Opening a Case with JTAC cxxvi

Part 1 QFX3500 Switch Overview

Chapter 1 **QFX3500 Switch Overview 3**

QFX3500 Device Overview 3
Software 3
Hardware 4
SFP+ Access Ports 5
QSFP+ Uplink Ports 6

Part 2 QFX3600 Switch Overview

Chapter 2 **QFX3600 Switch Overview 9**

QFX3600 Device Overview 9
Software 9
Hardware 10

Part 3 Software Feature Support

Chapter 3 **Software Feature Support for the QFX Series 15**

QFX Series Software Features Overview 15

Part 4 Junos OS Basics

Chapter 4 **Overview 33**

Software Overview 33
QFX Series Software Features Overview 33
Configuration File Terms 48
Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements 49
Junos OS Commit Model for Router or Switch Configuration 50

Junos OS Package Names . . . 51
NTP Time Server and Time Services Overview . . . 52
NTP Time Server and Time Services Overview (QFabric System) . . . 53
Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release) . . . 53
Understanding Autoinstallation of Configuration Files . . . 55
Typical Uses for Autoinstallation . . . 55
Autoinstallation Configuration Files and IP Addresses . . . 55
Typical Autoinstallation Process on a New Switch . . . 56
Understanding Nonstop Software Upgrade for QFabric Systems . . . 57
Understanding Zero Touch Provisioning . . . 61
Understanding DHCP Services for Switches . . . 63
DHCP Client/Server Model . . . 64
Using DHCP . . . 64
DHCP Relay Servers and DHCP Servers . . . 65
Legacy DHCP and Extended DHCP for Server Versions . . . 65
Configuring DHCP on a Switch . . . 66
How DHCP Works . . . 66
Understanding Software Infrastructure and Processes . . . 67
Routing Engine and Packet Forwarding Engine . . . 68
Junos OS Processes . . . 68
User Interfaces . . . 70
CLI User Interface Overview . . . 70
CLI Overview . . . 70
CLI Key Features . . . 71
CLI Command Modes . . . 71
Configuring CLI Tips . . . 72
Format for Specifying Filenames and URLs in Junos OS CLI Commands . . . 73
Junos OS Operational Mode Commands That Combine Other Commands . . . 74
Overview of Junos OS CLI Operational Mode Commands . . . 75
CLI Command Categories . . . 75
Commonly Used Operational Mode Commands . . . 76
Overview of Navigating the CLI . . . 78
CLI Command Hierarchy . . . 78
CLI Configuration Statements . . . 78
Moving Among Hierarchy Levels . . . 79
Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands . . . 79
Understanding Junos OS CLI Configuration Mode . . . 80
Configuration Mode Commands . . . 81
Configuration Statements and Identifiers . . . 82
Configuration Statement Hierarchy . . . 84
Licenses . . . 86
Junos OS Feature Licenses . . . 86
Software Features That Require Licenses on the QFX Series . . . 87

Junos OS License Keys . . . 88
Licensable Ports on MX5, MX10, and MX40 Routers . . . 88
Generating the License Keys for a Standalone QFX Series Device . . . 90
Generating the License Keys for a QFabric System . . . 91
Adding New Licenses (CLI Procedure) . . . 93
Deleting a License (CLI Procedure) . . . 94
Saving License Keys . . . 95
Verifying Junos OS License Installation . . . 96
Displaying Installed Licenses . . . 96
Displaying License Usage . . . 97

Chapter 5 Installation . . . 99

Software Installation . . . 99
Junos OS Package Names . . . 99
Configuring Zero Touch Provisioning . . . 101
Performing a Nonstop Software Upgrade on the QFabric System . . . 105
Backing Up the Current Configuration Files . . . 106
Downloading Software Files Using a Browser . . . 107
Retrieving Software Files for Download . . . 108
Performing a Nonstop Software Upgrade for Director Devices in a Director Group . . . 108
Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components . . . 108
(Optional) Creating Upgrade Groups for Node Groups . . . 109
Performing a Nonstop Software Upgrade on a Node Group . . . 110
Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device . . . 111
Performing a QFabric System Recovery Installation on the Director Group . . . 112
(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive . . . 113
Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software . . . 115
Recovering from a Failed Software Installation . . . 119
Software Installation Overview . . . 120
Upgrading Jloader Software on QFX Series Devices . . . 120
Jloader Software Version 1.1.4 Guidelines . . . 122
Upgrading Jloader Software on a QFX3500 Switch . . . 123
Upgrading Jloader Software on a QFabric System . . . 126
Upgrading Software on QFX3500 and QFX3600 Standalone Switches . . . 132
Downloading Software Files with a Browser . . . 132
Accessing Software Downloaded to a Remote Location . . . 133
Connecting to the Console Port . . . 133
Backing Up the Current Configuration Files . . . 133
Installing the Software Package . . . 133
Upgrading Software on a QFabric System . . . 134
Backing Up the Current Configuration Files . . . 135
Downloading Software Files Using a Browser . . . 135
Retrieving Software Files for Download . . . 136

Installing the Software Package on the Entire QFabric System 136

Chapter 6 Configuration 141

Initial Configuration 141
Configuring a DHCP Client (CLI Procedure) 142
Configuring a DHCP Server on Switches (CLI Procedure) 143
Configuring an Extended DHCP Server on a Switch 144
Configuring a Legacy DHCP Server on a Switch (CLI Procedure) 145
Configuring a DNS Name Server for Resolving a Hostname into Addresses 146
Configuring the Domain Name for the Router or Switch 146
Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains 147
Configuring the Hostname of the Router or Switch 147
Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types 147
Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch 148
Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses 148
Configuring the Junos OS to Display a System Login Announcement 149
Configuring the Junos OS to Display a System Login Message 149
Configuring the Junos OS to Extend the Default Port Address Range 151
Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages 151
Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets 151
Configuring NTP Authentication Keys 152
Configuring NTP Authentication Keys (QFabric System) 153
Configuring the NTP Time Server and Time Services 153
Configuring the Router or Switch to Operate in Client Mode 153
Configuring the Router or Switch to Operate in Symmetric Active Mode 154
Configuring the Router or Switch to Operate in Broadcast Mode 154
Configuring the Router or Switch to Operate in Server Mode 155
Configuring the NTP Time Server and Time Services (QFabric System) . . . 156
Specifying the Physical Location of the Switch 156
Configuring the Root Password 158
Configuring the Router or Switch to Listen for Broadcast Messages Using NTP 160
Configuring the Router or Switch to Listen for Multicast Messages Using NTP 160
Configuring System Alarms to Appear Automatically Upon Login 161
Configuring Time-Based User Access 161
Configuring the Timeout Value for Idle Login Sessions 162
Configuring a QFX3500 Device as a Standalone Switch 163
Creating an Emergency Boot Device for a QFX Series Device 165

Creating a Snapshot and Using It to Boot a QFX Series Switch 166
Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch 166
Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch 167
Including the Year or Millisecond in Timestamps 167
Mapping the Hostname of the Switch to IP Addresses 168
Methods for Configuring Junos OS 169
Junos OS Command-Line Interface (CLI) 170
ASCII File 170
J-Web Package 170
Junos XML Management Protocol Software 171
NETCONF XML Management Protocol Software 171
Configuration Commit Scripts 171
Modifying the Default Time Zone for a Router or Switch Running Junos OS 172
Rebooting and Halting a QFX Series Product 172
Reverting to the Default Factory Configuration 173
Reverting to the Default Factory Configuration by Using the request system zeroize Command 174
Reverting to the Rescue Configuration 175
Saving Core Files Generated by Junos OS Processes 175
Setting a Custom Time Zone on Routers or Switches Running Junos OS . . . 175
Importing and Installing Time Zone Files 176
Configuring a Custom Time Zone 177
Setting the Date and Time 177
Specifying Access Privileges for Junos OS Operational Mode Commands 178
Synchronizing and Coordinating Time Distribution Using NTP 180
Configuring NTP 180
Configuring the NTP Boot Server 180
Specifying a Source Address for an NTP Server 181
Viewing Core Files from Junos OS Processes 181
Configuration Examples 182
Example: Changing the Requirements for Junos OS Plain-Text Passwords 182
Example: Configuring the Domain Name for the Router or Switch 184
Example: Configuring the Name of the Switch, IP Address, and System ID 184
Example: Configuring NTP 185
Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization 187
Example: Configuring a Plain-Text Password for Root Logins 188
Example: Configuring the Root Password 189
Configuration Statements 190
QFX Series CLI Hierarchy 192
[edit access] Hierarchy 193
[edit accounting-options] Hierarchy 193
[edit chassis] Hierarchy 195

[edit class-of-service] Hierarchy . . . 196
[edit ethernet-switching-options] Hierarchy . . . 199
[edit fabric] Hierarchy . . . 200
[edit fc-fabrics] Hierarchy . . . 201
[edit fc-options] Hierarchy . . . 202

show chassis environment cb . . . 561
show chassis environment fpc . . . 579
show chassis environment pem . . . 604
show chassis environment routing-engine . . . 613
show chassis fan . . . 618
show chassis firmware . . . 631
show chassis fpc . . . 641
show chassis hardware . . . 667
show chassis lcd . . . 785
show chassis led . . . 798
show chassis location . . . 808
show chassis mac-addresses . . . 812
show chassis nonstop-upgrade node-group . . . 817
show chassis pic . . . 818
show chassis routing-engine . . . 831
show chassis temperature-thresholds . . . 852
show chassis zones . . . 868
show cli . . . 874
show cli authorization . . . 876
show cli directory . . . 880
show cli history . . . 881
show host . . . 882
show interfaces diagnostics optics . . . 883

show log . . . 889
show ntp associations . . . 892
show ntp status . . . 894
show subscribers . . . 897
show system alarms . . . 914
show system audit . . . 915
show system boot-messages . . . 923
show system buffers . . . 930
show system certificate . . . 937
show system commit . . . 939
show system configuration archival . . . 941
show system configuration rescue . . . 942
show system connections . . . 944
show system core-dumps . . . 963
show system directory-usage . . . 976
show system license . . . 980
show system processes . . . 983
show system reboot . . . 1010
show system resource-cleanup processes . . . 1013
show system rollback . . . 1015
show system services service-deployment . . . 1017
show system software . . . 1018
show system statistics . . . 1026
show system storage . . . 1061
show system uptime . . . 1067
show system users . . . 1072
show system virtual-memory . . . 1077
show version . . . 1135
start shell . . . 1148
test configuration . . . 1150
traceroute . . . 1151
traceroute monitor . . . 1155

Chapter 8 Troubleshooting . . . 1157

Troubleshooting Procedures . . . 1157
Rebooting and Halting a QFX Series Product . . . 1157
Recovering from a Failed Software Installation . . . 1158
Recovering the Root Password . . . 1159
Troubleshooting Network Interfaces . . . 1160
The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down . . . 1160
Troubleshooting an Aggregated Ethernet Interface . . . 1161

Part 5 QFabric System Deployment

Chapter 9 Overview 1165

Before You Begin 1165
QFabric System Overview 1165
Legacy Data Center Architecture 1165
QFX Series QFabric System Architecture 1167
Understanding QFabric System Terminology 1169
Understanding Interfaces on the QFabric System 1173
Four-Level Interface Naming Convention 1173
QSFP+ Interfaces 1174
Link Aggregation 1176
Hardware Architecture Overview 1177
Understanding the QFabric System Hardware Architecture 1177
QFabric System Hardware Architecture Overview 1177
QFX3000-G QFabric System Features 1180
QFX3000-M QFabric System Features 1180
Understanding the Director Group 1180
Director Group Components 1180
Director Group Services 1181
Understanding Routing Engines in the QFabric System 1181
Hardware-Based Routing Engines 1182
Software-Based External Routing Engines 1182
Understanding Interconnect Devices 1183
Interconnect Device Introduction 1183
QFX3008-I Interconnect Devices 1184
QFX3600-I Interconnect Devices 1185
Understanding Node Devices 1186
Node Device Introduction 1186
QFX3500 Node Devices 1187
QFX3600 Node Devices 1188
Understanding Node Groups 1190
Network Node Groups 1190
Server Node Groups 1190
Understanding Port Oversubscription on Node Devices 1191
Software Architecture Overview 1192
Understanding the QFabric System Software Architecture 1192
Understanding the Director Software 1193
Understanding Partitions 1194
QFabric System Default Partition 1194
Understanding the QFabric System Control Plane 1196
Control Plane Elements 1197
Control Plane Services 1199
Understanding the QFabric System Data Plane 1199
Data Plane Components 1199
QFabric System Fabric 1200

Software Features 1201
QFX Series Software Features Overview 1202
Understanding Software Upgrade on the QFabric System 1217
Operational Software Commands 1217
Operational Reboot Commands 1218
Understanding Nonstop Software Upgrade for QFabric Systems 1218
Understanding Statements and Commands on the QFabric System 1223
Chassis Statements 1223
Chassis Commands 1223
Understanding NTP on the QFabric System 1224
Understanding Network Management Implementation on the QFabric System 1224
Understanding the Implementation of SNMP on the QFabric System 1225
Understanding the Implementation of System Log Messages on the QFabric System 1227
Understanding User and Access Management Features on the QFabric System 1229
Understanding QFabric System Login Classes 1230
Understanding Interfaces on the QFabric System 1231
Four-Level Interface Naming Convention 1231
QSFP+ Interfaces 1231
Link Aggregation 1234
Understanding Layer 3 Features on the QFabric System 1234
Understanding Security Features on the QFabric System 1235
Understanding Port Mirroring on the QFabric System 1236
Understanding Fibre Channel Fabrics on the QFabric System 1236
Understanding CoS Fabric Forwarding Class Sets 1238
Default Fabric Forwarding Class Sets 1239
Fabric Forwarding Class Set Configuration and Implementation 1242
Fabric Forwarding Class Set Scheduling (CoS) 1244
Support for Flow Control and Lossless Transport Across the Fabric . . 1246
Viewing Fabric Forwarding Class Set Information 1248
Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences 1250
Licenses 1250
Junos OS Feature Licenses 1250
Software Features That Require Licenses on the QFX Series 1251
Junos OS License Keys 1253
Licensable Ports on MX5, MX10, and MX40 Routers 1253

Chapter 10 Configuration 1255

Initial Setup 1255
QFabric System Initial and Default Configuration Information 1255
Converting the Device Mode for a QFabric System Component 1258
Example: Configuring the Virtual Chassis for the QFX3000-G QFabric System Control Plane 1263
Importing a QFX3000-G QFabric System Control Plane Virtual Chassis Configuration with a USB Flash Drive 1308
Example: Configuring EX4200 Switches for the Copper-Based QFX3000-M QFabric System Control Plane 1309
Importing a QFX3000-M QFabric System Control Plane EX4200 Switch Configuration with a USB Flash Drive 1333
Generating the MAC Address Range for a QFabric System 1334
Performing the QFabric System Initial Setup on a QFX3100 Director Group 1335
Performing an Initial Setup 1336
Restoring a Backup Configuration 1339
QFabric System Configuration 1340
Understanding QFabric System Administration Tasks and Utilities 1340
Gaining Access to the QFabric System Through the Default Partition 1344
Example: Configuring QFabric System Login Classes 1345
Configuring Aliases for the QFabric System 1353
Configuring Node Groups for the QFabric System 1363
Configuring the Port Type on QFX3600 Node Devices 1367
Example: Configuring SNMP 1370
Example: Configuring System Log Messages 1372
Configuring Graceful Restart for QFabric Systems 1375
Enabling Graceful Restart 1375
Configuring Graceful Restart Options for BGP 1376
Configuring Graceful Restart Options for OSPF and OSPFv3 1377
Tracking Graceful Restart Events 1378
Configuration Statements 1378
aliases 1380
archive (QFabric System) 1381
chassis (QFabric System) 1382
director-device (Aliases) 1384
fabric 1385
file (QFabric System) 1386
graceful-restart (Enabling Globally) 1387
graceful-restart (Protocols BGP) 1388
graceful-restart (Protocols OSPF) 1389
interconnect-device (Chassis) 1391
interconnect-device (Aliases) 1392
multicast (QFabric Routing Options) 1393
network-domain 1393
no-make-before-break 1394
node-device (Aliases) 1395
node-device (Chassis) 1396
node-device (Resources) 1397

node-group (Chassis) . . . 1398
node-group (Resources) . . . 1399
pic (Port) . . . 1400
remote-debug-permission . . . 1401
resources . . . 1402
routing-options (QFabric System) . . . 1402
syslog (QFabric System) . . . 1403

Chapter 11 Administration . . . 1405

Software Upgrade and Recovery . . . 1405
Performing a Nonstop Software Upgrade on the QFabric System . . . 1405
Backing Up the Current Configuration Files . . . 1407
Downloading Software Files Using a Browser . . . 1407
Retrieving Software Files for Download . . . 1408
Performing a Nonstop Software Upgrade for Director Devices in a Director Group . . . 1408
Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components . . . 1408
(Optional) Creating Upgrade Groups for Node Groups . . . 1409
Performing a Nonstop Software Upgrade on a Node Group . . . 1410
Verifying Nonstop Software Upgrade for QFabric Systems . . . 1410
Verifying a Director Group Nonstop Software Upgrade . . . 1411
Verifying a Fabric Nonstop Software Upgrade . . . 1423
Verifying a Redundant Server Node Group Nonstop Software Upgrade . . . 1425
Verifying a Network Node Group Nonstop Software Upgrade . . . 1428
Upgrading Software on a QFabric System . . . 1430
Backing Up the Current Configuration Files . . . 1430
Downloading Software Files Using a Browser . . . 1431
Retrieving Software Files for Download . . . 1432
Installing the Software Package on the Entire QFabric System . . . 1432
Performing System Backup and Recovery for a QFabric System . . . 1435
Operational Mode Commands . . . 1436
QFabric System Operational Mode Commands . . . 1437
Filtering Operational Mode Command Output in a QFabric System . . . 1439
request chassis device-mode . . . 1441
request chassis fabric fpc . . . 1443
request component login . . . 1444
request fabric administration director-group change-master . . . 1446
request fabric administration remove . . . 1447
request fabric administration system mac-pool add . . . 1449
request fabric administration system mac-pool delete . . . 1450
request system halt . . . 1451
request system reboot . . . 1457
request system software format-qfabric-backup . . . 1460
request system software nonstop-upgrade . . . 1461
request system software system-backup . . . 1467
set chassis display message . . . 1469
show chassis device-mode . . . 1475

show chassis ethernet-switch interconnect-device cb . . . 1478
show chassis ethernet-switch interconnect-device fpc . . . 1495
show chassis fabric connectivity . . . 1520
show chassis fabric device . . . 1527
show chassis lcd . . . 1529
show chassis nonstop-upgrade node-group . . . 1542

show fabric administration inventory director-group status . . . 1548
show fabric administration inventory infrastructure . . . 1553
show fabric administration inventory interconnect-devices . . . 1556
show fabric administration inventory node-devices . . . 1558
show fabric administration inventory node-groups . . . 1560
show fabric administration system mac-pool . . . 1562
show fabric inventory . . . 1563
show fabric session-host . . . 1566
show log . . . 1567
show system software upgrade status . . . 1570

Chapter 12 Troubleshooting . . . 1573

QFabric System Troubleshooting . . . 1573
Performing System Backup and Recovery for a QFabric System . . . 1573
Performing a QFabric System Recovery Installation on the Director Group . . . 1574
(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive . . . 1575
Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software . . . 1577
Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device . . . 1581
Creating an Emergency Boot Device for a QFX Series Device . . . 1583

Part 6 Configuration and File Management

Chapter 13 Overview . . . 1587

Configuration Files Overview . . . 1587
Configuration File Terms . . . 1587
Software Overview . . . 1588
Forms of the configure Command . . . 1588
Junos OS Commit Model for Router or Switch Configuration . . . 1589
Understanding Configuration Files . . . 1590
Understanding How the Junos Configuration Is Stored . . . 1591

Chapter 14 Configuration . . . 1593

Configuration Tasks . . . 1593
Comparing Configuration Changes with a Prior Version . . . 1593
Compressing the Current Configuration File . . . 1595
Creating and Returning to a Rescue Configuration . . . 1596
Loading a Configuration from a File . . . 1597
Loading a Previous Configuration File . . . 1600

Returning to the Most Recently Committed Junos Configuration 1600
Returning to a Previously Committed Junos OS Configuration 1601
Returning to a Configuration Prior to the One Most Recently Committed 1601
Displaying Previous Configurations 1601
Comparing Configuration Changes with a Prior Version 1602
Creating and Returning to a Rescue Configuration 1604
Saving a Configuration to a File 1605
Reverting to the Default Factory Configuration 1606
Reverting to the Rescue Configuration 1606
Rolling Back Junos OS Configuration Changes 1607
Saving a Configuration to a File 1608
Setting or Deleting the Rescue Configuration 1609
Uploading a Configuration File 1609
Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site 1611
Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive 1611
Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site 1611
Configuring Transfer of the Current Active Configuration When a Configuration Is Committed 1612
Configuring Archive Sites for Transfer of Active Configuration Files . . . 1612
Configuration Statements 1613
archival 1614
archive-sites (Configuration File) 1615
configuration 1617
transfer-interval (Configuration) 1618
transfer-on-commit 1619
Default Configurations 1619
QFX3500 Switch Default Configuration 1619
Configuration Examples 1625
Examples: Loading a Configuration from a File 1625

Chapter 15 **Administration 1629**

Operational Commands 1629
clear log 1630
clear system commit 1631
file archive 1632
file checksum md5 1634
file checksum sha1 1635
file checksum sha-256 1636
file compare 1637
file delete 1640
file list 1641
file rename 1643
file show 1645
request system configuration rescue delete 1647
request system configuration rescue save 1648

show system commit 1649
show system configuration archival 1651
show system configuration rescue 1652
show system rollback 1654
test configuration 1656

Chapter 16 Troubleshooting 1657

Troubleshooting Procedures 1657
Loading a Previous Configuration File 1657
Reverting to the Default Factory Configuration 1658
Reverting to the Rescue Configuration 1658

Part 7 User and Access Management

Chapter 17 Overview 1661

Software Overview 1661
Understanding Software Infrastructure and Processes 1661
Routing Engine and Packet Forwarding Engine 1661
Junos OS Processes 1662
Understanding User and Access Management Features on the QFabric System 1663
Access Control Overview 1664
Overview of Template Accounts for RADIUS and TACACS+ Authentication 1665
Understanding Login Authentication 1665
MAC RADIUS Authentication 1665
Understanding LLDP 1666
Understanding RADIUS Accounting 1667
Understanding VSAs on the QFX Series 1668
Juniper Networks Vendor-Specific RADIUS Attributes 1668
Juniper Networks Vendor-Specific TACACS+ Attributes 1670
Understanding Junos OS Access Privilege Levels 1672
Junos OS Login Class Permission Flags 1672
Allowing or Denying Individual Commands for Junos OS Login Classes 1675
Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication 1676
Using RADIUS or TACACS+ Authentication 1676
Using Local Password Authentication 1677
Order of Authentication Attempts 1677
Junos OS User Authentication Methods 1681
Junos OS User Accounts Overview 1681
Junos OS Login Classes Overview 1683
Understanding QFabric System Login Classes 1684
Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies 1685
Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands 1686
Special Requirements for Junos OS Plain-Text Passwords 1687

Chapter 18 Configuration 1691

Configuration Tasks 1691
Configuring Access Privilege Levels 1692
Configuring CLI Tips 1692
Configuring Junos OS User Accounts 1692
Configuring LLDP 1693
Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication 1694
Configuring Local User Template Accounts for User Authentication 1695
Configuring Management Access 1697
Configuring RADIUS System Accounting 1697
Configuring Auditing of User Events on a RADIUS Server 1697
Specifying RADIUS Server Accounting and Auditing Events 1697
Configuring RADIUS Server Accounting 1698
Configuring RADIUS Authentication 1699
Configuring RADIUS Server Details 1699
Configuring MS-CHAPv2 for Password-Change Support 1700
Specifying a Source Address for the Junos OS to Access External RADIUS Servers 1701
Configuring Remote Template Accounts for User Authentication 1701
Configuring the Root Password 1702
Configuring SNMP 1703
Configuring SSH Host Keys for Secure Copying of Data 1707
Configuring SSH Known Hosts 1708
Configuring Support for SCP File Transfer 1708
Updating SSH Host Key Information 1709
Configuring SSH Service for Remote Access to the Router or Switch 1709
Configuring the Root Login Through SSH 1710
Configuring the SSH Protocol Version 1710
Configuring the Client Alive Mechanism 1711
Configuring TACACS+ Authentication 1711
Configuring TACACS+ Server Details 1711
Specifying a Source Address for the Junos OS to Access External TACACS+ Servers 1712
Configuring the Same Authentication Service for Multiple TACACS+ Servers 1713
Configuring Juniper Networks Vendor-Specific TACACS+ Attributes . . 1713
Configuring TACACS+ System Accounting 1714
Specifying TACACS+ Auditing and Accounting Events 1714
Configuring TACACS+ Server Accounting 1715
Defining Junos OS Login Classes 1716
Limiting the Number of User Login Attempts for SSH and Telnet Sessions 1716
Recovering the Root Password 1717
Specifying Access Privileges for Junos OS Configuration Mode Hierarchies 1719
Specifying Access Privileges for Junos OS Operational Mode Commands 1720

Using Junos OS to Configure Logical System Administrators 1721
Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands 1722
VSA Match Conditions and Actions 1724
Configuration Examples 1726
Example: Changing the Requirements for Junos OS Plain-Text Passwords 1727
Example: Configuring Access Privilege Levels 1729
Example: Configuring Access Privileges for Operational Mode Commands 1729
Example: Configuring a Plain-Text Password for Root Logins 1730
Example: Configuring RADIUS Authentication 1730
Example: Configuring RADIUS Authentication on a QFabric System 1731
Example: Configuring RADIUS System Accounting 1732
Example: Configuring the Root Password 1733
Example: Configuring SSH Authentication for Root Logins 1733
Example: Configuring User Accounts 1733
Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication 1734
Example: Creating Login Classes with Specific Privileges 1736
Example: Configuring QFabric System Login Classes 1737
Example: Configuring User Login Accounts 1744
Example: Configuring RADIUS Template Accounts 1745
Defining Access Privileges Using allow/deny-configuration Statements . . 1745
Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions 1746
Configuration Statements 1747

Part 8 Ethernet Features

Chapter 20 Overview 1867
Software Features Overview 1867
Overview of Layer 2 Networking 1867
Understanding Bridging 1869
Understanding Unicast 1871
Introduction to the Media Access Control (MAC) Layer 2 Sublayer 1871
Understanding Layer 2 Broadcasting 1872
Bridging and VLANs 1873
Understanding VLANs 1873
Introduction to VLANs 1873
VLAN Tagging 1874
Assigning Traffic to a VLAN 1874
Ethernet Switching Tables 1874
Layer 2 and Layer 3 Forwarding of VLAN Traffic 1874
Understanding Routed VLAN Interfaces 1875
Understanding MAC Learning 1876
Understanding Reflective Relay for Use with VEPA Technology 1877
VEPA 1877
Reflective Relay 1877
Understanding Private VLANs 1878
Typical Structure and Primary Application of PVLANs 1878
Using 802.1Q Tags to Identify Packets 1880
Efficient Use of IP Addresses 1881
PVLAN Port Types 1881
Limitations of Private VLANs 1883
Understanding PVLAN Traffic Flows Across Multiple Switches 1883
Community VLAN Sending Untagged Traffic 1883
Isolated VLAN Sending Untagged Traffic 1884

PVLAN Tagged Traffic Sent on a Promiscuous Port 1885
Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANs 1887
PVLAN Port Types 1887
Secondary VLAN Trunk Port Details 1888
Use Cases 1889
Understanding Egress Firewall Filters with PVLANs 1896
Understanding Multiple VLAN Registration Protocol (MVRP) 1897
QFabric Requirements 1897
MVRP Operations 1898
MRP Timers Control MVRP Updates 1898
MVRP Uses MRP Messages to Transmit Switch and VLAN States . . . 1899
Spanning Trees Overview 1899
Overview of Spanning-Tree Protocols 1900
Understanding Spanning Tree Protocols on a QFabric System 1900
Understanding MSTP 1901
Understanding RSTP 1901
Understanding VSTP 1902
Understanding BPDU Protection for STP, RSTP, and MSTP 1903
Understanding Loop Protection for STP, RSTP, VSTP, and MSTP 1904
Understanding Root Protection for STP, RSTP, VSTP, and MSTP 1905
Q-in-Q Tunneling 1906
Understanding Q-in-Q Tunneling and VLAN Translation 1906
How Q-in-Q Tunneling Works 1907
How VLAN Translation Works 1908
Mapping C-VLANs to S-VLANs 1908
Routed VLAN Interfaces on Q-in-Q VLANs 1909
Constraints for Q-in-Q Tunneling and VLAN Translation 1909
Layer 2 Protocol Tunneling 1910
Understanding Layer 2 Protocol Tunneling 1910
Layer 2 Protocols Supported by L2PT 1911
How L2PT Works 1911
L2PT Basics 1913
Proxy ARP 1914
Understanding Proxy ARP 1914
What Is ARP? 1914
Proxy ARP Overview 1915
Best Practices for Proxy ARP 1915

Chapter 21 Configuration 1917

Configuration Examples 1917
Example: Configuring Faster Convergence and Improving Network Stability with RSTP 1918
Example: Configuring Network Regions for VLANs with MSTP 1931
Example: Configuring Automatic VLAN Administration Using MVRP 1953
Example: Configuring Reflective Relay for Use with VEPA Technology . . . 1958
Example: Setting Up Basic Bridging and a VLAN on the QFX Series 1962
Example: Setting Up Bridging with Multiple VLANs 1971
Example: Configuring Routing Between VLANs on One Switch 1976

Example: Connecting an Access Switch to a Distribution Switch 1982
Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations 1990
Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees 1994
Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree 1999
Example: Disabling MAC Learning 2003
Example: Disabling MAC Learning in a VLAN 2003
Private VLAN Configuration Examples 2005
Example: Configuring a Private VLAN on a Single Switch 2005
Example: Configuring a Private VLAN Spanning Multiple Switches 2010
Example: Configuring PVLANs with Secondary VLAN Trunk Ports and Promiscuous Access Ports 2024
Q-in-Q Tunneling Configuration Example 2036
Example: Setting Up Q-in-Q Tunneling 2036
Configuration Tasks 2039
Configuring the Interface Address 2040
Configuring Interface IPv4 Addresses 2041
Configuring Interface IPv6 Addresses 2041
Configuring MAC Notification 2042
Enabling MAC Notification 2043
Disabling MAC Notification 2043
Setting the MAC Notification Interval 2043
Configuring MAC Table Aging 2044
Configuring Reflective Relay 2044
Configuring Static ARP Entries 2045
Configuring Reflective Relay 2045
Configuring Routed VLAN Interfaces 2046
Configuring the Native VLAN Identifier 2047
Configuring VLANs 2048
Creating a Series of Tagged VLANs 2050
Configuring Multiple VLAN Registration Protocol 2051
Enabling MVRP 2051
Disabling MVRP 2051
Configuring Timer Values 2052
Configuring Passive Mode 2052
Configuring STP 2053
Unblocking an Interface That Receives BPDUs in Error 2054
Configuring VLAN Spanning Tree Protocol 2054
Disabling MAC Learning 2055
Disabling MAC Learning in a VLAN 2056
Creating a Private VLAN on a Single Switch 2057
Creating a Private VLAN Spanning Multiple Switches 2058
Configuring the Forwarding Mode 2059
Private VLAN Configuration Tasks 2059
Creating a Private VLAN on a Single Switch 2060
Creating a Private VLAN Spanning Multiple Switches 2061

Q-in-Q Tunneling Configuration Tasks . . . 2062
Configuring Q-in-Q Tunneling . . . 2062
Configuring Layer 2 Protocol Tunneling . . . 2063

Firewall Filter Match Condition Not Working with Q-in-Q Tunneling . . 2266
Egress Port Mirroring with VLAN Translation . . . 2266

Part 9 High Availability

Chapter 24 Overview 2269

Software Features Overview 2269
Graceful Restart Concepts 2269
Understanding Nonstop Software Upgrade for QFabric Systems 2270
Understanding VRRP 2274
Overview of VRRP 2274
Sample VRRP Topology 2275
Understanding VRRP Between QFabric Systems 2277
VRRP Differences on QFabric Systems 2277
Configuration Details 2277

Chapter 25 Configuration 2281

Configuration Tasks for Graceful Restart 2281
Configuring Graceful Restart for QFabric Systems 2281
Enabling Graceful Restart 2282
Configuring Graceful Restart Options for BGP 2282
Configuring Graceful Restart Options for OSPF and OSPFv3 2283
Tracking Graceful Restart Events 2284
Configuring Routing Protocols Graceful Restart 2285
Enabling Graceful Restart 2285
Configuring Graceful Restart Options for BGP 2286
Configuring Graceful Restart Options for ES-IS 2287
Configuring Graceful Restart Options for IS-IS 2287
Configuring Graceful Restart Options for OSPF and OSPFv3 2288
Configuring Graceful Restart Options for RIP and RIPng 2289
Configuring Graceful Restart Options for PIM Sparse Mode 2289
Tracking Graceful Restart Events 2291
Configuration Example for VRRP 2291
Example: Configuring VRRP for Load Sharing 2291
Configuration Tasks for VRRP 2296
Configuring Basic VRRP Support 2296
Configuring VRRP Authentication (IPv4 Only) 2297
Configuring the Startup Period for VRRP Operations 2298
Configuring the Advertisement Interval for the VRRP Master 2299
Modifying the Advertisement Interval in Seconds 2299
Modifying the Advertisement Interval in Milliseconds 2299
Configuring VRRP Preemption and Hold Time 2300
Configuring VRRP Preemption 2300
Configuring the Preemption Hold Time 2300
Overriding the Hold Time 2301
Configuring a Route to Be Tracked 2301
Configuring a Logical Interface to Be Tracked 2302
Configuring a Backup to Accept Packets Destined for the Virtual IP Address 2304
Configuring Passive ARP Learning for VRRP Backups 2304
Configuring the Silent Period 2305
Configuring Inheritance for a VRRP Group 2305

Configuration Statements for Graceful Restart 2306
disable 2307
disable (BGP Graceful Restart) 2308
graceful-restart (Enabling Globally) 2309
graceful-restart (Protocols BGP) 2310
graceful-restart (Protocols OSPF) 2311
helper-disable (OSPF) 2313
no-strict-lsa-checking 2314
notify-duration 2315
restart-duration 2316

Chapter 27 **Troubleshooting . . . 2411**

Troubleshooting Procedures . . . 2411
Troubleshooting VRRP . . . 2411

Part 10 Interfaces

Chapter 28 **Overview . . . 2415**

Interfaces Overview . . . 2415
Interfaces Overview . . . 2415
Network Interfaces . . . 2415
Special Interfaces . . . 2416
Understanding Aggregated Ethernet Interfaces and LACP . . . 2417
Link Aggregation Group . . . 2417
Link Aggregation Control Protocol (LACP) . . . 2418
Understanding Interface Naming Conventions . . . 2419
Physical Part of an Interface Name . . . 2419
Logical Part of an Interface Name . . . 2431
Wildcard Characters in Interface Names . . . 2432
Understanding Interface Ranges on the QFX Series . . . 2432
Understanding Layer 3 Logical Interfaces . . . 2434
Understanding Management Interfaces . . . 2434
Understanding Multichassis Link Aggregation . . . 2435
Active-Active Mode . . . 2437
ICCP and ICL-PL . . . 2437
Failure Handling . . . 2437
Multichassis Link Protection . . . 2438
MC-LAG Packet Forwarding . . . 2438
Layer 3 Routing . . . 2438
Spanning Tree Protocol (STP) Guidelines . . . 2439
MC-LAG Upgrade Guidelines . . . 2439
Layer 2 Unicast Features Supported . . . 2440
Layer 2 Multicast Features Supported . . . 2440
IGMP Snooping on an Active-Active MC-LAG . . . 2440

Layer 3 Unicast Features Supported 2441
VRRP Active-Standby Support 2441
Routed VLAN Interface (RVI) MAC Address Synchronization 2442
Address Resolution Protocol (ARP) 2442
DHCP Relay with Option 82 2442
Private VLAN (PVLAN) 2443
Layer 3 Multicast 2443
Overview of Uplink Failure Detection 2445
Uplink Failure Detection Configuration 2445
Failure Detection Pair 2446

Chapter 29 Configuration 2449

Configuration Examples 2449
Example: Configuring Interfaces for Uplink Failure Detection 2449
Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch 2454
Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch 2458
Example: Configuring Multichassis Link Aggregation 2462
Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP 2477
Example: Configuring Multichassis Link Aggregation with Layer 3 MAC Address Synchronization 2500
Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol (VRRP) 2514
Configuration Tasks 2532
Configuring Gigabit and 10-Gigabit Ethernet Interfaces 2533
Configuring Port Mode 2533
Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces 2533
Configuring the IP Options 2534
Configuring Aggregated Ethernet LACP 2534
Configuring Ethernet Loopback Capability 2535
Configuring Interfaces for Uplink Failure Detection 2536
Configuring a Layer 3 Logical Interface 2537
Configuring Link Aggregation 2537
Creating an Aggregated Ethernet Interface 2538
Configuring the VLAN Name and VLAN ID Number 2538
Configuring Aggregated Ethernet LACP 2538
Configuring Multichassis Link Aggregation 2540
Configuring the QSFP+ Port Type on QFX3500 Standalone Switches . . . 2543
Configuring the Port Type on QFX3600 Standalone Switches 2545

show uplink-failure-detection 2808

Chapter 31 Troubleshooting 2811

Troubleshooting Procedures 2811
Troubleshooting an Aggregated Ethernet Interface 2811
Troubleshooting Multichassis Link Aggregation 2811
MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table 2812
MC-LAG Peer Does Not Go into Standby Mode 2813
Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive 2813
Redirect Filters Take Priority over User-Defined Filters 2813
Operational Command Output Is Wrong 2813
ICCP Connection Might Take Up to 60 Seconds to Become Active . . . 2814
MAC Address Age Learned on an MC-AE Interface Is Reset to Zero . . 2814
MAC Address Is Not Learned Remotely in a Default VLAN 2814
Snooping Entries Learned on MC-AE Interfaces Are Not Removed . . . 2814
ICCP Does Not Come Up After You Add or Delete an Authentication Key 2815
Local Status Is Standby When It Should Be Active 2815
Packets Loop on the Server When ICCP Fails 2815
Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change 2815
No Commit Checks Are Done for ICL-PL Interfaces 2816
Double Failover Scenario 2816
Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up 2816
Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer 2816
AE Interfaces Go Down 2816
Flooding of Upstream Traffic 2817
Troubleshooting Network Interfaces 2817
The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down 2817

Part 11 Routing Options

Chapter 32 Overview 2821

Routing Options Overview 2821
Overview of Routing Options 2821
Understanding Virtual Router Routing Instances 2822
Understanding Distributed Periodic Packet Management 2822

Chapter 33 Configuration 2825

Configuration Tasks 2825
Configuring Static Routing 2826
Configuring Per-Packet Load Balancing 2826
Configuring Distributed Periodic Packet Management 2828
Disabling or Enabling Distributed Periodic Packet Management Globally 2828
Disabling or Enabling Distributed Periodic Packet Management for LACP Packets 2828
Configuring Virtual Router Routing Instances 2829
Configuration Examples 2830
Examples: Configuring Per-Packet Load Balancing 2830
Examples: Configuring BFD for Static Routes 2831
Understanding BFD for Static Routes 2831
Example: Configuring BFD for Static Routes 2835
Example: Enabling BFD on Qualified Next Hops in Static Routes 2840
Example: Configuring BFD Authentication for Static Routes 2846
Understanding BFD Authentication for Static Routes 2846
Example: Configuring BFD Authentication for Static Routes 2848

Notification Messages . . . 3148

Chapter 37 Configuration . . . 3149

Basic BGP Configuration . . . 3149
Examples: Configuring External BGP Peering . . . 3149
Understanding External BGP Peering Sessions . . . 3149
Example: Configuring External BGP Point-to-Point Peer Sessions . . . 3150
Example: Configuring External BGP on Logical Systems with IPv6 Interfaces . . . 3157
Examples: Configuring Internal BGP Peering . . . 3172
Understanding Internal BGP Peering Sessions . . . 3172
Example: Configuring Internal BGP Peer Sessions . . . 3173
Example: Configuring Internal BGP Peering Sessions on Logical Systems . . . 3184
BGP Path Attribute Configuration . . . 3194
Example: Configuring BGP Local Preference . . . 3194
Understanding the BGP Local Preference . . . 3194
Example: Configuring the Local Preference Value for BGP Routes . . . 3195
Examples: Configuring BGP MED . . . 3208
Understanding the MED Attribute . . . 3208
Example: Configuring the MED Attribute Directly . . . 3210
Example: Configuring the MED Using Route Filters . . . 3223
Example: Configuring the MED Using Communities . . . 3236

Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates . . . 3236
Examples: Configuring BGP Local AS . . . 3246
Understanding the BGP Local AS Attribute . . . 3246
Example: Configuring a Local AS for EBGP Sessions . . . 3251
Example: Configuring a Private Local AS for EBGP Sessions . . . 3261
Example: Configuring the Accumulated IGP Attribute for BGP . . . 3266
Understanding the Accumulated IGP Attribute for BGP . . . 3267
Example: Configuring the Accumulated IGP Attribute for BGP . . . 3267
BGP Policy Configuration . . . 3305
Example: Configuring BGP Interactions with IGPs . . . 3305
Understanding Routing Policies . . . 3305
Example: Injecting OSPF Routes into the BGP Routing Table . . . 3306
Example: Configuring BGP Route Advertisement . . . 3309
Understanding Route Advertisement . . . 3309
Example: Configuring BGP Prefix-Based Outbound Route Filtering . . . 3313
Example: Configuring EBGP Multihop . . . 3317
Understanding BGP Multihop . . . 3317
Example: Configuring EBGP Multihop Sessions . . . 3317
Example: Configuring BGP Route Preference (Administrative Distance) . . . 3326
Understanding Route Preference Values . . . 3326
Example: Configuring the Preference Value for BGP Routes . . . 3327
Example: Configuring BGP Path Selection . . . 3332
Understanding BGP Path Selection . . . 3332
Example: Ignoring the AS Path Attribute When Selecting the Best Path . . . 3336
Example: Removing Private AS Numbers . . . 3342
Understanding Private AS Number Removal from AS Paths . . . 3342
Example: Removing Private AS Numbers from AS Paths . . . 3343
BGP BFD Configuration . . . 3348
Example: Configuring BFD for BGP . . . 3348
Understanding BFD for BGP . . . 3348
Example: Configuring BFD on Internal BGP Peer Sessions . . . 3349
Example: Configuring BFD Authentication for BGP . . . 3357
Understanding BFD Authentication for BGP . . . 3357
Example: Configuring BFD Authentication for BGP . . . 3359
BGP Load Balancing Configuration . . . 3362
Examples: Configuring BGP Multipath . . . 3362
Understanding BGP Multipath . . . 3362
Example: Load Balancing BGP Traffic . . . 3363
Example: Configuring Single-Hop EBGP Peers to Accept Remote Next Hops . . . 3367
Example: Advertising Multiple BGP Paths to a Destination . . . 3379
Understanding the Advertisement of Multiple Paths to a Single Destination in BGP . . . 3379
Example: Advertising Multiple Paths in BGP . . . 3380

IBGP Scaling Configuration . . . 3405
Example: Configuring BGP Route Reflectors . . . 3405
Understanding BGP Route Reflectors . . . 3405
Example: Configuring a Route Reflector . . . 3407
Example: Configuring BGP Confederations . . . 3422
Understanding BGP Confederations . . . 3422
Example: Configuring BGP Confederations . . . 3423
BGP Security Configuration . . . 3428
Example: Configuring BGP Route Authentication . . . 3429
Understanding Route Authentication . . . 3429

Chapter 42 Overview . . . 3797

OSPF Overview . . . 3797
OSPF Overview . . . 3798
OSPF Default Route Preference Values . . . 3800
OSPF Routing Algorithm . . . 3800
OSPF Three-Way Handshake . . . 3801
OSPF Version 3 . . . 3802
OSPF Areas and Router Functionality Overview . . . 3803
Areas . . . 3803
Area Border Routers . . . 3803
Backbone Areas . . . 3803
AS Boundary Routers . . . 3804
Backbone Router . . . 3804
Internal Router . . . 3804
Stub Areas . . . 3804
Not-So-Stubby Areas . . . 3804
Transit Areas . . . 3805
Packets Overview . . . 3805
OSPF Packet Header . . . 3805
Hello Packets . . . 3806
Database Description Packets . . . 3806

Link-State Request Packets . . . 3806
Link-State Update Packets . . . 3806
Link-State Acknowledgment Packets . . . 3807
Link-State Advertisement Packet Types . . . 3807
OSPF External Metrics Overview . . . 3808

Chapter 43 Configuration . . . 3809

Basic OSPF Area Configuration . . . 3809
Examples: Configuring OSPF Designated Routers . . . 3809
OSPF Designated Router Overview . . . 3809
Example: Configuring an OSPF Router Identifier . . . 3810
Example: Controlling OSPF Designated Router Election . . . 3812
Examples: Configuring OSPF Areas . . . 3814
Understanding OSPF Areas and Backbone Areas . . . 3814
Example: Configuring a Single-Area OSPF Network . . . 3815
Example: Configuring a Multiarea OSPF Network . . . 3817
Advanced OSPF Area Configuration . . . 3820
Examples: Configuring OSPF Stub and Not-So-Stubby Areas . . . 3821
Understanding OSPF Stub Areas, Totally Stubby Areas, and Not-So-Stubby Areas . . . 3821
Example: Configuring OSPF Stub and Totally Stubby Areas . . . 3822
Example: Configuring OSPF Not-So-Stubby Areas . . . 3826
Example: Configuring OSPF Multiarea Adjacency . . . 3831
Multiarea Adjacency for OSPF . . . 3831
Example: Configuring Multiarea Adjacency for OSPF . . . 3832
Example: Disabling OSPFv2 Compatibility with RFC 1583 . . . 3835
OSPFv2 Compatibility with RFC 1583 Overview . . . 3836
Example: Disabling OSPFv2 Compatibility with RFC 1583 . . . 3836
OSPF Interface Configuration . . . 3837
Examples: Configuring OSPF Interfaces . . . 3837
About OSPF Interfaces . . . 3838
Example: Configuring an Interface on a Broadcast or Point-to-Point Network . . . 3839
Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network . . . 3841
Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network . . . 3844
Example: Configuring OSPF Demand Circuits . . . 3846
Example: Configuring a Passive OSPF Interface . . . 3848
Example: Configuring OSPFv2 Peer interfaces . . . 3850

OSPF Route Control Configuration 3852
Examples: Configuring OSPF Route Summarization 3852
Understanding OSPF Route Summarization 3852
Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements 3852
Example: Limiting the Number of Prefixes Exported to OSPF 3858
Configuring OSPF Refresh and Flooding Reduction in Stable Topologies 3860
Examples: Configuring OSPF Traffic Control 3861
Understanding OSPF Traffic Control 3861
Example: Controlling the Cost of Individual OSPF Network Segments 3863
Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth 3867
Example: Controlling OSPF Route Preferences 3869
Example: Configuring OSPF Overload Mode 3871
OSPF Overload Function Overview 3871
Example: Configuring OSPF to Make Routing Devices Appear Overloaded 3872
OSPF Fault Detection Configuration 3875
Example: Configuring OSPF Timers 3875
OSPF Timers Overview 3875
Example: Configuring OSPF Timers 3876
Example: Configuring BFD for OSPF 3881
BFD for OSPF Overview 3881
Example: Configuring BFD for OSPF 3883
Example: Configuring BFD Authentication for OSPF 3887
BFD Authentication for OSPF Overview 3887
Configuring BFD Authentication for OSPF 3889
OSPF Redundancy Features Configuration 3892
Examples: Configuring Graceful Restart for OSPF 3892
Graceful Restart for OSPF Overview 3892
Example: Configuring Graceful Restart for OSPF 3894
Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart 3898
Example: Configuring the Helper Capability Mode for OSPFv3 Graceful Restart 3901
Example: Disabling Strict LSA Checking for OSPF Graceful Restart . . 3904
OSPF Traffic Engineering Configuration 3907
Examples: Configuring OSPF Traffic Engineering 3907
OSPF Support for Traffic Engineering 3908
Example: Enabling OSPF Traffic Engineering Support 3910
Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface 3914
Example: Configuring OSPF Passive Traffic Engineering Mode 3916
OSPF Passive Traffic Engineering Mode 3916
Example: Configuring OSPF Passive Traffic Engineering Mode 3917

OSPF Database Protection Configuration . . . 3919
Example: Configuring OSPF Database Protection . . . 3919
OSPF Database Protection Overview . . . 3919
Configuring OSPF Database Protection . . . 3920
OSPF Policy Configuration . . . 3921
Examples: Configuring OSPF Routing Policy . . . 3921
Understanding OSPF Routing Policy . . . 3921
Example: Injecting OSPF Routes into the BGP Routing Table . . . 3923
Example: Redistributing Static Routes into OSPF . . . 3927
Example: Configuring an OSPF Import Policy . . . 3929
Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF . . . 3933
Examples: Configuring Routing Policy for Network Summaries . . . 3937
Import and Export Policies for Network Summaries Overview . . . 3937
Example: Configuring an OSPF Export Policy for Network Summaries . . . 3938
Example: Configuring an OSPF Import Policy for Network Summaries . . . 3946
OSPF Monitoring Configuration . . . 3954
Example: Configuring OSPF Trace Options . . . 3954
Tracing OSPF Protocol Traffic . . . 3954

Part 15 Routing Information Protocol

Chapter 45 Overview 4103

RIP Overview 4103
RIP Overview 4103
Distance-Vector Routing Protocols 4103
RIP Protocol Overview 4104
RIP Packets 4105
Maximizing Hop Count 4106
Split Horizon and Poison Reverse Efficiency Techniques 4106
Limitations of Unidirectional Connectivity 4107

Chapter 46 Configuration 4109

RIP Configuration Tasks 4109
Example: Configuring RIP 4109
Understanding Basic RIP Routing 4109
Example: Configuring a Basic RIP Network 4110
Example: Configuring Authentication for RIP Routes 4116
Understanding RIP Authentication 4116
Example: Configuring Route Authentication for RIP 4116
Enabling Authentication with Plain-Text Passwords (CLI Procedure) 4121
Enabling Authentication with MD5 Authentication (CLI Procedure) . . 4121
Example: Configuring BFD for RIP 4122
Understanding BFD for RIP 4122
Example: Configuring BFD for RIP 4123
Example: Configuring BFD Authentication for RIP 4128
Understanding BFD Authentication for RIP 4128
Example: Configuring BFD Authentication for RIP 4130
Example: Applying Policies to RIP Routes Imported from Neighbors 4136
Understanding RIP Import Policy 4136
Example: Applying Policies to RIP Routes Imported from Neighbors . . 4136
Examples: Controlling Traffic with Metrics in a RIP Network 4142
Understanding Traffic Control with Metrics in a RIP Network 4142
Example: Controlling Traffic in a RIP Network with an Incoming Metric 4143
Example: Controlling Traffic in a RIP Network with an Outgoing Metric 4144
Example: Configuring the Metric Value Added to Imported RIP Routes 4146
Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets 4150
Understanding the Sending and Receiving of RIPv1 and RIPv2 Packets 4150
Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets 4150
Example: Redistributing Routes Among RIP Instances 4154
Understanding Route Redistribution Among RIP instances 4154
Example: Redistributing Routes Between Two RIP Instances 4155

Example: Configuring RIP Timers 4159
Understanding RIP Timers 4160
Example: Configuring RIP Timers 4161

Part 16 Multicast

Chapter 48 Overview 4209

Introduction to PIM Basics 4209
PIM Overview 4209
Basic PIM Network Components 4211
PIM on Aggregated Interfaces 4212
Introduction to PIM Sparse Mode 4212
Understanding PIM Sparse Mode 4213
Rendezvous Point 4214
RP Mapping Options 4215
Designated Router 4215
Introduction to Static RP 4216
Understanding Static RP 4216
Introduction to Anycast RP 4216
Understanding RP Mapping with Anycast RP 4217
Introduction to PIM Bootstrap Router 4217
Understanding the PIM Bootstrap Router 4217
Introduction to PIM Filtering 4218
Understanding Multicast Message Filters 4218
Filtering MAC Addresses 4219
Filtering RP and DR Register Messages 4219
Introduction to PIM RPT and SPT Cutover 4220
Understanding Multicast Rendezvous Points, Shared Trees, and Rendezvous-Point Trees 4220
Building an RPT Between the RP and Receivers 4221
PIM Sparse Mode Source Registration 4222
Multicast Shortest-Path Tree 4225
SPT Cutover 4226
SPT Cutover Control 4229
Introduction to IGMP 4229
Understanding Group Membership Protocols 4229
Understanding IGMP 4230
Introduction to IGMP Snooping 4232
IGMP Snooping Overview 4232
How IGMP Snooping Works 4232
How IGMP Snooping Works with Routed VLAN Interfaces 4233
How Hosts Join and Leave Multicast Groups 4233
IGMP Snooping Support for IGMPv3 4233
IGMP Snooping and Forwarding Interfaces 4234
General Forwarding Rules 4234
Introduction to MSDP 4235
Understanding MSDP 4235
Filtering MSDP SA Messages 4236
Introduction to Source-Specific Multicast 4237
Source-Specific Multicast Groups Overview 4237
Understanding PIM Source-Specific Mode 4238
PIM SSM 4239

Introduction to Multicast VLAN Registration 4241
Understanding Multicast VLAN Registration 4241
How MVR Works 4241

Chapter 49 Configuration 4245

Optimizing Multicast Flows on QFabric Systems 4245
Optimizing the Number of Multicast Flows on QFabric Systems 4246
PIM Basics 4246
Changing the PIM Version 4246
Modifying the PIM Hello Interval 4246
Preserving Multicast Performance by Disabling Response to the ping Utility 4247
Configuring PIM Trace Options 4248
Disabling PIM 4250
Disabling the PIM Protocol 4251
Disabling PIM On an Interface 4251
Disabling PIM for a Family 4252
Disabling PIM for a Rendezvous Point 4252
PIM Designated Router 4253
Configuring Interface Priority for PIM Designated Router Selection 4253
Configuring PIM Designated Router Election on Point-to-Point Links 4254
PIM Sparse Mode 4254
Enabling PIM Sparse Mode 4255
Configuring PIM Join Load Balancing 4256
Modifying the Join State Timeout 4259
Example: Enabling Join Suppression 4259
Static RP 4264
Configuring Local PIM RPs 4264
Configuring the Static PIM RP Address on the Non-RP Routing Device . . 4266
Anycast RP 4267
Example: Configuring PIM Anycast With or Without MSDP 4267
Configuring a PIM Anycast RP Router with MSDP 4271
Configuring a PIM Anycast RP Router Using Only PIM 4272
Configuring All PIM Anycast Non-RP Routers 4273
Example: Configuring Multiple RPs in a Domain with Anycast RP 4273
PIM Bootstrap Router 4276
Configuring PIM Bootstrap Properties for IPv4 or IPv6 4276
Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain 4277
Example: Configuring PIM BSR Filters 4278
PIM Filtering 4278
Configuring Interface-Level PIM Neighbor Policies 4279
Filtering Outgoing PIM Join Messages 4280
Filtering Incoming PIM Join Messages 4281
Configuring Register Message Filters on a PIM RP and DR 4282
PIM RPT and SPT Cutover 4284
Example: Configuring the PIM Assert Timeout 4284
Example: Configuring the PIM SPT Threshold Policy 4287

PIM and the BFD Protocol 4290
Configuring BFD for PIM 4290
Configuring BFD Authentication for PIM 4292
Configuring BFD Authentication Parameters 4292
Viewing Authentication Information for BFD Sessions 4293
IGMP 4295
Configuring IGMP 4295
Enabling IGMP 4297
Changing the IGMP Version 4298
Modifying the IGMP Host-Query Message Interval 4299
Modifying the IGMP Last-Member Query Interval 4299
Specifying Immediate-Leave Host Removal for IGMP 4300
Filtering Unwanted IGMP Reports at the IGMP Interface Level 4301
Accepting IGMP Messages from Remote Subnetworks 4302
Modifying the IGMP Query Response Interval 4303
Modifying the IGMP Robustness Variable 4304
Limiting the Maximum IGMP Message Rate 4305
Enabling IGMP Static Group Membership 4305
Recording IGMP Join and Leave Events 4312
Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces 4313
Tracing IGMP Protocol Traffic 4314
Disabling IGMP 4316
IGMP Snooping 4316
Configuring IGMP Snooping 4317
Changing the IGMP Snooping Group Timeout Value 4318
Example: Configuring IGMP Snooping 4318
Configuring Multicast VLAN Registration (CLI Procedure) 4321
Example: Configuring Multicast VLAN Registration 4322
MSDP 4327
Configuring MSDP 4327
Tracing MSDP Protocol Traffic 4328
Configuring the Interface to Accept Traffic from a Remote Source 4330
Example: Configuring MSDP 4331
Example: Configuring MSDP with Active Source Limits and Mesh Groups . . 4332
Example: Configuring PIM Anycast With or Without MSDP 4338
Configuring a PIM Anycast RP Router with MSDP 4341
Source-Specific Multicast 4342
Example: Configuring PIM SSM on a Network 4342
Example: Configuring an SSM-Only Domain 4344
Example: Configuring SSM Mapping 4344
Example: Configuring Source-Specific Multicast Groups with Any-Source Override 4347
Example: Configuring SSM Maps for Different Groups to Different Sources 4350
Multiple SSM Maps and Groups for Interfaces 4350
Example: Configuring Multiple SSM Maps Per Interface 4351

Part 17 Security

Chapter 51 Overview 4635

Firewall Filters 4635
Overview of Firewall Filters 4635
Firewall Filter Types 4636
Firewall Filter Components 4636
Firewall Filter Processing 4637
Understanding Filter-Based Forwarding 4637
Understanding How Firewall Filters Are Evaluated 4638
Understanding How Firewall Filters Control Packet Flows 4640
Understanding Firewall Filter Match Conditions 4641
Filter Match Conditions 4641
Numeric Filter Match Conditions 4641
Interface Filter Match Conditions 4642
IP Address Filter Match Conditions 4642
MAC Address Filter Match Conditions 4643
Bit-Field Filter Match Conditions 4643
Firewall Filter Match Conditions and Actions 4644
Understanding How a Firewall Filter Tests a Protocol 4656
Understanding Firewall Filter Planning 4657
Planning the Number of Firewall Filters to Create 4658
Understanding How Many Firewall Filters Are Supported 4658
Egress Filters 4660
Avoid Configuring too Many Filters 4660
Policers can Limit Egress Filters 4660
Planning for Filter-Specific Policers 4661
Planning for Filter-Based Forwarding 4662
Understanding Firewall Filter Processing Points for Bridged and Routed Packets 4662
Applying Firewall Filters to Interfaces 4663
Policers 4663
Overview of Policers 4664
Policer Overview 4664
Policer Types 4664
Policer Actions 4665
Policer Colors 4666
Filter-Specific Policers 4666
Suggested Naming Convention for Policers 4667
Policer Counters 4667
Policer Algorithms 4667
How Many Policers are Supported? 4668

Policers can Limit Egress Firewall Filters 4668
Understanding Policers with Link Aggregation Groups 4669
Understanding Color-Blind Mode for Single-Rate Tricolor Marking 4669
Understanding Color-Aware Mode for Single-Rate Tricolor Marking 4670
Summary of PLP Changes 4670
Understanding Color-Blind Mode for Two-Rate Tricolor Marking 4671
Understanding Color-Aware Mode for Two-Rate Tricolor Marking 4672
Summary of PLP Changes 4672
Effect on Green Packets (Low PLP) 4672
Effect on Yellow Packets (Medium PLP) 4673
Effect on Red Packets (High PLP) 4673
Port Security 4673
Overview of Access Port Protection 4674
Mitigation of Ethernet Switching Table Overflow Attacks 4674
Mitigation of Rogue DHCP Server Attacks 4674
Protection Against ARP Spoofing Attacks 4675
Protection Against DHCP Snooping Database Alteration Attacks . . . 4675
Protection Against DHCP Starvation Attacks 4676
Port Security Overview 4676
Understanding DHCP Snooping for Port Security 4678
DHCP Snooping Basics 4679
DHCP Snooping Process 4680
DHCP Server Access 4681
DHCP Snooping Table 4684
Static IP Address Additions to the DHCP Snooping Database 4684
Snooping DHCP Packets That Have Invalid IP Addresses 4684
Prioritizing Snooped Packets 4685
Understanding DAI for Port Security 4686
Address Resolution Protocol 4686
ARP Spoofing 4686
Dynamic ARP Inspection (DAI) 4687
Prioritizing Inspected Packets 4687
Understanding MAC Limiting and MAC Move Limiting for Port Security . . 4688
MAC Limiting 4688
MAC Move Limiting 4689
Actions for MAC Limiting 4689
MAC Addresses That Exceed the MAC Limit or MAC Move Limit 4689
Understanding Trusted and Untrusted Ports 4690
Understanding Trusted DHCP Servers for Port Security 4690
Understanding DHCP Option 82 for Port Security 4691
DHCP Option 82 Processing 4691
Suboption Components of Option 82 4692
Configurations That Support Option 82 4692
Understanding Static ARP Entries 4693
Device Security 4694
Understanding Storm Control 4694

Chapter 52 Configuration 4697

Firewall and Policer Configuration Examples 4697
Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device 4697
Example: Using Two-Color Policers and Prefix Lists 4701
Example: Using Policers to Manage Oversubscription 4704
Port Security Configuration Examples 4706
Example: Configuring Basic Port Security Features 4706
Example: Configuring Storm Control 4713
Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks 4715
Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks 4718
Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks 4722
Example: Configuring DHCP Snooping, DAI , and MAC Limiting on a Switch with Access to a DHCP Server Through a Second Switch 4725
Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks 4732
Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks 4737
Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server 4740
Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server 4744
Firewall and Policer Configuration Tasks 4746
Configuring Firewall Filters 4747
Configuring a Firewall Filter 4747
Applying a Firewall Filter to a Port 4749
Applying a Firewall Filter to a VLAN 4749
Applying a Firewall Filter to a Layer 3 (Routed) Interface 4749
Applying Firewall Filters to Interfaces 4750
Assigning Forwarding Classes and Loss Priority 4751
Configuring Color-Blind Egress Policers for Medium-Low PLP 4752
Configuring Two-Color and Three-Color Policers to Control Traffic Rates 4753
Configuring Two-Color Policers 4753
Configuring Three-Color Policers 4754
Specifying Policers in a Firewall Filter Configuration 4754
Applying a Firewall Filter That Includes a Policer 4755
Port Security Configuration Tasks 4755
Configuring Port Security (CLI Procedure) 4756
Enabling DHCP Snooping 4757
Enabling Dynamic ARP Inspection (DAI) 4757
Limiting Dynamic MAC Addresses on an Interface 4757
Enabling Persistent MAC Learning on an Interface 4757
Limiting MAC Address Movement 4758

Configuring Trusted DHCP Servers on an Interface 4758
Configuring MAC Limiting 4758
Configuring MAC Move Limiting (CLI Procedure) 4760
Configuring Autorecovery for MAC Limited or Storm Control Interfaces (CLI Procedure) 4762
Configuring the none Action to Override a MAC Limit Applied to All Interfaces (CLI Procedure) 4762
Configuring Static ARP Entries 4763
Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) 4763
Enabling DHCP Snooping (CLI Procedure) 4764
Enabling DHCP Snooping 4765
Applying CoS Forwarding Classes to Prioritize Snooped Packets 4765
Enabling Dynamic ARP Inspection (CLI Procedure) 4766
Enabling DAI 4767
Applying CoS Forwarding Classes to Prioritize Inspected Packets . . . 4767
Enabling a Trusted DHCP Server (CLI Procedure) 4768
Enabling a Trusted Port for DHCP 4769
Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure) 4770
Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure) 4773

Chapter 53 Administration 4845

Routine Monitoring 4845
Monitoring Firewall Filter Traffic 4845
Monitoring Traffic for All Firewall Filters and Policers That Are Configured 4845
Monitoring Traffic for a Specific Firewall Filter 4846
Monitoring Traffic for a Specific Policer 4846
Monitoring Port Security 4847
Verifying That Firewall Filters Are Operational 4848
Verifying That DAI Is Working Correctly 4848
Verifying That DHCP Snooping Is Working Correctly 4849
Verifying That MAC Limiting Is Working Correctly 4850
Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly 4851
Verifying That Allowed MAC Addresses Are Working Correctly 4851
Verifying That Interfaces Are Shut Down 4852
Customizing the Ethernet Switching Table Display to View Information for a Specific Interface 4852
Verifying That MAC Move Limiting Is Working Correctly 4853
Verifying That the Port Error Disable Setting Is Working Correctly 4854
Verifying That a Trusted DHCP Server Is Working Correctly 4854
Verifying That Three-Color Policers Are Operational 4855
Verifying That Two-Color Policers Are Operational 4856
Monitoring Commands 4856
clear arp inspection statistics 4857
clear dhcp snooping binding 4858
clear ethernet-switching port-error 4859
clear firewall 4860

Chapter 54 Troubleshooting 4873

Troubleshooting Procedures 4873
Troubleshooting Firewall Filter Configuration 4873
Firewall Filter Configuration Returns a No Space Available in TCAM Message 4873
Filter Counts Previously Dropped Packet 4875
Matching Packets Not Counted 4876
Counter Reset When Editing Filter 4876
Cannot Include loss-priority and policer Actions in Same Term 4876
Cannot Egress Filter Certain Traffic Originating on QFX Switch 4877
Firewall Filter Match Condition Not Working with Q-in-Q Tunneling . . 4877
Egress Firewall Filters with Private VLANs 4877
Egress Filtering of L2PT Traffic Not Supported 4878
Cannot Drop BGP Packets in Certain Circumstances 4878
Invalid Statistics for Policer 4878

Policers can Limit Egress Filters 4878
Troubleshooting Policer Configuration 4880
Incomplete Count of Packet Drops 4880
Counter Reset When Editing Filter 4880
Invalid Statistics for Policer 4880
Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured 4881
Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured 4882
Policers Can Limit Egress Filters 4882

Part 18 Services

Chapter 55 Overview 4887

Port Mirroring 4887
Understanding Port Mirroring 4887
Port Mirroring Overview 4887
Port-Mirroring Terminology 4888
Port Mirroring Constraints and Limitations 4889
Understanding Layer 3 Logical Interfaces 4892
DHCP Relay 4892
DHCP and BOOTP Relay Overview 4892

Chapter 56 Configuration 4895

Configuration Examples 4895
Example: Configuring Port Mirroring for Local Analysis 4895
Example: Configuring Port Mirroring for Remote Analysis 4900
Configuration Tasks 4904
Configuring Port Mirroring 4904
Configuring Port Mirroring for Local Analysis 4905
Configuring Port Mirroring for Remote Analysis 4905
Filtering the Traffic Entering an Analyzer 4906

Chapter 63 Overview 5411

Software Features Overview 5411
Overview of Junos OS CoS for the QFX Series 5412
CoS Standards 5412
How Junos CoS Works 5413
Default CoS Behavior 5414
Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release) 5414
Overview of CoS Upgrade Requirements to Junos OS Release 12.2 5416
Overview of CoS Upgrade Requirements to Junos OS Release 12.3 (QFX3500 and QFX3600 Switches) or to Junos OS Release 13.1 (QFabric Systems) 5418
Support for Six Lossless Forwarding Classes 5418
Scheduling on QFabric System Node Device Fabric (fte) Ports 5419
Strict-High Priority Scheduling on QFabric System Node Device Fabric (fte) Ports 5420
Overview of CoS Changes Introduced in Junos OS Release 11.3 5420
CoS Default Value Changes 5420
Queue Priority Configuration Changes 5425
Minimum Guaranteed Bandwidth (Transmit Rate and Guaranteed Rate) Changes 5426
Excess Rate Statement Disabled 5426
Queue Scheduling (Low and Strict-High Priority Queues) 5427
Multidestination Traffic Changes 5427
Overview of CoS Changes Introduced in Junos OS Release 12.2 5428
Lossless Forwarding Classes (fcoe and no-loss) 5428
Default MTU for Headroom Buffer Calculation for Lossless Forwarding Classes 5429
CoS for Layer 3 Physical Interfaces 5429
DSCP IPv6 Classifiers and Rewrite Rules 5429
Overview of Policers 5430
Policer Overview 5430
Policer Types 5431
Policer Actions 5432
Policer Colors 5432
Filter-Specific Policers 5433
Suggested Naming Convention for Policers 5433
Policer Counters 5434
Policer Algorithms 5434
How Many Policers are Supported? 5434

Policers can Limit Egress Firewall Filters 5434
CoS Overview 5435
Understanding Junos CoS Components 5436
Code-Point Aliases 5436
Policers 5436
Classifiers 5437
Forwarding Classes 5437
Forwarding Class Sets 5437
Flow Control (Ethernet PAUSE and Priority-Based Flow Control) . . . 5438
Tail-Drop Profiles 5438
Schedulers 5439
Rewrite Rules 5439
Understanding CoS Packet Flow 5440
CoS Inputs and Outputs Overview 5442
Understanding Default CoS Settings 5443
Default Forwarding Classes and Queue Mapping 5443
Default Forwarding Class Sets (Priority Groups) 5444
Default Code-Point Aliases 5444
Default Classifiers 5446
Default Rewrite Rules 5449
Default Drop Profile 5449
Default Schedulers 5449
Default Scheduler Maps 5449
Default Shared Buffer Configuration 5450
Understanding Host Inbound Traffic Classification 5451
Understanding Host Routing Engine Outbound Traffic Queues and Defaults 5451
Understanding CoS Code-Point Aliases 5453
Default Code-Point Aliases 5453
Understanding CoS Classifiers 5455
Interfaces and Output Queues 5455
Behavior Aggregate Classifiers 5456
Fixed Classifiers on Ethernet Interfaces 5459
Fixed Classifiers on Native Fibre Channel Interfaces (NP_Ports) 5459
Multifield Classifiers 5459
Packet Classification for Routed VLAN Interfaces (RVIs) 5460
Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces . . 5460
Supported Classifier and Rewrite Rule Types 5461
Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration 5462
Default Classifiers 5463
Default Rewrite Rules 5464
Classifier Precedence 5464
Classifier Behavior and Limitations 5465
Rewrite Rule Precedence and Behavior 5466
Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration 5466

Understanding CoS Forwarding Classes 5469
Default Forwarding Classes 5469
Forwarding Class Configuration Rules 5471
Lossless Transport Support 5472
Understanding CoS Forwarding Class Sets (Priority Groups) 5474
Understanding Default CoS Scheduling and Classification 5475
Default Classification 5475
Default Scheduling 5478
Default DCBX Advertisement 5479
Default Scheduling and Classification Summary 5479
Understanding CoS Hierarchical Port Scheduling (ETS) 5481
Hierarchical Scheduling and ETS 5482
ETS Advertisement in DCBX 5483
Hierarchical Scheduling Process 5483
Strict-High Priority Queues and Hierarchical Scheduling 5484
Default Hierarchical Scheduling 5485
Understanding CoS Output Queue Schedulers 5486
Output Queue Scheduling Components 5486
Default Schedulers 5487
Transmit Rate (Minimum Guaranteed Bandwidth) 5488
Sharing Extra Bandwidth 5489
Shaping Rate (Maximum Bandwidth) 5489
Scheduling Priority 5490
Scheduler Drop-Profile Maps 5491
Buffer Size 5491
Scheduler Maps 5492
Understanding CoS Priority Group Scheduling 5493
Priority Group Scheduling Components 5493
Default Traffic Control Profile 5494
Guaranteed Rate (Minimum Guaranteed Bandwidth) 5494
Sharing Extra Bandwidth 5494
Shaping Rate (Maximum Bandwidth) 5495
Scheduler Maps 5495
Understanding CoS Traffic Control Profiles 5496
Understanding CoS Priority Group and Queue Guaranteed Rates (Minimum Bandwidth) 5497
Guaranteeing Bandwidth Using Hierarchical Scheduling 5497
Priority Group Guaranteed Rate (Minimum Bandwidth) 5499
Queue Transmit Rate (Minimum Bandwidth) 5499
Understanding CoS Priority Group Shaping and Queue Shaping (Maximum Bandwidth) 5500
Priority Group Shaping 5500
Queue Shaping 5500
Shaping Maximum Bandwidth Using Hierarchical Scheduling 5501
Understanding CoS Scheduling Behavior and Configuration Considerations 5502
Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows 5506
Lossless Transport Features Introduced in Junos OS Release 12.3 . . . 5506
Default Lossless Priority Configuration 5507

Configuring Lossless Priorities 5509
Backward Compatibility with Junos OS Releases Earlier Than Release 12.3 5522
Configuration Rules and Recommendations 5523
Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway 5524
Priority Remapping Configuration 5524
Configuration Rules 5525
Fate Sharing 5526
Understanding CoS Buffer Configuration 5527
Buffer Pools 5528
Default Buffer Pool Values 5536
Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios 5538
Optimizing the Buffer Configuration 5542
Understanding CoS Tail-Drop Profiles 5545
Drop Profile Parameters 5545
Default Drop Profile 5546
Packet Drop Method 5547
Drop Profile Maps 5548
Congestion Prevention 5548
Understanding CoS Rewrite Rules 5549
Understanding DCB Features and Requirements 5550
Lossless Transport 5551
ETS 5552
DCBX 5552
Understanding CoS Flow Control (Ethernet PAUSE and PFC) 5554
Ethernet PAUSE 5554
PFC 5558
Lossless Transport Support Summary 5562
Understanding DCBX 5564
DCBX Basics 5564
DCBX Modes and Support 5565
DCBX Attribute Types 5568
DCBX Application Protocol TLV Exchange 5569
DCBX and PFC 5570
DCBX and ETS 5571
Understanding DCBX Application Protocol TLV Exchange 5573
Applications 5573
Application Maps 5574
Classifying and Prioritizing Application Traffic 5575
Enabling Interfaces to Exchange Application Protocol Information . . 5576
Disabling DCBX Application Protocol Exchange 5576
QFabric-Specific CoS Overview 5577
Understanding CoS Fabric Forwarding Class Sets 5578
Default Fabric Forwarding Class Sets 5579
Fabric Forwarding Class Set Configuration and Implementation 5582
Fabric Forwarding Class Set Scheduling (CoS) 5584
Support for Flow Control and Lossless Transport Across the Fabric . . 5586

Viewing Fabric Forwarding Class Set Information 5588
Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences 5590
Understanding CoS Scheduling on QFabric System Node Device Fabric (fte) Ports 5591
Hierarchical Scheduling Architecture on QFabric System Node Devices 5591
Default Scheduling on Node Device Fabric Interfaces 5592
Configuring Scheduling on Node Device Fabric Interfaces 5593
Understanding Default CoS Scheduling on QFabric System Interconnect Devices (Junos OS Release 13.1 and Later Releases) 5595
Hierarchical CoS Architecture Across a QFabric System Interconnect Device 5595
Default CoS on Interconnect Device Fabric Interfaces 5597

Chapter 64 Configuration 5605

Configuration Examples 5605
Example: Configuring CoS Hierarchical Port Scheduling (ETS) 5606
Example: Configuring CoS PFC for FCoE Traffic 5627
Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG 5635
Example: Configuring Unicast Classifiers 5658
Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers 5661
Example: Configuring Tail-Drop Profiles 5663
Example: Configuring Drop Profile Maps 5666
Example: Configuring Forwarding Classes 5668
Example: Configuring Forwarding Class Sets 5671
Example: Configuring Queue Schedulers 5674
Example: Configuring Queue Scheduling Priority 5679
Example: Configuring Traffic Control Profiles (Priority Group Scheduling) 5682
Example: Configuring Minimum Guaranteed Output Bandwidth 5684
Example: Configuring Maximum Output Bandwidth 5689
Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch) 5693
Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface 5701
Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces 5710
Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI) 5723
Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway 5739
Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic 5748

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled . . . 5754
Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic . . . 5759
Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic . . . 5764
Example: Configuring DCBX Application Protocol TLV Exchange . . . 5770
Configuration Tasks . . . 5781
Configuring CoS . . . 5781
Defining CoS Code-Point Aliases . . . 5783
Defining CoS Unicast BA Classifiers . . . 5784
Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers . . . 5785
Configuring CoS Tail-Drop Profiles . . . 5786

Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic 6072

Part 21 Network Management and Monitoring

Chapter 67 Overview 6077

Network Management 6077
Understanding Device and Network Management Features 6077
Understanding Network Management Implementation on the QFabric System 6080
Understanding Telnet on the QFabric System 6081
Understanding Tracing and Logging Operations 6081
Automation Scripts 6083
Understanding Automation Scripts Support 6083
How Commit Scripts Work 6084
Commit Script Input 6085
Commit Script Output 6086
Commit Scripts and the Junos OS Commit Model 6087
Avoiding Potential Conflicts When Using Multiple Commit Scripts 6089
Overview of Generating Persistent or Transient Configuration Changes . . 6090
Differences Between Persistent and Transient Changes 6091
Interaction of Configuration Changes and Configuration Groups 6094

Tag Elements and Templates for Generating Changes 6094
Required Boilerplate for Commit Scripts 6095
How Op Scripts Work 6096
Required Boilerplate for Op Scripts 6097
Fabric OAM 6099
Overview of Internal Fabric Monitoring 6099
Junos Space 6101
Understanding Junos Space Support 6101
Preparing the Device for Junos Space Management 6104
sFlow Techology 6104
Overview of sFlow Technology 6105
SNMP 6107
Understanding the Implementation of SNMP 6107
Understanding the Implementation of SNMP on the QFabric System 6110
Fabric Chassis MIB 6112
Utility MIB 6116
SNMPv3 Overview 6117
Minimum SNMPv3 Configuration on a Device Running Junos OS 6118
Understanding RMON 6119
RMON Overview 6119
Alarm Thresholds and Events 6120
RMON MIB Event, Alarm, Log, and History Control Tables 6121
Understanding Health Monitoring 6123
SNMP MIBs Support 6124
MIBs Supported on QFX3500 and QFX3600 Switches 6124
MIBs Supported on QFabric Systems 6133
SNMP Traps Support 6139
SNMP Traps Supported on QFX3500 and QFX3600 Switches 6140
SNMP Traps Supported on QFabric Systems 6148
MIB Objects for the QFX Series 6152
QFX3500 and QFX3600 Switches 6152
QFabric Systems 6152
QFabric System QFX3100 Director Device 6153
QFabric System QFX3008-I Interconnect Device 6153
QFabric System QFX3600-I Interconnect Device 6153
QFabric System Node Devices 6154
System Logging 6154
Overview of Junos OS System Log Messages 6154
Overview of Single-Chassis System Logging Configuration 6155
Understanding the Implementation of System Log Messages on the QFabric System 6156

Chapter 68 Configuration 6159

Configuration Examples 6159
Examples: Configuring System Logging 6159
Examples: Assigning an Alternative Facility 6161
Example: Configuring System Log Messages 6162
Example: Monitoring Network Traffic Using sFlow Technology 6165
Example: Configuring SNMP 6169

Example: Configuring Internal Fabric OAM Monitoring 6171
Configuration Tasks for Network Management 6177
Configuring Console and Auxiliary Port Properties 6177
Configuring SSH Service for Remote Access to the Router or Switch 6178
Configuring the Root Login Through SSH 6179
Configuring the SSH Protocol Version 6179
Configuring the Client Alive Mechanism 6180
Configuring Telnet Service for Remote Access to a Switch 6180
Configuration Tasks for Automation Scripts 6181
Controlling the Execution of Commit Scripts 6181
Enabling Commit Scripts to Execute 6181
Removing Commit Scripts from the Configuration 6182
Deactivating Commit Scripts 6183
Activating Inactive Commit Scripts 6183
Configuration Tasks for Fabric OAM 6183
Configuring a Fabric Maintenance Association 6184
Configuring Flow Specifications 6185
Configuring a Unicast Ethernet Flow Specification 6185
Configuring a Unicast Ethernet IPv4 Flow Specification 6186
Configuring a Multicast IPv4 Flow Specification 6187
Configuring a Multicast VLAN Flood Flow Specification 6188
Configuration Tasks for sFlow Technology 6188
Configuring sFlow Technology 6189
Configuration Tasks for SNMP 6190
Configuring SNMP 6190
Configuring the SNMP Community String 6194
Configuring SNMP Trap Groups 6195
Adding a Group of Clients to an SNMP Community 6196
Configuring the Interfaces on Which SNMP Requests Can Be Accepted . . 6197
Configuring MIB Views 6197
Configuring RMON Alarms and Events 6198
Configuring SNMP 6199
Configuring an Event 6199
Configuring an Alarm 6200
Configuring Health Monitoring 6200
Creating SNMPv3 Users 6201
Configuring Access Privileges for a Group 6202
Assigning a Security Name to a Group 6204
Configuring SNMPv3 Traps on a Device Running Junos OS 6204
Configuring SNMP Informs 6206
Configuration Tasks for System Log Messages 6207
Junos OS Minimum System Logging Configuration 6207
Junos OS System Log Configuration Statements 6208
Adding a Text String to System Log Messages 6209
Directing System Log Messages to a Log File 6209
Directing System Log Messages to a Remote Machine 6210
Directing System Log Messages to a User Terminal 6211
Directing System Log Messages to the Console 6211
Disabling the System Logging of a Facility 6212

Displaying a Log File from a Single-Chassis System 6212
Including Priority Information in System Log Messages 6213
Including the Year or Millisecond in Timestamps 6215
Logging Messages in Structured-Data Format 6215
Interpreting Messages Generated in Structured-Data Format 6216
Interpreting Messages Generated in Standard Format 6219
Specifying Log File Size, Number, and Archiving Properties 6220
Specifying the Facility and Severity of Messages to Include in the Log . . . 6222
Junos OS System Logging Facilities and Message Severity Levels 6222
System Log Default Facilities for Messages Directed to a Remote Destination 6224
Junos OS System Log Alternate Facilities for Remote Logging 6224
Changing the Alternative Facility Name for Remote System Log Messages 6225
Using Regular Expressions to Refine the Set of Logged Messages 6227
Configuration Statements for Network Management 6229

Chapter 70 Troubleshooting 6471

Troubleshooting Overview 6471
Understanding Troubleshooting Resources 6471
Troubleshooting Overview 6473
Troubleshooting Procedures 6475
Recovering from a Failed Software Installation 6475
Loading a Previous Configuration File 6476
Reverting to the Default Factory Configuration 6477
Reverting to the Rescue Configuration 6478
Recovering the Root Password 6478

Part 22 Troubleshooting

Chapter 71 Overview 6483

General Troubleshooting 6483
Understanding Troubleshooting Resources 6483
Troubleshooting Overview 6485
Alarms 6487
Understanding Alarms 6487
Chassis Alarm Messages on a QFX3500 Device 6488
Interface Alarm Messages 6491

Chapter 72 Administration 6493

Routine Monitoring Using the CLI 6493
Monitoring SNMP 6493
Tracing SNMP Activity on a Device Running Junos OS 6495
Configuring the Number and Size of SNMP Log Files 6496
Configuring Access to the Log File 6496
Configuring a Regular Expression for Lines to Be Logged 6496
Configuring the Trace Operations 6496
Monitoring RMON MIB Tables 6498
Displaying a Log File from a Single-Chassis System 6499
Monitoring System Log Messages 6500
Monitoring Traffic Through the Router or Switch 6501
Displaying Real-Time Statistics About All Interfaces on the Router or Switch 6501
Displaying Real-Time Statistics About an Interface on the Router or Switch 6501
Pinging Hosts 6503

Chapter 73 Troubleshooting 6505

Configuration and File Management 6505
Loading a Previous Configuration File 6505
Reverting to the Default Factory Configuration 6506

Reverting to the Rescue Configuration 6507
Cleaning Up the System File Storage Space 6507
Ethernet Switching 6508
Troubleshooting Ethernet Switching 6508
Troubleshooting Layer 2 Protocol Tunneling 6509
Drop Threshold Statistics Might Be Incorrect 6509
Egress Filtering of L2PT Traffic Not Supported 6509
Troubleshooting Private VLANs 6510
Limitations of Private VLANs 6510
Forwarding with Private VLANs 6510
Egress Firewall Filters with Private VLANs 6511
Egress Port Mirroring with Private VLANs 6512
Troubleshooting Q-in-Q and VLAN Translation Configuration 6513
Firewall Filter Match Condition Not Working with Q-in-Q Tunneling . . 6513
Egress Port Mirroring with VLAN Translation 6513
Hardware 6513
Troubleshooting QFX3100 Director Device Isolation 6514
High Availability 6515
Troubleshooting VRRP 6515
Interfaces 6516
Troubleshooting an Aggregated Ethernet Interface 6516
Troubleshooting Network Interfaces 6516
The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down 6516
Troubleshooting Multichassis Link Aggregation 6517
MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table 6517
MC-LAG Peer Does Not Go into Standby Mode 6518
Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive 6518
Redirect Filters Take Priority over User-Defined Filters 6518
Operational Command Output Is Wrong 6519
ICCP Connection Might Take Up to 60 Seconds to Become Active . . . 6519
MAC Address Age Learned on an MC-AE Interface Is Reset to Zero . . 6519
MAC Address Is Not Learned Remotely in a Default VLAN 6520
Snooping Entries Learned on MC-AE Interfaces Are Not Removed . . 6520
ICCP Does Not Come Up After You Add or Delete an Authentication Key 6520
Local Status Is Standby When It Should Be Active 6520
Packets Loop on the Server When ICCP Fails 6520
Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change 6521
No Commit Checks Are Done for ICL-PL Interfaces 6521
Double Failover Scenario 6521
Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up 6521
Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer 6522
AE Interfaces Go Down 6522

Flooding of Upstream Traffic 6522
Junos OS Basics 6522
Rebooting and Halting a QFX Series Product 6523
Recovering from a Failed Software Installation 6524
Recovering the Root Password 6524
Creating an Emergency Boot Device for a QFX Series Device 6526
Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device 6528
Performing a QFabric System Recovery Installation on the Director Group 6529
(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive 6530
Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software 6532
Layer 3 Protocols 6536
Troubleshooting Virtual Routing Instances 6536
Direct Routes Not Leaked Between Routing Instances 6536
Security 6537
Troubleshooting Firewall Filter Configuration 6537
Firewall Filter Configuration Returns a No Space Available in TCAM Message 6537
Filter Counts Previously Dropped Packet 6539
Matching Packets Not Counted 6539
Counter Reset When Editing Filter 6540
Cannot Include loss-priority and policer Actions in Same Term 6540
Cannot Egress Filter Certain Traffic Originating on QFX Switch 6540
Firewall Filter Match Condition Not Working with Q-in-Q Tunneling . . 6541
Egress Firewall Filters with Private VLANs 6541
Egress Filtering of L2PT Traffic Not Supported 6542
Cannot Drop BGP Packets in Certain Circumstances 6542
Invalid Statistics for Policer 6542
Policers can Limit Egress Filters 6542
Troubleshooting Policer Configuration 6543
Incomplete Count of Packet Drops 6544
Counter Reset When Editing Filter 6544
Invalid Statistics for Policer 6544
Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured 6544
Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured 6545
Policers Can Limit Egress Filters 6546
Services 6547
Troubleshooting Port Mirroring 6547
Port Mirroring Constraints and Limitations 6547
Egress Port Mirroring with VLAN Translation 6549
Egress Port Mirroring with Private VLANs 6549
Storage 6550
Troubleshooting Dropped FCoE Traffic 6550
Troubleshooting Fibre Channel Interface Deletion 6553

Troubleshooting Dropped FIP Traffic 6554
Traffic Management 6555
Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth 6555
Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth 6556
Troubleshooting Egress Queue Bandwidth Impacted by Congestion 6557
Troubleshooting an Unexpected Rewrite Value 6558
Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic 6559

Part 23 Index

Index 6565

List of Figures

Part 1 QFX3500 Switch Overview

About the Documentation

- Documentation and Release Notes on page cxxi
- Supported Platforms on page cxxi
- Using the Examples in This Manual on page cxxi
- Documentation Conventions on page cxxiii
- Documentation Feedback on page cxxv
- Requesting Technical Support on page cxxv

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at http://www.juniper.net/techpubs/.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at http://www.juniper.net/books.

Supported Platforms

For the features described in this document, the following platforms are supported:

- QFabric System

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

   For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

   ```
   system {
     scripts {
       commit {
         file ex-script.xsl;
       }
     }
   }
   interfaces {
     fxp0 {
       disable;
       unit 0 {
         family inet {
           address 10.0.0.1/24;
         }
       }
     }
   }
   ```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

   ```
   [edit]
   user@host# load merge /var/tmp/ex-script.conf
   load complete
   ```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

   For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

   ```
   commit {
     file ex-script-snippet.xsl; }
   ```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page cxxiii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page cxxiii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the **configure** command: user@host> **configure**

Table 2: Text and Syntax Conventions *(continued)*

Convention	Description	Examples
`Fixed-width text like this`	Represents output that appears on the terminal screen.	`user@host>` **show chassis alarms** `No alarms currently active`
Italic text like this	• Introduces or emphasizes important new terms. • Identifies guide names. • Identifies RFC and Internet draft titles.	• A policy *term* is a named structure that defines match conditions and actions. • *Junos OS CLI User Guide* • RFC 1997, *BGP Communities Attribute*
Italic text like this	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# **set system domain-name** *domain-name*
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	• To configure a stub area, include the **stub** statement at the **[edit protocols ospf area area-id]** hierarchy level. • The console port is labeled **CONSOLE**.
< > (angle brackets)	Encloses optional keywords or variables.	**stub <default-metric** ***metric*****>;**
| (pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	**broadcast | multicast** **(*string1* | *string2* | *string3*)**
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	**rsvp { # Required for dynamic MPLS only**
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	**community name members [** ***community-ids*** **]**

Indention and braces ({ })	Identifies a level in the configuration hierarchy.	[edit]
		routing-options {
		  static {
		  route default {
		  nexthop *address*;
		  retain;
		  }
		  }
		}

; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	• In the Logical Interfaces box, select **All Interfaces**. • To cancel the configuration, click **Cancel**.

Table 2: Text and Syntax Conventions *(continued)*

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select **Protocols>Ospf**.

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at https://www.juniper.net/cgi-bin/docbugreport/. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf.
- Product warranties—For product warranty information, visit http://www.juniper.net/support/warranty/.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: http://www.juniper.net/customers/support/
- Search for known bugs: http://www2.juniper.net/kb/
- Find product documentation: http://www.juniper.net/techpubs/
- Find solutions and answer questions using our Knowledge Base: http://kb.juniper.net/
- Download the latest versions of software and review release notes: http://www.juniper.net/customers/csc/software/

- Search technical bulletins for relevant hardware and software notifications: http://kb.juniper.net/InfoCenter/
- Join and participate in the Juniper Networks Community Forum: http://www.juniper.net/company/communities/
- Open a case online in the CSC Case Management tool: http://www.juniper.net/cm/

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: https://tools.juniper.net/SerialNumberEntitlementSearch/

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at http://www.juniper.net/cm/.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see http://www.juniper.net/support/requesting-support.html.

PART 1

QFX3500 Switch Overview

- QFX3500 Switch Overview on page 3

CHAPTER 1

QFX3500 Switch Overview

- QFX3500 Device Overview on page 3

QFX3500 Device Overview

The Juniper Networks QFX3500 device is a high-speed, multipurpose switch especially designed for next-generation data centers. Forty-eight 10-Gbps access ports in the device use small form-factor pluggable plus (SFP+) transceivers and operate by default as 10-Gigabit Ethernet interfaces. Optionally, you can choose to configure up to 12 of the ports as 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel (FC) interfaces, and up to 36 of the ports as 1-Gigabit Ethernet interfaces. When used as a standalone switch, four 40-Gbps uplink ports in the device use quad small form-factor pluggable plus (QSFP+) to four SFP+ copper breakout cables to support an additional 15 10-Gigabit Ethernet interfaces.

QFX3500 devices can function as a Fibre Channel over Ethernet (FCoE)-FC gateway or as an FCoE transit switch. FCoE is a method of supporting converged FC and Ethernet traffic on a data center bridging (DCB) network by encapsulating unmodified FC frames in Ethernet to transport the FC frames over the physical Ethernet network.

In a QFabric system, a QFX3500 device functions as a Node device, connected to a QFabric system through 40-Gbps uplink ports to a Juniper Networks QFX3008-I or QFX3600-I Interconnect device. Together, the QFX3500 Node devices and QFX3008-I or QFX3600-I Interconnect devices form a multistage, nonblocking switch fabric that provides a high-performance, low-latency, unified interconnect solution for next-generation data centers.

The QFX3500 Node devices and Interconnect devices are connected to Juniper Networks QFX3100 Director devices in an out-of-band management network through Juniper Networks EX4200 Ethernet Switches. The QFX3100 Director devices present the QFabric system devices as a single network entity, which enables simplified management of your data center using the Junos OS command-line interface (CLI).

- Software on page 3
- Hardware on page 4

Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on the QFX3500

device's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX3500 devices also runs on all Juniper Networks EX Series switches, and J Series, M Series, MX Series, and T Series routers.

For more information about which features are supported on QFX Series devices, see "QFX Series Software Features Overview" on page 15.

When the QFX3500 device is operating as a standalone switch, you manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

When a QFX Series device operates as part of a QFabric system, all the devices in the data center fabric are managed through the Administrator software installed on the QFX3100 Director devices. Each device in a QFabric system is interconnected in a single control plane and management network, using the redundant management ports on each device.

Hardware

The compact QFX3500 device is 1 rack unit (1 U) in size and designed to fit in industry-standard 19-inch rack-mount enclosures. See Figure 1 on page 4 and Figure 2 on page 4 and *Chassis Physical Specifications for a QFX3500 Chassis*.

Figure 1: QFX3500 Device Front

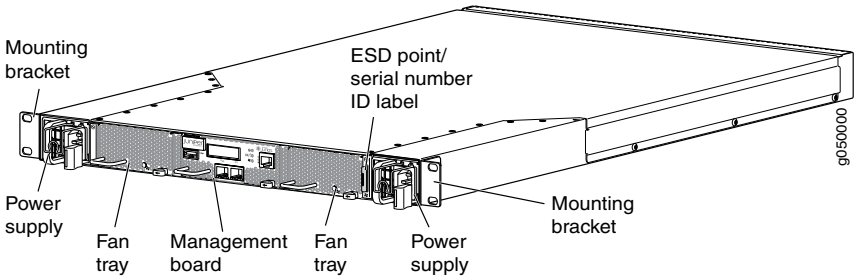

Figure 2: QFX3500 Device Rear

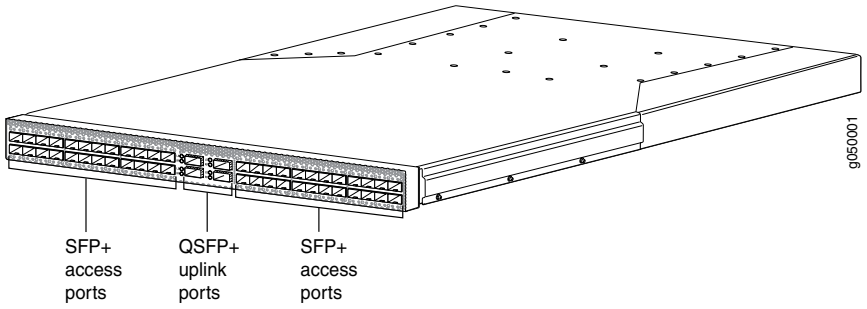


The front panel of the QFX3500 chassis has an LCD panel that displays the device hostname and the number of active alarms. See *Front Panel of a QFX3500 Device*. The rear panel has 48 10-Gbps access ports and 4 40-Gbps uplink ports. See *Rear Panel of a QFX3500 Device*.

SFP+ Access Ports

The QFX3500 device has 48 access ports (**0** through **47**) that support small form-factor pluggable plus (SFP+) and small form-factor pluggable (SFP) transceivers, as well as SFP+ direct attach copper cables, also known as Twinax cables. See *Interface Support for the QFX3500 Device*.

- Up to 48 of the access ports can be used for SFP+ transceivers or SFP+ direct attach copper cables. You can use 10-Gigabit Ethernet SFP+ transceivers and SFP+ direct attach copper cables in any access port. You can use 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel SFP+ transceivers in ports **0** through **5** and ports **42** through **47**.

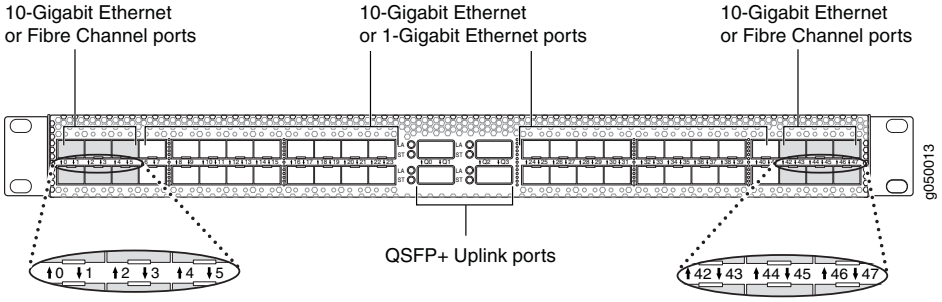
  NOTE: If you use Fibre Channel SFP+ transceivers in ports 0 through 5 or ports 42 through 47, you must configure the entire block of ports as Fibre Channel ports. For example, if you use a Fibre Channel SFP+ transceiver in any of the ports 0 through 5, then ports 0 through 5 must be configured as Fibre Channel ports. If you use a Fibre Channel SFP+ transceiver in any of the ports 42 through 47, then ports 42 through 47 must be configured as Fibre Channel ports. You then cannot use 10-Gigabit Ethernet SFP+ transceivers in these ports.

- Up to 36 of the access ports can be used for SFP transceivers. Gigabit Ethernet SFP transceivers can be used in ports **6** through **41**.

  CAUTION: Do not place a copper transceiver in an access port directly above or below another copper transceiver. Internal damage to the access ports and device can occur. Because of this limitation, a maximum of 18 copper transceivers can be installed in ports 6 through 41. We recommend using only the top row of access ports for copper transceivers.

Figure 3 on page 5 shows the location of the SFP+ access ports, including the ports that can be used with Fibre Channel SFP+ transceivers and Gigabit Ethernet SFP transceivers.

Figure 3: SFP+ Access Port Locations



QSFP+ Uplink Ports

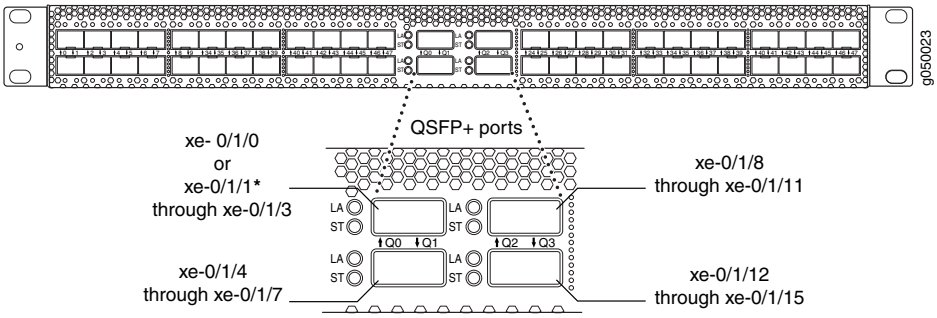
The QFX3500 device has four uplink ports (**Q0** through **Q3**) that support up to four QSFP+ transceivers, as well as QSFP+ DAC or DAC breakout cables. See *Interface Support for the QFX3500 Device*.

When the QFX3500 device is used as part of a QFabric system, these uplink ports are used to connect the QFX3500 Node device to QFX3008-I or QFX3600-I Interconnect devices. See *Connecting a QFX3500 Node Device to a QFX3008-I Interconnect Device* or *Connecting a QFX3500 Node Device to a QFX3600-I Interconnect Device*.

When the QFX3500 device is used as a standalone switch, these uplink ports are configured by default as 15 10-Gigabit Ethernet interfaces. Port **Q0** supports only three 10-Gigabit Ethernet interfaces. Ports **Q1** through **Q3** support four 10-Gigabit Ethernet interfaces. Optionally, you can configure one or more of the ports as 40-Gigabit Ethernet interfaces. Figure 4 on page 6 shows the location of the QSFP+ uplink ports and the default 10-Gigabit Ethernet interface numbering.

NOTE: The QSFP+ uplink ports are not supported in Junos OS Release 11.1. The QSFP+ uplink ports are supported in Junos OS Release 11.2 and later. To configure the ports as 40-Gigabit Ethernet interfaces, you must be using Junos OS Release 12.2X50-D20 or later.

Figure 4: QSFP+ Uplink Port Locations



*Port availability is release dependent.
See the topic on Channelizing Interfaces for your Junos Release.

CHAPTER 2

QFX3600 Switch Overview

- QFX3600 Device Overview on page 9

QFX3600 Device Overview

The Juniper Networks QFX3600 device is a high-speed, multipurpose switch especially designed for next-generation data centers. Sixteen 40-Gbps ports in the device use quad small form-factor pluggable plus (QSFP+) transceivers. The small form-factor and front facing ports in the switch make it suitable for deployment in high-density server racks and container-based data center deployments.

The QFX3600 device runs in three modes: standalone switch, a QFX Node in a QFabric system, and as a interconnect device in QFabric system. You can configure the device to run in any of these modes by using the **request chassis device-mode** commands.

In a QFabric system, a QFX3600 device functions as a Node device, connected to a QFabric system through 40-Gbps uplink ports to a Juniper Networks QFX3008-I or QFX3600-I Interconnect device. Together, the QFX3600 Node devices and QFX3008-I or QFX3600-I Interconnect devices form a multistage, nonblocking switch fabric that provides a high-performance, low-latency, unified interconnect solution for next-generation data centers.

The QFX3600 Node devices and QFX3008-I or QFX3600-I Interconnect devices are connected to Juniper Networks QFX3100 Director devices in a control plane and management network. The QFX3100 Director device presents the QFabric system devices as a single network entity, allowing for simplified management of your data center using the Junos OS command-line interface (CLI).

- Software on page 9
- Hardware on page 10

Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on the QFX3600 device's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX Series devices also runs on all Juniper Networks EX Series, J Series, M Series, MX Series, and T Series devices.

For more information about which features are supported on QFX Series devices, see "QFX Series Software Features Overview" on page 15.

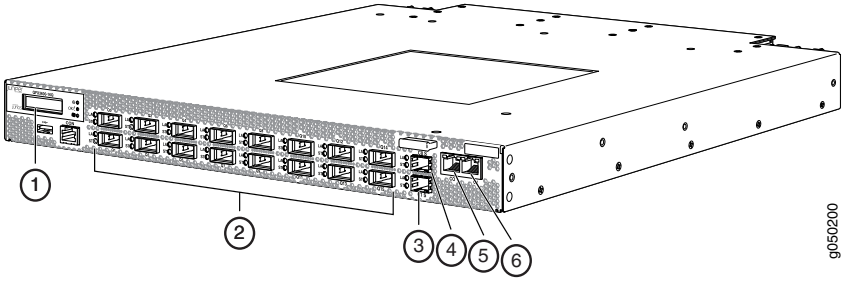
When the QFX3600 device is operating as a standalone switch, you manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

When a QFX Series device operates as part of a QFabric system, all the devices in the data center fabric are managed through the Administrator software installed on the QFX3100 Director devices. Each device in a QFabric system is interconnected in a single control plane and management network, using the redundant management ports on each device.

Hardware

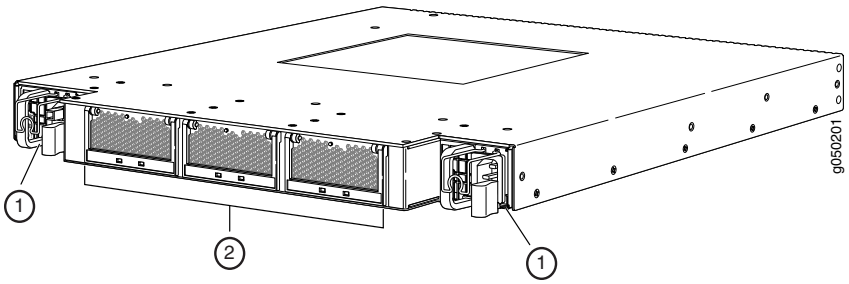
The compact QFX3600 chassis is 1 rack unit (1 U) in size and designed to fit in industry-standard 19-inch rack-mount enclosures, as well as high-density server racks and container-based data center deployments. See Figure 5 on page 10 and Figure 6 on page 10 and *Chassis Physical Specifications for QFX3600 and QFX3600-I Devices*.

Figure 5: QFX3600 Chassis Front



1—LCD panel	4—**C0S** 1-Gbps SFP management port
2—QSFP+ ports	5—**C0** 1000BASE-T RJ-45 management port
3—**C1S** 1-Gbps SFP management port	6—**C1** 1000BASE-T RJ-45 management port

Figure 6: QFX3600 Chassis Rear



1—Power supplies	2—Fan trays

The front panel of the QFX3600 chassis has an LCD panel that displays the device hostname and the number of active alarms. It also has sixteen 40-Gbps ports labeled

Q0 through **Q15** that support quad small form-factor pluggable plus (QSFP+) transceivers. See *Front Panel of a QFX3600 Device*.

If you are using the QFX3600 device as a Node device in a QFabric system, by default, four ports (labeled **Q0** through **Q3**) are configured for uplink connections between your QFX3600 Node device and your Interconnect device, and twelve ports (labeled **Q4** through **Q15**) support 48 10-Gigabit Ethernet or 12 40-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (labeled **Q0** through **Q7**) for uplink connections between your QFX3600 Node device and your Interconnect device and ports **Q2** through **Q15** for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks. See "Configuring the Port Type on QFX3600 Node Devices" on page 1367 and *Interface Support for the QFX3600 Device*.

If you are using the QFX3600 device as a standalone switch, by default, all 16 QSFP+ ports (**Q0** through **Q15**) are configured as 40-Gigabit Ethernet (*xle*) ports. Optionally, you can choose to configure each port to operate as 10-Gigabit Ethernet (*xe*) ports to support up to 63 10-Gigabit Ethernet ports. See "Configuring the Port Type on QFX3600 Standalone Switches" on page 2545 and *Interface Support for the QFX3600 Device*.

The rear panel of the QFX3600 chassis has two redundant power supplies and three redundant fan trays that are field-replaceable and hot-swappable. See *Rear Panel of QFX3600 and QFX3600-I Devices*.

QFX Series Software Features Overview

The following tables list the Juniper Networks QFX Series software features and the Juniper Networks Junos operating system (Junos OS) release in which they were introduced:

- Table 3 on page 16—Access Control Features
- Table 4 on page 16—Administration Features
- Table 5 on page 16—Class-of-Service (CoS) Features
- Table 6 on page 17—High Availability and Resiliency Features
- Table 7 on page 19—Interface Features
- Table 8 on page 19—IP Address Management Features
- Table 9 on page 20—Layer 2 Network Protocol Features
- Table 10 on page 22—Layer 3 Protocol Features
- Table 11 on page 23—Multicast Protocol Features
- Table 12 on page 24—Network Management and Monitoring Features
- Table 13 on page 26—Port Security Features
- Table 14 on page 26—QFabric System-Specific Features
- Table 15 on page 27—Security
- Table 16 on page 28—Storage and Fibre Channel Features
- Table 17 on page 29—System Management Features

NOTE: The command-line interface (CLI) on the QFX Series might display configuration statements that are not supported. However, configuring an unsupported statement on a device has no effect on the operation of the device. See "QFX Series CLI Hierarchy" on page 192 to see which statements are supported on the QFX Series.

Table 3: Access Control Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
MAC RADIUS authentication	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
TACACS+	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
QFabric system component-level access and login classes	Not applicable	Not applicable	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
SSH authentication keys	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15

Table 4: Administration Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
System logging (syslog) over IPv4	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Licensing	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 5: CoS Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabri System
Class of service (CoS)—Class-based queuing with prioritization	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS—Multidestination	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS support on link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 5: CoS Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Enhanced transmission selection (ETS)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Interface-specific CoS rewrite rules	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Port shaping and queue shaping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control (PFC)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control enhancements	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Re-marking of bridged packets	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority remapping	Junos OS 12.3X50-D10	Not supported	Not supported	Not supported
Weighted random early detection (WRED) tail-drop profiles	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
802.3X Ethernet PAUSE autonegotiation enhancements	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Layer 3 ingress packet classification and egress rewrite rule class-of-service features	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Software buffer configurability	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

IGMP querier	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
IGMP filtering	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10

Table 11: Multicast Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Protocol Independent Multicast sparse mode (PIM SM)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Protocol Independent Multicast source-specific multicast (PIM SSM)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Bidirectional Forwarding Detection (BFD) for PIM	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Static RP	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Anycast RP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Multicast Source Discovery Protocol (MSDP)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Multicast VLAN registration	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 12: Network Management and Monitoring Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Junos Space	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
Local port mirroring	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Remote port mirroring	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Remote port mirroring to IP address (GRE encapsulation)	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 12: Network Management and Monitoring Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Increased numbers of port-mirroring sessions	Not supported	Not supported	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
RMON	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
sFlow monitoring technology	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Simple Network Management Protocol version 1 (SNMPv1) and SNMPv2	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Simple Network Management Protocol version 3 (SNMPv3)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
Juniper enterprise-specific SNMP Utility MIB	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Juniper enterprise-specific SNMP Fabric Chassis MIB	Not applicable	Not applicable	Junos OS 12.2X50-D20 Junos OS 13.1X50-D10 (Added Director device information)	Junos OS 12.2X50-D20 Junos OS 13.1X50-D10 (Ad Director device informatio
Juniper Class-of-Service MIB	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Uplink failure detection	Junos OS 11.3R4	Junos OS 12.2X50-D20	Not supported	Not supported
Junos OS automation script support	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
QFabric system control plane debugging and diagnostics support	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Internal fabric OAM monitoring	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
DHCP smart relay	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 13: Port Security Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Automatic recovery for port error disable conditions	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
MAC limiting	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
MAC move limiting	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Persistent MAC learning (sticky MAC)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Static ARP support	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Storm control (broadcast, unicast, and multicast)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
DHCP snooping	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Dynamic ARP inspection (DAI)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 14: QFabric System-Specific Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Aliasing of Node devices	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
High availability of QFabric system components	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Node groups	Not applicable	Not applicable	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 14: QFabric System-Specific Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
QFabric system component-level access and login classes	Not applicable	Not applicable	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
Aliases for Director devices and Interconnect devices	Not applicable	Not applicable	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
QFabric system backup and recovery (software and configuration)	Not applicable	Not applicable	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10

Table 15: Security

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Firewall filters and rate limiting	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Firewall filters on LAGs	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Firewall filters on loopback interfaces	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Firewall filters on management interfaces	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported
Policing	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Increased numbers of supported filters and policers	Junos OS 12.2X50-D20	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Filter-based forwarding	Junos OS 12.2X50-D20	Junos OS 12.2X50-D20	Not supported	Not supported

(For a list of supported firewall filter match conditions and actions, see "Firewall Filter Match Conditions and Actions" on page 4644.)

Table 16: Storage and Fibre Channel Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Data center bridging technologies	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Data Center Bridging Capability Exchange protocol (DCBX)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
FCoE Initialization Protocol (FIP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Fibre Channel fabrics	Junos OS 11.1R1	Not Supported	Junos OS 11.3X30.6 (supported only on QFX3500 Node device)	Junos OS 12.2X50-D10 (supported only on QFX35 Node device)
Fibre Channel interfaces	Junos OS 11.1R1	Not Supported	Junos OS 11.3X30.6 (supported only on QFX3500 Node device)	Junos OS 12.2X50-D10 (supported only on QFX35 Node device)
Fibre Channel over Ethernet (FCoE) to Fibre Channel gateway	Junos OS 11.1R1	Not Supported	Junos OS 11.3X30.6 (supported only on QFX3500 Node device)	Junos OS 12.2X50-D10 (supported only on QFX35 Node device)
FCoE-FC gateway link automated load balancing	Junos OS 12.3X50-D10	Not Supported	Not Supported	Not Supported
FCoE OxID hash control	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not Supported	Not Supported
FIP snooping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Increase to 2500 FIP snooping sessions	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not Supported	Not Supported
Increase to 2500 FIP snooping sessions when QFX3500 switch acts as an FCoE-FC gateway.	Junos OS 12.3X50-D10	Not Supported	Not Supported	Not Supported
Transit switch	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
DCBX application protocol TLV exchange	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3R1	Junos OS 12.2X50-D10

Table 16: Storage and Fibre Channel Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
User-Configurable DCBX application protocol TLV exchange	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
DCBX version support for IEEE DCBX and DCBX version 1.01	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Graceful restart for FCoE-FC gateway	Junos OS 12.1X49-D1	Not supported	Junos OS 12.2X50-D10 (supported only on QFX3500 Node device)	Junos OS 12.2X50-D10 (supported only on QFX35 Node device)
Fibre Channel load balancing, maximum session limit, disabling fabric WWN verification check	Junos OS 12.1X49-D1	Not supported	Junos OS 12.1X49-D1 (supported only on QFX3500 Node device)	Junos OS 12.2X50-D10 (supported only on QFX35 Node device)
VN_Port to VN_Port FIP snooping to enable configuring virtual links between VN_Ports without sending traffic through an FCoE forwarder (FCF)	Junos OS 12.2X50-D10	Not supported	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10

Table 17: System Management Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Configuration rollback	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IP directed broadcast	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Online insertion and removal (OIR)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 17: System Management Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
J-Web interface, for switch configuration and management	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Zero Touch Provisioning	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not Supported	Not Supported

- Table 15 on page 27—Security
- Table 16 on page 28—Storage and Fibre Channel Features
- Table 17 on page 29—System Management Features

NOTE: The command-line interface (CLI) on the QFX Series might display configuration statements that are not supported. However, configuring an unsupported statement on a device has no effect on the operation of the device. See "QFX Series CLI Hierarchy" on page 192 to see which statements are supported on the QFX Series.

Table 18: Access Control Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
MAC RADIUS authentication	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
TACACS+	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
QFabric system component-level access and login classes	Not applicable	Not applicable	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
SSH authentication keys	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15

Table 19: Administration Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
System logging (syslog) over IPv4	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Licensing	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10

Table 20: CoS Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabri System
Class of service (CoS)—Class-based queuing with prioritization	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS—Multidestination	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
CoS support on link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Enhanced transmission selection (ETS)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Interface-specific CoS rewrite rules	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Port shaping and queue shaping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control (PFC)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority-based flow control enhancements	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Re-marking of bridged packets	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Priority remapping	Junos OS 12.3X50-D10	Not supported	Not supported	Not supported
Weighted random early detection (WRED) tail-drop profiles	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 20: CoS Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabri System
802.3X Ethernet PAUSE autonegotiation enhancements	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Layer 3 ingress packet classification and egress rewrite rule class-of-service features	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Software buffer configurability	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 21: High Availability and Resiliency Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Graceful protocol restart for BGP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Graceful protocol restart for OSPF	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Link aggregation groups (LAGs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Support for 32 members in a link aggregation group (LAG)	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Multichassis link aggregation	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10	Not supported	Not supported
Virtual Router Redundancy Protocol (VRRP)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10

Table 21: High Availability and Resiliency Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Graceful restart for FIP snooping to recover gracefully from Ethernet protocol restarts and crashes	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Nonstop software upgrade (NSSU)	Not supported	Not supported	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Layer 3 unicast and multicast support for multichassis link aggregation	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 22: Interface Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Interface ranges	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
VLAN-tagged Layer 3 logical interfaces	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 23: IP Address Management Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Static addresses	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IPv4 support for telnet	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6. For information about Telnet support on this system, see "Understanding Telnet on the QFabric System" on page 6081.	Junos OS 12.2X50-D10. For information about Telnet support on this system, see "Understanding Telnet on QFabric System" on page 6

Table 23: IP Address Management Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IPv6 support for neighbor discovery, SSH, Telnet, ping, traceroute, static routing, virtual routing instances, firewall filters, RADIUS, NTP, and SNMP, on network Node group	Not supported	Not supported	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
IPv6 support for neighbor discovery, SSH, Telnet, ping, traceroute, static routing, firewall filters, and SNMP on management interfaces	Junos OS 12.2X50-D20	Not supported	Not applicable	Not applicable
IPv6 support for neighbor discovery, router advertisements, stateless autoconfiguration, link aggregation, SSH, Telnet, ping, traceroute, path MTU, static routing, dynamic routing (BGPv6, IS-ISv6, OSPFv3, RIPv6), graceful restart, BFD, virtual routers, firewall filters, SNMP, CoS, VRRPv3, Radius, TACACS+, AAA, NTP, and syslog, on network interfaces	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not applicable	Not applicable

Table 24: Layer 2 Network Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
802.1Q VLAN tagging	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10

Table 24: Layer 2 Network Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
BPDU protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10 (network Node group only)	Junos OS 12.2X50-D10 (network Node group only)
Jumbo frames on routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Link Layer Discovery Protocol (LLDP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Loop protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
Root protection for spanning-tree protocols	Junos OS 11.1R1	Junos OS 12.2X50-D20	Not supported	Not supported
Spanning tree: • Spanning Tree Protocol (STP) • Rapid Spanning Tree Protocol (RSTP) • Multiple Spanning Tree Protocol (MSTP) • VLAN Spanning Tree Protocol (VSTP) • RSTP and VSTP concurrent configuration	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10 (network Node group only)	Junos OS 12.2X50-D10 (network Node group only)

Table 24: Layer 2 Network Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Multiple VLAN Registration Protocol (MVRP)	Not supported	Not supported	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15
VLAN ranges	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Private VLANs	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Secondary VLAN trunk ports and promiscuous access ports for private VLANs	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Q-in-Q tunneling	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D15	Junos OS 13.1X50-D15
VLAN translation	Junos OS 12.1X49-D1	Junos OS 12.1X49-D1	Not supported	Not supported
Layer 2 Tunneling Protocol	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Reflective relay	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Proxy ARP	Junos OS 12.2X50-D10	Junos OS 12.2X50-D20	Not supported	Not supported

Table 25: Layer 3 Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFab System
Bidirectional Forwarding Detection (BFD)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Border Gateway Protocol (BGP) A separate software license is required for BGP. See "Software Features That Require Licenses on the QFX Series" on page 87.	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D

Table 25: Layer 3 Protocol Features *(continued)*

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFab System
BGPv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Intermediate System-to-Intermediate System (IS-IS) A separate software license is required for IS-IS. See "Software Features That Require Licenses on the QFX Series" on page 87.	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
IS-ISv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Open Shortest Path First (OSPF) v2	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
OSPFv3	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Per-packet load balancing (ECMP)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Routing Information Protocol versions 1 and 2 (RIPv1 and RIPv2)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
RIPv6	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Routing options	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Static routes	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Virtual router routing instances for unicast protocols	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D
Virtual router routing instances for multicast protocols	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported

Table 26: Multicast Protocol Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
IGMPv1 and v2	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
IGMPv3	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
IGMPv1 and v2 snooping	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IGMP snooping with routed VLAN interfaces (RVIs)	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
IGMP querier	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
IGMP filtering	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Protocol Independent Multicast sparse mode (PIM SM)	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Protocol Independent Multicast source-specific multicast (PIM SSM)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Bidirectional Forwarding Detection (BFD) for PIM	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Not supported	Not supported
Static RP	Junos OS 11.3R1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Anycast RP	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Multicast Source Discovery Protocol (MSDP)	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10
Multicast VLAN registration	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported

Table 27: Network Management and Monitoring Features

Feature	QFX3500 Switch	QFX3600 Switch	QFX3000-G QFabric System	QFX3000-M QFabric System
Junos Space	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.9	Junos OS 12.2X50-D10
Local port mirroring	Junos OS 11.1R1	Junos OS 12.2X50-D20	Junos OS 11.3X30.6	Junos OS 12.2X50-D10
Remote port mirroring	Junos OS 12.1X49-D1	Junos OS 12.2X50-D20	Junos OS 12.2X50-D10	Junos OS 12.2X50-D10
Remote port mirroring to IP address (GRE encapsulation)	Junos OS 12.3X50-D10	Junos OS 12.3X50-D10	Not supported	Not supported
Increased numbers of port-mirroring sessions	Not supported	Not supported	Junos OS 13.1X50-D10	Junos OS 13.1X50-D10

Configuration File Terms

Table 33 on page 49 lists the various configuration file terms used for the QFX Series and their definitions.

Table 33: Configuration File Terms

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements

Many statements in the Junos OS configuration include an option to specify an IP address or route prefix. This option is represented in one of the following ways:

- ***network/prefix-length***—Network portion of the IP address, followed by a slash and the destination prefix length (previously called the subnet mask). For example, 10.0.0.1/8.
- ***network***—IP address. For example, 10.0.0.2.
- ***destination-prefix/prefix-length***—Route prefix, followed by a slash and the destination prefix length. For example, 192.168.1.10/32.

You enter all IP addresses in classless mode. You can enter the IP address with or without a prefix length, in standard dotted notation (for example, 1.2.3.4), or hexadecimal notation as a 32-bit number in network-byte order (for example, 0x01020304). If you omit any octets, they are assumed to be zero. Specify the prefix length as a decimal number from 1 through 32.

Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model: that is, a candidate configuration is modified as desired and then committed to the system. Once a configuration has been committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The former active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and all other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (1–49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1, juniper.conf.gz.2, juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

  NOTE: The QFX3500 switch has only one Routing Engine.

  To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

  NOTE: When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

***package-name-m.nZx.y*-domestic-signed.tgz**

where:

- ***package-name*** is the name of the package—for example, **jinstall-qfx**.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, **11.1**.
- ***Z*** indicates the type of software release, where **R** indicates released software and **B** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, **1.5**.

A sample switch software package name is:

```
jinstall-qfx-11.1R1.5-domestic-signed.tgz
```

NTP Time Server and Time Services Overview

When configuring the Network Time Protocol (NTP), you can specify which system on the network is the authoritative time source, or time server, and how time is synchronized between systems on the network. To do this, you configure the router or switch to operate in one of the following modes:

- Client mode—In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.
- Symmetric active mode—In this mode, the local router or switch and the remote system can synchronize with each other. You use this mode in a network in which either the local router or switch or the remote system might be a better source of time.

  NOTE: Symmetric active mode can be initiated by either the local or the remote system. Only one system needs to be configured to do so. This means that the local system can synchronize with any system that offers symmetric active mode without any configuration whatsoever. However, we strongly encourage you to configure authentication to ensure that the local system synchronizes only with known time servers.

- Broadcast mode—In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the local router or switch is operating as a transmitter.
- Server mode—In this mode, the local router or switch operates as an NTP server.

  NOTE: In NTP server mode, the Junos OS supports authentication as follows:

  - If the NTP request from the client comes with an authentication key (such as a key ID and message digest sent with the packet), the request is processed and answered based on the authentication key match.
  - If the NTP request from the client comes without any authentication key, the request is processed and answered without authentication.

NTP Time Server and Time Services Overview (QFabric System)

Network Time Protocol (NTP) synchronizes the time among all of the various devices in the QFabric system to an external time server. This ensures that time-stamped events, like log entries and database transactions, can be correlated between multiple devices in the QFabric system. The QFabric system can only be in client mode.

Additionally, you can authenticate time synchronization to ensure that the QFabric system obtains its time services only from known sources. By default, network time synchronization is unauthenticated. We strongly encourage you to configure authentication of network time services.

Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)

Before you upgrade to Junos OS Release 11.3, you must deactivate the CoS configuration if the CoS configuration includes any of the following features:

- **excess-rate** option
- **strict-high** or **high** priority queues
- Any of the Junos OS Release 11.1 or 11.2 default multidestination forwarding classes

CAUTION: If your CoS configuration contains any of the features listed above and you attempt to upgrade from Junos OS Release 11.1 or 11.2 to a later version without first editing the configuration, the Junos OS might not restart.

Junos OS Release 11.3 and later for QFX Series no longer supports the **excess-rate** statement, the **strict** priority option, or the default multidestination forwarding classes used in Junos OS Release 11.1 and 11.2. In addition, Junos OS Release 11.3 introduces new restrictions on how to configure and use **strict-high** priority queues.

This topic does not describe how to perform the software upgrade procedure. It describes how to deactivate your CoS configuration, edit your CoS configuration, and reactivate your CoS configuration at the appropriate times.

Use the following procedure to upgrade safely from Junos OS Release 11.1 or 11.2 to a later release:

1. Deactivate the CoS configuration *before* you upgrade the software:

   ```
   user@switch# deactivate class-of-service
   ```
2. Follow the upgrade procedure to Junos OS Release 11.3 or later software.

3. Make the following changes to the CoS configuration while the CoS configuration is still deactivated:
   - Remove the **excess-rate** statement from the CoS configuration if you have used it at the **[edit class-of-service schedulers]** or **[edit class-of-service traffic-control-profiles]** hierarchy level.
   - Remove the **strict-high** and **strict** priority queue configurations if you have used them at the **[edit class-of-service schedulers]** hierarchy level.
   - Remove the default multidestination forwarding classes (**mcast-be**, **mcast-af**, **mcast-ef**, and **mcast-nc**) if you have used them at the **[edit class-of-service schedulers]**, **[edit class-of-service rewrite-rules]**, **[edit class-of-service classifiers]**, **[edit class-of-service scheduler-maps]**, or **[edit class-of-service forwarding-class-sets]** hierarchy level. Alternatively, you can change the mapping of the multidestination traffic to use the new default multidestination forwarding class (**mcast**).
4. If desired, configure **strict-high** priority queues in accordance with the Junos OS Release 11.3 or later configuration rules, and map multidestination traffic to the default multidestination forwarding class (**mcast**).
5. Activate the CoS configuration:

   ```
   user@switch# activate class-of-service
   ```
6. Commit the CoS configuration:

   ```
   user@switch# commit
   ```

NOTE: If you configured the transmit-rate option for any queues under the **[edit class-of-service schedulers]** hierarchy level, if the rate is configured as an exact rate in Mbps, we recommend that you reconfigure the transmit-rate option as a percentage. This is because the scheduler converts exact rates to percentages, and when the exact rate is below 1 Gbps, some granularity may be lost in the conversion. You can avoid this potential issue by specifying the transmit-rate option as a percentage.

Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

- Typical Uses for Autoinstallation on page 55
- Autoinstallation Configuration Files and IP Addresses on page 55
- Typical Autoinstallation Process on a New Switch on page 56

Typical Uses for Autoinstallation

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

Autoinstallation Configuration Files and IP Addresses

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- ***hostname*.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, ***hostname*** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

Typical Autoinstallation Process on a New Switch

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

   If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

   - An IP address and subnet mask for the autoinstallation interface.
   - The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
   - The name of the configuration file to be requested from the TFTP server.
   - The IP address or hostname of the TFTP server.

     If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.
   - The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.

2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:

   a. If the DHCP server specifies the host-specific configuration file ***hostname*.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for ***hostname*.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.

   b. If the switch does not locate a ***hostname*.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.

   c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.

   d. If the switch determines its hostname, it sends a TFTP request for the ***hostname*.conf** file.

   e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.

3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

Understanding Nonstop Software Upgrade for QFabric Systems

The framework that underlies a nonstop software upgrade in a QFabric system enables you to upgrade the system in a step-by-step manner and minimize the impact to the continuous operation of the system. This topic explains how a nonstop software upgrade works in a QFabric system, the steps that are involved, and the procedures that you need to implement to experience the benefits of this style of software upgrade.

Nonstop software upgrade enables some QFabric system components to continue operating while similar components in the system are being upgraded. In general, the QFabric system upgrades redundant components in stages so that some components remain operational and continue forwarding traffic while their equivalent counterparts upgrade to a new version of software.

TIP: Use the following guidelines to decide when to implement a nonstop software upgrade:

- If you need to upgrade all components of the system in the shortest amount of time (approximately one hour) and you do not need to retain the forwarding resiliency of the data plane, issue the **request system software add component all** command to perform a standard software upgrade. All components of the QFabric system upgrade simultaneously and expediently, but this type of upgrade does not provide resiliency or switchover capabilities.
- If you need to minimize service impact, preserve the forwarding operations of the data plane during the upgrade, and are willing to take the extra time required for component switchovers (in many cases, several hours), issue the three nonstop software upgrade commands (**request system software nonstop-upgrade (director-group | fabric | node-group)** described in this topic in the correct order.

NOTE:

- Before you begin a nonstop software upgrade, issue the **request system software download** command to copy the software to the QFabric system.
- Each of the 3 nonstop software upgrade steps must be considered parts of the whole process. You must complete all 3 steps of a nonstop software upgrade in the correct order to ensure the proper operation of the QFabric system.
- Open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected. For more information on verification of the upgrade, see "Verifying Nonstop Software Upgrade for QFabric Systems" on page 1410.
- Issue the **show fabric administration inventory** command to verify that all upgraded components are operational at the end of a step before beginning the next step.
- Once you start the nonstop software upgrade process, we strongly recommend that you complete all 3 steps within 12 hours.

The three steps to a successful nonstop software upgrade must be performed in the following order:

- Director group—The first step upgrades the Director devices, the fabric manager Routing Engine, and the diagnostic Routing Engine. To perform the first step, issue the **request system software nonstop-upgrade director-group** command. The key actions that occur during a Director group upgrade are:

  1. Connecting to the QFabric system by way of an SSH connection. This action establishes a load-balanced CLI session on one of the Director devices in the Director group.
  2. The QFabric system downloads and installs the new software in both Director devices.
  3. The Director device hosting the CLI session becomes the master for all QFabric system processes running on the Director group, such as the fabric manager and network Node group Routing Engines.
  4. The QFabric system installs the new software for the backup fabric manager Routing Engine on the backup Director device.
  5. The backup Director device reboots to activate the new software.
  6. The master Director device begins a 15 minute sequence that includes a temporary suspension of QFabric services and a QFabric database transfer. You cannot issue operational mode commands in the QFabric CLI during this period.
  7. The QFabric system installs the new software for the fabric manager and diagnostic Routing Engines on the Director group master.

8. The QFabric system switches mastership of all QFabric processes from the master Director device to the backup Director device.
9. The master Director device reboots to activate the new software.
10. The CLI session terminates, and logging back in to the QFabric system with a new SSH connection establishes the session on the new master Director device (the original backup).
11. The previous master Director device resumes operation as a backup and the associated processes (such as the fabric manager and network Node group Routing Engines) become backup as well. The fabric control Routing Engine associated with this Director device returns to active status.

NOTE: After the Director group nonstop software upgrade completes, any Interconnect device or Node device that reboots will automatically download the new software, install it, and reboot again. As a result, try not to restart any QFabric system devices before you complete the rest of the nonstop software upgrade steps.

TIP:

- To enable BGP and OSPF to continue operating on the network Node group during a Director group nonstop service upgrade, we recommend that you configure graceful restart for these routing protocols. For more information on graceful restart, see "Configuring Graceful Restart for QFabric Systems" on page 1375.
- Wait 15 minutes after the second Director device returns to service and hosts Routing Engine processes before proceeding to step 2—the fabric upgrade. You can verify the operational status of both Director devices by issuing the **show fabric administration inventory director-group status** command. Also, issue the **show fabric administration inventory infrastructure** command to verify when the Routing Engine processes become load balanced (typically, there will be three to four Routing Engines running on each Director device).

- Fabric—The second step upgrades the Interconnect devices and the fabric control Routing Engines. To perform the second step, issue the **request system software nonstop-upgrade fabric** command. The key actions that occur during a fabric upgrade are:

  1. The QFabric system downloads, validates, and installs the new software in all Interconnect devices and fabric control Routing Engines (FC-0 and FC-1).
  2. One fabric control Routing Engine reboots and comes back online.
  3. The other fabric control Routing Engine reboots and comes back online.

4. The first Interconnect device reboots, comes back online, and resumes the forwarding of traffic.
5. Subsequent Interconnect devices reboot one at a time, come back online, and return to service.

NOTE:

- If the software does not load properly on any one of the fabric components, all components revert back to the original software version.
- If one of the components in a fabric upgrade does not reboot successfully, issue the **request system reboot fabric** command to reattempt the rebooting process for this fabric component and activate the new software.

- Node group—The third and final step upgrades Node groups. You can choose to upgrade a network Node group, a redundant server Node group, or individual server Node groups. You can upgrade the Node groups one at a time or in groups (known as upgrade groups). However, you must upgrade all Node groups in your QFabric system before you can complete the nonstop software upgrade process. To perform the third step, issue the **request system software nonstop-upgrade node-group** command.

  The key actions that occur during a network Node group upgrade are:

  1. The QFabric system copies the new software to each Node device one at a time.
  2. The QFabric system validates and then installs the new software in all Node devices simultaneously.
  3. The system copies the software to the network Node group Routing Engines.
  4. The QFabric system validates and then installs the software in the network Node group Routing Engines one at a time -- first the backup, then the master.
  5. The backup network Node group Routing Engine reboots and comes back online.
  6. The supporting Node devices reboot and come back online one at a time.

  

  NOTE: To reduce the total upgrade duration, configure an upgrade group. All Node devices within the upgrade group reboot at the same time.

  7. The master network Node group Routing Engine relinquishes mastership to the backup, reboots, and comes back online.

  The key actions that occur during a redundant server Node group upgrade are:

  1. The QFabric system copies the new software to the backup Node device, then the master Node device.
  2. The QFabric system validates and then installs the new software on the backup Node device, then the master Node device.

3. The backup Node device reboots, comes back online, and becomes the master Node device.
4. The previous master Node device reboots and comes back online as a backup Node device.

NOTE: For redundant server Node groups, both Node devices must be online before the upgrade will proceed. If one of the devices is no longer available, remove the Node device from the Node group configuration before you issue the nonstop software upgrade command.

The key actions that occur during a server Node group upgrade for a Node group that contains one member are:

1. The Node device downloads the software package and validates the software.
2. The Node device installs the software and reboots.

NOTE: Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade.

Understanding Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning, in a browser, go to Feature Explorer. In the **Explore Features** section of the Feature Explorer page, select **All Features**. In the **Features Grouped by Feature Family** box, select Zero Touch Provisioning. You can also type the name of the feature in the **Search for Features** edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning. Search for that feature name if you want to know if this feature is supported on EX Series switches.

Zero Touch Provisioning allows you to provision new Juniper Networks switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default factory configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from

the network. To make sure you have the default factory configuration loaded on the switch, issue the **request system zeroize** command on the switch you want to provision.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If you do not configure the DHCP server to provide this information, the switch boots with the preinstalled software and default factory configuration.

The Zero Touch Provisioning process will either upgrade or downgrade the Junos OS version. During an downgrade:

- On an EX Series switch, If you downgrade to a software version earlier than Junos OS Release 12.2, in which Zero Touch Provisioning is not supported, the configuration file autoinstall phase of the Zero Touch Provisioning process does not happen.
- On an EX Series switch, to downgrade to a software version that does not support resilient dual-root partitions (Junos OS Release 10.4R2 or earlier), you must perform some manual work on the switch. For more information, see *Understanding Resilient Dual-Root Partitions on Switches*.

When you boot a switch with the default factory configuration, the following process happens:

1. If DHCP option 43, suboption 00 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

   NOTE: **When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.**

2. If DHCP option 43, suboption 02 (a symbolic link to the software image file on the FTP, HTTP, or TFTP server), the switch compares the version of the provided software image to the version of the software installed on the switch.
   - If the Junos OS versions are different, the switch downloads the software image from the FTP, HTTP, or TFTP server, installs the Junos OS, and reboots using the default factory configuration.
   - If the software versions are the same, the switch does not upgrade the software.
3. If DHCP option 43, suboption 01 (the name of the configuration file on the FTP, TFTP, or HTTP server is configured, the switch compares the version of the provided configuration file to the version of the configuration file on the switch.

   If DHCP option 43 suboption 01 is not specified, the switch uses the default factory configuration.

   If the configuration file version on the FTP, HTTP, or TFTP server is newer than the configuration file on the switch, the configuration file is updated on the switch.

If both DHCP option 43 suboption 01 and suboption 2 are specified, suboption 01 is processed before suboption 02. The Junos OS is upgraded, and then the configuration file is applied.

4. If DHCP option 43, suboption 03 (the transfer mode setting) is configured, the switch accesses the FTP, HTTP, or TFTP server using the specified transfer mode setting—for example, FTP.

   If DHCP option 43, suboption 03, is not configured, TFTP becomes the transfer mode automatically.

5. If DHCP option 43, suboption 04 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

   NOTE: **When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.**

6. If DHCP option 150 or option 66 is specified, the IP address of the FTP, HTTP, or TFTP server is configured.

   NOTE: **You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.**

7. (Optional) If DHCP option 7 is specified, you can configure one or more syslog servers.
8. (Optional) If DHCP option 42 is specified, you can configure one or more NTP servers.
9. (Optional) If DHCP option 12 is specified, you can configure the hostname of the switch.

Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a Juniper Networks EX Series Ethernet Switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, router or switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

This topic describes:

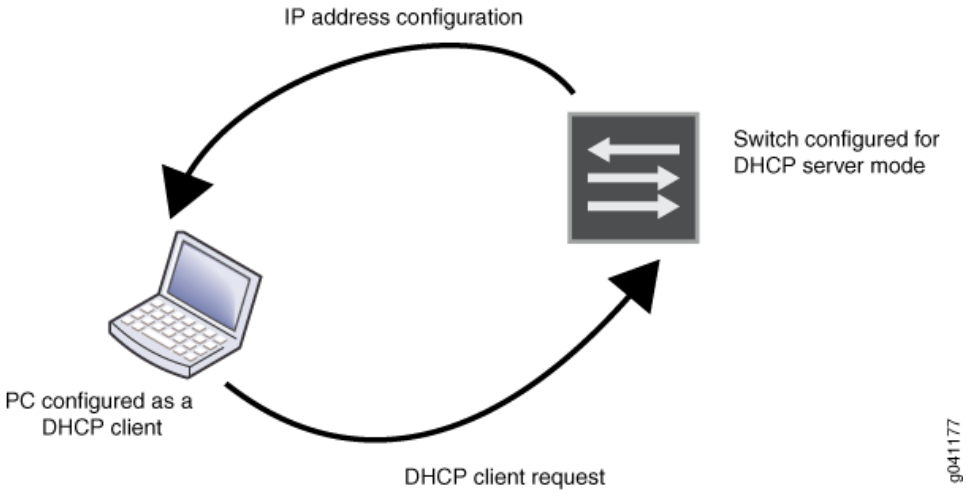
- DHCP Client/Server Model on page 64
- Using DHCP on page 64
- DHCP Relay Servers and DHCP Servers on page 65

- Legacy DHCP and Extended DHCP for Server Versions on page 65
- Configuring DHCP on a Switch on page 66
- How DHCP Works on page 66

DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See Figure 7 on page 64.

Figure 7: DHCP Client/Server Model



Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software

package that booted the DHCP client switch, the new software is downloaded and installed. See *Upgrading Software Using Automatic Software Download*.

DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server. For directions on configuring a DHCP relay server, see *DHCP/BOOTP Relay for Switches Overview*.

Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series switches and on the QFX Series. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch. See *EX Series Switch Software Features Overview* for a list of switches that support the extended DHCP server.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients. For details, see *High Availability Features for EX Series Switches Overview*.
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see *Understanding Virtual Routing Instances on EX Series Switches*.

NOTE: **Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See *EX Series Switch Software Features Overview* for a list of switches that support extended DHCP (VR-aware DHCP).**

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in Table 34 on page 65:

Table 34: Legacy DHCP and Extended DHCP Server Hierarchy Levels

DHCP Service	Hierarchy
Extended DHCP server	**edit system services dhcp-local-server**
Extended DHCP address pool	**edit access address-assignment pool**

Table 34: Legacy DHCP and Extended DHCP Server Hierarchy Levels *(continued)*

DHCP Service	Hierarchy
Legacy DHCP server	**edit system services dhcp**
Legacy DHCP relay	**edit forwarding-options helpers bootp**
Extended DHCP relay	**edit forwarding-options dhcp-relay**
Legacy DHCP address pool	**edit system services dhcp pool**

DHCP clients on a switch are always configured at the hierarchy level **[edit interfaces *interface-name* family dhcp]**.

Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

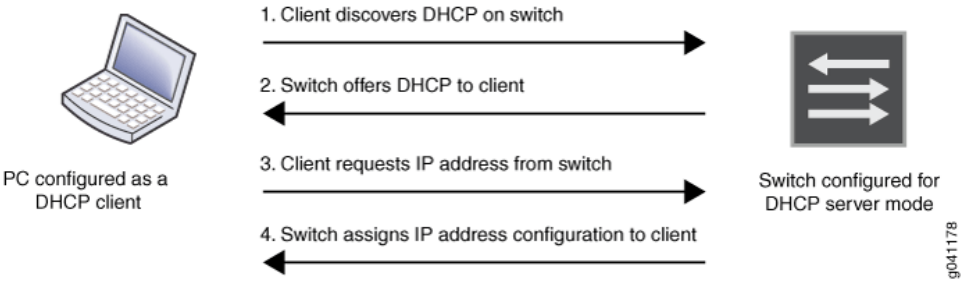
For directions for configuring either a legacy DHCP server or an extended DHCP server, see "Configuring a DHCP Server on Switches (CLI Procedure)" on page 143.

To configure a DHCP client, set the client's DHCP interface address in the **[edit interfaces interface-name unit 0 family inet dhcp]** hierarchy. For directions for configuring a DHCP client on a switch, see "Configuring a DHCP Client (CLI Procedure)" on page 142.

How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See Figure 8 on page 67.

Figure 8: DHCP Four-Step Transfer



NOTE: Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

Understanding Software Infrastructure and Processes

The QFX Series products run the Juniper Networks Junos OS. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 68
- Junos OS Processes on page 68

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch , which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
  - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 35 on page 68 describes the primary Junos OS processes.

Table 35: Junos OS Processes

Process	Name	Description
Chassis process	chassisd	Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.

Table 35: Junos OS Processes *(continued)*

Process	Name	Description
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.
Management process	mgd	Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the partition. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.
Multicast snooping process	multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

CLI User Interface Overview

- CLI Overview on page 70
- CLI Key Features on page 71
- CLI Command Modes on page 71

CLI Overview

The command-line interface (CLI) is the software interface you use to access, monitor, configure, troubleshoot, and manage a device running Junos OS. You can access the CLI either from the console or through a network connection. The CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel.

The CLI provides a variety of UNIX utilities, such as Emacs-style keyboard sequences, which allows you to perform the following actions:

- Move around on a command line and scroll through recently executed commands.
- Match regular expressions to locate and replace values and identifiers in a configuration.
- Filter command output.
- Log file entries.
- Store and archive device files on a UNIX-based file system.

You can exit the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage processes, and perform other tasks.

CLI Key Features

The CLI commands and statements follow a hierarchical organization and have consistent syntax. The CLI provides the following features for ease of use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (**?**) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with the Junos OS, you can use many of the CLI commands without referring to the documentation.
- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press Tab or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

CLI Command Modes

The CLI has two modes, operational mode and configuration mode.

- Operational mode—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot Junos OS and devices and network connectivity. Operational mode is indicated by the **>** prompt—for example, **user@switch> clear**
- Configuration mode—A Junos OS device configuration is stored as a hierarchy of statements. In configuration mode, you can define all properties of the Juniper Networks Junos OS, including interfaces, VLANs, Virtual Chassis information, user access, and several system hardware properties. To enter configuration mode, enter the **configure** command. Configuration mode is indicated by the **#** prompt and includes the current location in the configuration hierarchy—for example:

  [edit interfaces ge-0/0/12]
  user@switch#

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you must issue another **commit** command within the defined period of time (10 minutes by default), or the system reverts to the previous configuration.

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (**>**) and the configuration mode prompt is a pound sign (**#**).

When you log in to the switch and type the **cli** command, you are automatically in operational mode. To switch to configuration mode, type the **configure** command or the **edit** command.

The CLI prompt changes from **user@switch>** to **user@switch#**, and a banner appears to indicate the hierarchy level.

To return to operational mode as well as commit your changes, enter **command and-quit**. To return to operational mode without committing any of your changes, enter **exit**.

To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command.

- Overview of Navigating the CLI on page 78
- *CLI User Guide*
- Other Tools to Configure and Monitor Devices Running Junos OS on page 318

Configuring CLI Tips

The Junos OS CLI provides the option of configuring CLI tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

  ```
  [edit system login class class-name]
  login-tip;
  ```

  Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

Format for Specifying Filenames and URLs in Junos OS CLI Commands

In some command-line interface (CLI) commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication *load-key-file***, and **request system software add**—you can include a filename. On a routing matrix, you can include chassis information (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**) as part of the filename.

A *routing matrix* is a multichassis architecture composed of either one TX Matrix router and from one to four T640 routers connected to the TX Matrix router, or one TX Matrix Plus router and from one to four T1600 routers connected to the TX Matrix Plus router. From the perspective of the user interface, the routing matrix appears as a single router. On a routing matrix composed of the TX Matrix router and T640 routers, the TX Matrix router controls all the T640 routers. On a routing matrix composed of a TX Matrix Plus router and T1600 routers, the TX Matrix Plus router controls all the T1600 routers.

You can specify a filename or URL in one of the following ways:

- ***filename***—File in the user's current directory on the local CompactFlash card (not applicable on the QFX Series). You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in Hypertext Transfer Protocol (HTTP) or FTP.

  

  NOTE: **Wildcards are supported only by the file (compare | copy | delete | list | rename | show) commands. When you issue the file show command with a wildcard, it must resolve to one filename.**

- ***path/filename***—File on the local flash disk.
- **/var/*filename*** or **/var/*path/filename***—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

  ```
  user@host> file delete lcc0-re0:/var/tmp/junk
  ```

- **a:*filename*** or **a:*path/filename***—File on the local removable media. The default path is **/** (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- ***hostname*:*/path/filename***, ***hostname*:*filename***, ***hostname*:*path/filename***, or "**scp://*hostname/path/filename***"—File on an **scp/ssh** client. This form is not available in the worldwide version of the Junos OS. The default path is the user's home directory on the remote system. You can also specify ***hostname*** as ***username*@*hostname***.
- **ftp://*hostname/path/filename***—File on an FTP server. You can also specify ***hostname*** as ***username*@*hostname*** or ***username*:*password*@*hostname***. The default path is the user's home directory. To specify an absolute path, the path must start with **%2F**; for example, **ftp://*hostname*/%2F*path/filename***. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required and you do not specify the password or **prompt**, an error message is displayed:

  ```
  user@host> file copy ftp://username@ftp.hostname.net/filename
  file copy ftp.hostname.net: Not logged in.

  user@host> file copy ftp://username:prompt@ftp.hostname.net/filename
  Password for username@ftp.hostname.net:
  ```

- **re0:*/path/filename*** or **re1:*/path/filename***—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

  ```
  user@host> show log lcc0-re1:chassisd
  ```

NOTE: You cannot specify a URL for a file on a Hypertext Transfer Protocol (HTTP) server, because HTTP URLs are not writable.

Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in Figure 9 on page 75.

Figure 9: Commands That Combine Other Commands

Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- CLI Command Categories on page 75
- Commonly Used Operational Mode Commands on page 76

CLI Command Categories

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.
  - **clear**—Clear statistics and protocol database information.
  - **mtrace**—Trace mtrace packets from source to receiver.

  - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
  - **ping**—Determine the reachability of a remote network host.
  - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
  - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
  - **traceroute**—Trace the route to a remote network host.

- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the CLI Explorer.
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the CLI Explorer.
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the CLI Explorer.
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the CLI Explorer.
- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the CLI Explorer.
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see "Understanding Junos OS CLI Configuration Mode" on page 80.
- A command—**quit**—to exit the CLI. For information about this command, see the CLI Explorer.
- For more information about the CLI operational mode commands, see the CLI Explorer and the CLI Explorer.

Commonly Used Operational Mode Commands

Table 36 on page 77 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

Table 36: Commonly Used Operational Mode Commands

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	**show version**
Log files	Contents of the log files	**monitor**
	Log files and their contents and recent user logins	**show log**
Remote systems	Host reachability and network connectivity	**ping**
	Route to a network system	**traceroute**
Configuration	Current system configuration	**show configuration**
Manipulate files	List of files and directories on the router or switch	**file list**
	Contents of a file	**file show**
Interface information	Detailed information about interfaces	**show interfaces**
Chassis	Chassis alarm status	**show chassis alarms**
	Information currently on craft display	**show chassis craft-interface**
	Router or switch environment information	**show chassis environment**
	Hardware inventory	**show chassis hardware**
Routing table information	Information about entries in the routing tables	**show route**
Forwarding table information	Information about data in the kernel's forwarding table	**show route forwarding-table**
IS-IS	Adjacent routers or switches	**show isis adjacency**
OSPF	Display standard information about OSPF neighbors	**show ospf neighbor**
BGP	Display information about BGP neighbors	**show bgp neighbor**
MPLS	Status of interfaces on which MPLS is running	**show mpls interface**
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	**show mpls lsp**
	Routes that form a label-switched path	**show route label-switched-path**

Table 36: Commonly Used Operational Mode Commands *(continued)*

Items to Check	Description	Command
RSVP	Status of interfaces on which RSVP is running	**show rsvp interface**
	Currently active RSVP sessions	**show rsvp session**
	RSVP packet and error counters	**show rsvp statistics**

Overview of Navigating the CLI

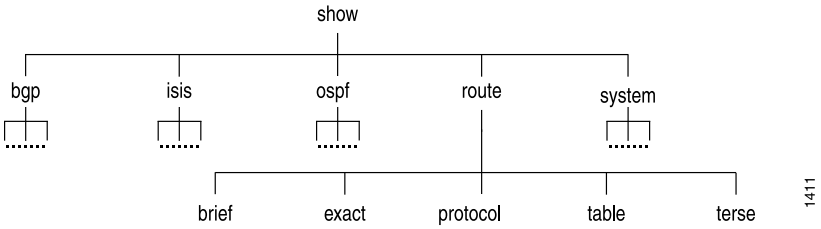
This topic describes how to navigate the CLI.

- CLI Command Hierarchy on page 78
- CLI Configuration Statements on page 78
- Moving Among Hierarchy Levels on page 79

CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command. Figure 10 on page 78 illustrates a portion of the **show** command hierarchy.

Figure 10: CLI Command Hierarchy



To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of your Ethernet switching options for your interfaces, use the command **show ethernet-switching-options interfaces**.

CLI Configuration Statements

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

Moving Among Hierarchy Levels

You can use the CLI commands to navigate the levels of the configuration statement hierarchy:

- edit— Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
- exit—Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the **edit** command. Alternatively, you can use the **quit** command. The **exit** and **quit** commands are interchangeable.
- up—Moves up the hierarchy one level at a time.
- top—Moves directly to the top level of the hierarchy.

Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

1. Use the ? prompt to list options available for the command. For example:

```
user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>            Execute this command
  brief              Display brief output
  descriptions       Display interface description strings
  detail             Display detailed output
  extensive          Display extensive output
  media              Display media information
  snmp-index         SNMP index of interface
  statistics         Display statistics and detailed output
  terse              Display terse output
  |                  Pipe through a command
```

2. Choose the option you wish to use with the command. (See Figure 11 on page 80.)

Figure 11: Command Output Options

Understanding Junos OS CLI Configuration Mode

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*, a router configuration is stored as a hierarchy of statements. In configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- Configuration Mode Commands on page 81
- Configuration Statements and Identifiers on page 82
- Configuration Statement Hierarchy on page 84

Configuration Mode Commands

Table 37 on page 81 summarizes each CLI configuration mode command. The commands are organized alphabetically.

Table 37: Summary of Configuration Mode Commands

Command	Description
activate	Remove the **inactive:** tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the **commit** command.
annotate	Add comments to a configuration. You can add comments only at the current hierarchy level.
commit	Commit the set of changes to the database and cause the changes to take operational effect.
copy	Make a copy of an existing statement in the configuration.
deactivate	Add the **inactive:** tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the **commit** command.
delete	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
edit	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
exit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The **quit** and **exit** commands are synonyms.
extension	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
help	Display help about available configuration statements.
insert	Insert an identifier into an existing hierarchy.
load	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 37: Summary of Configuration Mode Commands *(continued)*

Command	Description
quit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The **quit** and **exit** commands are synonyms.
rename	Rename an existing configuration statement or identifier.
replace	Replace identifiers or values in a configuration.
rollback	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit configuration** command.
run	Run a top-level CLI command without exiting from configuration mode.
save	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
set	Create a statement hierarchy and set identifier values. This is similar to **edit** except that your current level in the hierarchy does not change.
show	Display the current configuration.
status	Display the users currently editing the configuration.
top	Return to the top level of configuration command mode, which is indicated by the **[edit]** banner.
up	Move up one level in the statement hierarchy.
update	Update a private database.
wildcard	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 38 on page 83 describes top-level CLI configuration mode statements.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

Table 38: Configuration Mode Top-Level Statements

Statement	Description
access	Configure the Challenge Handshake Authentication Protocol (CHAP). For information about the statements in this hierarchy, see the *Junos OS System Basics Configuration Guide*.
accounting-options	Configure accounting statistics data collection for interfaces and firewall filters. For information about the statements in this hierarchy, see the *Network Management Configuration Guide*.
chassis	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. For information about the statements in this hierarchy, see the *Junos OS System Basics Configuration Guide*.
class-of-service	Configure class-of-service parameters. For information about the statements in this hierarchy, see the *Junos OS Class of Service Configuration Guide*.
firewall	Define filters that select packets based on their contents. For information about the statements in this hierarchy, see the *Routing Policy Configuration Guide*.
forwarding-options	Define forwarding options, including traffic sampling options. For information about the statements in this hierarchy, see the *Junos® OS Network Interfaces*.
groups	Configure configuration groups. For information about statements in this hierarchy, see the *Junos OS System Basics Configuration Guide*.
interfaces	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the *Junos® OS Network Interfaces*.
policy-options	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. For information about the statements in this hierarchy, see the *Routing Policy Configuration Guide*.
protocols	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the *Junos OS Routing Protocols Configuration Guide* and the *Junos OS MPLS Applications Configuration Guide*.

Table 38: Configuration Mode Top-Level Statements *(continued)*

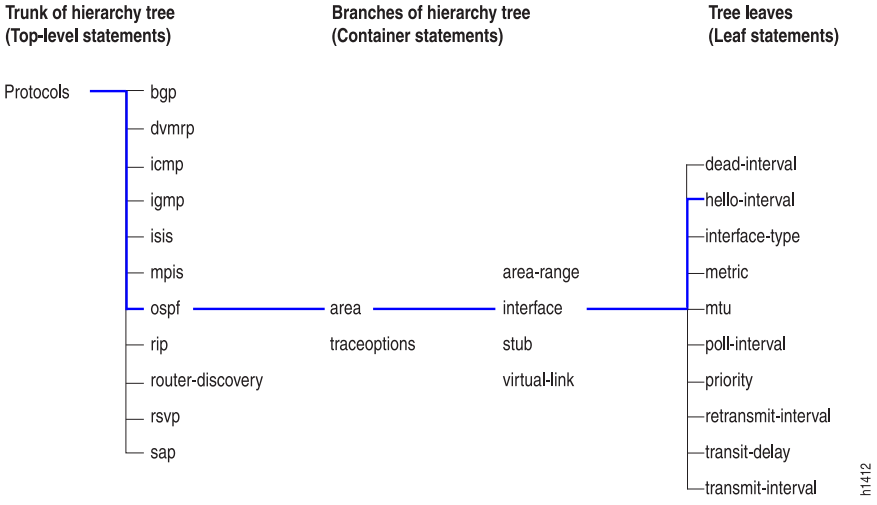
Statement	Description
routing-instances	Configure multiple routing instances. For information about the statements in this hierarchy, see the *Junos OS Routing Protocols Configuration Guide*.
routing-options	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the *Junos OS Routing Protocols Configuration Guide*.
security	Configure IP Security (IPsec) services. For information about the statements in this hierarchy see the *Junos OS System Basics Configuration Guide*.
snmp	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the *Network Management Configuration Guide*.
system	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. For information about the statements in this hierarchy, see the *Junos OS System Basics Configuration Guide*.

For specific information on configuration statements, see the Junos OS configuration guides.

Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see Figure 12 on page 84). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 12: Configuration Mode Hierarchy of Statements



Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. Figure 12 on page 84 illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in Figure 12 on page 84 as **[edit protocols ospf area *area-number* interface *interface-name*]** and displays the configuration as follows:

```
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/0 {
                hello-interval 5;
            }
            interface so-0/0/1 {
                hello-interval 5;
            }
        }
    }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain "oneliners" at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric *10*** is a oneliner because the **level** container statement with identifier ***1***, its child statement **metric**, and its corresponding attribute ***10*** all appear on a single line in the hierarchy:

```
[edit protocols]
    isis {
        interface ge-0/0/0.0 {
            level 1 metric 10;
        }
    }
}
```

Likewise, in the following example, **dynamic-profile** ***dynamic-profile-name*** **aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier ***dynamic-profile-name***, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

Software Features That Require Licenses on the QFX Series

The following Junos OS features require an Advanced Feature License (AFL) on QFX Series devices:

NOTE: If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- Multiprotocol Label Switching (MPLS)
- Fibre Channel support

Table 39 on page 87 lists the licenses you can purchase for each QFX Series software feature.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

Table 39: Junos OS Feature Licenses and Model Numbers for QFX Series Devices

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multiprotocol Label Switching (MPLS)	QFX3500, QFX3600, and QFX5100 switch	One per switch	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC

Table 39: Junos OS Feature Licenses and Model Numbers for QFX Series Devices *(continued)*

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB

Junos OS License Keys

Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of

restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity. Table 40 on page 89 displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

Table 40: Upgrade Licenses for Enhancing Port Capacity

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 • 1/MIC0	f1—MX5 to MX10 upgrade	Slot 1 and 2 • 1/MIC0 • 1/MIC1
MX10	40G	0x555	Slot 1 and 2 • 1/MIC0 • 1/MIC1	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 • 1/MIC1 • First 2 ports on 0/MIC0
MX40	60G	0x554	Slot 1, SLot 2 and first 2 ports on Slot 0 • 1/MIC0 • 1/MIC1 • First 2 ports on 0/MIC0	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 • 1/MIC1 • All 4 ports on 0/MIC0

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
  - An f1 feature ID on an MX10 upgrade license key rejects the license.
  - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

Generating the License Keys for a Standalone QFX Series Device

When you purchase a Junos OS software feature license for a QFX Series device, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the device's serial number) for the device, and then add the license key on the device.

Before generating the license keys for a device:

- Purchase the required licenses for the device. See "Software Features That Require Licenses on the QFX Series" on page 87.
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Determine the serial number of the device. For instructions, see *Locating the Serial Number on a QFX3500 Device or Component*.

To generate the license keys for a device:

1. In a browser, log in to the Juniper Networks License Management System at https://www.juniper.net/lcrs/license.do.

   The Manage Product Licenses page appears.

   

   NOTE: To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

   The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Device** option button, and click **Continue**.

   The Generate Licenses - QFX Series Product Devices page appears.

4. In the **Device Serial Number** field, enter the serial number for the device.

5. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.

6. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
7. Click **Confirm**.

   The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.
8. Review the information to ensure everything is correct and then click **Generate License**.

   The Generate Licenses - QFX Series Product Devices page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.
9. Select the file format in which you want to obtain your new license keys.
10. Select the delivery method you want to use to obtain your new license keys.

    To download the license keys:

    - Select the **Download to this computer** option button, and click **OK**.

    To e-mail the license keys:

    - Select the **Send e-mail to *e-mail ID*** option button, and click **OK**.

Generating the License Keys for a QFabric System

When you purchase a Junos OS software feature license for a QFabric system, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the QFabric system ID) for the QFabric system, and then add the license key on the QFabric system.

Before generating the license keys for a QFabric system:

- Purchase the required licenses for the QFabric system. See "Software Features That Require Licenses on the QFX Series" on page 87.
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Perform the initial setup of the QFabric system on the Director group. See "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335.
- Log in to the QFabric system, issue the **show version** command, and note down the software serial number and QFabric system ID for the QFabric system.

  ```
  user@qfabric> show version
  ```

```
Hostname: qfabric
Model: qfx3000-g
Serial Number: qfsn-0123456789
QFabric System ID: f158527a-f99e-11e0-9fbd-00e081c57cda
JUNOS Base Version [12.2I20111018_0215_dc-builder]
```

To generate the license keys for a QFabric system:

1. In a browser, log in to the Juniper Networks License Management System at https://www.juniper.net/lcrs/license.do.

   The Manage Product Licenses page appears.

   NOTE: To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

   The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Fabric** option button, and then click **Continue**.

   The Generate Licenses - QFX Series Product Fabrics page appears.

4. In the **Software Serial No** field, enter the software serial number for the QFabric system.

5. In the **QFabric System ID** field, enter the QFabric system ID for the QFabric system.

6. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.

7. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.

8. Click **Confirm**.

   The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

9. Review the information to ensure everything is correct and then click **Generate License**.

   The Generate Licenses - QFX Series Product Fabrics page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

10. Select the file format in which you want to obtain your new license keys.

11. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to *e-mail ID*** option button, and click **OK**.

Related Documentation

- Software Features That Require Licenses on the QFX Series on page 87
- Performing the QFabric System Initial Setup on a QFX3100 Director Group on page 1335
- Adding New Licenses (CLI Procedure) on page 93
- **show version on page 1135**

Adding New Licenses (CLI Procedure)

Before adding new licenses, complete the following tasks:

- Purchase the required licenses.
- Establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your device.

NOTE: On QFabric systems, install your licenses in the default partition of the QFabric system and not on the individual components (Node devices and Interconnect devices).

To add a new license key to the device using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:
   - To add a license key from a file or URL, enter the following command, specifying the filename or the URL where the key is located:

     user@host> **request system license add *filename* | *url***
   - To add a license key from the terminal, enter the following command:

     user@host> **request system license add terminal**
2. When prompted, enter the license key, separating multiple license keys with a blank line.

   If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit license entry mode.

NOTE: If the router has two Routing Engines, add the new license on each Routing Engine separately. This ensures that the license key is enabled on the backup Routing Engine during changeover of mastership between the Routing Engines.

To add a new license key to a router with dual Routing Engines:

1. After adding the new license key on the master Routing Engine, use the **request chassis routing-engine master switch** command to have the backup Routing Engine become the master Routing Engine.
2. Log in to the active Routing Engine and add the new license key, repeating the same process.

3. Go on to "Verifying Junos OS License Installation" on page 96.

NOTE: Adding a license key to the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-adding operation is about to be delayed:
A kernel re-sync operation is in progress. License update may take several minutes to complete.

Related Documentation

- Deleting a License (CLI Procedure) on page 94

Deleting a License (CLI Procedure)

Before deleting a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

You have the options to delete a single license, delete all licenses, or delete a list of licenses enclosed in brackets.

To delete a license key from a device using the CLI:

1. Display the licenses available to be deleted.

```
user@host> request system license delete license-identifier-list ?
Possible completions:
  E00468XXX4           License key identifier
  JUNOS10XXX1          License key identifier
  JUNOS10XXX2          License key identifier
  JUNOS10XXX3          License key identifier
```

```
JUNOS10XXX4          License key identifier
[                    Open a set of values
```

2. To delete a license key or keys from a device using the CLI operational mode, select one of the following methods:

   - Delete a single license by specifying the license ID. Using this option, you can delete only one license at a time.

     user@host> **request system license delete *license-identifier***

   - Delete all license keys from the current device.

     user@host> **request system license delete all**

   - Delete multiple license keys from the current device. Specify the license identifier for each key and enclose the list of identifiers in brackets.

     user@host> **request system license delete license-identifier-list [*JUNOS10XXX1 JUNOS10XXX3 JUNOS10XXX4 ...*]**

   ```
   Delete license(s) ?
    [yes,no] (no) yes
   ```

3. Go on to "Verifying Junos OS License Installation" on page 96.

NOTE: Deleting a license key from the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-deleting operation is about to be delayed:
A kernel re-sync operation is in progress. License update may take several minutes to complete.

- Saving License Keys on page 95
- Junos OS Feature Licenses on page 86
- Verifying Junos OS License Installation on page 96
- request system license delete on page 382

Saving License Keys

Before saving a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To save the licenses installed on a device to a file using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

   - To save the installed license keys to a file or URL, enter the following command:

     user@host> **request system license save *filename* | *url***

For example, the following command saves the installed license keys to a file named **license.config**:

- To save a license key from the terminal, enter the following command:

  user@host> **request system license save ftp://user@host/license.config**

2. Go on to "Verifying Junos OS License Installation" on page 96.

Related Documentation

Verifying Junos OS License Installation

To verify Junos OS license management, perform the following tasks:

- Displaying Installed Licenses on page 96
- Displaying License Usage on page 97

Displaying Installed Licenses

Purpose Verify that the expected licenses are installed and active on the router or switch.

Action From the CLI, enter the **show system license** command.

Sample Output

```
user@host> show system license
License usage:
                   Licenses     Licenses    Licenses    Expiry
  Feature name          used    installed      needed
  subscriber-acct          0            1           0    permanent
  subscriber-auth          0            1           0    permanent
  subscriber-addr          0            1           0    permanent
  subscriber-vlan          0            1           0    permanent
  subscriber-ip            0            1           0    permanent
  scale-subscriber         0         1000           0    permanent
  scale-l2tp               0         1000           0    permanent
  scale-mobile-ip          0         1000           0    permanent

Licenses installed:
  License identifier: E000185416
  License version: 2
  Features:
    subscriber-acct  - Per Subscriber Radius Accounting
      permanent
    subscriber-auth  - Per Subscriber Radius Authentication
      permanent
    subscriber-addr  - Address Pool Assignment
      permanent
    subscriber-vlan  - Dynamic Auto-sensed Vlan
      permanent
```

```
    subscriber-ip     - Dynamic and Static IP
      permanent
```

Meaning The output shows a list of the license usage and a list of the licenses installed on the router or switch. Verify the following information:

- Each license is present. Licenses are listed in ascending alphanumeric order by license ID.
- The state of each license is **permanent**.

NOTE: A state of invalid indicates that the license key is not a valid license key. Either it was entered incorrectly or it is not valid for the specific device.

- The feature for each license is the expected feature. The features enabled are listed by license. An all-inclusive license has all features listed.
- All configured features have the required licenses installed. The Licenses needed column must show that no licenses are required.

Displaying License Usage

Purpose Verify that the licenses fully cover the feature configuration on the router or switch.

Action From the CLI, enter the **show system license usage** command.

Sample Output

```
user@host> show system license usage
                Licenses     Licenses    Licenses    Expiry
  Feature name         used    installed      needed
  subscriber-addr         1            0           1    29 days
  scale-subscriber        0         1000           0    permanent
  scale-l2tp              0         1000           0    permanent
  scale-mobile-ip         0         1000           0    permanent
```

Meaning The output shows any licenses installed on the router or switch and how they are used. Verify the following information:

- Any configured licenses appear in the output. The output lists features in ascending alphabetical order by license name. The number of licenses appears in the third column. Verify that you have installed the appropriate number of licenses.
- The number of licenses used matches the number of configured features. If a licensed feature is configured, the feature is considered used. The sample output shows that the subscriber address pooling feature is configured.
- A license is installed on the router or switch for each configured feature. For every feature configured that does not have a license, one license is needed.

For example, the sample output shows that the subscriber address feature is configured but that the license for the feature has not yet been installed. The license must be installed within the remaining grace period to be in compliance.

Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

***package-name-m.nZx.y*-domestic-signed.tgz**

where:

- ***package-name*** is the name of the package—for example, **jinstall-qfx**.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, **11.1**.

- ***Z*** indicates the type of software release, where **R** indicates released software and **B** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, **1.5**.

A sample switch software package name is:

```
jinstall-qfx-11.1R1.5-domestic-signed.tgz
```

Configuring Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning, in a browser, go to Feature Explorer. In the **Explore Features** section of the Feature Explorer page, select **All Features**. In the **Features Grouped by Feature Family** box, select Zero Touch Provisioning. You can also type the name of the feature in the **Search for Features** edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning. Search for that feature name if you want to know if this feature is supported on EX Series switches.

Zero Touch Provisioning allows you to provision new switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Control Protocol (DHCP) server to determine whether to perform these actions and to locate the necessary software image and configuration files on the network. If you do not configure the DHCP server to provide this information, the switch boots with the preinstalled software and default configuration.

NOTE: If you have both DHCP and ZTP enabled, the switch broadcasts a DHCP DISCOVER packet every six minutes. If a DHCP server on the network responds with a DHCP ACK packet with DHCP vendor options set with the necessary values to initiate ZTP, then ZTP proceeds.

To disable broadcasting the DHCP DISCOVER packet every six minutes, without performing the ZTP process, manually delete the **auto-image-upgrade** statement located in the **[edit chassis]** hierarchy. If ZTP completes without errors, the auto-image-upgrade statement is automatically deleted.

NOTE: For detailed information regarding the DHCP and DHCP options, refer to RFC2131 (http://www.ietf.org/rfc/rfc2131.txt) and RFC2132 (www.ietf.org/rfc/rfc2132.txt). Also, this document refers to Internet Systems Consortium (ISC) DHCP version 4.2. For more information regarding this version, refer to http://www.isc.org/software/dhcp/documentation.

Before you begin:

- Ensure that the switch has access to the following network resources:

- The DHCP server provides the location of the software image and configuration files on the network

  Refer to your DHCP server documentation for configuration instructions.

- The File Transfer Protocol (anonymous FTP), Hypertext Transfer Protocol (HTTP), Trivial File Transfer Protocol (TFTP) server on which the software image and configuration files are stored

  

  NOTE: **Although TFTP is supported, we recommend that you use FTP or HTTP instead, because these transport protocols are more reliable.**

- A Domain Name System (DNS) server to perform reverse DNS lookup
- (Optional) An NTP server to perform time synchronization on the network
- (Optional) A system log (syslog) server to manage system log messages and alerts

- Locate and record the MAC address printed on the switch chassis.

CAUTION: **You cannot commit a configuration while the switch is performing the software update process. If you commit a configuration while the switch is performing the configuration file autoinstallation process, the process stops, and the configuration file is not downloaded from the network.**

To configure Zero Touch Provisioning for a switch:

1. Make sure the switch has the default factory configuration installed.

   Issue the **request system zeroize** command on the switch that you want to provision.

2. Download the software image file and the configuration file to the FTP, HTTP, TFTP, server that the switch will download these files from.

   You can download either one or both of these files.

3. Configure the DHCP server to provide the necessary information to the switch.

   Configure IP address assignment.

   You can configure dynamic or static IP address assignment for the switch's management address. To determine the switch's management MAC address for static IP address mapping, add 1 to the last byte of the switch's MAC address, which you noted before you began this procedure.

4. Define the format of the vendor-specific information for DHCP option 43 in the dhcpd.conf file.

   Here is an example of an ISC DHCP 4.2 server dhcpd.conf file:

   ```
   option space NEW_OP; option;
     option NEW_OP.config-file-name code 1 = text;
     option NEW_OP.image-file-type code 2 = text;
     option NEW_OP.transfer-mode code 3 = text;
   ```

```
option NEW_OP.alt-image-file-name code 4= text;
option NEW_OP-encapsulation code 43 = encapsulate NEW_OP;
```

5. Configure the following DHCP option 43 suboptions:

   - Suboption 00: The name of the software image file to install

     NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

     ```
     option NEW_OP.image-file-name
       "/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
     ```

   - Suboption 01: The name of the configuration file to install

     ```
     option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
     ```

   - Suboption 02: The symbolic link to the software image file to install

     ```
     option NEW_OP.image-file-type "symlink";
     ```

     NOTE: If you do not specify suboption 2, the Zero Touch Provisioning process handles the software image as a filename, not a symbolic link.

   - Suboption 03: The transfer mode that the switch uses to access the TFTP/FTP/HTTP server

     ```
     option NEW_OP.transfer-mode "ftp";
     ```

     NOTE: If suboption 03 is not configured, TFTP becomes the transfer mode by default.

   - Suboption 04: The name of the software image file to install

     NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

     ```
     option NEW_OP.alt-image-file-name
       "/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
     ```

6. NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

   Configure DHCP option 150 to specify the IP address of the FTP, HTTP, or TFTP server.

option option-150 code 150 "10.100.31.71";

7. Configure DHCP option 66 to specify the IP address of the FTP, HTTP, or TFTP server.

   option tftp-server-name "10.100.31.71";

8. (Optional) Configure DHCP option 7 to specify one or more system log (syslog) servers.

   option log-servers 10.100.31.72;

9. (Optional) Configure DHCP option 42 to specify one or more NTP servers.

   option ntp-servers 10.100.31.73;

10. (Optional) Configure DHCP option 12 to specify the hostname of the switch.

    option hostname "jn-switch35";

    The following sample configuration shows the DHCP options you just configured:

```
host jn-switch35 {
  hardware ethernet ac:4b:c8:29:5d:02;
  fixed-address 10.100.31.36;
  option tftp-server-name "10.100.31.71";
  option host-name "jn-switch35";
  option log-servers 10.100.31.72;
  option ntp-servers 10.100.31.73;
  option NEW_OP.image-file-name
    "/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
  option NEW_OP.transfer-mode "ftp";
  option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
}
```

    Based on the DHCP options you just configured, the following statements are appended to the Junos OS configuration file (for example, **jn-switch35.config**):

```
system {
  host-name jn-switch35;
  syslog {
    host 10.100.31.72 {
      any any;
    }
  }
  ntp {
    server 10.100.31.73;
  }
}
```

11. Connect the switch to the network that includes the DHCP server and the FTP, HTTP, or TFTP,server.

12. Boot the switch with the default configuration.

13. Monitor the ZTP process by looking at the following log files.

NOTE: When SLAX scripts are issued, the **op-script.log** and **event-script.log** files are produced.

- /var/log/dhcp_logfile
- /var/log/image_load_log
- /var/log/op-script.log
- /var/log/event-script.log

Performing a Nonstop Software Upgrade on the QFabric System

NOTE: Before you can perform a nonstop software upgrade to Junos OS Release 13.1X50-D10, you must have Junos OS Release 12.2X50-D42 or later installed. You cannot perform a nonstop software upgrade with Junos OS Release 12.2X50-D41 or earlier. Contact the Juniper Technical Assistance Center for information on how to download Junos OS Release 12.2X50-D42. Performing a standard software upgrade (that is, issuing the **request system software add component all** command) does not require that you that you upgrade to an intermediate Junos OS software release.

To perform a nonstop software upgrade to Junos OS Release 13.1X50-D10:

1. First perform a nonstop software upgrade to Junos OS Release 12.2X50-D42.
2. Then perform a nonstop software upgrade to Junos OS Release 13.1X50-D10.

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device

- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

NOTE: Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

NOTE: Before you install the software, we recommend that you back up your current configuration files by issuing the **request system software configuration-backup** command.

NOTE: Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the **request system software add component all** command.

This topic describes the following tasks:

- Backing Up the Current Configuration Files on page 106
- Downloading Software Files Using a Browser on page 107
- Retrieving Software Files for Download on page 108
- Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 108
- Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components on page 108
- (Optional) Creating Upgrade Groups for Node Groups on page 109
- Performing a Nonstop Software Upgrade on a Node Group on page 110

Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@qfabric> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@qfabric> request system software configuration-backup/media/USB/
```

Downloading Software Files Using a Browser

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install package you want to download in the **QFabric System Install Package** section:
   - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
   - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see "Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device" on page 111.

   A login screen appears.
7. Enter your user ID and password and press **Enter**.
8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-*version*.rpm** file on your computer.

Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

  ```
  user@qfabric> request system software download /path/package-name
  ```

  For example:

  ```
  user@qfabric> request system software download
  ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
  ```

Performing a Nonstop Software Upgrade for Director Devices in a Director Group

NOTE: If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group** *package-name* command.

  For example:

  ```
  user@qfabric> request system software nonstop-upgrade director-group
  jinstall-qfabric-12.2X50-D10.3.rpm
  ```

Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To do verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric** *package-name* command.

  For example:

  ```
  user@qfabric> request system software nonstop-upgrade fabric
  jinstall-qfabric-12.2X50-D10.3.rpm
  ```

(Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

NOTE:

- Upgrade groups work best when you build in redundancy so that not all the Node devices within the Node group restart at the same time. We suggest using the upgrade group feature for Node groups that have at least 2 pairs of Node devices (4 or more members), such as the network Node group.
- If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group** *node-group-name* **nssu upgrade-group** *upgrade-group-name* **node-devices** command at the **[edit chassis]** hierarchy.

  For example:

```
user@qfabric# set chassis node-group NW-NG-0 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
user@qfabric# set chassis node-group NW-NG-0 nssu upgrade-group upgrade2 node-devices
[ node3 node4 ]
```

Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

NOTE: You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group *node-group-name package-name*** command.

  To perform a nonstop upgrade on one Node group:

  ```
  user@qfabric> request system software nonstop-upgrade node-group nodegroup1
  jinstall-qfabric-12.2X50-D10.3.rpm
  ```

  To perform a nonstop upgrade on more than one Node group:

  ```
  user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
  nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
  ```

Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See "Creating an Emergency Boot Device for a QFX Series Device" on page 165 for information on how to create an emergency boot device.
2. Copy the existing configuration in the file **/config/juniper.conf.gz** from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named **/config/juniper.conf.*n***, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

   WARNING: **The recovery installation process completely overwrites the entire contents of the internal flash storage.**

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

   NOTE: **Do not power off the device if it is already on.**

   ```
   [edit system]
   user@device> request system reboot
   ```

   If you do not have access to the CLI, power cycle the QFX Series device.

   The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

   ```
   External USB install media detected.
   You can load Junos from this media onto an internal drive.
   Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
   Do you wish to continue ([y]/f/n)? f
   ```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

   If you do no want to format the internal flash storage, type **y**.

   The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G

Processing format options
Fri September  4 01:18:44 UTC 2012

-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.

Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins

Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

   When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ............... 2
Exit to installer debug shell ..................................... 3
Install Junos to alternate slice .................................. 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

Related Documentation

- Creating an Emergency Boot Device for a QFX Series Device on page 165

Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

   You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

   Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

   ```
   user@switch> request system software configuration-backup path
   ```

NOTE: To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 113
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 115

(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.

5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install media you want to download in the **QFabric System Install Media** section.

   A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.

    ftp ftp://*hostname/pathname install-media-qfabric-<version>*.img.tgz
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.

    binary
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

    get *install-media-qfabric-<version>*.img.tgz
14. Close the FTP session:

    bye
15. Untar the *install-media-qfabric-<version>* .img.tgz file on your UNIX workstation.

    ```
    tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
    ```
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

    dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
    ```
    250880+0 records in
    250880+0 records out
    4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
    ```
18. Perform the steps in "Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software" on page 115 to continue with the recovery installation.

Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

NOTE: Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
   - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
   - If you do not have access to the default partition, power cycle the Director device.

   The following menu appears on the Director device console when the Director device boots up:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```

3. Type **install** and then press **Enter** to install the software on the Director device.

   Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```

4. Press **Enter**.

   The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

   The following menu appears on the Director device console:

   ```
   Before you can access the QFabric system, you must complete the initial setup
    of the Director group by using the steps that follow.
   If the initial setup procedure does not complete successfully, log out of the
    Director device and then log back in to restart
    this setup menu.

   Continue?[y/n]
   ```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.
7. Issue the **ls /mnt** command to list the **mount** directory.

   ```
   root@dg0 ~]# ls /mnt
   ```
8. Issue the **mkdir** command to create a directory within the mount directory.

   ```
   root@dg0 ~]# mkdir /mnt/myusb
   ```
9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

   ```
   root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
   ```
10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

    ```
    root@dg0 ~]# ls -la /mnt/myusb/
    total 1770884
    drwxr-xr-x 2 root root       4096 Sep  7 05:16 .
    drwxr-xr-x 3 root root       4096 Sep  7 10:15 ..
    -rw-r--r-- 1 root root       4249 Sep  7 03:52 mybackup-20110907
    ```
11. Exit the Director device and log back in as root on the Director device.

    The following menu appears:

    ```
    Before you can access the QFabric system, you must complete the initial setup
     of the Director group by using the steps that follow.
    If the initial setup procedure does not complete successfully, log out of the
     Director device and then log back in to restart
     this setup menu.

    Continue?[y/n] y
    Initial Configuration

    You may enter the configuration manually or restore from a backup.

    Specify a backup file? [y/n] : y
    Please specify the full path of the configuration backup file. :
    /mnt/myusb/mybackup-20110907
    ```
12. Enter **y** to continue.
13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

    ```
    /mnt/myusb/mybackup-20110907
    ```

    The following messages appear:

    ```
    Saving temporary configuration...
    Configuring peer...
    connect error for 1.1.1.2:9001
    Configuring local interfaces...
    Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]
    Configured interface eth0 with [10.49.213.163/24:10.49.213.254]
    Configuring QFabric software with initial pool of 4000 MAC addresses

    Configuring QFabric address [10.49.213.50]
    Reconfiguring QFabric software static configuration
    Applying the new Director Device password
    Applying the QFabric component password
    ```

```
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
connect error for 1.1.1.2:9001
Shared SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

Recovering from a Failed Software Installation

Problem **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

   Hit [Enter] to boot immediately, or space bar for command prompt.

   Press the Spacebar to enter the manual loader. The **loader>** prompt appears.
3. Enter the following command:

   `loader>` **install [– –format] [– –external]** ***source***
   where:

   - **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
   - **external**—Installs the installation package onto external media (a USB stick, for example).
   - ***source***—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:

- Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
- Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**).

The installation now proceeds normally and ends with a login prompt.

Software Installation Overview

A QFX Series product is delivered with the Junos OS preinstalled. As new features and software fixes become available, you can upgrade your software to use them.

When you power on the switch, it starts (boots) using the installed software.

You upgrade the Junos OS on a switch by copying a software package to a switch or other system on your local network and then using the CLI to install the new software on the switch. You then reboot the switch, which boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the installation package removes all files from the **/var/tmp** directory of the switch and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

If you encounter any difficulties during software installation or an upgrade, you can use the recovery installation procedure to install the Junos OS on the switch.

Upgrading Jloader Software on QFX Series Devices

Jloader software contains a boot loader (Uboot), which is used to bring up QFX Series devices and load the Junos OS from the flash memory of these devices. You can upgrade Jloader software on QFX3500 switches, QFX3500 and QFX3600 Node devices, and QFX3600-I and QFX3008-I Interconnect devices.

NOTE: Before you upgrade the Jloader software, see Table 41 on page 121, Table 42 on page 121, and Table 43 on page 122 to make sure that you are upgrading to the right version of Jloader software for the Junos OS software release running on your QFX3500 and QFX3600 switches, or Node devices and Interconnect devices in your QFabric system.

See Table 44 on page 122 to see which Uboot software versions are available and the filenames of the Jloader software packages.

Table 41: Junos OS and Jloader Software Compatibility Matrix for the QFX3500 Switch and QFX3500 Node Device

	Jloader Software Version				
Junos OS Software Version	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
11.3R1 and later (QFX3500 switch)	Not supported	Supported	Supported	Supported and recommended	Not supported
11.3X30.6 and later (QFX3500 Node device)	Not supported	Supported	Supported	Supported and recommended	Not supported
12.1X49-D1 and later (QFX3500 switch)	Not supported	Supported	Supported	Supported and recommended	Not supported
12.2X50-D1 and later (QFX3500 switch and QFX3500 Node device)	Not supported	Supported	Supported	Supported and recommended	Not supported

NOTE: An en dash means that the item is not applicable.

Table 42: Junos OS and Jloader Software Compatibility Matrix for the QFX3008-I Interconnect Device

	Jloader Software Version				
Junos OS Software Version	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
11.3X30.9 and later (QFX3008-I Interconnect device)	-	Supported	Supported	Supported and recommended	Not supported
11.3X30.6 and later (QFX3008-I Interconnect device)	-	Supported	Supported	Supported and recommended	Not supported
12.2X50-D1 and later (QFX3008-I Interconnect device)	-	Supported	Supported	Supported and recommended	Not supported

NOTE: An en dash means that the item is not applicable.

Table 43: Junos OS and Jloader Software Compatibility Matrix for the QFX3600-I Interconnect Device and QFX3600 Node Device

Junos OS Software Version	Jloader Software Version				
	1.0.73	1.1.1	1.1.2	1.1.4	1.1.5
12.2X50-D1 and later (QFX3600-I Interconnect Device and QFX3600 Node Device)	-	-	-	-	Supported
12.2X50-D20 and later (QFX3600 switch)	-	-	-	-	Supported

Table 44: Uboot Software Release and Jloader Software Compatibility Matrix

Uboot Software Release Number	Jloader Package Name
1.0.73	jloader-qfx-1_0_73.tgz
1.1.1	jloader-qfx-11.3-20110510.0-signed.tgz
1.1.2	jloader-qfx-11.3X30.9-signed.tgz
1.1.4 (11.3R3 and 11.3R2 releases only. Not supported on 11.3R1)	jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz
1.1.4 (12.1R1 release and later)	jloader-qfx-12.1-20120125_pr.0-signed.tgz
1.1.5 (12.2X50-D1 and later)	jloader-qfx-12.2X50.D10.3-signed.tgz
1.1.8 (13.1X50-D15 and later)	jloader-qfx-13.3-20130831_pr_branch_qfd.0.tgz

Jloader Software Version 1.1.4 Guidelines

Jloader software version 1.1.4 is compatible with Junos OS Release 11.3R3 and 11.3R2, and Junos OS Release 12.1R1 and later. Jloader software version 1.1.4 is not compatible with Junos OS
Release 11.3R1. The Jloader package names are different for versions 1.1.4 (Junos OS 11.3R3 and 11.3R2) and 1.1.4 (Junos OS 12.2R1 release and later), but the binaries are the same. Because the binaries are the same, you can upgrade or downgrade to any Junos OS release.

- If you have Junos OS Release 11.3 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz** package.
- If you have Junos OS Release 11.3R2 installed and want to upgrade to Junos OS Release 12.1, you do not need to upgrade the Jloader software version and can continue to use Jloader version 1.1.2.

- If you have Junos OS Release 12.1 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-12.1-20120125_pr.0-signed.tgz** package.
- If you upgrade to Junos OS Release 12.1, you can upgrade to Jloader version 1.1.4 using the **jloader-qfx-12.1-20120125_pr.0-signed.tgz** package.

Upgrading Jloader Software on a QFX3500 Switch

The Jloader software for a QFX3500 switch resides in two flash memory banks. At any time, one bank acts as the primary bank, and the QFX3500 switch boots from it. The other bank is the backup bank—if the QFX3500 switch cannot boot from the primary bank, it boots from the backup bank. When you upgrade the Jloader software, the upgraded software is installed in the backup bank, which then becomes the new primary bank. Thus the primary and backup banks alternate each time you upgrade the Jloader software, with the primary bank containing the most recently installed version of the software, and the backup bank containing the previous version. To upgrade the Jloader software on a QFX3500 switch, you must perform the upgrade twice: once for each bank. Each upgrade requires that you to reboot the QFX3500 switch.

NOTE: If you are running Junos OS Release 11.3R1 or Junos OS Release 11.3R2, you must use the **no-validate** option when you issue the **request system software add** command to upgrade the Jloader software. Otherwise, the installation will fail and you receive a configuration error. The **no-validate** option is not required for Junos OS Release 11.3R3 and later.

NOTE: After you upgrade the Jloader software on the first bank, the package is deleted after you reboot. Make sure that you have either downloaded the Jloader software to either a remote site or in a local directory on the switch, such as the **/var/tmp** directory on the QFX3500 device.

1. In a browser, go to http://www.juniper.net/support/downloads/junos.html .

   The Junos Platforms Download Software page appears.
2. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
4. Select the Software tab and then select the install package you want to download in the Install Package section.
5. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
6. Enter your name and password and press **Enter**.

7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Open or save the **jloader-qfx-*version*-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
9. Log in to the QFX3500 switch and enter the shell. We recommend using a console connection.
10. Determine the version of the Jloader software package installed on the switch.

    For example:

    ```
    root@switch% ls
    gres-tp krt_gencfg_filter.txt
    jloader-qfx-11.3-20110510.0-signed.tgz
    ```
11. Determine the version of the Uboot software that is running in the bank:

    For example:

    ```
    root@switch% kenv | grep boot.version
    boot.version="1.0.7"
    ```
12. Enter the CLI and install the Jloader package.

    - To install a Jloader package that is located in the **/var/tmp** directory, issue the **request system software add /var/tmp/jloader-qfx-version.tgz no-validate** command:

      For example:

      ```
      user@switch> request system software add
      /var/tmp/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
      ```

      You see the following messages during the installation:

      ```
      Verified jloader-qfx-11.3-20110510.0.tgz signed by PackageProduction_11_3_0
      Adding jloader-qfx...
      Installation in progress, please wait...
      Mounted jloader-qfx package on /dev/md8...
      Verified manifest signed by PackageProduction_11_3_0
      Verified jloader-qfx-11.3-20110510.0 signed by PackageProduction_11_3_0
      Registering jloader-qfx as unsupported

      Installation finished successfully.
      Please reboot to activate the package
      Saving package file in /var/sw/pkg/jloader-qfx-11.3-20110510.0-signed.tgz
      ...
      Saving state for rollback ...

      juniper@qfx3500>
      ```

    - To install a Jloader package located on a remote server using FTP, issue the **request system software add /ftp://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

      For example:

      ```
      user@switch> request system software add
      /ftp://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
      ```

- To install a Jloader package located on a remote server using HTTP, issue the **request system software add /http://hostname/pathname/jloader-qfx-*version*-signed.tgz no-validate** command.

  For example:

  ```
  user@switch> request system software add
  /http://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
  ```

13. When prompted, reboot the Control Board by issuing the **request system reboot** command.

    For example:

    ```
    user@switch> request system reboot
    Reboot the system ? [yes,no] (no) yes
    ```

14. Enter the shell and verify that the version of the Uboot software in the primary bank is the version you just installed.

    For example:

    ```
    root@switch% kenv | grep boot.version
    boot.version="1.1.1"
    ```

15. To install the Jloader software package on the current backup bank, repeat Step 10 through Step 14.

Upgrading Jloader Software on a QFabric System

This procedure explains how to upgrade the Jloader software on your Node devices and Interconnect devices. The example shows how to upgrade the Jloader software from version 1.1.1 to 1.1.2 on a Node device with the serial number BBAK1186.

NOTE: Before you upgrade the Jloader software, make sure you have the serial numbers of the Node devices, Interconnect devices, and Control Boards in the Interconnect devices you want to upgrade.

1. Issue the **show chassis hardware node-device ?** command to view the serial numbers of the Node devices.

   For example:

```
user@qfabric> show chassis hardware node-device ?
  <node-device>        Node device identifier
  BBAK1186             Node device
  BBAK3149             Node device
  BBAK3177             Node device
  BBAK8063             Node device
  BBAK8799             Node device
  P2443-C              Node device
  P2515-C              Node device
  P3708-C              Node device
  P3885-C              Node device
  P3916-C              Node device
  node0                Node device
  node1                Node device
  node2                Node device
  node3                Node device
  node4                Node device
  node5                Node device
  node6                Node device
  node7                Node device
  node8                Node device
```

   An example of a Node device serial number is BBAK1186.

2. Issue the **show chassis hardware interconnect-device ?** command to view the serial numbers of the Interconnect devices.

   For example:

```
user@qfabric> show chassis hardware interconnect-device ?
Possible completions:
  interconnect-device  Interconnect device identifier
  IC-F1052             Interconnect device
  IC-F3947             Interconnect device
```

   The Interconnect device serial numbers are IC-F1052 and IC-F3947.

3. Issue the **show chassis hardware interconnect-device *name*** command to view the serial numbers of the Control Boards in the Interconnect device.

   For example:

```
user@qfabric> show chassis hardware interconnect-device IC-F3947
```

```
Hardware inventory:
Item             Version  Part number  Serial number     Description
Chassis          REV 10                F3947             QFXC08-3008
Midplane         REV 10   750-035835   F3947-C           QFX Midplane
CB 0             REV 14   750-035855   ZJ9432            QFX Chassis Control
Board
  Routing Engine 0        BUILTIN      BUILTIN           QFX Routing Engine
CB 1             REV 14   750-035855   ZJ9404            QFX Chassis Control
Board
```

The Control Board serial numbers are ZJ9432 and ZJ9404.

4. Issue the **show chassis firmware node-device *name*** command to see which version of Uboot software you have installed on your Node device.

   For example:

   ```
   user@qfabric> show chassis firmware node-device BBAK1186

   Part                    Type       Version
   node4                   U-Boot     1.1.6 (May 10 2011 - 04:52:59) 1.1.1

                           loader     FreeBSD/MIPS U-Boot bootstrap loader 0.1
   ```

   The Uboot software version is 1.1.1. The loader software version appears after the timestamp for U-Boot 1.1.6.

5. Issue the **show chassis firmware interconnect-device *name*** command to see which version of Uboot software you have installed on the Routing Engines located on the Control Boards of the Interconnect device.

   For example:

   ```
   user@qfabric> show chassis firmware interconnect-device IC-F3947

   Part                    Type       Version
   Routing Engine 0        U-Boot     U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4

                           loader     FreeBSD/MIPS U-Boot bootstrap loader 0.1

   Routing Engine 1        U-Boot     U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4

                           loader     FreeBSD/MIPS U-Boot bootstrap loader 0.1
   ```

   The Uboot software version is 1.1.4. The loader software version appears after the timestamp for U-Boot 1.1.6.

6. In a browser, go to http://www.juniper.net/support/downloads/junos.html .

   The Junos Platforms Download Software page appears.

7. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.

8. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.

9. Select the **Software** tab and then select the install package you want to download in the Install Package section.

10. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
11. Enter your username and password, and press **Enter**.
12. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
13. Open or save the **jloader-qfx-*version*-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
14. Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download *[/path/package-name]*** command.

    For example:

    ```
    user@qfabric> request system software download
    ftp://server/files/jloader-qfx-11.3X30.9-signed.tgz
    ```
15. Log in to the Director device as root and enter the shell to verify that you have downloaded the Jloader software package. We recommend using a console connection. The software package is copied from where you downloaded it and is placed locally on the QFabric system in the **/pbdata/packages** directory.

    For example:

    ```
    [root@dg0] # pwd
    /pbdata/packages

    [root@dg0] # ls
    jloader-qfx-11.3X30.9-signed.tgz
    ```
16. Before you copy over the Jloader software package to the Node device or Interconnect device, determine the directory that matches the serial number of the Node device or Interconnect device that you want to upgrade. View the remote logs and the Node device and Interconnect device serial numbers by issuing the **ls /pdbata/export/rlogs** command at the command line of the Director device before you copy the package over to the device.

    

    NOTE: The **/pbdata/export/rlogs/*node-device-serial-ID*** and **/pbdata/export/rlogs/*interconnect-device-serial-ID*** directories on the Director device are NFS mounted as the **/tftpboot/logfiles** directories on the Node device and Interconnect device. These directories are created for all Node devices and Interconnect devices in a QFabric system. The Jloader files are stored in the **/tftpboot/logfiles** directories for each Node device and Interconnect device.

    For example:

    ```
    [root@dg0 tmp] # ls /pdbata/export/rlogs
    02de4930-828b-11e1-a319-00e081c57938  c9898afe-828b-11e1-956c-00e081c57938
    04103b2a-29d5-e011-bf8a-0e6bdf3aa1e6  eeba4aac-828b-11e1-85e2-00e081c57938
    1e2739e0-828b-11e1-bf74-00e081c57938  F1052
    8d8a978c-828b-11e1-a833-00e081c57938  F3947
    ad55b89e-828b-11e1-b70e-00e081c57938  P2443-C
    BBAK1186                              P2515-C
    ```

```
BBAK3149                                P3708-C
BBAK3177                                P3885-C
BBAK8063                                P3916-C
BBAK8799
```

BBAK1186 is the serial number of the Node device that needs to be upgraded.

17. Copy the Jloader software package from the **/var/tmp** directory to the **/pbdata/export/rlogs/BBAK1186** directory.

    For example:

    ```
    [root@dg0 tmp] # cp jloader-qfx-11.3X30.9-signed.tgz /pbdata/export/rlogs/BBAK1186
    ```

18. Confirm that the Jloader software package you copied over is in the **/pbdata/export/rlogs/BBAK1186** directory.

    For example:

    ```
    [root@dg0 tmp] # ls /pbdata/export/rlogs/BBAK1186
    jloader-qfx-11.3X30.9-signed.tgz
    ```

19. Issue the **/root/dns.dump** command to find out the internal IP addresses of the Node device or Interconnect device.

    ```
    [root@dg0 tmp] # /root/dns.dump
    ; <<>> DiG 9.3.6-P1-RedHat-9.3.6-4.P1.el5 <<>> -t axfr pkg.dcbg.juniper.net
    @169.254.0.1
    ;; global options:  printcmd
    pkg.dcbg.juniper.net.   600     IN      SOA     ns.pkg.dcbg.juniper.net.

    pkg.dcbg.juniper.net.   600     IN      NS      ns.pkg.dcbg.juniper.net.
    pkg.dcbg.juniper.net.   600     IN      A       169.254.0.1
    pkg.dcbg.juniper.net.   600     IN      MX      1 mail.pkg.dcbg.juniper.net.
    dcfnode---DCF-ROOT.pkg.dcbg.juniper.net. 45 IN A 169.254.192.17
    dcfnode---DRE-0.pkg.dcbg.juniper.net. 45 IN A   169.254.3.3
    dcfnode-8d8a978c-828b-11e1-a833-00e081c57938.pkg.dcbg.juniper.net. 45 IN A
    169.254.128.19
    dcfnode-ad55b89e-828b-11e1-b70e-00e081c57938.pkg.dcbg.juniper.net. 45 IN A
    169.254.128.20
    dcfnode-BBAK1186.pkg.dcbg.juniper.net. 45 IN A  169.254.128.14
    ```

    The internal IP address for BBAK1186 is 169.254.128.14.

20. Upgrade the Jloader software on the Node device or Interconnect device.

    Before you can upgrade the Jloader software, you need to use SSH to log in to the Node device or Interconnect device and verify that the software is in the **/tftpboot/logfiles** directory.

    a. Use SSH to log in to the Node device or Interconnect device.

       For example:

       ```
       [root@dg0 tmp] # ssh 160.254.128.14
       root@169.254.128.14's password:
       --- JUNOS 11.3X30.10 built 2012-03-11 22:55:43 UTC
       At least one package installed on this device has limited support.
       Run 'file show /etc/notices/unsupported.txt' for details.
       root@sng3%
       ```

    b. Verify that the Jloader software package is in the **tftpboot/logfiles** directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /tftpboot/logfiles
.index                                  jloader-qfx-11.3X30.9-signed.tgz
```

c. Copy the Jloader software package from the **/tftpboot/logfiles** directory to the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% cp /tftpboot/logfiles/jloader-qfx-11.3X30.9-signed.tgz /var/tmp
```

d. Verify that the Jloader software package is in the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /var/tmp
.snap                                   jloader-qfx-11.3X30.9-signed.tgz
      tmp
gres-tp                                 krt_gencfg_filter.txt
      vc-autoupgrade
if-rtsdb                                rtsdb
```

e. Enter CLI mode and issue the **request system software add /var/tmp/jloader-qfx-*version*-signed.tgz** command.

For example:

```
root@sng3% cli
root@sng3> request system software add /var/tmp/jloader-qfx-11.3X30.9-signed.tgz

Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3X30.9-signed.tgz ...
Saving state for rollback ...

Upgrade has completed successfully.
Reboot is now required.
```

f. Reboot both the Node device and Interconnect device twice, because they each contain two partitions.

For example:

```
root@sng3> request system reboot
Reboot the system ? [yes,no] (no) yes
Shutdown NOW!
[pid 37663]

root@sng3>

*** FINAL System shutdown message from root@sng3 ***

System going down IMMEDIATELY
```

g. Verify that the Uboot software on the Node device or Interconnect device has been upgraded to the new Uboot software by logging in to the QFabric CLI and issuing either the **show chassis firmware node-device *name*** command or the **show chassis firmware interconnect-device *name*** command.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
Part                    Type       Version
node4                   U-Boot     1.1.6 (Nov 19 2011 - 11:42:07) 1.1.2

                        loader     FreeBSD/MIPS U-Boot bootstrap loader
0.1
```

The Uboot software version is now 1.1.2. The loader software version appears after the timestamp for U-Boot 1.1.6.

Upgrading Software on QFX3500 and QFX3600 Standalone Switches

To upgrade Junos OS, you need to install the appropriate upgrade package on the QFX Series. Upgrading involves these tasks:

1. Downloading Software Files with a Browser on page 132
2. Accessing Software Downloaded to a Remote Location on page 133
3. Connecting to the Console Port on page 133
4. Backing Up the Current Configuration Files on page 133
5. Installing the Software Package on page 133

Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website, go to http://www.juniper.net/support/ .

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. In the **Install Package** section of the **Software** tab, select the **Install Package** for the release.

   A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Save the **jinstall-qfx-<*version*>-domestic-signed.tgz** file on your computer.
10. Open or save the installation package either to the local system in the **var/tmp** directory or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

Accessing Software Downloaded to a Remote Location

To access the installation package if you downloaded it to a remote location (for example, any system other than the switch):

1. From the command line, make sure you are in the **/var/tmp** directory of the switch.
2. Start the shell interface:

   ```
   user@switch> start shell
   ```
3. Initiate an FTP, TFTP, or scp session.

   In this example, FTP is used.

   ```
   >ftp
   ```
4. Use FTP to access the remote location where the installation package resides.

   ftp ftp://*<hostname>*/*<pathname>*/*<package-name-m.mZx-distribution>*.tgz.
   where *<package-name-m.mZx-distribution>*.tgz is
   jinstall-qfx-11.1R1.5-domestic-signed.tgz
5. When prompted, enter your username and password.
6. Use the **get** command to transfer the installation package from the remote location to your **/var/tmp** directory on your switch.

   get *<package-name-m.mZx-distribution>*.tgz
7. Close the FTP session:

   bye

Connecting to the Console Port

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that may occur.

Backing Up the Current Configuration Files

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

```
user@switch> save filename
```

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

Installing the Software Package

NOTE: **Before you install the software, back up any critical files in /var/home. For more information regarding how to back up critical files, contact Customer Support at** http://www.juniper.net/support.

Install the software in one of two ways:

If the installation package resides locally on the switch, execute the **request system software add validate** *<pathname><source>* **reboot** command.

For example:

```
user@switch> request system software add validate
/var/tmp/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

If the Install Package resides remotely, execute the **request system software add validate** *<pathname><source>* **reboot** command.

For example:

```
user@switch# request system software add validate
ftp://ftpserver/directory/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

Related Documentation

- **request system software add on page 394**
- *Junos® OS Installation and Upgrade Guide*

Upgrading Software on a QFabric System

The QFabric system software package contains software for all of the different components in the QFabric system, such as the Director group, Interconnect devices, Node devices, and other QFabric system components. You can upgrade the software on all of the QFabric components at the same time using the **request system software add** ***package-name*** **component all reboot** command.

NOTE: Downgrading software on a QFabric system is not supported.

This topic describes the following tasks:

- Backing Up the Current Configuration Files on page 135
- Downloading Software Files Using a Browser on page 135
- Retrieving Software Files for Download on page 136
- Installing the Software Package on the Entire QFabric System on page 136

Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@switch> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@switch> request system software configuration-backup /media/USB/
```

Downloading Software Files Using a Browser

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website https://www.juniper.net/registration/Register.jsp .

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install package you want to download in the **QFabric System Install Package** section:
   - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
   - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see "Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device" on page 111.

   A login screen appears.
7. Enter your user ID and password and click **Login**.
8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-*version*.rpm** file on your computer.

Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

  ```
  user@switch> request system software download /path/package-name
  ```

  For example:

  ```
  user@switch> request system software download
  ftp://server/files/jinstall-qfabric-11.3X30.6.rpm
  ```

Installing the Software Package on the Entire QFabric System

NOTE: On a QFabric system, a QFX3500 Node device or QFX3600 Node device might not be able to participate as a Node device in the QFabric system if the Node device is running a different version of software from that of the Director group. This mismatch of software versions between the Node device and the Director group can occur when the Node device is introduced into the setup, and both Director devices go offline before the Node device completes its auto-upgrade process to upgrade its software version to the same software version running on the Director group. The workaround is to reboot the QFX3500 or QFX3600 Node device once the Director group comes back online. The QFX3500 or QFX3600 Node device will initiate auto-upgrade and upgrade its software version from the Director group.

1. Issue the **request system software add *package-name* component all reboot** command.

   For example:

   ```
   user@switch> request system software add jinstall-qfabric-11.3X30.6.rpm component all
   reboot
   ```

NOTE: If you receive an error message after issuing the **request system software add *package-name* component all reboot** command that says that the configuration file cannot be loaded as is, you will need to enter configuration mode, make any necessary changes to the configuration file, and then commit the changes.

NOTE: The default value for a QFabric system software upgrade is **validate**. The validation step adds up to 10 minutes to the overall software upgrade. If the validation fails, the upgrade does not proceed and the QFabric system automatically issues the **request system software rollback** command to restore the current software image. If you upgrade more than one component (for example, by issuing the **component all** option), validation failure on one device stops the upgrade process for the other devices. If you do not want to validate the software package against the current configuration, issue the **no-validate** option.

2. After the reboot has finished, verify that the new version of software has been properly installed by issuing the **show version component all** command.

```
user@switch> show version component all

Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see "Configuring a DHCP Server on Switches (CLI Procedure)" on page 143.

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in Table 45 on page 143. Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

Table 45: DHCP Client Settings

Configuration Statement	Description
client-identifier	Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.
lease-time	Ttime in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.
retransmission-attempt	Number of times the client attempts to retransmit a DHCP packet.
retransmission-interval	Time between transmission attempts.
server-address	IP address of the server that the client queries for an IP address.
update-server	TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.
vendor-option	Vendor class ID (CPU's manufacturer ID string) for the DHCP client.

Related Documentation

Configuring a DHCP Server on Switches (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, optional reconfiguration of default settings on DHCP clients and configuration of a DHCP server. This topic covers configuration of the DHCP server. For directions for reconfiguring a DHCP client, see "Configuring a DHCP Client (CLI Procedure)" on page 142.

You can configure either of two versions of a DHCP server on a switch—either the extended server version or the legacy server version. We recommend that you use the extended

server configuration unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. Configuring an Extended DHCP Server on a Switch on page 144
2. Configuring a Legacy DHCP Server on a Switch (CLI Procedure) on page 145

Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before assigning them to clients.

1. Create an address pool for DHCP IP addresses:

   ```
   [edit]
   user@switch# set access address-pool address-pool
   ```

2. Configure addresses for DHCP dynamic assignment:

   ```
   [edit access address-assignment]
   user@switch# set pool address-pool-name
   ```

3. Create a server group on the switch, providing a group name and an interface for DHCP:

   ```
   [edit system services dhcp-local-server]
   user@switch# set group group-name interface interface-name
   ```

4. Optionally, process the information protocol data units (PDUs):

   ```
   [edit system services dhcp-local-server]
   user@switch# set overrides process-inform
   ```

5. Optionally, redefine the order of attribute matching for pool selection:

   ```
   [edit system services dhcp-local-server]
   user@switch# set pool-match-order ip-address-first
   ```

6. Optionally, enable dynamic reconfiguration triggered by the DHCP extended server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces:

   ```
   [edit system services dhcp-local-server]
   user@switch# set reconfigure
   ```

   ```
   [edit system services dhcp-local-server group group-name]
   user@switch# set reconfigure
   ```

Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

   ```
   [edit system services dhcp]
   user@switch# set pool (Legacy DHCP) network-range
   ```

   NOTE: Step 2 through step 15 assign global values at the [edit system services dhcp] hierarchy level. You can also assign the same values to a specific pool using those same commands at the [edit system services dhcp pool *network-range*] hierarchy level.

2. Optionally, change the domain search list used to resolve hostnames:

   ```
   [edit system services dhcp]
   user@switch# set domain-search [ domain-list ]
   ```

3. Optionally, change the domain name server (DNS) name that the DHCP server advertises to clients:

   ```
   [edit system services dhcp]
   user@switch# set name-server address
   ```

4. Optionally, change the DHCP options:

   ```
   [edit system services dhcp]
   user@switch# set option id-number
   ```

5. Optionally, change the devices advertised to clients:

   ```
   [edit system services dhcp]
   user@switch# set router  address
   ```

6. Optionally, change the SIP server:

   ```
   [edit system services dhcp]
   user@switch# set sip-server addresses-or-names
   ```

   For more information, see *Configuring a DHCP SIP Server (CLI Procedure)*.

7. Optionally, change the DHCP client's hardware address:

   ```
   [edit system services dhcp]
   user@switch# set static-binding mac-address
   ```

8. Optionally, change the NetBIOs name server:

   ```
   [edit system services dhcp]
   user@switch# set wins-server address
   ```

Configuring a DNS Name Server for Resolving a Hostname into Addresses

To have the router or switch resolve hostnames into addresses, you must configure one or more Domain Name System (DNS) name servers by including the **name-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
name-server {
  address;
}
```

The following example shows how to configure two DNS name servers:

```
[edit]
user@switch# set system name-server 192.168.1.253
[edit]
user@switch# set system name-server 192.168.1.254
[edit]
user@switch# show
system {
  name server {
    192.168.1.253;
    192.168.1.254;
  }
}
```

Related Documentation

- name-server on page 273

Configuring the Domain Name for the Router or Switch

For each router or switch, you should configure the name of the domain in which the router or switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.

To configure the domain name, include the **domain-name** statement at the **[edit system]** hierarchy level:

```
[edit system]
domain-name domain-name;
```

The following example shows how to configure the domain name:

```
[edit]
user@host# set system domain-name company.net
[edit]
user@host# show
system {
  domain-name company.net;
}
```

Related Documentation

- *domain-name*

- domain-name on page 257
- Example: Configuring the Domain Name for the Router or Switch on page 184

Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains

If your router or switch is included in several different domains, you can configure those domain names to be searched.

To configure more than one domain to be searched, include the **domain-search** statement at the **[edit system]** hierarchy level:

```
[edit system]
domain-search [ domain-list ];
```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched:

```
[edit system]
domain-search [ domainone.net domainonealternate.com ]
```

Related Documentation

- Example: Configuring the Domain Name for the Router or Switch on page 184
- *Configuring a DNS Name Server for Resolving a Hostname into Addresses*

  Configuring a DNS Name Server for Resolving a Hostname into Addresses on page 146

Configuring the Hostname of the Router or Switch

To configure the name of the router or switch, include the **host-name** statement at the **[edit system]** hierarchy level:

```
[edit system]
host-name hostname;
```

The name value must be less than 256 characters.

- host-name on page 260

Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

NOTE: By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

alarm-name is the name of an alarm.

Related Documentation

- *System-Wide Alarms and Alarms for Each Interface Type*
- *Chassis Conditions That Trigger Alarms*
- *Silencing External Devices Connected to Alarm Relay Contacts*

Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch

By default, the router or switch sends protocol redirect messages. To disable the sending of redirect messages by the router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-redirects;
```

To reenable the sending of redirect messages on the router or switch, delete the **no-redirects** statement from the configuration.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]** hierarchy level.

Related Documentation

- *Configuring the Junos OS to Ignore ICMP Source Quench Messages*
- Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets on page 151
- *Junos® OS Network Interfaces*

Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

  ```
  [edit system]
  no-ping-record-route;
  ```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

  ```
  [edit system]
  no-ping-time-stamp;
  ```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

Related Documentation

- *Configuring the Junos OS to Disable the Routing Engine Response to Multicast Ping Packets*

Configuring the Junos OS to Display a System Login Announcement

By default, no login announcement is displayed. To configure a system login announcement, include the **announcement** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
announcement text;
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

TIP: You can use the same special characters described to format your system login announcement.

Related Documentation

- *Defining Junos OS Login Classes*
- *Configuring the Junos OS to Display a System Login Message*

Configuring the Junos OS to Display a System Login Message

By default, no login message is displayed on the router or switch. To configure a system login message, include the **message** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
```

message *text*;

If the message text contains any spaces, enclose it in quotation marks.

You can format the message using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

The following is a sample login message configuration:

```
[edit]
system {
    login {
        message "\n\n\n\tUNAUTHORIZED USE OF THIS SYSTEM\n
                 \tIS STRICTLY PROHIBITED!\n\n\tPlease contact
                 \'company-noc@company.com\' to gain\naccess
                 to this equipment if you need authorization.\n\n\n";
        }
    }
}
```

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet router1
Trying 1.1.1.1...
Connected to router1.
Escape character is '^]'.

          UNAUTHORIZED USE OF THIS SYSTEM
          IS STRICTLY PROHIBITED!

          Please contact 'company-noc@company.com' to gain
          access to this equipment if you need authorization.

router1 (ttyp0)

login:
```

A system login message appears before the user logs in. A system login announcement appears after the user logs in.

Related Documentation

- *Defining Junos OS Login Classes*
- message on page 267

Configuring the Junos OS to Extend the Default Port Address Range

By default, the upper range of a port address is 5000. You can increase the range from which the port number can be selected to decrease the probability that someone can determine your port number.

- To configure the Junos OS to extend the default port address range, include the **source-port** statement at the **[edit system internet-options]** hierarchy level:

```
[edit system internet-options]
source-port upper-limit upper-limit;
```

upper-limit *upper-limit* is the upper limit of a source port address and can be a value from 5000 through 65,355.

Related Documentation

- *Configuring the Junos OS to Disable TCP RFC 1323 Extensions*
- *Configuring the Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses*
- source-port on page 293

Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

To limit the rate at which ICMPv4 messages can be generated and received by the Routing Engine, include the **icmpv4-rate-limit** statement at the **[edit system internet-options]** hierarchy level:

```
icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
```

The bucket size is the number of seconds in the rate-limiting bucket. The packet rate is the rate-limiting packets earned per second. Specify a **bucket-size** from 0 through 4294967295 seconds. The default value is 5 seconds. Specify a **packet-rate** from 0 through 4,294,967,295. The default value is 1000.

Related Documentation

- icmpv4-rate-limit on page 260

Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets

By default, the source address included in locally generated Transmission Control Protocol/IP (TCP/IP) packets, such as FTP traffic, and in User Datagram Protocol (UDP) and IP packets, such as Network Time Protocol (NTP) requests, is chosen as the local address for the interface on which the traffic is transmitted. This means that the local address chosen for packets to a particular destination might change from connection to connection based on the interface that the routing protocol has chosen to reach the destination when the connection is established. If multiple equal-cost next hops are present for a destination, locally generated packets use the **lo0** address as a source.

- To configure the software to select a fixed address to use as the source for locally generated IP packets, include the **default-address-selection** statement at the **[edit system]** hierarchy level:

```
[edit system]
default-address-selection;
```

If you include the **default-address-selection** statement in the configuration, the Junos OS chooses the system default address as the source for most locally generated IP packets. The default address is usually an address configured on the **lo0** loopback interface. For example, if you specified that SSH and telnet use a particular address, but you also have **default-address selection** configured, the system default address is used.

Configuring NTP Authentication Keys

Time synchronization can be authenticated to ensure that the switch obtains its time services only from known sources. By default, network time synchronization is unauthenticated. The switch will synchronize to whatever system appears to have the most accurate time. We strongly encourage you to configure authentication of network time services.

To authenticate other time servers, include the **trusted-key** statement at the **[edit system ntp]** hierarchy level. Only time servers that transmit network time packets containing one of the specified key numbers are eligible to be synchronized. Additionally, the key needs to match the value configured for that key number. Other systems can synchronize to the local switch without being authenticated.

```
[edit system ntp]
trusted-key [ key-numbers ];
```

Each key can be any 32-bit unsigned integer except 0. Include the **key** option in the **peer**, **server**, or **broadcast** statements to transmit the specified authentication key when transmitting packets. The key is necessary if the remote system has authentication enabled so that it can synchronize to the local system.

To define the authentication keys, include the **authentication-key** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
```

number is the key number, ***type*** is the authentication type (only Message Digest 5 [MD5] is supported), and ***password*** is the password for this key. The key number, type, and password must match on all systems using that particular key for authentication.

- Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 187
- trusted-key on page 313
- *authentication-key*

Configuring NTP Authentication Keys (QFabric System)

To configure the authentication keys using the CLI:

1. Configure the authentication-key number.

   ```
   [edit system ntp]
   user@switch# set authentication-key key-number
   ```

   For example, to specify key **5**:

   ```
   user@switch# set authentication-key 5
   ```

2. Specify the type of authentication you want to use.

   ```
   [edit system ntp]
   user@switch# set authentication-key type type
   ```

   

   NOTE: MD5 is the only authentication type supported.

   For example, to specify **MD5**:

   ```
   user@switch# set authentication-key type md5
   ```

Configuring the NTP Time Server and Time Services

When you use NTP, configure the router or switch to operate in one of the following modes:

- Client mode
- Symmetric active mode
- Broadcast mode
- Server mode

The following topics describe how to configure these modes of operation:

1. Configuring the Router or Switch to Operate in Client Mode on page 153
2. Configuring the Router or Switch to Operate in Symmetric Active Mode on page 154
3. Configuring the Router or Switch to Operate in Broadcast Mode on page 154
4. Configuring the Router or Switch to Operate in Server Mode on page 155

Configuring the Router or Switch to Operate in Client Mode

To configure the local router or switch to operate in client mode, include the **server** statement and other optional statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
```

```
server address <key key-number> <version value> <prefer>;
authentication-key key-number type type value password;
boot-server address;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement, as described in .

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in client mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$EgfcrvX7VY4ZEcwgoHjkP5Q3CuREyv87";
boot-server 10.1.1.1;
server 10.1.1.1 key 1 prefer;
trusted-key 1;
```

Configuring the Router or Switch to Operate in Symmetric Active Mode

To configure the local router or switch to operate in symmetric active mode, include the **peer** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
peer address <key key-number> <version value> <prefer>;
```

Specify the address of the remote system. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2 or 3, include the **version** option.

If you configure more than one remote system, you can mark one system preferred by including the **prefer** option:

```
peer address <key key-number> <version value> prefer;
```

Configuring the Router or Switch to Operate in Broadcast Mode

To configure the local router or switch to operate in broadcast mode, include the **broadcast** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast address <key key-number> <version value> <ttl value>;
```

Specify the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2, or 3, include the **version** option.

Configuring the Router or Switch to Operate in Server Mode

In server mode, the router or switch acts as an NTP server for clients when the clients are configured appropriately. The only prerequisite for " server mode" is that the router or switch must be receiving time from another NTP peer or server. No other configuration is necessary on the router or switch.

To configure the local router or switch to operate as an NTP server, include the following statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
server address <key key-number> <version value> <prefer>;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1,or 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in server mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$txERuBEreWx-wtuLNdboaUjH.T3AtOESe";
server 172.17.27.46 prefer;
trusted-key 1;
```

- Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 187

Configuring the NTP Time Server and Time Services (QFabric System)

To configure the external time server using the CLI:

1. Configure the IP address of the external time server.

   ```
   [edit system ntp]
   user@switch# set server address
   ```

   For example, to set an IP address of **10.1.1.1** for your external time server:

   ```
   user@switch# set server 10.1.1.1
   ```

2. (Optional) Configure the key number to encrypt authentication fields in packets that are sent to the external time server.

   ```
   [edit system ntp]
   user@switch# set server address key key-number
   ```

   For example, to set a key number of **1**:

   ```
   user@switch# set server address key 1
   ```

3. (Optional) Specify the external time server as a preferred host. Doing this enables the switch to synchronize with the external time server.

   NOTE: The switch can synchronize with the external time server, but the external time server cannot synchronize with the switch.

   ```
   [edit system ntp]
   user@switch# set server address prefer
   ```

4. (Optional) Specify the NTP version number to be used in outgoing NTP packets.

   ```
   user@switch# set server address version
   ```

   For example, to specify version **3**:

   ```
   user@switch# set server address version 3
   ```

- server on page 289

Specifying the Physical Location of the Switch

To specify the physical location of the switch, specify the following options for the **location** statement at the **[edit system]** hierarchy level:

- **altitude** *feet*—Number of feet above sea level.
- **building** *name*—Name of the building, 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code** *code*—Two-letter country code.
- **floor** *number*—Floor in the building.

- **hcoord** ***horizontal-coordinate***—Bellcore Horizontal Coordinate.
- **lata** ***service-area***—Long-distance service area.
- **latitude** ***degrees***—Latitude in degree format.
- **longitude** ***degrees***—Longitude in degree format.
- **npa-nxx** ***number***—First six digits of the phone number (area code and exchange).
- **postal-code** ***postal-code***—Postal code.
- **rack** ***number***—Rack number.
- **vcoord** ***vertical-coordinate***—Bellcore Vertical Coordinate.

The following example shows how to specify the physical location of the switch:

```
[edit system]
location {
    altitude feet;
    building name;
    country-code code;
    floor number;
    hcoord horizontal-coordinate;
    lata service-area;
    latitude degrees;
    longitude degrees;
    npa-nxx number;
    postal-code postal-code;
    rack number;
    vcoord vertical-coordinate;
}
```

Related Documentation

Configuring the Root Password

The Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user root with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as *root user*. The root user (also referred to as *superuser*) has unrestricted access and full permissions within the system. The expression "log in as root" is commonly used when an action requires you to log into the device as the root user.

NOTE: If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as the root user and gain root-level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level and configuring one of the password options:

```
[edit system]
root-authentication {
   (encrypted-password "password"| load-key-password URL | plain-text-password);
   ssh-dsa "public-key" <from hostname>;
   ssh-ecdsa "public-key" <from hostname>;
   ssh-rsa "public-key" <from hostname>;
}
```

NOTE: ECDSA is not supported on the QFabric system.

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
  - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
  - Valid passwords must contain at least one change of case or character class.

To enter a password that is already encrypted, use the following command to set the root password:

```
[edit system]
user@host# set root-authentication encrypted-password password
```

To view the encrypted password entries, use the configuration mode **show** command. For example:

```
[edit system]
```

```
user@host# show
root-authentication {
    "$1$ZUIES4dp$OUwWo1g7cLoV/aMWPHUnC/",##SECRET-DATA
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@host# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

To view the encrypted password entries, use the configuration mode **show** command. For example:

```
[edit system]
user@host# show
root-authentication {
    "$1$ZUIES4dp$OUwWo1g7cLoV/aMWPHUnC/",##SECRET-DATA
}
```

You can use the **load-key-file** *URL filename* statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file** *URL* statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Optionally, you can use the **ssh-dsa**, **ssh-ecdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA (not supported on the QFabric system) keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@host# set root-authentication load-key-file
    scp://user@1.2.3.4/home/test/.ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
    ssh-dsa "1024 35 9727638204084251055468226757249864241630322
        2074049625283903820386901415845349641700196106083587229 6
        1563475749182736033612764418742659468932077391083448101 2
        6831259577226254616679992783161235004386609158662838224 8
        9746732605661192148953981396556156378621194032768706538
        1696020274916416373591326939634400844 3 boojum@juniper.net"; #
        SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot

configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

Configuring the Router or Switch to Listen for Broadcast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet by including the **broadcast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast-client;
```

When the router or switch detects a broadcast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *broadcast client* mode, in which it listens for, and synchronizes to, succeeding broadcast messages.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

Related Documentation

- Configuring the Router or Switch to Listen for Multicast Messages Using NTP on page 160
- Configuring the NTP Time Server and Time Services on page 153
- Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 187

Configuring the Router or Switch to Listen for Multicast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet by including the **multicast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
multicast-client <address>;
```

When the router or switch receives a multicast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *multicast client* mode, in which it listens for, and synchronizes to, succeeding multicast messages.

You can specify one or more IP addresses. (You must specify an address, not a hostname.) If you do, the router or switch joins those multicast groups. If you do not specify any addresses, the software uses **224.0.1.1**.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

Related Documentation

Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]
login-alarms;
```

For more information on the **show system alarms** command, see the CLI Explorer.

Related Documentation

- *System Alarms on J Series Routers*
- show system alarms on page 914

Configuring Time-Based User Access

The Junos OS enables you to configure time-based restrictions for user access to log in to a device. This is useful for restricting the time and duration of user logins for all users belonging to a login class. You can specify the days of the week when users can log in, the access start time, and the access end time.

- To configure user access on specific days of the week, without any restrictions on the duration of login, include the **allowed-days** statement only.

  ```
  [edit system]
  login {
    class class-name {
      allowed-days [ days-of-the-week ];
    }
  ```

- To configure user access on all the days of the week for a specific duration, include the **access-start** and **access-end** statements only.

  ```
  [edit system]
  login {
    class class-name {
      access-start HH:MM;
      access-end HH:MM;
  ```

```
    }
  }
```

- To configure user access on specific days of the week for a specified duration, include the **allowed-days**, **access-start**, and **access-end** statements.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

Specify the start time and end time in ***HH:MM*** (24-hour) format, where ***HH*** represents the hours and ***MM*** represents the minutes.

NOTE: Access start time and end time that spans across 12:00 AM on a specified day results in the user having access until the next day, even if the access day is not explicitly configured. For instance, the following configuration results in the user having access until 6:00 AM on Tuesday and Thursday, although the **allowed-days** statement specifies access only on Monday and Wednesday:

```
[edit system]
login {
  class operator-night-shift {
    allowed-days [ monday wednesday ];
    access-start 2000;
    access-end 0600;
  }
}
```

Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until

a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.
Warning: session will be closed in 1 minute if there is no activity
Warning: session will be closed in 10 seconds if there is no activity
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

- idle-timeout on page 261

Configuring a QFX3500 Device as a Standalone Switch

If you are using the QFX3500 device as a standalone switch, you must perform the initial configuration of the QFX3500 device through the console port using the command-line interface (CLI). If you are using the QFX3500 as a Node device in a QFX3000 QFabric system, you instead perform the initial setup of a QFabric system on a QFX3100 Director device (see "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335).

Before you begin connecting and configuring a QFX3500 device, set the following parameter values on the console server or PC:

- Baud Rate—9600
- Flow Control—None
- Data—8
- Parity—None
- Stop Bits—1
- DCD State—Disregard

To connect and configure the device from the console:

1. Connect the console port to a laptop or PC using the supplied RJ-45 cable and RJ-45 to DB-9 adapter. The console (**CON**) port is located on the front panel of the device.
2. Log in as **root**. There is no password. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

   ```
   login: root
   ```
3. Start the CLI.

   ```
   root@% cli
   ```
4. Enter configuration mode.

   ```
   root> configure
   ```
5. Add a password to the root administration user account.

   ```
   [edit]
   root@# set system root-authentication plain-text-password
   New password: password
   Retype new password: password
   ```
6. (Optional) Configure the name of the device. If the name includes spaces, enclose the name in quotation marks (“ ”).

   ```
   [edit]
   root@# set system host-name host-name
   ```
7. Configure the default gateway.

   ```
   [edit]
   root@# set routing-options static route default next-hop address
   ```
8. Configure the IP address and prefix length for the device management interface.

   ```
   [edit]
   root@# set interfaces me0 unit 0 family inet address address/prefix-length
   ```

   CAUTION: Configuring the two management Ethernet interfaces within the same subnet is not supported.

   NOTE: The management ports are on the front panel of the QFX3500 device. They are labeled C0 and C1 on the front panel. In the CLI they are referred to as me0 and me1.
9. (Optional) Configure the static routes to remote prefixes with access to the management port.

   ```
   [edit]
   root@# set routing-options static route remote-prefix next-hop destination-ip retain
   no-readvertise
   ```
10. Enable telnet service.

    ```
    [edit]
    root@# set system services telnet
    ```

NOTE: When Telnet is enabled, you cannot log in to a QFX3500 device through Telnet using root credentials. Root login is allowed only for SSH access.

11. Commit the configuration to activate it on the device.

```
[edit]
root@# commit
```

Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from http://www.juniper.net/customers/support/ .

NOTE: In the following procedure, we assume that you are creating the emergency boot device on a QFX3500 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX3500 device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the QFX3500 device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

NOTE: The password is the root password for the QFX3500 device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command:

   ```
   root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
   ```

   The device writes the installation media image to the USB device:

   ```
   root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
   11006+1 records in
   11006+1 records out
   180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
   ```

6. Log out of the shell:

   ```
   root@device% exit
   % exit
   user@device>
   ```

Creating a Snapshot and Using It to Boot a QFX Series Switch

The system snapshot feature takes a "snapshot" of the files currently used to run the QFX Series switch—the complete contents of the **/config** and **/var** directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

- Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 166
- Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 167

Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the QFX Series switch USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

   ```
   user@switch> request system snapshot partition
   ```

NOTE: This example uses the partition option. If you have already created a partition for the snapshot, you don't need to use the partition option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.

   - To reboot the switch using the most recently created snapshot:

     user@switch> request system reboot

   - To reboot the switch using a snapshot in a specific partition on the USB flash drive:

     user@switch> request system reboot slice 1

Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:

   user@switch> request system snapshot partition

NOTE: This example uses the partition option. If you have already created a partition for the snapshot, you don't need to use the partition option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.

   - To reboot the switch using the most recently created snapshot:

     user@switch> request system reboot

   - To reboot the switch using a snapshot in a specific partition in internal memory:

     user@switch> request system reboot slice 1

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

Aug 21 12:36:30

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

```
Aug 21 12:36:30.401 2006
```

NOTE: Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the **[edit system syslog file *filename*]** hierarchy level along with the **time-format** statement, the **time-format** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

Mapping the Hostname of the Switch to IP Addresses

To map a hostname of a switch to one or more IP addresses, include the **inet** statement at the **[edit system static-host-mapping *hostname*]** hierarchy level:

```
[edit system]
static-host-mapping {
  hostname {
    inet [ addresses ];
    alias [ aliases ];
  }
}
```

hostname is the name specified by the **host-name** statement at the **[edit system]** hierarchy level.

For each host, you can specify one or more aliases.

Methods for Configuring Junos OS

You can use any of the methods shown in Table 46 on page 169 to configure Junos OS:

Table 46: Methods for Configuring Junos OS

Method	Description
Command-line interface (CLI)	Create the configuration for the device using the CLI. You can enter commands from a single command line, and scroll through recently executed commands.
ASCII file	Load an ASCII file containing a configuration that you created earlier, either on this system or on another system. You can then activate and run the configuration file, or you can edit it using the CLI and then activate it.
J-Web graphical user interface (GUI)	Use the J-Web graphical user interface (GUI) to configure the device. J-Web enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser. The J-Web GUI is preinstalled on J Series Services Routers and is an optional software package that can be installed on M Series and T Series routers. J-Web is not available for the QFX Series.
Junos XML management protocol (API)	Use Junos XML protocol Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the Junos XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The Junos XML management protocol is customized for Junos OS, and operations in the API are equivalent to those in the Junos OS CLI.
NETCONF application programming interface (API)	Use NETCONF Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the NETCONF XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The NETCONF XML management protocol includes features that accommodate the configuration data models of multiple vendors.
Configuration commit scripts	Create scripts that run at commit time to enforce custom configuration rules. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). Commit scripts are not available for the QFX Series.

The following sections contain complete descriptions of the methods you can use to configure Junos OS:

- Junos OS Command-Line Interface (CLI) on page 170
- ASCII File on page 170

- J-Web Package on page 170
- Junos XML Management Protocol Software on page 171
- NETCONF XML Management Protocol Software on page 171
- Configuration Commit Scripts on page 171

Junos OS Command-Line Interface (CLI)

The Junos OS CLI is a straightforward command interface. You use Emacs-style keyboard sequences to move around on a command line and scroll through a buffer that contains recently executed commands. You type commands on a single line, and the commands are executed when you press the Enter key. The CLI also provides command help and command completion. For more information about the CLI, see the *CLI User Guide* and CLI Explorer.

ASCII File

You can load an ASCII file containing a configuration that you created earlier, either on this system or another system. You can then activate and run the configuration file as is, or you can edit it using the CLI and then activate it.

J-Web Package

As an alternative to entering CLI commands, the Junos OS supports the J-Web graphical user interface (GUI). The J-Web user interface enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled.

The J-Web user interface is preinstalled on J Series Services Routers. It is provided as an optional, licensed software package (jweb package) on M Series and T Series routers. The jweb package is not included in jinstall and jbundle software bundles. It must be installed separately. To install the package on M Series and T Series routers, follow the procedure described in the *Junos® OS Installation and Upgrade Guide*.

J-Web supports weak (56-bit) encryption by default. This enables international customers to install J-Web and use HTTPS connections for J-Web access. Domestic customers can also install the jcrypto strong encryption package. This package automatically overrides the weak encryption. For more information about the J-Web GUI, see the *J-Web Interface User Guide*.

NOTE: Because the J-Web package is bundled separately from other packages, it is possible to have a version mismatch between J-Web and other Junos OS packages you have installed.

To check for a version mismatch, use the **show system alarms** CLI command. If the version number does not match exactly, a system alarm appears. For example, if you install the 7.4R1.2 jroute package and the 7.4R1.1 jweb package, an alarm is activated. For more information on the **show system alarms** command, see the CLI Explorer.

Junos XML Management Protocol Software

The Junos XML management protocol is an Extensible Markup Language (XML) application that client applications use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and operations in the API are equivalent to Junos OS CLI configuration mode commands. The Junos XML management protocol includes a set of Perl modules that enable client applications to communicate with a Junos XML protocol server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and Junos XML management protocol software, see the *Junos XML Management Protocol Developer Guide*.

NETCONF XML Management Protocol Software

The NETCONF XML management protocol is an Extensible Markup Language (XML) application that client applications can use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and includes features that accommodate the configuration data models of multiple vendors. The NETCONF XML management protocol includes a set of Perl modules that enable client applications to communicate with a NETCONF server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and NETCONF XML management protocol software, see the *NETCONF XML Management Protocol Guide*.

Configuration Commit Scripts

You can create and use scripts that run at commit time to enforce custom configuration rules. If a configuration breaks the custom rules, the script can generate actions that the Junos OS performs. These actions include:

- Generating custom error messages
- Generating custom warning messages
- Generating custom system log messages
- Making changes to the configuration

Configuration commit scripts also enable you to create macros, which expand simplified custom aliases for frequently used configuration statements into standard Junos configuration statements. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). For more information, see the *Junos OS Configuration and Operations Automation Guide*.

Related Documentation

- *Junos OS Configuration from External Devices*

Modifying the Default Time Zone for a Router or Switch Running Junos OS

The default local time zone on the router or switch is UTC (Coordinated Universal Time, formerly known as Greenwich Mean Time, or GMT).

- To modify the local time zone, include the **time-zone** statement at the **[edit system]** hierarchy level:

```
[edit system]
time-zone (GMT hour-offset | time-zone);
```

You can use the **GMT *hour-offset*** option to set the time zone relative to UTC (GMT) time. By default, ***hour-offset*** is **0**. You can configure this to be a value from **–14** to **+12**.

You can also specify the ***time-zone*** value as a string such as PDT (Pacific Daylight Time) or WET (Western European Time), or specify the continent and major city.

NOTE: Junos OS complies with the POSIX time-zone standard, which is counter-intuitive to the way time zones are generally indicated relative to UTC. A time zone ahead of UTC (east of the Greenwich meridian) is commonly indicated as GMT +*n*; for example, the Central European Time (CET) zone is indicated as GMT +1. However, this is not true for POSIX time zone designations. POSIX indicates CET as GMT-1. If you include the **set system time-zone GMT+1** statement for a router in the CET zone, your router time will be set to one hour behind GMT, or two hours behind the actual CET time. For this reason, you might find it easier to use the POSIX time-zone strings, which you can list by entering **set system time-zone ?**.

For the time zone change to take effect for all processes running on the router or switch, you must reboot the router or switch.

The following example shows how to change the current time zone to **America/New_York**:

```
[edit]
user@host# set system time-zone America/New_York
[edit]
user@host# show
system {
   time-zone America/New_York;
}
```

Related Documentation

- NTP Time Server and Time Services Overview on page 52
- Setting a Custom Time Zone on Routers or Switches Running Junos OS on page 175

Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
  <[Enter]>            Execute this command
```

```
  at                  Time at which to perform the operation
  in                  Number of minutes to delay before operation
  media               Boot media for next boot
  message             Message to display to all users
  |                   Pipe through a command
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
  <[Enter]>           Execute this command
  at                  Time at which to perform the operation
  in                  Number of minutes to delay before operation
  media               Boot media for next boot
  message             Message to display to all users
  |                   Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says "Hardware-based members will halt, Virtual Junos Routing Engines will reboot." If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. [edit]
   user@switch# **load factory-default**
   [edit]
   user@switch# **delete system commit factory-settings**
   [edit]
   user@switch# **commit**

Related Documentation

- Reverting to the Rescue Configuration on page 175

Reverting to the Default Factory Configuration by Using the request system zeroize Command

The **request system zeroize** command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the **request system zeroize media** command.

CAUTION: Before issuing request system zeroize, use the request system snapshot command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the **request system zeroize** command:

1. `user@switch>` **request system zeroize**
   `warning: System will be rebooted and may not boot without configuration`
   `Erase all data, including configuration and log files? [yes,no] (yes)`
2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch. See or "Configuring a QFX3500 Device as a Standalone Switch" on page 163

Related Documentation

- request system zeroize on page 433

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   ```
   [edit]
   user@switch# load override filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit filename
   ```

Saving Core Files Generated by Junos OS Processes

By default, when an internal Junos OS process generates a core file, the file and associated context information are saved for debugging purposes in a compressed tar file named **/var/tmp/*process-name*.core.*core-number*.tgz**. The contextual information includes the configuration and system log message files.

- To disable the saving of core files and associated context information:

  ```
  [edit system]
  no-saved-core-context;
  ```

- To save the core files only:

  ```
  [edit system]
  saved-core-files number;
  ```

  Where ***number*** is the number of core files to save and can be a value from 1 through 10.

- To save the core files along with the contextual information:

  ```
  [edit system]
  saved-core-context;
  ```

Related Documentation

- Viewing Core Files from Junos OS Processes on page 181

Setting a Custom Time Zone on Routers or Switches Running Junos OS

You can update the time zone database information on routers or switches running Junos OS. This feature simplifies time zone management in devices running Junos OS by allowing

for future unforeseen time zone database adjustments. You can configure your router or switch to use a custom time zone database file that you create to meet your requirements by editing an existing time zone database file.

Tasks for setting a custom time zone are:

1. Importing and Installing Time Zone Files on page 176
2. Configuring a Custom Time Zone on page 177

Importing and Installing Time Zone Files

To import and install time zone files, follow these steps:

1. Download the time zone files archive and untar them to a temporary directory such as **/var/tmp**:

```
# mkdir -p /var/tmp/tz && cd /var/tmp/tz && rm *
# wget 'ftp://ftp.iana.org/tz/tzdata-latest.tar.gz'
# tar xvzf tzdata*.gz
africa
antarctica
asia
australasia
europe
northamerica
southamerica
pacificnew
etcetera
factory
backward
systemv
solar87
solar88
solar89
iso3166.tab
zone.tab
leapseconds
yearistype.sh
```

NOTE: If needed, you can edit the above untarred files to create or modify time zones.

2. Select the names of time zone files to compile and feed them to the following script. For example, to generate **northamerica** and **asia** tz files:

```
# /usr/libexec/ui/compile-tz northamerica asia
```

3. Enable the use of the generated tz files using the CLI:

```
[edit]
# set system use-imported-time-zones
[edit]
# set system time-zone ?
```

This should show the newly generated tz files in **/var/db/zoneinfo/**.

4. Set the time zone and commit the configuration:

```
[edit]
# set system time-zone <your-time-zone>
# commit
```

5. Verify that the time zone change has taken effect:

```
[edit]
# run show system uptime
```

Configuring a Custom Time Zone

To use a custom time zone, follow these steps:

1. Download a time zones archive (from a known or designated source) to the router or switch. Compile the time zone archive using the *zic* time zone compiler, which generates *tz* files.
2. Using the CLI, configure the router or switch to enable the use of the generated tz files as follows:

```
[edit]
user@host# set system use-imported-time-zones
```

3. Display the imported time zones (saved in the directory **/var/db/zoneinfo/**):

```
[edit]
user@host# set system time-zone ?
```

   If you do not configure the router to use imported time zones, the Junos OS default time zones are shown (saved in the directory **/usr/share/zoneinfo/**).

- *NTP Overview*
- NTP Time Server and Time Services Overview on page 52
- Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 187
- *use-imported-time-zones*

Setting the Date and Time

To set the date and time from a QFX Series product:

NOTE: **The set date command is not operational on the QFabric system.**

1. Enter operational mode in the CLI.
2. Enter the following command:

```
user@switch> set date YYYYMMDDHHMM.ss source-address
```

   For example, the following command sets the date and time.

```
user@switch# set date 201102151010.55
```

3. To set the date and time from an NTP server, enter the following command:

   ```
   user@switch# set date ntp servers
   ```

   For example, the following command sets the date and time from an NTP server:

   ```
   user@switch# set date ntp 200.40.40.1
   ```

4. To set the date and time from more than one NTP server, enter the same command:

   ```
   user@switch# set date ntp servers
   ```

   For example, the following command sets the date and time from more than one NTP server:

   ```
   user@switch# set date ntp 200.40.40.1 200.40.40.2
   ```

Related Documentation

- *set date*

Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

NOTE: Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect: **allow-commands = "(monitor.*)|(ping.*)|(show.*)|(exit)"** . Instead, you must specify the expression using the following syntax: **allow-commands** = **"(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands ="^(monitor | ping | show | exit)"**

- *deny-commands*

Synchronizing and Coordinating Time Distribution Using NTP

Using NTP to synchronize and coordinate time distribution in a large network involves these tasks:

1. Configuring NTP on page 180
2. Configuring the NTP Boot Server on page 180
3. Specifying a Source Address for an NTP Server on page 181

Configuring NTP

- To configure NTP on the router or switch, include the **ntp** statement at the **[edit system]** hierarchy level:

```
[edit system]
ntp {
    authentication-key number type type value password;
    boot-server (address | hostname);
    broadcast <address> <key key-number> <version value> <ttl value>;
    broadcast-client;
    multicast-client <address>;
    peer address <key key-number> <version value> <prefer>;
    server address <key key-number> <version value> <prefer>;
    source-address source-address;
    trusted-key [ key-numbers ];
}
```

Configuring the NTP Boot Server

When you boot the router or switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP will not be able to synchronize to a time server if the server's time appears to be very far off of the local router's or switch's time.

- To configure the NTP boot server, include the **boot-server** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
boot-server (address | hostname);
```

Specify either the IP address or the hostname of the network server.

Specifying a Source Address for an NTP Server

For IP version 4 (IPv4), you can specify that if the NTP server configured at the **[edit system ntp]** hierarchy level is contacted on one of the loopback interface addresses, the reply always uses a specific source address. This is useful for controlling which source address NTP uses to access your network when it is either responding to or sending an NTP client request from your network.

To configure the specific source address that the reply will always use, and the source address that requests initiated by NTP server will use, include the **source-address** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

NOTE: If a firewall filter is applied on the loopback interface, ensure that the source address specified for the NTP server at the **[edit system ntp]** hierarchy level is explicitly included as one of the match criteria in the firewall filter. This enables the Junos OS to accept traffic on the loopback interface from the specified source address.

The following example shows a firewall filter with the source address 10.0.10.100 specified in the **from** statement included at the **[edit firewall filter *firewall-filter-name*]** hierarchy:

```
[edit firewall filter Loopback-Interface-Firewall-Filter]
term Allow-NTP {
  from {
    source-address {
      172.17.27.46/32; // IP address of the NTP server
      10.0.10.100/32; // Source address specified for the NTP server
      }
    then accept;
  }
}
```

If no source address is configured for the NTP server, include the primary address of the loopback interface in the firewall filter.

Viewing Core Files from Junos OS Processes

When an internal Junos process generates a core file, the output found at **/var/crash/** and **/var/tmp/** can now be viewed. This provides a quick method of finding core issues across large networks.

Use the CLI command **show system core-dumps** to view core files.

```
root@host> show system core-dumps
-rw-------  1 root  wheel  268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw----  1 root  field    3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r--  1 root  wheel   27775914 Jun 18 17:59 /var/crash/kernel.0
```

Configuration Examples

- Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 182
- Example: Configuring the Domain Name for the Router or Switch on page 184
- Example: Configuring the Name of the Switch, IP Address, and System ID on page 184
- Example: Configuring NTP on page 185
- Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 187
- Example: Configuring a Plain-Text Password for Root Logins on page 188
- Example: Configuring the Root Password on page 189

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- Requirements on page 182
- Overview on page 182
- Configuration on page 183

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numerics**, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12

set system login password maximum-length 22

set system login password minimum-numerics 1

set system login password minimum-upper-cases 1

set system login password minimum-lower-cases 1

set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure

This example configures password requirements that require the user to creat a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.

   ```
   user@host> edit
   [edit]
   user@host# edit system login password
   ```

2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

   ```
   [edit system login password]
   user@host# set minimum-length 12
   [edit system login password]
   user@host# set maximum-length 22
   ```

3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

   ```
   [edit system login password]
   user@host# set minimum-lower-cases 1
   [edit system login password]
   user@host# set minimum-upper-cases 1
   ```

4. Require users to set a password that has at least one punctuation-class character and at least one number.

   ```
   [edit system login password]
   user@host# set minimum-punctuations 1
   [edit system login password]
   user@host# set minimum-numerics 1
   ```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. if the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numerics 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

Example: Configuring NTP

The Network Time Protocol (NTP) provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network. NTP uses a returnable-time design in which a distributed subnet of time servers operating in a self-organizing, hierarchical primary-secondary configuration synchronizes local clocks within the subnet and to national time standards by means of wire or radio. The servers also can redistribute reference time using local routing algorithms and time daemons.

This example shows how to configure NTP:

- Requirements on page 185
- Overview on page 185
- Configuration on page 185
- Verification on page 186

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later
- A switch connected to a network on which an NTP boot server and NTP server reside

Overview

Debugging and troubleshooting are much easier when the timestamps in the log files of all switches are synchronized, because events that span a network can be correlated with synchronous entries in multiple logs. We recommend using the Network Time Protocol (NTP) to synchronize the system clocks of your switch and other network equipment.

In this example, an administrator wants to synchronize the time in a switch to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date are obtained when the router or switch boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme is used to hash the key value for authentication, which prevents the switch from synchronizing with an attacker's host that is posing as the time server.

Configuration

To configure NTP:

CLI Quick Configuration

To quickly configure NTP, copy the following commands and paste them into the switch's terminal window:

```
[edit system]
set ntp boot-server 10.1.4.1
set ntp server 10.1.4.2
set ntp authentication-key 2 type md5 value "$9$aH1j8"
```

Step-by-Step Procedure

To configure NTP :

1. Specify the boot server:

   ```
   [edit system]
   user@switch# set ntp boot-server 10.1.4.1
   ```

2. Specify the NTP server:

   ```
   [edit system]
   user@switch# set ntp server 10.1.4.2
   ```

3. Specify the key number, authentication type (MD5), and key for authentication:

   ```
   [edit system]
   user@switch# set ntp authentication-key 2 type md5 value "$9$aH1j8"
   ```

Results

Check the results:

```
[edit system]
user@switch# show
ntp {
    boot-server 10.1.4.1;
    authentication-key 2 type md5 value "$9$aH1j8"; ## SECRET-DATA
    server 10.1.4.2;
}
```

Verification

To confirm that the configuration is correct, perform these tasks:

- Checking the Time on page 186
- Displaying the NTP Peers on page 187
- Displaying the NTP Status on page 187

Checking the Time

Purpose

Check the time that has been set on the switch.

Action

Enter the **show system uptime** operational mode command to display the time.

```
user@switch> show system uptime
fpc0:
--------------------------------------------------------------------------
Current time: 2009-06-12 12:49:03 PDT
System booted: 2009-05-15 06:24:43 PDT (4w0d 06:24 ago)
Protocols started: 2009-05-15 06:27:08 PDT (4w0d 06:21 ago)
Last configured: 2009-05-27 14:57:03 PDT (2w1d 21:52 ago) by admin1
12:49PM  up 28 days,  6:24, 1 user, load averages: 0.05, 0.06, 0.01
```

Meaning

The output shows that the current date and time are June 12, 2009 and 12:49:03 PDT. The switch booted 4 weeks, 6 hours, and 24 minutes ago, and its protocols were started

approximately 3 minutes before it booted. The switch was last configured by user **admin1** on May 27, 2009, and there is currently one user logged in to the switch.

The output also shows that the load average is 0.05 seconds for the last minute, 0.06 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

Displaying the NTP Peers

Purpose Verify that the time has been obtained from an NTP server.

Action Enter the **show ntp associations** operational mode command to display the NTP server from switch obtained its time.

```
user@switch> show ntp associations
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*ntp5.domain1.ne .GPS.            1 u  414 1024  377    3.435    4.002   0.765
```

Meaning The asterisk (*) in front of the NTP server name, or peer, indicates that the time is synchronized and obtained from this server. The delay, offset, and jitter are displayed in milliseconds.

Displaying the NTP Status

Purpose View the configuration of the NTP server and the status of the system.

Action Enter the **show ntp status** operational mode command to view the status of the NTP.

```
user@switch> show ntp status
status=0644 leap_none, sync_ntp, 4 events, event_peer/strat_chg,
version="ntpd 4.2.0-a Mon Apr 13 19:09:05 UTC 2009 (1)",
processor="powerpc", system="JUNOS9.5R1.8", leap=00, stratum=2,
precision=-18, rootdelay=2.805, rootdispersion=42.018, peer=48172,
refid=172.17.28.5,
reftime=cddd397a.60e6d7bf  Fri, Jun 12 2009 13:30:50.378, poll=10,
clock=cddd3b1b.ec5a2bb4  Fri, Jun 12 2009 13:37:47.923, state=4,
offset=3.706, frequency=-23.018, jitter=1.818, stability=0.303
```

Meaning The output shows status information about the switch and the NTP.

Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization

Debugging and troubleshooting are much easier when the timestamps in the log files of all the routers or switches are synchronized, because events that span the network can

be correlated with synchronous entries in multiple logs. We strongly recommend using the Network Time Protocol (NTP) to synchronize the system clocks of routers, switches, and other network equipment.

By default, NTP operates in an entirely unauthenticated manner. If a malicious attempt to influence the accuracy of a router or switch's clock succeeds, it could have negative effects on system logging, make troubleshooting and intrusion detection more difficult, and impede other management functions.

The following sample configuration synchronizes all the routers or switches in the network to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date is obtained when the router boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme should be used to hash the key value for authentication, which prevents the router or switch from synchronizing with an attacker's host posing as the time server.

```
[edit]
system {
  ntp {
    authentication-key 2 type md5 value "$9$aH1j8gqQ1gjyjgjhgjgiiii"; # SECRET-DATA
    boot-server 10.1.4.1;
    server 10.1.4.2;
  }
}
```

Example: Configuring a Plain-Text Password for Root Logins

The following example shows how to set a plain-text password for root logins:

```
[edit]
user@switch# set system root-authentication plain-text-password
New password: type root password
Retype new password: retype root password
[edit]
user@switch# show
system {
  root-authentication {
    encrypted-password "$1$14c5.$sBopasddsdfs0";
  }
```

```
}
```

Related Documentation

- Configuring the Root Password on page 158

Example: Configuring the Root Password

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the user "root" with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as the *root user*. The root user (also referred to as *superuser*) has unrestricted access and full permissions within the system. The expression "log in as root" is commonly used when an action requires the user to log into the device as the root user.

To set the root password, you have several options: enter a clear-text password that the system will encrypt, enter a password that is already encrypted, or enter a secure shell (ssh) public key string.

To set the root password, follow these steps:

1. To enter a clear-text password that the system will encrypt, use the following command to set the root password:

   ```
   [edit]
   root@# set system root-authentication plain-text-password
   New Password: type password here
   Retype new password: retype password here
   ```

2. To enter a password that is already encrypted, use the following command to set the root password:

   ```
   [edit]
   root@# set system root-authentication encrypted-password password
   ```

3. To enter an ssh public string, use the following command to set the root password:

   ```
   [edit]
   root@# set system root-authentication ssh-rsa key
   ```

4. Commit the changes:

   ```
   [edit]
   root@# commit
   ```

5. Exit from configuration mode:

   ```
   [edit]
   root@# exit
   root@>
   ```

access-end

Syntax access-end *HH*:*MM*;

Hierarchy Level [edit system login class]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the end time for login access.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Time-Based User Access on page 161

access-start

Syntax access-start *HH*:*MM*;

Hierarchy Level [edit system login class]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the start time for login access.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Time-Based User Access on page 161

accounting

Syntax

```
accounting {
  destination {
    radius {
      server {
        server-address {
          accounting-port port-number;
          secret password;
          source-address address;
          retry number;
          timeout seconds;
        }
      }
    }
    tacplus {
      server {
        server-address {
          port port-number;
          secret password;
          single-connection;
          timeout seconds;
        }
      }
    }
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure audit of TACACS+ or RADIUS authentication events, configuration changes, and interactive commands.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring RADIUS Accounting*
- Configuring TACACS+ System Accounting on page 1714

accounting-port

Syntax accounting-port *port-number*;

Hierarchy Level [edit system accounting destination radius server *server-address*],
[edit system radius server *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the accounting port number on which to contact the RADIUS server.

Options *number*—Port number on which to contact the RADIUS server.

Default: 1813

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- *Configuring RADIUS Accounting*

allow-commands

Syntax allow-commands "*regular-expression*";

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the operational mode commands that members of a login class can use.

Default If you omit this statement and the **deny-commands** statement, users can issue only those commands for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Specifying Access Privileges for Junos OS Operational Mode Commands on page 178
- deny-commands on page 253
- user on page 314

allow-configuration

Syntax allow-configuration "*regular-expression*";

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Explicitly allow configuration access to the specified levels in the hierarchy even if the permissions set with the **permissions** statement do not grant such access by default.

Default If you omit this statement and the **deny-configuration** statement, users can edit only those commands for which they have access privileges through the **permissions** statement.

Options *regular-expression*—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

allowed-days

Syntax allowed-days [*days-of-the-week*];

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the days of the week when users can log in.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Time-Based User Access on page 161

allow-transients

Syntax allow-transients;

Hierarchy Level [edit systems scripts commit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, enable transient configuration changes to be committed.

Default Transient changes are disabled by default. If you do not include the **allow-transients** statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Generating a Persistent or Transient Change*
- *Creating a Macro to Read the Custom Syntax and Generate Related Configuration Statements*

announcement

Syntax announcement *text*;

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a system login announcement. This announcement appears after a user logs in.

Options ***text***—Text of the announcement. If the text contains any spaces, enclose it in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration

Related Documentation

- *Configuring the Junos OS to Display a System Login Announcement*
- Configuring the Junos OS to Display a System Login Message on page 149

archival

Syntax

```
archival {
  configuration {
    archive-sites {
      file://<path>/<filename>;
      ftp://username@host:<port>url-path password password;
      http://username@host:<port>url-path password password;
      pasvftp://username@host:<port>url-path password password;
      scp://username@host:<port>url-path password password;
    }
    transfer-interval interval;
    transfer-on-commit;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.

NOTE: The **edit system archival** hierarchy is not available on QFabric systems.

Options The remaining statements are explained separately.

NOTE: The **[edit system archival]** hierarchy is not available on QFabric systems.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1611

arp (System)

Syntax

```
arp {
  aging-timer minutes;
  gratuitous-arp-delayseconds;
  gratuitous-arp-on-ifup;
  interfaces {
    interface-name {
      aging-timer minutes;
    }
  }
  passive-learning;
  purging;
}
```

For EX-Series switches:

```
arp {
  aging-timer minutes;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

For EX-Series switches, set only the time interval between ARP updates.

Options

aging-timer—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

passive-learning (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.

Default: 20 minutes

Range: 1 to 240 minutes

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

authentication (Login)

Syntax

```
authentication {
  encrypted-password password;
  load-key-file URL;
  plain-text-password password;
  remote-debug-permission (qfabric-admin | qfabric-operator |qfabric-user);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

Hierarchy Level [edit system login user *username*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.

Options

encrypted-password "*password*"—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.

load-key-file—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.

plain-text-password—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.

remote-debug-permission (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.

ssh-dsa "*public-key*"—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.

ssh-rsa "*public-key*"—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- root-authentication on page 286

authentication-key

Syntax authentication-key *key-number* type *type* value *password*;

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure Network Time Protocol (NTP) authentication keys so that the router or switch can send authenticated packets. If you configure the router or switch to operate in authenticated mode, you must configure a key.

Both the keys and the authentication scheme (MD5) must be identical between a set of peers sharing the same key number.

Options ***key-number***—An integer in the range of 1 to 65533.

type *type*—Authentication type. It can only be **md5**.

value *password*—Key itself, consisting of 1 through 8 ASCII characters. If the key contains spaces, enclose it in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring NTP Authentication Keys (QFabric System) on page 153
- NTP Time Server and Time Services Overview (QFabric System) on page 53

authentication-order

Syntax authentication-order [*authentication-methods*];

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.

Default If you do not include the **authentication-order** statement, users are verified based on their configured passwords.

Options ***authentication-methods***—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:

- **password**—Use the password configured for the user with the **authentication** statement at the **[edit system login user]** hierarchy level.
- **radius**—Use RADIUS authentication services.
- **tacplus**—Use TACACS+ authentication services.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 1694
- authentication on page 239

auxiliary

Syntax

```
auxiliary {
  disable;
  insecure;
  type terminal-type;
}
```

Hierarchy Level [edit system ports]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the characteristics of the auxiliary port.

Default The auxiliary port is disabled.

Options **disable**—Disable the port.

insecure—Disable superuser access or root logins to establish a terminal connection.

type *terminal-type*—Type of terminal that is connected to the port.

Range: **ansi**, **vt100**, **small-xterm**, **xterm**

Default: The terminal type is unknown, and the user is prompted for the terminal type.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Console and Auxiliary Port Properties on page 6177

boot-server (NTP)

Syntax boot-server (*address* | *hostname*);

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the server that NTP queries when the router or switch boots to determine the local date and time.

When you boot the router or switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local router's or switch's time. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the **ntpdate** request resolves the hostname to an IP address when the router or switch boots up.

Options

- ***address***—IP address of an NTP boot server.
- ***hostname***—Hostname of an NTP boot server.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Synchronizing and Coordinating Time Distribution Using NTP on page 180

broadcast

Syntax broadcast *address* <key *key-number*> <version *value*> <ttl *value*>;

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the local router or switch to operate in broadcast mode with the remote system at the specified address to send periodic broadcast messages to a client population. Normally, you include this statement only when the local router or switch is operating as a transmitter.

Options

address—Broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

key *key-number*—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer).

ttl *value*—(Optional) Time-to-live (TTL) value to use.

Range: 1 through 255

Default: 1

version *value*—(Optional) Specify the version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the NTP Time Server and Time Services on page 153

broadcast-client

Syntax broadcast-client;

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Router or Switch to Listen for Broadcast Messages Using NTP on page 160

change-type

Syntax change-type (character-sets | set-transitions);

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set requirements for using character sets in plain-text passwords. When you combine this statement with the **minimum-changes** statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.

Options Specify one of the following:

- **character-sets**—Number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.
- **set-transitions**—Number of transitions between character sets.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- minimum-changes on page 267

checksum

Syntax checksum (md5 | sha-256 | sha1) *hash*;

Hierarchy Level [edit event-options event-script file*filename*],
[edit system scripts commit file *filename*],

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event or commit script, the Junos OS verifies the authenticity of the script by using the configured checksum hash.

Options

md5 *hash*—MD5 checksum of this script.

sha-256 *hash*—SHA-256 checksum of this script.

sha1 *hash*—SHA-1 checksum of this script.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- file checksum sha-256 on page 341
- file checksum sha1 on page 340

class (Defining Login Classes)

Syntax

```
class class-name {
  access-end;
  access-start;
  allow-commands "regular-expression";
  allow-configuration "regular-expression";
  deny-commands "regular-expression";
  deny-configuration "regular-expression";
  idle-timeout minutes;
  login-tip;
  permissions [ permissions ];
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a login class.

Options ***class-name***—A name you choose for the login class.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Defining Junos OS Login Classes on page 1716
- user on page 314

class (Assigning a Class to an Individual User)

Syntax

```
class class-name {
    operator;
    read-only;
    super-user;
    unauthorized;
}
```

Hierarchy Level [edit system login user *username*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a user's login class. You must configure one class for each user.

Options ***class-name***—One of the classes defined at the **[edit system login class]** hierarchy level.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Junos OS User Accounts on page 1692

commit

Syntax

```
commit {
  allow-transients;
  direct-access;
  file filename {
    checksum (md5 | sha-256 | sha1) hash;
    optional;
    refresh;
    refresh-from url;
    sourceurl;
  }
  refresh;
  refresh-from url;
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit system scripts]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, configure the commit-time scripting mechanism.

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

compress-configuration-files (System)

Syntax (compress-configuration-files | no-compress-configuration-files);

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Compress the current operational configuration file. The file is stored in the file **juniper.conf**, in the **/config** file system, along with the last three committed versions of the configuration. However, with large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file allows the file to fit in the file system, typically reducing the size of the file by 90 percent. The current configuration file is compressed on the second commit of the configuration after the first commit is made to include the **compress-configuration-files** statement.

NOTE: We recommend that you enable compression of the configuration files to minimize the amount of disk space that they require.

Default The current operational configuration file is uncompressed.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Compressing the Current Configuration File on page 1595

console (Physical Port)

Syntax

```
console {
  disable;
  insecure;
  log-out-on-disconnect;
  type terminal-type;
}
```

Hierarchy Level [edit system ports]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the characteristics of the console port.

Default The console port is enabled and its speed is 9600 baud.

Options

disable—Disable console login connections.

insecure—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.

log-out-on-disconnect—Log out the session when the data carrier on the console port is lost.

type *terminal-type*—Type of terminal that is connected to the port: **ansi**, **vt100**, **small-xterm**, or **xterm**.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Console and Auxiliary Port Properties on page 6177

default-address-selection

Syntax default-address-selection;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Use the loopback interface, **lo0**, as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as **fxp0**. The **lo0** interface is the interface to the switch's Routing Engine.

Default The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:

- The primary address on the loopback interface **lo0** that is *not* **127.0.0.1** is used.
- The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.

  By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.

  An interface's *primary address* is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's *preferred address* is the default local address used for packets sourced by the local switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.

  To configure a different primary address or preferred address, include the **primary** or **preferred** statement at the **[edit interfaces** ***interface-name*** **unit** ***logical-unit-number*** **family** ***family*** **address** ***address*****]** or **[edit logical-systems** ***logical-system-name*** **interfaces** ***interface-name*** **unit** ***logical-unit-number*** **family** ***family*** **address** ***address*****]** hierarchy levels.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Junos® OS Network Interfaces*

deny-commands

Syntax deny-commands "*regular-expression*";

Hierarchy Level [edit system login class]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the **permissions** statement would allow their use.

Default If you omit this statement and the **allow-commands** statement, users can issue only those commands for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- allow-commands on page 234
- user on page 314

deny-configuration

Syntax deny-configuration "*regular-expression*";

Hierarchy Level [edit system login class]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Explicitly deny configuration access to the specified levels in the hierarchy even if the permissions set with the **permissions** statement grant such access by default.

Default If you omit this statement and the **allow-configuration** statement, users can edit those levels in the configuration hierarchy for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

destination (Accounting)

Syntax

```
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        secret password;
        source-address address;
        retry number;
        timeout seconds;
      }
    }
  }
  tacplus {
    server {
      server-address {
        port port-number;
        secret password;
        single-connection;
        timeout seconds;
      }
    }
  }
}
```

Hierarchy Level [edit system accounting]

Release Information

Statement introduced before Junos OS Release 7.4.
radius statement added in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the authentication server.

Options The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting on page 1697

destination-override

Syntax

```
destination-override {
  syslog host ip-address;
}
```

Hierarchy Level [edit system tracing]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Override the system-wide configuration of the switch at the **[edit system tracing]** hierarchy level. This statement has no effect if system tracing is not configured.

Options **syslog**—System process log files to send to the remote tracing host.

- **syslog**—System process log files to send to the remote tracing host.
- **host *ip-address***—IP address to which to send tracing information.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding Tracing and Logging Operations on page 6081
- tracing on page 312

direct-access

Syntax direct-access;

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify that commit scripts read input configurations directly from the database when inspecting these scripts for errors.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

domain-name

Syntax domain-name *domain-name*;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the name of the domain in which the switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.

Options ***domain-name***—Name of the domain.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Domain Name for the Router or Switch on page 146
- Example: Configuring the Domain Name for the Router or Switch on page 184

domain-search

Syntax domain-search *domain-list*;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a list of domains to be searched.

Options ***domain-list***—List of domain names to search. The list can contain up to 6 domain names, with a total of up to 256 characters.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains on page 147

explicit-priority

Syntax

```
explicit-priority {
  archive <files number> <size size <start-timetime> <transfer-interval
    interval><world-readable | no-world-readable>;
  archive-sites {
    file://<path>/<filename>;
    ftp://username@host:<port>url-path password password;
    scp://username@host:<port>url-path password password;
  }
structured-data {
  brief;
  }
}
```

Hierarchy Level [edit system syslog file *filename*],
[edit system syslog host]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.

When the **structured-data** statement is also included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including Priority Information in System Log Messages on page 6213

events

Syntax events [*events*];

Hierarchy Level [edit system accounting]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the types of events to track and log.

Options ***events***—Event types; can be one or more of the following:

- **change-log**—Audit configuration changes.
- **interactive-commands**—Audit interactive commands (any command-line input).
- **login**—Audit logins.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ System Accounting on page 1714

format

Syntax format (des | md5 | sha1);

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the authentication algorithm for plain-text passwords.

Default For Junos OS, the default encryption format is **md5**. For Junos OS-FIPS software, the default encryption format is **sha1**.

Options The hash algorithm that authenticates the password can be one of three algorithms:

- **des**—Has a block size of 8 bytes; its key size is 48 bits long.
- **md5**—Produces a 128-bit digest.
- **sha1**—Produces a 160-bit digest.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords on page 1687

host-name

Syntax host-name *hostname*;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the hostname of the switch.

Options ***hostname***—Name of the switch.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Hostname of the Router or Switch on page 147

icmpv4-rate-limit

Syntax
```
icmpv4-rate-limit {
    bucket-size seconds;
    packet-rate pps;
}
```

Hierarchy Level [edit system internet-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure rate-limiting parameters for ICMPv4 messages sent.

Options **bucket-size *seconds***—Number of seconds in the rate-limiting bucket.
Range: 0 through 4294967295 seconds
Default: 5

packet-rate *pps*—Rate-limiting packets earned per second.
Range: 0 through 4294967295 pps
Default: 1000

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Junos OS ICMPv6 Rate Limit for ICMPv6 Routing Engine Messages*

idle-timeout

Syntax idle-timeout *minutes*;

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For a login class, configure the maximum time that a session can be idle before the user is logged off the switch. The session times out after remaining at the CLI operational mode prompt for the specified time.

Default If you omit this statement, a user is never forced off the system after extended idle times.

Options ***minutes***—Maximum idle time.

Range: 0 through 4294967295 minutes

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Timeout Value for Idle Login Sessions on page 162

internet-options

Syntax

```
internet-options {
  icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
  source-port upper-limit upper-limit;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure system IP options to protect against certain types of denial-of-service (DoS) attacks.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Extend the Default Port Address Range on page 151

load-key-file

Syntax load-key-file *URL filename*;

Hierarchy Level [edit system root-authentication],
[edit system login user *username* authentication]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

NOTE: ECDSA is not supported on the QFabric system.

Load RSA (SSH version 1 and SSH version 2) and DSA or ECDSA (SSH version 2) public keys from a previously-generated named file at a specified URL location or local path. The file contains one or more SSH keys that are copied into the configuration when the command is issued.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

location

Syntax

```
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the system location.

Options

altitude *feet*—Number of feet above sea level.

building *name*—Name of the building. The name of the building can be 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").

country-code *code*—Two-letter country code.

floor *number*—Floor in the building.

hcoord *horizontal-coordinate*—Bellcore Horizontal Coordinate.

lata *service-area*—Long-distance service area.

latitude *degrees*—Latitude in degree format.

longitude *degrees*—Longitude in degree format.

npa-nxx *number*—First six digits of the phone number (area code and exchange).

postal-code *postal-code*—Postal code.

rack *number*—Rack number.

vcoord *vertical-coordinate*—Bellcore Vertical Coordinate.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

login

Syntax

```
login {
  announcementtext;
  class class-name {
    access-end "regular-expression";
    access-start "regular-expression";
    allow-commands "regular-expression";
    allow-configuration "regular-expression";
    deny-commands "regular-expression";
    deny-configuration "regular-expression";
    idle-timeout minutes;
    login-tip;
    permissions [ permissions ];
  }
  message text;
  password {
    change-type (set-transitions | character-set);
    format (md5 | sha1 | des);
    maximum-length length;
    minimum-changes number;
    minimum-length length;
  }
  retry-options {
    backoff-factor seconds;
    backoff-threshold number;
    minimum-time seconds;
    tries-before-disconnect number;
  }
  user username {
    authentication authentication;
      (encrypted-password "password" | plain-text-password);
      load-key-file URL;
      remote-debug-permission (qfabric-admin | qfabric-operator |qfabric-user);
      ssh-dsa "public-key";
      ssh-rsa "public-key";
    }
    class class-name;
    full-name complete-name;
    uid uid-value;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure user access to the switch.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Defining Junos OS Login Classes on page 1716

login-alarms

Syntax login-alarms;

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Show system alarms automatically when an **admin** user logs in to the router or switch.

Options ***class-name***—Login class name.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring System Alarms to Appear Automatically Upon Login on page 161

login-tip

Syntax login-tip;

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Enable CLI tips at login.

Default Disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring CLI Tips on page 72

max-configurations-on-flash

Syntax max-configurations-on-flash *number*;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the number of configurations stored on the internal fixed media storage (for example, USB device).

Options ***number***—The number of configurations stored on the CompactFlash card.

Range: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

maximum-length

Syntax maximum-length *length*;

Hierarchy Level [edit system login passwords]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the maximum number of characters allowed in plain-text passwords. Newly created passwords must meet this requirement.

Default For Junos OS-FIPS software, the maximum number of characters for plain-text passwords is **20**. For Junos OS, no maximum is set.

Options **length**—Maximum number of characters the password can include.

Range: 1 to 64 characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- minimum-length on page 268

message

Syntax message *text*;

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a system login message. This message appears before a user logs in.

Options ***text***—Text of the message.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration

Related Documentation
- Configuring the Junos OS to Display a System Login Message on page 149
- announcement on page 236

minimum-changes

Syntax minimum-changes *number*;

Hierarchy Level [edit system login passwords]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.

This statement is used in combination with the **change-type** statement. If the change type is **character-sets**, then the number of character sets included in the password is checked against the specified minimum. If the change type is **set-transitions**, then the number of character set changes in the password is checked against the specified minimum.

Default For Junos OS, the minimum number of changes is 1. For Junos-FIPS software, the minimum number of changes is 3.

Options ***number***—Minimum number of character sets (or character set changes) required for the password.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- change-type on page 245

minimum-length

Syntax minimum-length *length*;

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.

Default For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.

Options **length**—Minimum number of characters the password must include.

Range: 6 to 20 characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- maximum-length on page 266

minimum-lower-cases

Syntax minimum-lower-cases *number*;

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 12.1.

Description Specify the minimum number of lower-case letters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as **minimum-length**, **minimum-punctuations**, **minimum-upper-cases,** and so on.

Using several password minimum requirement options will cause the **minimum-length** to be reset if the total sum of the required minimums exceeds the **minimum-length** setting.

Options ***number***—The minimum number of lower-case letters required for the password.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 182
- **password (Login) on page 278**

minimum-numerics

Syntax minimum-numerics *number*;

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 12.1.

Description Specify the minimum number of numeric class characters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as **minimum-length**, **minimum-punctuations**, **minimum-lower-cases,** and so on.

Using several password minimum requirement options will cause the **minimum-length** to be reset if the total sum of the required minimums exceeds the **minimum-length** setting.

Options *number*—The minimum number of numeric class characters required for the password.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 182
- password (Login) on page 278

minimum-punctuations

Syntax minimum-punctuations *number*;

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 12.1.

Description Specify the minimum number of punctuation class characters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as **minimum-length**, **minimum-upper-cases**, **minimum-lower-cases,** and so on.

Using several password minimum requirement options will cause the **minimum-length** to be reset if the total sum of the required minimums exceeds the **minimum-length** setting.

Options ***number***—The minimum number of punctuation class characters required for the password.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 182
- **password (Login) on page 278**

minimum-upper-cases

Syntax minimum-upper-cases *number*;

Hierarchy Level [edit system login password]

Release Information Statement introduced in Junos OS Release 12.1.

Description Specify the minimum number of upper-case letters required in plain-text passwords. Newly created passwords must meet this requirement.

This statement can be used in combination with all of the other requirement options for plain-text passwords, such as **minimum-length**, **minimum-punctuations**, **minimum-lower-cases,** and so on.

Using several password minimum requirement options will cause the **minimum-length** to be reset if the total sum of the required minimums exceeds the **minimum-length** setting.

Options ***number***—The minimum number of upper-case letters required for the password.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 182
- **password (Login) on page 278**

multicast-client

Syntax multicast-client <*address*>;

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Network Time Protocol (NTP), configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet.

Options ***address***—(Optional) One or more IP addresses. If you specify addresses, the router or switch joins those multicast groups.

Default: 224.0.1.1.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Router or Switch to Listen for Multicast Messages Using NTP on page 160

name-server

Syntax

```
name-server {
  address;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure one or more Domain Name System (DNS) name servers.

Options ***address***—Address of the name server. To configure multiple name servers, include multiple ***address*** options.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring a DNS Name Server for Resolving a Hostname into Addresses on page 146

no-multicast-echo

Syntax

```
no-multicast-echo {
  arp {
    aging-timer minutes;
    gratuitous-arp-delayseconds;
    gratuitious-arp-on-ifup;
    interfaces {
      interface-name {
        aging-timer minutes;
      }
    }
    passive-learning;
    purging;
    }
    host-name hostname;
    location{
      altitude feet;
      building name;
      country-code code;
      floor number;
      hcoord horizontal-coordinate;
      lata service-area;
      latitude degrees;
      longitude degrees;
      npa-nxx number;
      postal-code postal-code;
      rack number;
      vcoord vertical-coordinate;
      }
    }
    license {
      autoupdate URL;
        }
        renew before-expiration (number | interval number)
      }
    }
  }
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses.

Default The Routing Engine responds to ICMP echo requests sent to multicast group addresses.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Junos OS to Disable the Routing Engine Response to Multicast Ping Packets*

no-ping-record-route

Syntax no-ping-record-route;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 9.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the Junos OS to disable the reporting of the IP address in ping responses.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 148

no-ping-time-stamp

Syntax no-ping-time-stamp;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 9.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the Junos OS to disable the recording of timestamps in ping responses.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 148

no-redirects (IPv4 Traffic)

Syntax no-redirects;

Hierarchy Level [edit system],
[edit interfaces *interface-name* unit *logical-unit-number* family *family*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for EX Series switches.

Description Stop protocol redirect messages for IPv4 traffic from being sent on the entire switch or on an interface on the router or switch.

To disable the sending of protocol redirect messages for the entire router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level.

To disable the sending of protocol redirect messages on a specific interface, include the **no-redirects** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]** hierarchy level.

Default The router or switch sends redirect messages.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

ntp

Syntax

```
ntp {
  authentication-key number type type value password;
  boot-server address;
  broadcast <address> <key key-number> <version value> <ttl value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure Network Time Protocol (NTP) on the switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Synchronizing and Coordinating Time Distribution Using NTP on page 180

ntp (QFabric)

Syntax

```
ntp {
  authentication-key number type type value password;
  server address <key key-number> <version value> <prefer>;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure Network Time Protocol (NTP) on the switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring NTP Authentication Keys (QFabric System) on page 153
- Configuring the NTP Time Server and Time Services (QFabric System) on page 156
- authentication-key on page 240
- server on page 289

optional

Syntax optional;

Hierarchy Level [edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the **file** statement is missing from the **/var/db/scripts/commit** directory on the router.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- *Controlling Execution of Commit Scripts During Commit Operations*

password (Login)

Syntax

```
password {
  change-type (set-transitions | character-set);
  format (md5 | sha1);
  maximum-length length;
  minimum-changes number;
  minimum-length length;
  minimum-lower-cases number;
  minimum-numerics number;
  minimum-punctuations number;
  minimum-upper-cases number;
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.

Description Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.

Using several password minimum requirement options will cause the **minimum-length** to be reset if the total sum of the required minimums exceeds the **minimum-length** setting.

The individual statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords on page 1687
- Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 182

peer

Syntax peer *address* <key *key-number*> <version *value*> <prefer>;

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.

Options ***address***—Address of the remote system. You must specify an address, not a hostname.

key ***key-number***—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.

Range: Any unsigned 32-bit integer

prefer—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version *value*—(Optional) Specify the NTP version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the NTP Time Server and Time Services on page 153

permissions

Syntax
```
permissions {
  storage;
  storage-control;
}
```

Hierarchy Level [edit system login class]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the login access privileges to be provided on the switch.

Options ***permissions***—Privilege type.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Access Privilege Levels on page 1692
- Table 164 on page 1672
- user on page 314

port (TACACS+ Server)

Syntax port *port-number*;

Hierarchy Level [edit system accounting destination tacplus server *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the port number on which to contact the TACACS+ server.

Options ***number***—Port number on which to contact the TACACS+ server.
Default: 49

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring TACACS+ System Accounting on page 1714

ports

Syntax

```
ports {
  auxiliary {
    disable;
    insecure;
    type terminal-type;
  }
  console {
    disable;
    insecure;
    log-out-on-disconnect;
    type terminal-type;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the properties of the console and auxiliary ports. The ports are located on the craft interface.

See the switch hardware documentation for port locations.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Console and Auxiliary Port Properties on page 6177

radius (System)

Syntax

```
radius {
  server {
    server-address {
      accounting-port port-number;
      secret password;
      source-address address;
      retry number;
      timeout seconds;
    }
  }
}
```

Hierarchy Level [edit system accounting destination]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the RADIUS accounting server.

Options *server-address*—Address of the RADIUS accounting server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting on page 1697

refresh (Commit Scripts)

Syntax refresh;

Hierarchy Level [edit system scripts commit],
[edit system scripts file *filename*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the **/var/db/scripts/commit** directory with the copy located at the source URL, as specified in the **source** statement at the same hierarchy level.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- refresh-from on page 283
- source on page 291

refresh-from (Commit Scripts)

Syntax refresh-from *url*;

Hierarchy Level [edit system scripts commit],
[edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the **/var/db/scripts/commit** directory with the copy located at a URL other than the URL specified in the **source** statement.

Options *url*—The source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- refresh on page 283
- source on page 291

retry

Syntax retry *number*;

Hierarchy Level [edit system radius server *server-address*],
[edit system accounting destination radius server *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.

Options ***number***—Number of retries allowed for contacting a RADIUS server.

Range: 1 through 10

Default: 3

NOTE: The **[edit system accounting]** hierarchy is not available on QFabric systems.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication on page 1699
- *Configuring RADIUS Accounting*
- timeout on page 307

retry-options

Syntax

```
retry-options {
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds;
  minimum-time seconds;
  tries-before-disconnect number;
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.

Options

backoff-threshold *number*—Threshold for the number of failed login attempts before the user experiences a delay when attempting to reenter a password. Use the **backoff-factor** option to specify the length of delay, in seconds.

Range: 1 through 3

Default: 2

backoff-factor *seconds*—Length of delay after each failed login attempt. The length of delay increases by this value for each subsequent login attempt after the value specified in the **backoff-threshold** option.

Range: 5 through 10

Default: 5

maximum-time *seconds*—Maximum length of time that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured **maximum-time**, the connection is closed.

Range: 20 through 300

Default: 120

minimum-time *seconds*—Minimum length of time that the connection remains open while the user is attempting to enter a password to log in.

Range: 20 through 60

Default: 20

tries-before-disconnect *number*—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.

Range: 1 through 10

Default: 10

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Limiting the Number of User Login Attempts for SSH and Telnet Sessions on page 1716

root-authentication

Syntax

```
root-authentication {
  (encrypted-password "password" | load-key-password URL | plain-text-password);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the authentication methods for the root-level user, whose username is **root**.

Options

encrypted-password "*password*"— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.

You cannot configure a blank password for the **encrypted-password** option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.

plain-text-password—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.

ssh-dsa "*public-key*"—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.

ssh-rsa "*public-key*"—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring the Root Password on page 1702
- authentication on page 239

saved-core-context

Syntax (saved-core-context | no-saved-core-context);

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure whether the switch saves core files generated by internal Junos OS processes, along with contextual information (system log files and a copy of the current configuration):

- **saved-core-context**—The switch saves each core file and its associated context in a compressed tar file named **/var/tmp/*process-name*.core.*core-number*.tgz**.
- **no-saved-core-context**—The switch does not save core files and their associated context.

Default The switch saves core files.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- *Saving Core Files from Junos OS Processes*
- saved-core-files on page 287

saved-core-files

Syntax saved-core-files *number*;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Save core files generated by internal Junos OS processes, but not the associated contextual information (configuration and system log files).

Options *number*—Maximum number of core files to save.
Range: 1 through 10

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- *Saving Core Files from Junos OS Processes*
- saved-core-context on page 287

secret

Syntax secret *password*;

Hierarchy Level [edit system accounting destination radius server *server-address*],
[edit system accounting destination tacplus server *server-address*],
[edit system radius-server *server-address*],
[edit system tacplus-server *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the password to use with the RADIUS or TACACS+ server. The secret password used by the local switch must match that used by the server.

Options ***password***—Password to use; can include spaces included in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

server (NTP)

Syntax server *address* <key *key-number*> <version *value*> <prefer>;

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For NTP, configure the switch to operate in client mode with the remote system at the specified server address. In this mode, the local switch can be synchronized with the remote system, but the remote system can never be synchronized with the local switch.

Options ***address***—Address of the remote system. You must specify an address, not a hostname.

key *key-number*—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.

Range: Any unsigned 32-bit integer

prefer—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version *value*—(Optional) Specify the version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- ntp on page 277

server (RADIUS Accounting)

Syntax

```
server {
  server-address {
    accounting-port port-number;
    retry number
    secret password;
    source-address address;
    timeout seconds;
  }
}
```

Hierarchy Level [edit system accounting destination radius]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure RADIUS logging.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS System Accounting on page 1697

server (TACACS+ Accounting)

Syntax

```
server {
  server-address {
    port port-number;
    secret password;
    single-connection;
    timeout seconds;
  }
}
```

Hierarchy Level [edit system accounting destination tacplus]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure TACACS+ logging.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ System Accounting on page 1714

single-connection

Syntax single-connection;

Hierarchy Level [edit system accounting destination tacplus server *server-address*],
[edit system tacplus *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ Authentication on page 1711
- Configuring TACACS+ System Accounting on page 1714

source (Commit Scripts)

Syntax source *url*;

Hierarchy Level [edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series .

Description For Junos OS commit scripts, specify the location of the source file for an enabled script located in the **/var/db/scripts/commit** directory. When you include the **refresh** statement at the same hierarchy level and commit the configuration, the local copy is overwritten by the version stored at the specified URL.

Options *url*—The source specified as an HTTP URL, FTP URL, or scp-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

source-address (NTP, RADIUS, System Logging, or TACACS+)

Syntax source-address *source-address*;

Hierarchy Level [edit system accounting destination radius server *server-address*],
[edit system accounting destination tacplus server *server-address*],
[edit system ntp],
[edit system radius-server *server-address*],
[edit system syslog],
[edit system tacplus-server *server-address*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

NOTE: The source address is not supported at the **[edit system radius-server]** hierarchy on the QFabric.

Specify a source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine.

Options ***source-address***—Valid IP address configured on one of the switch interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all **host *hostname*** statements at the **[edit system syslog]** hierarchy level.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring RADIUS Authentication on page 1699
- Synchronizing and Coordinating Time Distribution Using NTP on page 180
- *Specifying an Alternative Source Address for System Log Messages*

source-port (Port Addresses)

Syntax source-port upper-limit <*upper-limit*>;

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the range of port addresses.

Options **upper-limit *upper-limit***—(Optional) The range of port addresses and can be a value from 5000 through 65,355.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Extend the Default Port Address Range on page 151

ssh-dsa

Syntax ssh-dsa "*public-key*";

Hierarchy Level [edit system root-authentication]
[edit system login user authentication]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the DSA (SSH version 2) public key. You can specify one or more public keys.

Options **ssh-dsa "*public-key*"**—SSH version 2 authentication.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring the Root Password on page 158
- **authentication on page 239**
- *root-authentication*

ssh-rsa

Syntax ssh-dsa "*public-key*";

Hierarchy Level [edit system root-authentication]
[edit system login user authentication]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the RSA (SSH version 1) public key. You can specify one or more public keys.

Options **ssh-rsa "*public-key*"**—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Root Password on page 1702
- authentication on page 239
- *root-authentication*

static-host-mapping

Syntax

```
static-host-mapping {
  hostname {
    alias [ alias ];
    inet [ address ];
    sysid system-identifier;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).

Options

alias *alias*—Alias for the hostname.

hostname—Fully qualified hostname.

inet *address*—IP address. You can specify one or more IP addresses for the host.

sysid *system-identifier*—ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address **208.197.169.18** is **2081.9716.9018** in BCD.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Hostname of the Router or Switch on page 147

structured-data

Syntax

```
structured-data {
  brief;
}
```

Hierarchy Level [edit system syslog file *filename*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol* (http://tools.ietf.org/html/draft-ietf-syslog-protocol-23).

NOTE: When this statement is included, other statements that specify the format for messages written to the file are ignored (the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level and the **time-format** statement at the **[edit system syslog]** hierarchy level).

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- explicit-priority on page 258
- time-format on page 306

syslog (System)

Syntax

```
syslog {
  archive {
    (binary-data| no-binary-data);
    files number;
    size maximum-file-size;
    start-time "YYYY-MM-DD.hh:mm";
    transfer-interval minutes;
    (world-readable | no-world-readable);
  }
  console {
    facility severity;
  }
  file filename {
    facility severity;
    explicit-priority;
    match "regular-expression";
    archive {
      (binary-data| no-binary-data);
      files number;
      size maximum-file-size;
      start-time "YYYY-MM-DD.hh:mm";
      transfer-interval minutes;
      (world-readable | no-world-readable);
    }
    structured-data {
      brief;
    }
  }
  host (hostname | other-routing-engine | scc-master) {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
    source-address source-address;
    structured-data {
      brief;
    }
    port port number;
  }
  log-rotate-frequency frequency;
  server server name;
  source-address source-address;
  time-format(millisecond | year | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* system],
[edit system]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Support at the **[edit logical-systems *logical-system-name* system]** hierarchy level introduced in Junos OS Release 11.4.

Description

Configure the types of system log messages to send to files, to a remote destination, to user terminals, or to the system console.

The remaining statements are explained separately.

Options

archive—Define parameters for archiving log messages.

console—Send log messages of a specified class and severity to the console.

file—Send log messages to a named file.

host —Remote location to be notified of specific log messages.

log-rotate-frequency—Configure the interval for checking logfile size and archiving messages.

server—Name of the system log server in the inet.0 routing instance.

source-address—Include a specified address as the source address for log messages.

time-format—Additional information to include in the system log time stamp.

user—Notify a specific user of the log event.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure system management properties.

NOTE: The radius-server source-address and radius-options statements are not available on the QFabric system.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

tacplus

Syntax

```
tacplus {
  server {
    server-address {
      port port-number;
      secret password;
      single-connection;
      timeout seconds;
    }
  }
}
```

Hierarchy Level [edit system accounting destination]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure TACACS+.

Options *server-address*—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ System Accounting on page 1714

tacplus-server

Syntax

```
tacplus-server server-address {
  port
  secret password;
  single-connection;
  source-address source-address;
  timeout seconds;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the TACACS+ server.

Options ***server-address***—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ Authentication on page 1711

time-format

Syntax time-format (year | millisecond | year millisecond);

Hierarchy Level [edit system syslog]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

Default The timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, **Aug 21 12:36:30**.

NOTE: When the **structured-data** statement is included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Options **millisecond**—Include the millisecond in the timestamp.

year—Include the year in the timestamp.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including the Year or Millisecond in Timestamps on page 167
- structured-data on page 296

timeout

Syntax timeout *seconds*;

Hierarchy Level [edit system radius-server *server-address*],
[edit system tacplus-server *server-address*],
[edit system accounting destination radius server server-address],
[edit system accounting destination tacplus server server-address]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the length of time that the local router or switch waits to receive a response from a RADIUS or TACACS+ server.

Options ***seconds***—Length of time to wait.

Range: 1 through 90 seconds

Default: 3 seconds

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Configuring RADIUS Accounting*
- Configuring TACACS+ System Accounting on page 1714
- retry on page 284

time-zone

Syntax time-zone (GMT *hour-offset* | *time-zone*);

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the local time zone. To have the time zone change take effect for all processes running on the switch, you must reboot the switch.

Default UTC

Options GMT *hour-offset*—Set the time zone relative to UTC time.

Range: –14 through +12

Default: 0

time-zone—Specify the time zone as **UTC**, which is the default time zone, or as a string such as PDT (Pacific Daylight Time), or use one of the following continents and major cities:

Africa/Abidjan, Africa/Accra, Africa/Addis_Ababa, Africa/Algiers, Africa/Asmera, Africa/Bamako, Africa/Bangui, Africa/Banjul, Africa/Bissau, Africa/Blantyre, Africa/Brazzaville, Africa/Bujumbura, Africa/Cairo, Africa/Casablanca, Africa/Ceuta, Africa/Conakry, Africa/Dakar, Africa/Dar_es_Salaam, Africa/Djibouti, Africa/Douala, Africa/El_Aaiun, Africa/Freetown, Africa/Gaborone, Africa/Harare, Africa/Johannesburg, Africa/Kampala, Africa/Khartoum, Africa/Kigali, Africa/Kinshasa, Africa/Lagos, Africa/Libreville, Africa/Lome, Africa/Luanda, Africa/Lubumbashi, Africa/Lusaka, Africa/Malabo, Africa/Maputo, Africa/Maseru, Africa/Mbabane, Africa/Mogadishu, Africa/Monrovia, Africa/Nairobi, Africa/Ndjamena, Africa/Niamey, Africa/Nouakchott, Africa/Ouagadougou, Africa/Porto-Novo, Africa/Sao_Tome, Africa/Timbuktu, Africa/Tripoli, Africa/Tunis, Africa/Windhoek

traceoptions (Commit Scripts)

Syntax

```
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit system scripts commit],

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define tracing operations for commit or op scripts.

Default If you do not include this statement, no script-specific tracing operations are performed.

Options ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, commit script process tracing output is placed in the file **cscript.log** and op script process tracing is placed in the file **op-script.log**. If you include the **file** statement, you must specify a filename. To retain the default, you can specify **cscript.log** or **op-script.log** as the filename.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: 2 through 1000

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Log all operations
- **events**—Log important events
- **input**—Log script input data
- **offline**—Generate data for offline development
- **output**—Log script output data
- **rpc**—Log script RPCs
- **xslt**—Log the XSLT library

no-world-readable—Restrict file access to owner. This is the default.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—Enable unrestricted file access.

Required Privilege Level

maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Tracing Commit Script Processing*

tracing

Syntax

```
tracing {
  destination-override syslog host ip-address;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch to enable remote tracing to a specified host IP address.

NOTE: **The tracing statement is not supported on the QFX3000 QFabric system.**

The following processes are supported:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit system *process-name* traceoptions]** hierarchy level.

Default Remote tracing is disabled by default.

Options

destination-override syslog host *ip-address*—Overrides the global configuration for system tracing and has no effect if the **tracing** statement is not configured.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding Tracing and Logging Operations on page 6081
- destination-override on page 256

trusted-key

Syntax trusted-key [*key-numbers*];

Hierarchy Level [edit system ntp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For NTP, configure the keys to use when you configure the switch to synchronize its time with other systems on the network.

Options ***key-numbers***—One or more key numbers. Each key can be any 32-bit unsigned integer except 0.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring NTP Authentication Keys on page 152
- *authentication-key*
- server on page 289

uid

Syntax uid *uid-value*;

Hierarchy Level [edit system login user]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a user identifier for a login account.

Options ***uid-value***—Number associated with the login account. This value must be unique on the router or switch.

Range: **100** through **64000**

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Junos OS User Accounts on page 1692

use-imported-time-zones

Syntax use-imported-time-zones;

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a custom time zone from a locally generated time zone database.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Setting a Custom Time Zone on Routers or Switches Running Junos OS on page 175

user (Access)

Syntax

```
user username {
  authentication {
    (encrypted-password "password" | plain-text-password);
    load-key-file URL;
    remote-debug-permission (qfabric-admin | qfabric-operator |qfabric-user);
    ssh-dsa "public-key" <from hostname>;
    ssh-rsa "public-key" <from hostname>;
  }
  class class-name;
  full-name "complete-name";
  uid uid-value;
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure access permission for individual users.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Monitoring System Process Information

Purpose View the processes running on the QFX Series.

Action To view the software processes running on the QFX Series:

[edit system]

user@switch> **show system processes**

Meaning Table 47 on page 315 summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

Table 47: Summary of System Process Information Output Fields

Field	Values
PID	Identifier of the process.
Name	Owner of the process.
State	Current state of the process.
CPU Load	Percentage of the CPU that is being used by the process.
Memory Utilization	Amount of memory that is being used by the process.

Table 47: Summary of System Process Information Output Fields *(continued)*

Field	Values
Start Time	Time of day when the process started.

Related Documentation

- Monitoring System Properties on page 316
- show system uptime on page 1067

Monitoring System Properties

Purpose View system properties such as the name and IP address of a QFX Series product and resource usage.

Action To monitor system properties in the CLI, enter the following commands:

- show system uptime
- show system users
- show system storage

Meaning Table 48 on page 316 summarizes key output fields in the system properties display.

Table 48: Summary of Key System Properties Output Fields

Field	Values	Additional Information
General Information		
Serial Number	Serial number for a QFX Series product.	
Junos OS Version	Version of Junos OS active on the switch, including whether the software is for domestic or export use.	Export software is for use outside the USA and Canada.
Hostname	Name of the QFX Series product.	
IP Address	IP address of the QFX Series product.	
Loopback Address	Loopback address.	
Domain Name Server	Address of the domain name server.	
Time Zone	Time zone on the QFX Series product.	
Time		
Current Time	Current system time, in Coordinated Universal Time (UTC).	

Table 48: Summary of Key System Properties Output Fields *(continued)*

Field	Values	Additional Information
System Booted Time	Date and time when the QFX Series product was last booted and how long it has been running.	
Protocol Started Time	Date and time when the protocols were last started and how long they have been running.	
Last Configured Time	Date and time when a configuration was last committed. This field also shows the name of the user who issued the last **commit** command.	
Load Average	CPU load average for 1, 5, and 15 minutes.	
Storage Media		
Internal Flash Memory	Usage details of internal flash memory.	
External Flash Memory	Usage details of external USB flash memory.	
Logged in Users Details		
User	Username of any user logged in to the switch.	
Terminal	Terminal through which the user is logged in.	
From	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.	
Login Time	Time when the user logged in.	This is the **user@switch** field in **show system users** command output.
Idle Time	How long the user has been idle.	

Related Documentation

- Monitoring System Process Information on page 315
- show system processes on page 983

Monitoring Interface Status and Traffic

Purpose View interface status to monitor interface bandwidth utilization and traffic statistics on the QFX Series product.

Action

- To view interface status for all the interfaces, enter show interfaces xe.
- To view status and statistics for a specific interface, enter show interfaces xe *interface-name*.

- To view status and traffic statistics for all interfaces, enter either show interfaces xe **detail** or show interfaces xe **extensive**.

Meaning For details about output from the CLI commands, see show interfaces xe.

Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- Junos XML Management Protocol Application Programming Interface (API)—Application programmers can use the Junos XML Management Protocol API to monitor and configure Juniper Networks QFX Series products. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring the QFX Series.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF API to monitor and configure Juniper Networks QFX Series products.
- Junos OS commit scripts—You can define scripts to enforce custom configuration tasks, enforce consistency, prevent common mistakes, and more. Every time you commit a new candidate configuration, the active commit scripts are called to inspect the new candidate configuration. If a configuration violates your custom rules, the script can instruct the Junos OS to perform various actions, including making changes to the configuration and generating custom, warning, and system log messages.
- Junos OS Op scripts—You can add your own commands to the operation-mode CLI. You can use these scripts to automate troubleshooting of known network problems and correct them.
- Junos OS event scripts—You can use event scripts to diagnose and fix issues, monitor the overall status of the system, and examine errors periodically. Event scripts are similar to op scripts except that certain events on the switch will trigger these scripts.
- Junos Space—The Junos Space application design allows multiple users concurrent access to its user interface. It also includes applications for network infrastructure automation.

commit

Syntax commit <<***at*** <"string">> <and-quit> <check> <comment <"***comment-string***">> <confirmed> <display detail> <**fast-synchronize**> <***minutes***> <synchronize<force>>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option **fast-synchronize** added in Junos OS Release 12.2.

Description Commit the set of changes to the database and cause the changes to take operational effect.

NOTE: Beginning in Junos OS 12.3, it is possible that FPCs brought offline using the **request chassis fpc slot** ***fpc-slot*** **offline** operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the **set fpc** ***fpc-slot*** **power off** configuration-mode command at the **[edit chassis]** hierarchy level to ensure that the FPCs remain offline.

Options **at <"string">**—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.

string is **reboot** or the future time to activate the configuration changes. Enclose the ***string*** value (including **reboot**) in quotation marks (“ ”). You can specify time in two formats:

- A time value in the form ***hh:mm***[**:*ss***] (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the **commit at** configuration command is issued. Use 24-hour time for the ***hh*** value; for example, **04:30:00** is 4:30:00 AM, and **20:00** is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.
- A date and time value in the form ***yyyy-mm-dd hh:mm***[**:*ss***] (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the **commit at** command is issued. Use 24-hour time for the ***hh*** value. For example, **2003-08-21 12:30:00** is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.

For example, **commit at “18:00:00"**. For date and time, include both values in the same set of quotation marks. For example, **commit at "2005-03-10 14:00:00"**.

A *commit check* is performed when you issue the **commit at** configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.

NOTE: If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at** configuration command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see the CLI Explorer.

and-quit—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

check—(Optional) Verify the syntax of the configuration, but do not activate it.

comment <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab".**

confirmed <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is **1** through **65,535** minutes, and the default is **10** minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

display detail—(Optional) Monitors the commit process.

NOTE: In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the **more** pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

fast-synchronize—(Optional) Configure the commits to run in parallel on both the master and backup Routing Engines to reduce the time taken for commit synchronization.

synchronize <**force**>—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the

commit synchronize command. The Routing Engine on which you execute this command (request Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine is terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

NOTE: When you issue the **commit synchronize** command, you must use the **apply-groups re0** and **re1** commands. For information about how to use groups, see *Disabling Inheritance of a Junos OS Configuration Group*.

The responding Routing Engine must use Junos OS Release 5.0 or later.

Required Privilege Level

configure—To enter configuration mode.

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*

clear log

Syntax clear log *filename*
<all>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Remove contents of a log file.

Options ***filename***—Name of the specific log file to delete.

all—(Optional) Delete the specified log file and all archived versions of it.

Required Privilege Level clear

Related Documentation

List of Sample Output clear log on page 327

Output Fields See file list for an explanation of output fields.

Sample Output

clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
--------------------------------------------------------------------------

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel         57 Sep 15 03:44 /var/log/sampled
total 1
```

clear chassis display message

List of Syntax

Syntax on page 328
Syntax (TX Matrix Router) on page 328
Syntax (TX Matrix Plus Router) on page 328
Syntax (QFabric Systems) on page 328

Syntax

clear chassis display message

Syntax (TX Matrix Router)

clear chassis display message
<lcc *number* | scc>

Syntax (TX Matrix Plus Router)

clear chassis display message
<lcc *number* | sfc *number*>

Syntax (QFabric Systems)

clear chassis display message
<node-device *name* | interconnect-device *name*>

Release Information

Command introduced in Junos OS Release 7.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option for the TX Matrix Plus routers introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

Options

none—Clear or stop a text message on the craft interface display.

interconnect-device *name*—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

node-device *name*—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

scc—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.

Options

none—Clear all pending system software reboots or halts.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.

all-members—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

infrastructure *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

node-group *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

scc—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace ***number*** with 0.

--------------------------------------------------------------------------
No shutdown/reboot scheduled.
lcc2-re0:
--------------------------------------------------------------------------
No shutdown/reboot scheduled.
```

clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```

file

Syntax file <**archive** |**checksum** |**compare** | **copy** | **delete** | **list** | **rename** | **show** | **source address** |**archive**>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Archive files from the device, copy files to and from the router or switch, calculate the file checksum, compare files, delete a file from the device, list files on the device, rename a file, show file contents, or show the local address to initiate a connection.

Options

archive (Optional) —Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

checksum (Optional) —Calculate the Message Digest 5 (MD5) checksum of a file.

compare (Optional) —Compare two local files and describe the differences between them in default, context, or unified output styles.

copy (Optional) —Copy files from one place to another on the local switch or between the local switch and a remote system.

delete (Optional) —Delete a file on the local switch.

list (Optional) —Display a list of files on the local switch.

rename (Optional) —Rename a file on the local switch.

show (Optional) —Display the contents of a file.

source address (Optional) —Specify the source address of the local file.

Required Privilege Level maintenance

file archive

Syntax file archive destination *destination* source *source* <compress>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

Options

destination ***destination***—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:

- For archived files—The suffix **.tar**
- For archived and compressed files—The suffix **.tgz**

source ***source***—Source of the original file or files. Specify the source as a URL or filename.

compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix **.tgz**.

Required Privilege Level maintenance

List of Sample Output
file archive (Multiple Files) on page 337
file archive (Single File) on page 337
file archive (with Compression) on page 338

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file archive (Multiple Files)

The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file archive (Single File)

The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

file checksum md5

Syntax file checksum md5 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Calculate the Message Digest 5 (MD5) checksum of a file.

Options ***pathname***—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the MD5 checksum.

Required Privilege Level maintenance

file compare

Syntax

file compare (files *filename filename*)
<context | unified>
<ignore-white-space>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Compare two local files and describe the differences between them in default, context, or unified output styles:

- **Default**—In the first line of output, **c** means lines were changed between the two files, **d** means lines were deleted between the two files, and **a** means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (**<**) in front of output lines refers to the first file. A right angle bracket (**>**) in front of output lines refers to the second file.
- **Context**—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (**!**) have changed. Additions are marked with a plus sign (**+**), and deletions are marked with a minus sign (**-**).
- **Unified**—The display is preceded by the line number from the first and the second file (*xx*,*xxx*,*x*). Before the line number, additions to the file are marked with a plus sign (**+**), and deletions to the file are marked with a minus sign (**-**). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

Options

files *filename*—Names of two local files to compare.

context—(Optional) Display output in context format.

ignore-white-space—(Optional) Ignore changes in the amount of white space.

unified—(Optional) Display output in unified format.

Required Privilege Level

none

List of Sample Output

file compare files on page 343
file compare files context on page 343
file compare files unified on page 343
file compare files unified ignore-white-space on page 343

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<             full-name "File 1";
---
>             full-name "File 2";
102c102

file delete

Syntax file delete *filename*
<purge>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Delete a file on the local router or switch.

Options ***filename***—Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.

purge—(Optional) Overwrite regular files before deleting them.

Required Privilege Level maintenance

List of Sample Output file delete on page 345
file delete (Routing Matrix) on page 345

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax
file list
<detail | recursive>
<*filename*>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display a list of files on the local router or switch.

Options
none—Display a list of all files for the current directory.

detail | recursive—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.

filename—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.

Additional Information
The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the **file list** command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the **file list** command.

Required Privilege Level
maintenance

List of Sample Output
file list on page 346
file list (Routing Matrix) on page 346

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp

file rename

Syntax file rename *source destination*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Rename a file on the local router or switch.

Options ***destination***—New name for the file.

source—Original name of the file. For a routing matrix, the filename must include the chassis information.

Required Privilege Level maintenance

List of Sample Output file rename on page 348
file rename (Routing Matrix) on page 348

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file rename

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

file rename (Routing Matrix)

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
--------------------------------------------------------------------------

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
--------------------------------------------------------------------------

/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

file show

Syntax file show *filename*
<encoding (base64 | raw)>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of a file.

Options ***filename***—Name of a file. For a routing matrix, the filename must include the chassis information.

encoding (base64 | raw)—(Optional) Encode file contents with base64 encoding or show raw text.

Required Privilege Level maintenance

List of Sample Output
file show on page 350
file show (Routing Matrix) on page 350

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.

        printf "%s", msgbufp->msg_ptr
end
```

```
# hex dump of a block of memory
# usage: dump address length
define dump
   p $arg0, $arg1
   set $ch = $arg0
   set $j = 0
   set $n = $arg1
   while ($j < $n)
        #printf "%x %x ",&$ch[$j],$ch[$j]
        printf "%x ",$ch[$j]
        set $j = $j + 1
        if (!($j % 16))
                printf "\n"
        end
   end
end
```

load

Syntax load (factory-default | merge | override | patch | replace | set | update)
load (***filename*** | terminal) <relative>

QFX Series load (dhcp-snooping *filename*)

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Options **dhcp-snooping**—(QFX Series switches) Loads DHCP snooping entries.

factory-default—Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on.

On J Series Services Routers, pressing and holding down the Config button on the router for 15 seconds causes the factory configuration to be loaded and committed. However, this operation deletes all other configurations on the router; using the **load factory-default** command does not.

filename—Name of the file to load. For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

merge—Combine the configuration that is currently shown in the CLI with the configuration.

override—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.

patch—Change part of the configuration and mark only those parts as changed.

replace—Look for a **replace** tag in ***filename***, delete the existing statement of the same name, and replace it with the configuration.

set—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**.

relative—(Optional) Execute set of commands relative to current edit point.

terminal—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.

update—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS* .

Required Privilege Level configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

<size bytes>
<source source-address>
<strict>
< strict-source value>
<tos type-of-service>
<ttl value>
<verbose>
```

<wait *seconds*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options ***host***—IP address or hostname of the remote system to ping.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

count *requests*—(Optional) Number of ping requests to send. The range of values is **1** through **2,000,000,000**. The default value is an unlimited number of requests.

detail—(Optional) Include in the output the interface on which the ping reply was received.

do-not-fragment—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

NOTE: In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.

interface *source-interface*—(Optional) Interface to use to send the ping requests.

interval *seconds*—(Optional) How often to send ping requests. The range of values, in seconds, is **1** through infinity. The default value is **1**.

logical-system *logical-system-name*—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system *logical-system-name*** command and then run the **ping** command. To return to the main router, enter the **clear cli logical-system** command.

loose-source ***value***—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address ***mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern ***string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance ***routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

size ***bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source ***source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

strict—(Optional) Use the strict source route option (IPv4).

strict-source ***value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos ***type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

ttl ***value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

verbose—(Optional) Display detailed output.

vpls ***instance-name***—(Optional) Ping the instance to which this VPLS belongs.

wait ***seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

Required Privilege Level network

List of Sample Output

ping hostname on page 357
ping hostname rapid on page 357
ping hostname size count on page 357

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

Sample Output

request chassis beacon

Syntax (QFX Series)

request chassis beacon
<all (off | on)>
<fpc *slot-number* (off | on)>
<interconnect-device *name* (cb *slot-number* | fpc *slot-number* | (off | on)>
<node-device *name* (off | on)>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

(QFX Series only) Enable or disable the beacon LED on a QFX Series device.

Options

all—Turn the beacon LED either **on** or **off** on all QFabric system Interconnect and Node devices.

cb *slot-number*—Turn the beacon LED either **on** or **off** on the Control Board of the QFX3008-I Interconnect device.

fpc *slot-number*—Turn the beacon LED either **on** or **off** on the Flexible PIC Concentrator on the standalone QFX3500 switch or the Interconnect device.

interconnect-device *name*—Turn the beacon LED either **on** or **off** on the Interconnect device.

node-device *name*—Turn the beacon LED either **on** or **off** on the Node device.

off—Turn the beacon LED **off**.

on—Turn the beacon LED **on**.

Required Privilege Level

maintenance

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS 9.4 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS 11.3 for QFX Series.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

(M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB). For information about the meaning of "CBs" on the switches, see *EX Series Switches Hardware and CLI Terminology Mapping*.

Options

offline—Take the Control Board offline.

NOTE: On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the **request chassis cb slot *backup-slot-number* offline** command.

NOTE: Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.

online—Bring the Control Board online.

interconnect-device *name*—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:

slot *slot-number*—Control Board slot number:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the **lcc *number*** option (the recommended method), replace ***cb-slot-number*** with a value from 0 through 1.

  Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc *number*** option (the recommended method), replace ***cb-slot-number*** with a value from 0 through 1.
- M320 router—Replace ***slot-number*** with a value from 0 through 1.
- MX480/MX240 routers—Replace ***slot-number*** with a value from 0 through 1.
- MX960 router—Replace ***slot-number*** with a value from 0 through 2.
- MX2020 and MX2010 routers—Replace ***slot-number*** with 0 or 1.
- EX8208 switch—Replace ***slot-number*** with a value from 0 through 2.
- EX8216 switch—Replace ***slot-number*** with a value from 0 through 1.
- QFabric System—Replace ***slot-number*** with a value from 0 through 1.

lcc *number*—(TX Matrix, TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc *number*—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (switch-fabric chassis). Replace ***number*** with 0.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS 11.3 for QFX Series.
Command introduced in Junos OS 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Switches only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see *EX Series Switches Hardware and CLI Terminology Mapping*.

NOTE: Beginning in Junos OS 12.3, it is possible that FPCs brought offline using the **request chassis fpc slot** *fpc-slot* **offline** operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the **set fpc** *fpc-slot* **power off** configuration-mode command at the **[edit chassis]** hierarchy level to ensure that the FPCs remain offline.

Options

offline—Take the FPC offline.

online—Bring the FPC online.

interconnect-device *name*—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

restart—Restart the FPC.

slot *slot-number*—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the **lcc** ***number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31.

  Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc** ***number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace

slot-number with a value from **0** through **63**. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace ***slot-number*** with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace ***slot-number*** with a value from 0 through 9.
  - EX6210 switches—Replace ***slot-number*** with a value from 0 through 9.

NOTE: These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

  - EX8208 switches—Replace ***slot-number*** with a value from 0 through 7.
  - EX8216 switches—Replace ***slot-number*** with a value from 0 through 15.
- PTX5000 Packet Transport Switch—Replace ***slot-number*** with a value from 0 through 7.

all-members—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Release Information

Command introduced before Junos OS Release 7.4.
all-chassis option added in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.3 for QFX Series.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

CAUTION: (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the *TX Matrix Router Hardware Guide* or the *Junos OS High Availability Configuration Guide*.

NOTE: Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to "Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset," do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating "Command aborted. Not ready for mastership switch, try after n seconds" when this command is re-entered before 240 seconds have elapsed on EX Series switches.

NOTE: On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

Options **acquire**—Attempt to become the master Routing Engine.

release—Request that the other Routing Engine become the master.

switch—Toggle mastership between Routing Engines.

The **acquire**, **release**, and **switch** options have the following suboptions:

all-chassis—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

all-lcc—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

all-members—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

check—(QFabric systems, MX240, MX480, MX960, MX2010, and MX2020 Routers only) (Optional) Available only with the **switch** option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

interconnect-device ***name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

lcc ***number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

member ***member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace ***member-id*** with a value of 0 or 1.

no-confirm—(Optional) Do not request confirmation for the switch.

node-group ***name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

scc—(TX Matrix routers only) TX Matrix (switch-card chassis).

sfc—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

force—(Optional) Available only with the acquire option. Force the change to a new master Routing Engine.

Additional Information

Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (RE0) is the master and the Routing Engine in slot 1 (RE1) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the [**edit chassis redundancy**] hierarchy level in the configuration. For more information, see the *Junos OS System Basics Configuration Guide*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

NOTE: Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

List of Sample Output

request chassis routing-engine master acquire on page 370
request chassis routing-engine master switch on page 371

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis routing-engine master acquire

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

request chassis routing-engine master switch

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

request message

Syntax
request message all message "*text*"
request message message "*text*" (terminal *terminal-name* | user *user-name*)

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display a message on the screens of all users who are logged in to the router or switch or on specific screens.

Options
all—Display a message on the terminal of all users who are currently logged in.

message "*text*"—Message to display.

terminal *terminal-name*—Name of the terminal on which to display the message.

user *user-name*—Name of the user to whom to direct the message.

Release Information

Command introduced before Junos OS Release 7.4.
other-routing-engine option introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
director-device option introduced for QFabric systems in Junos OS Release 12.2.
backup-routing-engine option introduced in Junos OS Release 13.1.

Description

Stop the router or switch software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, use the **member** option from the Node group CLI. You cannot issue this command from the QFabric CLI.

Options

none—Stop the router or switch software immediately.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

at *time* —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to stop the software.
- ***yymmddhhmm***—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to stop the software.

backup-routing-engine—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

both-routing-engines—(Optional) Halt both Routing Engines at the same time.

director-device *director-device-id*—(QFabric systems only) Halt a specific Director device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

in *minutes*—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping the software.

other-routing-engine—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

slice *slice*—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information

On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

NOTE: If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

request system halt on page 380
request system halt (In 2 Hours) on page 380
request system halt (Immediately) on page 380
request system halt (At 1:20 AM) on page 380

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

request system halt (Immediately)

```
user@host> request system halt at now
```

request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

request system license add

Syntax request system license add (*filename* | terminal)

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Add a license key.

Options ***filename***—License key from a file or URL. Specify the filename or the URL where the key is located.

terminal—License key from the terminal.

Required Privilege Level maintenance

Related Documentation
- Adding New Licenses (CLI Procedure) on page 93

List of Sample Output request system license add on page 381

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license add

```
user@host> request system license add terminal
```

request system license delete

Syntax request system license delete (*license-id* | license-identifier-list [*licenseid001 licenseid002 licenseid003*] | all)

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option **license-identifier-list** introduced in Junos OS Release 13.1.

Description Delete a license key. You can choose to delete one license at a time, all licenses at once, or a list of license identifiers enclosed in brackets.

Options ***license-identifier***—Text string that uniquely identifies a license key.

license-identifier-list [***licenseid001 licenseid002 licenseid003....*** **]**— Delete multiple license identifiers as a list enclosed in brackets.

all—Delete all licenses on the device.

Required Privilege Level maintenance

request system license save

Syntax request system license save (*filename* | terminal)

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Save installed license keys to a file or URL.

Options ***filename***—License key from a file or URL. Specify the filename or the URL where the key is located.

terminal—License key from the terminal.

Required Privilege Level maintenance

Related Documentation
- Saving License Keys on page 95

List of Sample Output request system license save on page 383

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license save

```
user@host> request system license save ftp://user@host/license.conf
```

request system logout

Syntax request system logout (pid *pid* | terminal *terminal* | user *username*)
<all>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Log out users from the router or switch and the configuration database. If a user held the **configure exclusive** lock, this command clears the exclusive lock.

Options **all**—(Optional) Log out all sessions owned by a particular PID, terminal session, or user. (On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.)

pid *pid*—Log out the user session using the specified management process identifier (PID). The PID type must be management process.

terminal *terminal*—Log out the user for the specified terminal session.

user *username*—Log out the specified user.

Required Privilege Level configure

Release Information

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Power off the software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says "Hardware-based members will halt, Virtual Junos Routing Engines will reboot." If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Options

none—Power off the router or switch software immediately.

all-chassis—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.

all-lcc—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.

at *time*—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to power off the software.
- ***yymmddhhmm***—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to power off the software.

both-routing-engines—(Optional) Power off both Routing Engines at the same time.

in *minutes*—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +*minutes*** option.

lcc *number*—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before powering off the software.

other-routing-engine—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

sfc *number*—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

slice *slice*—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

Required Privilege Level maintenance

List of Sample Output request system power-off on page 388

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system power-off

```
user@host> request system power-off message "This router will be powered off in 30 minutes.
Please save your data and log out immediately."
warning: This command will not halt the other routing-engine.
If planning to switch off power, use the both-routing-engines option.
Power Off the system ? [yes,no] (no) yes

*** FINAL System shutdown message from remote@nutmeg ***
System going down IMMEDIATELY

This router will be powered off in 30 minutes. Please save your data and log out
immediately.

Shutdown NOW!
[pid 5177]
```

request system reboot

Syntax

request system reboot
<at **time**>
<in **minutes**>
<media (external | internal)>
<message "**text**">
<routing-engine>

Syntax (QFX Series)

request system reboot
<all <graceful>>
<director-device *name*>
<director-group <graceful>>
<fabric <graceful>>
<node-group *name*>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Reboot the Junos OS.

NOTE: On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

Options

none—Reboots the software immediately.

all—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

at time—(Optional) Time at which to reboot the software, specified in one of the following ways:

- ***+minutes***—Number of minutes from now to reboot the software.
- ***hh:mm***—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

director-device *name*—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

director-group—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

fabric—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

graceful—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

in minutes—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +*minutes*** option.

media (external | internal)—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

message "text"—(Optional) Message to display to all system users before rebooting the software.

node-group *name*—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

routing-engine—(Optional) Reboot the Routing Engine.

Required Privilege Level maintenance

Related Documentation

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system reboot

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no)
```

request system reboot (At 2300)

```
user@switch> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

request system reboot (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@switch> request system reboot at now
```

request system reboot (At 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system reboot director-device

```
user@switch> request system reboot director-device Node1
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

request system reboot director-group

```
user@switch> request system reboot director-group
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

request system reboot director-group graceful

```
user@switch> request system reboot director-group graceful
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

request system snapshot

Syntax request system snapshot
<partition>

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Copy the currently running Junos OS and configuration to alternate media. This command takes a snapshot of the contents of the / (root), and **/var** partitions on the media used to boot the switch and then copies the snapshot to alternate media. If the switch was booted from internal flash memory, the snapshot is copied to an external USB flash drive. If the switch was booted from an external USB flash drive, the snapshot is copied to internal flash memory.

Options **none**—Create a snapshot on the alternate media—that is, the external media if you booted the switch using software stored on internal media or internal media if you booted the switch using software stored on external media.

partition—Partition the destination media before copying over the snapshot.

Required Privilege Level view

Release Information

Command introduced before Junos OS Release 7.4.
best-effort-load and **unlink** options added in Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
set [*package-name package-name*] option added in Junos OS Release 11.1 for EX Series switches.
set [*package-name package-name*] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

NOTE: On EX Series switches, the set [*package-name package-name*] option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the set [*package-name package-name*] option allows you to install multiple software packages and software add-on packages at the same time.

upgrade-with-config and **upgrade-with-config-format** *format* options added in Junos OS Release 12.3 for M Series routers, MX Series routers, T Series routers, EX Series Ethernet switches, and QFX Series devices.

Description

NOTE: We recommend that you always download the software image to **/var/tmp** only. On EX Series and QFX Series switches, you must use the **/var/tmp** directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

Options

package-name—Location from which the software package or bundle is to be installed. For example:

- **/var/tmp/***package-name*—For a software package or bundle that is being installed from a local directory on the router or switch.
- ***protocol*://*hostname*/*pathname*/*package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:
  - **ftp**—File Transfer Protocol.
    Use **ftp://*hostname*/*pathname*/*package-name***. To specify authentication credentials, use **ftp://<*username*>:<*password*>@*hostname*/*pathname*/*package-name***. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.
    Use **http://*hostname*/*pathname*/*package-name***. To specify authentication credentials, use **http://<*username*>:<*password*>@*hostname*/*pathname*/*package-name***. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).
    Use **scp://*hostname*/*pathname*/*package-name***. To specify authentication credentials, use **scp://<*username*>:<*password*>@*hostname*/*pathname*/*package-name***.

NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the **scp** protocol in the **request system software add** command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support scp.
  Use the **file copy** command to copy the software package or bundle from the remote location to the **/var/tmp** directory on the hard disk:
  file copy scp://*source/package-name* /var/tmp
  Then install the software package or bundle using the **request system software add** command:
  request system software add /var/tmp/*package-name*
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the **unlink** option to achieve the same effect and allow the installation to be completed.

best-effort-load—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

component all—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

delay-restart—(Optional) Install a software package or bundle, but do not restart software processes.

force—(Optional) Force the addition of the software package or bundle (ignore warnings).

lcc *number* —(TX Matrix and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router (or line-card chassis) that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a T1600 router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.

member *member-id*—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace ***member-id*** with a value of 0 or 1.

partition —(QFX3500 switches only) (Optional) Format and repartition the media before installation.

scc—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router (or switch-fabric chassis). Replace *number* with **0**.

no-copy—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

no-validate—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

re0 | re1—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (**re0**) or the Routing Engine in slot 1 (**re1**).

reboot—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

set [*package-name package-name*]—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

unlink—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the **unlink** option to remove the software package from this directory after a successful upgrade is completed.

upgrade-with-config—(Optional) Install one or more configuration files.

upgrade-with-config-format *format*—(Optional) Specify the configuration file fomat, **text** or **xml**. The default format is **text**.

NOTE: The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the .failed suffix.

validate—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

Additional Information

NOTE: The request system snapshot command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, **jkernel**, last. Add the operating system package, **jkernel**, first and the routing software package, **jroute**, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add** *package-name* command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add** *package-name* command on a TX Matrix Plus master Routing Engine, all the T1600 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 backup Routing Engines that are connected to it are upgraded to the same version of software.

request system software configuration-backup

Syntax request system software configuration-backup (*path*)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Save the currently active configuration and any installation-specific parameters such as a configuration that you have entered outside of the CLI, Director group IP addresses, and the default partition IP address.

Options **path**—(QFabric System) Provide the path to the location of the backup configuration files. You can save the backup configuration files to either a URL, local directory, remote server, or removable drive.

Required Privilege Level configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

Related Documentation

```

request system software configuration-restore

Syntax request system software configuration-restore (*path*)

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Restore a previously saved configuration and any installation-specific parameters, such as a configuration that you have entered outside of the CLI, Director group IP addresses, and the default partition IP address.

Options **path**—(QFabric System) Provide the path to the location of the backup configuration files. The path can be to a local file, a file on an external flash drive, or an SCP or FTP destination.

Required Privilege Level configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

request system software delete

List of Syntax

Syntax on page 404
Syntax (TX Matrix Router) on page 404
Syntax (TX Matrix Plus Router) on page 404

Syntax

request system software delete *software-package*
<force>
<reboot>
<set [*package-name package-name*]>

Syntax (TX Matrix Router)

request system software delete *software-package*
<force>
<lcc *number* | scc>
<reboot>
<set [*package-name package-name*]>

Syntax (TX Matrix Plus Router)

request system software delete *software-package*
<force>
<lcc *number* | sfc *number*>
<reboot>
<set [*package-name package-name*]>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option **set [*package-name package-name*]** added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways.
Option reboot introduced in Junos OS Release 12.3.

Description

Remove a software package or bundle from the router or switch.

CAUTION: Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

Options

software-package—Software package or bundle name. You can delete any or all of the following software bundles or packages:

- **jbase**—(Optional) Junos base software suite
- **jcrypto**—(Optional, in domestic version only) Junos security software
- **jdocs**—(Optional) Junos online documentation file
- **jkernel**—(Optional) Junos kernel software suite
- **jpfe**—(Optional) Junos Packet Forwarding Engine support

- **jroute**—(Optional) Junos routing software suite
- **junos**—(Optional) Junos base software

NOTE: On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

force—(Optional) Ignore warnings and force removal of the software.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

scc—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc ***number***—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace *number* with 0.

Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the /altroot and /altconfig file systems (on routers) or the /, /altroot,

/config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

request system software download

Syntax (QFabric System) request system software download *path package-name*

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Download a software package from a location on the Director device, mounted external USB flash drive, remote FTP or SCP location, or other location.

Options *path*—Location where the software package is located. For example:

- **/pbdata/packages/*package-name***—For a software package that is being installed from a local directory on the switch.
- ***protocol*://*hostname/pathname/package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:
  - **ftp**—File Transfer Protocol.
    Use **ftp://*hostname/pathname/package-name***. To specify authentication credentials, use **ftp://<*username*>:<*password*>@*hostname/pathname/package-name***. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **scp**—Secure copy (available only for Canada and U.S. version).
    Use **scp://*hostname/pathname/package-name***. To specify authentication credentials, use **scp://<*username*>:<*password*>@*hostname/pathname/package-name***.

```

request system software nonstop-upgrade

Syntax request system software nonstop-upgrade *package-name*
<fabric >
<director-group>
<node-group *name*>

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.

Options *package-name*—Location from which the software is to be installed. For example:

- ***protocol*://*hostname/pathname/package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:
  - **ftp**—File Transfer Protocol.
    Use **ftp://*hostname/pathname/package-name***. To specify authentication credentials, use **ftp://<*username*>:<*password*>@*hostname/pathname/package-name***. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.
    Use **http://*hostname/pathname/package-name***. To specify authentication credentials, use **http://<*username*>:<*password*>@*hostname/pathname/package-name***. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).
    Use **scp://*hostname/pathname/package-name***. To specify authentication credentials, use **scp://<*username*>:<*password*>@*hostname/pathname/package-name***.

NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

director-group—Install software package on the Director group and Fabric managers.

fabric—Install software package on the Interconnect devices and Fabric controls.

node-group *name* —Install software package on the redundant server Node group, server Node group, or network Node group.

Required Privilege Level maintenance

<reboot>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command behavior changed in Junos OS Release 12.1.
Option **reboot** introduced in Junos OS Release 12.3.

Description

For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful **request system software add** command.

As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command. For example, using rollback in Junos OS 12.1 after using **request system software add** restores the system to a known good state prior to using the **add** command. Similarly, using rollback in Junos OS 12.1 after using **request system software delete** restores the system to a known good state prior to using the **delete** command.

A software rollback fails if any required package (or a **jbundle** package containing the required package) cannot be found in /var/sw/pkg.

Additional Information

- On M Series and T Series routers, if **request system software add <jinstall> reboot** was used for the previous installation, then **request system software rollback** has o effect. In this case, use **jinstall** to reinstall the required package.
- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.

Options

all-members—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

lcc ***number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

member ***member-id***—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

none—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

scc—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

Required Privilege Level maintenance

Release Information

Command introduced before Junos OS Release 7.4.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
set [*package-name package-name*] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.
upgrade-with-config and **upgrade-with-config-format *format*** options added in Junos OS Release 12.3 for M Series routers, MX Series routers, and T Series routers.

Description

Validate candidate software against the current configuration of the router.

Options

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member ***member-id***—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

package-name—Name of the software bundle or package to test.

scc—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc ***number***—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

upgrade-with-config—(Optional) Install one or more configuration files.

upgrade-with-config-format ***format***—(Optional) Specify the configuration file fomat, **text** or **xml**. The default format is **text**.

NOTE: The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the .failed suffix.

Additional Information

By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

<node-group name>
<prune>
<qfabric (component name) | dry-run | name-tag | repository)>
<repository (core | log)>
```

Release Information

Command introduced in Junos OS Release 7.4.
dry-run option introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.

Options

all-members—(EX4200 switches and MX Series routers only) (Optional) Delete files on all members of the Virtual Chassis configuration.

component (*UUID* | *serial number* | all)—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

director-group *name*—(QFabric systems only) (Optional) Delete files on the Director group.

dry-run—(Optional) List files proposed for deletion (without deleting them).

infrastructure *name*—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) Optional) Delete files on the Interconnect device.

local—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

name-tag *name-tag*—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

node-group *name*—(QFabric systems only) (Optional) Delete files on the Node group.

prune—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

qfabric component *name*—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

repository (core | log)—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

Additional Information

If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message "Currently rotating log files, please wait." If no logging is currently under way, the output displays only a list of files to delete.

Required Privilege Level

maintenance

List of Sample Output

request system storage cleanup dry-run on page 425
request system storage cleanup on page 426
request system storage cleanup director-group (QFabric Systems) on page 426
request system storage cleanup infrastructure device-name (QFabric Systems) on page 428
request system storage cleanup interconnect-device device-name (QFabric Systems) on page 429
request system storage cleanup node-group group-name (QFabric Systems) on page 430
request system storage cleanup qfabric component device-name (QFabric Systems) on page 431
request system storage cleanup qfabric component device-name repository core (QFabric Systems) on page 431
request system storage cleanup qfabric component all (QFabric Systems) on page 431

Output Fields

Table 49 on page 425 describes the output fields for the **request system storage cleanup** command. Output fields are listed in the approximate order in which they appear.

Table 49: request system storage cleanup Output Fields

Field Name	Field Description
List of files to delete:	Shows list of files available for deletion.
Size	Size of the core-dump file.
Date	Last core-dump file modification date and time.
Name	Name of the core-dump file.
Directory to delete:	Shows list of directories available for deletion.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the **core** repository, and the log files are located in the **log** repository. The default **Repository scope** is shared since both the **core** and **log** repositories are shared by all of the QFabric system devices.
Repository head:	Name of the top-level repository location.
Repository name:	Name of the repository: **core** or **log**.
Creating list of debug artifacts to be removed under:	Shows location of files available for deletion.
List of debug artifacts to be removed under:	Shows list of files available for deletion.

Sample Output

request system storage cleanup dry-run

```
user@host> request system storage cleanup dry-run

request system zeroize

Syntax

request system zeroize
<media>

Release Information

Command introduced before Junos OS Release 9.0.
Command introduced in Junos OS Release 11.2 for EX Series switches.
Option **media** added in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 12.2 for MX Series devices.
Command introduced in Junos OS Release 12.3 for the QFX Series.

Description

NOTE: The **media** option is not available on the QFX Series.

Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as **root** and start the Junos OS command-line interface (CLI) by typing **cli** at the prompt.

To completely erase user-created data so that it is unrecoverable, use the **media** option.

Options

media—(Optional) In addition to removing all configuration and log files, the **media** option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the **request system zeroize media** operation can take considerably more time than the **request system zeroize** operation. However, the critical security parameters are all removed at the beginning of the process.

Required Privilege Level

maintenance

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series routers.
Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dlsw** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

Description Restart a Junos OS process.

CAUTION: Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

Options **none**—Same as **gracefully**.

adaptive-services—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all routers connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

all-sfc—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

ancpd-service—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

auto-configuration—(Optional) Restart the Interface Auto-Configuration process.

autoinstallation—(EX Series switches only) (Optional) Restart the autoinstallation process.

captive-portal-content-delivery—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

ce-l2tp-service—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

chassis-control—(Optional) Restart the chassis management process.

class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

database-replication—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

datapath-trace-service—(Optional) Restart the packet path tracing process.

dhcp—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

dhcp-service—(Optional) Restart the Dynamic Host Configuration Protocol process.

dialer-services—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

diameter-service—(Optional) Restart the diameter process.

disk-monitoring—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

dlsw—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

dot1x-protocol—(EX Series switches only) (Optional) Restart the port-based network access control process.

dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

ethernet-switching—(EX Series switches only) (Optional) Restart the Ethernet switching process.

event-processing—(Optional) Restart the event process (eventd).

fibre-channel—(QFX Series only) (Optional) Restart the Fibre Channel process.

firewall—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

gracefully—(Optional) Restart the software process.

iccp-service—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

immediately—(Optional) Immediately restart the software process.

interface-control—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

ipsec-key-management—(Optional) Restart the IPsec key management process.

isdn-signaling—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

kernel-replication—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Restart the Layer 2 address flooding and learning process.

l2cpd-service—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

l2tp-service— (M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

l2tp-universal-edge—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

lacp—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG,

and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

license-service—(EX Series switches only) (Optional) Restart the feature license management process.

link-management— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

lldpd-service—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

local—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

local-policy-decision-function— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

mac-validation— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member ***member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace ***member-id*** with a value of **0** or **1**.

mib-process—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

mountd-service—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

mpls-traceroute—(Optional) Restart the MPLS Periodic Traceroute process.

mspd—(Optional) Restart the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

network-access-service—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

nfsd-service—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

packet-triggered-subscribers—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Restart the Peer Selection Service process.

pgcp-service—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

pgm—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

pic-services-logging—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

pki-service—(Optional) Restart the PKI Service process.

ppp—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

pppoe—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

protected-system-domain-service—(Optional) Restart the Protected System Domain (PSD) process.

redundancy-interface-process—(Optional) Restart the ASP redundancy process.

remote-operations—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

root-system-domain-service—(Optional) Restart the Root System Domain (RSD) service.

routing—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

routing <logical-system *logical-system-name*>—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

sampling—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

sdk-service—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

sfc *number*—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with **0**.

service-deployment—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

services—(Optional) Restart a service.

services pgcp gateway *gateway-name*—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

sflow-service—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

snmp—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

soft—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

static-subscribers—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

statistics-service—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

subscriber-management—(Optional) Restart the Subscriber Management process.

subscriber-management-helper—(Optional) Restart the Subscriber Management Helper process.

tunnel-oamd—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

usb-control—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

vrrp—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

web-management—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

Required Privilege Level reset

- Overview of Junos OS CLI Operational Mode Commands on page 75

List of Sample Output restart interfaces on page 447

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

rollback

Syntax rollback <*number* | rescue>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Return to a previously committed configuration. The software saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

The currently operational Junos OS configuration is stored in the file **juniper.conf**, and the last three committed configurations are stored in the files **juniper.conf.1**, **juniper.conf.2**, and **juniper.conf.3**. These four files are located in the directory **/config**, which is on the router's flash drive. The remaining 46 previous committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config**, which is on the router's hard disk.

During rollback, the configuration you specify is loaded from the associated file. Only objects in the rollback configuration that differ from the previously loaded configuration are marked as changed (equivalent to **load update**).

Options none (Optional)—Return to the most recently saved configuration.

number—(Optional) Configuration to return to. The range of values is from **0** through **49**. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. The default is **0**.

rescue—(Optional) Return to the rescue configuration.

Required Privilege Level rollback—To roll back to configurations other than the one most recently committed.

save

Syntax save *filename*

QFX Series save (dhcp-snooping *filename*)

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

When saving a file to a remote system, the software uses the **scp**/**ssh** protocol.

Options *filename*—Name of the saved file. You can specify a filename in one of the following ways:

- *filename*—File in the user's home directory (the current directory) on the local flash drive.
- *path/filename*—File on the local flash drive.
- /var/*filename* or /var/*path/filename*—File on the local hard disk.
- a:*filename* or a:*path/filename*—File on the local drive. The default path is / (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- *hostname:/path/filename, hostname:filename, hostname:path/filename,* or **scp://***hostname/path/filename*—File on an **scp**/**ssh** client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify *hostname* as *username*@*hostname*.
- **ftp://***hostname/path/filename*—File on an FTP server. You can also specify *hostname* as *username* @*hostname* or *username*:*password* @*hostname*. The default path is the user's home directory. To specify an absolute path, the path must start with the string **%2F**; for example, **ftp://***hostname/%2Fpath/filename*. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed:

  user@host> **file copy ftp://***username*@ftp.*hostname*.net//*filename*
  file copy ftp.*hostname*.net: Not logged in.
  user@host> **file copy ftp://***username*:prompt@ftp*hostname*.net//*filename*

  Password for *username*@ftp.*hostname*.net:

- **http://***hostname/path/filename*—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify *hostname* as *username*@*hostname* or *username*:*password*@*hostname*. If a password is required and you omit it, you are prompted for it.
- **re0**:*/path/filename* or **re1**:*/path/filename*—File on a local Routing Engine.

Required Privilege Level configure—To enter configuration mode.

Syntax (PTX Series Packet Transport Switches)

show chassis alarms

Syntax (ACX Series Universal Access Routers)

show chassis alarms

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.

Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description Display information about the conditions that have been configured to trigger alarms.

Options **none**—Display information about the conditions that have been configured to trigger alarms.

all-members—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

interconnect-device ***name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

lcc ***number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

member ***member-id***—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

node-device ***name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

scc—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

sfc ***number***—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with **0**.

Additional Information You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code:
257
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

To understand what CM_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

As per the above table, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

First, you have to convert 559 to binary; that is **1000101111**. The LSB in this case is **1**, which means that this is a major alarm. After removing the LSB, you are left with **100010111**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	**Code**
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3

CMALARM_LCHIP_LOUT_DESRD_ILLEGALSIZE_ERR	4
CMALARM_LCHIP_LOUT_HDRF_TOERR_ERR	5

CMALARM_NCHIP_WRDMA_FIFO_UNFLW_ERR	265

CMALARM_NCHIP_WRDMA_PKT_LEN_ERR	266
CMALARM_NCHIP_WRDMA_JBUS_CRC_ERR	267
CMALARM_NCHIP_PKTR_DMA_AGE_ERR	268
CMALARM_NCHIP_PKTR_ICELLSIG_ERR	269
CMALARM_NCHIP_PKTR_FTTL_ERR	270
CMALARM_NCHIP_RODR_OFFSET_OVFLW_ERR	271
CMALARM_NCHIP_PKTR_TMO_CELL_ERR	272
CMALARM_NCHIP_PKTR_TMO_OUTRANGE_ERR	273
CMALARM_NCHIP_PKTR_MD_REQUEST_Q_OVFLW_ERR	274
CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR	275
CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR	276
CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279

Chip Type: R Chip	Code
CMALARM_RCHIP_SRAM_PARITY_ERR	512

Chip Type: R Chip	Code
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602
CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608

CMALARM_ICHIP_WO_IP_INTER_ERR	609
CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630
CMALARM_ICHIP_SDRAM_BIST_ERR	631
CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM_NCHIP_DBUF_CRC_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice-versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257
```

Actual Error Code = (257-1)/2 = 128. Similarly, for minor alarms, Actual Error Code = (Error Code)/2

Output Fields Table 50 on page 458 lists the output fields for the **show chassis alarms** command. Output fields are listed in the approximate order in which they appear.

Table 50: show chassis alarms Output Fields

Field Name	Field Description
Alarm time	Date and time the alarm was first recorded.
Class	Severity class for this alarm: **Minor** or **Major**.
Description	Information about the alarm.

show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router are online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

```

show chassis beacon

show chassis beacon (QFX Series)

show chassis beacon
<cb *slot-number*>
<fpc *slot-number*>
<interconnect-device *name* (cb *slot-number* | fpc *slot-number*)>
<node-device *name*>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the beacon LED status on a QFX3500 standalone switch, Node device, and an Interconnect device. You can also display the beacon LED status of the Control Boards and Flexible PIC Concentrators on the Interconnect device.

Options

cb *slot-number*— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Control Board on the Interconnect device.

fpc *slot-number* — (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator (FPC) on the Interconnect device. (QFX3500 switches only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator on the standalone switch.

interconnect-device *name*— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Interconnect device.

node-device *name*— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Node device.

Output Fields

Table 51 on page 464 lists the output fields for the **show chassis beacon** command. Output fields are listed in the approximate order in which they appear.

Table 51: show chassis led Output Fields

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always **0**.

Table 51: show chassis led Output Fields *(continued)*

Field Name	Field Description
Beacon State	Status of the beacon state: • Off—The beacon is **OFF**. • On—The beacon is **ON**.

Sample Output

show chassis beacon (QFX Series)

```
user@switch> show chassis beacon
Slot            Beacon State
   FPC     0          OFF
```

show chassis beacon interconnect-device (QFabric System)

```
user@switch> show chassis beacon interconnect-device interconnect1
Chassis              OFF
CB 0                 OFF
CB 1                 OFF
FC 0 FPC 0           OFF
FC 1 FPC 1           OFF
RC 0 FPC 8           OFF
RC 1 FPC 9           OFF
```

show chassis beacon interconnect-device fpc (QFabric System)

```
user@switch> show chassis beacon interconnect-device interconnect1 fpc 0
FPC 0                ON
```

show chassis beacon node-device (QFabric System)

```
user@switch> show chassis beacon node-device node1
node1                ON
```

show chassis beacon node-device fpc (QFabric System)

```
user@switch> show chassis beacon node-device node1 fpc 0
FPC 0              ON
```

show chassis ethernet-switch interconnect-device fpc

Syntax

show chassis ethernet-switch interconnect-device *name* fpc
<detail>
<port *number*>
<slot *number*>

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

(QFX3000-G QFabric systems only) Display Ethernet switch information for the front card Flexible Port Concentrators (FPCs) in an Interconnect device.

Options

none—Display Ethernet switch information about each connected port on each online FPC in the Interconnect device.

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot in the Interconnect device.

port *number*—(Optional) Display Ethernet switch information about a specific port on an FPC in the Interconnect device.

slot *number*—(Optional) Display Ethernet switch information about an FPC in a specific slot in the Interconnect device.

Output Fields

Table 52 on page 466 lists the output fields for the **show chassis ethernet-switch interconnect-device fpc** command. Output fields are listed in the approximate order in which they appear.

Table 52: show chassis ethernet-switch interconnect-device fpc Output Fields

Field Name	Field Description
Link is good on port n connected to device	Information about the link between each port on the FPC's Ethernet switch and one of the following devices: • FWD-SWITCH-0 • FWD-SWITCH-1 • CB0 • CB1
Speed is	Speed at which the Ethernet link is running: **10 Mb**When the device is **RE** or **Other RE** on the TX Matrix router, the speed is **1000 Mb**.

Table 52: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
Duplex is	Duplex type of the Ethernet link: **full** or **half**.
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the **no-concatenate** statement at the **[edit chassis]** hierarchy level, as described in the *Junos OS System Basics Configuration Guide*).
TX Octets	Number of octets sent.
TX Packets 64 Octets	Number of transmitted frames of size 64 octets.
TX Packets 65-127 Octets	Number of transmitted frames of size 65 through 127 octets.
TX Packets 128-255 Octets	Number of transmitted frames of size 128 through 255 octets.
TX Packets 256-511 Octets	Number of transmitted frames of size 256 through 511 octets.
TX Packets 512-1023 Octets	Number of transmitted frames of size 512 through 1023 octets.
TX Packets 1024-1518 Octets	Number of transmitted frames of size 1024 through 1518 octets.
TX Packets 1519-2047 Octets	Number of transmitted frames of size 1519 through 2047 octets.
TX Packets 2048-4095 Octets	Number of transmitted frames of size 2048 through 4095 octets.
TX Packets 4096-9216 Octets	Number of transmitted frames of size 4096 through 9216 octets.
TX Packets 9217-16383 Octets	Number of transmitted frames of size 9217 through 16383 octets.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	Number of packets sent after one collision.
TX Mult. Collision frames	Number of packets sent after multiple collisions.
TX Late Collision Frames	Number of packets aborted during sending because of collisions after 64 bytes.

Table 52: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Collision frames	Number of collision packets sent.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands sent.
TX MAC ctrl frames	Number of MAC control packets sent.
TX Frame deferred Xmns	Number of frames deferred in *x* milliseconds.
TX Oversize Packets	Number of oversized packets sent.
TX Jabbers	Total number of frames sent that exceed the maximum byte count and contain CRC errors .
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
RX Octets	Number of octets received.
RX Packets 64 Octets	Number of received packets of size 64 octets.
RX Packets 65-127 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 128-255 Octets	Number of received packets of size 128 through 255 octets.
RX Packets 256-511 Octets	Number of received packets of size 256 through 511 octets.
RX Packets 512-1023 Octets	Number of received packets of size 512 through 1023 octets.
RX Packets 1024-1518 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 1519-2047 Octets	Number of received packets of size 1519 through 2047 octets.
RX Packets 2048-4095 Octets	Number of received packets of size 2048 through 4095 octets.
RX Packets 4096-9216 Octets	Number of received packets of size 4096 through 9216 octets.

Table 52: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
RX Multicast Packets	Number of multicast packets received.
RX Broadcast Packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Align Errors	Number of incomplete octets received.
RX Fragments	Number of fragmented packets received.
RX Symbol errors	Number of symbols received that the router did not correctly decode.
RX Unsupported opcodes	Number of packets received with unsupported op codes.
RX Out of Range Length	Number of packets received with an out of range length.
RX False Carrier Errors	Number of packets received with false carrier errors.
RX Undersize Packets	Number of undersized packets received.
RX Oversize Packets	Number of oversized packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX 1519-1522 Good Vlan frms	Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.
RX MTU Exceed Counter	Number of packets received that exceed the MTU.
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX Byte Counter	Number of bytes received.

show chassis ethernet-switch interconnect-device cb

Syntax
show chassis ethernet-switch interconnect-device *name* cb
<detail>
<port *number*>
<slot*number*>

Release Information
Command introduced in Junos OS Release 12.2 for the QFX Series.

Description
(QFX3000-G QFabric systems only) Display Ethernet switch information for the Control Board (CB) ports in an Interconnect device.

Options
none—Display Ethernet switch information about each connected port on each online CB in the Interconnect device.

detail—(Optional) Display detailed status information for all CBs or for the CB in the specified slot in the Interconnect device.

port *number*—(Optional) Display Ethernet switch information about a specific port on a CB in the Interconnect device.

slot *number*—(Optional) Display Ethernet switch information about a CB in a specific slot in the Interconnect device.

Required Privilege Level
view

List of Sample Output
show chassis ethernet-switch interconnect-device cb on page 495
show chassis ethernet-switch interconnect-device cb detail on page 496
show chassis ethernet-switch interconnect-device cb detail slot port on page 501

Output Fields
Table 52 on page 466 lists the output fields for the **show chassis ethernet-switch interconnect-device cb** command. Output fields are listed in the approximate order in which they appear.

Table 53: show chassis ethernet-switch interconnect-device fpc Output Fields

Field Name	Field Description
Link is good on port n connected to device	Information about the link between each port on the FPC's Ethernet switch and one of the following devices: • FWD-SWITCH-0 • FWD-SWITCH-1 • CB0 • CB1
Speed is	Speed at which the Ethernet link is running: **10 Mb**When the device is **RE** or **Other RE** on the TX Matrix router, the speed is **1000 Mb**.
Duplex is	Duplex type of the Ethernet link: **full** or **half**.

Table 53: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the **no-concatenate** statement at the **[edit chassis]** hierarchy level, as described in the *Junos OS System Basics Configuration Guide*).
Flow Control TX is Enabled (or Disabled)	Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.
Flow Control RX is Enabled (or Disabled)	Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.
TX Octets	Number of octets sent.
TX Packets 64 Octets	Number of transmitted packets of size 64 octets.
TX Packets 65-127 Octets	Number of transmitted frames of size 65 through 127 octets.
TX Packets 128-255 Octets	Number of transmitted frames of size 128 through 255 octets.
TX Packets 256-511 Octets	Number of transmitted frames of size 256 through 511 octets.
TX Packets 512-1023 Octets	Number of transmitted frames of size 512 through 1023 octets.
TX Packets 1024-1518 Octets	Number of transmitted frames of size 1024 through 1518 octets.
TX Packets 1519-2047 Octets	Number of transmitted frames of size 1519 through 2047 octets.
TX Packets 2048-4095 Octets	Number of transmitted frames of size 2048 through 4095 octets.
TX Packets 4096-9216 Octets	Number of transmitted frames of size 4096 through 9216 octets.
TX Packets 9217-16383 Octets	Number of transmitted frames of size 9217 through 16383 octets.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	Number of packets sent after one collision.

Table 53: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
TX Mult. Collision frames	Number of packets sent after multiple collisions.
TX Late Collision Frames	Number of packets aborted during sending because of collisions after 64 bytes.
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Collision frames	Number of collision packets sent.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands sent.
TX MAC ctrl frames	Number of MAC control packets sent.
TX Frame deferred Xmns	Number of frames deferred in *x* milliseconds.
TX Oversize Packets	Number of oversized packets sent.
TX Jabbers	Total number of frames sent that exceed the maximum byte count and contain CRC errors .
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
RX Octets	Number of octets received.
RX Packets 64 Octets	Number of received packets of size 64 octets.
RX Packets 65-127 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 128-255 Octets	Number of received packets of size 128 through 255 octets.
RX Packets 256-511 Octets	Number of received packets of size 256 through 511 octets.
RX Packets 512-1023 Octets	Number of received packets of size 512 through 1023 octets.
RX Packets 1024-1518 Octets	Number of received packets of size 65 through 127 octets.
RX Packets 1519-2047 Octets	Number of received packets of size 1519 through 2047 octets.

Table 53: show chassis ethernet-switch interconnect-device fpc Output Fields *(continued)*

Field Name	Field Description
RX Packets 2048-4095 Octets	Number of received packets of size 2048 through 4095 octets.
RX Packets 4096-9216 Octets	Number of received packets of size 4096 through 9216 octets.
RX Multicast Packets	Number of multicast packets received.
RX Broadcast Packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Align Errors	Number of incomplete octets received.
RX Fragments	Number of fragmented packets received.
RX Symbol errors	Number of symbols received that the router did not correctly decode.
RX Unsupported opcodes	Number of packets received with unsupported op codes.
RX Out of Range Length	Number of packets received with an out of range length.
RX False Carrier Errors	Number of packets received with false carrier errors.
RX Undersize Packets	Number of undersized packets received.
RX Oversize Packets	Number of oversized packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX 1519-1522 Good Vlan frms	
RX MTU Exceed Counter	Number of packets received that exceed the MTU.
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX Byte Counter	Number of bytes received.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
monitored option added in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
pem option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.

Description

Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

Options

none—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

adc *adc-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace ***adc-slot-number*** with a value from **0** through **19**. For MX2010 routers, replace ***adc-slot-number*** with a value from **0** through **9**.

cb *cb-slot-number*—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Switches, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace ***cb-slot*** with **0** or **1**. For the EX Series switches, see *EX Series Switches Hardware and CLI Terminology Mapping* for information on CB slot numbering.

cip *cip-slot-number*—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the ***cip-slot-number*** variable with a value of **0** or **1**.

cb interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

ccg *ccg-slot-number*—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace ***cb-slot*** with a value of **0** or **1**.

fpc *fpc-slot*—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Switches, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace ***fpc-slot*** with a value from **0** through **9**. For MX2020 routers, replace ***fpc-slot*** with a value from **0** through **19**. For information about FPC numbering, see show chassis environment fpc. On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see *EX Series Switches Hardware and CLI Terminology Mapping* for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace *fpc-slot* with a value from **0** through **63**.

fpm—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Switches, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

monitored—(MX2020 routers and PTX Series Packet Transport Switches only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* variable with a value of **0** or **1**. For EX Series switches, see *member* for member ID values.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

pdu ***pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

pem—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

pem ***pem-slot-number***—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see show chassis environment pem.

psm ***psm-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace ***psm-slot-number*** with a value from **0** through **17**. For MX2010 routers, replace ***psm-slot-number*** with a value from **0** through **8**.

psu ***psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See *EX Series Switches Hardware and CLI Terminology Mapping* for detailed information.

routing-engine—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

routing-engine ***re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see show chassis environment routing-engine.

scg—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

scc—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

sfb ***sfb-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace ***sfb-slot-number*** with a value from **0** through **7**.

sfc ***number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router (switch-fabric chassis). Replace ***number*** variable with **0**.

sib ***sib-slot-number***—(M320 routers, PTX Series Packet Transport Switches, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

Output Fields Table 54 on page 514 lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 54: show chassis environment Output Fields

Field Name	Field Description

Class	Information about the category or class of chassis component:
	• **Power**: Power information:
	  ◦ (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: **OK**, **Testing**, (during initial power-on), **Failed**, or **Absent**.
	  ◦ (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: **OK**, **Testing**, (during initial power-on), **Check**, **Failed**, or **Absent**.
	  ◦ (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: **OK**, **Testing**, (during initial power-on), **Check**, **Failed**, or **Absent**.
	• **Temp**: Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F).
	On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.
	• **Pic**: On ACX4000 Routers, multiple temperature channels on a MIC. The status is: **OK** and the **Measurement** is in degrees Celsius (C) and Fahrenheit (F).
	• **Fan**: Fan status: **OK**, **Testing** (during initial power-on), **Failed**, or **Absent**.
	On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. **Measurement** indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only).
	• **Misc**: Information about other components of the chassis.
	  ◦ On some routers, this field indicates the status of one or more additional components.
	  ◦ On the M40e, M160, and M320 router, **Misc** includes **CIP** (Connector Interface Panel). **OK** indicates that the CIP is present. **Absent** indicates that the CIP is not present.
	  ◦ On T Series routers, **Misc** includes **CIP** and **SPMB** (Switch Processor Mezzanine Board). **OK** indicates that the **CIP** or **SPMB** is present. **Absent** indicates that the **CIP** or **SPMB** is not present.
	  ◦ On PTX Series Packet Transport Switches, **Misc** includes the **SPMB** (Switch Processor Mezzanine Board). The SPMB is located on the control boards. **OK** indicates that the control board is present. **Absent** indicates that the control board is not present.

Table 54: show chassis environment Output Fields *(continued)*

Field Name	Field Description
Item	(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).
Status	(MX2010 and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be: • **OK**: The fans are operational. • **Testing**: The fans are being tested during initial power-on. • **Failed**: The fans have failed or the fans are not spinning. • **Absent**: The fan tray is not installed. If the Class is Power, the power supply status can be: • **OK**: The power component is operational. • **Testing**: The power component is being tested during initial power-on. • **Check**: There is insufficient power---that is, fewer than the minimum required feeds are connected. • **Failed**: The inputs leads have failed. • **Absent**: The power component is not installed.
Measurement	(MX2010 and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.

Sample Output

show chassis environment (J2300 Router)

```
user@host> show chassis environment
Class Item                 Status     Measurement
Temp  Routing Engine       OK         40 degrees C / 104 degrees F
Fan   Fan                  OK
```

show chassis environment (J4300 or J6300 Router)

Release Information

Command introduced before Junos Release 7.4.
Command introduced in Junos OS Release 9.4 for EX Series switches.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
sfc option introduced for the TX Matrix Plus router in Junos Release 9.6.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Switches only) Display environmental information about the Control Boards (CBs). For information about the meaning of "CBs" on the switches, see *EX Series Switches Hardware and CLI Terminology Mapping*.

Options

none—Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 or T4000 routers.

all-members—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

interconnect-device—(QFabric systems only) Display environmental information about the CBs on the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Switches, replace ***slot*** with **0** or **1**. On EX Series switches replace ***slot*** with **0**, **1**, or **2**. On QFX Series switches, replace ***slot*** with **0** or **1**.

Output Fields

Table 55 on page 563 lists the output fields for the **show chassis environment cb** command. Output fields are listed in the approximate order in which they appear.

Table 55: show chassis environment cb Output Fields

Field Name	Field Description
State	Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby. • **Online**—CB is online and running. • **Offline**— CB is powered down. NOTE: On the EX8208 switch, the installation can include three CBs. See *EX Series Switches Hardware and CLI Terminology Mapping*.
Temperature	Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB. • **Temperature Intake**—Measures the temperature of the air intake to cool the power supplies. • **Temperature Exhaust**—Measures the temperature of the hot air exhaust. NOTE: On the MX2010 and MX2020 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010 and MX2020 routers include intake and exhaust temperatures for multiple zones (**Intake A**, **Intake B**, **Intake C**, **Exhaust A**, **Exhaust B**, and **TCBC**).
Power	Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
BUS Revision	Revision level of the generic bus device. (Not on switches.)
FPGA Revision	Revision level of the field-programmable gate array (FPGA). (Not on switches.)

Table 55: show chassis environment cb Output Fields *(continued)*

Field Name	Field Description
PMBus device (on MX240, MX480, and MX960 routers with Enhanced MX SCB)	Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB: • **Expected voltage** • **Measured voltage** • **Measured current** • **Calculated power**

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series switches only) Display environmental information about Flexible PIC Concentrators (FPCs).

Options

none—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

slot* or *fpc-slot—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc *number*** option (the recommended method), replace ***slot*** with a value from **0** through **7**. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc *number*** option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**. For example, the following commands have the same result:

  ```
  user@host> show chassis environment fpc 1 lcc 1
  user@host> show chassis environment fpc 9
  ```

- M120 router—Replace ***slot*** with a value from **0** through **5.**
- MX240 router—Replace ***slot*** with a value from **0** through **2**.
- MX480 router—Replace ***slot*** with a value from **0** through **5**.
- MX960 router—Replace ***slot*** with a value from **0** through **11**.
- MX2010 router—Replace ***slot*** with a value from **0** through **9**.
- MX2020 router—Replace ***slot*** with a value from **0** through **19**.
- Other routers—Replace ***slot*** with a value from **0** through **7**.
- EX Series switches:

- EX3200 switches and EX4200 standalone switches—Replace ***slot*** with 0.
- EX4200 switches in a Virtual Chassis configuration—Replace ***slot*** with a value from 0 through 9 (switch's member ID).
- EX6210 switches–Replace ***slot*** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotuing Engine (SRE) module), or 6 through 9 (line card only).
- EX8208 switches—Replace ***slot*** with a value from 0 through 7 (line card).
- EX8216 switches—Replace ***slot*** with a value from 0 through 15 (line card).

- QFX3500 switches —Replace ***fpc-slot*** with 0 through 15.
- PTX5000 Packet Transport Switch—Replace ***fpc-slot*** with 0 through 7.

Output Fields Table 56 on page 582 lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

Table 56: show chassis environment fpc Output Fields

Field Name	Field Description
State	Status of the FPC: • **Unknown**—FPC is not detected by the router. • **Empty**—No FPC is present. • **Present**—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online. • **Ready**—FPC is in intermediate or transition state. • **Announce online**—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative. • **Online**—FPC is online and running. • **Offline**—FPC is powered down. • **Diagnostics**—FPC is set to operate in diagnostics mode.
Temperature	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
PMB Temperature	(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).
Temperature Intake	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
Temperature Top	(T Series routers only) Temperature of the air flowing past the top of the FPC.
Temperature Exhaust	(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis. The PTX Series Packet Transport Switches, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (**Exhaust A** and **Exhaust B**).
Temperature Bottom	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
TL *n* Temperature	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
TQ *n* Temperature	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
Temperature MMBO	(T640 router only) Temperature of the air flowing past the type 3 FPC.
Temperature MMB1	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
Power	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
CMB Revision or **BUS revision**	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS 11.3 for the QFX Series.

Description

Display Power Entry Module (PEM) environmental status information.

NOTE: The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

Options

none—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached routers.

all-members—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.

scc—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).

slot —(Optional) Display environmental information about an individual PEM. Replace ***slot*** with **0** or **1**.

Output Fields Table 57 on page 606 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

Table 57: show chassis environment pem Output Fields

Field Name	Field Description
PEM *slot* status	Number of the PEM slot.
State	Status of the PEM.
Temperature	Temperature of the air flowing past the PEM.
AC Input	Status of the AC input for the specified component
AC Output	Status of the AC output for the specified component.
DC input	Status of the DC input for the specified component.
DC output	Status of the DC output for the specified component.
Load	(Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.
Voltage	(M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.
Current	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.
Power	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.
SCG/CB/SIB	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board.
FAN	(T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.

Sample Output

show chassis environment pem (M40e Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State                          Online
  Temperature                    OK
  AC input                       OK
  DC output                      OK
```

show chassis environment pem (M120 Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State                     Online
  Temperature               OK
  DC Input:                 OK
  DC Output:                OK
  Load                      Less than 20 percent
  Voltage:
    48.0 V input            52864 mV
    48.0 V fan supply       41655 mV
    3.3 V                    3399 mV
PEM 1 status:
  State                     Online
  Temperature               OK
  DC Input:                 OK
  DC Output:                OK
  Load                      Less than 20 percent
  Voltage:
    48.0 V input            54537 mV
    48.0 V fan supply       42910 mV
    3.3 V                    3506 mV
```

show chassis environment pem (M160 Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State                          Online
  Temperature                    OK
  DC input                       OK
  DC output                      OK
  Load                           Less than 20 percent
  Voltage:
    48.0 V input            54833 mV
    48.0 V fan supply       50549 mV
    8.0 V bias              8239 mV
    5.0 V bias              5006 mV
```

show chassis environment pem (M320 Router)

```
user@host> show chassis environment pem
PEM 2 status:
  State                          Online
  Temperature                    OK
  DC input                       OK
  Load                           Less than 40 percent
    48.0 V input           51853 mV
    48.0 V fan supply      48877 mV
    8.0 V bias              8449 mV
```

```
    5.0 V bias               4998 mV
PEM 3 status:
  State                           Online
  Temperature                     OK
  DC input                        OK
  Load                            Less than 40 percent
    48.0 V input            51717 mV
    48.0 V fan supply       49076 mV
    8.0 V bias               8442 mV
    5.0 V bias               4998 mV
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.1 for the T4000 Core Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

Display Routing Engine environmental status information.

Options

none—Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix

router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

lcc *number*——(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace ***member-id*** with the value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX2020 routers, and T Series routers, replace ***slot*** with **0** or **1**. On M5, M7i, M10, and M40 routers and on the J Series router, replace ***slot*** with **0**. On EX3200 and EX4200 standalone switches, replace ***slot*** with **0**. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace ***slot*** with **0** or **1**. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Switches, replace ***slot*** with **0** or **1**

Output Fields

Table 58 on page 615 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 58: show chassis environment routing-engine Output Fields

Field Name	Field Description
Routing engine *slot* status	Number of the Routing Engine slot: **0** or **1**.
State	Status of the Routing Engine: • **Online Master**—Routing Engine is online, operating as Master. • **Online Standby**—Routing Engine is online, operating as Standby. • **Offline**—Routing Engine is offline.
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	(PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.

Sample Output

show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                          Online Master
  Temperature                 27 degrees C / 80 degrees
```

show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
  State:                       Online Master
  Temperature:              26 degrees C / 78 degrees F
Route Engine 1 status:
  State:                       Online Standby
  Temperature:              26 degrees C / 78 degrees F
```

show chassis environment routing-engine (MX2010 Router)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                       Online Master
  Temperature                 37 degrees C / 98 degrees F
  CPU Temperature             37 degrees C / 98 degrees F
Routing Engine 1 status:
  State                       Online Standby
  Temperature                 35 degrees C / 95 degrees F
  CPU Temperature             34 degrees C / 93 degrees F
```

show chassis environment routing-engine (MX2020 Router)

Release Information

Command introduced in Junos OS Release 10.0 on MX Series 3D Universal Edge Routers, M120 routers, and M320 routers, T320 routers, T640 routers, T1600 routers, TX Matrix Routers, and TX Matrix Plus routers.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 12.3 for PTX5000 Packet Transport Switches.
Command introduced in Junos OS Release 12.1 for T4000 routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for ACX Series Routers.

Description (T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers, QFX3008-I Interconnect devices, EX Series switches, and PTX Series Packet Transport Switches only) Show information about the fan tray and fans.

Options

all-members—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.

member ***member-id***—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* variable with a value 0 or 1.

interconnect-device ***name***—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

scc —(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

sfc ***number***—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with **0**.

Output Fields Table 59 on page 620 lists the output fields for the **show chassis fan** command. Output fields are listed in the approximate order in which they appear.

Table 59: show chassis fan Output Fields

Field Name	Field Description
Item	Fan item identifier.
Status	Status of the fan: • **OK**—Fan is running properly and within the normal range. • **Check**—Fan is in **Check** state because of some fault or alarm condition.
RPM	(T Series routers, TX Matrix routers, TX Matrix Plus routers, MX Series 3D Universal Edge Routers, QFX3108 Interconnect devices, and EX Series switches only) Fan speed in revolutions per minute (RPM).
% RPM	(MX2010 routers, MX2020 routers, and PTX Series Packet Transport Switches only) Percentage of the fan speed being used.
Measurement	(T Series routers, TX Matrix routers, TX Matrix Plus routers, MX Series 3D Universal Edge Routers, QFX3108 Interconnect devices, and EX Series switches only) Fan speed status based on different chassis cooling requirements: • Spinning at high speed • Spinning at intermediate speed • Spinning at normal speed • Spinning at low speed (except EX Series switches) (MX2010 routers, MX2020 routers, and PTX Series Packet Transport Switches only) Fan speed in revolutions per minute (RPM) for each fan in the fan tray.

Sample Output

show chassis fan

```
user@host> show chassis fan

      Item                      Status   RPM     Measurement
```

```
Top Tray Fan 1           OK       3790    Spinning at normal speed
Top Tray Fan 2           OK       3769    Spinning at normal speed
Top Tray Fan 3           OK       3769    Spinning at normal speed
Top Tray Fan 4           OK       3790    Spinning at normal speed
Top Tray Fan 5           OK       3790    Spinning at normal speed
Top Tray Fan 6           OK       3769    Spinning at normal speed
Top Tray Fan 7           OK       3790    Spinning at normal speed
Top Tray Fan 8           OK       3769    Spinning at normal speed
Top Tray Fan 9           OK       3769    Spinning at normal speed
Top Tray Fan 10          OK       3790    Spinning at normal speed
Top Tray Fan 11          OK       3790    Spinning at normal speed
Top Tray Fan 12          OK       3769    Spinning at normal speed
Bottom Tray Fan 1        OK       2880    Spinning at normal speed
Bottom Tray Fan 2        OK       2912    Spinning at normal speed
Bottom Tray Fan 3        OK       2928    Spinning at normal speed
Bottom Tray Fan 4        OK       2896    Spinning at normal speed
Bottom Tray Fan 5        OK       2896    Spinning at normal speed
Bottom Tray Fan 6        OK       2928    Spinning at normal speed
```

show chassis fan (QFabric Systems)

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.4 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced for EX8200 switches in Junos OS Release 10.2 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.

Description On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

Options

none—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

scc—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with **0**.

detail—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

Output Fields

Table 60 on page 634 lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

Table 60: show chassis firmware Output Fields

Field Name	Field Description
Part	(MX Series, MX2010, and MX2020 routers) Chassis part name.
Type	(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: **ROM** or **O/S.** On switches: **uboot** or **loader**.
Version	(MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.
FPC	(*detail* option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.
Boot	(*detail* option only) Version of the SYSPLD.
PoE	(*detail* option only) Version of the PoE firmware.
PFE-<*number*>	(*detail* option only) Version of the PFE used in the switch.
PHY-	(*detail* option only) Version of the physical layer device (PHY) used in the switch.
microcode	(*detail* option only) Microcode of the physical layer devices (PHY) used in the switch.
uboot	(*detail* option only) Version of the u-boot used in the switch.
loader	(*detail* option only) Version of the loader used in the switch.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

Display status information about the installed Flexible PIC Concentrators (FPCs)and PICs.

Options

none—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached routers in the routing matrix.

NOTE: In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
                    Temp  CPU Utilization (%)   Memory
Utilization (%)
Slot State            (C)  Total  Interrupt      DRAM (MB) Heap
  Buffer
  0  Empty
  1  Empty
  2  Empty
  3  Empty
  4  Empty
  5  Offline         ---Hard FPC error---
  6  Empty
  7  Online            26      4          0       1024        0
     32
```

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
4 alarms currently active

RE
```

NOTE: On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation the alarms.

The following sample output shows the FPC status after the **enhanced-mode** statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
                    Temp  CPU Utilization (%)   Memory
Utilization (%)
Slot State            (C)  Total  Interrupt      DRAM (MB) Heap
  Buffer
  0  offline         ---FPC misconfiguration---
  1  offline         ---FPC misconfiguration---
  2  offline         ---FPC misconfiguration---
  3  Empty
  4  Empty
  5  Online            66      50          0       2816       29
    27
```

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
3 alarms currently active
Alarm time               Class  Description
2011-03-24 00:52:51 PST  Major  FPC 1 misconfig
2011-03-24 00:52:31 PST  Major  FPC 2 misconfig
2011-03-24 00:52:31 PST  Major  FPC 3 misconfig
```

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see ***fpc-slot*** or ***slot***).

all-members—(MX Series routers only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

fpc-slot—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the **lcc *number*** option (the recommended method), replace ***fpc-slot*** with a value from **0** through **7**. Otherwise, replace ***fpc-slot*** with a value from **0** through **31**. Likewise, on a TX Matrix Plus router, if you specify the number of the specified router (line-card chassis)

by using the **lcc** ***number*** option (the recommended method), replace ***fpc-slot*** with a value from **0** through **7**. Otherwise, replace ***fpc-slot*** with a value from **0** through **31**. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace ***fpc-slot*** with a value from **0** through **5**.
- MX80 router—Replace ***fpc-slot*** with a value from **0** through **1**.
- MX240 router—Replace ***fpc-slot*** with a value from **0** through **2**.
- MX480 router—Replace ***fpc-slot*** with a value from **0** through **5**.
- MX-960 router—Replace ***fpc-slot*** with a value from **0** through **11**.
- MX2010 router—Replace ***fpc-slot-number*** with a value from **0** through **9**.
- MX2020 router—Replace ***fpc-slot-number*** with a value from **0** through **19**.
- Other routers—Replace ***fpc-slot*** with a value from **0** through **7**.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace ***fpc-slot*** with **0**.
  - EX4200 switches in a Virtual Chassis configuration—Replace ***fpc-slot*** with a value from **0** through **9**.
  - EX6210 switches—Replace ***fpc-slot*** with a value from **0** through **9**.
  - EX8208 switches—Replace ***fpc-slot*** with a value from **0** through **7**.
  - EX8216 switches—Replace ***fpc-slot*** with a value from **0** through **15**.
- QFX Series:
  - QFX3500 switches—Replace ***fpc-slot*** with 0.
  - QFabric systems—Replace ***fpc-slot*** with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Switches:
  - PTX5000 Packet Transport Switch—Replace ***fpc-slot*** with a value from **0** through **7**.
- ACX Series Universal Access Routers:
  - ACX1000 and ACX2000 Universal Access Routers—Replace ***fpc-slot*** with **0**.

local—(MX Series routers only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

member ***member-id***—(MX Series routers only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device ***name***—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

pic-status—(Optional) Display status information for all PICs or for the PIC in the specified slot (see ***fpc-slot***).

NOTE: On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the **show chassis fpc** command with the **pic-status** option, the CLI displays the string "Not Supported" for 10x10GE(LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0   Online       E2-FPC Type 1
  PIC 0  Online       1x G/E SFP, 1000 BASE
  PIC 1  Online       Adaptive Services-II
  PIC 2  Online       1x G/E IQ, 1000 BASE
  PIC 3  Online       1x G/E IQ, 1000 BASE
Slot 1   Online       FPC Type 3-ES
  PIC 0  Present      UNUSED- Not Supported
Slot 2   Online       FPC Type 4-ES
  PIC 0  Offline      4x OC-192 SONET XFP
  PIC 1  Present      10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4   Offline      FPC Type 1-ES
Slot 5   Offline      FPC Type 2-ES
Slot 6   Online       E2-FPC Type 3
  PIC 0  Online       1x OC-192 SONET XFP
  PIC 1  Online       4x OC-48 SONET
  PIC 2  Online       4x OC-48 SONET
  PIC 3  Online       MultiServices 500
Slot 7   Online       FPC Type 4-ES
  PIC 0  Online       4x 10GE (LAN/WAN) XFP
  PIC 1  Online       4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (/var/log/messages) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr  5 08:47:36  router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
 PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see PSN-2010-03-696.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Output Fields Table 61 on page 648 lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

Table 61: show chassis fpc Output Fields

Field Name	Field Description	Level of Output

Slot or **Slot State**	Slot number and state. The state can be one of the following conditions:
	• **Dead**—Held in reset because of errors.
	• **Diag**—Slot is being ignored while the FPC is running diagnostics.
	• **Dormant**—Held in reset.
	• **Empty**—No FPC is present.
	• **Offline**—(PTX Series Packet Transport Switches only) One of the following two states is displayed:
	  • **FPC offlined due to unreachable destinations**
	  • **FPC Offlined due to degraded FPC action**
	• **Online**—FPC is online and running.
	• **Present**—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either **Hardware Not Supported** or **Hardware Not In Right Slot**. The FPC is coming up but not yet online.
	• **Probed**—Probe is complete; awaiting restart of the Packet Forwarding Engine.
	• **Probe-wait**—Waiting to be probed.
		all levels

Logical slot	Slot number.	all levels
Temp (C) or Temperature	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels all levels
Temperature (PTX Series)	On PTX Series Packet Transport Switches, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: • Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC. • Temperature (Intake)—Temperature of the air flowing into the chassis. • Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B). • Temperature (TL*n*)-–Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC. • Temperature (TQ*n*)-–Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC.	**detail**
Total CPU Utilization (%)	Total percentage of CPU being used by the FPC's processor.	all levels
Interrupt CPU Utilization (%)	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
Memory DRAM (MB)	Total DRAM, in megabytes, available to the FPC's processor.	none specified

Table 61: show chassis fpc Output Fields *(continued)*

Field Name	Field Description	Level of Output
Heap Utilization (%)	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak). NOTE: On MX Series routers in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.	none specified
Buffer Utilization (%)	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
Total CPU DRAM	Amount of DRAM available to the FPC's CPU.	**detail**
Total RLDRAM	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	**detail**
Total DDR DRAM	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	**detail**
Total SRAM	Amount of static RAM (SRAM) used by the FPC's CPU.	**detail**
Total SDRAM	Total amount of memory used for storing packets and notifications.	**detail**
I/O Manager ASICs information	I/O Manager version number, manufacturer, and part number.	**detail**
Start time	Time when the Routing Engine detected that the FPC was running.	**detail**
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	**detail**
PIC type	(**pic-status** output only) Type of PIC.	none specified

Release Information

Command introduced before Junos OS Release 7.4.
models option introduced in Junos OS Release 8.2.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description

Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.

In the EX Series switch command output, FPC refers to the following:

- On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC *number* is always 0.
- On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC *number* equals the member ID, from 0 through 9.
- On EX8208 and EX8216 switches—Refers to a line card; FPC *number* equals the slot number for the line card.

On a QFX3500 standalone switch, both the FPC and FPC *number* are always **0**.

On Type 5 FPC on T4000 routers, there are no **top temperature sensor** or **bottom temperature sensor** parameters. Instead, **fan intake temperature sensor** and **fan exhaust temperature sensors** parameters are displayed.

Options

none—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

detail—(Optional) Include RAM and disk information in output.

extensive—(Optional) Display ID EEPROM information.

all-members—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

interconnect-device ***name***—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

lcc ***number***—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

member ***member-id***—(MX Series routers only) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

node-device ***name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

scc—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with **0**.

Additional Information The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

Table 62: Routing Engines Displaying DIMM Information

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

Output Fields Table 63 on page 673 lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 63: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	Chassis component: • (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See *EX Series Switches Hardware and CLI Terminology Mapping*. • (MX Series routers)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two "pseudo" FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). • (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller. • (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB. • (QFX Series)—Information about the chassis, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). • (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal). • (MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
Assb ID or **Assembly ID**	(**extensive** keyword only) Identification number that describes the FRU hardware.	**extensive**

Table 63: show chassis hardware Output Fields *(continued)*

Field Name	Field Description	Level of Output
Assembly Version	(**extensive** keyword only) Version number of the FRU hardware.	**extensive**
Assembly Flags	(**extensive** keyword only) Flags.	**extensive**
FRU model number	(**clei-models**, **extensive**, and **models** keyword only) Model number of the FRU hardware component.	none specified
CLEI code	(**clei-models** and **extensive** keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: **0x00** (version 0), **0x01** (version 1), or **0x02** (version 2).	**extensive**
Description	Brief description of the hardware item: • Type of power supply. • Type of PIC. If the PIC type is not supported on the current software release, the output states **Hardware Not Supported**. • Type of FPC: **FPC Type 1**, **FPC Type 2**, **FPC Type 3**, **FPC Type 4** , or **FPC TypeOC192**. On EX Series switches, a brief description of the FPC. On the J Series routers, the FPC type corresponds to the Physical Interface Module (PIM). The following list shows the PIM abbreviation in the output and the corresponding PIM name. • **2x FE**—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM • **4x FE**—4-port Fast Ethernet ePIM • **1x GE Copper**—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port) • **1x GE SFP**—SFP Gigabit Ethernet ePIM (one fiber port) • **4x GE Base PIC**—Four built-in Gigabit Ethernet ports on a J4350 or J6350 chassis (fixed PIM) • **2x Serial**—Dual-port serial PIM • **2x T1**—Dual-port T1 PIM • **2x E1**—Dual-port E1 PIM • **2x CT1E1**—Dual-port channelized T1/E1 PIM • **1x T3**—T3 PIM (one port) • **1x E3**—E3 PIM (one port) • **4x BRI S/T**—4-port ISDN BRI S/T PIM • **4x BRI U**—4-port ISDN BRI U PIM • **1x ADSL Annex A**—ADSL 2/2+ Annex A PIM (one port, for POTS) • **1x ADSL Annex B**—ADSL 2/2+ Annex B PIM (one port, for ISDN) • **2x SHDSL (ATM)**—G SHDSL PIM (2-port two-wire module or 1-port four-wire module)	All levels

Table 63: show chassis hardware Output Fields *(continued)*

Field Name	Field Description	Level of Output
	• **1x TGM550**—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog **LINE** ports, and two analog **TRUNK** ports) • **1x DS1 TIM510**—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup) • **4x FXS, 4xFXO, TIM514**—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog **LINE** ports and four analog **TRUNK** ports) • **4x BRI TIM521**—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports) • **Crypto Accelerator Module**—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services • **MPC M 16x 10GE**—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: **LX**, **SX**, **LH**, or **T**. • LCD description for EX Series switches (except EX2200 switches). • **MPC2**—1-port MPC2 that supports two separate slots for MICs. • **MPC3E**—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs. • 100GBASE-LR4, pluggable CFP optics • Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy. • Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs). • LCD description for MX Series routers

show chassis lcd

List of Syntax

show chassis lcd (EX Series) on page 785
show chassis lcd (QFX Series and QFabric Systems) on page 785

show chassis lcd (EX Series)

show chassis lcd
<**fpc-slot** *fpc-slot-number*>
<**menu** <(**all-members** | **local** | **member** *member-id*)>>

show chassis lcd (QFX Series and QFabric Systems)

show chassis lcd
<**fpc-slot** *fpc-slot-number*>
<**interconnect-device** *device-id*>
<**node-device** *device-id*>

Release Information

Command introduced in Junos OS Release 9.0 for EX Series switches.
menu option introduced in Junos OS Release 10.2 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 13.1 for QFabric systems.

Description

Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.

Options

none—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.

fpc-slot <***fpc-slot-number***>—(Optional) Display the information as follows:

- (EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no ***fpc-slot-number*** value specified or for the FPC slot specified by **fpc-slot 0**. **fpc-slot** refers to the switch itself and **0** is the only valid value for ***fpc-slot-number***. Output for these options is the same as for the **none** option.

  Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no ***fpc-slot-number*** value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the **none** option. If the ***fpc-slot-number*** value is specified (it equals the ***member-id*** value), display the information for the specified member.

  Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the ***fpc-slot-number*** value.

Also display the status of the currently selected port parameter of the Status LED for each network port.

interconnect-device ***device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

menu—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

menu all-members—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

menu local—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

menu member ***member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

node-device ***device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

Output Fields Table 64 on page 787 lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

Table 64: show chassis lcd Output Fields

Field Name	Field Description
member*number* (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
Front panel contents for slot **Front panel contents** (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	FPC slot number of the switch whose content is being displayed. The number is always **0**, except for EX4200 switches in a Virtual Chassis, where it is the member ID value. On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed. On XRE200 External Routing Engines, this field appears under the **member *number*** field for each member device in the EX8200 Virtual Chassis.
LCD screen	The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays **RE** and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are: • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet (EX3200 and EX4200 switches only)
LEDs status	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
Interface	Names of the interfaces on the switch.
LED (ADM/SPD/DPX/POE)	State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are: NOTE: The XRE200 External Routing Engine always displays the **NA** parameter. The QFX Series products do not have any of the port parameters listed below. • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **NA**—Not applicable. • **POE**—Power over Ethernet
fpc*x*	On standalone EX Series and QFX Series switches, always **0**. On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

Release Information

Command introduced in Junos OS Release 10.1 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.

Options

none—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).

fpc-slot <*fpc-slot-number*>—(Optional) (Not on EX2200 switches) Display the information as follows:

- (EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches) Display the status of the chassis status LEDs for either an FPC slot with no ***fpc-slot-number*** value specified or for the FPC slot specified by **fpc-slot 0**. **fpc-slot** refers to the switch itself and **0** is the only valid value for ***fpc-slot-number***. Output for these options is the same as for the **none** option.
