. Standalone mode is the factory default setting.

Required Privilege Level admin

List of Sample Output

request chassis device-mode node-device (Starting in Standalone Mode) on page 1442
request chassis device-mode node-device (Starting in Node Device Mode) on page 1442
request chassis device-mode standalone (Starting in Node Device Mode) on page 1442
request chassis device-mode standalone (Starting in Standalone Mode) on page 1442

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis device-mode node-device (Starting in Standalone Mode)

```
user@switch> request chassis device-mode node-device
Device mode set to 'node-device' mode.
Please reboot the system to complete the process.
```

request chassis device-mode node-device (Starting in Node Device Mode)

```
user@switch> request chassis device-mode node-device
Device mode set to 'node-device' mode.
No reboot required.
```

request chassis device-mode standalone (Starting in Node Device Mode)

```
user@switch> request chassis device-mode standalone
Device mode set to 'standalone' mode.
Please reboot the system to complete the process.
```

request chassis device-mode standalone (Starting in Standalone Mode)

```
user@switch> request chassis device-mode standalone
Device mode set to 'standalone' mode.
No reboot required.
```

request chassis fabric fpc

Syntax request chassis fabric fpc interconnect-device *interconnect-device-name* slot *slot-number* (offline | online)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Set the Interconnect device Flexible PIC Concentrator (FPC) offline or online for the QFabric system. When the FPC is offline, traffic is redirected to other FPCs and is not lost while you remove or install an FPC. After issuing this command, you must issue the request chassis fpc command.

Options

interconnect-device *interconnect-device-name*—Set the Interconnect device containing the FPC you want to bring either offline or online.

slot *slot-number*—Set the specific FPC slot on the Interconnect device.

offline—Set the Interconnect device FPC to offline for removal.

online—Set the Interconnect device FPC to online after installation.

Required Privilege Level admin

Related Documentation

- request chassis fpc on page 363
- show chassis fabric connectivity on page 1520
- show chassis fabric device on page 1527
- Understanding Interconnect Devices on page 1183

List of Sample Output

request chassis fabric fpc online on page 1443
request chassis fabric fpc offline on page 1443

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis fabric fpc online

```
user@qfabric> request chassis fabric fpc interconnect-device IC-YW3781 offline slot 15
Graceful offline of the fabric card has been initiated. Please wait 20 seconds
before offlining or removing the card.
```

request chassis fabric fpc offline

```
user@qfabric> request chassis fabric fpc interconnect-device IC-YW3781 online slot 15
Bring the FPC online by issuing the "request chassis fpc online" command.
```

request component login

Syntax request component login *component-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Log in to a QFabric system component. To gain access to individual components by way of the **request component login** command, you must first provide the **qfabric-admin** or **qfabric-operator** class privilege to your user (for more information, see: remote-debug-permission).

Options *component-name*—Specify the QFabric system component to which you wish to log in.

Required Privilege Level admin

Related Documentation

request fabric administration director-group change-master

Syntax request fabric administration director-group change-master (director-device *director-device-name*)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Select a Director device to become the new primary device within a Director group. The specified device becomes the new master Director device, and the previous master Director device becomes a backup Director device.

Options

none—Change the device that controls the Director group. Assign the current backup Director device as the new master and the current master Director device as the backup.

director-device *director-device-name*—Specify which Director device should become the primary device within the Director group.

Required Privilege Level admin

Related Documentation

List of Sample Output request fabric administration director-group change-master on page 1446

Sample Output

request fabric administration director-group change-master

```
user@qfabric> request fabric administration director-group change-master
Do you intend to switchover mastership? [yes,no] (no) yes

Cluster master successfully switched
```

request fabric administration remove

Syntax request fabric administration remove (interconnect-device *interconnect-device-name* | node-device *node-device-name*)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Remove a disconnected Interconnect or Node device from the QFabric system inventory so that it does not appear in the output of the **show fabric administration inventory** command.

NOTE:

- You cannot remove any devices that appear in the **Connected** state in the output of the **show fabric administration inventory** command.
- For Node devices, you can only remove a device if it belongs to an autogenerated server Node group that contains a single Node device. Node devices contained within redundant server Node groups or network Node groups cannot be removed directly. To remove a Node device that is part of a group, delete the device from the Node group configuration first before attempting to remove the device from the inventory.

Options **interconnect-device *interconnect-device-name***—Remove a disconnected Interconnect device from the QFabric system inventory.

node-device *node-device-name*—Remove a disconnected Node device from the QFabric system inventory.

Required Privilege Level admin

List of Sample Output

request fabric administration remove interconnect-device on page 1447
request fabric administration remove node-device on page 1448

Sample Output

request fabric administration remove interconnect-device

```
user@qfabric> request fabric administration remove interconnect-device IC1
Device successfully removed
```

Sample Output

request fabric administration remove node-device

```
user@qfabric> request fabric administration remove node-device node5
Device successfully removed
```

request fabric administration system mac-pool add

Syntax request fabric administration system mac-pool add mac-base *starting-mac-address* count *number-of-mac-address*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Add a MAC address pool to expand the initial set of MAC addresses assigned to the QFabric system.

Options

mac-base *starting-mac-address*—Set the starting MAC address for a pool of addresses assigned to the QFabric system.

count *number-of-mac-address*—Set the total number of MAC addresses in the specified address pool assigned to the QFabric system.

Required Privilege Level admin

Related Documentation

- request fabric administration system mac-pool delete on page 1450
- show fabric administration system mac-pool on page 1562

List of Sample Output request fabric administration system mac-pool add mac-base starting-mac-address count on page 1449

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request fabric administration system mac-pool add mac-base starting-mac-address count

```
user@switch> request fabric administration system mac-pool add mac-base 02:00:00:11:22:00
count 10
```

request fabric administration system mac-pool delete

Syntax request fabric administration system mac-pool delete mac-base *starting-mac-address*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Delete a range of MAC addresses assigned manually to the QFabric system.

NOTE: You cannot delete the MAC address range assigned during the initial setup of the QFabric system. Also, you cannot delete a MAC address range if the MAC address block is still in use.

Options **mac-base *starting-mac-address***—Specify the starting MAC address for a pool of addresses you wish to remove from the QFabric system.

Additional Information After you issue the **request fabric administration system mac-pool delete** command, issue the show fabric administration system mac-pool command to verify that the MAC address range has been deleted.

Required Privilege Level admin

Release Information

Command introduced before Junos OS Release 7.4.
other-routing-engine option introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
director-device option introduced for QFabric systems in Junos OS Release 12.2.
backup-routing-engine option introduced in Junos OS Release 13.1.

Description

Stop the router or switch software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, use the **member** option from the Node group CLI. You cannot issue this command from the QFabric CLI.

Options

none—Stop the router or switch software immediately.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

at *time* —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to stop the software.
- ***yymmddhhmm***—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to stop the software.

backup-routing-engine—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

both-routing-engines—(Optional) Halt both Routing Engines at the same time.

director-device *director-device-id*—(QFabric systems only) Halt a specific Director device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

in *minutes*—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping the software.

other-routing-engine—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

slice *slice*—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information

On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

NOTE: If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

Required Privilege Level maintenance

List of Sample Output

request system halt on page 1456
request system halt (In 2 Hours) on page 1456
request system halt (Immediately) on page 1456
request system halt (At 1:20 AM) on page 1456

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

request system halt (Immediately)

```
user@host> request system halt at now
```

request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

request system reboot

Syntax

request system reboot
<at **time**>
<in **minutes**>
<media (external | internal)>
<message "**text**">
<routing-engine>

Syntax (QFX Series)

request system reboot
<all <graceful>>
<director-device *name*>
<director-group <graceful>>
<fabric <graceful>>
<node-group *name*>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Reboot the Junos OS.

NOTE: On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

Options

none—Reboots the software immediately.

all—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

at time—(Optional) Time at which to reboot the software, specified in one of the following ways:

- ***+minutes***—Number of minutes from now to reboot the software.
- ***hh:mm***—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

director-device *name*—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

director-group—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

fabric—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

graceful—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

in minutes—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +*minutes*** option.

media (external | internal)—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

message "text"—(Optional) Message to display to all system users before rebooting the software.

node-group *name*—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

routing-engine—(Optional) Reboot the Routing Engine.

```

request system reboot (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@switch> request system reboot at now
```

request system reboot (At 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system reboot director-device

```
user@switch> request system reboot director-device Node1
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

request system reboot director-group

```
user@switch> request system reboot director-group
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

request system reboot director-group graceful

```
user@switch> request system reboot director-group graceful
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

request system software format-qfabric-backup

Syntax request system software format-qfabric-backup

Release Information Command introduced in Junos OS Release 13.1 for the QFX Series.

Description (QFabric systems only) Copy the install media files from a USB flash drive to your QFabric system recovery directory on the Director group. You must issue this command before you can use the **request system software system-backup** and **request system software system-backup copy-to-usb** commands.

Options **none**—Copy the install media files from a USB flash drive to a Director group recovery directory.

Required Privilege Level maintenance

List of Sample Output request system software format-qfabric-backup on page 1460

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system software format-qfabric-backup

```
user@qfabric> request system software format-qfabric-backup
Copying QFabric USB template image from /dev/sdb(Unigen,PQS4000,4009 MB)......
```

request system software nonstop-upgrade

Syntax request system software nonstop-upgrade *package-name*
<fabric >
<director-group>
<node-group *name*>

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.

Options *package-name*—Location from which the software is to be installed. For example:

- ***protocol*://*hostname/pathname/package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:
  - **ftp**—File Transfer Protocol.
    Use **ftp://*hostname/pathname/package-name***. To specify authentication credentials, use **ftp://<*username*>:<*password*>@*hostname/pathname/package-name***. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.
    Use **http://*hostname/pathname/package-name***. To specify authentication credentials, use **http://<*username*>:<*password*>@*hostname/pathname/package-name***. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).
    Use **scp://*hostname/pathname/package-name***. To specify authentication credentials, use **scp://<*username*>:<*password*>@*hostname/pathname/package-name***.

NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

director-group—Install software package on the Director group and Fabric managers.

fabric—Install software package on the Interconnect devices and Fabric controls.

node-group *name* —Install software package on the redundant server Node group, server Node group, or network Node group.

Required Privilege Level maintenance

request system software system-backup

Syntax

request system software system-backup
<usb-create>

Release Information

Command introduced in Junos OS Release 13.1 for the QFX Series.

Description

(QFabric systems only) Save a copy of the current QFabric system configuration file and the current software package for recovery purposes. You can use these saved files to restore your QFabric system to full operation after a system failure or shutdown.

Options

none—Copy the QFabric system software package and system configuration file to a Director group recovery directory.

NOTE: If this command fails, insert a Juniper Networks software installation USB flash drive into the master Director device and issue the **request system software format-qfabric-backup** command. For more details about this prerequisite procedure that is required before you can use the QFabric system backup and recovery feature, see "Performing System Backup and Recovery for a QFabric System" on page 1435.

usb-create—Copy the QFabric system software package and system configuration file from the Director group recovery directory to a USB flash drive. When the files have been copied, you can use the USB flash drive to help your QFabric system recover from a failure condition.

NOTE: You must issue the **request system software system-backup** command (which saves the files to the Director group) before you can issue the **request system software system-backup usb-create** command.

request system software system-backup usb-create on page 1468

Output Fields When you enter these commands, you are provided feedback on the status of your request.

Sample Output

request system software system-backup

```
user@qfabric> request system software system-backup

user@qfabric>
```

request system software system-backup usb-create

```
user@qfabric> request system software system-backup usb-create /dev/sdb
Issuing this command will overwrite the contents of the USB drive.
Continue? [yes,no] (no) yes

This operation will access the USB drive on 0281042010000013.
Are you sure you want to continue? [yes,no] (no) yes

Copying QFabric recovery media to /dev/sdb...
Successfully copied QFabric recovery media to /dev/sdb

<permanent>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option for TX Matrix Plus router introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series standalone switches.
Command introduced in Junos OS Release 13.1 for QFabric systems.

Description

Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages three times, switching between messages every 60 seconds.

NOTE: On T Series routers, when this command is executed with the **permanent** option, the display of the text message alternates with that of the standard craft interface message continuously every 60 seconds.

By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

Options

"*message*"—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks (“ ”) deletes the text message from the craft interface display. On the LCD panel display, the message is limited to 16 characters.

fpc-slot *slot-number*—(TX Matrix Plus routers and EX4200 and QFX Series only) On the router or switch, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace ***slot-number*** with a value from **0** through **31**. On the

switch, display the text message for a specific member of a Virtual Chassis, where **fpc-slot *slot-number*** corresponds to the member ID. Replace ***slot-number*** with a value from **0** through **9**. On the QFX Series, the ***slot-number*** is always **0**. On a TX Matrix Plus router with 3D SIBs replace *slot-number* with a value from **0** through **63**.

interconnect-device *device-id*—(QFabric systems only) Display the text message on the craft interface display of an Interconnect device within a QFabric system.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

node-device *device-id*—(QFabric systems only) Display the text message on the craft interface display of a Node device within a QFabric system.

permanent—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

scc—(TX Matrix routers only) Display the text message on the craft interface display of the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) Display the text message on the craft interface display of the TX Matrix Plus router (or switch-fabric chassis).

Output Fields See *show chassis craft-interface* or show chassis lcd for an explanation of output fields.

Sample Output

set chassis display message (Creating)

The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
message sent

user@host> show chassis craft-interface
Red alarm:     LED off, relay off
Yellow alarm:  LED off, relay off
Host OK LED:   On
Host fail LED: Off
FPCs     0  1  2  3  4  5  6  7
-------------------------------
Green  ..  *..  *  *.
Red    ........
LCD screen:
     +--------------------+
     |NOC contact Dusty   |
     |(888) 555-1234      |
     +--------------------+
```

set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```
user@host> set chassis display message ""
message sent

user@host> show chassis craft-interface
Red alarm:     LED off, relay off
Yellow alarm:  LED off, relay off
Host OK LED:   On
Host fail LED: Off
FPCs     0  1  2  3  4  5  6  7
-------------------------------
Green  ..  *..  *  *.
Red    ........
LCD screen:
     +--------------------+

show chassis device-mode

Syntax show chassis device-mode

Release Information Command introduced in Junos OS Release 11.2 for the QFX Series.

Description Display information about the operating mode of the device. For example, QFX3500 devices operate either as a single switch in standalone mode or as a QFabric system Node device in node-device mode.

NOTE: Issue the **show chassis device-mode** command only when your management station is connected directly to the device over a console port connection.

Options There are no options for this command.

Required Privilege Level admin

Future device-mode after reboot : Node-device
```

show chassis ethernet-switch interconnect-device cb

Syntax

show chassis ethernet-switch interconnect-device *name* cb
<detail>
<port *number*>
<slot*number*>

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

(QFX3000-G QFabric systems only) Display Ethernet switch information for the Control Board (CB) ports in an Interconnect device.

Options

none—Display Ethernet switch information about each connected port on each online CB in the Interconnect device.

detail—(Optional) Display detailed status information for all CBs or for the CB in the specified slot in the Interconnect device.

port *number*—(Optional) Display Ethernet switch information about a specific port on a CB in the Interconnect device.

slot *number*—(Optional) Display Ethernet switch information about a CB in a specific slot in the Interconnect device.

Output Fields

Table 52 on page 466 lists the output fields for the **show chassis ethernet-switch interconnect-device cb** command. Output fields are listed in the approximate order in which they appear.

Table 141: show chassis ethernet-switch interconnect-device fpc Output Fields

Field Name	Field Description
Link is good on port n connected to device	Information about the link between each port on the FPC's Ethernet switch and one of the following devices: • FWD-SWITCH-0 • FWD-SWITCH-1 • CB0 • CB1
Speed is	Speed at which the Ethernet link is running: **10 Mb**When the device is **RE** or **Other RE** on the TX Matrix router, the speed is **1000 Mb**.
Duplex is	Duplex type of the Ethernet link: **full** or **half**.

Table 141: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the **no-concatenate** statement at the **[edit chassis]** hierarchy level, as described in the *Junos OS System Basics Configuration Guide*).
Flow Control TX is Enabled (or Disabled)	Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.
Flow Control RX is Enabled (or Disabled)	Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.
TX Octets	Number of octets sent.
TX Packets 64 Octets	Number of transmitted packets of size 64 octets.
TX Packets 65-127 Octets	Number of transmitted frames of size 65 through 127 octets.
TX Packets 128-255 Octets	Number of transmitted frames of size 128 through 255 octets.
TX Packets 256-511 Octets	Number of transmitted frames of size 256 through 511 octets.
TX Packets 512-1023 Octets	Number of transmitted frames of size 512 through 1023 octets.
TX Packets 1024-1518 Octets	Number of transmitted frames of size 1024 through 1518 octets.
TX Packets 1519-2047 Octets	Number of transmitted frames of size 1519 through 2047 octets.
TX Packets 2048-4095 Octets	Number of transmitted frames of size 2048 through 4095 octets.
TX Packets 4096-9216 Octets	Number of transmitted frames of size 4096 through 9216 octets.
TX Packets 9217-16383 Octets	Number of transmitted frames of size 9217 through 16383 octets.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	Number of packets sent after one collision.

Table 141: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
TX Mult. Collision frames	Number of packets sent after multiple collisions.
TX Late Collision Frames	Number of packets aborted during sending because of collisions after 64 bytes.
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Collision frames	Number of collision packets sent.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands sent.
TX MAC ctrl frames	Number of MAC control packets sent.
TX Frame deferred Xmns	Number of frames deferred in *x* milliseconds.
TX Oversize Packets	Number of oversized packets sent.
TX Jabbers	Total number of frames sent that exceed the maximum byte count and contain CRC errors .
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
RX Octets	Number of octets received.
RX Packets 64 Octets	Number of received packets of size 64 octets.
RX Packets 65-127 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 128-255 Octets	Number of received packets of size 128 through 255 octets.
RX Packets 256-511 Octets	Number of received packets of size 256 through 511 octets.
RX Packets 512-1023 Octets	Number of received packets of size 512 through 1023 octets.
RX Packets 1024-1518 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 1519-2047 Octets	Number of received packets of size 1519 through 2047 octets.

Table 141: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
RX Packets 2048-4095 Octets	Number of received packets of size 2048 through 4095 octets.
RX Packets 4096-9216 Octets	Number of received packets of size 4096 through 9216 octets.
RX Multicast Packets	Number of multicast packets received.
RX Broadcast Packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Align Errors	Number of incomplete octets received.
RX Fragments	Number of fragmented packets received.
RX Symbol errors	Number of symbols received that the router did not correctly decode.
RX Unsupported opcodes	Number of packets received with unsupported op codes.
RX Out of Range Length	Number of packets received with an out of range length.
RX False Carrier Errors	Number of packets received with false carrier errors.
RX Undersize Packets	Number of undersized packets received.
RX Oversize Packets	Number of oversized packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX 1519-1522 Good Vlan frms	
RX MTU Exceed Counter	Number of packets received that exceed the MTU.
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX Byte Counter	Number of bytes received.

show chassis ethernet-switch interconnect-device fpc

Syntax
show chassis ethernet-switch interconnect-device *name* fpc
<detail>
<port *number*>
<slot *number*>

Release Information
Command introduced in Junos OS Release 12.2 for the QFX Series.

Description
(QFX3000-G QFabric systems only) Display Ethernet switch information for the front card Flexible Port Concentrators (FPCs) in an Interconnect device.

Options
none—Display Ethernet switch information about each connected port on each online FPC in the Interconnect device.

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot in the Interconnect device.

port *number*—(Optional) Display Ethernet switch information about a specific port on an FPC in the Interconnect device.

slot *number*—(Optional) Display Ethernet switch information about an FPC in a specific slot in the Interconnect device.

Required Privilege Level
view

List of Sample Output
show chassis ethernet-switch interconnect-device fpc on page 1498
show chassis ethernet-switch interconnect-device fpc detail on page 1501
show chassis ethernet-switch fpc detail slot on page 1508
show chassis ethernet-switch fpc interconnect-device port on page 1514
show chassis ethernet-switch fpc interconnect-device detail port on page 1516

Output Fields
Table 52 on page 466 lists the output fields for the **show chassis ethernet-switch interconnect-device fpc** command. Output fields are listed in the approximate order in which they appear.

Table 142: show chassis ethernet-switch interconnect-device fpc Output Fields

Field Name	Field Description
Link is good on port n connected to device	Information about the link between each port on the FPC's Ethernet switch and one of the following devices: • FWD-SWITCH-0 • FWD-SWITCH-1 • CB0 • CB1
Speed is	Speed at which the Ethernet link is running: **10 Mb**When the device is **RE** or **Other RE** on the TX Matrix router, the speed is **1000 Mb**.

Table 142: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
Duplex is	Duplex type of the Ethernet link: **full** or **half**.
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the **no-concatenate** statement at the **[edit chassis]** hierarchy level, as described in the *Junos OS System Basics Configuration Guide*).
TX Octets	Number of octets sent.
TX Packets 64 Octets	Number of transmitted frames of size 64 octets.
TX Packets 65-127 Octets	Number of transmitted frames of size 65 through 127 octets.
TX Packets 128-255 Octets	Number of transmitted frames of size 128 through 255 octets.
TX Packets 256-511 Octets	Number of transmitted frames of size 256 through 511 octets.
TX Packets 512-1023 Octets	Number of transmitted frames of size 512 through 1023 octets.
TX Packets 1024-1518 Octets	Number of transmitted frames of size 1024 through 1518 octets.
TX Packets 1519-2047 Octets	Number of transmitted frames of size 1519 through 2047 octets.
TX Packets 2048-4095 Octets	Number of transmitted frames of size 2048 through 4095 octets.
TX Packets 4096-9216 Octets	Number of transmitted frames of size 4096 through 9216 octets.
TX Packets 9217-16383 Octets	Number of transmitted frames of size 9217 through 16383 octets.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	Number of packets sent after one collision.
TX Mult. Collision frames	Number of packets sent after multiple collisions.
TX Late Collision Frames	Number of packets aborted during sending because of collisions after 64 bytes.

Table 142: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Collision frames	Number of collision packets sent.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands sent.
TX MAC ctrl frames	Number of MAC control packets sent.
TX Frame deferred Xmns	Number of frames deferred in *x* milliseconds.
TX Oversize Packets	Number of oversized packets sent.
TX Jabbers	Total number of frames sent that exceed the maximum byte count and contain CRC errors .
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
RX Octets	Number of octets received.
RX Packets 64 Octets	Number of received packets of size 64 octets.
RX Packets 65-127 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 128-255 Octets	Number of received packets of size 128 through 255 octets.
RX Packets 256-511 Octets	Number of received packets of size 256 through 511 octets.
RX Packets 512-1023 Octets	Number of received packets of size 512 through 1023 octets.
RX Packets 1024-1518 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 1519-2047 Octets	Number of received packets of size 1519 through 2047 octets.
RX Packets 2048-4095 Octets	Number of received packets of size 2048 through 4095 octets.
RX Packets 4096-9216 Octets	Number of received packets of size 4096 through 9216 octets.

Table 142: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
RX Multicast Packets	Number of multicast packets received.
RX Broadcast Packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Align Errors	Number of incomplete octets received.
RX Fragments	Number of fragmented packets received.
RX Symbol errors	Number of symbols received that the router did not correctly decode.
RX Unsupported opcodes	Number of packets received with unsupported op codes.
RX Out of Range Length	Number of packets received with an out of range length.
RX False Carrier Errors	Number of packets received with false carrier errors.
RX Undersize Packets	Number of undersized packets received.
RX Oversize Packets	Number of oversized packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX 1519-1522 Good Vlan frms	Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.
RX MTU Exceed Counter	Number of packets received that exceed the MTU.
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX Byte Counter	Number of bytes received.

show chassis fabric connectivity

Syntax show chassis fabric connectivity (device | slot)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Display the status of the data plane connections in your QFabric system.

Options

none—Display the status of all data plane connections in your QFabric system.

device—Display the status of the data plane connections for a specific device.

slot—Display the status of the data plane connections for a specific Flexible PIC Concentrator (FPC) slot on a specific device.

Required Privilege Level admin

Output Fields Table 143 on page 1520 lists the output fields for the **show chassis fabric connectivity** command. Output fields are listed in the approximate order in which they appear.

Table 143: show chassis fabric connectivity Output Fields

Field Name	Field Description
Device ID	Hardware serial identifier of the QFabric system component.
Type	Model number of the QFabric system component. Values include **qfxc08-3008** (QFX3008-I Interconnect device), **qfx3600-I** (QFX3600-I Interconnect device, **qfx3500** (QFX3500 Node device), and **qfx3600-16q** (QFX3600 Node device).
Fabric: Incoming links	Displays inbound data plane (fte-) connections between Node devices and Interconnect devices, and their status (such as **Ok**).
Fabric: Outgoing links	Displays outbound data plane (fte-) connections between Node devices and Interconnect devices, and their status (such as **Ok**).

Sample Output

show chassis fabric connectivity

```
user@qfabric> show chassis fabric connectivity
Device ID: ED1487, Type: qfx3500

show chassis fabric device

Syntax show chassis fabric device *device-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Display the fabric management status of devices in your QFabric system.

Options **none**—Display the fabric management status for all devices in your QFabric system.

device-name—Display the fabric management status for a specific device in your QFabric system. You can enter either the alias name or the serial number of the device.

Required Privilege Level admin

List of Sample Output show chassis fabric device on page 1527

Output Fields Table 144 on page 1527 lists the output fields for the **show chassis fabric device** command. Output fields are listed in the approximate order in which they appear.

Table 144: show chassis fabric device Output Fields

Field Name	Field Description
Device ID	Hardware serial identifier of the QFabric system component.
Type	Model number of the QFabric system component. Values include qfxc08-3008 (QFX3008-I Interconnect device), qfx3600-I (QFX3600-I Interconnect device, qfx3500 (QFX3500 Node device), and qfx3600-16q (QFX3600 Node device).
Management status	Displays keepalive status for fabric management processes on a specific device. Values include **On** and **Off**.
Hardware status	Displays operational status of the device participating in fabric management (such as **Ok**).

Sample Output

show chassis fabric device

```
user@qfabric> show chassis fabric device

Device ID: node2, Type: qfx3500
Management status: On, Hardware status: Ok
```

```
Device ID: node3, Type: qfx3500
Management status: On, Hardware status: Ok

Device ID: node0, Type: qfx3500
Management status: On, Hardware status: Ok

Device ID: node1, Type: qfx3500
Management status: On, Hardware status: Ok
```

<**node-device** *device-id*>

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
menu option introduced in Junos OS Release 10.2 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 13.1 for QFabric systems.

Description

Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.

Options

none—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.

fpc-slot <***fpc-slot-number***>—(Optional) Display the information as follows:

- (EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no ***fpc-slot-number*** value specified or for the FPC slot specified by **fpc-slot 0**. **fpc-slot** refers to the switch itself and **0** is the only valid value for ***fpc-slot-number***. Output for these options is the same as for the **none** option.

  Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no ***fpc-slot-number*** value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the **none** option. If the ***fpc-slot-number*** value is specified (it equals the ***member-id*** value), display the information for the specified member.

  Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the ***fpc-slot-number*** value.

Also display the status of the currently selected port parameter of the Status LED for each network port.

interconnect-device ***device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

menu—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

menu all-members—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

menu local—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

menu member ***member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

node-device ***device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

Output Fields Table 64 on page 787 lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

Table 145: show chassis lcd Output Fields

Field Name	Field Description
member*number* (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
Front panel contents for slot **Front panel contents** (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	FPC slot number of the switch whose content is being displayed. The number is always **0**, except for EX4200 switches in a Virtual Chassis, where it is the member ID value. On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed. On XRE200 External Routing Engines, this field appears under the **member *number*** field for each member device in the EX8200 Virtual Chassis.
LCD screen	The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays **RE** and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are: • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet (EX3200 and EX4200 switches only)
LEDs status	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
Interface	Names of the interfaces on the switch.
LED (ADM/SPD/DPX/POE)	State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are: NOTE: The XRE200 External Routing Engine always displays the **NA** parameter. The QFX Series products do not have any of the port parameters listed below. • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **NA**—Not applicable. • **POE**—Power over Ethernet
fpc*x*	On standalone EX Series and QFX Series switches, always **0**. On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

Sample Output

show chassis nonstop-upgrade node-group

Syntax **show chassis nonstop-upgrade node-group** *node-group-name*

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Display the status of the Node group after the most recent nonstop software upgrade (NSSU).

Required Privilege Level view

Related Documentation

List of Sample Output show chassis nonstop-upgrade node-group on page 1542

Output Fields Table 68 on page 817 lists the output fields for the **show chassis nonstop-upgrade node-group** command. Output fields are listed in the approximate order in which they appear.

Table 146: show chassis nonstop-upgrade node-group Output Fields

Field Name	Field Description
Item	Node device slot number.
Status	State of Node device: • **Error**—Node device is in an error state. • **Offline**—Node device is powered down. • **Online**—Node device is online and running.
Reason	Reason for the state (if the line card is offline).

Sample Output

show chassis nonstop-upgrade node-group

```
user@qfabric> show chassis nonstop-upgrade node-group NW-NG-0
 Item           Status                  Reason
  P1550-C        Online
```

show fabric administration inventory

Syntax

show fabric administration inventory
<brief | detail | summary | terse>
<director-group (status)>
<infrastructure (fabric-controls | fabric-managers | diagnostic-routing-engines)>
<interconnect-devices *interconnect-device-name*>
<node-devices *node-device-name*>
<node-groups *node-group-name*>
<summary>

Release Information

Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

(QFabric systems only) Display all devices that belong to the QFabric system. You can narrow the level of output by specifying a device type.

NOTE: If your Node devices do not appear in the output of the **show fabric administration inventory** command, check the cabling of your system.

Options

none—Display all devices within a QFabric system.

brief | detail | summary | terse—(Optional) Display the specified level of output.

director-group (status)—(Optional) Display the status for the Director group within a QFabric system.

infrastructure (fabric-controls | fabric-managers | diagnostic-routing-engines)—(Optional) Display information for the fabric control Routing Engine, fabric manager Routing Engine, and diagnostic Routing Engine running on the Director group for the QFabric system.

interconnect-devices *interconnect-device-name*—(Optional) Display a specific Interconnect device within a QFabric system.

node-devices *node-device-name*—(Optional) Display a specific Node device within a QFabric system.

node-groups *node-group-name*—(Optional) Display a specific Node group within a QFabric system.

Required Privilege Level

admin

Output Fields

Table 147 on page 1544 lists the output fields for the **show fabric administration inventory** command. Output fields are listed in the approximate order in which they appear.

Table 147: show fabric administration inventory Output Fields

Field Name	Field Description	Level of Output
Item	Type of QFabric system component being viewed. Possible values include **Node group**, **Interconnect device**, **Fabric control**, **Fabric manager**, **Diagnostic routing engine**, **Director group**, and **Ungrouped Node device**.	detail none
Identifier	Hardware serial identifier of a QFabric system component. When you configure an alias name for a component, the ID is displayed.	detail none
Connection	Status of a QFabric system component: either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the listed component.	detail none
Configuration	Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be **Configured**, **Failed** (with details about the failure), **Pending** (in the process of being written or retried), or **Unknown**.	detail none
Node group	Name of the Node groups associated with the QFabric system, and the Node devices assigned to each Node group. The group can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the devices in the group. This field also displays the serial ID for the Node group and the status for the Node group.	detail none
Interconnect device	Name of the Interconnect devices associated with the Node group. The device can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the device. This field also displays the serial ID and configuration status for the Interconnect device.	detail none
Fabric manager	Name of the primary virtual Junos Routing Engine associated with the QFabric system. The fabric manager Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric manager Routing Engine.	detail none
Fabric control	Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition. The fabric control Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric control Routing Engine.	detail none

Table 147: show fabric administration inventory Output Fields *(continued)*

Field Name	Field Description	Level of Output
Diagnostic routing engine	Name of the virtual Junos Routing Engine responsible for troubleshooting and diagnostic utilities within a QFabric system partition. The diagnostic Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the diagnostic Routing Engine.	detail none
Director group	Identifier for the Director devices that are part of the Director group in a QFabric system. Each Director device can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the device.	detail none
Connection uptime	Length of time the component has been operational. The time is listed in days, hours, minutes, and seconds (**D+HH:MM:SS**).	detail
Network domain	Indicates whether a Node group is a network Node group (**Yes**) or a server Node group (**No**).	detail
Member id	Member identification number for a Node device within a Node group.	detail
Node group master	Indicates whether or not a Node device acts as a master device within a Node group. Values for this field are **Yes** or **No**.	detail
Configuration checkout failed	Provides troubleshooting details about a failed configuration on a component. This field includes the following output: • **Edit path**—Displays the configuration hierarchy level where the problem occurs. • **Statement**—Displays the configuration statement that causes the problem. • **Message**—Provides a suggested workaround to resolve the problem.	detail
Member	Name of a Routing Engine allocated to an Interconnect device.	detail
Master	Indicates whether or not a Routing Engine acts as a master device within an Interconnect device. Values are **Yes** or **No**.	detail
Total Node devices	Number of connected and disconnected Node devices in the QFabric system.	summary
Total connected Node devices	Number of available Node devices in the QFabric system.	summary
Total disconnected Node devices	Number of unavailable Node devices in the QFabric system.	summary
Total Interconnect devices	Number of Interconnect devices in the QFabric system.	summary

show fabric administration inventory director-group status

Syntax show fabric administration inventory director-group status (target *director-device-name* | all)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Display the status of Director devices that belong to a QFabric system Director group.

Options

none—Display the status of all Director devices within a QFabric system.

all—Display the status of all Director devices within a QFabric system.

target *director-device-name*—Display the status of a specific Director device within a QFabric system.

Required Privilege Level admin

List of Sample Output

show fabric administration inventory director-group status on page 1549
show fabric administration inventory director-group status target on page 1551

Output Fields Table 148 on page 1548 lists the output fields for the **show fabric administration inventory director-group status** command. Output fields are listed in the approximate order in which they appear.

Table 148: show fabric administration inventory director-group status Output Fields

Field Name	Field Description
Director Group Status	Timestamp for the Director group status report.
Member	Name of the Director device.
Status	Current operational mode of the Director device: **online** or **offline**.
Role	High availability operational role of the Director device: **master** or **standby**.
Mgmt Address	Management IP address of the Director device.
CPU	Percentage of CPU processing memory being used by the Director device.
Free Memory	Available storage memory on the Director device.

Table 148: show fabric administration inventory director-group status Output Fields *(continued)*

Field Name	Field Description
VMs	Number of virtual machines operating on the Director device. A Routing Engine issue exists on a particular Director device when the system displays a star (*) in the **VMs** column along with the following message: **Error in retrieving VM Count in dg*X***.
Up Time	Length of time the Director device has been operating.
Device Id/Alias	Name or identifier of the Director device.
Master Services	Operational status of the database server, load balancer, and QFabric partition address.
Director Group Managed Services	Operational status of the shared file system, network file system, virtual machine server, and DHCP load balancer.
Hard Drive Status	Operational status of the Director device hard drive, including information about the volume identifier, physical identifiers, and SCSI identifiers. There is also status information for the drive partitions, including directory size, available and used drive space, utilization, and directory locations. A hard drive issue exists when the system displays one of the following messages: **Error in retrieving Hard disk status** or **Error in retrieving Hard disk storage status**.
Director Group Processes	Operational status of the Director group processes, such as device managers, SSH, NFS, FTP, system log messages, and SNMP.
Interface Link Status	Operational status of the Director device interfaces, such as the management interface, the control plane bridge interface, the control plane LAG, the control plane links (where the first number represents the Ethernet module [0 or 1] and the second number represents the port [0 - 3]), and the inter-Director crossover LAG. The state of the interfaces can be **up** or **down**. The **Active** designation indicates that a control plane link is active.

show fabric administration inventory infrastructure

Syntax
show administrator inventory infrastructure
<brief | detail>
(fabric-controls | fabric-managers | diagnostic-routing-engines)

Release Information
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description
(QFabric systems only) Display the services running on the Director group for the QFabric system. These services can include external Routing Engines that are used to support QFabric system operations, such as partitioning and fabric control.

Options
none—Display all services running on the Director group, which are used to support the QFabric system.

brief | detail—(Optional) Display the specified level of output.

fabric-managers—Display information for the fabric manager Routing Engine running on the Director group, which is used to support all partitions in the QFabric system.

fabric-controls—Display information for the fabric control Routing Engine running on the Director group, which is used to support route information in the QFabric system.

diagnostic-routing-engines—Display information for the diagnostic Routing Engine running on the Director group, which is responsible for troubleshooting and diagnostic utilities within a QFabric system partition.

Required Privilege Level
admin

show fabric administration inventory infrastructure fabric-managers on page 1555
show fabric administration inventory infrastructure diagnostic-routing-engines on page 1555

Output Fields
Table 149 on page 1553 lists the output fields for the **show fabric administration inventory infrastructure** command. Output fields are listed in the approximate order in which they appear.

Table 149: show fabric administration inventory infrastructure Output Fields

Field Name	Field Description
Routing Engine Type	Type of virtual Junos Routing Engine being viewed. Examples include the network Node group, fabric control, fabric manager, and diagnostic Routing Engines.
Hostname	Name of the QFabric system component.

Table 149: show fabric administration inventory infrastructure Output Fields *(continued)*

Field Name	Field Description
PID	Process identifier for the component.
CPU-Use (%)	Percentage of CPU processing memory being used by the component.
Fabric control	Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition. With the **fabric-controls** option, the fabric control Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. This field also displays the identifier and configuration status for the fabric control Routing Engine.
Fabric manager	Name of the virtual Junos Routing Engine that manages the QFabric system. With the **fabric-managers** option, the fabric manager Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. This field also displays the identifier and configuration status for the fabric manager Routing Engine.
Network Node group	Name of the virtual Junos Routing Engine instance that handles routing processes for a network Node group.
Diagnostic	Name of the virtual Junos Routing Engine responsible for troubleshooting and diagnostic utilities within a QFabric system partition. With the **diagnostic-routing-engines** option, the diagnostic Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the diagnostic Routing Engine.
Item	Type of QFabric system component being viewed.
Identifier	Hardware serial identifier of a QFabric system component.
Connection	Status of a QFabric system component: either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the listed component.
Configuration	Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be **Configured**, **Failed** (unsuccessful), **Pending** (in the process of being written or retried), or **Unknown**.

Sample Output

show fabric administration inventory infrastructure

```
user@qfabric> show fabric administration inventory infrastructure
dg0:
Routing Engine Type     Hostname                        PID      CPU-Use(%)
------------------------------------------------------------------------------
Fabric manager          FM-0                            9832      1.0
Network Node group      QFabric_default_NW-NG-1_RE1     24633     4.2
Fabric control          QFabric_default_FC-1_RE0        25374     1.8
```

```
Diagnostic              QFabric_DRE                  6789      1.3

dg1:
Routing Engine Type     Hostname                     PID       CPU-Use(%)
-------------------------------------------------------------------------
Fabric manager          FM-1                         572       1.6
Network Node group      QFabric_default_NW-NG-0_RE0  19217     7.8
Fabric control          QFabric_default_FC-0_RE0     20071     1.9
```

show fabric administration inventory infrastructure fabric-controls

```
user@qfabric> show fabric administration inventory infrastructure fabric-controls fabric-controls
Item                    Identifier              Connection      Configuration
Fabric control
  FC-0                                          Connected       Configured
  FC-1                                          Connected       Configured
```

show fabric administration inventory infrastructure fabric-managers

```
user@qfabric> show fabric administration inventory infrastructure fabric-managers
Item                    Identifier              Connection      Configuration
Fabric manager
  FM-0                                          Connected       Configured
```

show fabric administration inventory infrastructure diagnostic-routing-engines

```
user@qfabric> show fabric administration inventory infrastructure diagnostic-routing-engines
Item                    Identifier              Connection      Configuration
Diagnostic routing engine
  DRE-0                                         Connected       Configured
```

show fabric administration inventory interconnect-devices

Syntax show fabric administration inventory interconnect-devices *interconnect-device-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Display the Interconnect devices that belong to a QFabric system.

Options **none**—Display all Interconnect devices within a QFabric system.

interconnect-device-name—Display a specific Interconnect device within a QFabric system.

Required Privilege Level admin

show fabric administration inventory interconnect-devices device-name on page 1557

Output Fields Table 150 on page 1556 lists the output fields for the **show fabric administration inventory interconnect-devices** command. Output fields are listed in the approximate order in which they appear.

Table 150: show fabric administration inventory interconnect-devices Output Fields

Field Name	Field Description
Interconnect device	Name of the Interconnect devices associated with the partition.
Item	Type of QFabric system component being viewed. Interconnect devices either display the alias name (if configured) or the hardware serial identifier and Control Board Routing Engine numbers.
Identifier	Hardware serial identifier of a QFabric system component. When you configure an alias name for a component, the ID is displayed.
Connection	Status of a QFabric system component: either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the listed component.
Configuration	Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be **Configured**, **Failed** (unsuccessful), **Pending** (in the process of being written or retried), or **Unknown**.

Sample Output

show fabric administration inventory interconnect-devices

```
user@qfabric> show fabric administration inventory interconnect-devices
Item                  Identifier              Connection      Configuration
Interconnect device
  IC-YW3781                                   Connected       Configured
    YW3781/RE0                                Connected
    YW3781/RE1                                Connected
  IC-YW3798                                   Connected       Configured

    YW3798/RE1                                Connected
```

show fabric administration inventory interconnect-devices device-name

```
user@qfabric> show fabric administration inventory interconnect-devices IC-YW3781
Item                  Identifier              Connection      Configuration
Interconnect device
  IC-YW3781                                   Connected       Configured
    YW3781/RE0                                Connected
    YW3781/RE1                                Connected
```

show fabric administration inventory node-devices

Syntax show fabric administration inventory node-devices *node-device-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Display the Node devices that belong to the QFabric system.

NOTE: If your Node devices do not appear in the output of the **show fabric administration inventory node-devices** command, check the cabling of your system.

Options **none**—Display all Node devices within the QFabric system.

node-device-name—Display a specific Node device within the QFabric system.

Required Privilege Level admin

show fabric administration inventory node-devices device-name on page 1559

Output Fields Table 151 on page 1558 lists the output fields for the **show fabric administration inventory node-devices** command. Output fields are listed in the approximate order in which they appear.

Table 151: show fabric administration inventory node-devices Output Fields

Field Name	Field Description
Item	Type of QFabric system component being viewed.
Identifier	Hardware serial identifier of a QFabric system component.
Connection	Status of a QFabric system component: either **Connected** or **Not Connected**, depending on whether or not the Director software has detected keepalive messages for the listed component.
Node device	Name of the Node devices associated with the Node group. The device can be either **Connected** or **Not Connected**, depending on whether or not the Director software has detected keepalive messages for the device. This field also displays the serial ID and configuration status for the Node device.

Sample Output

show fabric administration inventory node-devices

```
user@qfabric> show fabric administration inventory node-devices
Item                    Identifier              Connection
Node device
  node1                 P3749-C                 Connected
  node2                 P3767-C                 Connected
  node3                 P3850-C                 Connected

```

show fabric administration inventory node-devices device-name

```
user@qfabric> show fabric administration inventory node-devices node0
Item                    Identifier              Connection
Node device
  node1                 P3749-C                 Connected
```

show fabric administration inventory node-groups

Syntax show fabric administration inventory node-groups *node-group-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Display the Node groups and the corresponding Node devices that belong to the QFabric system.

Options **none**—Display all Node groups within the QFabric system.

node-group-name—Display information for a specific Node group within the QFabric system.

Required Privilege Level admin

show fabric administration inventory node-groups node-group-name on page 1561

Output Fields Table 152 on page 1560 lists the output fields for the **show fabric administration inventory node-groups** command. Output fields are listed in the approximate order in which they appear.

Table 152: show fabric administration inventory node-groups Output Fields

Field Name	Field Description
Node group	Name of the Node groups associated with the partition.
Item	Type of QFabric system component being viewed. • Autogenerated Node groups display the hardware serial identifier for both the name of the Node group and the name of the included Node device. • User-configured Node groups either display the alias name (if configured) or the hardware serial identifier for each Node device contained in the Node group.
Identifier	Hardware serial identifier of a QFabric system component. When you configure an alias name for a component, the ID is displayed.
Connection	Status of a QFabric system component: either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the listed component.
Configuration	Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be **Configured**, **Failed** (unsuccessful), **Pending** (in the process of being written or retried), or **Unknown**.

Sample Output

show fabric administration inventory node-groups

```
user@qfabric> show fabric administration inventory node-groups
Item                    Identifier              Connection      Configuration

List of Sample Output show fabric administration system mac-pool on page 1562

Output Fields Table 153 on page 1562 lists the output fields for the **show fabric administration system mac-pool** command. Output fields are listed in the approximate order in which they appear.

Table 153: show fabric administration system mac-pool Output Fields

Field Name	Field Description
MAC Block Base	Starting MAC address for the pool assigned to the QFabric system.
Total MACs	Total number of MAC addresses assigned to the QFabric system.
Available MACs	Number of available MAC addresses from the total.

Sample Output

show fabric administration system mac-pool

```
user@qfabric> show fabric administration system mac-pool
 Mac Block Base          Total MACs      Available MACs
         00:11:00:00:00:00       4096            4084
         02:00:00:11:22:00       10              10
```

show fabric inventory

Syntax

show fabric inventory
<brief | detail | terse>
<infrastructure fabric-controls <FC-0 | FC-1>>
<node-devices *node-device-name*>
<node-groups *node-group-name*>

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

(QFabric systems only) Display Node devices, Node groups, and fabric control Routing Engines that belong to the QFabric system. You can narrow the level of output by specifying a device type.

NOTE:

- If you have administrator privileges, issue the **show fabric administration inventory** command to view all devices in your QFabric system (including Interconnect devices and Director devices).
- If your Node devices do not appear in the output of the **show fabric inventory** command, check the cabling of your system.

Options

none—Display all devices within a QFabric system.

brief | detail | terse—(Optional) Display the specified level of output.

infrastructure fabric-controls <FC-0 | FC-1>—(Optional) Display information for all fabric control Routing Engines running on the Director group within the QFabric system, or the individual fabric control Routing Engine you specify (either FC-0 or FC-1).

node-devices *node-device-name*—(Optional) Display a specific Node device within a QFabric system.

node-groups *node-group-name*—(Optional) Display a specific Node group within a QFabric system.

Required Privilege Level

admin

show fabric inventory infrastructure fabric-controls on page 1565

show fabric inventory node-devices on page 1565
show fabric inventory node-groups on page 1565

Output Fields Table 154 on page 1564 lists the output fields for the **show fabric inventory** command. Output fields are listed in the approximate order in which they appear.

Table 154: show fabric inventory Output Fields

Field Name	Field Description
Item	Type of QFabric system component being viewed. Possible values include **Node device**, **Node group**, **Fabric control**, and **Ungrouped Node device**.
Identifier	Hardware serial identifier of a QFabric system component.
Connection	Status of a QFabric system component: either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the listed component.
Configuration	Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be **Configured**, **Failed** (unsuccessful), **Pending** (in the process of being written or retried), or **Unknown**.
Node group	Name of the Node groups associated with the QFabric system, and the Node devices assigned to each Node group. The group can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the devices in the group. This field also displays the serial ID for the Node group and the status for the Node group.
Node device	Name of the Node devices associated with the Node group. The device can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for the device. This field also displays the serial ID and configuration status for the Node device.
Fabric control	Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition. The fabric control Routing Engine can be either **Connected** or **Disconnected**, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric control Routing Engine.

Sample Output

show fabric inventory

```
user@qfabric> show fabric inventory

Item                    Identifier              Connection      Configuration
Ungrouped Node device
  P3747-C                                       Disconnected
Node group
  NW-NG-0                                       Connected       Configured
    Node-1              P4093-C                 Connected
  RSNG-1                                        Connected       Configured
    Node-2              P4514-C                 Connected
    Node-3              P3917-C                 Connected
Fabric control
  FC-0                                          Connected       Configured
  FC-1                                          Connected       Configured
```

show fabric inventory infrastructure fabric-controls

```
user@qfabric> show fabric inventory infrastructure fabric-controls

Item                    Identifier              Connection      Configuration
Fabric control

Table 155: show fabric session-host Output Fields

Field Name	Field Description
Identifier	Hardware serial identifier of the Director device that hosts the SSH QFabric CLI session.

Sample Output

show fabric session-host

```
user@qfabric> show fabric session-host
Identifier: 0281052011000032
```

show log

List of Syntax

Syntax on page 1567
Syntax (QFabric System) on page 1567
Syntax (TX Matrix Routers) on page 1567

Syntax

show log
<*filename* | user <*username*>>

Syntax (QFabric System)

show log *filename*
<*device-type (device-id* | *device-alias*)>

Syntax (TX Matrix Routers)

show log
<all-lcc | lcc *number* | scc>
<*filename* | user <*username*>>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option *device-type (device-id* | *device-alias*) is introduced in Junos OS Release 13.1 for the QFX Series.

Description

List log files, display log file contents, or display information about users who have logged in to the router or switch.

Options

none—List all log files.

<all-lcc | lcc *number* | scc>—(TX Matrix routers only)(Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace ***number*** with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(*device-id* | *device-alias*)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

user <*username*>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include ***username***, display logging information about the specified user.

show system software upgrade status

Syntax **show system software upgrade status**

Release Information Command introduced in Junos OS Release 13.1 for the QFX Series.

Description (QFabric systems only) Display the status of a software upgrade, including details for both nonstop software upgrades and *component all* style upgrades.

Required Privilege Level view

Related Documentation

- Performing a Nonstop Software Upgrade on the QFabric System on page 105
- Verifying Nonstop Software Upgrade for QFabric Systems on page 1410
- Upgrading Software on a QFabric System on page 134
- **request system software nonstop-upgrade on page 410**

List of Sample Output

show system software upgrade status (Nonstop Software Upgrade) on page 1570
show system software upgrade status (Component All Upgrade) on page 1571

Output Fields Table 156 on page 1570 lists the output fields for the **show system software upgrade status** command. Output fields are listed in the approximate order in which they appear.

Table 156: show system software upgrade status Output Fields

Field Name	Field Description
Timestamp	Displays the day of the week, month, date, hour, minute, second, and year when you issue the **show system software upgrade status** command. An example of the timestamp format is as follows: Wed Jan 16 22:06:02 2013.
Software nonstop upgrade on:	Status of the upgrade: • **FM-0 in progress**—A Director group nonstop software upgrade is in process for the fabric manager Routing Engine. • **NW-NG-0 in progress**—A Node group nonstop software upgrade is in process for the network Node group. • **RSNG in progress**—A Node group nonstop software upgrade is in process for the redundant server Node group. • **all in progress**—A *component all* style upgrade is in process for the entire QFabric system.

Sample Output

show system software upgrade status (Nonstop Software Upgrade)

```
user@qfabric> show system software upgrade status
Wed Jan 16 22:06:02 2013 Software nonstop upgrade on:
                         NW-NG-0 in progress
                         RSNG in progress
```

show system software upgrade status (Component All Upgrade)

```
user@qfabric> show system software upgrade status
Wed Jan 16 22:37:48 2013 Software component upgrade on:
                         all in progress
```

Performing System Backup and Recovery for a QFabric System

Many routers and switches require an administrator to recover the software package and the configuration file for the device separately. In the case of a device failure, this means the administrator might need to perform two separate tasks (if neither the software package nor the configuration file can be recovered).

In contrast, the QFabric system uses a unique mechanism that saves the backup and recovery files for both the Junos OS software and the system configuration into a single collection. The following QFabric system backup and recovery mechanism simplifies and streamlines the recovery process so you can return to normal operations as quickly as possible.

To backup and recover your QFabric system:

1. (First time only) Implement the following one-time procedure to prepare your QFabric system to use the system backup and recovery feature:
   - Insert a Juniper Networks software installation USB flash drive into the master Director device. (This drive was provided to you as one of the components of your QFabric system shipment.)
   - Issue the **request system software format-qfabric-backup** command. The contents and format of the USB flash drive are copied to the Director group shared directory and are used as the basis for all future backup and recovery operations.

     ```
     user@qfabric> request system software format-qfabric-backup
     Copying QFabric USB template image from /dev/sdb(Unigen,PQS4000,4009 MB)......
     ```

- Remove the Juniper Networks software installation USB drive from the master Director device.

2. Issue the **request system software system-backup** command to backup the software package and configuration file. This command saves the current files necessary to recover the QFabric system. The files are saved to a shared memory directory in the Director group.

NOTE: As you upgrade your system with new software and change the system configuration over time, remember to reissue this command periodically to save the newest files for recovery purposes.

```
user@qfabric> request system software system-backup

user@qfabric>
```

3. Insert a 4 GB or larger USB flash drive into the master Director device for your Director group, and issue the **request system software system-backup usb-create** command. This command copies the recovery files that have been backed up in the Director group and transfers them to the USB flash drive to create a recovery USB drive.

NOTE: Issuing this command overwrites the contents of the USB flash drive with the QFabric system recovery files.

```
user@qfabric> request system software system-backup usb-create /dev/sdb
Issuing this command will overwrite the contents of the USB drive.
Continue? [yes,no] (no) yes

This operation will access the USB drive on 0281042010000013.
Are you sure you want to continue? [yes,no] (no) yes

Copying QFabric recovery media to /dev/sdb...
Successfully copied QFabric recovery media to /dev/sdb
```

4. Remove the recovery USB drive from the Director device, and store it securely in a known location that you will remember when you need to use the recovery USB drive.
5. If the QFabric system fails, power off the Director group, insert the recovery USB drive into the master Director device of your Director group, turn on power to the Director device, and follow the prompts to recover your system. This step restores the software package and the configuration file for your QFabric system.

Related Documentation

- request system software format-qfabric-backup on page 1460
- request system software system-backup on page 1467

Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

   You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

   Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

   ```
   user@switch> request system software configuration-backup path
   ```

NOTE: To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 1575
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 1577

(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.

5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install media you want to download in the **QFabric System Install Media** section.

   A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.

    ftp ftp://*hostname/pathname install-media-qfabric-<version>*.img.tgz
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.

    binary
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

    get *install-media-qfabric-<version>*.img.tgz
14. Close the FTP session:

    bye
15. Untar the *install-media-qfabric-<version>* .img.tgz file on your UNIX workstation.

    ```
    tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
    ```
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

    dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
    ```
    250880+0 records in
    250880+0 records out
    4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
    ```
18. Perform the steps in "Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software" on page 115 to continue with the recovery installation.

Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

NOTE: Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
   - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
   - If you do not have access to the default partition, power cycle the Director device.

   The following menu appears on the Director device console when the Director device boots up:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```

3. Type **install** and then press **Enter** to install the software on the Director device.

   Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```

4. Press **Enter**.

   The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

   The following menu appears on the Director device console:

   ```
   Before you can access the QFabric system, you must complete the initial setup
    of the Director group by using the steps that follow.
   If the initial setup procedure does not complete successfully, log out of the
    Director device and then log back in to restart
    this setup menu.

   Continue?[y/n]
   ```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.
7. Issue the **ls /mnt** command to list the **mount** directory.

   ```
   root@dg0 ~]# ls /mnt
   ```
8. Issue the **mkdir** command to create a directory within the mount directory.

   ```
   root@dg0 ~]# mkdir /mnt/myusb
   ```
9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

   ```
   root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
   ```
10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

    ```
    root@dg0 ~]# ls -la /mnt/myusb/
    total 1770884
    drwxr-xr-x 2 root root       4096 Sep  7 05:16 .
    drwxr-xr-x 3 root root       4096 Sep  7 10:15 ..
    -rw-r--r-- 1 root root       4249 Sep  7 03:52 mybackup-20110907
    ```
11. Exit the Director device and log back in as root on the Director device.

    The following menu appears:

    ```
    Before you can access the QFabric system, you must complete the initial setup
     of the Director group by using the steps that follow.
    If the initial setup procedure does not complete successfully, log out of the
     Director device and then log back in to restart
     this setup menu.

    Continue?[y/n] y
    Initial Configuration

    You may enter the configuration manually or restore from a backup.

    Specify a backup file? [y/n] : y
    Please specify the full path of the configuration backup file. :
    /mnt/myusb/mybackup-20110907
    ```
12. Enter **y** to continue.
13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

    ```
    /mnt/myusb/mybackup-20110907
    ```

    The following messages appear:

    ```
    Saving temporary configuration...
    Configuring peer...
    connect error for 1.1.1.2:9001
    Configuring local interfaces...
    Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]
    Configured interface eth0 with [10.49.213.163/24:10.49.213.254]
    Configuring QFabric software with initial pool of 4000 MAC addresses
    [00:10:00:00:00:00 - 00:10:00:00:0f:3b]
    Configuring QFabric address [10.49.213.50]
    Reconfiguring QFabric software static configuration
    Applying the new Director Device password
    Applying the QFabric component password
    ```

```
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
connect error for 1.1.1.2:9001
Shared SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See "Creating an Emergency Boot Device for a QFX Series Device" on page 165 for information on how to create an emergency boot device.
2. Copy the existing configuration in the file **/config/juniper.conf.gz** from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named **/config/juniper.conf.*n***, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

   

   WARNING: **The recovery installation process completely overwrites the entire contents of the internal flash storage.**

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

NOTE: Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

   If you do no want to format the internal flash storage, type **y**.

   The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G

Processing format options
Fri September  4 01:18:44 UTC 2012

-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.

Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins

Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

   When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ............... 2
Exit to installer debug shell ...................................... 3
Install Junos to alternate slice ................................... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.

7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from http://www.juniper.net/customers/support/ .

NOTE: In the following procedure, we assume that you are creating the emergency boot device on a QFX3500 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX3500 device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the QFX3500 device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

   ```
   user@device> start shell
   %
   ```
4. Switch to the root account using the **su** command:

   ```
   % su
   Password: password
   ```

   

   NOTE: The password is the root password for the QFX3500 device. If you logged in to the device as root, you do not need to perform this step.
5. Enter the following command:

   ```
   root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
   ```

   The device writes the installation media image to the USB device:

   ```
   root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
   11006+1 records in
   ```

```
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Configuration File Terms

Table 33 on page 49 lists the various configuration file terms used for the QFX Series and their definitions.

Table 157: Configuration File Terms

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

- Junos OS Commit Model for Router or Switch Configuration on page 1589
- Understanding Configuration Files on page 1590
- Understanding How the Junos Configuration Is Stored on page 1591

Forms of the configure Command

The Junos OS supports three forms of the **configure** command: **configure**, **configure private**, and **configure exclusive**. These forms control how users edit and commit configurations and can be useful when multiple users configure the software. See Table 158 on page 1588.

Table 158: Forms of the configure Command

Command	Edit Access	Commit Access
configure	• No one can lock the configuration. All users can make configuration changes. When you enter configuration mode, the CLI displays the following information: ◦ A list of other users editing the configuration. ◦ Hierarchy levels the users are viewing or editing. ◦ Whether the configuration has been changed, but not committed. ◦ When multiple users enter conflicting configurations, the most recent change to be entered takes precedence.	• No one can lock the configuration. All users can commit all changes to the configuration. • If you and another user make changes and the other user commits changes, your changes are committed as well.

Table 158: Forms of the configure Command *(continued)*

Command	Edit Access	Commit Access
configure exclusive	• One user locks the configuration and makes changes without interference from other users. • Other users can enter and exit configuration mode, but they cannot commit the configuration. • If you enter configuration mode while another user has locked the configuration (with the **configure exclusive** command), the CLI displays the user and the hierarchy level the user is viewing or editing. • If you enter configuration mode while another user has locked the configuration, you can forcibly log out that user with the **request system logout** operational mode command. For details, see the CLI Explorer.	
configure private	• Multiple users can edit the configuration at the same time. • Each user has a private candidate configuration to edit independently of other users. • When multiple users enter conflicting configurations, the first commit operation takes precedence over subsequent commit operations.	• When you commit the configuration, the router verifies that the operational (running) configuration has not been modified by another user before accepting your private candidate configuration as the new operational configuration. • If the configuration has been modified by another user, you can merge the modifications into your private candidate configuration and attempt to commit again.

Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model: that is, a candidate configuration is modified as desired and then committed to the system. Once a configuration has been committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The former active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and all other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (1–49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1, juniper.conf.gz.2, juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

  

  NOTE: The QFX3500 switch has only one Routing Engine.

  To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

  

  NOTE: When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

Understanding Configuration Files

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration.

Juniper Networks Junos OS saves the 50 most recently committed configuration files on a switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.

- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

Understanding How the Junos Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

The currently operational Junos OS configuration is stored in the file **juniper.conf** and the last three committed configurations are stored in the files **juniper.conf.1**, **juniper.conf.2**, and **juniper.conf.3**. These four files are located in the directory **/config**, which is on the switch's hard disk. The remaining 46 previous versions of committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config** on the hard disk.

Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

[edit]

user@host# **show | compare** (*filename*| **rollback** *n*)

filename is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

n is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (**/config/juniper.conf**).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
```

```
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
   -type external;
   -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
   type internal;
   hold-time 90;
   allow 1.1.1.1/32;
}
group fred {
   type external;
   advertise-inactive;
   peer-as 3333;
   allow 2.2.2.2/32;
}
```

Compressing the Current Configuration File

By default, the current operational configuration file is compressed, and is stored in the file **juniper.conf.gz**, in the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

NOTE: We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

  ```
  [edit system]
  compress-configuration-files;
  ```

  Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

  ```
  [edit system]
  user@host# set compress-configuration-files
  user@host# commit
  ```

```
commit complete
user@host# commit
commit complete
```

- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```

Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

NOTE: If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the rollback command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
```

```
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the CLI Explorer.

Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
  filename <relative>
```

For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Press Ctrl-d to end input.

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
terminal <relative>
```

To replace an entire configuration, specify the **override** option at any level of the hierarchy. A **load override** operation completely replaces the current candidate configuration with the file you are loading. Thus, if you saved a complete configuration, use this option.

An **override** operation discards the current candidate configuration and loads the configuration in ***filename*** or the configuration that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. For an example, see Figure 36 on page 1625.

To replace portions of a configuration, specify the **replace** option. The **load replace** operation looks for **replace:** tags that you added to the loaded file, and replaces the parts of the candidate configuration with whatever is specified after the tag. This is useful when you want more control over exactly what is being changed. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see Figure 37 on page 1626.

If, in an **override** or **merge** operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

The **load merge** operation adds the saved file to the existing candidate configuration. This is useful if you are adding new configuration sections. For example, suppose that you are adding a BGP configuration to the **[edit protocols]** hierarchy level, where there was no BGP configuration before, you can use the **load merge** operation to combine the saved file configuration to the existing candidate configuration. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration.

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. The **load update** operation compares the candidate configuration and the file you are loading, and only changes the parts of the candidate configuration that are different from the new configuration. You would use this, for example, if there is an existing BGP configuration and the file you are loading changes it in some way.

To change part of the configuration with a patch file, specify the **patch** option. The **load patch** operation loads a file or terminal input that contains configuration changes. First, on a device that already has the configuration changes, you type the **show | compare** command to output the differences between two configurations. Then you can load the differences on another router. The advantage of the **load patch** command is that it saves you from having to copy snippets from different hierarchy levels into a text file prior to loading them into the target device. This might be a useful time saver if you are configuring several devices with the same options. For example, suppose that you configure a routing policy on Device router1 and you want to replicate the policy configuration on Device router2, router3, and router4, you can use the **load patch** operation.

First, run the **show | compare** command.

```
user@router1# show | compare rollback 3
[edit protocols ospf]
+    export default-static;
-    export static-default
[edit policy-options]
+    policy-statement default-static {
```

```
+       from protocol static;
+       then accept;
+   }
```

Copy the output of the **show | compare** command to the clipboard, making sure to include the hierarchy levels. On Device router2, router3, and router4, type **load patch terminal** and paste the output. Press Enter and then press Ctrl-d to end the operation. If the patch input specifies different values for an existing statement, the patch input overrides the existing statement.

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
   bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see Figure 40 on page 1627.

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities, as described in the CLI Explorer.

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

- Examples: Loading a Configuration from a File on page 1625

Loading a Previous Configuration File

You can use the **rollback** <***number*** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <***number***>

Options

- **none**— Return to the most recently saved configuration.
- ***number***—Configuration to return to.
  - **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

   ```
   [edit]
   user@switch# rollback 1
   load complete
   ```

2. Activate the configuration you have loaded:

   ```
   [edit]
   user@switch# commit
   ```

- Configuration File Terms on page 48

Returning to the Most Recently Committed Junos Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback
load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- Returning to a Configuration Prior to the One Most Recently Committed on page 1601
- Displaying Previous Configurations on page 1601
- Comparing Configuration Changes with a Prior Version on page 1602
- Creating and Returning to a Rescue Configuration on page 1604
- Saving a Configuration to a File on page 1605

Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```
[edit]
user@host# show | compare (filename| rollback n)
```

filename is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

n is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (**/config/juniper.conf**).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
```

```
    -type external;
    -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 90;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    advertise-inactive;
    peer-as 3333;
    allow 2.2.2.2/32;
}
```

Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

NOTE: If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the rollback command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the CLI Explorer.

Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
    bgp {
        disable;
        group int {
            type internal;
        }
    }
    isis {
        disable;
        interface all {
            level 1 disable;
        }
        interface fxp0.0 {
            disable;
        }
    }
    ospf {
        traffic-engineering;
        reference-bandwidth 4g;
        ...
    }
}
```

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1.
```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   ```
   [edit]
   user@switch# load override filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit filename
   ```

Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

   ```
   user@host> configure
   entering configuration mode
   [edit]
   user@host#
   ```

2. Show the current configuration (if any) for SNMP:

   ```
   [edit]
   user@host# show snmp
   ```

   No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

   ```
   [edit]
   user@host# set snmp health-monitor
   ```

4. Show the new configuration:

   ```
   [edit]
   user@host# show snmp
   health-monitor;
   ```

   The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

   ```
   [edit]
   user@host# rollback
   load complete
   ```

6. Show the configuration again to make sure your change is no longer present:

   ```
   [edit]
   user@host# show snmp
   ```

   No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

   ```
   [edit]
   ```

```
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
    bgp {
        disable;
        group int {
            type internal;
        }
    }
    isis {
        disable;
        interface all {
            level 1 disable;
        }
        interface fxp0.0 {
            disable;
        }
```

```
    }
    ospf {
      traffic-engineering;
      reference-bandwidth 4g;
      ...
    }
}
```

Setting or Deleting the Rescue Configuration

A rescue configuration is user-defined configuration that restores connectivity to switch. You set a current committed configuration to be the rescue configuration through the CLI. If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

Uploading a Configuration File

You can create a configuration file on your local system, copy the file to the switch, and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the *Junos OS System Basics and Services Command Reference* at http://www.juniper.net/techpubs/software/junos/index.html.
2. In the configuration text file, use an option to perform the required action when the file is loaded. Table 159 on page 1610 lists and describes some options for the **load** command.

Table 159: Options for the load Command

Options	Description
merge	Combines the current active configuration and the configuration in the filename you specify or the one that you type at the terminal. A **merge** operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
override	Discards the current candidate configuration and loads the configuration in the filename you specify or the one that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. You can use the **override** option at any level of the hierarchy.
replace	Searches for the **replace** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds the statements marked with the **replace** tag to the active configuration. NOTE: For this operation to work, you must include **replace** tags in the text file or in the configuration you type at the terminal.

3. Press Ctrl+a to select all the text in the configuration file.
4. Press Ctrl+c to copy the contents of the configuration text file to the Clipboard.
5. Log in to the switch using your username and password.
6. To enter configuration mode:
   user@switch> **configure**

   You will see this output, with the hash or pound mark indicating configuration mode.
   Entering configuration mode
   [edit]
   user@switch#
7. Load the configuration file:
   [edit]
   user@switch# **load merge terminal**
8. At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:
   [edit]
   user@switch# **load merge terminal**
   [Type ^D at a new line to end input]
   >Cursor is here. Paste the contents of the clipboard here<
9. Press Enter.
10. Press Ctrl+d to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

You can configure a router or switch to transfer its configuration to an archive file periodically. The following tasks describe how to transfer the configuration to an archive site:

1. Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive on page 1611
2. Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1611
3. Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1612
4. Configuring Archive Sites for Transfer of Active Configuration Files on page 1612

Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive

If you want to back up your device's current configuration to an archive site, you can configure the router or switch to transfer its currently active configuration by FTP or secure copy (SCP) periodically or after each commit.

To configure the router or switch to transfer its currently active configuration to an archive site, include statements at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
   ftp://username<:password>@host-address<:port>/url-path;
   scp://username<:password>@host-address<:port>/url-path;
}
transfer-interval interval;
transfer-on-commit;
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ("") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*"

Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site

To configure the router or switch to periodically transfer its currently active configuration to an archive site, include the **transfer-interval** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-interval interval;
```

The ***interval*** is a period of time ranging from 15 through 2880 minutes.

Configuring Transfer of the Current Active Configuration When a Configuration Is Committed

To configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration, include the **transfer-on-commit** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-on-commit;
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ("") and enclose the IPv6 host address in brackets ([ ]). For example, "scp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*"

Configuring Archive Sites for Transfer of Active Configuration Files

When you configure the router or switch to transfer its configuration files, you specify an archive site to which the files are transferred. If you specify more than one archive site, the router or switch attempts to transfer files to the first archive site in the list, moving to the next site only if the transfer fails.

When you use the **archive-sites** statement, you can specify a destination as an FTP URL, or SCP-style remote file specification. The URL type **file://** is also supported.

To configure the archive site, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
   ftp://username@host:<port>url-path password password;
   scp://username@host:<port>url-path password password;
   file://<path>/<filename>;
}
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ("") and enclose the IPv6 host address in brackets ([ ]). For example, "scp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*"

When you specify the archive site, do not add a forward slash (/) to the end of the URL.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

*<router-name>*_juniper.conf.*n*.gz_*YYYYMMDD_HHMMSS*

NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

archive-sites (Configuration File)

Syntax

```
archive-sites {
  file://<path>/<filename>;
  ftp://username@host:<port>url-path password password;
  http://username@host:<port>url-path password password;
  pasvftp://username@host:<port>url-path password password;
  scp://username@host:<port>url-path password password;
}
```

Hierarchy Level [edit system archival configuration]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, **"scp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*"**

If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

router-name*_juniper.conf.*n*.gz_*YYYYMMDD_HHMMSS.

NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Options The prefix used in the configuration statement determines the form of transfer:

file:// —transfer on a path to a named file

ftp:// —transfer using active FTP server

pasvftp:// —transfer to a device that only accepts passive FTP services

scp:// —transfer to a known host using background SCP file transfers

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Default Configurations

- QFX3500 Switch Default Configuration on page 1619

QFX3500 Switch Default Configuration

Each QFX Series product is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**, configures storm control and Ethernet switching on all interfaces, and enables IGMP snooping, RSTP, and LLDP protocols.

When you commit changes to the configuration, a new configuration file is created, which becomes the active configuration. You can always revert to the factory default configuration if you need to.

The following factory default configuration file is for a QFX3500 switch with 48 ports:

NOTE: In this example, xe-0/0/0 through xe-0/0/47 are the network interface ports.

```
protocols {
    igmp-snooping {
        vlan all;
    }
    rstp;
        lldp {
        interface all;
    }
}
interfaces {
    xe-0/0/0 {
        unit 0 {
            family ethernet-switching;
        }
    }
    xe-0/0/1 {
        unit 0 {
            family ethernet-switching;
        }
    }
    xe-0/0/2 {
        unit 0 {
            family ethernet-switching;
        }
    }
    xe-0/0/3 {

clear log

Syntax clear log *filename*
<all>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Remove contents of a log file.

Options ***filename***—Name of the specific log file to delete.

all—(Optional) Delete the specified log file and all archived versions of it.

Required Privilege Level clear

Related Documentation
- show log on page 889

List of Sample Output clear log on page 1630

Output Fields See file list for an explanation of output fields.

Sample Output

clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
--------------------------------------------------------------------------

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel         57 Sep 15 03:44 /var/log/sampled
total 1
```

clear system commit

Syntax clear system commit

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear any pending commit operation.

Options This command has no options.

Required Privilege Level maintenance (or the actual user who scheduled the commit)

Related Documentation

clear system commit on page 1631
clear system commit (None Pending) on page 1631
clear system commit (User Does Not Have Required Privilege Level) on page 1631

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear system commit

```
user@host> clear system commit
Pending commit cleared.
```

clear system commit (None Pending)

```
user@host> clear system commit
No commit scheduled.
```

clear system commit (User Does Not Have Required Privilege Level)

```
user@host> clear system commit
error: Permission denied
```

file archive

Syntax file archive destination *destination* source *source* <compress>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

Options

destination *destination*—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:

- For archived files—The suffix **.tar**
- For archived and compressed files—The suffix **.tgz**

source *source*—Source of the original file or files. Specify the source as a URL or filename.

compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix **.tgz**.

Required Privilege Level maintenance

List of Sample Output
file archive (Multiple Files) on page 1632
file archive (Single File) on page 1632
file archive (with Compression) on page 1633

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file archive (Multiple Files)

The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file archive (Single File)

The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

file checksum md5

Syntax file checksum md5 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Calculate the Message Digest 5 (MD5) checksum of a file.

Options ***pathname***—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the MD5 checksum.

Required Privilege Level maintenance

List of Sample Output file checksum md5 on page 1634

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

file checksum sha1

Syntax file checksum sha1 <*pathname*> *filename*

Release Information Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.

Options ***pathname***—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the SHA-1 checksum.

Required Privilege Level maintenance

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax

SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

file checksum sha-256

Syntax file checksum sha-256 <*pathname*> *filename*

Release Information Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.

Options ***pathname***—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the SHA-256 checksum.

Required Privilege Level maintenance

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file checksum sha-256

```
user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

file compare

Syntax

file compare (files *filename filename*)
<context | unified>
<ignore-white-space>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Compare two local files and describe the differences between them in default, context, or unified output styles:

- **Default**—In the first line of output, **c** means lines were changed between the two files, **d** means lines were deleted between the two files, and **a** means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (**<**) in front of output lines refers to the first file. A right angle bracket (**>**) in front of output lines refers to the second file.
- **Context**—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (**!**) have changed. Additions are marked with a plus sign (**+**), and deletions are marked with a minus sign (**-**).
- **Unified**—The display is preceded by the line number from the first and the second file (*xx*,*xxx*,*x*). Before the line number, additions to the file are marked with a plus sign (**+**), and deletions to the file are marked with a minus sign (**-**). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

Options

files *filename*—Names of two local files to compare.

context—(Optional) Display output in context format.

ignore-white-space—(Optional) Ignore changes in the amount of white space.

unified—(Optional) Display output in unified format.

Required Privilege Level

none

List of Sample Output

file compare files on page 1638
file compare files context on page 1638
file compare files unified on page 1638
file compare files unified ignore-white-space on page 1638

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<             full-name "File 1";
---
>             full-name "File 2";

file delete

Syntax file delete *filename*
<purge>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Delete a file on the local router or switch.

Options ***filename***—Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.

purge—(Optional) Overwrite regular files before deleting them.

Required Privilege Level maintenance

List of Sample Output file delete on page 1640
file delete (Routing Matrix) on page 1640

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax
file list
<detail | recursive>
<*filename*>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display a list of files on the local router or switch.

Options
none—Display a list of all files for the current directory.

detail | recursive—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.

filename—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.

Additional Information
The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the **file list** command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the **file list** command.

Required Privilege Level
maintenance

List of Sample Output
file list on page 1641
file list (Routing Matrix) on page 1641

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp
lcc0-re0:
--------------------------------------------------------------------------
/var/tmp/:
.gdbinit
.pccardd
Test/
chassisd*
chassisd.nathan*

file rename

Syntax file rename *source destination*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Rename a file on the local router or switch.

Options ***destination***—New name for the file.

source—Original name of the file. For a routing matrix, the filename must include the chassis information.

Required Privilege Level maintenance

List of Sample Output file rename on page 1643
file rename (Routing Matrix) on page 1643

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file rename

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

file rename (Routing Matrix)

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
--------------------------------------------------------------------------

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
--------------------------------------------------------------------------

/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

file show

Syntax file show *filename*
<encoding (base64 | raw)>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of a file.

Options ***filename***—Name of a file. For a routing matrix, the filename must include the chassis information.

encoding (base64 | raw)—(Optional) Encode file contents with base64 encoding or show raw text.

Required Privilege Level maintenance

List of Sample Output file show on page 1645
file show (Routing Matrix) on page 1645

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

file show (Routing Matrix)

```
user@host> file show lcc0-re0:/var/tmp/.gdbinit
lcc0-re0:
------------------------------------------------------------------------
######################################################################
# Settings

# Basic stuff
######################################################################

define msgbuf
        printf "%s", msgbufp->msg_ptr
end
```

```
# hex dump of a block of memory
# usage: dump address length
define dump
   p $arg0, $arg1
   set $ch = $arg0
   set $j = 0
   set $n = $arg1
   while ($j < $n)
        #printf "%x %x ",&$ch[$j],$ch[$j]
        printf "%x ",$ch[$j]
        set $j = $j + 1
        if (!($j % 16))
                printf "\n"
        end
   end
end
```

request system configuration rescue delete

Syntax request system configuration rescue delete

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Delete an existing rescue configuration.

NOTE: The **[edit system configuration]** hierarchy is not available on QFabric systems.

Options This command has no options.

Required Privilege Level maintenance

show system commit (Rollback Pending) on page 1650
show system commit (QFX Series) on page 1650

Output Fields Table 83 on page 939 describes the output fields for the **show system commit** command. Output fields are listed in the approximate order in which they appear.

Table 160: show system commit Output Fields

Field Name	Field Description
Junos XML protocol	Displays the last 50 commit operations listed, most recent to first. The identifier **Junos XML protocol** designates a configuration created for recovery using the **request system configuration rescue save** command.
Junos XML protocol	Date and time of the commit operation.
Junos XML protocol	User who executed the commit operation.
Junos XML protocol	Method used to execute the commit operation: • **Junos XML protocol**—CLI interactive user performed the commit operation. • **Junos XML protocol**—Junos XML protocol client performed the commit operation. • **synchronize**—The **commit synchronize** command was performed on the other Routing Engine. • **snmp**—An SNMP **set** request caused the commit operation. • **button**—A button on the router or switch was pressed to commit a rescue configuration for recovery. • **autoinstall**—A configuration obtained through autoinstallation was committed. • **other**—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.

Sample Output

show system commit

```
user@host> show system commit
0   2003-07-28 19:14:04 PDT by root via other
1   2003-07-25 22:01:36 PDT by regress via cli

show system rollback

Syntax show system rollback *number*
<compare *number*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

NOTE: The **show system rollback** command is a purely operational mode command and cannot be issued with **run** from the configuration mode.

Options ***number***—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

compare *number* —(Optional) Number of another previously committed (rollback) configuration to compare to rollback ***number***. The output displays the differences between the two configurations. The range of values is 0 through 49.

Required Privilege Level view

+                  }
+                  address 12.1.1.1/30;
+              }
+          }
+      }
+}
```

test configuration

Syntax test configuration *filename*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found.

Options ***filename***—Name of the configuration file.

syntax-only—Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.

Required Privilege Level view

List of Sample Output test configuration on page 1656

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

test configuration

```
user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
  [edit system]
    'paris-23;'
      syntax error

  [edit system login]
    'login ;'
      statement must contain additional statements
configuration syntax failed
```

CHAPTER 16

Troubleshooting

- Troubleshooting Procedures on page 1657

Troubleshooting Procedures

- Loading a Previous Configuration File on page 1657
- Reverting to the Default Factory Configuration on page 1658
- Reverting to the Rescue Configuration on page 1658

Loading a Previous Configuration File

You can use the **rollback** <***number*** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <***number***>

Options

- **none**— Return to the most recently saved configuration.
- ***number***—Configuration to return to.
  - **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

   ```
   [edit]
   user@switch# rollback 1
   load complete
   ```

2. Activate the configuration you have loaded:

   ```
   [edit]
   ```

```
user@switch# commit
```

Related Documentation

- Configuration File Terms on page 48

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1.
```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

Related Documentation

- Understanding Configuration Files on page 1590
- Loading a Previous Configuration File on page 1600
- Reverting to the Rescue Configuration on page 175

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   ```
   [edit]
   user@switch# load override filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit filename
   ```

CHAPTER 17

Overview

- Software Overview on page 1661
- Access Control Overview on page 1664

Software Overview

- Understanding Software Infrastructure and Processes on page 1661
- Understanding User and Access Management Features on the QFabric System on page 1663

Understanding Software Infrastructure and Processes

The QFX Series products run the Juniper Networks Junos OS. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 1661
- Junos OS Processes on page 1662

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch , which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 35 on page 68 describes the primary Junos OS processes.

Table 161: Junos OS Processes

Process	Name	Description
Chassis process	chassisd	Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

Table 161: Junos OS Processes *(continued)*

Process	Name	Description
Link Management Protocol (LMP) process	lmp-management	Establishes and maintains LMP control channels.
Management process	mgd	Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the partition. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.
Multicast snooping process	multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

Understanding User and Access Management Features on the QFabric System

The QFabric system supports the following user and access management features:

- User authentication
- RADIUS
- Link Layer Discovery Protocol (LLDP)

- SSH
- TACACS+
- Access privilege management

The specific functionality, features, options, syntax, and hierarchy levels of some of the user and access management commands and configuration statements implemented on the QFabric system may differ somewhat from the same commands and configuration statements on standard Junos OS. See the configuration statement or command topic in the documentation set for additional information, and use the help (**?**) command-line function to display specific information as needed.

Some user and access management features are not yet fully supported in the full QFabric architecture, although full support is planned for future releases. The user and access management features currently unsupported on the QFabric system include:

- Full RADIUS server support, including RADIUS accounting
- **accounting-options** configuration statement hierarchy
- **tacplus-options** configuration statement

Overview of Template Accounts for RADIUS and TACACS+ Authentication

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

Related Documentation

- Configuring Remote Template Accounts for User Authentication on page 1701
- Configuring Local User Template Accounts for User Authentication on page 1695

Understanding Login Authentication

You can control access to your network through the Juniper Networks QFX Series using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the **authentication-whitelist** statement.

You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.

On a single interface you can configure one or a combination of several authentication methods.

This topic covers:

- MAC RADIUS Authentication on page 1665

MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices.

The EAP method supported for MAC RADIUS authentication on the QFX Series is EAP-MD5.

When you configure the **mac-radius restrict** option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

Related Documentation

- Configuring RADIUS Authentication on page 1699

Understanding LLDP

The QFX Series product uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The QFX Series products support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The QFX Series products support the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

Related Documentation

- Configuring LLDP on page 1693

Understanding RADIUS Accounting

Juniper Networks QFX Series products support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the QFX Series supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the switch and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The switch forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 122.69.1.250.
4. The accounting server sends an *accounting-response* packet back to the switch confirming it has received the accounting request.
5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

Understanding VSAs on the QFX Series

The Juniper Networks QFX Series products support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS).

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the switch as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches.

Juniper Networks Vendor-Specific RADIUS Attributes

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. Table 162 on page 1668 lists the Juniper Networks VSAs you can configure.

Table 162: Juniper Networks Vendor-Specific RADIUS Attributes

Name	Description	Type	Length	String
Juniper-Local-User-Name	Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets.	1	≥3	One or more octets containing printable ASCII characters.

Table 162: Juniper Networks Vendor-Specific RADIUS Attributes *(continued)*

Name	Description	Type	Length	String
Juniper-Allow-Commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	2	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands" on page 1686.
Juniper-Deny-Commands	Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	3	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands" on page 1686.
Juniper-Allow-Configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	4	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1685.
Juniper-Deny-Configuration	Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	5	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1685.
Juniper-Interactive-Command	Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.	8	≥3	One or more octets containing printable ASCII characters.
Juniper-Configuration-Change	Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.	9	≥3	One or more octets containing printable ASCII characters.

Table 162: Juniper Networks Vendor-Specific RADIUS Attributes *(continued)*

Name	Description	Type	Length	String
Juniper-User-Permissions	Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets. NOTE: When the **Juniper-User-Permissions** attribute is configured to grant the Junos OS **maintenance** or **all** permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the **su root** command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions **maintenance** or **all**, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.	10	≥3	One or more octets containing printable ASCII characters. The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See Table 164 on page 1672.

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. Table 163 on page 1670 lists the Juniper Networks VSAs you can configure.

Table 163: Juniper Networks Vendor-Specific TACACS+ Attributes

Name	Description	Length	String
local-user-name	Indicates the name of the user template used by this user when logging in to a device.	≥3	One or more octets containing printable ASCII characters.

Table 163: Juniper Networks Vendor-Specific TACACS+ Attributes *(continued)*

Name	Description	Length	String
allow-commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 168 on page 1686.
allow-configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1685.
deny-commands	Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 168 on page 1686.
deny-configuration	Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 167 on page 1686.
user-permissions	Contains information the server uses to specify user permissions. NOTE: When the **user-permissions** attribute is configured to grant the Junos OS **maintenance** or **all** permissions on a TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the **su root** command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions **maintenance** or **all**, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.	≥3	One or more octets containing printable ASCII characters. See Table 164 on page 1672.

Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- Junos OS Login Class Permission Flags on page 1672
- Allowing or Denying Individual Commands for Junos OS Login Classes on page 1675

Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in Table 164 on page 1672. Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

Table 164 on page 1672 lists the Junos® operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.

Table 164: Login Class Permission Flags

Permission Flag	Description
access	Can view the access configuration in configuration mode and with the **show configuration** operational mode command.
access-control	Can view and configure access information at the **[edit access]** hierarchy level.
admin	Can view user account information in configuration mode and with the **show configuration** operational mode command.
admin-control	Can view user accounts and configure them at the **[edit system login]** hierarchy level.

Table 164: Login Class Permission Flags *(continued)*

Permission Flag	Description
all-control	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
clear	Can clear (delete) information learned from the network that is stored in various network databases by using the **clear** commands.
configure	Can enter configuration mode by using the **configure** command.
control	Can perform all control-level operations—all operations configured with the **-control** permission flags.
field	Can view field debug commands. Reserved for debugging support.
firewall	Can view the firewall filter configuration in configuration mode.
firewall-control	Can view and configure firewall filter information at the **[edit firewall]** hierarchy level.
floppy	Can read from and write to the removable media.
flow-tap	Can view the flow-tap configuration in configuration mode.
flow-tap-control	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the **[edit services flow-tap]** hierarchy level.
flow-tap-operation	Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have **flow-tap-operation** permission. NOTE: The **flow-tap-operation** option is not included in the **all-control** permissions flag.
idp-profiler-operation	Can view profiler data.
interface	Can view the interface configuration in configuration mode and with the **show configuration** operational mode command.

Table 164: Login Class Permission Flags *(continued)*

Permission Flag	Description
interface-control	Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: • **[edit chassis]** • **[edit class-of-service]** • **[edit groups]** • **[edit forwarding-options]** • **[edit interfaces]**
maintenance	Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell by using the **su root** command, and can halt and reboot the router by using the **request system** commands.
network	Can access the network by using the **ping**, **ssh**, **telnet**, and **traceroute** commands.
pgcp-session-mirroring	Can view the **pgcp** session mirroring configuration.
pgcp-session-mirroring-control	Can modify the **pgcp** session mirroring configuration.
reset	Can restart software processes by using the **restart** command and can configure whether software processes are enabled or disabled at the **[edit system processes]** hierarchy level.
rollback	Can use the **rollback** command to return to a previously committed configuration other than the most recently committed one.
routing	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
routing-control	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the **[edit routing-options]** hierarchy level, routing protocols at the **[edit protocols]** hierarchy level, and routing policy at the **[edit policy-options]** hierarchy level.
secret	Can view passwords and other authentication keys in the configuration.
secret-control	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
security	Can view security configuration in configuration mode and with the **show configuration** operational mode command.

Table 164: Login Class Permission Flags *(continued)*

Permission Flag	Description
security-control	Can view and configure security information at the **[edit security]** hierarchy level.
shell	Can start a local shell on the router or switch by using the **start shell** command.
snmp	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
snmp-control	Can view SNMP configuration information and can modify SNMP configuration at the **[edit snmp]** hierarchy level.
system	Can view system-level information in configuration and operational modes.
system-control	Can view system-level configuration information and configure it at the **[edit system]** hierarchy level.
trace	Can view trace file settings and configure trace file properties.
trace-control	Can modify trace file settings and configure trace file properties.
view	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.
view-configuration	Can view all of the configuration excluding secrets, system scripts, and event options. NOTE: Only users with the **maintenance** permission can view commit script, op script, or event script configuration.

Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmd*n***), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration** and

deny-configuration, **allow-commands** and **deny-commands**, and all user permission bits.

- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

  For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

  Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However; if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order *authentication-methods*]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order *authentication-methods*** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

Order of Authentication Attempts

Table 165 on page 1678 describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 165: Order of Authentication Attempts

Syntax	Order of Authentication Attempts
authentication-order radius;	1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS server is available but authentication is rejected, deny access. 4. If RADIUS servers are not available, try password authentication. NOTE: If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.
authentication-order [radius password];	1. Try configured RADIUS authentication servers. 2. If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [radius tacplus];	1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ server is available but authentication is rejected, deny access. 6. If both RADIUS and TACACS+ servers are not available, try password authentication. NOTE: If either RADIUS or TACACS+ servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.
authentication-order [radius tacplus password];	1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.

Table 165: Order of Authentication Attempts *(continued)*

Syntax	Order of Authentication Attempts
authentication-order tacplus;	1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ server is available but authentication is rejected, deny access. 4. If TACACS+ servers are not available, try password authentication. NOTE: If a TACACS+ server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.
authentication-order [tacplus password];	1. Try configured TACACS+ authentication servers. 2. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [tacplus radius];	1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS server is available but authentication is rejected, deny access. 6. If both TACACS+ and RADIUS servers are not available, try password authentication. NOTE: If either TACACS+ or RADIUS servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.
authentication-order [tacplus radius password];	1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.

Table 165: Order of Authentication Attempts *(continued)*

Syntax	Order of Authentication Attempts
authentication-order password;	1. Try to authenticate the user, using the password configured at the **[edit system login]** hierarchy level. 2. If the authentication is accepted, grant access. 3. If the authentication is rejected, deny access.

NOTE: If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the **authentication-order** statement. If you want SSH logins to use the authentication methods configured in the authentication-order statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups **re0** and **re1**. The authentication order must not be configured at the **[edit system]** hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the **authentication-order** statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the **authentication-order** statement.

Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in "Junos OS User Authentication Methods" on page 1681.) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User's full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must

be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.

- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.

- User's access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1685.

- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user's password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

  ```
  [edit system login user user-name]
  user@switch# set authentication plain-text-password
  New password: type password here
  Retype new password: retype password here
  ```

  The default requirements for plain-text passwords are:

  - The password must be between 6 and 128 characters long
    - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
    - Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
```

```

      44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in "Configuring the Root Password" on page 1702.

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

Related Documentation

- Configuring Junos OS User Accounts on page 1692
- Junos OS Login Classes Overview on page 1683

Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in Table 166 on page 1683. The predefined login classes cannot be modified.

Table 166: Predefined System Login Classes

Login Class	Permission Flag Set
operator	clear, network, reset, trace, and view
read-only	view
superuser or **super-user**	all
unauthorized	None

NOTE:

- You cannot modify a predefined login class name. If you issue the **set** command on a predefined class name, the Junos OS appends **-local** to the login class name. The following message also appears:

  warning: '<*class-name*>' is a predefined class name; changing to '<*class-name*>-local'

- You cannot issue the **rename** or **copy** command on a predefined login class. Doing so results in the following error message:

  error: target '<*class-name*>' is a predefined class

Related Documentation

- *Defining Junos OS Login Classes*
- Defining Junos OS Login Classes on page 1716
- Understanding QFabric System Login Classes on page 1230

Understanding QFabric System Login Classes

In some cases (such as device-level troubleshooting), it is useful to log in to individual QFabric system components so you can view and manage issues on a per-device basis. This topic explains the login classes that provide individual component access within a QFabric system.

NOTE: Under normal operating conditions, you should manage the QFabric system as a single entity by using the QFabric system default partition command-line interface (CLI). The default partition CLI provides you with the ability to configure and monitor your entire QFabric system from a central location and should be used as the primary way to manage the system.

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system:

- **qfabric-admin**—Provides the ability to log in to individual QFabric system components and manage them. This class is equivalent to setting the following permissions: **access**, **admin**, **clear**, **firewall**, **interface**, **maintenance**, **network**, **reset**, **routing**, **secret**, **security**, **snmp**, **system**, **trace**, and **view**. The *qfabric-admin* class also enables you issue all operational mode commands except **configure**. To provide QFabric system component-level login and management privileges, include the **qfabric-admin** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-operator**—Provides the privilege to log in to individual QFabric system components and view component operations and configurations. This class is equivalent to setting the following permissions: **trace** and **view**. The *qfabric-operator* class also enables you issue the **monitor** and **show log messages** operational mode commands. To provide limited QFabric system component-level access, include the

qfabric-operator statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

- **qfabric-user**—Prevents access to individual QFabric system components. This class is the default setting for all QFabric system users and is equivalent to the preset Junos OS class of **unauthorized**. To prevent a user from accessing individual QFabric system components, include the **qfabric-user** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

When you perform the initial setup for the Director group, you must specify a username and password for QFabric components. Once configured, this information is stored in the QFabric system and mapped to the QFabric system login classes. Such mapping allows users with the proper login class (**qfabric-admin** or **qfabric-operator**) to log in automatically to a component without being prompted for the username and password.

After you assign the **qfabric-admin** or **qfabric-operator** class to a user, the user can log in to an individual QFabric system component by issuing the **request component login *component-name*** command. You can access Node devices, Interconnect devices, and virtual Junos Routing Engines (diagnostics, fabric control, and fabric manager) one at a time when you issue this command. To leave the CLI prompt of a component and return to the QFabric system default partition CLI, issue the **exit** command from the component's operational mode CLI prompt.

Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the **allow/deny-configuration-regexps** and **allow/deny-configuration** statements at the **[edit system login class]** hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

Table 167 on page 1686 lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

Table 167: Configuration Mode Hierarchies—Common Regular Expression Operators

Operator	Match
|	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, (**show system alarms**)|(**show system software**).
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.
$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, **allow-commands "show interfaces$"** means that the user can issue the **show interfaces** command but cannot issue **show interfaces detail** or **show interfaces extensive**.
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen (-).
( )	A group of commands, indicating a complete, standalone expression to be evaluatedhe result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained .
*	Zero or more terms.
+	One or more terms.
.	Any character except for a space " ".

Related Documentation

- *Specifying Access Privileges for Junos OS Configuration Mode Hierarchies*
- Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1719

Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands

Use extended regular expressions to specify which operational mode commands are denied or allowed. Table 168 on page 1686 lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

Table 168: Common Regular Expression Operators to Allow or Deny Operational Mode Commands

Operator	Match
|	One of two or more terms separated by the pipe (|) symbol. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, (**show system alarms**)|(**show system software**).

Table 168: Common Regular Expression Operators to Allow or Deny Operational Mode Commands *(continued)*

Operator	Match
^	At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.
$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, **allow-commands "show interfaces$"** means that the user can issue the **show interfaces** command but cannot issue the **show interfaces detail** or **show interfaces extensive** command.
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen (-).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. Table 169 on page 1687 shows the default requirements.

Table 169: Special Requirements for Plain-Text Passwords

Junos OS	Junos-FIPS
The password must be between 6 and 128 characters long.	FIPS passwords must be between 10 and 20 characters long
You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.	You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.

Table 169: Special Requirements for Plain-Text Passwords *(continued)*

Junos OS	Junos-FIPS
Valid passwords must contain at least one change of case or character class.	Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # $ % ^ & * , +< > : ;

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- **[edit system diag-port-authentication]**
- **[edit system pic-console-authentication]**
- **[edit system root-authentication]**
- **[edit system login user *username* authentication]**

  The **change-type** statement specifies whether the password is checked for the following:

  - The total number of character sets used (**character-set**)
  - The total number of character set changes (**set-transitions**)

  For example, the following password:

  MyPassWd@2

  has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (**M–y**, **y–P**, **P–a**, **s–W**, **W–d**, **d–@**, and **@–2**).

  The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

  The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be **5** or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
   change-type character-sets;
   format md5;
   minimum-changes 1;
   minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
   change-type set-transitions;
   format sha1;
   maximum-length 20;
   minimum-changes 3;
   minimum-length 10;
}
```

Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
permissions [ permissions ];
```

Related Documentation

- Example: Configuring Access Privilege Levels on page 1729

- Specifying Access Privileges for Junos OS Operational Mode Commands on page 178
- *permissions*

Configuring CLI Tips

The Junos OS CLI provides the option of configuring CLI tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

Related Documentation

- CLI User Interface Overview on page 70
- *Defining Junos OS Login Classes*
- **login-tip on page 265**

Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
  class class-name;
    class {
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
  full-name complete-name;
  uid uid-value;
  class class-name;
}
```

- Limiting the Number of User Login Attempts for SSH and Telnet Sessions on page 1716

Configuring LLDP

QFX Series products use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to identify a variety of devices quickly. The result is a LAN that interoperates smoothly and efficiently.

The LLDP protocol cannot be enabled by issuing the **set protocols lldp** statement at the **[edit]** hierarchy level. Enable the LLDP protocol by configuring it on all interfaces or on specific interfaces.

To configure basic LLDP options using the CLI:

1. Configure the advertisement interval in seconds:

   ```
   [edit protocols lldp]
   user@switch# set advertisement-interval 45
   ```
2. Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded:

   ```
   [edit protocols lldp]
   user@switch# set hold-multiplier 5
   ```
3. Configure LLDP on all interfaces or on a specific interface:

   ```
   [edit protocols lldp]
   user@switch# set interface (LLDP) all
   ```
4. Configure tracing operations for the LLDP protocol:

   ```
   [edit protocols lldp]
   user@switch# set traceoptions file lldptrace
   ```

Related Documentation

Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

To configure the authentication order, include the **authentication-order** statement at the **[edit system]** hierarchy level:

```
[edit system]
authentication-order [ authentication-methods ];
```

Specify one or more of the following authentication methods in the preferred order, from first tried to last tried:

- **radius**—Verify the user using RADIUS authentication services
- **tacplus**—Verify the user using TACACS+ authentication services.
- **password**—Verify the user using the username and password configured locally by including the authentication statement at the **[edit system login user]** hierarchy level.

The CHAP authentication sequence cannot take more than 30 seconds. If it takes longer to authenticate a client, the authentication is abandoned and a new sequence is initiated.

For example, if you configure three RADIUS servers so that the router or switch attempts to contact each server three times, and with each retry the server times out after 3 seconds, then the maximum time given to the RADIUS authentication method before CHAP considers it a failure is 27 seconds. If you add more RADIUS servers to this configuration, they might not be contacted because the authentication process might be abandoned before these servers are tried.

The Junos OS enforces a limit on the number of standing authentication server requests that the CHAP authentication can have at one time. Thus, an authentication server method—RADIUS, for example—might fail to authenticate a client when this limit is exceeded. If it fails, the authentication sequence is reinitiated by the router or switch until authentication succeeds and the link is brought up. However, if the RADIUS servers are not available and if additional authentication methods such as **tacplus** or **password** are configured along with **radius**, the next authentication method is tried.

The following example shows how to configure **radius** and **password** authentication:

```
[edit system]
user@switch# authentication-order [ radius password ];
```

The following example shows how to delete the **radius** statement from the authentication order:

```
[edit system]
user@switch# delete authentication-order radius
```

The following example shows how to insert the **tacplus** statement after the **radius** statement:

```
[edit system]
user@switch# insert authentication-order tacplus after radius
```

- *authentication-order*

Configuring Local User Template Accounts for User Authentication

You use local user template accounts when you need different types of templates for authentication. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the router and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, the Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is authenticated, the server returns the local username to the Junos OS, which then determines whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, the Junos OS selects the appropriate local user template locally configured on the router. If a local user template does not exist for the authenticated user, the router defaults to the **remote** template.

To configure different access privileges for users who share the local user template account, include the **allow-commands** and **deny-commands** commands in the authentication server configuration file.

To configure a local user template, include the **user *local-username*** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to the local users to whom the template applies:

```
[edit system login]
user local-username {
   full-name "Local user account";
   uid uid-value;
   class class-name;
}
```

This example configures the **sales** and **engineering** local user templates:

```
[edit]
system {
   login {
      user sales {
         uid uid-value;
```

```
        class class-name;
      }
      user engineering {
        uid uid-value;
        class class-name;
      }
    }
  }

  user = simon {
    ...
    service = junos-exec {
      local-user-name = sales
      allow-commands = "configure"
      deny-commands = "shutdown"
    }
  }
  user = rob {
    ...
    service = junos-exec {
      local-user-name = sales
      allow-commands = "(request system) | (show rip neighbor)"
      deny-commands = "clear"
    }
  }
  user = harold {
    ...
    service = junos-exec {
      local-user-name = engineering
      allow-commands = "monitor | help | show | ping | traceroute"
      deny-commands = "configure"
    }
  }
  user = jim {
    ...
    service = junos-exec {
      local-user-name = engineering
      allow-commands = "show bgp neighbor"
      deny-commands = "telnet | ssh"
    }
  }
```

When the login users Simon and Rob are authenticated, the switch applies the sales local user template. When login users Harold and Jim are authenticated, the switch applies the engineering local user template.

Related Documentation

- Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1665
- *user (Access)*
- user (Access) on page 314

Configuring Management Access

To define the management access settings for the routing platform:

1. Next to Allow Telnet Access, select the check box to allow remote Telnet access to the routing platform.
2. Next to Allow SSH Access, selected the check box to allow remote SSH access to the routing platform.
3. Click **Apply** to apply the configuration.

Configuring RADIUS System Accounting

With RADIUS accounting enabled, Juniper Networks routers or switches, acting as RADIUS clients, can notify the RADIUS server about user activities such as software logins, configuration changes, and interactive commands. The framework for RADIUS accounting is described in RFC 2866.

Tasks for configuring RADIUS system accounting are:

1. Configuring Auditing of User Events on a RADIUS Server on page 1697
2. Specifying RADIUS Server Accounting and Auditing Events on page 1697
3. Configuring RADIUS Server Accounting on page 1698

Configuring Auditing of User Events on a RADIUS Server

To audit user events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
    radius {
        server {
            server-address {
                accounting-port port-number;
                secret password;
                source-address address;
                retry number;
                timeout seconds;
            }
        }
    }
}
```

Specifying RADIUS Server Accounting and Auditing Events

To specify the events you want to audit when using a RADIUS server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

events is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

Configuring RADIUS Server Accounting

To configure RADIUS server accounting, include the **server** statement at the **[edit system accounting destination radius]** hierarchy level:

```
server {
  server-address {
    accounting-port port-number;
    secret password;
    source-address address;
    retry number;
    timeout seconds;
  }
}
```

server-address specifies the address of the RADIUS server. To configure multiple RADIUS servers, include multiple **server** statements.

NOTE: If no RADIUS servers are configured at the **[edit system accounting destination radius]** statement hierarchy level, the Junos OS uses the RADIUS servers configured at the **[edit system radius-server]** hierarchy level.

accounting-port ***port-number*** specifies the RADIUS server accounting port number.

The default port number is 1813.

NOTE: If you enable RADIUS accounting at the **[edit access profile** ***profile-name*** **accounting-order]** hierarchy level, accounting is triggered on the default port of 1813 even if you do not specify a value for the **accounting-port** statement.

You must specify a secret (password) that the local router or switch passes to the RADIUS client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (“ “).

In the **source-address** statement, specify a source address for the RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. The source address is a valid IPv4 address configured on one of the router or switch interfaces.

Optionally, you can specify the number of times that the router or switch attempts to contact a RADIUS authentication server by including the **retry** statement. By default, the router or switch retries three times. You can configure the router or switch to retry from 1 through 10 times.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a RADIUS server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure the timeout to be from 1 through 90 seconds.

Configuring RADIUS Authentication

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

NOTE: The source-address statement is not supported at the **[edit system radius-options** or **[edit system-radius-server** *name*] hierarchies on the QFabric system.

- Configuring RADIUS Server Details on page 1699
- Configuring MS-CHAPv2 for Password-Change Support on page 1700
- Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1701

Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the **[edit system]** hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
    accounting-port port-number;
    port number;
    retry number;
    secret password;
    source-address source-address;
    timeout seconds;
}
```

server-address is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the **secret *password*** statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the **timeout** statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the **retry** statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries

connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the **source-address** statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple **radius-server** statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level, as described in "Overview of Template Accounts for RADIUS and TACACS+ Authentication" on page 1665.

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile *profile-name* radius-server *server-address*]**
2. **[edit access radius-server *server-address*]**
3. **[edit system radius-server *server-address*]**

Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters
- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
   authentication-order [ radius password ];
   radius-server {
      192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
   }
   radius-options {
      password-protocol mschap-v2;
   }
```

```
    login {
      user bob {
        class operator;
      }
    }
}
```

Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server *server-address*]** hierarchy level:

```
[edit system radius-server server-address]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

Configuring Remote Template Accounts for User Authentication

By default, the Junos OS uses remote template accounts for user authentication when:

- The authenticated user does not exist locally on the router or switch.
- The authenticated user's record in the authentication server specifies local user, or the specified local user does not exist locally on the router or switch.

To configure the remote template account, include the **user remote** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to remote users:

```
[edit system login]
user remote {
  full-name "All remote users";
  uid uid-value;
```

```
    class class-name;
}
```

To configure different access privileges for users who share the remote template account, include the **allow-commands** and **deny-commands** statements in the authentication server configuration file.

- user (Access) on page 314

Configuring the Root Password

Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password.

NOTE: If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as superuser and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level:

```
[edit system]
root-authentication {
    (encrypted-password "password" | load-key-password URL | plain-text-password);
    ssh-dsa "public-key";
    ssh-rsa "public-key";
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@switch# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

To load an SSH key file, enter the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

You can also configure SSH RSA keys and SSH DSA keys to authenticate root logins. You can configure more than one public RSA or DSA key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@switch# set root-authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
    2074049625283903820386901415845349641700196106083587229 6
    1563475749182736033612764418742659468932077391083448101 2
    6831259577226254616679992783161235004386609158662838224 8
    9746732605661192148953981396556156378621194032768706538
    1696020274916416373591326939634400844 3 boojum@juniper.net"; #
    SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
```

```
community community-name {
  authorization authorization;
  client-list-name client-list-name;
  clients {
    address restrict;
  }
  logical-system logical-system-name {
    routing-instance routing-instance-name {
      clients {
      addresses;
      }
    }
  }
  routing-instance routing-instance-name {
    clients {
    addresses;
    }
  }
  view view-name;
}
contact contact;
description description;
filter-duplicates;
filter-interfaces;
health-monitor {
  falling-threshold integer;
  interval seconds;
  rising-threshold integer;
}
interface [ interface-names ];
location location;
name name;

Configuring SSH Host Keys for Secure Copying of Data

Secure Shell (SSH) uses encryption algorithms to generate a host, server, and session key system that ensures secure data transfer. You can configure SSH host keys to support secure copy (SCP) as an alternative to FTP for the background transfer of data such as configuration archives and event logs. To configure SSH support for SCP, you must complete the following tasks:

- Specify SSH known hosts by including hostnames and host key information in the Routing Engine configuration hierarchy.
- Set an SCP URL to specify the host from which to receive data. Setting this attribute automatically retrieves SSH host key information from the SCP server.
- Verify that the host key is authentic.
- Accept the secure connection. Accepting this connection automatically stores host key information in the local host key database. Storing host key information in the configuration hierarchy automates the secure handshake and allows background data transfer using SCP.

Tasks to configure SSH host keys for secure copying of data are:

1. Configuring SSH Known Hosts on page 1708
2. Configuring Support for SCP File Transfer on page 1708
3. Updating SSH Host Key Information on page 1709

Configuring SSH Known Hosts

To configure SSH known hosts, include the **host** statement, and specify hostname and host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level:

```
[edit security ssh-known-hosts]
host corporate-archive-server, ip-address {
    dsa-key key;
}
host archive-server-url {
    rsa-key key;
}
host server-with-ssh-version-1, ip-address {
    rsa1-key key;
}
```

Host keys are one of the following:

- **dsa-key**—Base64 encoded Digital Signature Algorithm (DSA) key.
- **rsa-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures.
- **rsa1-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures for SSH version 1 and SSH version 2.

Configuring Support for SCP File Transfer

To configure a known host to support background SCP file transfers, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level.

```
[edit system archival configuration]
archive-sites {
    scp://username<:password>@host<:port>/url-path;
}
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, **"scp://username<:password>@[host]<:port>/url-path";**

Setting the **archive-sites** statement to point to an SCP URL triggers automatic host key retrieval. At this point, Junos OS connects to the SCP host to fetch the SSH public key, displays the host key message digest or fingerprint as output to the console, and terminates the connection to the server.

```
user@switch# set system archival configuration archive-sites "<scp-url-path>"
The authenticity of host <my-archive-server (<server-ip-address>)> can't be established.
    RSA key fingerprint is <ascii-text key>. Are you sure you want to continue connecting
    (yes/no)?
```

To verify that the host key is authentic, compare this fingerprint with a fingerprint that you obtain from the same host using a trusted source. If the fingerprints are identical,

accept the host key by entering **yes** at the prompt. The host key information is then stored in the Routing Engine configuration and supports background data transfers using SCP.

Updating SSH Host Key Information

Typically, SSH host key information is automatically retrieved when you set a URL attribute for SCP using the **archival configuration archive-sites** statement at the **[edit system]** hierarchy level. However, if you need to manually update the host key database, use one of the following methods.

1. Retrieving Host Key Information Manually on page 1709
2. Importing Host Key Information from a File on page 1709

Retrieving Host Key Information Manually

To manually retrieve SSH public host key information, use the **fetch-from-server** option with the **set security ssh-known-hosts** command. You must include a hostname attribute with the **set security ssh-known-hosts fetch-from-server** command to specify the host from which to retrieve the SSH public key.

```
user@switch# set security ssh-known-hosts fetch-from-server <hostname>
```

Importing Host Key Information from a File

To manually import SSH host key information from the known-hosts file located at **/var/tmp/known-hosts** on the server, include the **load-key-file** option with the **set security ssh-known-hosts** command. You must include the path to the **known-hosts** file with the **set security ssh-known-hosts load-key-file** command to specify the location from which to import host key information.

```
user@switch# set security ssh-known-hosts load-key-file /var/tmp/known-hosts
```

Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
   ciphers [ cipher-1 cipher-2 cipher-3 ...]
   client-alive-count-max number;
   client-alive-interval seconds;
   connection-limit limit;
   hostkey-algorithm <algorithm | no-algorithm>;
   key-exchange algorithm;
   macs algorithm;
   max-sessions-per-connection number;
   no-tcp-forwarding;
   protocol-version [v1 v2] ;
   rate-limit limit;
   root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit** ***limit***—Maximum number of simultaneous connections per protocol (IPV4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection** ***number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit** ***limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

For information about other configuration settings, see the following topics:

- Configuring the Root Login Through SSH on page 1710
- Configuring the SSH Protocol Version on page 1710
- Configuring the Client Alive Mechanism on page 1711

Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit systems services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

allow—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

deny—Disables users from logging in to the router or switch as root through SSH.

deny-password—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

Configuring TACACS+ Authentication

TACACS+ authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure TACACS+ configuration are:

- Configuring TACACS+ Server Details on page 1711
- Specifying a Source Address for the Junos OS to Access External TACACS+ Servers on page 1712
- Configuring the Same Authentication Service for Multiple TACACS+ Servers on page 1713
- Configuring Juniper Networks Vendor-Specific TACACS+ Attributes on page 1713

Configuring TACACS+ Server Details

To use TACACS+ authentication on the router or switch, configure information about one or more TACACS+ servers on the network by including the **tacplus-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
tacplus-server server-address {
    port port-number;
    secret password;
    single-connection;
```

```
    timeout seconds;
}
```

server-address is the address of the TACACS+ server.

port-number is the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password included spaces, enclose the password in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can use the **single-connection** statement to have the software maintain one open Transmission Control Protocol (TCP) connection to the server for multiple requests, rather than opening a connection for each connection attempt.

NOTE: Early versions of the TACACS+ server do not support the **single-connection** option. If you specify this option and the server does not support it, Junos OS will be unable to communicate with that TACACS+ server.

To configure multiple TACACS+ servers, include multiple **tacplus-server** statements.

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

NOTE: Accounting should not be configured at the **[edit system]** hierarchy level; on a TX Matrix router, control is done under the switch-card chassis only.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level.

Specifying a Source Address for the Junos OS to Access External TACACS+ Servers

You can specify which source address Junos OS uses when accessing your network to contact an external TACACS+ server for authentication. You can also specify which source address Junos OS uses when contacting a TACACS+ server for sending accounting information.

To specify a source address for a TACACS+ server for authentication, include the **source-address** statement at the **[edit system tacplus-server *server-address*]** hierarchy level:

```
[edit system tacplus-server server-address]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

To specify a source address for a TACACS+ server for system accounting, include the **source-address** statement at the **[edit system accounting destination tacplus server *server-address*]** hierarchy level:

```
[edit system accounting destination tacplus server server-address]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

Configuring the Same Authentication Service for Multiple TACACS+ Servers

To configure the same authentication service for multiple TACACS+ servers, include statements at the **[edit system tacplus-server]** and **[edit system tacplus-options]** hierarchy levels. For information about how to configure a TACACS+ server at the **[edit system tacplus-server]** hierarchy level.

To assign the same authentication service to multiple TACACS+ servers, include the **service-name** statement at the **[edit system tacplus-options]** hierarchy level:

```
[edit system tacplus-options]
service-name service-name;
```

service-name is the name of the authentication service. By default, the service name is set to **junos-exec**.

The following example shows how to configure the same authentication service for multiple TACACS+ servers:

```
[edit system]
tacplus-server {
   10.2.2.2 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
   10.3.3.3 secret "$9$2dgoJGDiqP5ZG9A";## SECRET-DATA
}
tacplus-options {
   service-name bob;
}
```

Configuring Juniper Networks Vendor-Specific TACACS+ Attributes

The Juniper Networks vendor-specific TACACS+ attributes enable you to configure access privileges for users on a TACACS+ server. They are specified in the TACACS+ server configuration file on a per-user basis. Junos OS retrieves these attributes through an authorization request of the TACACS+ server after authenticating a user. You do not need to configure these attributes to run Junos OS with TACACS+.

To specify these attributes, include a **service** statement of the following form in the TACACS+ server configuration file:

```
service = junos-exec {
   local-user-name = <username-local-to-router>
   allow-commands = "<allow-commands-regex>"
```

```
    allow-configuration = "<allow-configuration-regex>"
    deny-commands = "<deny-commands-regex>"
    deny-configuration = "<deny-configuration-regex>"
}
```

This **service** statement can appear in a **user** or **group** statement.

- Junos OS User Authentication Methods on page 1681

Configuring TACACS+ System Accounting

You can use TACACS+ to track and log software logins, configuration changes, and interactive commands. To audit these events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  tacplus {
    server {
      server-address {
        port port-number;
        secret password;
        single-connection;
        timeout seconds;
      }
    }
  }
}
```

Tasks for configuring TACACS+ system accounting are:

1. Specifying TACACS+ Auditing and Accounting Events on page 1714
2. Configuring TACACS+ Server Accounting on page 1715

Specifying TACACS+ Auditing and Accounting Events

To specify the events you want to audit when using a TACACS+ server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

events is one or more of the following:

- **login**—Audit logins

- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

Configuring TACACS+ Server Accounting

To configure TACACS+ server accounting, include the **server** statement at the **[edit system accounting destination tacplus]** hierarchy level:

```
[edit system accounting destination tacplus]
server {
  server-address {
    port port-number;
    secret password;
    single-connection;
    timeout seconds;
  }
}
```

server-address specifies the address of the TACACS+ server. To configure multiple TACACS+ servers, include multiple **server** statements.

NOTE: If no TACACS+ servers are configured at the **[edit system accounting destination tacplus]** statement hierarchy level, Junos OS uses the TACACS+ servers configured at the **[edit system tacplus-server]** hierarchy level.

port-number specifies the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password contains spaces, enclose the entire password in quotation marks (“ ”). The password used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can maintain one open TCP connection to the server for multiple requests, rather than opening a connection for each connection attempt, by including the **single-connection** statement.

To ensure that start and stop requests for accounting of login events are correctly logged in the Accounting file instead of the Administration log file on a TACACS+ server, include either the **no-cmd-attribute-value** statement or the **exclude-cmd-attribute** at the **[edit system tacplus-options]** hierarchy level.

If you use the **no-cmd-attribute-value** statement, the value of the **cmd** attribute is set to a null string in the start and stop requests. If you use the **exclude-cmd-attribute** statement, the **cmd** attribute is totally excluded from the start and stop requests. Both statements

support the correct logging of accounting requests in the Accounting file, instead of the Administration file.

```
[edit system tacplus-options]
(no-cmd-attribute-value | exclude-cmd-attribute);
```

Defining Junos OS Login Classes

To define a login class and its access privileges, include the **class** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
class class-name {
  allow-commands "regular-expression";
  allow-configuration "regular-expression";
  deny-commands "regular-expression";
  deny-configuration "regular-expression";
  idle-timeout minutes;
  permissions [ permissions ];
}
```

Limiting the Number of User Login Attempts for SSH and Telnet Sessions

You can limit the number of times a user can attempt to enter a password while logging in through SSH or Telnet. The connection is terminated if a user fails to log in after the number of attempts specified. You can also specify a delay, in seconds, before a user can try to enter a password after a failed attempt. In addition, you can specify the threshold for the number of failed attempts before the user experiences a delay in being able to enter a password again.

To specify the number of times a user can attempt to enter a password while logging in, include the **retry-options** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
retry-options {
  tries-before-disconnect number;
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds
  minimum-time seconds;
}
```

You can configure the following options:

- **tries-before-disconnect**—Number of times a user can attempt to enter a password when logging in. The connection closes if a user fails to log in after the number specified. The range is from 1 through 10, and the default is 10.
- **backoff-threshold**—Threshold for the number of failed login attempts before the user experiences a delay in being able to enter a password again. Use the **backoff-factor** option to specify the length of the delay in seconds. The range is from 1 through 3, and the default is 2.
- **backoff-factor**—Length of time, in seconds, before a user can attempt to log in after a failed attempt. The delay increases by the value specified for each subsequent attempt after the threshold. The range is from 5 through 10, and the default is 5 seconds.
- **maximum-time** ***seconds***—Maximum length of time, in seconds, that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the **maximum-time** value, the connection is closed. The range is from 20 through 300 seconds, and the default is 120 seconds.
- **minimum-time**—Minimum length of time, in seconds, that a connection remains open while a user is attempting to enter a correct password. The range is from 20 through 60, and the default is 40.

Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45–to–DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45–to–DB-9 serial port adapter into the serial port on the management device.

5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

   The terminal emulation screen on your management device displays the switch's boot sequence.
10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

    ```
    Hit [Enter] to boot immediately, or space bar for command prompt.
    Booting [kernel] in 9 seconds...
    ```
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

    ```
    ok boot -s
    ```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

    ```
    Enter full pathname of shell or 'recovery' for root password recovery or RETURN
    for /bin/sh: recovery
    ```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

    ```
    user@switch# set system root-authentication plain-text-password
    ```
15. At the following prompt, enter the new root password. For example:

    ```
    New password: juniper1
    Retype new password:
    ```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

    ```
    root@host# commit
    commit complete
    ```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.

    ```
    Reboot the system? [y/n] y
    ```

Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

You can specify extended regular expressions with the **allow-configuration** and **deny-configuration** statements to define user access privileges to parts of the configuration hierarchy. Doing so overrides login class permission bits set for a user. You can also use wildcards to restrict access. When you define access privileges to parts of the configuration hierarchy, do the following tasks:

- Specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements.
- Put parentheses around an extended regular expression that connects two or more expressions with the pipe | symbol. For example:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

NOTE: Each expression separated by a pipe (|) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (|) symbol. You cannot define access to keywords such as **set**, **edit**, or **activate**.

When you explicitly provide access to configuration mode hierarchies or regular expressions using the **allow-configuration** statement, you add to the regular permissions set with the **permissions** statement. If you explicitly deny access to configuration mode hierarchies or regular expressions using the **deny-configuration** statement, you remove permissions for the specified configuration mode hierarchy from the default permissions provided by the **permissions** statement.

To explicitly provide access to an individual configuration mode hierarchy that would otherwise be denied, include the **allow-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-configuration "regular-expression";
```

To explicitly deny access to an individual configuration hierarchy that would otherwise be supported, include the **deny-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-configuration “regular-expression";
```

You can include one **deny-configuration** and one **allow-configuration** statement in each login class.

If you allow and deny the same set of configuration hierarchy levels, regular expressions, or commands, the **allow-configuration** statement permissions take precedence over the

permissions specified by the **deny-configuration** statement. For example, if you include **allow-configuration "system services"** and **deny-configuration "system services"**, the login class user can continue to edit the configuration or issue commands at the **edit system services** hierarchy level.

Related Documentation

- Defining Access Privileges Using allow/deny-configuration Statements on page 1745
- Configuring Access Privilege Levels on page 1692

Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

NOTE: Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement

includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect: **allow-commands = "(monitor.*)|(ping.*)|(show.*)|(exit)"** . Instead, you must specify the expression using the following syntax: **allow-commands** = **"(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands ="^(monitor | ping | show | exit)"**

- *allow-commands*
- *deny-commands*

Using Junos OS to Configure Logical System Administrators

Using Junos OS, you can partition a single router or switch into multiple logical devices that perform independent routing or switching tasks. When creating logical systems, you must configure logical system administrators and interfaces, assign logical interfaces to logical systems, and configure various other logical system statements.

The master administrator can assign one or more logical system administrators to each logical system. Once assigned to a logical system, administrators are restricted to viewing

only configurations of the logical system to which they are assigned and accessing only the operational commands that apply to that particular logical system. This restriction means that these administrators cannot access global configuration statements, and all command output is restricted to the logical system to which the administrators are assigned.

To configure logical system administrators, include the **logical-system *logical-system-name*** statement at the **[edit system login class *class-name*]** hierarchy level and apply the class to the user. For example:

```
[edit]
system {
  login {
    class admin1 {
      permissions all;
      logical-system logical-system-LS1;
    }
    class admin2 {
      permissions view; # Gives users assigned to class admin2 the ability to view
        # but not to change the configuration.
      logical-system logical-system-LS2;
    }
    user user1 {
      class admin1;
    }
    user user2 {
      class admin2;
    }
  }
}
```

Fully implementing logical systems requires that you also configure any protocols, routing statements, switching statements, and policy statements for the logical system.

- Defining Junos OS Login Classes on page 1716

Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmd*n*)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```
Juniper-Allow-Commands+="cmd1"
Juniper-Allow-Commands+="cmd2"
Juniper-Allow-Commands+="cmdn"
Juniper-Deny-Commands+="cmd1"
Juniper-Deny-Commands+="cmd2"
Juniper-Deny-Commands+="cmdn"
Juniper-Allow-Configuration+="regex1"
Juniper-Allow-Configuration+="regex2"
Juniper-Allow-Configuration+="regexn"
Juniper-Deny-Configuration+="regex1"
Juniper-Deny-Configuration+="regex2"
Juniper-Deny-Configuration+="regexn"
Juniper-User-Permissions+="permission-flag1"
Juniper-User-Permissions+="permission-flag2"
Juniper-User-Permissions+="permission-flagn"
```

For a TACACS+ server, specify the individual regular expressions using the following syntax:

```
allow-commands1="cmd1"
allow-commands2="cmd2"
allow-commandsn="cmdn"
deny-commands1="cmd1"
deny-commands2="cmd2"
deny-commandsn="cmdn"
allow-configuration1="regex1"
allow-configuration2="regex2"
allow-configurationn="regexn"
deny-configuration1="regex1"
deny-configuration2="regex2"
deny-configurationn="regexn"
user-permissions1="permission-flag1"
user-permissions2="permission-flag2"
user-permissionsn="permission-flagn "
```

NOTE:

- Numeric values 1 to *n* in the syntax (for a TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```
allow-commands1="cmd1"
allow-commands3="cmd3"
allow-commands2="cmd2"
deny-commands3="cmd3"
deny-commands2="cmd2"
deny-commands1="cmd1"
```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the **show cli authorization** command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see "Juniper Networks Vendor-Specific RADIUS Attributes" on page 1668 and "Juniper Networks Vendor-Specific TACACS+ Attributes" on page 1670.

NOTE: When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the **[edit system login class]** hierarchy level using the **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, or **permissions** statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

VSA Match Conditions and Actions

EX Series switches and the QFX Series support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match **10.1.1.0/24** OR **11.1.1.0/24**), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

Table 170 on page 1725 describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

Table 170: Match Conditions

Option	Description
destination-mac *mac-address*	Destination media access control (MAC) address of the packet.
source-vlan *source-vlan*	Name of the source VLAN.
source-dot1q-tag *tag*	Tag value in the 802.1Q header, in the range **0** through **4095**.
destination-ip *ip-address*	Address of the final destination node.
ip-protocol *protocol-id*	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms: **ah**, **egp (8)**, **esp (50**, **gre (47)**, **icmp (1)**, **igmp (2)**, **ipip (4)**, **ipv6 (41)**, **ospf (89)**, **pim (103)**, **rsvp (46)**, **tcp (6)**, or **udp (17)**
source-port *port*	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the **ip-protocol** match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under **destination-port**.

Table 170: Match Conditions *(continued)*

Option	Description
destination-port *port*	TCP or UDP destination port field. Normally, you specify this match in conjunction with the **ip-protocol** match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): **afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cvspserver (2401), cmd (514), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), telnet (23), tacacs-ds (65), talk (517), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)**

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. Table 171 on page 1726 shows the actions that you can specify in a term.

Table 171: Actions for VSAs

Option	Description
(**allow** | **deny**)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.
forwarding-class *class-of-service*	(Optional) Classify the packet in one of the following forwarding classes: • **assured-forwarding** • **best-effort** • **expedited-forwarding** • **network-control**
loss-priority (**low** | **medium** | **high**)	(Optional) Set the packet loss priority (PLP) to **low**, **medium**, or **high**. Specify both the forwarding class and loss priority.

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- Requirements on page 1727
- Overview on page 1727
- Configuration on page 1727

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numerics**, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12

set system login password maximum-length 22

set system login password minimum-numerics 1

set system login password minimum-upper-cases 1

set system login password minimum-lower-cases 1

set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure

This example configures password requirements that require the user to creat a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.

   ```
   user@host> edit
   [edit]
   user@host# edit system login password
   ```

2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

   ```
   [edit system login password]
   user@host# set minimum-length 12
   [edit system login password]
   user@host# set maximum-length 22
   ```

3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

   ```
   [edit system login password]
   user@host# set minimum-lower-cases 1
   [edit system login password]
   user@host# set minimum-upper-cases 1
   ```

4. Require users to set a password that has at least one punctuation-class character and at least one number.

   ```
   [edit system login password]
   user@host# set minimum-punctuations 1
   [edit system login password]
   user@host# set minimum-numerics 1
   ```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. if the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numerics 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

- password (Login) on page 278

Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```
[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}
```

- Configuring Access Privilege Levels on page 1692

Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```
[edit]
system {
  # This login class has operator privileges and the additional ability
    # to reboot the router.
    login {
    # This login class has operator privileges and the additional ability to reboot the
    # router or switch.
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
    # This login class has operator privileges but can't use any commands beginning
    # with “set” .
    # This login class has operator privileges
      # but cannot use any commands beginning with “set”
      class operator-no-set {
      permissions [ clear network reset trace view ];
      deny-commands "^set";
```

```
    }
    # This login class has operator privileges and can install software but not view
      # BGP information, and can issue the show route command, without specifying
      # commands or arguments under it.
      class operator-and-install-but-no-bgp {
      permissions [ clear network reset trace view ];
      allow-commands "(request system software add)|(show route$)";
      deny-commands "show bgp";
    }
  }
}
```

Example: Configuring a Plain-Text Password for Root Logins

The following example shows how to set a plain-text password for root logins:

```
[edit]
user@switch# set system root-authentication plain-text-password
New password: type root password
Retype new password: retype root password
[edit]
user@switch# show
system {
  root-authentication {
    encrypted-password "$1$14c5.$sBopasddsdfs0";
  }
}
```

Related Documentation

- Configuring the Root Password on page 158

Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
  authentication-order [ radius password ];
  root-authentication {
    encrypted-password "$9$aH1j8gqQ1gjyjgjhgjgiiii"; # SECRET-DATA
  }
```

```
    name-server {
      10.1.1.1;
      10.1.1.2;
    }
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
system {
  radius-server {
    10.1.2.1 {
      secret "$9$aH1j8gqQ1sdjerrrhser"; # SECRET-DATA
      timeout 5;
    }
    10.1.2.2 {
      secret "$9$aH1j8gqQ1csdoiuardwefoiud"; # SECRET-DATA
      timeout 5;
    }
  }
}
```

Related Documentation

- *Configuring RADIUS Authentication*

Example: Configuring RADIUS Authentication on a QFabric System

RADIUS authentication is a method of authenticating users who are attempting to access a network device. On a QFabric system, users are load balanced on each of the Director devices. Each Director device needs to be able to communicate with the RADIUS server. Packets sent to the RADIUS server originate from the Director device IP addresses.

The following example shows how to configure RADIUS authentication on the QFabric system:

Perform the following steps to configure RADIUS authentication on the QFabric system:

1. Configure the order in which the authentication methods are used.

   For example:

   ```
   user@switch # set system authentication-order [radius password]
   ```

   In this example, RADIUS authentication is the first authentication method that Junos OS will use when a user logs into the system.

2. Configure the IP address of the RADIUS server and the secret password. The secret password on the switch must match the secret password on the RADIUS server.

   For example:

```
user@switch # set system radius-server 172.28.36.108 secret testing123
```

3. Assign the login class and the template account for the user.

   For example:

```
user@switch # set system login user remote class super-user
```

Here are the results of your configuration:

```
[edit]
system {
  authentication-order [ radius password ];
  login {
    user remote {
      class super-ruser;
    ]
    ]
  }
  radius--server {
    172.28.36.108 {
    secret test123
  }
}
```

Example: Configuring RADIUS System Accounting

The following example shows three servers (**10.5.5.5**, **10.6.6.6**, and **10.7.7.7**) configured for RADIUS accounting.

```
system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
      radius {
        server {
          10.5.5.5 {
            accounting-port 3333;
            secret $9$dkafeqwrew;
            source-address 10.1.1.1;
            retry 3;
            timeout 3;
          }
          10.6.6.6 secret $9$fe3erqwrez;
          10.7.7.7 secret $9$f34929ftby;
        }
      }
    }
  }
}
```

Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name “Philip of Macedonia”;
      uid 1001;
      class super-user;
      authentication {
        encrypted-password “$1$poPPeY”;
      }
```

```
    }
    user alexander {
      full-name “Alexander the Great”;
      uid 1002;
      class view;
      authentication {
        encrypted-password “$1$14c5.$sBopasdFFdssdfFFdsdfs0”;
        ssh-dsa “8924 37 5678 5678@gaugamela.per”;
        ssh-dsa “6273 94 9283@boojum.per”;
      }
    }
    user darius {
      full-name “Darius King of Persia”;
      uid 1003;
      class operator;
      authentication {
        ssh-rsa “1024 37 12341234@ecbatana.per”;
      }
    }
    user anonymous {
      class unauthorized;
    }
    user remote {
      full-name “All remote users”;
      uid 9999;
      class read-only;
    }
  }
}
```

Related Documentation

- *Junos OS User Accounts Overview*
- *Limiting the Number of User Login Attempts for SSH and Telnet Sessions*

Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see “Using Local Password Authentication” on page 1677.

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

[edit]

```
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class operator;
    }
  }
}
```

NOTE: For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see "Overview of Template Accounts for RADIUS and TACACS+ Authentication" on page 1665.

When a user logs in to a device, the user's login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the **[edit system login user]** hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the **edit system login user remote** hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
```

```
        uid 9999;
        class read-only;
      }
    }
  }
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

Related Documentation

- Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 1694

Example: Creating Login Classes with Specific Privileges

The following example shows how to create several user classes, each with specific privileges. In this example, you configure timeouts to disconnect the class members after a period of inactivity. Users’ privilege levels, and therefore the classes of which they are members, should be dependent on their responsibilities within the organization, and the permissions shown here are only examples.

The first class of users (called “observation”) can only view statistics and configuration. They are not allowed to modify any configuration. The second class of users (called “operation”) can view and modify the configuration. The third class of users (called “engineering”) has unlimited access and control.

```
[edit]
system {
  login {
    class observation {
      idle-timeout 5;
      permissions [ view ];
    }
    class operation {
      idle-timeout 5;
      permissions [ admin clear configure interface interface-control network
      reset routing routing-control snmp snmp-control trace-control
      firewall-control rollback ];
    }
    class engineering {
      idle-timeout 5;
      permissions all;
    }
  }
```

```
}
```

Related Documentation

- *Defining Junos OS Login Classes*

Example: Configuring QFabric System Login Classes

This example shows you how to assign the correct login class to users so they can access components within a QFabric system.

- Requirements on page 1737
- Overview on page 1737
- Configuration on page 1738
- Verification on page 1740

Requirements

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
  - Junos OS Release 12.2 for these QFX Series components
- Eight EX4200 switches, used to make two redundant Virtual Chassis with four members apiece
- Junos OS Release 12.1R1.9 for the EX Series switches used in the Virtual Chassis

Before you begin:

- Perform the initial setup of the QFabric system on the Director group, which includes the creation of a username and password for the QFabric system components. See "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335.

Overview

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system (such as Node devices and Interconnect devices). The *qfabric-admin* class provides the ability to log in to individual QFabric system components and manage them. The *qfabric-operator* class enables the user to log in to individual components and view component-level operations and configurations. The *qfabric-user* class prevents access to individual QFabric system components.

You include these classes in your configuration at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level. The key task is to decide which class you should apply to users based on their need to access QFabric system components.

NOTE: To set QFabric system login classes for a root user, include the **remote-debug-permission** statement at the **[edit system root-authentication]** hierarchy level and specify the qfabric-admin class.

If you assign the qfabric-admin or the qfabric-operator class to a user, the QFabric system maps the user to a list of authorized users who are permitted to access components. To facilitate ease of use, the QFabric system uses the component password you specified during the initial setup of the Director group. When users assigned the qfabric-admin or the qfabric-operator class log in to a component by issuing the **request component login** operational mode command, the QFabric system verifies the class and sends the username and password to the component. The component accepts these credentials and permits access.

NOTE:

- The three QFabric system login classes give access to the components only. To provide access to the QFabric system as a whole through the default partition command-line interface (CLI), you must configure the usual Junos OS login classes or permissions (such as the *super-user* class). For more information about login classes, see "Junos OS Login Classes Overview" on page 1683.
- If you have completed the QFabric system initial setup and the system is operational, you can change the component password by issuing the **device-authentication** statement at the **[edit system]** hierarchy level in the QFabric default partition CLI.

Topology

This example defines three users: Adam, Oscar, and Ulf. Adam needs to manage QFabric system components, Oscar needs limited access, and Ulf should not have any access to the components. As a result, assign the qfabric-admin class to Adam, the qfabric-operator class to Oscar, and the qfabric-user class to Ulf. However, all three users should have all permissions to access the QFabric system CLI.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login class all-qfabric permissions all
set system login user Adam class all-qfabric
set system login user Adam authentication encrypted-password
  "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
set system login user Adam authentication remote-debug-permission qfabric-admin
set system login user Oscar class all-qfabric
set system login user Oscar authentication encrypted-password
  "$1$3e.3wJQ8$31SrzV0.efdRbk.ZJncKm0"
```

```
set system login user Oscar authentication remote-debug-permission qfabric-operator
set system login user Ulf class all-qfabric
set system login user Ulf authentication encrypted-password
    "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
set system login user Ulf authentication remote-debug-permission qfabric-user
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To provide the same access to the QFabric system CLI for all users, but different QFabric system component-level access to different users:

1. Define and provide all-qfabric access and passwords to all three users. This administrator-defined class provides full permissions, enabling the users to log in to the QFabric system default partition and use the CLI. Alternatively, you can assign the super-user class to these users to accomplish the same goal.

   ```
   [edit]
   user@qfabric# set system login class all-qfabric permissions all
   user@qfabric# set system login user Adam class all-qfabric
   user@qfabric# set system login user Adam authentication encrypted-password
     "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
   user@qfabric# set system login user Oscar class all-qfabric
   user@qfabric# set system login user Oscar authentication encrypted-password
     "$1$3e.3wJQ8$31SrzV0.efdRbk.ZJncKm0"
   user@qfabric# set system login user Ulf class all-qfabric
   user@qfabric# set system login user Ulf authentication encrypted-password
     "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
   ```

2. Provide qfabric-admin component access to Adam so he can manage QFabric system components.

   ```
   [edit]
   user@qfabric# set system login user Adam authentication remote-debug-permission
     qfabric-admin
   ```

3. Provide qfabric-operator component access to Oscar so he can view the CLI at the QFabric system components.

   ```
   [edit]
   user@qfabric# set system login user Oscar authentication remote-debug-permission
     qfabric-operator
   ```

4. Assign qfabric-user component restrictions to Ulf to prevent him from accessing the QFabric system components.

   ```
   [edit]
   user@qfabric# set system login user Ulf authentication remote-debug-permission
     qfabric-user
   ```

Results

From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example.

```
[edit]
system {
  login {
    class all-qfabric {
      permissions all;
    }
    user Adam {
      class all-qfabric;
      authentication {
        encrypted-password "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."; ##
          SECRET-DATA
        remote-debug-permission qfabric-admin;
      }
    }
    user Oscar {
      class all-qfabric;
      authentication {
        encrypted-password "$1$3e.3wJQ8$31SrzV0.efdRbk.ZJncKm0"; ## SECRET-DATA
        remote-debug-permission qfabric-operator;
      }
    }
    user Ulf {
      class all-qfabric;
      authentication {
        encrypted-password "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"; ##
          SECRET-DATA
        remote-debug-permission qfabric-user;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the QFabric system and component-level access configuration is working properly for all three users. Adam, Oscar, and Ulf should have equivalent, full-permission access to the QFabric system CLI. Adam should have management-level access to components. Oscar should have read-only access to components. Ulf should have no component-level access.

- Verifying qfabric-admin Access on page 1740
- Verifying qfabric-operator Access on page 1742
- Verifying qfabric-user Access on page 1743

Verifying qfabric-admin Access

Purpose Verify that Adam can access the QFabric system CLI at the default partition and manage QFabric system components.

Action From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Adam to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Adam has permission to use on the QFabric system default partition.

```
> ssh Adam@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Adam@qfabric.network.net's password:
Last login: Sun Nov 20 14:12:29 2011 from 192.168.28.19
Juniper QFabric Director 11.3.5510 2011-10-21 16:31:44 UTC

RUNNING ON DIRECTOR DEVICE : dg0
Adam@qfabric>

Adam@qfabric> ?
Possible completions:
  clear                Clear information in the system
  configure            Manipulate software configuration information
  file                 Perform file operations
  help                 Provide help information
  load                 Load information from file
  op                   Invoke an operation script
  ping                 Ping remote target
  quit                 Exit the management session
  request              Make system-level requests
  restart              Restart software process
  save                 Save information to file
  set                  Set CLI properties, date/time, craft interface message
  show                 Show system information
  telnet               Telnet to another host
  test                 Perform diagnostic debugging
  traceroute           Trace route to remote host
```

Issue the **request component login ?** command to view the components that Adam can access. Next, issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Adam@qfabric> request component login ?
Possible completions:
  <[Enter]>            Execute this command
  <node-name>          Inventory name for the remote node
  BBAK0372             Node device
  BBAK0394             Node device
  DRE-0                Diagnostic routing engine
  EE3093               Node device
  FC-0                 Fabric control
  FC-1                 Fabric control
  FM-0                 Fabric manager
  NW-NG-0              Node group
  WS001/RE0            Interconnect device control board
  WS001/RE1            Interconnect device control board
  |                    Pipe through a command

Adam@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Adam has the permission to use on the Node device. Notice that the CLI prompt now indicates Adam's component access level (**qfabric-admin**) as the username and the Node device identifier (**EE3093**) as the host.

```
qfabric-admin@EE3093> ?
Possible completions:
  clear                Clear information in the system
  file                 Perform file operations
  help                 Provide help information
  load                 Load information from file
  monitor              Show real-time debugging information
  mtrace               Trace multicast path from source to receiver
  op                   Invoke an operation script
  ping                 Ping remote target
  quit                 Exit the management session
  request              Make system-level requests
  restart              Restart software process
  save                 Save information to file
  set                  Set CLI properties, date/time, craft interface message
  show                 Show system information
  ssh                  Start secure shell on another host
  start                Start shell
  telnet               Telnet to another host
  test                 Perform diagnostic debugging
  traceroute           Trace route to remote host
```

Meaning The output shows that Adam has received the proper permissions to access the QFabric system CLI and log in to individual components with management-level access.

Verifying qfabric-operator Access

Purpose Verify that Oscar can access the QFabric system CLI at the default partition and view the CLI on the QFabric system components.

Action From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Oscar to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam.

```
> ssh Oscar@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Oscar@qfabric.network.net's password:
Last login: Sun Nov 19 19:21:29 2011 from 192.168.28.14
Juniper QFabric Director 11.3.5510 2011-10-22 18:33:41 UTC

RUNNING ON DIRECTOR DEVICE : dg1
Oscar@qfabric>

Oscar@qfabric> ?
Possible completions:
  clear                Clear information in the system
  configure            Manipulate software configuration information
  file                 Perform file operations
  help                 Provide help information
  load                 Load information from file
```

```
  op                  Invoke an operation script
  ping                Ping remote target
  quit                Exit the management session
  request             Make system-level requests
  restart             Restart software process
  save                Save information to file
  set                 Set CLI properties, date/time, craft interface message
  show                Show system information
  telnet              Telnet to another host
  test                Perform diagnostic debugging
  traceroute          Trace route to remote host
```

Issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Oscar@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the Node device. Notice that the CLI prompt now indicates Oscar's component access level (**qfabric-operator**) as the username and the Node device identifier (**EE3093**) as the host. Additionally, Oscar has fewer CLI commands available than Adam because of Oscar's read-only qfabric-operator login class.

```
qfabric-operator@EE3093> ?
Possible completions:
  file                Perform file operations
  help                Provide help information
  load                Load information from file
  op                  Invoke an operation script
  quit                Exit the management session
  request             Make system-level requests
  save                Save information to file
  set                 Set CLI properties, date/time, craft interface message
  show                Show system information
  start               Start shell
  test                Perform diagnostic debugging
```

Meaning The output shows that Oscar has full permissions to access the QFabric system CLI, but only read-only access when he logs in to individual components. Oscar's permissions on the QFabric system are the same as Adam's, but Oscar has fewer permissions than Adam on the Node device.

Verifying qfabric-user Access

Purpose Verify that Ulf has full access to the QFabric system CLI at the default partition but cannot access the QFabric system components.

Action From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Ulf to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Ulf has permission to use

on the QFabric system default partition. Notice that these permissions are the same as those given to Adam and Oscar.

```
> ssh Ulf@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Ulf@qfabric.network.net's password:
Last login: Sun Nov 17 17:12:24 2011 from 192.168.28.22
Juniper QFabric Director 11.3.5510 2011-10-23 19:23:31 UTC

RUNNING ON DIRECTOR DEVICE : dg0
Ulf@qfabric>

Ulf@qfabric> ?
Possible completions:
  clear                Clear information in the system
  configure            Manipulate software configuration information
  file                 Perform file operations
  help                 Provide help information
  load                 Load information from file
  op                   Invoke an operation script
  ping                 Ping remote target
  quit                 Exit the management session
  request              Make system-level requests
  restart              Restart software process
  save                 Save information to file
  set                  Set CLI properties, date/time, craft interface message
  show                 Show system information
  telnet               Telnet to another host
  test                 Perform diagnostic debugging
  traceroute           Trace route to remote host
```

When Ulf issues the **request component login *component-name*** command, the Node device denies his access attempt.

```
Ulf@qfabric> request component login EE3093
error: User Ulf does not have sufficient permissions to login to device EE3093
```

Meaning The output shows that Ulf has full permissions to access the QFabric system CLI in the same way as Adam and Oscar. However, unlike Adam and Oscar, Ulf cannot access individual components because of the qfabric-user login class assigned to him.

Example: Configuring User Login Accounts

The following example shows how to configure the local administrator account (**user admin**). If RADIUS fails or becomes unreachable, the login process reverts to password authentication on the local accounts on the router or switch.

```
[edit]
system {
  login {
    user admin {
      uid 1000;
      class engineering;
      authentication {
        encrypted-password "<PASSWORD>"; # SECRET-DATA
      }
    }
  }
}
```

Related Documentation

- *Configuring Junos OS User Accounts*

Example: Configuring RADIUS Template Accounts

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```
[edit]
system {
  login {
    user observation {
      uid 1001;
      class observation;
    }
    user operation {
      uid 1002;
      class operation;
    }
    user engineering {
      uid 1003;
      class engineering;
    }
  }
}
```

Related Documentation

Defining Access Privileges Using allow/deny-configuration Statements

The following examples show how to configure access privileges for individual configuration mode hierarchy levels.

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@switch# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@switch# set deny-configuration "system login class m.*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit a configuration or issue commands (such as **commit**) at the login class or system services hierarchy levels:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

The following example shows how to configure permissions for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet. Set the **backoff-threshold** to 2, the **back-off-factor** to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
  login {
    retry-options {
      backoff-threshold 2;
      backoff-factor 5;
      minimum-time 40;
      tries-before-disconnect 4;
    }
```

```
        password {
        }
    }
}
```

NOTE: This sample only shows the portion off the [edit system login] hierarchy level being modified.

}
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure options for accounting statistics collection.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

accounting-server

Syntax accounting-server[*server-addresses*];

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Default Not enabled

Options ***server-addresses***—One or more addresses of RADIUS authentication servers.

NOTE: **The [edit access] hierarchy is not available on QFabric systems.**

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

accounting-stop-on-failure

Syntax accounting-stop-on-failure;

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if a supplicant fails AAA authorization, but the RADIUS server grants access. For example, a supplicant might fail AAA authentication because of an internal error such as a timeout.

NOTE: The **[edit access]** hierarchy is not available on QFabric systems.

Default Not enabled

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

advertisement-interval

Syntax advertisement-interval *seconds*;

Hierarchy Level [edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6 for MX Series and T Series routers.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For MX Series and T Series routers, configure an interval for LLDP advertisement.

For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.

The **advertisement-interval** value must be greater than or equal to four times the **transmit-delay** value, or an error will be returned when you attempt to commit the configuration.

NOTE: The default value of **transmit-delay** is 2 seconds. If you configure the **advertisement-interval** as less than 8 seconds and you do not configure a value for **transmit-delay**, the default value of **transmit-delay** is automatically changed to 1 second in order to satisfy the requirement that the **advertisement-interval** value must be greater than or equal to four times the **transmit-delay** value.

Default Disabled.

Options ***seconds***—Interval between LLDP advertisement.
Default: 30
Range: 5 through 32768

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding LLDP on page 1666

agent-address

Syntax agent-address outgoing-interface;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is **outgoing-interface**, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Options

outgoing-interface—Value of the agent address of all SNMPv1 traps generated by this router or switch. The **outgoing-interface** option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Default: Disabled (the agent address is not specified in SNMPv1 traps).

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Agent Address for SNMP Traps*

archival

Syntax

```
archival {
  configuration {
    archive-sites {
      file://<path>/<filename>;
      ftp://username@host:<port>url-path password password;
      http://username@host:<port>url-path password password;
      pasvftp://username@host:<port>url-path password password;
      scp://username@host:<port>url-path password password;
    }
    transfer-interval interval;
    transfer-on-commit;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.

NOTE: The **edit system archival** hierarchy is not available on QFabric systems.

Options The remaining statements are explained separately.

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1611

archive-sites (Configuration File)

Syntax

```
archive-sites {
  file://<path>/<filename>;
  ftp://username@host:<port>url-path password password;
  http://username@host:<port>url-path password password;
  pasvftp://username@host:<port>url-path password password;
  scp://username@host:<port>url-path password password;
}
```

Hierarchy Level [edit system archival configuration]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, **"scp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*"**

If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

router-name*_juniper.conf.*n*.gz_*YYYYMMDD_HHMMSS.

NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Options The prefix used in the configuration statement determines the form of transfer:

file:// —transfer on a path to a named file

ftp:// —transfer using active FTP server

pasvftp:// —transfer to a device that only accepts passive FTP services

scp:// —transfer to a known host using background SCP file transfers

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

authentication-order

Syntax authentication-order [**none** | **password** | **radius**];

Hierarchy Level [edit access profile *profile-name*],
[edit system]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

Default Not enabled

Options **none**—No authentication for specified subscribers.

password—Password authentication.

radius—RADIUS authentication.

NOTE: **The [edit access] hierarchy is not available on QFabric systems.**

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

authentication-server

Syntax authentication-server [*server-addresses*];

Hierarchy Level [edit access profile *profile-name* radius]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the RADIUS server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Options ***server-addresses***—Configure one or more RADIUS server addresses.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch*
- *show network-access aaa statistics authentication*

authorization

Syntax authorization *authorization*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the access authorization for SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests.

Options ***authorization***—Access authorization level:

- **read-only**—Enable **Get**, **GetNext**, and **GetBulk** requests.
- **read-write**—Enable all requests, including **Set** requests. You must configure a view to enable **Set** requests.

NOTE: **The read-write option is not supported on the QFX3000 QFabric system.**

Default: read-only

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String on page 6194

categories

Syntax

```
categories {
  category;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the types of traps that are sent to the targets of the named trap group.

Default If you omit the **categories** statement, all trap types are included in trap notifications.

Options ***category***—Name of a trap type: **authentication**, **chassis**, **configuration**, **link**, **remote-operations**, **rmon-alarm**, or **startup**.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6195

client-list

Syntax

```
client-list client-list-name {
  ip-addresses;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a list of SNMP clients.

Options ***client-list-name***—Name of the client list.

ip-addresses—IP addresses of the SNMP clients to be added to the client list,

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Adding a Group of Clients to an SNMP Community on page 6196

client-list-name

Syntax client-list-name *client-list-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Add a client list or prefix list to an SNMP community.

Options ***client-list-name***—Name of the client list or prefix list.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Adding a Group of Clients to an SNMP Community on page 6196

clients

Syntax
```
clients {
  address <restrict>;
}
```

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.

Default If you omit the **clients** statement, all SNMP clients using this community string are authorized to access the switch.

Options ***address***—Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple ***address*** options.

restrict—(Optional) Do not allow the specified SNMP client to access the switch.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the SNMP Community String*

commit-delay

Syntax commit-delay *seconds*;

Hierarchy Level [edit snmp nonvolatile]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the timer for the SNMP **Set** reply and start of the commit.

Options ***seconds***—Delay between an affirmative SNMP **Set** reply and start of the commit operation.
Default: 5 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Commit Delay Timer*

community (SNMP)

Syntax

```
community community-name {
  authorization authorization;
  client-list-name client-list-name;
  clients {
    address restrict;
  }
  view view-name;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

NOTE: The **authorization read-write** option is not supported on the QFX3000 QFabric system.

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

Default If you omit the **community** statement, all SNMP requests are denied.

Options ***community-name***—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String on page 6194

configuration

Syntax

```
configuration {
  transfer-interval interval;
  transfer-on-commit;
  archive-sites {
    file://<path>/<filename>;
    ftp://username@host:<port>url-path password password;
    http://username@host:<port>url-path password password;
    pasvftp://username@host:<port>url-path password password;
    scp://username@host:<port>url-path password password;
  }
}
```

Hierarchy Level [edit system archival]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the router or switch to periodically transfer its currently active configuration (or after each commit).

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Options The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

connection-limit

Syntax connection-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).

Options ***limit***—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).

Range: 1 through 250

Default: 75

NOTE: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured connection-limit value if the system resources are limited.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

contact

Syntax contact *contact*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysContact** object, which is the contact person for the managed system.

Options ***contact***—Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

disable (LLDP)

Syntax disable;

Hierarchy Level [edit protocols lldp],
[edit protocols interface lldp]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Disable the LLDP configuration on the switch or on one or more interfaces.

Default If you do not configure LLDP, it is disabled on the switch and on specific switch interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

falling-threshold (Health Monitor)

Syntax falling-threshold *percentage*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options *percentage*—Lower threshold for the alarm entry.

Range: 1 through 100

Default: 70 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- rising-threshold on page 1807
- Configuring Health Monitoring on page 6200

filter-duplicates

Syntax filter-duplicates;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Filter duplicate **Get**, **GetNext**, or **GetBulk** SNMP requests.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

full-name

Syntax full-name *complete-name*;

Hierarchy Level [edit system login user]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the complete name of a user.

Options ***complete-name***—Full name of the user. If the name contains spaces, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- *Configuring Junos OS User Accounts*

- user on page 314

health-monitor

Syntax
```
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure health monitoring.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring Health Monitoring on page 6200

hold-multiplier

Syntax hold-multiplier *number*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for QFX Series.

Description Specify the multiplier used in combination with the advertisement-interval value to determine the length of time LLDP information is held before it is discarded. The default value is 4 (or 120 seconds).

Default Disabled.

Options ***number***—A number used as a multiplier.
Range: 2 through 10
Default: 4 (or 120 seconds)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

idle-timeout (Access)

Syntax idle-timeout *seconds*;

Hierarchy Level [edit access group-profile *profile-name* ppp],
[edit access profile *profile-name* client *client-name* ppp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the idle timeout for a user. The router might consider a PPP session to be idle because of the following reasons:

- There is no ingress traffic on the PPP session.
- There is no egress traffic.
- There is neither ingress or egress traffic on the PPP session.
- There is no ingress or egress PPP control traffic. This is applicable only if keepalives are enabled.

Options ***seconds***—Number of seconds a user can remain idle before the session is terminated.

Range: 0 through 4,294,967,295 seconds

Default: 0

NOTE: The **[edit access]** hierarchy is not available on QFabric systems.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

interface (LLDP)

Syntax

```
interface (all | interface-name) {
  disable;
  power-negotiation {
    disable;
  }
}
```

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure Link Layer Discovery Protocol (LLDP) on all interfaces or on a specific interface.

Default None

Options **all**—All interfaces on the switch.

interface-name—Name of a specific interface.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interval (Health Monitor)

Syntax interval *seconds*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interval between sampling of the object being monitored by the health monitor.

Options ***seconds***—Time between samples, in seconds.

Range: 1 through 2147483647 seconds

Default: 300 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

lldp

Syntax

```
lldp {
  advertisement-interval seconds;
  disable;
  hold-multiplier number;
  interface (all | [interface-name]) {
    disable;
    power-negotiation {
      disable;
    }
  }
  lldp-configuration-notification-interval seconds;
  management-address ip-management-address;
  netbios-snooping;
  ptopo-configuration-maximum-hold-time seconds;
  ptopo-configuration-trap-interval seconds;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>
      <no-stamp> <replace>;
    flag flag <disable>;
  }
  transmit-delay seconds;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for QFX Series.

Description Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

NOTE: The **transmit-delay** and **netbios-snooping** options are not available on QFabric systems.

Default LLDP is enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

lldp-configuration-notification-interval

Syntax lldp-configuration-notification-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify how often SNMP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, trap notifications of database changes are disabled.

Default SNMP trap notifications of LLDP database changes are disabled.

Options ***seconds***—Interval between trap notifications about LLDP database changes.
Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- show lldp on page 1842

location

Syntax location *location*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysLocation** object, which is the physical location of the managed system.

Options ***location***—Location of the local system. You must enclose the name within quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Location for a Device Running Junos OS*

management-address

Syntax management-address *ip-management-address*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.5 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the management address of the switch to be used in the LLDP Management type, length, and value (TLV) .

Default LLDP Management TLV uses the IP address of the switch's management Ethernet interface (**me0**) or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis.

Options ***ip-management-address***—You can specify either an IPv4 or IPv6 management address for the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

name

Syntax name *name*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the system name from the command-line interface.

Options ***name***—System name override.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Name*

nas-ip-address

Syntax nas-ip-address *ip-address*;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the NAS-IP address for outgoing RADIUS packets.

Options **ip-address**—IP address of the network access server (NAS) that requests user authentication.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- *Configuring RADIUS Authentication*
- Configuring RADIUS Authentication on page 1699

nonvolatile

Syntax
```
nonvolatile {
  commit-delay seconds;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure options for SNMP **Set** requests.

The statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Commit Delay Timer*
- *commit-delay*

oid

Syntax oid *object-identifier* (exclude| include);

Hierarchy Level [edit snmp view *view-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects.

Options

exclude—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

object-identifier—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

order

Syntax order (**radius** | [***accounting-order-data-list***]);

Hierarchy Level [edit access profile *profile-name* accounting]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending accounting messages and updates.

Default No order specified

Options **radius**—RADIUS accounting for specified subscribers.

[*accounting-order-data-list*]— Set of data listing the authentication order to be used, enclosed by brackets. This can be any combination of the authentication methods, up to and including a full list of the entire authentication order.

NOTE: **The [edit access] hierarchy is not available on QFabric systems.**

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch*
- *Configuring 802.1X RADIUS Accounting (CLI Procedure)*
- *Configuring RADIUS Accounting*

port (RADIUS Server)

Syntax port *port-number*;

Hierarchy Level [edit system radius-server *address*],
[edit system accounting destination radius server *address*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the port number on which to contact the RADIUS server.

Options ***number***—Port number on which to contact the RADIUS server.

Default: 1812 (as specified in RFC 2865)

NOTE: The **[edit system accounting]** hierarchy is not available on QFabric systems.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

profile

Syntax

```
profile profile-name {
  accounting {
    accounting-stop-on-access-deny;
    accounting-stop-on-failure;
    order ( radius | [ accounting-order-data-list ] )];
  }
  authentication-order [authentication-method];
  radius {
    accounting-server [server-addresses];
    authentication-server [server-addresses];
  }
}
```

Hierarchy Level [edit access]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

Default Not enabled

Options ***profile-name***—Profile name of up to 32 characters.

The remaining statements are explained separately.

NOTE: **The [edit access] hierarchy is not available on QFabric systems.**

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure protocols.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- *Junos OS Routing Protocols Configuration Guide*

protocol-version

Syntax protocol-version *version*;

Hierarchy Level [edit system services ssh]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the secure shell (SSH) protocol version.

Default **v2**—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.

Options ***version***—SSH protocol version: **v1**, **v2**, or both.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring the SSH Protocol Version on page 1710

ptopo-configuration-maximum-hold-time

Syntax ptopo-configuration-maximum-hold-time *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure how long to maintain the physical topology database entries. The physical topology identifies the devices on the network and their physical interconnections.

Options ***seconds***—Time to maintain physical topology database entries.
Default: 300
Range: 1 through 2147483647

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- show lldp on page 1842
- *Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches*
- Understanding LLDP on page 1666

ptopo-configuration-trap-interval

Syntax ptopo-configuration-trap-interval *seconds*;

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify how often SNMP trap notifications are sent regarding changes in physical topology global statistics.

Default SNMP trap notifications of changes in physical topology global statistics are disabled.

Options ***seconds***—Interval between SNMP trap notifications about physical topology global statistics.

Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

radius

Syntax

```
radius {
  accounting-server [server-addresses];
  authentication-server [server-addresses];
}
```

Hierarchy Level [edit access profile *profile-name*]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple **radius** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

The statements are explained separately.

NOTE: The **[edit access]** hierarchy is not available on QFabric systems.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

radius-options (edit system)

Syntax

```
radius-options {
  attributes {
    nas-ip-address ip-address;
  }
  password-protocol mschap-v2;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.
MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

NOTE: The **radius-options** statement is not available on QFabric systems.

Description Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.

Options

nas-ip-address *ip-address*—IP address of the network access server (NAS) that requests user authentication.

password-protocol ***mschap-v2***—Protocol MS-CHAPv2, used for password authentication and password changing.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Configuring RADIUS Authentication*
- Configuring RADIUS Authentication on page 1699

radius-server

Syntax

```
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
  secret password;
  source-address source-address;
  timeout seconds;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a RADIUS server for Point-to-Point Protocol (PPP).

To configure multiple RADIUS servers, include multiple **radius-server** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

Options *server-address*—Address of the RADIUS authentication server.

The remaining statements are explained separately.

NOTE: The **accounting-port** and **source-address** options are not available on QFabric systems.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

- timeout on page 307

rate-limit

Syntax rate-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.

Default 150 connections

Options **rate-limit *limit***—(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6).

Range: 1 through 250

Default: 150

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Configuring clear-text or SSL Service for Junos XML Protocol Client Applications*

remote-debug-permission

Syntax remote-debug-permission (qfabric-admin | qfabric-operator | qfabric-user);

Hierarchy Level [edit system login user *username* authentication]
[edit system root-authentication]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Configure authentication classes that permit or deny user access to individual components of the QFabric system.

Default qfabric-user

Options **qfabric-admin**—Permits a user to log in to individual QFabric system components, view operations, and change component configurations.

qfabric-operator—Permits a user to log in to individual QFabric system components and view component operations.

qfabric-user—Prevents a user from logging in to individual QFabric system components.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring QFabric System Login Classes on page 1345
- **request component login on page 1444**

retry

Syntax retry *number*;

Hierarchy Level [edit system radius server *server-address*],
[edit system accounting destination radius server *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.

Options ***number***—Number of retries allowed for contacting a RADIUS server.

Range: 1 through 10

Default: 3

NOTE: The **[edit system accounting]** hierarchy is not available on QFabric systems.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication on page 1699
- *Configuring RADIUS Accounting*
- timeout on page 307

rising-threshold (Health Monitor)

Syntax rising-threshold *percentage*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options *percentage*—Upper threshold for the alarm entry.

Range: 1 through 100

Default: 80 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6200
- falling-threshold on page 1772

root-login

Syntax root-login (allow | deny | deny-password);

Hierarchy Level [edit system services ssh]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Control user access through SSH.

Default Allow user access through SSH.

Options

allow—Allow users to log in to the router or switch as root through SSH.

deny—Disable users from logging in to the router or switch as root through SSH.

deny-password—Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Root Login Through SSH on page 1710

services (Switches)

Syntax

```
services {
  service-deployment {
    servers address {
      port-number port-number;
    }
    source-address address;
  }
  ssh {
    connection-limit limit;
    protocol-version [v1 v2];
    rate-limit limit;
    root-login (allow | deny | deny-password);
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch so that users on remote systems can access the local switch through SSH.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

snmp

Syntax

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure system management properties.

NOTE: The **radius-server source-address** and **radius-options** statements are not available on the QFabric system.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

tacplus-options

Syntax

```
tacplus-options {
  (exclude-cmd-attribute | no-cmd-attribute-value);
  service-name service-name;
  timestamp-and-timezone;
}
```

Hierarchy Level [edit system]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Options for **no-cmd-attribute-value** and **exclude-cmd-attribute** introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.1 for QFX Series.
Option for **timestamp-and-timezone** introduced in Junos OS Release 12.2.

Description Configure TACACS+ options for authentication and accounting.

Options

exclude-cmd-attribute—Exclude the **cmd** attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.

no-cmd-attribute-value—Set the **cmd** attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.

service-name *service-name*—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.

Default: junos-exec

timestamp-and-timezone—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

targets

Syntax

```
targets {
  address;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure one or more systems to receive SNMP traps.

Options ***address***—IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6195

traceoptions (LLDP)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <no-stamp>
    <replace>;
  flag flag <disable>;
}
```

Hierarchy Level [edit protocols lldp]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.

NOTE: The traceoptions statement is not supported on the QFX3000 QFabric system.

Default Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **configuration**—Trace configuration operations.
- **interface**—Trace interface update events.
- **netbios**—Trace NetBIOS events.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.

- **vlan**—Trace VLAN update events.

no-stamp—(Optional) Do not timestamp the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending output to it.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

Default: If you do not include this option, tracing output is appended to an existing trace file.

world-readable—(Optional) Enable unrestricted file access.

NOTE: The traceoptions statement is not supported on the QFX3000 QFabric system.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

transfer-interval (Configuration)

Syntax transfer-interval *interval*;

Hierarchy Level [edit system archival configuration]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the router or switch to periodically transfer its currently active configuration to an archive site.

NOTE: The **edit system archival** hierarchy is not available on QFabric systems.

Options ***interval***—Interval at which to transfer the current configuration to an archive site.
Range: 15 through 2880 minutes

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1611
- archive on page 6366
- configuration on page 1617
- transfer-on-commit on page 1619

transfer-on-commit

Syntax transfer-on-commit;

Hierarchy Level [edit system archival configuration]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*" .

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1612

trap-group

Syntax

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

Options ***group-name***—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring SNMP Trap Groups*

trap-options

Syntax

```
trap-options {
    agent-address outgoing-interface;
    source-address address;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

The remaining statements are explained separately.

Default Disabled

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring SNMP Trap Options*

user (Access)

Syntax

```
user username {
  authentication {
    (encrypted-password "password" | plain-text-password);
    load-key-file URL;
    remote-debug-permission (qfabric-admin | qfabric-operator |qfabric-user);
    ssh-dsa "public-key" <from hostname>;
    ssh-rsa "public-key" <from hostname>;
  }
  class class-name;
  full-name "complete-name";
  uid uid-value;
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure access permission for individual users.

Options The remaining statements are explained separately.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Junos OS User Accounts on page 1692
- class on page 247

version

Syntax version (all | v1 | v2);

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the version number of SNMP traps.

Default **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

Options **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

v1—Send SNMPv1 traps only.

v2—Send SNMPv2 traps only.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Administration

- Routine Monitoring on page 1831
- Monitoring Commands on page 1832

Routine Monitoring

- Monitoring SNMP on page 1831

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                          Value State

 32768 Health Monitor: root file system utilization
       jnxHrStoragePercentUsed.1                       58 active

 32769 Health Monitor: /config file system utilization
       jnxHrStoragePercentUsed.2                        0 active

 32770 Health Monitor: RE 0 CPU utilization
       jnxOperatingCPU.9.1.0.0                          0 active

 32773 Health Monitor: RE 0 Memory utilization
       jnxOperatingBuffer.9.1.0.0                      35 active

 32775 Health Monitor: jkernel daemon CPU utilization
       Init daemon                                      0 active
```

```
Chassis daemon                                      50 active
Firewall daemon                                      0 active
Interface daemon                                     5 active
SNMP daemon                                         11 active
MIB2 daemon                                         42 active
...
```

The following example provides sample output from the **show snmp mib** command:

user@switch> show snmp mib walk system

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:

clear lldp neighbors

Syntax clear lldp neighbors <interface *interface*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear the learned remote neighbor information on all or selected interfaces.

Options **none**—Clear the remote neighbor information on all interfaces.

interface *interface*—(Optional) Clear the remote neighbor information from the selected interface.

Required Privilege Level view

Related Documentation

- *show lldp*
- Configuring LLDP on page 1693

List of Sample Output

clear lldp neighbors on page 1834
clear lldp neighbors interface on page 1834

Sample Output

clear lldp neighbors

```
user@switch> clear lldp neighbors
```

clear lldp neighbors interface

```
user@switch> clear lldp neighbors interface ge-0/1/1.0
```

clear lldp statistics

Syntax clear lldp statistics
<interface *interface*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear LLDP statistics on one or more interfaces.

Options **none**—Clears LLDP statistics on all interfaces.

interface *interface-names*—(Optional) Clear LLDP statistics on an interface.

Required Privilege Level view

Related Documentation

List of Sample Output
clear lldp statistics on page 1835
clear lldp statistics interface on page 1835

Sample Output

clear lldp statistics

```
user@switch> clear lldp statistics
```

clear lldp statistics interface

```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

request component login

Syntax request component login *component-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description (QFabric systems only) Log in to a QFabric system component. To gain access to individual components by way of the **request component login** command, you must first provide the **qfabric-admin** or **qfabric-operator** class privilege to your user (for more information, see: remote-debug-permission).

Options *component-name*—Specify the QFabric system component to which you wish to log in.

Required Privilege Level admin

Related Documentation
- Example: Configuring QFabric System Login Classes on page 1345
- remote-debug-permission on page 1401
- Understanding QFabric System Login Classes on page 1230

List of Sample Output
request component login (with qfabric-admin Privileges) on page 1836
request component login (with qfabric-operator Privileges) on page 1837
request component login (with qfabric-user Privileges) on page 1837

Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

request component login (with qfabric-admin Privileges)

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
 of known hosts.

```
user0@qfabric> request component login EE3093
error: User user0 does not have sufficient permissions to login to device ee3093
```

show ethernet-switching interfaces

Syntax show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about switched Ethernet interfaces.

Options **none**—(Optional) Display brief information for Ethernet-switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet-switching information for a specific interface.

Required Privilege Level view

List of Sample Output
show ethernet-switching interfaces on page 1839
show ethernet-switching interfaces summary on page 1840
show ethernet-switching interfaces brief on page 1840
show ethernet-switching interfaces detail on page 1840
show ethernet-switching interfaces interface-name on page 1841
