When traffic meets the two configuration constraints, the fabric propagates the back pressure from the egress Node device across the fabric to the ingress Node device during periods of congestion. However, to achieve end-to-end lossless transport across the switch, you must also configure a congestion notification profile to enable PFC on the Node device ingress ports.

For all other combinations of IEEE 802.1p priority to forwarding class mapping and all other combinations of forwarding class to fabric fc-set mapping, the congestion control mechanism is normal packet drop. For example:

- **Case 1**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 2**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.

- **Case 3**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_noloss2** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 4**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 5**—If the IEEE 802.1p priority **5** is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 6**—If the IEEE 802.1p priority **5** is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is packet drop.

NOTE: Lossless transport across the fabric also must meet the following two conditions:

1. The maximum cable length between the Node device and the Interconnect device is a 150 meters of fiber cable.
2. The maximum frame size is 9216 bytes.

If the MTU is 9216 KB, in some cases the QFabric system supports only five lossless forwarding classes instead of six lossless forwarding classes because of headroom buffer limitations.

The number of IEEE 802.1p priorities (forwarding classes) the QFabric system can support for lossless transport across the Interconnect device fabric depends on several factors:

- Approximate fiber cable length—The longer the fiber cable that connects Node device fabric (FTE) ports to the Interconnect device fabric ports, the more data the connected ports need to buffer when a pause is asserted. (The longer the fiber cable, the more frames are traversing the cable when a pause is asserted. Each port must be able to store all of the “in transit” frames in the buffer to preserve lossless behavior and avoid dropping frames.)
- MTU size—The larger the maximum frame sizes the buffer must hold, the fewer frames the buffer can hold. The larger the MTU size, the more buffer space each frame consumes.
- Total number of Node device fabric ports connected to the Interconnect device—The higher the number of connected fabric ports, the more headroom buffer space the Node device needs on those fabric ports to support the lossless flows that traverse the Interconnect device. Because more buffer space is used on the Node device fabric ports, less buffer space is available for the Node device access ports, and a lower total number of lossless flows are supported.

The QFabric system supports six lossless priorities (forwarding classes) under most conditions. The priority group headroom that remains after allocating headroom to lossless flows is sufficient to support best-effort and multidestination traffic.

Table 120 on page 1248 shows how many lossless priorities the QFabric system supports under different conditions (fiber cable lengths and MTUs) in cases when the QFabric system supports fewer than six lossless priorities. The number of lossless priorities is the same regardless of how many Node device FTE ports are connected to the Interconnect device. However, the higher the number of FTE ports connected to the Interconnect device, the lower the number of total lossless flows supported. In all cases that are not shown in Table 120 on page 1248, the QFabric system supports six lossless priorities.

NOTE: The system does not perform a configuration commit check that compares available system resources with the number of lossless forwarding classes configured. If you commit a configuration with more lossless forwarding classes than the system resources can support, frames in lossless forwarding classes might be dropped.

Table 401: Lossless Priority (Forwarding Class) Support for QFX3500 and QFX3600 Node Devices When Fewer than Six Lossless Priorities Are Supported

MTU in Bytes	Fiber Cable Length in Meters (Approximate)	Maximum Number of Lossless Priorities (Forwarding Classes) on the Node Device
9216 (9K)	100	5
9216 (9K)	150	5

NOTE: The total number of lossless flows decreases as resource consumption increases. For a Node device, the higher the number of FTE ports connected to the Interconnect device, the larger the MTU, and the longer the fiber cable length, the fewer total lossless flows the QFabric system can support.

Viewing Fabric Forwarding Class Set Information

You can display information about fabric fc-sets using the same CLI command you use to display information about Node device fc-sets:

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: fabric_fcset_be, Type: fabric-type, Forwarding class set
index: 1
  Forwarding class                        Index
  best-effort                               0

Forwarding class set: fabric_fcset_mcast1, Type: fabric-type, Forwarding class
set index: 5
  Forwarding class                        Index
  mcast                                     8
```

```
Forwarding class set: fabric_fcset_mcast2, Type: fabric-type, Forwarding class
set index: 6

Forwarding class set: fabric_fcset_mcast3, Type: fabric-type, Forwarding class
set index: 7

Forwarding class set: fabric_fcset_mcast4, Type: fabric-type, Forwarding class
set index: 8

Forwarding class set: fabric_fcset_noloss1, Type: fabric-type, Forwarding class
set index: 2
  Forwarding class                      Index
  fcoe                                    1

Forwarding class set: fabric_fcset_noloss2, Type: fabric-type, Forwarding class
set index: 3
  Forwarding class                      Index
  no-loss                                 2

Forwarding class set: fabric_fcset_noloss3, Type: fabric-type, Forwarding class
set index: 9

Forwarding class set: fabric_fcset_noloss4, Type: fabric-type, Forwarding class
set index: 10

Forwarding class set: fabric_fcset_noloss5, Type: fabric-type, Forwarding class
set index: 11

Forwarding class set: fabric_fcset_noloss6, Type: fabric-type, Forwarding class
set index: 12

Forwarding class set: fabric_fcset_strict_high, Type: fabric-type, Forwarding
class set index: 4
  Forwarding class                      Index
  network-control                         3
```

Table 121 on page 1249 describes the meaning of the **show class-of-service forwarding-class-set** output fields when you display fabric fc-set information.

Table 402: show class-of-service forwarding-class-set Command Output Fields

Field Name	Field Description
Forwarding class set	Name of the fabric forwarding class set.
Type	Type of forwarding class set: • Fabric-type—Fabric fc-set • Normal-type—Node device fc-set
Forwarding class set index	Index of this forwarding class set.
Forwarding class	Name of a forwarding class.
Index	Index of the forwarding class.

Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences

Table 122 on page 1250 summarizes the differences between fabric fc-sets and Node device fc-sets:

Table 403: Summary of Differences Between Fabric fc-sets and Node Device fc-sets

Characteristic	Fabric fc-set	Node device fc-set
Location	QFX3008-I or QFX3600-I Interconnect device (the fabric).	QFabric system Node device.
Global or Node-device specific	Global, valid for the entire fabric.	Local to the Node device on which the fc-set is configured.
Ability to create (define) a new fc-set	No. Use the 12 default fabric fc-sets provided.	Yes.
Ability to configure CoS	Default CoS settings only. CoS is not user-configurable.	User-configurable using traffic control profiles.
Ability to map forwarding classes to an fc-set	Yes. Mapping is global and applies to all forwarding classes across Interconnect device fabric (traffic from all connected Node devices).	Yes. Mapping is local to a Node device and applies only to the forwarding classes on the Node device.

Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric

To transmit Fibre Channel (FC) traffic between FCoE devices and a storage area network (SAN) FC switch, you configure a local FC fabric on the gateway. The gateway FC fabric includes FCoE and native FC interfaces, and a VLAN to carry FCoE traffic from FCoE-capable devices. The gateway FC fabric creates the path between the FCoE devices and the SAN.

This example describes how to configure the interfaces, VLAN, and FC fabric to connect FCoE devices to the FC switch and route traffic between the VLAN and FC interfaces:

- Requirements on page 5100
- Overview on page 5100
- Configuration on page 5103
- Verification on page 5110

Requirements

This example uses the following hardware and software components:

- A configured and provisioned Juniper Networks QFX3500 Switch to act as an FCoE-FC gateway
- FCoE-capable devices in an Ethernet network equipped with converged network adapters (CNAs)
- An FC switch to transmit and receive native FC traffic
- FC storage devices in the SAN
- Junos OS Release 11.1 or later for the QFX Series

Overview

No interfaces are configured for FC network connectivity by default. You need to configure the FC fabric and its interfaces explicitly. Each FC fabric consists of a combination of at least one FCoE VLAN interface between the FCoE-FC gateway and the FCoE devices, and one or more native FC interfaces between the FCoE-FC gateway and the FC switch.

An FCoE VLAN interface connects the FCoE-FC gateway to FCoE devices. FCoE traffic between the devices and the FCoE-FC gateway requires a dedicated VLAN used only for FCoE traffic. You cannot mix standard Ethernet traffic and FCoE traffic on the FCoE VLAN.

NOTE: IGMP snooping is not supported on FCoE VLANs. Disable IGMP snooping on FCoE VLANs.

Storm control is not supported on Ethernet interfaces that belong to the FCoE VLAN. Ensure that storm control is disabled on all Ethernet interfaces that belong to the FCoE VLAN to prevent FCoE traffic from being dropped.

When FCoE frames enter the FCoE-FC gateway, the gateway:

1. Strips the Ethernet encapsulation from the FCoE frames.
2. Sends the resulting native FC frames to the FC switch through the gateway's native FC interfaces.

Each FC interface and FCoE VLAN interface can belong to only one FC fabric. Different FC fabrics must use different native FC interfaces and different FCoE VLAN interfaces. Multiple FC fabrics on the FCoE-FC gateway can connect to the same FC switch, but they must use different FC interfaces and different FCoE VLAN interfaces.

The Ethernet interfaces that belong to the FCoE VLAN should be configured in tagged-access port mode and must include the native VLAN because FIP VLAN discovery and notification frames are exchanged as untagged packets. These Ethernet interfaces require a maximum transmission unit (MTU) size of at least 2180 bytes to accommodate the FC payload and FCoE encapsulation. (Sometimes the MTU is rounded up to 2500 bytes. If larger frames are expected on the interface, set the MTU size accordingly.)

This example shows a simple configuration to illustrate the basic steps for creating:

- The FCoE-device-facing VLAN and its 10-Gigabit Ethernet interfaces
- The VLAN interface
- The FC-switch-facing native FC interfaces
- One FC fabric on the FCoE-FC gateway

Configuring these elements results in traffic being routed between the VLAN and FC interfaces, thus connecting the FCoE devices to the FC switch through the FCoE-FC gateway.

A VLAN called **blue** transports FCoE traffic between FCoE devices and the FCoE-FC gateway using an FCoE VLAN interface called **vlan.100**. The FCoE-FC gateway's **vlan.100** interface presents an F_Port interface to the FCoE devices on the VLAN. For each FCoE device ENode that logs in to the FCoE-FC gateway, the gateway instantiates a virtual F_Port (VF_Port) interface. This creates a virtual link between the ENode VN_Port and the FCoE-FC gateway. The FCoE-FC gateway's native FC interfaces transport FC traffic between the gateway and the FC switch.

Configuring both the FCoE VLAN interface and the native FC interfaces as part of a gateway fabric associates them in the switch and makes the connection between the FCoE servers and the FC switch.

Topology

The topology for this example consists of one QFX3500 switch with FC-capable ports to connect to the FC switch and with Ethernet ports in tagged-access mode to connect to the FCoE devices. Table 404 on page 5101 and Figure 195 on page 5102 show the configuration components of this example.

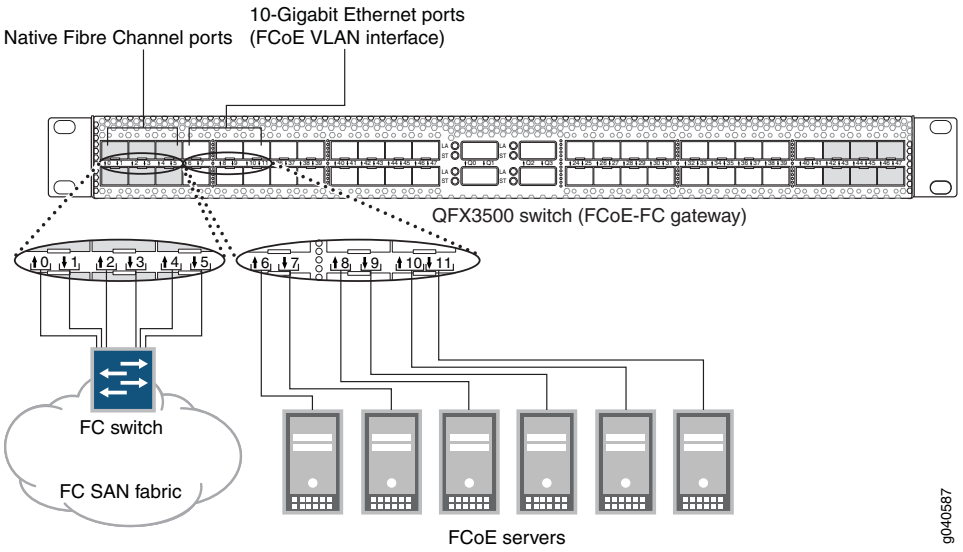
Table 404: Components of the Fibre Channel Interface Configuration Topology

Property	Settings
Switch hardware	QFX3500 switch in gateway mode
FCoE VLAN name and tag ID	**blue**, tag **100** IGMP snooping disabled on the FCoE VLAN.
Interfaces in VLAN **blue**	Interfaces: **xe-0/0/6**, **xe-0/0/7**, **xe-0/0/8**, **xe-0/0/9**, **xe-0/0/10**, **xe-0/0/11** Port mode: **tagged-access** MTU: **2180** Native VLAN: **1** NOTE: You can bundle two or more of the VLAN interfaces in a link aggregation group (LAG) if you wish. NOTE: FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.

Table 404: Components of the Fibre Channel Interface Configuration Topology *(continued)*

Property	Settings
FCoE VLAN interface	**vlan.100** Port mode: **f-port**
Native Fibre Channel interfaces	Interfaces: **fc-0/0/0**, **fc-0/0/1**, **fc-0/0/2**, **fc-0/0/3**, **fc-0/0/4**, **fc-0/0/5** Port mode: **np-port** Speed: **4 Gbps**
Fibre Channel fabric **fcproxy1**	Fabric type: **proxy** Fabric ID: **1** FC interfaces: **fc-0/0/0**, **fc-0/0/1**, **fc-0/0/2**, **fc-0/0/3**, **fc-0/0/4**, **fc-0/0/5**

Figure 195: Fibre Channel Interface Configuration Topology



This configuration example creates a VLAN for FCoE traffic and routes its traffic to an FCoE VLAN interface that is part of the FC fabric. It also creates the FC interfaces needed to connect to the FC switch.

To set up FC interfaces and FCoE VLAN interfaces:

- Configure a VLAN to use as a dedicated FCoE VLAN:
  - Configure the interfaces the FCoE VLAN uses as Ethernet switching interfaces in tagged-access port mode.
  - If storm control is enabled, disable it on the interfaces.
  - Configure the interfaces the FCoE VLAN uses with the native VLAN.

    - Configure the FCoE VLAN to use the desired Ethernet interfaces.
    - Disable IGMP snooping on the FCoE VLAN. (IGMP snooping is enabled by default on all VLANs, but is not supported on FCoE VLANs).
- Configure the FCoE VLAN interface.
- Define the interface for the FCoE VLAN (associate the VLAN with the FCoE VLAN interface).
- Configure the physical FC interfaces (either one or two 6-port blocks) that connect to the FC switch.
- Configure the logical FC interfaces that connect to the FC switch.
- Configure the FCoE-FC gateway fabric:
    - Configure the fabric ID.
    - Configure the fabric as a proxy fabric.
    - Add the FCoE VLAN interface and the native FC interfaces to the fabric.

To keep the example simple, the configuration steps show six Ethernet interfaces in the FCoE VLAN and six native FC interfaces in the FC fabric. Use the same configuration procedure to add more interfaces to the FCoE VLAN or to the FC fabric.

Configuration

CLI Quick Configuration

To quickly configure FCoE and native FC interfaces on an FCoE-FC gateway and route traffic between the FCoE VLAN and FC interfaces, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans blue vlan-id 100
set vlans native vlan-id 1
set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/7 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/8 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode tagged-access vlan members blue

set fc-fabrics fcproxy1 interface fc-0/0/1.0
set fc-fabrics fcproxy1 interface fc-0/0/2.0
set fc-fabrics fcproxy1 interface fc-0/0/3.0
set fc-fabrics fcproxy1 interface fc-0/0/4.0
set fc-fabrics fcproxy1 interface fc-0/0/5.0
```

Step-by-Step Procedure

Configure FCoE and FC interfaces in an FCoE-FC gateway FC fabric and set up traffic routing between the FCoE VLAN and FC interfaces:

1. Configure the VLAN for FCoE traffic:

   ```
   [edit vlans]
   user@switch# set blue vlan-id 100
   ```

2. Configure the native VLAN:

   ```
   [edit vlans]
   user@switch# set native vlan-id 1
   ```

3. Configure the Ethernet interfaces for the FCoE VLAN in tagged-access mode and as members of the FCoE VLAN (VLAN **blue**):

   ```
   [edit interfaces]
   user@switch# set xe-0/0/6 unit 0 family ethernet-switching port-mode tagged-access
   vlan members blue
   user@switch# set xe-0/0/7 unit 0 family ethernet-switching port-mode tagged-access
   vlan members blue
   user@switch# set xe-0/0/8 unit 0 family ethernet-switching port-mode tagged-access
   vlan members blue
   user@switch# set xe-0/0/9 unit 0 family ethernet-switching port-mode tagged-access
   vlan members blue
   user@switch# set xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access
   vlan members blue
   ```

```
user@switch# set xe-0/0/11 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
```

4. Configure the native VLAN on the Ethernet interfaces in the FCoE VLAN:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/7 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/8 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/9 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/10 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/11 unit 0 family ethernet-switching native-vlan-id 1
```

5. Set the MTU to 2180 for each Ethernet interface:

```
[edit interfaces]
user@switch# set xe-0/0/6 mtu 2180
user@switch# set xe-0/0/7 mtu 2180
user@switch# set xe-0/0/8 mtu 2180
user@switch# set xe-0/0/9 mtu 2180
user@switch# set xe-0/0/10 mtu 2180
user@switch# set xe-0/0/11 mtu 2180
```

6. Assign the Ethernet interfaces to the FCoE VLAN:

```
[edit vlans blue interface]
user@switch# set xe-0/0/6.0
user@switch# set xe-0/0/7.0
user@switch# set xe-0/0/8.0
user@switch# set xe-0/0/9.0
user@switch# set xe-0/0/10.0
user@switch# set xe-0/0/11.0
```

7. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan blue disable
```

8. Configure the FCoE VLAN interface and port mode for the FCoE traffic:

```
[edit interfaces]
user@switch# set vlan unit 100 family fibre-channel port-mode f-port
```

9. Define the FCoE VLAN interface as the interface for the FCoE VLAN:

```
[edit vlans]
user@switch# set blue l3-interface vlan.100
```

10. Configure the physical FC interfaces the fabric uses to connect to the FC switch:

```
[edit chassis fpc 0 pic 0]
user@switch# set fibre-channel port-range 0 5
```

NOTE: When you configure ports as FC ports, the port designation changes from xe-n/n/n.n format to fc-n/n/n.n format to indicate that the interface is an FC interface. FC interfaces do not support 10-Gbps interface speed but instead conform to FC interface speeds of 2 Gbps, 4 Gbps, or 8 Gbps.

11. Configure the native FC interfaces and port mode:

```
[edit interfaces]
user@switch# set fc-0/0/0 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/1 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/2 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/3 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/4 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/5 unit 0 family fibre-channel port-mode np-port
```

12. Configure the native FC interface port speed:

```
[edit interfaces]
user@switch# set fc-0/0/0 fibrechannel-options speed 4g
user@switch# set fc-0/0/1 fibrechannel-options speed 4g
user@switch# set fc-0/0/2 fibrechannel-options speed 4g
user@switch# set fc-0/0/3 fibrechannel-options speed 4g
user@switch# set fc-0/0/4 fibrechannel-options speed 4g
user@switch# set fc-0/0/5 fibrechannel-options speed 4g
```

13. Configure the FC fabric name and unique ID:

```
[edit fc-fabrics]
user@switch# set fcproxy1 fabric-id 1
```

14. Define the FC fabric as an FCoE-FC gateway:

```
[edit fc-fabrics]
user@switch# set fcproxy1 fabric-type proxy
```

15. Assign the FCoE VLAN interface to the fabric:

```
[edit fc-fabrics]
user@switch# set fcproxy1 interface vlan.100
```

16. Assign the native FC interfaces to the fabric:

```
[edit fc-fabrics]
user@switch# set fcproxy1 interface fc-0/0/0.0
user@switch# set fcproxy1 interface fc-0/0/1.0
user@switch# set fcproxy1 interface fc-0/0/2.0
user@switch# set fcproxy1 interface fc-0/0/3.0
user@switch# set fcproxy1 interface fc-0/0/4.0
user@switch# set fcproxy1 interface fc-0/0/5.0
```

Results Display the results of the configuration:

```
user@switch> show configuration
fc-0/0/0 {
    fibrechannel-options {
        speed 4g;
    }

          xe-0/0/7.0;
          xe-0/0/8.0;
          xe-0/0/9.0;
          xe-0/0/10.0;
          xe-0/0/11.0;
        }
        l3-interface vlan.100
      }
      native {
        vlan-id 1;
      }
    }
```

TIP: To quickly configure the interfaces, issue the **load merge terminal** command and then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the native FC interfaces and FCoE VLAN interface have been created, added to the FC fabric, and are operating properly, perform these tasks:

- Verifying That the Native FC Interfaces and the FCoE VLAN Interface Have Been Created on page 5110
- Verifying That the FCoE VLAN Includes the Correct Ethernet Interfaces on page 5111
- Verifying That the FC Fabric Includes the Correct Interfaces on page 5111
- Verifying Native FC Interface Operation on page 5112
- Verifying That IGMP Snooping Has Been Disabled on the FCoE VLAN on page 5112

Verifying That the Native FC Interfaces and the FCoE VLAN Interface Have Been Created

Purpose Verify that the six native FC interfaces and the FCoE VLAN interface have been created on the switch and are configured in the correct mode.

Action List all of the FC interfaces configured on the switch using the **show fibre-channel interfaces** command:

```
user@switch> show fibre-channel interfaces
                                Native                  Config  Oper
Interface       Idx   Type      Fabric-id     NPIV      Mode    Mode    State
fc-0/0/0.0      70    FC        1             YES       NP      NP      up
fc-0/0/1.0      71    FC        1             YES       NP      NP      up
fc-0/0/2.0      72    FC        1             YES       NP      NP      up
fc-0/0/3.0      73    FC        1             YES       NP      NP      up
fc-0/0/4.0      74    FC        1             YES       NP      NP      up
fc-0/0/5.0      75    FC        1             YES       NP      NP      up
vlan.100        67    FCOE      1             YES       F       F       up
```

Meaning The **show fibre-channel interfaces** command lists all native FC interfaces and FCoE VLAN interfaces configured on the switch. The command output shows that the FC interfaces **fc-0/0/0.0**, **fc-0/0/1.0**, **fc-0/0/2.0**, **fc-0/0/3.0**, **fc-0/0/4.0**, and **fc-0/0/5.0** have been created and that those six interfaces:

- Are native Fibre Channel interfaces (type **FC**).
- Belong to the FC fabric with a configured fabric ID of **1**.
- Are capable of N_Port ID virtualization (NPIV).
- Have a configured mode and an operational mode of proxy N_Port (**NP**), which means that they should be connected to an FCF or an FC switch, not to an FCoE device, and that they carry native FC traffic.
- Show an operational state of **up**.

The command output also shows that the FCoE VLAN interface **vlan.100** has been created and that interface:

- Is an FCoE VLAN interface (type **FCOE)**.
- Belongs to the FC fabric with a configured fabric ID of **1**.
- Is capable of N_Port ID virtualization (NPIV).
- Has a configured mode and an operational mode of F_Port (**F**), which means that its interfaces connect to FCoE devices and carry FCoE traffic.
- Shows an operational state of **up**.

Verifying That the FCoE VLAN Includes the Correct Ethernet Interfaces

Purpose Verify that the FCoE VLAN **blue** has been created with the correct VLAN tag (**100**) and with the correct Ethernet interfaces.

Action List all of the interfaces configured on the switch in VLAN **blue** using the **show vlans** command:

```
user@switch> show vlans blue
Name            Tag     Interfaces
blue            100
                      xe-0/0/6.0, xe-0/0/7.0, xe-0/0/8.0, xe-0/0/9.0, xe-0/0/10.0

                        xe-0/0/11.0
```

Meaning The **show vlans blue** command lists the interfaces that are members of the FCoE VLAN **blue**. The command output shows that the **blue** VLAN has a tag ID of 100 and includes the interfaces **xe-0/0/6.0**, **xe-0/0/7.0**, **xe-0/0/8.0**, **xe-0/0/9.0**, **xe-0/0/10.0**, and **xe-0/0/11.0**.

Verifying That the FC Fabric Includes the Correct Interfaces

Purpose Verify that the FC fabric configuration is configured on the switch with the correct native FC and FCoE VLAN interfaces.

Action List all of the interfaces configured on FC fabrics on the switch using the **show fibre-channel fabric** command:

```
user@switch> show fibre-channel fabric
Name            Fabric-id       Type      Interfaces
fcproxy1        1               PROXY
                                          fc-0/0/0.0
                                          fc-0/0/1.0
                                          fc-0/0/2.0
                                          fc-0/0/3.0
                                          fc-0/0/4.0
                                          fc-0/0/5.0
                                          vlan.100
```

Meaning The **show fibre-channel fabric** command lists the interfaces that are members of each FC fabric. The command output shows that the only fabric configured on the switch is

named **fcproxy1**, has a fabric-id of **1**, and is a **proxy** fabric in an FCoE-FC gateway. The command output also shows that the native FC interfaces **fc-0/0/0.0**, **fc-0/0/1.0**, **fc-0/0/2.0**, **fc-0/0/3.0**, **fc-0/0/4.0**, and **fc-0/0/5.0**, and the FCoE VLAN interface **vlan.100** belong to **fcproxy1**.

Verifying Native FC Interface Operation

Purpose Verify that the native FC interfaces are online and display the number of FC sessions on each interface.

Action List all of the native FC NP_Port interface states and sessions by FC fabric using the **show fibre-channel proxy np-port** command:

```
user@switch> show fibre-channel proxy np-port
Fabric: fcproxy1, Fabric-id: 1
NP-Port     State              Sessions       LB state   LB weight
fc-0/0/0.0  online             3              ON         4
fc-0/0/1.0  online             3              ON         4
fc-0/0/2.0  online             2              ON         4
fc-0/0/3.0  online             2              ON         4
fc-0/0/4.0  online             2              ON         4
fc-0/0/5.0  online             2              ON         4
```

Meaning The **show fibre-channel proxy np-port** command lists the interfaces that are configured as native FC proxy N_Port interfaces. The command output shows:

- The fabric name is **fcproxy1** and its fabric ID is **1**.
- The interfaces are **online**.
- The number of FC sessions (virtual links) running on each interface.
- The load-balancing (LB) state is **ON** for all of the interfaces.
- The LB weight reflects the port speed of each interface, which is **4** Gbps.

Verifying That IGMP Snooping Has Been Disabled on the FCoE VLAN

Purpose Verify that IGMP snooping is disabled on the FCoE VLAN.

Action List the IGMP snooping protocol information for the FCoE VLAN using the **show configuration protocols igmp-snooping vlan blue** command:

```
user@switch> show configuration protocols igmp-snooping vlan blue
    disable;
```

Meaning The **show configuration protocols igmp-snooping vlan blue** command lists the IGMP snooping configuration for the FCoE VLAN. The command output shows that IGMP snooping is disabled on the FCoE VLAN.

Example: Configuring CoS PFC for FCoE Traffic

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight "lanes" of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.
- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless fcoe forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

This example describes how to configure PFC for FCoE traffic:

- Requirements on page 5114
- Overview on page 5114
- Configuration on page 5115
- Verification on page 5119

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).
- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

Topology

Table 405 on page 5114 shows the configuration components for this example.

Table 405: Components of the PFC for FCoE Traffic Configuration Topology

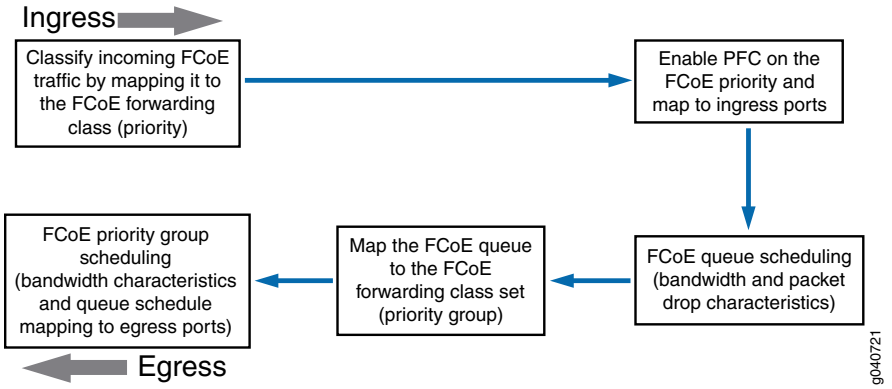
Component	Settings
Hardware	QFX3500 switch
Behavior aggregate classifier (maps the FCoE forwarding class to incoming packets by IEEE 802.1 code point)	Code point **011** to forwarding class **fcoe** and loss priority **low** Ingress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**

Table 405: Components of the PFC for FCoE Traffic Configuration Topology *(continued)*

Component	Settings
PFC congestion notification profile	**fcoe-cnp**: Code point **011** Ingress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**
FCoE queue scheduler	**fcoe-sched**: Minimum bandwidth **3g** Maximum bandwidth **100%** Priority **low**
Forwarding class-to-scheduler mapping	Scheduler map **fcoe-map**: Forwarding class **fcoe** Scheduler **fcoe-sched**
Forwarding class set (FCoE priority group)	**fcoe-pg**: Forwarding class **fcoe** Egress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**
Traffic control profile	**fcoe-tcp**: Scheduler map **fcoe-map** Minimum bandwidth **3g** Maximum bandwidth **100%**

Figure 196 on page 5115 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

Figure 196: PFC for FCoE Traffic Configuration Components Block Diagram



Configuration

CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
```

```
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100
set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
```

Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:

   ```
   [edit class-of-service]
   user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
   ```

2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point **011**:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
   ```

3. Apply the PFC configuration to the ingress interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
   ```

4. Assign the classifier to the ingress interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
   user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
   user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
   user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
   ```

5. Configure output scheduling for the FCoE queue:

   ```
   [edit class-of-service]
   user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
   user@switch# set schedulers fcoe-sched shaping-rate percent 100
   ```

6. Map the FCoE forwarding class to the FCoE scheduler:

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
   ```

7. Configure the forwarding class set for the FCoE traffic:

   ```
   [edit class-of-service]
   user@switch# set forwarding-class-sets fcoe-pg class fcoe
   ```

8. Define the traffic control profile for the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 fcoe-classifier {
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
  }
  traffic-control-profiles {
    fcoe-tcp {
      scheduler-map fcoe-map;
      shaping-rate percent 100;
      guaranteed-rate 3000000000;
    }
  }
  forwarding-class-sets {
    fcoe-pg {
      class fcoe;
    }
  }
  congestion-notification-profile {
    fcoe-cnp {
      input {
        ieee-802.1 {
          code-point 011 {
            pfc;
          }
        }
      }
    }
  }
  interfaces {
    xe-0/0/31 {
      congestion-notification-profile fcoe-cnp;
```

```
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
  xe-0/0/32 {
    congestion-notification-profile fcoe-cnp;

        ieee-802.1 fcoe-classifier;
      }
    }
  }
  xe-0/0/33 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
  xe-0/0/34 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
```

```
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
    shaping-rate percent 100;
    priority low;
  }
}
```

TIP: To quickly configure the interfaces, issue the **load merge terminal** command and then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- Verifying That Priority-Based Flow Control Has Been Enabled on page 5119
- Verifying the Ingress Interface PFC Configuration on page 5120

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the FCoE queue to enable lossless transport.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Type: Input, Name: fcoe-cnp, Index: 51697
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2500
  100          Disabled
  101          Disabled
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
```

```
                6
  111
                7
```

Meaning The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point **011** for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying the Ingress Interface PFC Configuration

Purpose Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

Action List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces** commands list the congestion notification profile that is mapped to the interface (**fcoe-cnp**) and the IEEE 802.1p classifier associated with the interface (**fcoe-classifier**).

Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX3500 switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree protocol (STP).

You can use an MC-LAG to provide a redundant aggregation layer for Fiber Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX3500 switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

NOTE: This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two QFX3500 switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the QFX3500 switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see "Example: Configuring Multichassis Link Aggregation" on page 2462. However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

QFX3500 Node devices support MC-LAGs. QFabric system Node devices do not support MC-LAGs.

This topic describes:

- Requirements on page 5122
- Overview on page 5122
- Configuration on page 5127
- Verification on page 5135

Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX3500 Switches that provide FCoE server access in transit switch mode, and connect to the MC-LAG switches. These switches can be standalone QFX3500 switches or they can be Node devices in a QFabric system.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 12.2 or later for the QFX Series.

Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX3500 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).

  NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Disable IGMP snooping on the FCoE VLAN.
- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

This example does not show how to configure the MC-LAG itself. This example does include a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Topology

QFX3500 switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in Figure 197 on page 5123:

Figure 197: Supported Topology for an MC-LAG on an FCoE Transit Switch

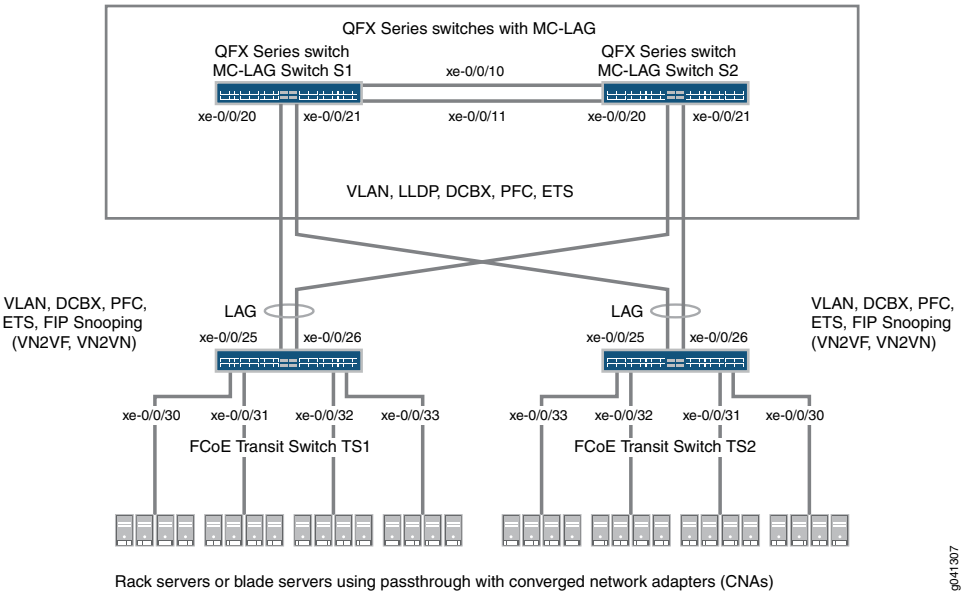

Table 406 on page 5123 shows the configuration components for this example.

Table 406: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology

Component	Settings
Hardware	Four QFX3500 switches (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access)
Forwarding class (all switches)	Default **fcoe** forwarding class.
Classifier (forwarding class mapping of incoming traffic to IEEE priority)	Default IEEE 802.1p trusted classifier on all FCoE interfaces.

Table 406: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology *(continued)*

Component	Settings
LAGs and MC-LAG	S1—Ports xe-0/0/10 and x-0/0/11 are members of LAG **ae0**, which connects Switch S1 to Switch S2. Ports xe-0/0/20 and xe-0/0/21 are members of MC-LAG **ae1**. All ports are configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. S2—Ports xe-0/0/10 and x-0/0/11 are members of LAG **ae0**, which connects Switch S2 to Switch S1. Ports xe-0/0/20 and xe-0/0/21 are members of MC-LAG **ae1**. All ports are configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. NOTE: Ports xe-0/0/20 and xe-0/0/21 on Switches S1 and S2 are the members of the MC-LAG. TS1—Ports xe-0/0/25 and x-0/0/26 are members of LAG **ae1**, configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. Ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are configured in **tagged-access** port mode, with an MTU of **2180**. TS2—Ports xe-0/0/25 and x-0/0/26 are members of LAG **ae1**, configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. Ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are configured in **tagged-access** port mode, with an MTU of **2180**.
FCoE queue scheduler (all switches)	**fcoe-sched**: Minimum bandwidth **3g** Maximum bandwidth **100**% Priority **low**
Forwarding class-to-scheduler mapping (all switches)	Scheduler map **fcoe-map**: Forwarding class **fcoe** Scheduler **fcoe-sched**
Forwarding class set (FCoE priority group, all switches)	**fcoe-pg**: Forwarding class **fcoe** Egress interfaces: • S1—LAG **ae0** and MC-LAG **ae1** • S2—LAG **ae0** and MC-LAG **ae1** • TS1—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** • TS2—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**
Traffic control profile (all switches)	**fcoe-tcp**: Scheduler map **fcoe-map** Minimum bandwidth **3g** Maximum bandwidth **100**%

Table 406: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology *(continued)*

Component	Settings
PFC congestion notification profile (all switches)	**fcoe-cnp**: Code point **011** Ingress interfaces: • S1—LAG **ae0** and MC-LAG **ae1** • S2—LAG **ae0** and MC-LAG **ae1** • TS1—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** • TS2—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**
FCoE VLAN name and tag ID	Name—**fcoe_vlan** ID—**100** Include the FCoE VLAN on the interfaces that carry FCoE traffic on all four switches. Disable IGMP snooping on the FCoE VLAN on all four switches.
FIP snooping	Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping. This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration.

NOTE: This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode and tagged access mode ports if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is queue **3**.

  NOTE: In Junos OS Release 12.2, traffic mapped to explicitly configured forwarding classes, even lossless forwarding classes such as **fcoe**, is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. To receive lossless treatment in release 12.2, traffic must use one of the default lossless forwarding classes (**fcoe** or **no-loss**).

  In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.

- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk and tagged-access port modes. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (011) to the FCoE forwarding class. You can configure the BA classifier if you wish, but you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.
- Configure a congestion notification profile that enables PFC on the FCoE code point (code point 011 in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers and how to disable IGMP snooping on the FCoE VLAN. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required

to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ("Example: Configuring Multichassis Link Aggregation" on page 2462 describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ("Configuring Link Aggregation" on page 2537 describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

Configuration

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

- Configuring MC-LAG Switches S1 and S2 on page 5129
- Configuring FCoE Transit Switches TS1 and TS2 on page 5130
- Results on page 5132

CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the [edit] hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g
set class-of-service schedulers fcoe-sched shaping-rate percent 100

Configuring MC-LAG Switches S1 and S2

Step-by-Step Procedure

To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
```

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

7. Apply the PFC configuration to the LAG and MC-LAG interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```

8. Configure the VLAN for FCoE traffic (**fcoe_vlan**):

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

9. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG between the two MC-LAG switches:

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```

11. Add the member interfaces to the MC-LAG:

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```

12. Configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe_vlan**) for the LAG (**ae0**) and for the MC-LAG (**ae1**):

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and MC-LAG interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```

14. Set the LAG and MC-LAG interfaces as FCoE trusted ports (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

Configuring FCoE Transit Switches TS1 and TS2

Step-by-Step Procedure

The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/30 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/31 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/32 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/33 congestion-notification-profile
fcoe-cnp
```

8. Configure the VLAN for FCoE traffic (**fcoe_vlan**):

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

9. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG:

```
[edit interfaces]
user@switch# set xe-0/0/25 ether-options 802.3ad ae1
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```

11. On the LAG (**ae1**), configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

12. On the FCoE access interfaces (**xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**), configure the port mode as **tagged-access** and membership in the FCoE VLAN (**fcoe_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and FCoE access interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

14. Set the LAG interface as an FCoE trusted port (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

15. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN_Port FIP snooping; the example is equally valid if you use VN2VF_Port FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port vlan fcoe_vlan
examine-fip examine-vn2v2 beacon-period 90000
```

Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
    fcoe-tcp {
        scheduler-map fcoe-map;
        shaping-rate percent 100;
        guaranteed-rate 3000000000;
    }
}
forwarding-class-sets {
    fcoe-pg {
        class fcoe;
    }
```

```
}
congestion-notification-profile {
    fcoe-cnp {
        input {
            ieee-802.1 {
                code-point 011 {
                    pfc;
                }
            }
        }
    }
}
interfaces {
    ae0 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
    ae1 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {
        transmit-rate 3000000000;
        shaping-rate percent 100;
        priority low;
    }
}
```

NOTE: The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

For MC-LAG verification commands, see "Example: Configuring Multichassis Link Aggregation" on page 2462.

Display the results of the CoS configuration on FCoE Transit Switch TS1 and on FCoE Transit Switch TS2 (the results on both transit switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
   fcoe-tcp {
      scheduler-map fcoe-map;
      shaping-rate percent 100;
      guaranteed-rate 3000000000;
   }
}
forwarding-class-sets {
   fcoe-pg {
      class fcoe;
   }
}
congestion-notification-profile {
   fcoe-cnp {
      input {
         ieee-802.1 {
            code-point 011 {
               pfc;
            }
         }
      }
   }
}
interfaces {
   xe-0/0/30 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
   }
   xe-0/0/31 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
   }
   xe-0/0/32 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
   }
   xe-0/0/33 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
```

```
    }
    ae1 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
  }
  scheduler-maps {
    fcoe-map {
      forwarding-class fcoe scheduler fcoe-sched;
    }
  }
  schedulers {
    fcoe-sched {
      transmit-rate 3000000000;
      shaping-rate percent 100;
      priority low;
    }
  }
```

NOTE: The forwarding class and classifier configurations are not shown because the **show** command does not display default portions of the configuration.

Verification

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

- Verifying That the Output Queue Schedulers Have Been Created on page 5136
- Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created on page 5136
- Verifying That the Forwarding Class Set (Priority Group) Has Been Created on page 5137
- Verifying That Priority-Based Flow Control Has Been Enabled on page 5137
- Verifying That the Interface Class of Service Configuration Has Been Created on page 5138
- Verifying That the Interfaces Are Correctly Configured on page 5140
- Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces on page 5142
- Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2 on page 5143
- Verifying That IGMP Snooping Is Disabled on the FCoE VLAN on page 5143

Verifying That the Output Queue Schedulers Have Been Created

Purpose Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

Action List the scheduler map using the operational mode command **show class-of-service scheduler-map fcoe-map**:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023

  Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any             1    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>
```

Meaning The **show class-of-service scheduler-map fcoe-map** command lists the properties of the scheduler map **fcoe-map**. The command output includes:

- The name of the scheduler map (**fcoe-map**)
- The name of the scheduler (**fcoe-sched**)
- The forwarding classes mapped to the scheduler (**fcoe**)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)
- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created

Purpose Verify that the traffic control profile **fcoe-tcp** has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

Action List the FCoE traffic control profile properties using the operational mode command **show class-of-service traffic-control-profile fcoe-tcp**:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
  Shaping rate: 100 percent
```

```
  Scheduler map: fcoe-map
  Guaranteed rate: 3000000000
```

Meaning The **show class-of-service traffic-control-profile fcoe-tcp** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**fcoe-tcp**)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (**fcoe-map**)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

Verifying That the Forwarding Class Set (Priority Group) Has Been Created

Purpose Verify that the FCoE priority group has been created and that the **fcoe** priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

Action List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class                        Index
  fcoe                                      1
```

Meaning The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

Action List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2500
  100          Disabled
  101          Disabled
```

```
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
               6
  111
               7
```

Meaning The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point **011** (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying That the Interface Class of Service Configuration Has Been Created

Purpose Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

Action List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}

ae1 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/30 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/31 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/32 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/33 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
ae1 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
```

Meaning The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

NOTE: Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33, which are not members of a LAG.

Verifying That the Interfaces Are Correctly Configured

Purpose Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

Action List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
ae0 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
```

```
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/25 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/26 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/30 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/31 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/32 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/33 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
```

```
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}

ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

Meaning The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The port mode (**trunk** mode for interfaces that connect two switches, **tagged-access** mode for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe_vlan**)

Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces

Purpose Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

Action List the port security configuration on FCoE transit switches TS1 and TS2 using the operational mode command **show configuration ethernet-switching-options secure-access-port**:

```
user@switch> show configuration ethernet-switching-options secure-access-port
interface ae1.0 {
    fcoe-trusted;
}
vlan fcoe_vlan {
```

```
    examine-fip;
}
```

Meaning The **show configuration ethernet-switching-options secure-access-port** command lists port security information, including whether a port is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- FIP snooping is enabled (**examine-fip**) on the FCoE VLAN (**fcoe_vlan**). On Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**,**xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2

Purpose Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

Action List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
VLAN: fcoe_vlan,    Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
…
```

NOTE: The output has been truncated to show only the relevant information.

Meaning The **show fip snooping brief** command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe_vlan**
- The FIP snooping mode is VN2VN_Port FIP snooping (**VN2VN Snooping**)

Verifying That IGMP Snooping Is Disabled on the FCoE VLAN

Purpose Verify that IGMP snooping is disabled on the FCoE VLAN on all four switches.

Action List the IGMP snooping protocol information on each of the four switches using the **show configuration protocols igmp-snooping** command:

```
user@switch> show configuration protocols igmp-snooping
vlan fcoe_vlan {
    disable;
}
```

Meaning The **show configuration protocols igmp-snooping** command lists the IGMP snooping configuration for the VLANs configured on the switch. The command output shows that IGMP snooping is disabled on the FCoE VLAN (**fcoe_vlan**).

Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The QFX Series handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the QFX Series exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE priority (the FCoE IEEE 802.1p code point). The default priority mapping for the FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).

- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

- Requirements on page 5145
- Overview on page 5145
- Configuration on page 5149
- Verification on page 5150

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX Series device
- Junos OS Release 12.1 or later for the QFX Series

Overview

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

NOTE: DCBX also advertises PFC and enhanced transmission selection (ETS) information. See "Configuring DCBX Autonegotiation" on page 5204 for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.
- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. Table 407 on page 5146 shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode. Table 408 on page 5146 shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

Table 407: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Table 408: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low
010	best-effort	low
011	best-effort	low
100	best-effort	low
101	best-effort	low

Table 408: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier) *(continued)*

Code Point	Forwarding Class	Loss Priority
110	best-effort	low
111	best-effort	low

Topology

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

NOTE: You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 409 on page 5147 shows the configuration components for this example.

Table 409: Components of DCBX Application Protocol Exchange Configuration Topology

Component	Settings
Hardware	QFX Series device
LLDP	Enabled by default on Ethernet interfaces
DCBX	Enabled by default on Ethernet interfaces
iSCSI application (Layer 4)	Application name—**iscsi** protocol—**TCP** destination-port—**3260** code-points—**111**
PTP application (Layer 2)	Application name—**ptp** ether-type—**0x88F7** code-points—**001**, **101**

Table 409: Components of DCBX Application Protocol Exchange Configuration Topology *(continued)*

Component	Settings
FCoE application (Layer 2)	Application name—**fcoe** ether-type—**0x8906** code-points—**011** NOTE: You explicitly configure the FCoE application because you are applying an application map to the interface. When you apply an application map to an interface, all applications must be explicitly configured and included in the application map.
Application maps	**dcbx-iscsi-fcoe-app-map**—Maps the iSCSI and FCoE applications to IEEE 802.1p code points **dcbx-iscsi-ptp-app-map**—Maps iSCSI and PTP applications to IEEE 802.1p code points
Interfaces	**xe-0/0/10**—Configured to exchange FCoE and iSCSI application TLVs (uses application map **dcbx-iscsi-fcoe-app-map**, carries FCoE traffic, and has PFC enabled on the FCoE priority) **xe-0/0/11**—Configured to exchange iSCSI and PTP application TLVs (uses application map **dcbx-iscsi-ptp-app-map**)
PFC congestion notification profile for FCoE application exchange	**fcoe-cnp**: • Code point—**011** • Interface—**xe-0/0/10**
Behavior aggregate classifiers (map forwarding classes to incoming packets by the packet's IEEE 802.1 code point)	**fcoe-iscsi-cl1**: • Maps the **fcoe** forwarding class to the IEEE 802.1p code point used for the FCoE application (**011**) and a loss priority of **high** • Maps the **network-control** forwarding class to the IEEE 802.1p code point used for the iSCSI application (**111**) and a loss priority of **high** • Applied to interface **xe-0/0/10** **iscsi-ptp-cl2**: • Maps the **network-control** forwarding class to the IEEE 802.1p code point used for the iSCSI application (**111**) and a loss priority of **low** • Maps the **best-effort** forwarding class to the IEEE 802.1p code points used for the PTP application (**001** and **101**) and a loss priority of **low** • Applied to interface **xe-0/0/11**

NOTE: This example does not include scheduling (bandwidth allocation) configuration or lossless configuration for the iSCSI forwarding class.

Configuration

CLI Quick Configuration

To quickly configure DCBX application protocol exchange, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set applications application iSCSI protocol tcp destination-port 3260
set applications application FCoE ether-type 0x8906
set applications application PTP ether-type 0x88F7
set policy-options application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
set policy-options application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001
101]
set protocols dcbx interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
set protocols dcbx interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe
loss-priority high code-points 011
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class
network-control loss-priority high code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class
network-control loss-priority low code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
set class-of-service interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

Configuring DCBX Application Protocol TLV Exchange

Step-by-Step Procedure

To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.

   ```
   [edit applications]
   user@switch# set application iSCSI protocol tcp destination-port 3260
   user@switch# set application FCoE ether-type 0x8906
   user@switch# set application PTP ether-type 0x88F7
   ```

2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.

   ```
   [edit policy-options]
   user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points
   111
   user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points
   011
   ```

3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.

   ```
   [edit policy-options]
   user@switch# set application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points
   111
   user@switch# set application-maps dcbx-iscsi-ptp-app-map application PTP code-points
   [001 101]
   ```

4. Apply the iSCSI and FCoE application map to interface **xe-0/0/10**, and apply the iSCSI and PTP application map to interface **xe-0/0/11**.

```
[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
```

5. Create the congestion notification profile to enable PFC on the FCoE code point (**011**), and apply the congestion notification profile to interface **xe-0/0/10**.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
```

6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority
high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control
loss-priority high code-points 111
```

7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control
loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- Verifying the Application Configuration on page 5150
- Verifying the Application Map Configuration on page 5151
- Verifying DCBX Application Protocol Exchange Interface Configuration on page 5151
- Verifying the PFC Configuration on page 5152
- Verifying the Classifier Configuration on page 5153

Verifying the Application Configuration

Purpose Verify that DCBX applications have been configured.

Action List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
```

```
application iSCSI {
   protocol tcp;
   destination-port 3260;
}

application fcoe {
   ether-type 0x8906;
}

application ptp {
   ether-type 0x88F7;
}
```

Meaning The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

Verifying the Application Map Configuration

Purpose Verify that the application maps have been configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
   application iSCSI code-points 111;
   application FCoE code-points 011;
}

dcbx-iscsi-ptp-app-map {
   application iSCSI code-points 111;
   application PTP code-points [001 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ptp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the FCoE application, which is mapped to IEEE 802.1p code point **011**.

The application map **dcbx-iscsi-ptp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the PTP application, which is mapped to IEEE 802.1p code points **001** and **101**.

Verifying DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps have been applied to the correct interfaces.

Action List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
   application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
   application-map dcbx-iscsi-ptp-app-map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

Verifying the PFC Configuration

Purpose Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

Action Display the PFC configuration to verify that PFC is enabled on the FCoE code point (**011**) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
        }
    }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
}
```

NOTE: The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

Meaning The **show class-of-service congestion-notification-profile** configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile **fcoe-cnp** has been configured and has enabled PFC on the IEEE 802.1p code point **011** (the default FCoE code point).

The **show class-of-service interfaces** configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile **fcoe-cnp**, which enables PFC on the FCoE code point, is applied to interface **xe-0/0/10**.

Verifying the Classifier Configuration

Purpose Verify that the classifiers have been configured and applied to the correct interfaces.

Action Display the classifier configuration by using the configuration mode command **show class-of-service**:

```
user@switch# show class-of-service
classifiers {
    ieee-802.1 fcoe-iscsi-cl1 {
        import default;
        forwarding-class network-control {
            loss-priority high code-points 111;
        }
        forwarding-class fcoe {
            loss-priority high code-points 011;
        }
    }
    ieee-802.1 iscsi-ptp-cl2 {
        import default;
        forwarding-class network-control {
            loss-priority low code-points 111;
        }
        forwarding-class best-effort {
            loss-priority low code-points [ 001 101 ];
        }
    }
}
interfaces {
    xe-0/0/10 {
        congestion-notification-profile fcoe-cnp;
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-iscsi-cl1;
            }
        }
    }
    xe-0/0/11 {
        unit 0 {
            classifiers {
                ieee-802.1 iscsi-ptp-cl2;
            }
        }
    }
}
```

NOTE: The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

Meaning The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ptp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)

This example shows how to configure VN_Port to VN_Port (VN2VN_Port) FIP snooping when the hosts are directly connected to the same FCoE transit switch.

VN2VN_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN_Port FIP snooping is conceptually similar to VN2VN_Port FIP snooping between VN_Ports and VF_Ports, but VN2VN_Port FIP snooping does not require traffic between VN_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN_Port communicates transparently through the transit switch on a virtual link that emulates a direct connection to the VN_Port at the other end of the virtual link.

To configure VN2VN_Port FIP snooping when the hosts are directly connected to the same FCoE transit switch, you must follow these configuration rules:

- VN2VN_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN_Port FIP snooping must use that FCoE VLAN. You cannot mix VN2VN_Port FIP snooping traffic with VN2VF_Port FIP snooping traffic in the same FCoE VLAN.

  NOTE: **An FCoE VLAN can support either VN2VF_Port FIP snooping or VN2VN_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF_Port FIP snooping traffic and for VN2VN_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN_Port FIP snooping VLANs, VN_Port to VF_Port (FIP snooping) traffic is dropped.**

- ENode-facing ports must be set in **tagged-access** port mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** port mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable VN2VF_Port FIP snooping, the system snoops VN_Port to VF_Port packets and enforces security only on VN_Port to VF_Port virtual links. When you enable VN2VN_Port FIP snooping, the system snoops VN_Port to VN_Port packets and enforces security only on VN_Port to VN_Port virtual links.

The transit switch applies VN2VN_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN_Port FIP snooping when the FCoE hosts are directly connected to the same transit switch:

- Requirements on page 5156
- Overview on page 5156
- Configuration on page 5157
- Verification on page 5158

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch used as a transit switch
- Junos OS Release 12.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

Overview

This example shows you how to:

- Set the correct interface port modes on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN_Port FIP snooping.
- Configure the dedicated FCoE VLAN for VN2VN_Port FIP snooping traffic.
- Enable VN2VN_Port FIP snooping on the FCoE VLAN and configure the beacon period.

Topology

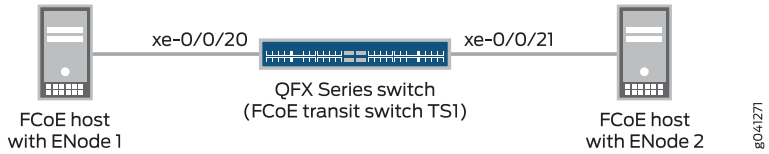
Table 410 on page 5156 shows the configuration components for this example.

Table 410: Components of the VN2VN_Port FIP Snooping Configuration Topology (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)

Component	Settings
Hardware	QFX3500 switch (FCoE transit switch TS1) Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)
Interfaces and port modes	• Interface **xe-0/0/20**, port mode **tagged-access**, connects directly to the FCoE host with ENode1. • Interface **xe-0/0/21**, port mode **tagged-access**, connects directly to the FCoE host with ENode2.
Interface VLAN membership	Both interfaces use VLAN **vlan200**.
VN2VN_Port FIP snooping VLAN	VLAN name—**vlan200** VLAN ID—200
FIP snooping mode and beacon period	Set **examine-vn2vn** (VN2VN_Port FIP snooping) Beacon period—90000 ms

Figure 198 on page 5157 shows the network topology for this example.

Figure 198: VN2VN_Port FIP Snooping (FCoE Hosts Connected to Same Transit Switch) Topology



Configuration

CLI Quick Configuration

To quickly configure VN2VN_Port FIP snooping for FCoE hosts connected directly to the same transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
```

Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)

Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN_Port traffic, configure the VLAN, set the beacon period, and enable VN2VN_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host ENodes:

   ```
   user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
   set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode tagged-access
   ```

2. Configure the interface VLAN membership so that the interfaces connected to theENodes are members of the dedicated VN2VN_Port VLAN (**vlan200**):

   ```
   user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
   set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
   ```

3. Configure the FCoE VLAN dedicated to VN2VN_Port FIP snooping:

   ```
   user@switch# set vlans vlan200 vlan-id 200
   ```

4. Enable VN2VN_Port FIP snooping on the VLAN and configure the beacon period:

   ```
   user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
   ```

Verification

To verify that the VN2VN_Port FIP snooping configuration has been created and is operating properly, perform these tasks:

- Verifying That VN2VN_Port FIP Snooping is Enabled on the FCoE VLAN on page 5158
- Verifying the Interface Port Mode on page 5159

Verifying That VN2VN_Port FIP Snooping is Enabled on the FCoE VLAN

Purpose Verify that VN2VN_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and the correct interfaces (**xe-0/0/20** and **xe-0/0/21**) are members of the VLAN.

Action List the FIP snooping information using the operational mode command **show fip snooping detail**.

```
user@switch> show fip snooping detail
VLAN: vlan200,  Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
  Beacon_Period:  90000
  VN2VN Mode: Point-to-Point
    Enode Information
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/20
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/21
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
```

Meaning The **show fip snooping detail** command lists all of the transit switch information about VN2VN_Port FIP snooping and VN2VF_Port FIP snooping. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF_Port FIP snooping.)
- The beacon period is **90000**.
- The interfaces for the ENodes are **xe-0/0/20** and **xe-0/0/21**.

In addition, this useful command shows information about the ENodes and the VN2VN_Port sessions.

Verifying the Interface Port Mode

Purpose Verify that the interface port modes are **tagged-access**.

Action List the Ethernet switching interfaces to confirm the port mode using the **show ethernet-switching interfaces detail** operational command.

Use the operational mode commands **show ethernet-switching interfaces xe-0/0/20.0 detail** and **show ethernet-switching interfaces xe-0/0/21.0 detail** to list the Ethernet switching interface information. The output is truncated to show only the relevant portions:

```
user@switch> show ethernet-switching interfaces xe-0/0/20.0 detail
Interface: xe-0/0/20.0, Index: 75, State: up, Port mode: Tagged-Access
.
.
.
user@switch> show ethernet-switching interfaces xe-0/0/21.0 detail
Interface: xe-0/0/21.0, Index: 83, State: up, Port mode: Tagged-Access
.
.
.
```

Meaning The **show ethernet-switching interfaces detail** command lists the port mode as **tagged-access** for both interfaces.

Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches)

This example shows how to configure VN_Port to VN_Port (VN2VN_Port) FIP snooping when the hosts are directly connected to different FCoE transit switches, and the transit switches are directly connected to each other.

VN2VN_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN_Port FIP snooping is conceptually similar to VN2VF_Port FIP snooping between VN_Ports and VF_Ports, but VN2VN_Port FIP snooping does not require traffic between VN_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a

VN_Port communicates transparently through one or more transit switches on a virtual link that emulates a direct connection to the VN_Port at the other end of the virtual link.

To configure VN2VN_Port FIP snooping when the hosts are directly connected to different FCoE transit switches, and the transit switches are directly connected to each other, you must follow these configuration rules:

- VN2VN_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN_Port FIP snooping must use that FCoE VLAN. The FCoE VLAN must be configured on each transit switch. You cannot mix VN2VN_Port FIP snooping traffic with VN2VF_Port FIP snooping traffic in the same FCoE VLAN.

  NOTE: **An FCoE VLAN can support either VN2VF_Port FIP snooping or VN2VN_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF_Port FIP snooping traffic and for VN2VN_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN_Port FIP snooping VLANs, VN2VF_Port traffic is dropped.**

- ENode-facing ports must be set in **tagged-access** port mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** port mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable VN2VF_Port FIP snooping, the system snoops VN_Port to VF_Port packets and enforces security only on VN_Port to VF_Port virtual links. When you enable VN2VN_Port FIP snooping, the system snoops VN_Port to VN_Port packets and enforces security only on VN_Port to VN_Port virtual links.

The transit switch applies VN2VN_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN_Port FIP snooping when the FCoE hosts are directly connected to different transit switches, and the transit switches are directly connected to each other:

- Requirements on page 5160
- Overview on page 5161
- Configuration on page 5162
- Verification on page 5164

Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches used as transit switches

- Junos OS Release 12.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

Overview

This example shows you how to:

- Set the correct interface port modes on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN_Port FIP snooping.
- Configure the network-facing interfaces as FCoE trusted interfaces.
- Configure the dedicated FCoE VLAN for VN2VN_Port FIP snooping traffic.
- Enable VN2VN_Port FIP snooping on the FCoE VLAN and configure the beacon period.

Topology

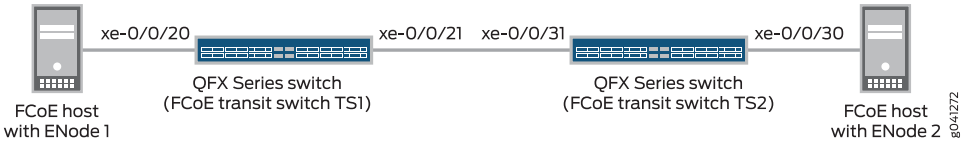
Table 411 on page 5161 shows the configuration components for this example.

Table 411: Components of the VN2VN_Port FIP Snooping Configuration Topology (FCoE Hosts Directly Connected to Different FCoE Transit Switches)

Component	Settings
Hardware	Two QFX3500 switches (FCoE transit switch TS1 and FCoE transit switch TS2) Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)
Interfaces and port modes	• Interface **xe-0/0/20**, port mode **tagged-access**, connects directly from transit switch TS1 to the FCoE host with ENode1. • Interface **xe-0/0/21**, port mode **trunk**, connects directly from transit switch TS1 to transit switch TS2. • Interface **xe-0/0/31**, port mode **trunk**, connects directly from transit switch TS2 to transit switch TS1. • Interface **xe-0/0/30**, port mode **tagged-access**, connects directly from transit switch TS2 to the FCoE host with ENode2.
Interface VLAN membership	The interfaces on both transit switches use VLAN **vlan200**.
VN2VN_Port FIP snooping VLAN	VLAN name (both transit switches)—**vlan200** VLAN ID—200
FIP snooping mode and beacon period	Set **examine-vn2vn** (VN2VN_Port FIP snooping) Beacon period—90000 ms

Figure 199 on page 5162 shows the network topology for this example.

Figure 199: VN2VN_Port FIP Snooping (FCoE Hosts Connected to Different Transit Switches) Topology



Configuration

To configure VN2VN_Port FIP snooping for VN_Ports that are directly connected to different transit switches (and the transit switches are directly connected to each other), perform these tasks:

- Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS1 on page 5163
- Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS2 on page 5163

CLI Quick Configuration

The configuration for each FCoE transit switch is shown separately.

To quickly configure VN2VN_Port FIP snooping for FCoE hosts connected directly to different transit switches, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS1:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

To quickly configure VN2VN_Port FIP snooping for FCoE hosts connected directly to different transit switches, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS2:

```
set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port interface xe-0/0/31 fcoe-trusted
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS1

Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode1 (**xe-0/0/20**) and to FCoE transit switch TS2 (**xe-0/0/21**):

   ```
   user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode
   tagged-access
   set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
   ```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN_Port VLAN (**vlan200**):

   ```
   user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members
   vlan200
   set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
   ```

3. Configure the network-facing port (**xe-0/0/21**) as an FCoE trusted port:

   ```
   user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/21
   fcoe-trusted
   ```

4. Configure the FCoE VLAN dedicated to VN2VN_Port FIP snooping:

   ```
   user@switch# set vlans vlan200 vlan-id 200
   ```

5. Enable VN2VN_Port FIP snooping on the VLAN and configure the beacon period:

   ```
   user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip
   examine-vn2v2 beacon-period 90000
   ```

Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS2

Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode2 (**xe-0/0/30**) and to FCoE transit switch TS1 (**xe-0/0/31**):

   ```
   user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode
   tagged-access
   set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
   ```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN_Port VLAN (**vlan200**):

   ```
   user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members
   vlan200
   set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
   ```

3. Configure the network-facing port (**xe-0/0/31**) as an FCoE trusted port:

   ```
   user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/31
   fcoe-trusted
   ```

4. Configure the FCoE VLAN dedicated to VN2VN_Port FIP snooping:

   ```
   user@switch# set vlans vlan200 vlan-id 200
   ```

5. Enable VN2VN_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip
examine-vn2v2 beacon-period 90000
```

Verification

To verify that the VN2VN_Port FIP snooping configuration has been created and is operating properly on both switches, perform these tasks:

- Verifying That VN2VN_Port FIP Snooping is Enabled on the FCoE VLAN (Transit Switches TS1 and TS2) on page 5164
- Verifying the Interface Port Mode on page 5166

Verifying That VN2VN_Port FIP Snooping is Enabled on the FCoE VLAN (Transit Switches TS1 and TS2)

Purpose Verify that VN2VN_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and that the correct interfaces (**xe-0/0/20** and **xe-0/0/21** on TS1, and **xe-0/0/30**and **xe-0/0/31** on TS2) are members of the VLAN.

Action List the FIP snooping information on transit switch TS1 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200,  Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
  Beacon_Period:  90000
  VN2VN Mode: Point-to-Point
    Enode Information
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/20
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/21
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
```

List the FIP snooping information on transit switch TS2 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200,  Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
  Beacon_Period:  90000
  VN2VN Mode: Point-to-Point
    Enode Information
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/30
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/31
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
```

Meaning The **show fip snooping detail** command lists all of the transit switch information about VN2VN_Port FIP snooping and VN2VF_Port FIP snooping on each transit switch. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF_Port FIP snooping.)

- The beacon period is **90000**.
- The interfaces connected to the ENodes are **xe-0/0/20** and **xe-0/0/21** on transit switch TS1, and **xe-0/0/30** and **xe-0/0/31** on transit switch TS2. Because the transit switches are transparent passthrough switches, the network-facing trunk ports "see" the FCoE host ENodes at the far end of the VN2VN_Port virtual link.

In addition, this useful command shows information about the ENodes and the VN2VN_Port sessions.

Verifying the Interface Port Mode

Purpose Verify that the interface port modes are **tagged-access** for ENode-facing ports and **trunk** for network-facing ports on each transit switch.

Action List the Ethernet switching interfaces to confirm the port mode using the **show ethernet-switching interfaces detail** operational command.

Use the operational mode commands **show ethernet-switching interfaces xe-0/0/20.0 detail** and **show ethernet-switching interfaces xe-0/0/21.0 detail** to list the Ethernet switching interface information on FCoE transit switch TS1. The output is truncated to show only the relevant portions:

```
user@switch> show ethernet-switching interfaces xe-0/0/20.0 detail
Interface: xe-0/0/20.0, Index: 75, State: up, Port mode: Tagged-Access
.
.
.

user@switch> show ethernet-switching interfaces xe-0/0/21.0 detail
Interface: xe-0/0/21.0, Index: 83, State: up, Port mode: Trunk
.
.
.
```

List the Ethernet switching interface information on FCoE transit switch TS2 using the operational mode commands **show ethernet-switching interfaces xe-0/0/30.0 detail** and **show ethernet-switching interfaces xe-0/0/31.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/30.0 detail
Interface: xe-0/0/30.0, Index: 56, State: up, Port mode: Tagged-Access
.
.
.

user@switch> show ethernet-switching interfaces xe-0/0/31.0 detail
Interface: xe-0/0/31.0, Index: 59, State: up, Port mode: Trunk
.
.
.
```

- Understanding VN_Port to VN_Port FIP Snooping on an FCoE Transit Switch on page 5031

Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch)

This example shows how to configure VN_Port to VN_Port (VN2VN_Port) FIP snooping when the hosts are indirectly connected through an aggregation layer FCoE transit switch. Each FCoE host ENode is directly connected to an FCoE transit switch, but the FCoE transit switches are not directly connected to each other. The FCoE transit switches are both connected to a third FCoE transit switch that acts as an aggregation layer switch.

VN2VN_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN_Port FIP snooping is conceptually similar to VN2VN_Port FIP snooping between VN_Ports and VF_Ports, but VN2VN_Port FIP snooping does not require traffic between VN_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN_Port communicates transparently through one or more transit switches on a virtual link that emulates a direct connection to the VN_Port at the other end of the virtual link.

To configure VN2VN_Port FIP snooping when the hosts are indirectly connected, you must follow these configuration rules:

- VN2VN_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN_Port FIP snooping must use that FCoE VLAN. The FCoE VLAN must be configured on each transit switch. You cannot mix VN2VN_Port FIP snooping traffic with VN2VF_Port FIP snooping traffic in the same FCoE VLAN.

  NOTE: **An FCoE VLAN can support either VN2VF_Port FIP snooping or VN2VN_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF_Port FIP snooping traffic and for VN2VN_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN_Port FIP snooping VLANs, VN_Port to VF_Port traffic is dropped.**

- ENode-facing ports must be set in **tagged-access** port mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** port mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable FIP snooping, the system snoops VN_Port to VF_Port packets and enforces security only on VN_Port to VF_Port virtual links. When you enable VN2VN_Port FIP snooping, the system snoops VN_Port to VN_Port packets and enforces security only on VN_Port to VN_Port virtual links.

The transit switch applies VN2VN_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN_Port FIP snooping when the FCoE hosts are indirectly connected across an aggregation layer FCoE transit switch:

- Requirements on page 5168
- Overview on page 5168
- Configuration on page 5169
- Verification on page 5172

Requirements

This example uses the following hardware and software components:

- Three Juniper Networks QFX3500 Switches used as transit switches
- Junos OS Release 12.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

Overview

This example shows you how to:

- Set the correct interface port modes on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN_Port FIP snooping.
- Configure the network-facing interfaces as FCoE trusted interfaces.
- Configure the dedicated FCoE VLAN for VN2VN_Port FIP snooping traffic.
- Enable VN2VN_Port FIP snooping on the FCoE VLAN and configure the beacon period.

Topology

Table 412 on page 5168 shows the configuration components for this example.

Table 412: Components of the VN2VN_Port FIP Snooping Configuration Topology (FCoE Hosts Indirectly Connected Across an Aggregation Layer FCoE Transit Switch)

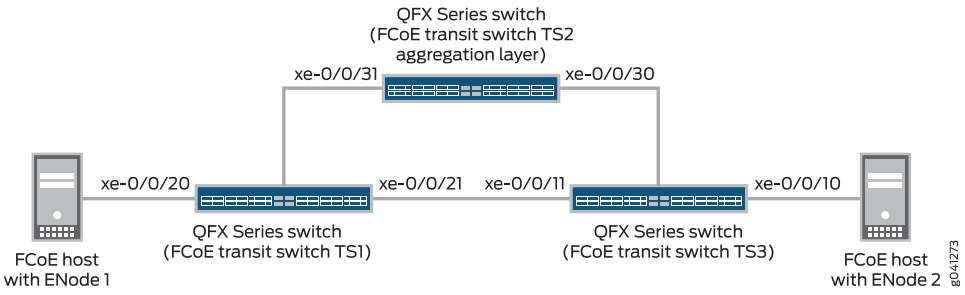
Component	Settings
Hardware	Three QFX3500 switches, two of which are FCoE transit switches that are directly attached to the FCoE hosts (transit switches TS1 and TS2) and one of which is an aggregation layer FCoE transit switch (TS3) Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)

Table 412: Components of the VN2VN_Port FIP Snooping Configuration Topology (FCoE Hosts Indirectly Connected Across an Aggregation Layer FCoE Transit Switch) *(continued)*

Component	Settings
Interfaces and port modes	• Interface **xe-0/0/20**, port mode **tagged-access**, connects directly from transit switch TS1 to the FCoE host with ENode1. • Interface **xe-0/0/21**, port mode **trunk**, connects directly from transit switch TS1 to aggregation layer transit switch TS2. • Interface **xe-0/0/31**, port mode **trunk**, connects directly from aggregation layer transit switch TS2 to transit switch TS1. • Interface **xe-0/0/30**, port mode **trunk**, connects directly from aggregation layer transit switch TS2 to transit switch TS3. • Interface **xe-0/0/11**, port mode **trunk**, connects directly from transit switch TS3 to aggregation layer transit switch TS2. • Interface **xe-0/0/10**, port mode **tagged-access**, connects directly from transit switch TS3 to the FCoE host with ENode2.
Interface VLAN membership	The interfaces on all three switches use VLAN **vlan200**.
VN2VN_Port FIP snooping VLAN	VLAN name (all three switches)—**vlan200** VLAN ID—200
FIP snooping mode and beacon period	Set **examine-vn2vn** (VN2VN_Port FIP snooping) Beacon period—90000 ms

Figure 200 on page 5169 shows the network topology for this example.

Figure 200: VN2VN_Port FIP Snooping (FCoE Hosts Indirectly Connected) Topology



Configuration

To configure VN2VN_Port FIP snooping for VN_Ports that are indirectly connected across an aggregation layer FCoE transit switch, perform these tasks:

- Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS1 on page 5170
- Configuring VN2VN_Port FIP Snooping on Aggregation Layer FCoE Transit Switch TS2 on page 5171
- Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS3 on page 5172

CLI Quick Configuration

The configuration for each FCoE transit switch is shown separately.

To quickly configure VN2VN_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS1:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

To quickly configure VN2VN_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS2:

```
set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port interface xe-0/0/30 fcoe-trusted
set ethernet-switching-options secure-access-port interface xe-0/0/31 fcoe-trusted
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

To quickly configure VN2VN_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS3:

```
set interfaces xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port interface xe-0/0/11 fcoe-trusted
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS1

Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode1 (**xe-0/0/20**) and to aggregation layer FCoE transit switch TS2 (**xe-0/0/21**):

   ```
   user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode
   tagged-access
   set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
   ```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN_Port VLAN (**vlan200**):

   ```
   user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
   set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
   ```

3. Configure the network-facing port (**xe-0/0/21**) as an FCoE trusted port:

   ```
   user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
   ```

4. Configure the FCoE VLAN dedicated to VN2VN_Port FIP snooping:

   ```
   user@switch# set vlans vlan200 vlan-id 200
   ```

5. Enable VN2VN_Port FIP snooping on the VLAN and configure the beacon period:

   ```
   user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
   ```

Configuring VN2VN_Port FIP Snooping on Aggregation Layer FCoE Transit Switch TS2

Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN_Port traffic, set the network-facing ports as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to FCoE transit switches TS1 (**xe-0/0/31**) and TS3 (**xe-0/0/30**). Both interfaces are network-facing and must be configured as trunk interfaces:

   ```
   user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode trunk
   set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
   ```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN_Port VLAN (**vlan200**):

   ```
   user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
   set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
   ```

3. Configure the network-facing ports (**xe-0/0/30** and **xe-0/0/31**) as FCoE trusted ports:

   ```
   user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/30 fcoe-trusted
   user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/31 fcoe-trusted
   ```

4. Configure the FCoE VLAN dedicated to VN2VN_Port FIP snooping:

   ```
   user@switch# set vlans vlan200 vlan-id 200
   ```

5. Enable VN2VN_Port FIP snooping on the VLAN and configure the beacon period:

   ```
   user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
   ```

Configuring VN2VN_Port FIP Snooping on FCoE Transit Switch TS3

Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode2 (**xe-0/0/10**) and to aggregation layer FCoE transit switch TS2 (**xe-0/0/11**):

   ```
   user@switch# set interfaces xe-0/0/10 unit 0 family ethernet-switching port-mode
   tagged-access
   set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
   ```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN_Port VLAN (**vlan200**):

   ```
   user@switch# set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members
   vlan200
   set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members vlan200
   ```

3. Configure the network-facing port (**xe-0/0/11**) as an FCoE trusted port:

   ```
   user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/11
   fcoe-trusted
   ```

4. Configure the FCoE VLAN dedicated to VN2VN_Port FIP snooping:

   ```
   user@switch# set vlans vlan200 vlan-id 200
   ```

5. Enable VN2VN_Port FIP snooping on the VLAN and configure the beacon period:

   ```
   user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip
   examine-vn2v2 beacon-period 90000
   ```

Verification

To verify that the VN2VN_Port FIP snooping configuration has been created and is operating properly on all three switches, perform these tasks:

- Verifying That VN2VN_Port FIP Snooping Is Enabled on the FCoE VLAN (All Three Transit Switches) on page 5172
- Verifying the Interface Port Mode on page 5174

Verifying That VN2VN_Port FIP Snooping Is Enabled on the FCoE VLAN (All Three Transit Switches)

Purpose

Verify that VN2VN_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and that the correct interfaces (**xe-0/0/20** and **xe-0/0/21** on TS1, **xe-0/0/30** and **xe-0/0/31** aggregation layer TS2, and **xe-0/0/10** and **xe-0/0/11** on TS3) are members of the VLAN.

Action List the FIP snooping information on transit switch TS1 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200,  Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
  Beacon_Period:  90000
  VN2VN Mode: Point-to-Point
    Enode Information
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/20
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/21
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
```

List the FIP snooping information on aggregation layer transit switch TS2 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200,  Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
  Beacon_Period:  90000
  VN2VN Mode: Point-to-Point
    Enode Information
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/30
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
    Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/31
      Active VN_Ports : 1
      VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
         Active Sessions    : 1
         Session Information
     Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
```

List the FIP snooping information on transit switch TS3 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200,  Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
  Beacon_Period:  90000
  VN2VN Mode: Point-to-Point
    Enode Information
```

```
Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/10
  Active VN_Ports : 1
  VN_Port Information
  VN-Port MAC: 0e:fd:00:00:0b:01
     Active Sessions    : 1
     Session Information
 Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
Enode-MAC: 10:10:94:01:00:02,       Interface: xe-0/0/11
  Active VN_Ports : 1
  VN_Port Information
  VN-Port MAC: 0e:fd:00:00:0a:01
     Active Sessions    : 1
     Session Information
 Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
```

Meaning The **show fip snooping detail** command lists all of the transit switch information about VN2VN_Port FIP snooping and VN2VF_Port FIP snooping on each transit switch. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF_Port FIP snooping.)
- The beacon period is **90000**.
- The interfaces connected to the ENodes are **xe-0/0/20** and **xe-0/0/21** on transit switch TS1, **xe-0/0/30** and **xe-0/0/31** on aggregation layer transit switch TS2, and **xe-0/0/10** and **xe-0/0/11** on transit switch TS3. Because the transit switches are transparent passthrough switches, the network-facing trunk ports “see” the FCoE host ENodes at the far end of the VN2VN_Port virtual link.

In addition, this useful command shows information about the ENodes and the VN2VN_Port sessions.

Verifying the Interface Port Mode

Purpose Verify that the interface port modes are **tagged-access** for ENode-facing ports and **trunk** for network-facing ports on each transit switch.

Action List the Ethernet switching interfaces to confirm the port mode using the **show ethernet-switching interfaces detail** operational command for each interface. The output is truncated to show only the relevant portions.

List the Ethernet switching interface information on FCoE transit switch TS1 using the operational mode commands **show ethernet-switching interfaces xe-0/0/20.0 detail** and **show ethernet-switching interfaces xe-0/0/21.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/20.0 detail
Interface: xe-0/0/20.0, Index: 75, State: up, Port mode: Tagged-Access
.
.
.
```

```
user@switch> show ethernet-switching interfaces xe-0/0/21.0 detail
```

```
Interface: xe-0/0/21.0, Index: 83, State: up, Port mode: Trunk
.
.
.
```

List the Ethernet switching interface information on aggregation layer FCoE transit switch TS2 using the operational mode commands **show ethernet-switching interfaces xe-0/0/30.0 detail** and **show ethernet-switching interfaces xe-0/0/31.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/30.0 detail
Interface: xe-0/0/30.0, Index: 71, State: up, Port mode: Trunk
.
.
.
user@switch> show ethernet-switching interfaces xe-0/0/31.0 detail
Interface: xe-0/0/31.0, Index: 73, State: up, Port mode: Trunk
.
.
.
```

List the Ethernet switching interface information on FCoE transit switch TS3 using the operational mode commands **show ethernet-switching interfaces xe-0/0/10.0 detail** and **show ethernet-switching interfaces xe-0/0/11.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/10.0 detail
Interface: xe-0/0/10.0, Index: 56, State: up, Port mode: Tagged-Access
.
.
.
user@switch> show ethernet-switching interfaces xe-0/0/11.0 detail
Interface: xe-0/0/11.0, Index: 59, State: up, Port mode: Trunk
.
.
.
```

Example: Configuring Automated Fibre Channel Interface Load Rebalancing

Automated Fibre Channel (FC) interface (NP_Port) load rebalancing configures the switch to rebalance the session loads on the native FC interfaces automatically on a load-rebalancing trigger event. (Alternatively, you can rebalance the link load on the FC interfaces on demand so that you control when the link load is rebalanced.) Rebalancing the FC link load is a disruptive action that causes some or all of the current sessions to log out, then log in again to be placed on the active FC links in a balanced manner.

This example shows you how to configure and verify automated FC link load rebalancing on an FCoE-FC gateway local FC fabric.

- Requirements on page 5176
- Overview on page 5176
- Configuration on page 5177
- Verification on page 5178

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

When a load rebalancing trigger occurs, the switch automatically rebalances the link loads by redistributing the sessions across the active NP_Port links.

There are three possible load-rebalancing triggers:

1. When you enable automated load rebalancing, the switch checks the load balance on the existing NP_Port links. If the links are already balanced, the switch does not rebalance the link load. If the links are not balanced, the switch rebalances the link loads using the configured load-balancing algorithm.
2. When a new NP_Port link comes up on a local FCoE-FC gateway fabric, the switch rebalances the link load using the configured load-balancing algorithm if automated load balancing is enabled.
3. When the port speed is changed (unless the port speed change does not change the actual port speed, for example, changing the port speed from auto to 8 Gbps).

Automated load rebalancing logs out sessions in accordance with the configured load-balancing algorithm. Disabling automated load rebalancing is not disruptive because the link load is already balanced.

Use automated load rebalancing if you want link loads to be rebalanced automatically instead of at times of your choosing. Keep in mind that load rebalancing is a disruptive event (sessions are logged out).

Topology

This example configures automated load rebalancing on a local FC fabric on an FCoE-FC gateway. This example does not show you how to configure the load-balancing algorithm or any other load-balancing characteristics. The load-balancing configuration for this example is:

- FC fabric name—fc_fabric_100
- FC fabric ID—100

- FC fabric type—Proxy
- FC fabric interfaces—fc-0/0/0, fc-0/0/1, fc-0/0/42, fc-0/0/43, vlan.100, vlan.20
- Load-balancing algorithm—Simple
- No fabric WWN verify—Configured
- Traceoptions—Configured to log in file fc_fabric_100_proxy.log

Configuration

To configure automated load balancing on a local FC fabric, perform this task:

- [xref target has no title]
- Results on page 5177

CLI Quick Configuration

To quickly configure automated load balancing, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit]
set fc-fabrics fc_fabric_100 proxy auto-load-rebalance
```

Step-by-Step Procedure

- Configure automated load balancing on FC fabric fc_fabric_100:

  ```
  user@switch# set fc-fabrics fc_fabric_100 proxy auto-load-rebalance
  ```

Results

Display the results of the configuration:

```
user@switch> show configuration fc-fabrics
fc_fabric_100 {
    fabric-id 100;
    fabric-type proxy;
    interface {
        fc-0/0/0.0;
        fc-0/0/1.0;
        vlan.100;
        vlan.20;
        fc-0/0/42.0;
        fc-0/0/43.0;
    }
    proxy {
        traceoptions {
            file fc_fabric_100_proxy.log size 20m;
            flag all;
        }
        load-balance-algorithm simple;
        auto-load-rebalance;
        no-fabric-wwn-verify;
    }
}
```

Verification

Verifying That Automated Load Rebalancing Is Enabled

Purpose Verify that automated load rebalancing is configured on local FC fabric **fc_fabric_100**.

Action Verify the results of the automated load-rebalancing configuration using the operational mode command **show fibre-channel proxy fabric-state fabric fc_fabric_100**:

```
user@switch> show fibre-channel proxy fabric-state fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
Proxy load balance algorithm: Simple, Fabric WWN verification: No
Auto load rebalance enabled  : Yes
Last rebalance start-time    : Never
Last rebalance end-time      : Never
Last rebalance trigger       : None
Last rebalance trigger-time  : Mon Sep 10 21:42:30 2012 usec: 814602
Last rebalance trigger-result: None
```

Meaning The **show fibre-channel proxy fabric-state fabric fc_fabric_100** operational command displays information about the specified local FC fabric. The output shows that the **Auto load rebalance enabled** field value is **Yes**, which indicates that automated load rebalancing is enabled on fabric fc_fabric_100.

Configuring an FCoE-FC Gateway Fibre Channel Fabric

Fibre Channel (FC) fabric configuration consists of creating a unique name and identifier for each FC fabric you want to create and configuring it as an FCoE-FC gateway.

You can create a maximum of 12 FC fabrics on a QFX3500 switch. After you create a fabric, you can create and assign interfaces to the fabric, configure FIP parameters for the fabric, and set proxy traceoptions.

To configure an FC fabric using the CLI, specify a unique name and identification number for the fabric:

1. Configure the fabric name and fabric ID:

   ```
   [edit]
   user@switch# set fc-fabrics fabric-name fabric-id fabric-id
   ```

   

   NOTE: **Changing the fabric name or the fabric ID causes all logins to drop and forces the ENodes to log in again.**

   For example, to configure an FC fabric with the name **fab_ulous** and the fabric ID **10** (the range of **fabric-id** values is 1 through 4095):

   ```
   [edit]
   user@switch# set fc-fabrics fab_ulous fabric-id 10
   ```

2. Configure the fabric as a gateway fabric:

   ```
   [edit fc-fabrics fabric-name]
   user@switch# set fabric-type proxy
   ```

   For example, to configure the FC fabric with the name **fab_ulous** as a gateway fabric:

   ```
   [edit fc-fabrics fab_ulous]
   user@switch# set fabric-type proxy
   ```

Disabling the Fabric WWN Verification Check

When a QFX Series NP_Port sends a fabric login (FLOGI) request to a Fibre Channel (FC) switch, the FLOGI accept (FLOGI-ACC) reply from the FC switch contains the SAN fabric worldwide name (WWN). The QFX Series uses the SAN fabric WWN in the multicast discovery advertisement (MDA) that the QFX Series sends to the ENodes in the FCoE network.

However, some FC switches substitute their own WWN (often the FC switch's virtual WWN) for the SAN fabric WWN in the FLOGI-ACC message. In this case, different NP_Ports that log in to the same FC fabric might receive different fabric WWNs in the FLOGI-ACC messages if the NP_Ports are connected to different FC switches in the SAN fabric.

If the QFX Series receives different fabric WWNs on NP_Ports that are connected to the same SAN fabric, the QFX Series uses the first fabric WWN it receives in the MDA it sends to the ENodes. The QFX Series isolates the NP_Ports that receive a different fabric WWN from other FC switches in that SAN fabric. No ENode sessions are assigned to the isolated NP_Ports. FC traffic is assigned only to NP_Ports that receive a fabric WWN in the FLOGI-ACC message that matches the fabric WWN received by the first NP_Port to log in to the FC fabric. (If an NP_Port receives a fabric WWN that does not match the fabric WWN received by the first NP_Port to log in to the FC fabric, it does not carry traffic to the SAN fabric.)

To prevent ENodes from being isolated due to a mismatched fabric WWN, you can disable the gateway fabric WWN verification check. Disabling the fabric WWN verification check enables all NP_Ports connected to a SAN fabric are used to carry traffic between the gateway and the FC switch, regardless of the fabric WWN the NP_Port receives in the FLOGI-ACC message.

NOTE: **Disabling or enabling the fabric WWN verification check logs out all FCoE sessions.**

To disable the fabric WWN verification check:

- ```
  [edit fc-fabrics fabric-name proxy]
  user@switch# set no-fabric-wwn-verify
  ```
  ```

Configuring a Physical Fibre Channel Interface

When you configure the switch as an FCoE-FC gateway, you must configure either 6 or 12 of the physical interfaces as native FC interfaces. Native FC interfaces connect to the storage area network (SAN) FC switch.

You can configure ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces. You cannot individually configure a single port as a native FC interface. Within these port blocks, you cannot mix FC interfaces with Ethernet interfaces. All of the ports in a block must be either native FC interfaces or Ethernet interfaces.

You can configure:

- Six native FC interfaces by configuring either ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, or ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- Twelve native FC interfaces by configuring ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- No native FC interfaces by leaving ports xe-0/0/0 through xe-0/0/5 and ports xe-0/0/42 through xe-0/0/47 in their default state as Ethernet interfaces.
- To configure physical FC interfaces using the CLI, specify the physical port block you want to configure on the switch as native FC interfaces:

  ```
  [edit chassis]
  user@switch# set fpc fpc pic pic fibre-channel port-range port-range-low port-range-high
  ```

  For example, to configure six native FC interfaces, you can configure ports 0 through 5 as physical FC interfaces:

  ```
  [edit chassis]
  user@switch# set fpc 0 pic 0 fibre-channel port-range 0 5
  ```

  To configure 12 native FC interfaces requires two separate statements:

  ```
  [edit chassis]
  user@switch# set fpc 0 pic 0 fibre-channel port-range 0 5
  user@switch# set fpc 0 pic 0 fibre-channel port-range 42 47
  ```

Configuring a Fibre Channel Interface

When a QFX3500 acts as an FCoE-FC gateway, native Fibre Channel (FC) traffic flows between the switch and the storage area network (SAN) FC switch. When you configure a port as an FC interface, it transports only FC traffic. It does not transport Ethernet traffic.

You can configure ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces.

Each of these blocks of ports must be configured either as all Ethernet ports or as all native FC ports. Within each block of ports, you cannot mix FC and Ethernet interfaces. This means that you can configure 0, 6, or 12 ports as native FC ports. "Configuring a Physical Fibre Channel Interface" on page 5181 describes how to configure the port blocks as physical FC interfaces.

NOTE: **Do not configure ports that you want to use for native FC traffic as part of an Ethernet VLAN or as Ethernet ports.**

Configure a port as an FC interface when the port connects to the F_Port of an FC switch.

FC interface configuration includes:

- Explicitly specifying one or more ports as an FC family interface in NP_Port mode (mandatory).
- Configuring the FC interface options port speed and buffer-to-buffer credit state change number (BB_SC_N) (optional).
- Configuring the interface as a loopback interface (optional).

The buffer-to-buffer state change number feature prevents the loss of buffer-to-buffer credits between the two interfaces on either end of an FC link. The state change number determines the number of frames and receiver ready (R_RDY) primitives the interfaces exchange between the state change send (BB_SCs) and the state change receive (BB_SCr) primitives used to track these transactions.

Enabling BB_SC_N by configuring BB_SC_N on both of the FC link interfaces:

- Requests that $2^{BB\_SC\_N}$ number of frames be sent between two consecutive BB_SCs primitives, and
- Requests that $2^{BB\_SC\_N}$ number of R_RDY primitives be sent between two consecutive BB_SCr primitives.

When the number of R_RDY primitives received equals $2^{BB\_SC\_N}$, the R_RDY counter resets to zero. When the number of frames received equals $2^{BB\_SC\_N}$, the frame counter resets

to zero. The interfaces calculate the number of buffer-to-buffer credits lost based on counter discrepancies and take corrective action to recover the lost credits.

If you enable BB_SC_N, the recommended BB_SC_N setting is eight. Setting the BB_SC_N number to zero (0) disables the feature. If either of the two connected FC interfaces is configured with zero as the BB_SC_N value, then both interfaces disable the feature. If the two connected FC interfaces have different nonzero BB_SC_N numbers configured, both interfaces use the higher number.

For the port to transport FC traffic, you must also set the physical port as an FC port using the port-range command.

To configure an FC interface using the CLI:

1. Specify the interface as family FC and set the port mode to NP_Port (setting the port mode to NP_Port is a mandatory configuration):

   ```
   [edit]
   user@switch# set interfaces interface-name unit unit family fibre-channel port-mode np-port
   ```

   For example, to configure the interface **fc-0/0/3** as an FC interface and set the port mode to **np-port**:

   ```
   [edit]
   user@switch# set interfaces fc-0/0/3 unit 0 family fibre-channel port-mode np-port
   ```

2. Configure the FC interface speed option:

   ```
   [edit]
   user@switch: set interfaces interface-name fibrechannel-options speed (auto-negotiation | 2g | 4g | 8g)
   ```

   For example, to set the FC interface speed option to **8g** for the interface **fc-0/0/3**:

   ```
   [edit]
   user@switch: set interfaces fc-0/0/3 fibrechannel-options speed 8g
   ```

   The default port mode is **auto-negotiation**, which sets the port speed to match the speed of the attached FC F_Port interface (2 Gbps, 4 Gbps, or 8 Gbps).

3. Configure the optional buffer-to-buffer credit state change number:

   ```
   [edit]
   user@switch: set interfaces interface-name fibrechannel-options bb-sc-n 0..15
   ```

   For example, to set the FC interface buffer-to-buffer credit state change number to **8** for the interface **fc-0/0/3**:

   ```
   [edit]
   user@switch: set interfaces fc-0/0/3 fibrechannel-options bb-sc-n 8
   ```

After you configure one or more FC interfaces, assign them and an FCoE VLAN to an FC fabric.

Configuring an FCoE VLAN Interface

When you configure the switch as an FCoE-FC gateway, a Layer 3 FCoE VLAN interface transmits and receives Fibre Channel over Ethernet (FCoE) traffic between the gateway and FCoE-capable servers on the Ethernet network. Configuring a Layer 3 FCoE VLAN interface on the switch creates virtual fabric port (VF_Port) interfaces facing the FCoE server virtual node ports (VN_Ports).

The FCoE VLAN interface is the interface for the dedicated VLAN the FCoE servers use for FCoE traffic. Each FC fabric requires at least one dedicated FCoE VLAN and at least one Layer 3 FCoE VLAN interface to transport FCoE traffic. On QFabric systems, the FCoE VLAN interface, the FCoE VLAN, and the interfaces that are members of the FCoE VLAN must be on the same Node device.

NOTE: **FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.**

Before you configure an FCoE VLAN interface, create the FCoE VLAN and assign 10-Gigabit Ethernet interfaces configured in tagged-access port mode to the VLAN. These 10-Gigabit Ethernet interfaces are the physical interfaces that transport the FCoE traffic to and from the FCoE devices in the Ethernet network.

Each Ethernet interface that connects to FCoE devices must also include the native VLAN to transport FIP traffic, because FIP VLAN discovery and notification frames are exchanged as untagged packets. The FCoE VLAN must carry only FCoE traffic. A VLAN cannot transport a mix of FCoE and standard Ethernet traffic.

FCoE VLAN interface configuration includes:

- Configuring a VLAN to use as a dedicated FCoE VLAN.
- Configuring a native VLAN for FIP traffic.
- Configuring member interfaces for the FCoE VLAN.
- Configuring the FCoE VLAN as a Fibre Channel (family) VLAN and setting the port mode value to **f-port**. Explicitly configuring the FCoE VLAN interface in F_Port mode is mandatory. The switch interface with which the FCoE server VN_Ports communicate must present a VF_Port to the servers.
- Configuring the FCoE VLAN interface as the Layer 3 interface for FCoE traffic.

To configure an FCoE VLAN interface:

1. Configure a dedicated FCoE VLAN:

   ```
   [edit vlans]
   user@switch# set vlan-name vlan-id vlan-id
   ```

   For example, to configure a VLAN named **fcoe_vlan** with a VLAN ID of **100** as the FCoE VLAN:

   ```
   [edit vlans]
   user@switch# set fcoe_vlan vlan-id 100
   ```

2. Configure a native VLAN for FIP traffic:

   ```
   [edit vlans]
   user@switch# set native vlan-id vlan-id
   ```

   For example, to configure the native VLAN with a VLAN ID of **1**:

   ```
   [edit vlans]
   user@switch# set native vlan-id 1
   ```

3. Configure member interfaces for the FCoE VLAN (use **ethernet-switching** as the family and **tagged-access** as the port mode):

   ```
   [edit interfaces]
   user@switch# set interface-name unit unit family family port-mode mode vlan members
   vlan-name
   ```

   For example, to configure the interface **xe-0/0/10** as a member of the FCoE VLAN **fcoe_vlan**:

   ```
   [edit interfaces]
   user@switch# set xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access vlan
   members fcoe_vlan
   ```

4. Assign member interfaces to the native VLAN:

   ```
   [edit interfaces]
   user@switch# set interface-name unit unit family family native-vlan-id vlan-id
   ```

   For example, to configure the interface **xe-0/0/10** as a member of the native VLAN with the native VLAN ID **1**:

   ```
   [edit interfaces]
   user@switch# set xe-0/0/10 unit 0 family ethernet-switching native-vlan-id 1
   ```

5. Assign the Ethernet interfaces to the FCoE VLAN:

   ```
   [edit vlans]
   user@switch# set vlan-name interface interface-name
   ```

   For example, to assign the interface **xe-0/0/10.0** to the FCoE VLAN named **fcoe_vlan**:

   ```
   [edit vlans]
   user@switch# set fcoe_vlan interface xe-0/0/10.0
   ```

6. Define an interface as an FCoE VLAN interface in F_Port mode (to present a VF_Port to the FCoE servers):

   ```
   [edit interfaces]
   user@switch# set vlan unit unit family fibre-channel port-mode f-port
   ```

   For example, to configure VLAN unit **100** as an FCoE VLAN interface and set the port mode to **f-port**:

   ```
   [edit interfaces]
   user@switch# set vlan unit 100 family fibre-channel port-mode f-port
   ```

7. Define the Layer 3 FCoE VLAN interface:

```
[edit vlans]
user@switch# set vlan-name l3-interface vlan-interface-name
```

For example, to configure VLAN interface unit **100** (the FCoE VLAN interface defined earlier in this example) as the Layer 3 FCoE VLAN interface for FCoE VLAN **fcoe_vlan**:

```
[edit vlans]
user@switch# set fcoe_vlan l3-interface vlan.100
```

Assigning Interfaces to a Fibre Channel Fabric

When you configure the switch as an FCoE-FC gateway, you assign one or more (up to 12) native Fibre Channel (FC) interfaces and at least one FCoE VLAN interface to each FC fabric. FC interfaces transport native FC traffic between the proxy gateway and the storage area network (SAN) FC switch. FCoE VLAN interfaces transport FCoE traffic between FCoE-capable servers and the gateway.

Each FC fabric needs both types of interfaces to transport traffic between FCoE servers on the Ethernet network and FC storage devices in the core FC network behind the FC switch. FCoE traffic between the FCoE servers and the gateway must travel in a dedicated FCoE VLAN. Native FC traffic passes between the gateway and the FC switch on the native FC interfaces.

You must configure the FC interfaces and the FCoE VLAN interfaces that you assign to a particular fabric on the same Juniper Networks QFX3500 Switch. Traffic between an FCoE device and the FC switch must ingress and egress the same gateway.

To assign core-facing native FC interfaces and a server-facing FCoE VLAN interface to an FC fabric, configure a fabric and then specify the interfaces:

1. Assign the native FC interfaces to the FC fabric:

   ```
   [edit fc-fabrics fabric-name]
   user@switch: set interface interface-name
   user@switch: set interface interface-name
   user@switch: set interface interface-name
   ...
   ```

2. Assign an FCoE VLAN interface to the FC fabric:

   ```
   [edit fc-fabrics fabric-name]
   user@switch: set interface vlan-name
   ```

For example, to assign the native FC interfaces **fc-0/0/0.0**, **fc-0/0/1.0**, and **fc-0/0/2.0** and the FCoE VLAN interface **vlan.100** to an FC fabric named **san_tana**:

```
user@switch: set fc-fabrics san_tana interface fc-0/0/0.0
user@switch: set fc-fabrics san_tana interface fc-0/0/1.0
user@switch: set fc-fabrics san_tana interface fc-0/0/2.0
user@switch: set fc-fabrics san_tana interface vlan.100
```

Deleting a Fibre Channel Interface

Before you delete a Fibre Channel (FC) interface, you must first delete the interface from the FC fabric configuration. This prevents configuration errors that would result if you deleted an FC interface from the **[edit interfaces]** hierarchy level but did not delete the interface from the FC fabric.

When you configure the switch as an FCoE-FC gateway, FC interfaces transmit and receive native FC traffic between the gateway and the FC switch. You can configure ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create one or two blocks of six native FC interfaces.

To delete an FC interface using the CLI:

1. Delete the FC interface from the FC fabric to which it belongs:

   ```
   [edit]
   user@switch# delete fc-fabrics fabric-name interface interface-name
   ```

   For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

   ```
   [edit]
   user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
   ```

2. Delete the FC interface from the switch **[edit interfaces]** hierarchy:

   ```
   [edit]
   user@switch: delete interfaces interface-name
   ```

   For example, to delete the interface **fc-0/0/3.0** from the switch:

   ```
   [edit]
   user@switch: delete interfaces fc-0/0/3.0
   ```

The FC interface has been deleted from the FC fabric and from the switch.

Disabling Storm Control on FCoE Interfaces on an FCoE-FC Gateway

Storm control is not supported on the FCoE interfaces of an FCoE-FC gateway VLAN. Enabling storm control on an FCoE-FC gateway VLAN interface may cause FCoE packet loss. Storm control is disabled by default on all interfaces. However, if you enabled storm control globally on all switch interfaces or on any interfaces that are part of the FCoE VLAN interface, you must disable storm control on the Ethernet interfaces of the FCoE VLAN.

If storm control is enabled on only a few interfaces of the FCoE VLAN, you can disable storm control on individual interfaces by including the **set ethernet-switching-options storm-control interface *interface-name*** statement in the configuration, where ***interface-name*** is the name of the interface on which you want to disable storm control.

If storm control is enabled globally on the switch when the switch is acting as an FCoE-FC gateway, it is often easiest to disable storm control on all interfaces, then enable storm control only on Ethernet interfaces that are not part of the FCoE VLAN interface.

If storm control is enabled globally, you can disable storm control in either of two ways:

- Disable storm control on all interfaces, then enable storm control on the interfaces you want to use storm control. (From the default configuration, you cannot disable storm control on individual interfaces because the default configuration enables storm control on **all** interfaces, not on individual interfaces.)

  For example, if you want interfaces xe-0/0/20, xe-0/0/21, and xe-0/0/22 to use storm control, disable storm control on all interfaces, then enable storm control on those three interfaces:

  1. Disable storm control on all interfaces:

     ```
     user@switch# delete ethernet-switching-options storm-control interface all
     ```

  2. Enable storm control on interfaces xe-0/0/20, xe-0/0/21, and xe-0/0/22:

     ```
     user@switch# set ethernet-switching-options storm-control interface xe-0/0/20
     user@switch# set ethernet-switching-options storm-control interface xe-0/0/21
     user@switch# set ethernet-switching-options storm-control interface xe-0/0/22
     ```

- Disable storm control for all unknown unicast traffic on all interfaces by including the following statement in your configuration:

  ```
  user@switch# set ethernet-switching-options storm-control interface all no-unknown-unicast
  ```

Defining the Proxy Load-Balancing Algorithm

When the QFX Series is configured as an FCoE-FC gateway, it balances the FCoE session load assigned to each NP_Port link between the gateway and the FC switch in the FC SAN to avoid overloading or underutilizing each link. The QFX Series supports three types of load-balancing mechanisms:

- Simple load balancing—Load balancing is based on the weighted utilization (session load) of the NP_Ports connected to an FC fabric. The session load is the sum of the FLOGI and FDISC sessions on each link. Each new ENode fabric login (FLOGI) or VN_Port fabric discovery (FDISC) session is assigned to the least-loaded link, so an FDISC session initiated by the VN_Port on an ENode might not be assigned to the same link as the parent ENode's FLOGI session. Simple load balancing is the default algorithm. Simple load balancing is the default load-balancing algorithm. Rebalancing the link load disrupts only selected sessions to minimize the impact (the switch uses an algorithm to log out only the sessions that need to be moved to other links to balance the load when those sessions log in again).
- ENode-based load balancing—Load balancing is based on the weighted utilization (session load) of the NP_Ports connected to an FC fabric. The session load is the sum of the FLOGI and FDISC sessions on each link. However, when an ENode logs in to the fabric, the switch places all subsequent VN_Port FDISC sessions associated with that ENode on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. The switch calculates the link load based on the combined total of FLOGIs and FDISCs on each NP_Port link. Rebalancing the link load disrupts all sessions (all sessions log out and then log in again).
- FLOGI-based load balancing—Load balancing is based on the weighted utilization (session load) of the NP_Ports connected to an FC fabric. The session load is the sum of the FLOGI sessions on each link. FDISC sessions are not counted. When an ENode logs in to the fabric, the switch places all subsequent VN_Port FDISC sessions associated with that ENode on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. Rebalancing the link load disrupts only selected sessions to minimize the impact (the switch uses an algorithm to log out only the sessions that need to be moved to other links to balance the load when those sessions log in again).

To define the proxy load-balancing algorithm for a proxy fabric on the FCoE-FC gateway, set the algorithm as **enode-based**, **simple**, or **flogi-based**:

- `[edit fc-fabrics` *`fabric-name`* `proxy]`
  `user@switch#` **set load-balance-algorithm (enode-based | simple | flogi-based)**

  For example, to configure a gateway fabric named **san_fab1** to use **enode-based** load balancing:

  `user@switch#` **set fc-fabrics san_fab1 proxy load-balance-algorithm enode-based**

Simulating On-Demand Fibre Channel Link Load Rebalancing (Dry Run Test)

On-demand Fibre Channel (FC) link load rebalancing is a disruptive action that causes sessions to log out of the network, then log back in to be placed on FC links (NP_Ports) in a balanced manner. The number of sessions logged out to rebalance the links depends on the load-balancing algorithm used (simple, ENode-based, or FLOGI-based) and whether or not the load is already balanced. (If the link load is already balanced, the switch does not rebalance the loads when you request on-demand load rebalancing.)

You can use the **dry-run** option to list the sessions that might be affected (logged out to be redistributed among the active FC interface links) by on-demand load rebalancing *before* you actually rebalance the link load. (Because new sessions might log in between the time you perform a dry run and the time you request on-demand load rebalancing, the affected sessions may change. Therefore, the sooner that you perform an on-demand load rebalance after you perform a dry run, the more accurate the dry run results are likely to be.)

To request a link load rebalancing dry run:

```
user@switch> request fibre-channel proxy load-rebalance dry-run fabric fabric-name
```

For example, to request a dry run on an FC fabric named *fc_fabric_100* to display a list of sessions that might be disrupted if you request an actual link load rebalance:

```
user@switch> request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
F-Port                          FCID     Port-WWN                 NP-Port
vlan.100                        0x8a013a 02:01:00:64:00:00:00:2a fc-0/0/1.0
vlan.100                        0x8a013c 02:01:00:64:00:00:00:2b fc-0/0/1.0
vlan.100                        0x8a0146 02:01:00:64:00:00:00:2e fc-0/0/1.0
vlan.100                        0x8a014c 02:01:00:64:00:00:00:2f fc-0/0/1.0
```

Enabling and Disabling CoS OxID Hash Control

The originator exchange identifier (OxID) field is one of several fields that the switch can use in its hash function computation for FCoE traffic load balancing over multiple outgoing links. You can configure whether or not the switch uses the OxID in the hash computation.

Including the OxID field in the load-balancing hash computation allows different exchanges between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) to take different paths across the network, thus improving the aggregate network throughput.

However, if the paths between different sets of FC endpoints have common links, congestion on one set of FC endpoints can affect the other set of endpoints. Such congestion can happen if the FCoE traffic on the two sets of endpoints uses the same priority (IEEE 802.1p code point). It is common for networks to use priority 3 (IEEE 802.1p code point 011) for FCoE traffic. However, on the QFX3500, you can assign different IEEE priorities to different lossless FCoE flows as described in "Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows" on page 5506 to further separate the traffic flows.

OxID hash control is enabled by default.

- To enable OxID hash control field for FCoE traffic load balancing:

```
[edit forwarding-options hash-key]
user@switch# set family fcoe oxid enable
```

- To disable OxID hash control field for FCoE traffic load balancing:

```
[edit forwarding-options hash-key]
user@switch# set family fcoe oxid disable
```

Configuring FIP on an FCoE-FC Gateway

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) establishes and maintains Fibre Channel (FC) virtual links between pairs of FCoE devices. A virtual link emulates the physical point-to-point link that FC requires between two FC devices.

FIP is enabled by default and uses the default FIP settings on all FCoE interfaces that are part of the gateway FC fabric. You can use the default FIP parameter values, or you can configure FIP parameters globally or on a per-interface basis. Configuring FIP on an individual interface overrides the global FIP configuration.

You can configure the following parameters globally for the fabric and per interface:

- FIP keepalive message transmission interval—This interval is the time period between sending FIP keepalive messages.

- Priority—If an FCoE node (ENode) connects to more than one switch, the priority value determines the switch to which the ENode connects. The switch with the lowest priority number has the highest priority.

You can only configure the following parameters globally on an FC fabric:

- FC-MAP—The 24-bit FCoE mapped address prefix that identifies the attached FC switch in the SAN fabric. The FC-MAP value is used in the fabric provided MAC address (FPMA) created for each ENode that logs in. This value must be the same for the FC switch and the QFX Series.

  

  NOTE: Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

- FCoE trusted—You can globally configure all of the Ethernet ports in a specified FC fabric to be FCoE trusted. You might want to configure interfaces as FCoE trusted if the interfaces are connected to a transit switch that is performing FIP snooping. For interfaces that are directly connected to FCoE hosts, FIP snooping should be enabled, and you should not configure the fabric as FCoE trusted.

  

  NOTE: Do not configure interfaces with FIP snooping enabled as FCoE trusted.

  Configuring interfaces as FCoE trusted reduces system overhead by eliminating the need for filters. The total number of sessions the system can support is 2500 sessions. Sessions are defined as the combined number of VN_Port to VF_Port sessions and VN_Port to VN_Port sessions. (Although VN2VF and VN2VN sessions run in different FCoE VLANs, the session limit is a system limit, not a per-VLAN limit.)

  

  NOTE: A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions. There is no limit to the number of end-to-end storage sessions.

  

  NOTE: Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN_Ports log in again, the switch can build the appropriate FIP snooping filters.

- Maximum number of FCoE sessions per ENode—You can globally configure the maximum number of FCoE sessions (FLOGI plus FDISC) permitted from an ENode. The maximum number of sessions per ENode is 2000 sessions. The total number of sessions (VN2VF_Port sessions and VN2VN_Port sessions combined) cannot exceed the gateway fabric's maximum limit of 2500 sessions.

To configure FIP options globally using the CLI:

1. Specify the fabric on which you want to configure FIP:

   ```
   [edit]
   user@switch# set fc-fabrics fabric-name protocols fip
   ```

2. Configure the FIP keepalive message transmission interval in milliseconds to specify the amount of time between periodic FIP discovery advertisements for the fabric interfaces (the default is 8000 ms; the range is 250 through 90000 ms):

   ```
   [edit fc-fabrics fabric-name protocols fip]
   user@switch# set fka-adv-period milliseconds
   ```

3. Configure the priority value the switch advertises to ENodes in the range from 0 through 255; the default value is 128:

   ```
   [edit fc-fabrics fabric-name protocols fip]
   user@switch# set priority priority
   ```

4. Configure the FC-MAP value to match the FC-MAP value of the attached FC switch in the FC SAN fabric; the range of possible values is 0EFC00 through 0EFCFF, and the default value is 0EFC00:

   ```
   [edit fc-fabrics fabric-name protocols fip]
   user@switch# set fc-map fc-map
   ```

5. Configure the interfaces in the FC fabric as FCoE trusted (in this example, we assume that the interfaces have not been enabled for FIP snooping):

   ```
   [edit fc-fabrics fabric-name protocols fip]
   user@switch# set fcoe-trusted
   ```

6. Configure the maximum number of FCoE sessions for each ENode in the fabric:

   ```
   [edit fc-fabrics fabric-name protocols fip]
   user@switch# set max-sessions-per-enode
   ```

For example, to configure all FCoE interfaces associated with an FC fabric called **movieco_san** with a FIP keepalive interval value of **25000** milliseconds, a priority of **70**, an FC-MAP value of **0EFC01**, as FCoE trusted, and with a maximum number of FCoE sessions per ENode of 200 sessions:

```
[edit fc-fabrics movieco_san protocols fip]
user@switch# set fka-adv-period 25000
user@switch# set priority 70
user@switch# set fc-map 0EFC01
user@switch# set fcoe-trusted
user@switch# set max-sessions-per-enode 200
```

To override the global FC fabric FIP configuration for a specific FCoE interface using the CLI:

1. Specify the fabric and interface on which you want to configure FIP:

   ```
   [edit fc-fabrics fabric-name protocols fip interface interface-name]
   ```

2. Configure the FIP keepalive message transmission interval and priority:

   ```
   [edit fc-fabrics fabric-name protocols fip interface interface-name]
   user@switch# set fka-adv-period milliseconds
   user@switch# set priority priority
   ```

Setting the Maximum Number of FIP Login Sessions per ENode

When the switch acts as an FCoE-FC gateway, FCoE node (ENode) devices in the Ethernet network use the gateway to connect to the Fibre Channel (FC) storage area network (SAN). You can limit the maximum number of FIP login sessions permitted on each ENode. Limiting the number of login sessions can prevent login session rejections caused when the connected FC switch port configuration limits the number of FIP login sessions.

The maximum number of FIP sessions per ENode is 2000 sessions (FLOGI plus FDISC sessions). The limit you set applies to every ENode in the specified gateway fabric. Each ENode in the fabric can have up to the maximum number of sessions, but the total number of active sessions cannot exceed the session limits you apply to the fabric or the Node device.

There are also configurable FIP login session limits that you can apply to the gateway FC fabric, to the QFX3500 switch or QFabric system Node device, and to the interfaces in each FC fabric.

- To set a maximum number of FIP login sessions per ENode using the CLI:

  ```
  [edit fc-fabrics fc-fabric-name protocols fip]
  user@switch# set max-sessions-per-enode max-login-sessions
  ```

  For example, to configure the ENodes on an FC fabric named **sanfab1** with a maximum FIP login session limit of **250** sessions:

  ```
  [edit fc-fabrics sanfab1]
  user@switch# set protocols fip max-sessions-per-enode 250
  ```

Setting the Maximum Number of FIP Login Sessions per FC Interface

When the switch acts as an FCoE-FC gateway, NP_Ports are the native FC interfaces the gateway uses to connect to the FC switch. You can limit the maximum number of FIP login sessions permitted on an NP_Port interface. Limiting the number of login sessions on an interface can prevent login session rejections caused when the connected FC switch port configuration limits the number of FIP login sessions.

TIP: A good practice is to configure a maximum number of login sessions on each NP_Port that is less than or equal to the maximum number of login sessions permitted on the connected FC switch port.

The maximum number of FIP sessions is 2500 sessions. (This is the combined total of all VN2VF_Port and VN2VN_Port sessions on the system.)

There are also configurable FIP login session limits that you can apply to the gateway FC fabric, to the QFX3500 switch or QFabric system Node device, and to the ENodes in each FC fabric. To prevent unexpected FIP login rejections, the sum of the maximum FIP login sessions on all of the NP_Port interfaces that belong to an FC fabric should not exceed the maximum number of sessions the FC fabric supports or the device supports.

- To set a maximum number of FIP login sessions on an NP_Port using the CLI:

  ```
  [edit fc-fabrics fc-fabric-name interface interface-name]
  user@switch# set max-login-sessions max-login-sessions
  ```

  For example, to configure NP_Port interface **fc-0/0/5** with a maximum FIP login session limit of **500** sessions on an FC fabric named **sanfab1**:

  ```
  [edit fc-fabrics sanfab1]
  user@switch# set interface fc-0/0/5 max-login-sessions 500
  ```

- Understanding Interfaces on an FCoE-FC Gateway on page 4996

Setting the Maximum Number of FIP Login Sessions per FC Fabric

When the QFX Series acts an FCoE-FC gateway, you configure at least one local FC fabric on the gateway. A gateway FC fabric creates associations that connect FCoE devices on an Ethernet network to an FC switch on a Fibre Channel network. Each FC fabric on a gateway includes native FC interfaces (NP_Ports) that connect the gateway to the FC switch. When FCoE devices want to log in to the FC switch, the gateway sends the FIP login requests to the FC switch on the NP_Port links.

You can limit the maximum number of FIP login sessions permitted on a gateway FC fabric. If a QFX3500 switch or QFabric system Node device has more than one FC fabric, limiting the number of login sessions on an FC fabric can prevent one FC fabric from using all of the login sessions available on the device.

The maximum number of FIP sessions is 2500 sessions. (This is the combined total of all VN2VF_Port and VN2VN_Port sessions on the system.)

There are also configurable FIP login session limits that you can apply to the FC fabric NP_Port interfaces, to the QFX3500 switch or QFabric system Node device, and to the ENodes in each FC fabric. To prevent unexpected FIP login rejections:

- The sum of the maximum FIP login sessions on all of the NP_Port interfaces that belong to an FC fabric should not exceed the maximum number of sessions the FC fabric supports or the device supports.
- The sum of the maximum FIP login sessions on all of the FC fabrics on a device should not exceed the maximum number of sessions per device.
- To set a maximum number of FIP login sessions on an FC fabric using the CLI:

  ```
  [edit fc-fabrics fc-fabric-name]
  user@switch# set max-login-sessions max-login-sessions
  ```

  For example, to configure an FC fabric named **sanfab1** with a maximum FIP login session limit of **2000** sessions:

  ```
  [edit fc-fabrics sanfab1]
  user@switch# set fc-fabrics sanfab1 max-login-sessions 2000
  ```

- Understanding Interfaces on an FCoE-FC Gateway on page 4996

Setting the Maximum Number of FIP Login Sessions per Node Device

When a QFX3500 switch or QFabric system Node device acts an FCoE-FC gateway, it connects FCoE devices on an Ethernet network to an FC switch in a Fibre Channel network. You can limit the maximum number of FIP login sessions for the FCoE devices on each Node device.

For QFX3500 switches, the maximum limit means that the sum of the FIP login sessions on all of the local FC fabrics on that QFX3500 switch cannot exceed the device maximum.

For the QFabric system, the limit applies to each Node device in the QFabric system. For example, if you configure a maximum FIP login session value of 2000 sessions, each Node device in the QFabric system can have a total of up to 2000 FIP login sessions running on its FC fabrics.

The maximum number of FIP sessions a device can support is 2500 sessions. (This is the combined total of all VN2VF_Port and VN2VN_Port sessions on the system.)

There are also configurable FIP login session limits that you can apply to the FC fabrics on the devices, to the NP_Port interfaces in each FC fabric, and to the ENodes in each FC fabric. To prevent unexpected FIP login rejections:

- The sum of the maximum FIP login sessions for all of the FC fabrics on a device should not exceed the maximum number of sessions per device.
- The sum of the maximum FIP login sessions on all of the NP_Port interfaces that belong to an FC fabric should not exceed the maximum number of sessions the FC fabric supports or the device supports.
- To set a maximum number of FIP login sessions for Node devices using the CLI:

  ```
  [edit fc-options]
  user@switch# set max-login-sessions-per-node max-login-sessions-per-node
  ```

  For example, to configure a maximum FIP login limit of **2000** sessions on a QFX3500 switch or on all Node devices in a QFabric system:

  ```
  [edit fc-options]
  user@switch# set max-login-sessions-per-node 2000
  ```

Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch

VN_Port to VF_Port (VN2VF_Port) Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping uses information gathered during FIP discovery and login to create firewall filters that provide security against unauthorized access to the FC switch or FCoE forwarder (FCF) through the EX4500 or QFX Series when the switch is acting as an FCoE transit switch. The firewall filters allow only FCoE devices that succeed at logging in to the FC fabric to access the FCF through the transit switch. VN2VF_Port FIP snooping provides security for the point-to-point virtual links that connect host FCoE Nodes (ENodes) and FCFs in the FCoE VLAN by denying access to any device that does not successfully log in to the FCF.

VN2VF_Port FIP snooping is disabled by default. You enable VN2VF_Port FIP snooping on a per-VLAN basis for VLANs that carry FCoE traffic. Ensure that a VLAN that carries FCoE traffic carries only FCoE traffic, because enabling VN2VF_Port FIP snooping denies access for all other Ethernet traffic.

NOTE: All of the transit switch ports are untrusted by default. If an ENode on an FCoE device logs in to an FCF before you enable VN2VF_Port FIP snooping on the VLAN and you then enable VN2VF_Port FIP snooping, the transit switch denies traffic from the ENode because the transit switch has not snooped (learned) the ENode state. The following process automatically logs the ENode back in to the FCF to reestablish the connection:

1. VN2VF_Port FIP snooping is enabled on an FCoE VLAN on the switch.
2. The switch denies existing connections between servers and the FCF on the FCoE VLAN by filtering the FCoE traffic and FIP traffic, so no keepalive messages from the ENodes reach the FCF.
3. The FCF port timer for each ENode and for each VN_Port on each ENode expires.
4. The FCF sends each ENode whose port timer has expired a Clear Virtual LInks (CVL) message.
5. The CVL message causes the ENode to log in again.

Because the FCF is a trusted source, you configure interfaces that connect to the FCF as trusted interfaces. VN2VF_Port FIP snooping continues to run on trusted interfaces so that the switch learns the FCF state.

NOTE: Do not configure ENode-facing interfaces both with FIP snooping enabled and as trusted interfaces. FCoE VLANs with interfaces that are directly connected to FCoE hosts should be configured with FIP snooping enabled and the interfaces should not be trusted interfaces. Ethernet interfaces that are connected to an FCF should be configured as trusted interfaces and should not have FIP snooping enabled. Interfaces that are connected to a transit switch that is performing FIP snooping can be configured as trusted interfaces if the FCoE VLAN is not enabled for FIP snooping.

Optionally, you can specify an FC-MAP value for each FCoE VLAN. On a given FCoE VLAN, the switch learns only FCFs that have a matching FC-MAP value. The default FC-MAP value is 0EFC00h for all FC devices. (Enter hexadecimal values for FC-MAP preceded by the hexadecimal indicator "0x"—for example, 0x0EFC00.) If you change the FC-MAP value of an FCF, change the FC-MAP value for the FCoE VLAN it belongs to on the switch and on the servers you want to communicate with the FCF. An FCoE VLAN can have one and only one FC-MAP value.

To enable VN2VF_Port FIP snooping:

- To enable VN2VF_Port FIP snooping on a single VLAN and specify the optional FC-MAP value:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan vlan-name examine-fip fc-map fc-map-value
  ```

  For example, to enable VN2VF_Port FIP snooping on a VLAN named **san1_vlan** and change the FC-MAP value to **0x0EFC03**:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan san1_vlan examine-fip fc-map 0x0EFC03
  ```

  NOTE: Changing the FC-MAP value causes all logins to drop and forces ENodes to log in again.

- To enable VN2VF_Port FIP snooping on all VLANs and use the default FC-MAP value:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan all examine-fip
  ```

- To configure an interface as a trusted interface:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set interface interface-name fcoe-trusted
  ```

  For example, to configure interface **xe-0/0/30** as a trusted interface:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set interface xe-0/0/30 fcoe-trusted
  ```

Related Documentation

- *Understanding FIP Snooping*

- Understanding VN_Port to VF_Port FIP Snooping on an FCoE Transit Switch on page 5025

Disabling VN2VF_Port FIP Snooping on an FCoE-FC Gateway Switch Interface

When the switch acts an FCoE-FC gateway, the FCoE-network-facing Ethernet interfaces in the FCoE VLAN are automatically enabled for VN_Port to VF_Port (VN2VF_Port) FIP snooping. You can disable VN2VF_Port FIP snooping on an individual Ethernet interface or you can disable VN2VF_Port FIP snooping globally for all Ethernet interfaces in a gateway Fibre Channel (FC) fabric.

Disable VN2VF_Port FIP snooping on an Ethernet interface by configuring it as an FCoE trusted interface. Disable VN2VF_Port FIP snooping on all Ethernet interfaces in an FC fabric by configuring the FC fabric as FCoE trusted.

Do not disable VN2VF_Port FIP snooping on an interface unless you are certain that the interface is connected to a trusted device. Do not disable VN2VF_Port FIP snooping on an FC fabric unless all of the FCoE-network-facing interfaces in the fabric are either connected to a transit switch that is performing VN2VF_Port FIP snooping on the FCoE devices as they log in to the FC network or all of the interfaces are connected to trusted devices.

VN2VF_Port FIP snooping installs firewall filters that block FIP and FCoE frames from sources that have not logged in to the switch and prevents unauthorized access to the network. Disabling VN2VF_Port FIP snooping disables these firewall filters and permits access to all FIP and FCoE frames transported on that interface.

- To disable VN2VF_Port FIP snooping on an FCoE-device-facing Ethernet interface in an FCoE VLAN, configure that interface as a trusted interface:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set interface interface-name fcoe-trusted
  ```

  For example, to configure interface **xe-0/0/7** as a trusted FC interface:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set interface xe-0/0/7 fcoe-trusted
  ```

- To disable VN2VF_Port FIP snooping on all FCoE-device-facing interfaces in a gateway FC fabric, configure that fabric as a trusted fabric:

  ```
  [edit]
  user@switch# set fc-fabrics fabric-name protocols fip fcoe-trusted
  ```

  For example, to configure an FC fabric named *santastic* as an FCoE trusted fabric:

  ```
  [edit]
  user@switch# set fc-fabrics santastic protocols fip fcoe-trusted
  ```

Enabling VN2VN_Port FIP Snooping and Configuring the Beacon Period on an FCoE Transit Switch

VN_Port to VN_Port (VN2VN_Port) FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN_Port FIP snooping is conceptually similar to VN2VF_Port FIP snooping between VN_Ports and VF_Ports, but VN2VN_Port FIP snooping does not require traffic between VN_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN_Port communicates transparently through the transit switch on a virtual link that emulates a direct connection to the VN_Port at the other end of the virtual link.

VN2VN_Port FIP snooping is disabled by default. You enable VN2VN_Port FIP snooping on a per-VLAN basis on VLANs that carry VN2VN_Port FCoE traffic. Ensure that the VLAN carries only FCoE traffic between VN_Ports, because enabling VN2VN_Port FIP snooping denies access for all other traffic, including VN2VF_Port FIP snooping traffic.

All ENodes that you want to communicate using VN2VN_Port FIP snooping must use an FCoE VLAN dedicated to VN2VN_Port traffic. You cannot mix VN2VN_Port FIP snooping traffic with VN2VF_Port FIP snooping traffic in the same FCoE VLAN.

NOTE: An FCoE VLAN can support either VN2VF_Port FIP snooping or VN2VN_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF_Port FIP snooping traffic and for VN2VN_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN_Port FIP snooping VLANs, VN2VF_Port traffic is dropped.

The *beacon period* is conceptually similar to the FIP keepalive period (timer) for VN2VF_Port FIP snooping virtual link maintenance. The beacon period performs virtual link maintenance for VN2VN_Port FIP snooping. It is the time interval between messages that verify the connection is still valid and the device at the other end of the virtual link is still reachable. You set the beacon period value for each FCoE VLAN that you configure to do VN2VN_Port FIP snooping.

NOTE: In addition to enabling VN2VN_Port FIP snooping and configuring the beacon period, you must also configure a dedicated FCoE VLAN for the VN2VN_Port traffic, and set the FCoE transit switch ports in the proper port mode and trusted or untrusted state (interfaces are untrusted by default). See the VN2VN_Port FIP snooping configuration example topics for complete configurations of several common network topologies.

To enable VN2VN_Port FIP snooping and set the beacon period on an FCoE VLAN that is dedicated to VN2VN_Port traffic:

- ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan vlan-name examine-fip examine-vn2vn beacon-period milliseconds
  ```

  For example, to enable VN2VN_Port FIP snooping on a VLAN named **vlan200** and set the beacon period to **90000** milliseconds:

  ```
  [edit ethernet-switching-options secure-access-port]
  user@switch# set vlan vlan200 examine-fip examine-vn2vn beacon-period 90000
  ```

Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. QFX Systems support three DCBX modes:

- Autonegotiation—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- IEEE DCBX—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- DCBX Version 1.01—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric Node devices come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

NOTE: QFX Systems do not support pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00. If a QFX Series interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

  ```
  [edit protocols dcbx]
  user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |
  dcbx-version-1.01)
  ```
  ```

For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

```
user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
```

To configure IEEE DCBX on all interfaces:

```
user@switch# set protocols dcbx interface all mode ieee-dcbx
```

Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default

forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as “willing”).

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

NOTE: If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as "FCoE down" and disables FCoE on the interface.

When DCBX marks an interface as "FCoE down," the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as "FCoE down."

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

   ```
   [edit]
   user@switch# set protocols dcbx interface interface-name priority-flow-control
   no-auto-negotiation
   ```

2. Turn off autonegotiation for applications.

   ```
   [edit]
   user@switch# set protocols dcbx interface interface-name applications no-auto-negotiation
   ```

3. Turn off autonegotiation for ETS.

   ```
   [edit]
   user@switch# set protocols dcbx interface interface-name enhanced-transmission-selection
   no-auto-negotiation
   ```

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- `[edit protocols dcbx interface interface-name]`
  `user@switch# set enhanced-transmission-selection no-recommendation-tlv`

Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

NOTE: **Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.**

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is "willing," the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- `[edit protocols dcbx interface` *`interface-name`*`]`
  `user@switch#` **set enhanced-transmission-selection no-recommendation-tlv**

Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

  ```
  [edit applications]
  user@switch# set application application-name ether-type ether-type
  ```

  For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

  ```
  user@switch# set applications application ptp ether-type 0x88F7
  ```

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

  ```
  [edit]
  user@switch# set applications application application-name protocol (tcp | udp)
  destination-port port-value
  ```

  For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

  ```
  user@switch# set applications application iscsi protocol tcp destination-port 3260
  ```

Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

  ```
  [edit policy-options]
  user@switch# set application-maps application-map-name application application-name
  code-points [ aliases ] [ bit-patterns ]
  ```

  For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

  ```
  user@switch# set policy-options application-maps ptp-app-map application ptp code points
  [ 001 101 ]
  ```

beacon-period

Syntax beacon-period *milliseconds*

Hierarchy Level [edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip examine-vn2vn]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Set the interval between periodic beacons. Beacons perform virtual link maintenance for VN_Ports in a way that is similar to FIP keepalive advertisements.

The ENode sends periodic beacons every 90 seconds on behalf of the VN_Port. Each received beacon resets the session timer for the virtual link connection to the other VN_Port. If the FCF does not receive a beacon before the beacon timer expires, the VN_Port is considered as “down” and the virtual link is terminated. The beacon timer expires in 2.5 times the configured beacon timer value.

Options *milliseconds*—Time in milliseconds between beacons.

Range: 250 through 90000 milliseconds

Default: 8000 milliseconds

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

code-points (Application Maps)

Syntax code-points [*aliases*] [*bit-patterns*];

Hierarchy Level [edit policy-options application-maps *application-map-name* application *application-name*]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Define one or more code-point aliases or bit sets for an application.

Options ***aliases***—Name of the alias or aliases.

bit-patterns—Value of the code-point bits, in decimal form.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

dcbx

Syntax

```
dcbx {
  disable;
  interface (interface-name | all) {
    disable;
    application-map application-map-name;
    applications {
      no-auto-negotiation;
    }
    enhanced-transmission-selection {
      no-auto-negotiation;
      no-recommendation-tlv;
      recommendation-tlv {
        no-auto-negotiation;
      }
    }
    dcbx-version (auto-negotiate | ieee-dcbx | dcbx-version-1.01);
    priority-flow-control {
      no-auto-negotiation;
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.
mode and **recommendation-tlv** statements introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure DCBX properties.

Options The statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

dcbx-version

Syntax dcbx-version (auto-negotiate | ieee-dcbx | dcbx-version-1.01);

Hierarchy Level [edit protocols dcbx interface (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Set the DCBX version for the specified interface or interfaces.

QFX3500 switches come up in IEEE DCBX mode and then autonegotiate with the connected peer to set the DCBX version.

QFabric system Node devices come up using DCBX version 1.01, and then autonegotiate with the connected peer to set the DCBX mode.

Default The default DCBX mode is autonegotation.

Options **auto-negotiate**—Automatically negotiate the DCBX version with the connected peer.

ieee-dcbx—Force the interface to use IEEE DCBX mode, regardless of the peer configuration.

dcbx-version-1.01—Force the interface to use version 1.01 DCBX mode, regardless of the peer configuration.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

description (Fibre Channel Fabrics)

Syntax description *description*

Hierarchy Level [edit fc-fabrics *fabric-name*]

Description Text string that describes the Fibre Channel fabric. The text string has no effect on the operation of the fabric.

Options ***description***—Text that describes the fabric. Text can include letters, numbers, and hyphens (-) and can be up to 255 characters in length. If the text includes spaces, enclose the entire text string in quotation marks.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

- show fibre-channel fabric on page 5322

destination-port (Applications)

Syntax destination-port *port-value*;

Hierarchy Level [edit applications application *application-name*]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) destination port number, which combines with **protocol** to identify an application type. The Internet Assigned Numbers Authority (IANA) assigns port numbers. See the IANA *Service Name and Transport Protocol Port Number Registry* at http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml for a list of assigned port numbers.

NOTE: To create an application for iSCSI, use the protocol **tcp** with the destination port number **3260**.

Options *port-value*—Identifier for the port.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

disable (DCBX)

Syntax disable

Hierarchy Level [edit protocols dcbx]

[edit protocols dcbx interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.

Description Disable Data Center Bridging Capability Exchange protocol (DCBX) on one or more 10-Gigabit Ethernet interfaces.

Default DCBX is enabled by default on all 10-Gigabit or higher Ethernet interfaces.

DCBX is enabled by default on all 10-Gigabit Ethernet interfaces on EX4500 CEE-enabled switches.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

enhanced-transmission-selection

Syntax

```
enhanced-transmission-selection {
  no-auto-negotiation;
  no-recommendation-tlv;
  recommendation-tlv {
    no-auto-negotiation;
  }
}
```

Hierarchy Level [edit protocols dcbx interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Disable advertising the enhanced transmission selection (ETS) state of the interface to the peer. To disable ETS on the interface, do not enable ETS on the interface in the class-of-service (CoS) configuration.

Disabling ETS autonegotiation stops the QFX Series from advertising the ETS Configuration TLV and the ETS Recommendation TLV.

Disabling the ETS recommendation TLV stops the QFX Series from advertising the ETS Recommendation TLV, but the ETS Configuration TLV is still advertised.

Options

no-auto-negotiation—Disable automatic negotiation of ETS (Configuration TLV and Recommendation TLV)

no-recommendation-tlv—Disable automatic negotiation of the ETS Recommendation TLV

recommendation-tlv—Enable automatic negotiation of ETS Recommendation TLV

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

ether-type

Syntax ether-type *ether-type*;

Hierarchy Level [edit applications application *application-name*]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Two-octet field in an Ethernet frame that defines the protocol encapsulated in the frame payload. See http://standards.ieee.org/develop/regauth/ethertype/eth.txt for a list of Institute of Electrical and Electronics Engineers (IEEE) EtherTypes.

NOTE: To create a FIP application, use the EtherType 0x8914.

Options *type*—Identifier for the EtherType.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

examine-fip

Syntax

```
examine-fip {
  examine-vn2vn {
    beacon-period milliseconds;
  }
  fc-map fc-map-value;
}
```

Hierarchy Level [edit ethernet-switching-options secure-access-port vlan (all | *vlan-name*)]

Release Information

Statement introduced in Junos OS Release 10.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement **examine-vn2vn** introduced in Junos OS Release 12.2 for the QFX Series.

Description

Enable FIP snooping on a specified VLAN. Ensure that the VLAN is a dedicated FCoE VLAN that transports only FCoE traffic.

(QFX Series only) Enable VN_Port to VN_Port (VN2VN_Port) FIP snooping on a specified VLAN. The VLAN must be a dedicated FCoE VLAN that transports only VN2VN_Port traffic. One FCoE VLAN cannot support both VN_Port to VF_Port (VN2VF_Port) FIP snooping and VN2VN_Port FIP snooping. Configure separate, dedicated FCoE VLANs for VN2VN_Port FIP snooping and VN2VN_Port FIP snooping.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- *vlan*
- *Example: Configuring an FCoE Transit Switch*
- Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 5199

examine-vn2vn

Syntax

```
examine-vn2vn {
  beacon-period milliseconds;
}
```

Hierarchy Level [edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Enable VN_Port to VN_Port (VN2VN) FIP snooping on a specified VLAN. The VLAN must be a dedicated FCoE VLAN that transports only FCoE traffic. A VLAN cannot support VN2VN FIP snooping and VN_Port to VF_Port FIP snooping (VN2VF) simultaneously. Configure separate VLANs for VN2VN FIP snooping and VN2VF FIP snooping.

When you enable VN2VN FIP snooping on a VLAN, the VN2VF session filters are removed and the all existing VN2VF sessions are terminated.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

        interface {
          interface-name {
            fka-adv-period milliseconds;
            priority priority;
          }
        }
        max-sessions-per-enode max-sessions-per-enode;
        priority priority;
        traceoptions {
          file filename <replace> <size size> <files number> <no-stamp>;
          <world-readable | no-world-readable>;
          flag flag <flag-modifier> <disable>;
        }
      }
    }
    proxy {
      auto-load-rebalance
      load-balance-algorithm (simple | enode-based | flogi-based);
      no-fabric-wwn-verify;
      traceoptions {
        file filename <replace> <size size> <files number> <no-stamp>;
        <world-readable | no-world-readable>;
```

```
            flag flag <flag-modifier> <disable>;
        }
    }
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure an FC fabric. You can configure a maximum of 12 FC fabrics, one per native FC port.

NOTE: Changing the name of an FC fabric causes all logins to drop and forces the ENodes to log in again.

Options *fc-fabric-name* —Unique name of the FC fabric.

The other statements are explained separately.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

fc-map

Syntax fc-map *fc-map-value*;

Hierarchy Level [edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

For the QFX Series only:

[edit fc-fabrics *fc-fabric-name* protocols fip]

Release Information Statement introduced in Junos OS Release 10.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).

You can configure the FC-MAP value or use the default value. The default FC-MAP value is different for VN_Port to VF_Port (VN2VF_Port) FIP snooping (0x0EFC00) than for VN_Port to VN_Port (VN2VN_Port) FIP snooping.

The FC switch provides the FC-MAP value to FCoE nodes (ENodes) in the FIP discovery advertisement message. If the EX Series switch or the QFX Series FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, neither device discovers the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN_Port MAC address.

When the QFX Series acts as an FCoE-FC gateway, the FC-MAP value for the gateway and the FCoE devices must match the FC switch FC-MAP value in order to communicate with the FC switch.

NOTE: Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

Options *fc-map-value*—FC-MAP value, hexadecimal value preceded by “0x”.

Range: 0x0EFC00 through 0x0EFCFF

Default: 0x0EFC00 for VN2VF_Port FIP snooping0x0EFD00 for VN2VN_Port FIP snooping

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

fc-options

Syntax

```
fc-options
  max-login-sessions-per-node max-login-sessions-per-node;
  traceoptions {
    file filename <replace> <size size> <files number> <no-stamp>;
    <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
  }
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set Fibre Channel options.

Required Privilege Level
storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

fcoe-trusted

Syntax fcoe-trusted;

Hierarchy Level [edit ethernet-switching-options secure-access-port interface *interface-name*]

For the QFX Series only:

[edit fc-fabrics *fc-fabric-name* protocols fip]

Release Information Statement introduced in Junos OS Release 10.4 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced for the FC fabric in Junos OS Release 11.3 for the QFX Series.

Description Configure the specified 10-Gigabit Ethernet interface to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is connected to another switch such as an FCoE forwarder (FCF) or a transit switch, you can configure the interface as trusted so that the interface forwards FCoE traffic from the switch to the FCoE devices without installing FIP snooping filters.

(QFX Series only) Configure the specified local Fibre Channel fabric to trust FCoE traffic on all ports in the fabric. Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted by removing the **fcoe-trusted** configuration from the fabric forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN_Ports log in again, the switch can build the appropriate FIP snooping filters.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

interface (Fibre Channel Fabric)

Syntax

```
interface {
  interface-name {
    max-login-sessions max-login-sessions;
  }
  interface-name {
    max-login-sessions max-login-sessions;
  }
  <...> {
    max-login-sessions max-login-sessions;
  }
  vlan.interface-name;
}
```

Hierarchy Level [edit fc-fabrics *fc-fabric-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate one or more native Fibre Channel (FC) interfaces with an FC fabric and one VLAN interface for FCoE traffic. An FC interface can be associated with only one FC fabric.

Options

interface-name—Name of the native FC interface. You can assign one or more FC interfaces to an FC fabric.

vlan.*vlan-interface-name*—Name of the VLAN interface for FCoE traffic. You can assign one VLAN interface to an FC fabric.

The remaining statement is explained separately.

Required Privilege Level
storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

interface (FIP)

Syntax

```
interface {
  interface-name {
    fka-adv-period milliseconds;
    priority priority;
  }
}
```

Hierarchy Level [edit fc-fabrics *fc-fabric-name* protocols fip]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure FIP options on a per-interface basis. (Override global FIP configuration for a specified interface.)

Options *interface-name*—Name of the interface.

The statements are explained separately.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

load-balance-algorithm

Syntax load-balance-algorithm (simple | enode-based | flogi-based);

Hierarchy Level [edit fc-fabrics *fabric-name* proxy]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Set the load-balancing algorithm that the QFX Series uses to distribute FCoE sessions (FLOGI and FDISC sessions from the FCoE devices in the Ethernet network) among the NP_Port links to the FC switch.

NOTE: **Changing the load-balancing algorithm when FCoE sessions are running forces the FCoE sessions to log out, then log in again.**

Options

simple—Load balancing is based on the weighted utilization (load) of the NP_Ports connected to an FC fabric. Each new FLOGI or FDISC is assigned to the least-loaded link. When a link load rebalance occurs, the system minimizes disruption by using an algorithm to log out only the sessions that need to be moved to other links to balance the link load. To further minimize disruption, the algorithm logs out the sessions with the fewest dependencies (for example, FDISC sessions are logged out before FLOGI sessions). When the sessions log in again, they are placed on NP_Port interfaces in a manner that balances the link loads. This is the default load-balancing algorithm.

enode-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions (VN_Port sessions) associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. When a link load rebalance occurs, the system logs off all sessions. The sessions log in again and are placed on NP_Port interfaces in a balanced manner.

flogi-based—FLOGI-based load balancing is similar to ENode-based load balancing, but the behavior when the loads are rebalanced is different. Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. When a link load rebalance occurs, the system minimizes disruption by using an algorithm to log out only the sessions that need to be moved to other links to balance the link load. When the logged out sessions log back in, they are placed on NP_Port interfaces in a manner that balances the link loads.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

loopback (Fibre Channel Interface)

Syntax (loopback | no-loopback);

Hierarchy Level [edit interfaces *interface-name* fibrechannel-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Enable or disable loopback mode for FC interfaces.

Default By default, loopback mode is disabled on FC interfaces.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- show fibre-channel interfaces on page 5357
- Configuring a Fibre Channel Interface on page 5182

max-login-sessions

Syntax max-login-sessions *max-login-sessions*;

Hierarchy Level [edit fc-fabrics *fc-fabric-name*];
[edit fc-fabrics *fc-fabric-name* interface *interface-name*];

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Set the maximum number of FCoE initialization protocol (FIP) session logins permitted for an individual NP_Port interface in an FCoE-FC gateway fabric (FC fabric) or for the entire FCoE-FC gateway fabric. You can set a maximum FIP session limit for each NP_Port interface connected to an FC switch. You can also set a maximum FIP session limit for the entire FC fabric. The sum of the maximum login sessions permitted on the NP_Port interfaces in an FC fabric should not exceed the maximum login sessions configured for that FC fabric.

The maximum number of FIP sessions (the combined total of all VN2VF_Port and VN2VN_Port sessions on the system) is 2500 sessions.

Options *max-login-sessions*—Maximum number of FIP login sessions.

Range: 128 through 2500

Default: 2500

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

max-login-sessions-per-node

Syntax max-login-sessions-per-node *max-login-sessions-per-node*;

Hierarchy Level [edit fc-options]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Set the maximum number of FCoE initialization protocol (FIP) session logins permitted on a Node device. (This is the combined total of all VN2VF_Port and VN2VN_Port sessions on the Node device.)

On a QFX3500 switch, the **max-login-sessions-per-node** command sets the maximum FIP session login limit for all of the FC fabrics configured on the device. The combined number of FIP sessions on all FC fabrics on the device should not exceed this limit.

On a QFabric system, the **max-login-sessions-per-node** command globally sets the maximum FIP session login limit for each QFabric system Node device in the QFabric system. For example, if you set the Node limit to 2000 login sessions, then each QFabric Node device supports up to 2000 FIP login sessions. The total configured maximum number of login sessions of all of the FC fabrics on a Node device should not exceed the Node session limit.

NOTE: **FIP login session limits configured at the FC fabric level or at the FC fabric interface level might limit a Node device to fewer total sessions than the configured Node limit.**

Options *max-login-sessions-per-node*—Maximum number of FIP login sessions.

Range: 128 through 2500

Default: 2500

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

- max-login-sessions on page 5246
- Setting the Maximum Number of FIP Login Sessions per Node Device on page 5198

max-sessions-per-enode

Syntax max-sessions-per-enode *max-sessions-per-enode*;

Hierarchy Level [edit fc-fabrics *fc-fabric-name* protocols fip]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Set the maximum number of FCoE login sessions (FLOGI plus FDISC) from a single ENode allowed on the gateway FC fabric (the fabric configured on the QFabric system). The maximum number of logins per ENode is 2000 sessions.

NOTE: A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions. There is no limit to the number of end-to-end storage sessions.

Options *max-sessions-per-enode*—Maximum number of FCoE sessions a single ENode can establish on the switch.

Range: 32 through 2000

Default: 32

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

no-fabric-wwn-verify

Syntax no-fabric-wwn-verfiy;

Hierarchy Level [edit fc-fabrics *fabric-name* proxy]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Disable the fabric worldwide name (WWN) verification check in the fabric login accept message (FLOGI-ACC) for implicit FLOGIs. If you enable this option, when a QFX Series NP_Port performs a FLOGI to the FC fabric, the QFX Series does not verify the fabric WWN in the FLOGI-ACC against the current fabric WWN.

NOTE: **Disabling or enabling the fabric WWN verification check logs out all FCoE sessions.**

Default Disabled. By default, all implicit FLOGIs from the QFX Series NP_Ports to the FC fabric are verified against the current fabric WWN.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

oxid

Syntax oxid (enable | disable)

Hierarchy Level [edit forwarding-options hash-key family fcoe]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Enable or disable whether the switch uses the originator exchange identifier (OxID) field for hash control for FCoE traffic load balancing.

Default OxID hash control is enabled by default.

Options **oxid (enable | disable)**—Enable or disable whether the switch uses the OxID hash control field for FCoE traffic load balancing.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

policy-options

Syntax

```
policy-options
  application-maps application-map-name {
    application application-name {
      code-points [ aliases ] [ bit-patterns ];
    }
  }
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list prefix-list-name;
        prefix-list-filter prefix-list-name match-type <actions>;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then actions;
    }
  }
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.
Statement introduced in Junos OS Release 12.1 for the EX Series.

Description Configure options such as application maps for DCBX application protocol exchange and policy statements.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

port-mode (Fibre Channel Interfaces)

Syntax port-mode (f-port | np-port);

Hierarchy Level [edit interfaces vlan unit *unit* family fibre-channel],
[edit interfaces *interface-name* unit *logical-unit-number* family fibre-channel]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the FCoE VLAN interface port mode to F_Port to connect the switch to FCoE initiators, or configure the native FC interface port mode to proxy N_Port (NP_Port) to connect the switch to an FC switch fabric port (F_Port).

Options

f-port—Configure an FCoE VLAN interface to connect to FCoE initiator Virtual N_Ports (VN_Ports).

np-port—Configure a native FC port to connect to an FC switch F_Port.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

port-range

Syntax port-range *port-range-low port-range-high*;

Hierarchy Level [edit chassis fpc *fpc-id* pic *pic-id* fibre-channel]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a contiguous block of ports as FC ports. You can configure the FC-capable ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces. You cannot individually configure a single port as a native FC interface. Within these port blocks, you cannot mix FC interfaces with Ethernet interfaces. All of the ports in a block must be either native FC interfaces or Ethernet interfaces.

You can configure:

- Six native FC interfaces by configuring either ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, or ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- Twelve native FC interfaces by configuring ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- No native FC interfaces by leaving ports xe-0/0/0 through xe-0/0/5 and ports xe-0/0/42 through xe-0/0/47 in their default state as Ethernet interfaces.

Options ***port-range-low***—Lowest-numbered port in the block of native FC interfaces, either **0** or **42**.

port-range-high—Highest-numbered port in the block of native FC interfaces. The value is **5** if the ***port-range-low*** value is **0**. The value is **47** if the ***port-range-low*** value is **42**.

NOTE: **Only a complete block of ports, xe-0/0/0 through xe-0/0/5, xe-0/0/42 through xe0/0/47, or both, can be configured as FC ports.**

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

priority (FIP)

Syntax priority *priority*;

Hierarchy Level [edit fc-fabrics *fc-fabric-name* protocols fip],
[edit fc-fabrics *fc-fabric-name* protocols fip interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Sets the global or interface-specific priority value associated with the switch FCF-MAC. CNAs use the priority value to determine the switch with which they will perform FIP FLOGI. The lower the value, the higher the priority. The switch advertises this value to the server ENodes on the FCoE network. A priority value set at the interface level overrides the global setting.

Options *priority* —Value that determines the FCF an ENode selects to perform FIP FLOGI. The lower the priority number, the higher the priority of the FCF.

Range: 0 through 255

Default: 128

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

priority-flow-control

Syntax

```
priority-flow-control {
  no-auto-negotiation;
}
```

Hierarchy Level [edit protocols dcbx interface (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.

Description Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.

Options **no-auto-negotiation**—Disable automatic negotiation of PFC.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

protocol (Applications)

Syntax protocol (tcp | udp);

Hierarchy Level [edit applications application *application-name*]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Networking protocol type, which combines with **destination-port** to identify an application type.

NOTE: To create an application for iSCSI, use the protocol **tcp** with the destination port number **3260**.

Options **tcp**—Transmission Control Protocol

udp—User Datagram Protocol

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

protocols (FIP)

Syntax

```
protocols {
  fip {
    fcoe-trusted;
    fc-map fc-map-value;
    fka-adv-period milliseconds;
    interface {
      interface-name {
        fka-adv-period milliseconds;
        priority priority;
      }
    }
    max-sessions-per-enode max-sessions-per-enode;
    priority priority;
    traceoptions {
      file filename <replace> <size size> <files number> <no-stamp>;
      <world-readable | no-world-readable>;
      flag flag <flag-modifier> <disable>;
    }
  }
}
```

Hierarchy Level [edit fc-fabrics *fc-fabric-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure global or interface-specific FC protocol options. Individual interface settings override global settings.

Options The statements are explained separately.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

- show fibre-channel fip on page 5328
- Configuring FIP on an FCoE-FC Gateway on page 5192

proxy (Fibre Channel)

Syntax

```
proxy {
  auto-load-rebalance
  load-balance-algorithm (simple | enode-based | flog-based);
  no-fabric-wwn-verify;
  traceoptions {
    file filename <replace> <size size> <files number> <no-stamp>
    <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
  }
}
```

Hierarchy Level [edit fc-fabrics *fabric-name*]

Description Configure proxy fabric operations.

Options The statement is explained separately.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation
- Understanding FCoE-FC Gateway Functions on page 4979

recommendation-tlv

Syntax

```
recommendation-tlv {
  no-auto-negotiation;
}
```

Hierarchy Level [edit protocols dcbx interface *interface-name* enhanced-transmission-selection]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Disable or enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.)

Default DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.

Options **no-auto-negotiation**—Disable sending of the ETS recommendation TLV.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- show dcbx neighbors on page 5300
- Configuring DCBX Autonegotiation on page 5204

speed (Fibre Channel Interfaces)

Syntax speed (auto-negotiation | 2g | 4g | 8g);

Hierarchy Level [edit interfaces *interface-name* fibrechannel-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure FC interface speed.

Options

auto-negotiation—Automatically negotiate interface speed to match the speed of the attached link (2 Gbps, 4 Gbps, 8 Gbps).

2g—2 Gbps link speed

4g—4 Gbps link speed

8g—8 Gbps link speed

Default: auto-negotiation

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traceoptions (FC-2 Fibre Channel)

Syntax

```
traceoptions {
  file filename <replace> <size size> <files number> <no-stamp>;
  <world-readable | no-world-readable>;
  flag flag <flag-modifier>;
}
```

Hierarchy Level [edit fc-fabrics *fabric-name* fc2]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set FC-2 protocol tracing options.

NOTE: The **traceoptions** statement is not supported on the QFabric system.

Default Traceoptions is disabled.

Options **file** ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all** —Trace all operations.
- **error**—Trace all error events
- **normal**—Trace all normal events.

Default: If you do not specify the **normal** option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **rx-frame**—(Optional) Trace received frames.
- **rx-frame-header**—(Optional) Trace received frame headers.

- **tx-frame**—(Optional) Trace transmitted frames.
- **tx-frame-header**—(Optional) Trace transmitted frame headers.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*** **.0**. Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*****.0** is renamed ***trace-file*****.1** and ***trace-file*** is renamed ***trace-file*****.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*****k** to specify KB, ***x*****m** to specify MB, or ***x*****g** to specify GB

Range: 10 KB through the maximum file size of 4 GB (the maximum is lower if 4 GB is not supported on your system)

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

traceoptions (Fibre Channel)

Syntax

```
traceoptions {
  file filename <replace> <size size> <files number> <no-stamp>
  <world-readable | no-world-readable>;
  flag flag <flag-modifier>;
}
```

Hierarchy Level [edit fc-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set FC protocol tracing options.

NOTE: The **traceoptions** statement is not supported on the QFabric system.

Default Traceoptions is disabled.

Options **file** ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **fabric**—Trace virtual fabric events.
- **fc2**—Trace the FC2 (network layer protocols) events.
- **fip**—Trace the Fibre Channel over Ethernet (FCoE) Initialization Protocol events.
- **flogi** —Trace the fabric login server events.
- **forwarding-database**—Trace the forwarding database and next-hop events.
- **interface**—Trace the interface events.

- **krt**—Trace the communication over the routing socket.
- **lib**—Trace library calls.
- **lif**—Trace Fibre Channel logical interface (fc-lif) events.
- **vswitch**—Trace virtual switch events.

The following are the global tracing options:

- **all**—All trace operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*** **.0.** Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*****.0** is renamed ***trace-file*****.1** and ***trace-file*** is renamed ***trace-file*****.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*****k** to specify KB, ***x*****m** to specify MB, or ***x*****g** to specify GB

Range: 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level
storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

traceoptions (FIP Protocol Fibre Channel)

Syntax

```
traceoptions {
  file filename <replace> <size size> <files number> <no-stamp>
  <world-readable | no-world-readable>;
  flag flag <flag-modifier>
}
```

Hierarchy Level [edit fc-fabrics *fabric-name* protocols fip]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set proxy FC protocol tracing options.

NOTE: The **traceoptions** statement is not supported on the QFabric system.

Default Traceoptions is disabled.

Options

file ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number*** —(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **error**—Trace all error events
- **normal**—Trace all normal events.

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **packet**—Trace packet decoding operations
- **parse**—Trace configuration parsing.
- **state**—Trace state transitions.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0.** Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

traceoptions (Proxy Fibre Channel)

Syntax

```
traceoptions {
  file filename <replace> <size size> <files number> <no-stamp>
  <world-readable | no-world-readable>;
  flag flag <flag-modifier>
}
```

Hierarchy Level [edit fc-fabrics *fabric-name* proxy]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set proxy FC protocol tracing options.

NOTE: The **traceoptions** statement is not supported on the QFabric system.

Default Traceoptions is disabled.

Options **file** ***name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **error**—Trace all error events.
- **interface**—Trace the interface events.
- **normal**—Trace all normal events.

storage-control—To add this statement to the configuration.

CHAPTER 61

Administration

- Routine Monitoring on page 5269
- Operational Commands on page 5274

Routine Monitoring

- Monitoring Fibre Channel Interface Load Balancing on page 5269

Monitoring Fibre Channel Interface Load Balancing

You can use operational mode commands to monitor load balancing when the switch is in FCoE-FC gateway mode:

1. Monitoring the Interface Load-Balancing State on page 5269
2. Monitoring the Fabric Load-Balancing Algorithm on page 5270

Monitoring the Interface Load-Balancing State

Purpose Monitor the number of sessions, whether load balancing is enabled or disabled, and the load-balancing weight for each native Fibre Channel (FC) interface.

NOTE: A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

Action To monitor the load-balancing state of the native FC interfaces in the CLI, enter the following CLI command:

user@switch> **show fibre-channel proxy np-port**

For example:

```
user@switch> show fibre-channel proxy np-port
Fabric: sanfab1, Fabric-id: 10
NP-Port     State              Sessions       LB state   LB weight
fc-0/0/0.0  online             5              ON         4
fc-0/0/1.0  online             5              ON         4
fc-0/0/2.0  online             10             ON         8

Fabric: fc_fab2, Fabric-id: 200
```

```
NP-Port     State              Sessions       LB state   LB weight
fc-0/0/44.0 isolated           0              OFF        0

Fabric: fc_fabric_100, Fabric-id: 100
NP-Port     State              Sessions       LB state   LB weight
fc-0/0/46.0 online             1              ON         8
```

Meaning Table 413 on page 5270 summarizes key output fields for the FC interface load-balancing state.

Table 413: Summary of Key FC Interface Load-Balancing Output Fields

Field	Values
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.
NP-Port	NP_Port interface connected to the FCoE forwarder (FCF) or the FC switch.
State	FCID state of the NP_Port interface: • **online**—The port is online and connected to the FC switch. FCoE devices can log in to the FC switch using this port. • **isolated**—The port is isolated and is not part of the load-balancing function. FCoE devices cannot log in to the FC switch using this port. • **offline**—The port is offline.
Sessions	Number of active sessions on the NP_Port interface.
LB state	Load-balancing state: • **On**—Load balancing is on • **Off**—Load balancing is off.
LB weight	Load-balancing weight, which reflects the port speed: • **2**—Port speed is 2 Gbps. • **4**—Port speed is 4 Gbps. • **8**—Port speed is 8 Gbps.

The gateway determines the least-loaded interface using the following weighted round-robin (WRR) algorithm:

(number-of-sessions * max-weight) / weight

where *max-weight* is an internal constant. If the load on the FC interfaces is equal, the session is assigned to the interface with the highest link speed (the greatest weight).

Monitoring the Fabric Load-Balancing Algorithm

Purpose Monitor the type of load-balancing algorithm (simple, ENode-based, or FLOGI-based) used on the native FC interfaces, whether or not automated load rebalancing is enabled, and the load rebalancing state of the fabric.

Action To monitor the load-balancing algorithm used on the native FC interfaces and the load rebalancing state in the CLI, enter the following CLI command:

user@switch> **show fibre-channel proxy fabric-state**

For example:

```
user@switch> show fibre-channel proxy fabric-state
Fabric: sanfab1, Fabric-id: 10
Proxy load balance algorithm: Simple, Fabric WWN verification: Yes
Auto load rebalance enabled  : No
Last rebalance start-time    : Never
Last rebalance end-time      : Never
Last rebalance trigger       : Link-up
Last rebalance trigger-time  : Mon Sep 10 21:42:30 2012 usec: 814602
Last rebalance trigger-result: Not-configured

Fabric: fc_fab2, Fabric-id: 200
Proxy load balance algorithm: ENode based, Fabric WWN verification: Yes
Auto load rebalance enabled  : No
Last rebalance start-time    : Never
Last rebalance end-time      : Never
Last rebalance trigger       : Link-up
Last rebalance trigger-time  : Mon Sep 17 17:23:35 2012 usec: 619684
Last rebalance trigger-result: Not-configured

Fabric: fc_fabric_100, Fabric-id: 100
Proxy load balance algorithm: FLOGI based, Fabric WWN verification: No
Auto load rebalance enabled  : Yes
Last rebalance start-time    : Never
Last rebalance end-time      : Never
Last rebalance trigger       : Config-CLI
Last rebalance trigger-time  : Fri Nov  2 08:56:16 2012 usec: 004487
Last rebalance trigger-result: Not-required
```

Meaning You can configure each local FC fabric on an FCoE-FC gateway to use one of three types of load-balancing algorithms, *simple*, *ENode-based*, or *FLOGI-based*. All of the native FC interfaces (NP_Ports) in a particular gateway FC fabric use the same load-balancing algorithm (the load-balancing algorithm is applied on a per-fabric basis).

Table 414 on page 5271 summarizes key output fields for the FC interface load-balancing algorithm and state.

Table 414: show fibre-channel proxy fabric-state Output Fields

Field Name	Field Description
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.

Table 414: show fibre-channel proxy fabric-state Output Fields *(continued)*

Field Name	Field Description
Proxy load balance algorithm	Load-balancing algorithm used on the FCoE-FC gateway FC fabric: • Simple—Load balancing is based on the weighted utilization (load) of the NP_Ports connected to an FC fabric. Each new FLOGI or FDISC is assigned to the least-loaded link. On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner. • ENode-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions (VN_Port sessions) associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. On a link load rebalance, all sessions are logged out. When the sessions log in again, they are placed on active NP_Port interfaces in a balanced manner. • FLOGI-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions (VN_Port sessions) associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.
Fabric WWN verification	Fabric worldwide name (WWN) verification check state on the FCoE-FC gateway fabric: • Yes—Fabric WWN verification check is enabled. • No—Fabric WWN verification check is disabled.
Auto load rebalance enabled	Automated link load rebalancing configuration for the FCoE-FC gateway fabric: • No—Automated load balancing is disabled (default state). • Yes—Automated load balancing is enabled.
Last rebalance start-time	Time that the last link load rebalance began on the FCoE-FC gateway fabric: • Never—The link load has never been rebalanced. • Timestamp value—Time the last link load rebalancing started.
Last rebalance end-time	Time that the last link load rebalance ended on the FCoE-FC gateway fabric: • Never—The link load has never been rebalanced. • Timestamp value—Time the last link load rebalancing ended.

Table 414: show fibre-channel proxy fabric-state Output Fields *(continued)*

Field Name	Field Description
Last rebalance trigger	Event that triggered the last link load rebalance on the FCoE-FC gateway fabric: • None—The link load has never been rebalanced. • Config-CLI—Configure (enable) automated load balancing. • Request-CLI—Rebalance requested from the CLI using the **request fibre-channel proxy load-rebalance fabric *fabric-name*** operational command. • Preview-CLI—Rebalancing *dry run* requested from the CLI using the **request fibre-channel proxy load-rebalance dry-run fabric *fabric-name*** operational command. Indicates that the switch completed the dry run. A dry run simulates a link load rebalance and displays a list of sessions that might be affected if you request an actual rebalance. • Link-up—New FC link (NP_Port) up on the FCoE-FC gateway fabric, which causes a rebalance to distribute sessions to the new link. • Restore-complete—If the FC process on the switch restarts, the switch attempts to restore the session state that existed before the restart. When automated rebalance is enabled, restore-complete indicates that the sessions have been restored and rebalanced.
Last rebalance trigger-time	Time that the last link load rebalance was triggered on the FCoE-FC gateway fabric: • Never—Link load rebalancing has never been triggered. • Timestamp value—Time the last link load rebalancing was triggered.
Last rebalance trigger-result	Result of the last trigger event on the FCoE-FC gateway fabric: • Never—Link load rebalancing has never been triggered. • Not-configured—Automated rebalancing is not configured on the FCoE-FC gateway fabric. • Not-required—Last rebalance trigger did not require rebalancing the link load (the link load was already balanced across the active NP_Port links). • In-progress—Link load rebalancing is in progress and has not finished yet. • Restore-in-progress—The switch is recovering from an FC process restart and is in the process of restoring the sessions to the active NP_Port links. • Success—Link load rebalancing was successful. • Logged-out-all—All sessions have been logged out. • Preview-complete—The switch has finished simulating a dry run rebalancing request from the CLI (**request fibre-channel proxy load-rebalance dry-run fabric *fabric-name*** operational command) and reported the sessions that might be affected if you request an actual link load rebalance. • Fabric-deletion-in-progress—FCoE-FC gateway fabric is in the process of being deleted. NOTE: A trigger event does not necessarily result in a rebalance action. Link load rebalancing only occurs if the NP_Port interface session load is not balanced at the time of the trigger event.

clear fibre-channel fc2 statistics

Syntax **clear fibre-channel fc2 statistics**
<**fabric** *fabric-name*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear FC-2 (network layer) Fibre Channel statistics globally or on a specified Fibre Channel fabric.

Options **fabric** ***fabric-name***—(Optional) Clear FC-2 statistics only on the specified fabric.

Required Privilege Level view

Related Documentation
- show fibre-channel fc2 statistics on page 5326

List of Sample Output clear fibre-channel fc2 statistics on page 5276

Sample Output

clear fibre-channel fc2 statistics

```
user@switch> clear fibre-channel fc2 statistics
```

clear fibre-channel fip enode

Syntax clear fibre-channel fip enode *enode-mac*

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear Fibre Channel over Ethernet (FCoE) node (ENode) information for a specified ENode. This operation deletes the ENode state from the switch database and from the FIP snooping firewall filters, which causes the ENode to lose the connection to the Fibre Channel (FC) fabric and to log in to the fabric again. If you clear an ENode, all VN_Ports associated with that ENode are also cleared and lose their connection to the FC fabric and must log in to the fabric again.

Options *enode-mac*—MAC address of the ENode.

Required Privilege Level view

user@switch> clear fibre-channel fip statistics
```

clear fibre-channel fip vn-port

Syntax clear fibre-channel fip vn-port *vn-port--mac*

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear virtual N_Port (VN_Port) information for a specified VN_Port. This operation deletes the VN_Port state from the switch database and from the FIP snooping firewall filters, which causes the VN_Port to lose its connection to the Fibre Channel fabric and to log in to the fabric again. When you clear a VN_Port, other VN_Ports associated with the same Fibre Channel over Ethernet (FCoE) Node (ENode) are not affected and are not cleared.

Options *vn-port-mac*—MAC address of the VN_Port.

Required Privilege Level view

clear fip snooping enode

Syntax **clear fip snooping enode *enode-mac***
<vlan *vlan-name*>

Release Information Command introduced in Junos OS Release 10.4 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear FIP snooping information for the specified FCoE Node (ENode) or (optionally) only on a specified VLAN. This operation deletes the ENode state from the switch database and from the FIP snooping firewall filters, which causes the ENode to lose its connection to the FCoE forwarder (FCF) and to log in to the FCF again.

Options ***enode-mac***—MAC address of the ENode.

vlan *vlan-name*—(Optional) Name of the VLAN.

Required Privilege Level view

clear fip snooping vlan

Syntax clear fip snooping vlan *vlan-name*

Release Information Command introduced in Junos OS Release 10.4 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear FIP snooping information for the specified VLAN. This operation deletes all ENode and FCF information for the VLAN from the switch database and causes the ENodes to lose their connections to the FCFs. After clearing a VLAN, the switch relearns all of the FCFs and ENodes on the VLAN, and the ENodes must log in to the FCF again.

Options *vlan-name*—Name of the VLAN.

request fibre-channel proxy load-rebalance

Syntax

request fibre-channel proxy load-rebalance
<dry-run>
fabric <*fabric-name*>
<brief | detail>

Release Information

Command introduced in Junos OS Release 12.3 for the QFX Series.

Description

Rebalance the link load on one or more FCoE-FC gateway proxy fabrics (local Fibre Channel fabrics on the gateway) on demand. Load rebalancing is a disruptive action that forces some or all sessions (depending on the configured load-balancing algorithm) to log out and then log in again. When sessions log in again, they are placed on NP_Port interfaces so that the link loads are balanced.

Link load rebalancing occurs 10 seconds after you run the rebalancing command, unless another rebalancing trigger occurs before the 10 seconds elapse. If another rebalancing event occurs before the 10-second timer elapses, the timer is extended. Rebalancing occurs a maximum of 30 seconds after you run the rebalancing command, regardless of whether more rebalancing events occur.

You can also perform a *dry run* to see a list of sessions that might be affected (logged out) if you request a load rebalance. A dry run does not rebalance the link loads; it only lists the sessions that might be affected if you rebalance.

Options

dry-run—(Optional) Simulates performing link load rebalancing and displays a list of sessions that might be affected if you rebalance the link loads.

fabric *fabric-name*—Name of the fabric on which you want to rebalance the link loads. If you do not specify a fabric name with the fabric keyword, all fabrics on the FCoE-FC gateway rebalance their link loads.

brief | detail—(Optional) Display the specified level of output.

Additional Information

Requesting link load rebalancing is a one-time, on-demand operation. You must explicitly request load rebalancing every time you want to rebalance the link loads. Alternatively, you can configure automated load rebalancing if you want the NP_Port links to be rebalanced automatically whenever a load-rebalancing trigger occurs.

Required Privilege Level

maintenance

List of Sample Output request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100 on page 5287

Output Fields Table 415 on page 5287 lists the output fields for the **request fibre-channel proxy load-rebalance dry-run** command. Output fields are listed in the approximate order in which they appear.

Table 415: request fibre-channel proxy load-rebalance dry-run Output Fields

Field Name	Field Description
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.
F-Port	FCoE VLAN interface (VF_Port interface to the FCoE network).
FCID	VN_Port Fibre Channel identifier provided by the Fibre Channel over Ethernet Forwarder (FCoE forwarder) or the Fibre Channel switch.
Port-WWN	Unique worldwide name (WWN) of the VN_Port.
NP-Port	Name of the native Fibre Channel interface.

Sample Output

request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100

```
user@host> request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
F-Port                        FCID     Port-WWN                 NP-Port
vlan.100                      0x8a013a 02:01:00:64:00:00:00:2a fc-0/0/1.0
vlan.100                      0x8a013c 02:01:00:64:00:00:00:2b fc-0/0/1.0
vlan.100                      0x8a0146 02:01:00:64:00:00:00:2e fc-0/0/1.0
vlan.100                      0x8a014c 02:01:00:64:00:00:00:2f fc-0/0/1.0

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series routers.
Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dlsw** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

Description Restart a Junos OS process.

CAUTION: Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

Options **none**—Same as **gracefully**.

adaptive-services—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all routers connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

all-sfc—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

ancpd-service—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

auto-configuration—(Optional) Restart the Interface Auto-Configuration process.

autoinstallation—(EX Series switches only) (Optional) Restart the autoinstallation process.

captive-portal-content-delivery—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

ce-l2tp-service—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

chassis-control—(Optional) Restart the chassis management process.

class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

database-replication—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

datapath-trace-service—(Optional) Restart the packet path tracing process.

dhcp—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

dhcp-service—(Optional) Restart the Dynamic Host Configuration Protocol process.

dialer-services—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

diameter-service—(Optional) Restart the diameter process.

disk-monitoring—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

dlsw—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

dot1x-protocol—(EX Series switches only) (Optional) Restart the port-based network access control process.

dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

ethernet-switching—(EX Series switches only) (Optional) Restart the Ethernet switching process.

event-processing—(Optional) Restart the event process (eventd).

fibre-channel—(QFX Series only) (Optional) Restart the Fibre Channel process.

firewall—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

gracefully—(Optional) Restart the software process.

iccp-service—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

immediately—(Optional) Immediately restart the software process.

interface-control—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

ipsec-key-management—(Optional) Restart the IPsec key management process.

isdn-signaling—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

kernel-replication—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Restart the Layer 2 address flooding and learning process.

l2cpd-service—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

l2tp-service— (M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

l2tp-universal-edge—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

lacp—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG,

and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

license-service—(EX Series switches only) (Optional) Restart the feature license management process.

link-management— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

lldpd-service—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

local—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

local-policy-decision-function— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

mac-validation— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member ***member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace ***member-id*** with a value of **0** or **1**.

mib-process—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

mountd-service—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

mpls-traceroute—(Optional) Restart the MPLS Periodic Traceroute process.

mspd—(Optional) Restart the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

network-access-service—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

nfsd-service—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

packet-triggered-subscribers—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Restart the Peer Selection Service process.

pgcp-service—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

pgm—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

pic-services-logging—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

pki-service—(Optional) Restart the PKI Service process.

ppp—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

pppoe—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

protected-system-domain-service—(Optional) Restart the Protected System Domain (PSD) process.

redundancy-interface-process—(Optional) Restart the ASP redundancy process.

remote-operations—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

root-system-domain-service—(Optional) Restart the Root System Domain (RSD) service.

routing—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

routing <logical-system *logical-system-name*>—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

sampling—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

sdk-service—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

sfc *number*—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with **0**.

service-deployment—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

services—(Optional) Restart a service.

services pgcp gateway *gateway-name*—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

sflow-service—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

snmp—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

soft—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

static-subscribers—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

statistics-service—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

subscriber-management—(Optional) Restart the Subscriber Management process.

subscriber-management-helper—(Optional) Restart the Subscriber Management Helper process.

tunnel-oamd—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

usb-control—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

vrrp—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

web-management—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

show dcbx

Syntax show dcbx

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description List DCBX status (enabled or disabled) and the interfaces on which DCBX is enabled.

Required Privilege Level view

Related Documentation
- show dcbx neighbors on page 5300
- Configuring DCBX Autonegotiation on page 5204

Output Fields Table 416 on page 5299 lists the output fields for the **show dcbx** command. Output fields are listed in the approximate order in which they appear.

Table 416: show dcbx output fields

Field Name	Field Description
DCBX	Status of DCBX on the switch or for the specified interface: • Enabled—DCBX is enabled on the switch or on the specified interface • Disabled—DCBX is disabled on the switch or on the specified interface
Interface	Name of the interface

Sample Output

show dcbx

```
user@switch> show dcbx
DCBX                    : Enabled
Interface       DCBX
xe-0/0/9.0      enabled
xe-0/0/32.0     enabled
xe-0/0/36.0     enabled
```

show dcbx neighbors

Syntax

show dcbx neighbors
<**interface** *interface-name*>
<**terse**>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 11.3 for EX Series switches.

Description

Display information about Data Center Bridging Capability Exchange protocol (DCBX) neighbor interfaces.

Options

none—Display information about all DCBX neighbor interfaces.

interface-name—(Optional) Display information for the specified interface.

terse—Display the specified level of output.

Required Privilege Level

Output Fields

Table 417 on page 5300 lists the output fields for the **show dcbx neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 417: show dcbx neighbors Output Fields

Field Name	Field Description
Interface	Name of the interface.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Parent Interface	Name of the link aggregation group (LAG) interface to which the DCBX interface belongs.
Active-application-map	Name of the application map applied to the interface.
Protocol-Mode	(QFX Series) DCBX protocol mode the interface uses: • IEEE DCBX Version—The interface uses IEEE DCBX mode. • DCBX Version 1.01—The interface uses DCBX version 1.01. NOTE: On interfaces that use the IEEE DCBX mode, the **show dcbx neighbors interface *interface-name*** operational command does not include application, PFC, or ETS operational state in the output.
Protocol-State	(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.
Local-Advertisement	(DCBX Version 1.01 only) Status of advertisements that the local interface sends to the peer.
Operational version	Version of the DCBX standard used.
sequence-number	Number of state change messages sent to the peer. If the interface **Protocol-State** value is **in-sync**, this number should match the **acknowledge-id** number in the **Peer-Advertisement** section. If the interface **Protocol-State** value is **ack-pending**, this number does not match the **acknowledge-id** number in the **Peer-Advertisement** section.
acknowledge-id	Number of acknowledge messages received from the peer. If the **Protocol-State** value is **in-sync**, this number should match the **sequence-number** value in the **Peer-Advertisement** section. If the **Protocol-State** value is **ack-pending**, this number does not match the **sequence-number** value in the **Peer-Advertisement** section.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
Peer-Advertisement		(DCBX Version 1.01 only) Status of advertisements that the peer sends to the local interface.
	Operational version	Version of the DCBX standard used.
	sequence-number	Number of state change messages the peer sent to the local interface. If this number matches the **acknowledge-id** number in the **Local-Advertisement** field, this indicates that the local interface has acknowledged all of the peer's state change messages and is synchronized. If this number does not match the **acknowledge-id** number in the **Local-Advertisement** field, this indicates that the peer has not yet received an acknowledgment for a state change message from the local interface.
	acknowledge-id	Number of acknowledge messages the peer has received from the local interface. If this number matches the **sequence-number** value in the **Local-Advertisement** field, this indicates that the peer has acknowledged all of the local interface's state change messages and is in synchronization. If this number does not match the **sequence-number** value in the **Local-Advertisement** field, this indicates that the peer has not yet sent an acknowledgment for a state change message from the local interface.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: PFC			Priority-based flow control (PFC) feature DCBX state information.
	Protocol-State		(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface. • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface. • **not-applicable**—PFC autonegotiation is disabled.
	Operational State		(DCBX Version 1.01 only) Operational state of the feature: **enabled** or **disabled**.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		Willing	Willingness of the local interface to learn the PFC configuration from the peer using DCBX: • **Yes**—The local interface is willing to learn the PFC configuration from the peer. • **No**—The local interface is not willing to learn the PFC configuration from the peer.
		Mac auth Bypass Capability	(IEEE DCBX only) (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. This is not supported, so the only value seen in the local advertisement field is **no**.
		Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Operational State	PFC operational state on the interface: • Enabled—PFC is enabled on the interface • Disabled—PFC is disabled on the interface
	Maximum Traffic Classes capable to support PFC	Largest number of traffic classes the local interface supports for PFC: • **6** (EX Series switches) • **8** (QFX Series)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Admin Mode	PFC administrative state for each code point on the local interface: • **Enabled**—PFC is enabled for the code point. • **Disabled**—PFC is disabled for the code point.
	Operational Mode	(QFX Series) PFC operational mode for each code point: • Enable—PFC is enabled on the code point. • Disable—PFC is disabled on the code point.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
	Willing	Willingness of the peer to learn the PFC configuration from the local interface using DCBX: • **Yes**—The peer is willing to learn the PFC configuration from the local interface. • **No**—The peer is not willing to learn the PFC configuration from the local interface.
	Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Operational State	PFC operational state on the interface: • Enabled—PFC is enabled on the interface • Disabled—PFC is disabled on the interface
	Mac auth Bypass Capability	(IEEE DCBX only) (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. Although the QFX Series does not support this feature, the connected peer might support it. This field reports the peer state: • **Yes**—The connected peer supports MAC authentication bypass. • **No**—The connected peer does not support MAC authentication bypass.
	Maximum Traffic Classes capable to support PFC	Largest number of traffic classes the peer supports for PFC: • **6** (EX Series switches) • **8** (QFX Series)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Admin Mode	PFC administrative state for each code point on the peer: • **Enabled**—PFC is enabled for the code point. • **Disabled**—PFC is disabled for the code point.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: Application			State information for the DCBX application.
	Protocol-State		(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface. • **not-applicable**—The local interface is set to **no-auto-negotiation** (autonegotiation is disabled). If the interface is associated with an FCoE forwarding class, the interface advertises FCoE capability even if the connected peer does not advertise FCoE capability.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer. If the local interface is set to **no-auto-negotiation** (autonegotiation is disabled), the local advertisement portion of the output is not shown.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		Willing	(DCBX Version 1.01 only) Willingness of the local interface to learn the FCoE interface state from the peer using DCBX: • **Yes**—The local interface is willing to learn the FCoE interface state from the peer. • **No**—The local interface is not willing to learn the FCoE interface state from the peer.
		Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. The local and peer configuration are compatible. • **Yes**—Error detected. The local and peer configuration are not compatible.
		Appl-Name	Name of the application:

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Ethernet-Type	(DCBX Version 1.01 only) Ethernet type (EtherType) of the application. For example, **0x8906** indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Socket-Number	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Priority-Field or **Priority-Map**	Priority assigned to the application. For EX Series switches, the priority of the FCoE application is determined by the PFC congestion notification profile that has been configured and associated with the FCoE interface. For other applications, the priority is based on the application map.
	Status	(DCBX Version 1.01 only) Local status when autonegotiation is enabled: • **Enabled**—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.) • **Disabled**—The local configuration and the peer configuration do not match. NOTE: If there is a configuration mismatch in one application between the switch and the peer, all the other applications including FCoE are disabled.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
	Willing	(DCBX Version 1.01 only) Willingness of the peer to learn the FCoE interface state from the local interface using DCBX: • **Yes**—The peer is willing to learn the FCoE interface state from the local interface. • **No**—The peer is not willing to learn the FCoE interface state from the local interface.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.
	Appl-Name	Name of the application: • **FCoE**—Fibre Channel over Ethernet
	Ethernet-Type	Ethernet type (EtherType) of the application. For example, **0x8906** indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket-Number (for Layer 4 applications) of the application is displayed in the output.
	Socket-Number	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Priority-Field or **Priority-Map**	Priority assigned to the application.
	Status	(DCBX Version 1.01 only) Peer interface status: • **Enabled**—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.) • **Disabled**—The local configuration and the peer configuration do not match.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: ETS			Enhanced Transmission Selection (ETS) DCBX state information.
	Protocol-State		(DCBX Version 1.01 only) ETS protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.
	Operational State		(DCBX Version 1.01 only) Operational state of the feature, **enabled** or **disabled**.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		TLV Type	(IEEE DCBX only) Type of ETS TLV: • Configuration—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration. • Recommendation—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is "willing," configures the peer interface to match the local ETS configuration. • Recommendation-or-Configuration—Advertises both TLVs.
		Willing	Willingness of the local interface to learn the ETS state from the peer using DCBX (EX Series switches always advertise **No** for this field): • **Yes**—Local interface is willing to learn the ETS state from the peer. • **No**—Local interface is not willing to learn the ETS state from the peer.
		Credit Based Shaper	

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
		(IEEE DCBX only) Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always **No**.
	Error	(DCBX Version 1.01 only) Configuration error status: • **No**—No error. This should always be the switch ETS error state. • **Yes**—Error detected.
	Maximum Traffic Classes capable to support PFC	(DCBX Version 1.01 only) Largest number of traffic classes the local interface supports for PFC.
	Maximum Traffic Classes supported	(IEEE DCBX only) Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Priority-Group	Class-of-service (CoS) priority group (forwarding class set) identification number.
	Percentage B/W	Configured minimum percentage of link bandwidth allocated to the priority group. Only explicitly configured values appear in this output column. If the link bandwidth is the default percentage, it is not shown. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
	Transmission Selection Algorithm	(IEEE DCBX only) The transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is **ETS**.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
TLV Type	(IEEE DCBX only) Type of ETS TLV: • Configuration—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration. • Recommendation—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is "willing," configures the peer interface to match the local ETS configuration. • Configuration/Recommendation—Advertises both TLVs.
Willing	Willingness of the peer to learn the ETS state from the local interface using DCBX: • **Yes**—Peer is willing to learn the ETS state from the local interface. • **No**—Peer is not willing to learn the ETS state from the local interface.
Credit Based Shaper	(IEEE DCBX only) Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always **No**.
Error	(DCBX Version 1.01 only) Configuration error status of the peer: • **No**—No error in peer ETS TLV. • **Yes**—Error in peer ETS TLV.
Maximum Traffic Classes capable to support PFC	(DCBX Version 1.01 only) Largest number of traffic classes the local interface supports for PFC.
Maximum Traffic Classes supported	(IEEE DCBX only) Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
Code Point	

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
		PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Priority-Group	CoS priority group (forwarding class set) identification number.
	Percentage B/W	Configured minimum percentage of link bandwidth allocated to the priority group. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
	Transmission Selection Algorithm	(IEEE DCBX only) Transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is **ETS**.
PFC		(QFX Series, **terse** option only) DCBX TLV advertisement state for PFC: • Disabled—PFC configuration matches the configuration on the connected peer and PFC is disabled • Enabled—PFC configuration matches the configuration on the connected peer and PFC is enabled • Not Advt—Interface does not advertise PFC to the connected peer
ETS		(**terse** option only) Local DCBX TLV advertisement state for ETS: • Advt—Interface advertises ETS TLVs • Disabled—ETS is disabled on the interface (interface does not advertise ETS)
ETS Rec		(**terse** option only) DCBX TLV peer advertisement state for ETS (state received from the connected DCBX peer): • Advt—Peer interface advertises ETS TLVs • Not Advt—Peer interface does not advertise ETS NOTE: When the DCBX mode is DCBX version 1.01, no peer information is displayed.

Table 417: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Version	(**terse** option only) The DCBX version used on the interface and whether the DCBX version was autonegotiated or explicitly configured: • **IEEE**—The interface uses IEEE DCBX. • **1.01**—The interface uses DCBX version 1.01. When the DCBX version used is the result of autonegotiation, the term **(Auto)** appears next to the version. For example, **IEEE (Auto)** indicates that the interface autonegotiated with the connected peer to use IEEE DCBX. Autonegotiation is enabled by default.

Sample Output

show fibre-channel fabric

Syntax

show fibre-channel fabric
<extensive | summary>
<*fabric-name*>
<sort-by (name | fabric-id)>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Fibre Channel fabric information.

Options

fabric-name—(Optional) Display output only for the specified fabric.

extensive | summary—(Optional) Display the specified level of output.

sort-by (name | fabric-id)—(Optional) Sort output by fabric name or fabric ID.

Required Privilege Level

Output Fields

Table 418 on page 5322 lists the output fields for the **show fibre-channel fabric** command. Output fields are listed in the approximate order in which they appear.

Table 418: show fibre-channel fabric Output Fields

Field Name	Field Description	Level of Output
Fabric	Name of the fabric.	All
Fabric-ID	Identification number of the fabric.	All
Type	Type of fabric. All fabrics are **PROXY** fabrics.	All
Interfaces	Native Fibre Channel interfaces and FCoE interfaces assigned to the fabric.	All
Created at	Date and time the fabric was created.	**extensive**
Internal Index	Fabric index internal to Junos OS.	**extensive**
Origin	Origin information internal to Junos OS.	**extensive**
Description	Text description of the fabric.	**extensive**

Table 418: show fibre-channel fabric Output Fields *(continued)*

Field Name	Field Description	Level of Output
Fabric WWN	Unique WWN of the fabric generated by the FCF.	**extensive**
Login sessions	Number of FIP login sessions currently running on the fabric.	**extensive**
Configured max login sessions	Configured maximum number of FIP login sessions permitted on the fabric.	**extensive**

Sample Output

show fibre-channel fabric

```
user@switch> show fibre-channel fabric
Fabric          Fabric-ID      Type      Interfaces

proxy2          200            PROXY
                                        fc-0/0/0.0
                                        fc-0/0/1.0
```

show fibre-channel fabric extensive

```
user@switch> show fibre-channel fabric extensive
Fabric: proxy2, Created at: Mon Apr 19 14:02:58 2010
Fabric-ID: 200, Internal index: 2, Origin: Static
Description: srv-fabric,  Type: PROXY,  Fabric WWN: 10:00:00:05:33:51:d7:cd
Login sessions: 200,  Configured max login sessions: 500
      fc-0/0/0.0, (untagged)
      fc-0/0/1.0, (untagged)
```

show fibre-channel fc2 sessions

Syntax **show fibre-channel fc2 sessions**
<**fabric** *fabric-name*>
<**brief | detail**>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display Fibre Channel FC-2 information.

NOTE: A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

Options **fabric** *fabric-name*—(Optional) Display output only for the specified fabric.

brief | detail—(Optional) Display the specified level of output.

show fibre-channel fc2 statistics

Syntax **show fibre-channel fc2 statistics**
<**fabric** *fabric-name*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display Fibre Channel FC-2 statistics.

Options **fabric** ***fabric-name***—(Optional) Display output only for the specified fabric.

Required Privilege Level view

Output Fields Table 420 on page 5326 lists the output fields for the **show fibre-channel fc2 statistics** command. Output fields are listed in the approximate order in which they appear.

Table 420: show fibre-channel fc2 statistics Output Fields

Field Name	Field Description
Global statistics	Statistics for all fabrics.
Frame buffers allocated	Number of frame buffers currently allocated to all fabrics.
Frame buffers freed	Number of frame buffers freed.
Frames dropped	Number of dropped frames.
Fabric statistics	Fabric-specific statistics.
Fabric	Name of the fabric.
Fabric-id	Identification number of the fabric.
Tx-FRJTs	Number of fabric frame rejects (F_RJTs).
Tx-PRJTs	Number of port frame rejects (P_RJTs).
Tx-LSRJTs	Number of link service rejections.
Tx-ABTS	Number of abort sequence frames sent.
Rx-Drops	Number of received frames dropped.

Table 420: show fibre-channel fc2 statistics Output Fields *(continued)*

Field Name	Field Description
Rx-ABTS	Number of abort sequence frames received.

Sample Output

show fibre-channel fc2 statistics

```
user@switch> show fibre-channel fc2 statistics
Global statistics:

Frame buffers allocated: 60
Frame buffers freed:     60
Frames dropped:          0

Fabric statistics:

Fabric : fip-proxy, Fabric-id: 1
Tx-FRJTs:    0
Tx-PRJTs:    0
Tx-LSRJTs:   0
Tx-ABTS:     0
Rx-Drops:    0
Rx-ABTS:     0
```

show fibre-channel fip

Syntax
show fibre-channel fip
<brief | detail>

Release Information
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display Fibre Channel over Ethernet Initialization Protocol (FIP) information.

Options
brief | detail—(Optional) Display the specified level of output.

Output Fields
Table 421 on page 5328 lists the output fields for the **show fibre-channel fip** command. Output fields are listed in the approximate order in which they appear. A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

Table 421: show fibre-channel fip Output Fields

Field Name	Field Description	Level of Output
Configured max FIP sessions per Node Device	Configured maximum number of FIP sessions permitted on the Node device. For QFabric systems, this is the maximum number of FIP sessions permitted on each Node device in the fabric. For QFX3500 devices, this is the maximum number of FIP sessions permitted on the device.	**detail**
Node Device	Node device identifier.	**detail**
Total FIP sessions	Total number of FIP sessions on the FCoE-FC gateway switch.	**detail**

Table 421: show fibre-channel fip Output Fields *(continued)*

Field Name	Field Description	Level of Output
Total FCoE filters	Total number of FIP filters on the FCoE-FC gateway switch.	**detail**
Fabric Name	Name of the fabric and in parentheses the fabric ID.	All
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the fabric.	**detail**
FKA-ADV-PERIOD	Period of time in milliseconds between FIP keepalive advertisements configured for the FC fabric.	**detail**
MAX-SESSIONS-PER-ENODE	Maximum number of concurrent sessions (FLOGI and FDISC combined) that each ENode can instantiate.	**detail**
FCoE trusted	Whether ports on the FC fabric are trusted or untrusted: • **Yes**—Ports on the FC fabric are trusted; FIP snooping is turned off. • **No**—Ports on the FC fabric are not trusted; FIP snooping is turned on.	**detail**
Member	Information about an FCF that is a member of the fabric.	All
• **FCF-MAC**	MAC address used in discovery advertisements.	All
• **FKA-ADV-PERIOD**	Period of time in milliseconds between FIP keepalive advertisements configured for the FC interface.	**detail**
• **FKA-ADV-D-BIT**	Disable FIP keepalive advertisement monitoring bit. The state is always **off**.	**detail**
• **Type**	Type of interface: • **VF_Port Capable**—Interface can act as a VF_Port interface.	**detail**
• **Priority**	Priority value associated with the switch FCF-MAC. Converged network adapters (CNAs) use the priority value to determine the switch with which they will perform FIP FLOGI. The lower the value, the higher the priority. Value range: 0 through 255.	**detail**
• **State**	FIP state on the fabric: • **Enable**—FIP is enabled on the fabric. • **Disable**—FIP is disabled on the fabric.	**detail**

Table 421: show fibre-channel fip Output Fields *(continued)*

Field Name	Field Description	Level of Output
ENode	Information about a connected FCoE node (ENode).	All
• **ENode-MAC**	MAC address of the connected ENode.	All
• **Enode State**	Login state internal to Junos OS.	All
• **Configured ENode timer**	User-configured FIP keepalive advertisement interval in milliseconds.	**detail**
• **Running ENode timer**	Runtime interval in milliseconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	**detail**
• **Active FIP Sessions**	Number of active FIP sessions on the ENode.	**detail**
• **VN-Port-MAC**	MAC address of a VN_Port on the ENode.	All
• **Session State**	Session state internal to Junos OS.	**detail**
• **Configured FKA-ADV**	User-configured FIP keepalive advertisement interval in milliseconds.	**detail**
• **Running FKA-ADV**	Runtime interval in milliseconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	**detail**
• **Configured VN-Port Timer**	Configured state of the VN_Port keepalive timer in milliseconds. This value is always 90 and is not user-configurable.	**detail**
• **Running VN-Port Timer**	Running state of the VN_Port keepalive timer in milliseconds.	**detail**
• **FCID**	Fibre Channel ID of the VN_Port.	**detail**
• **WWN**	Unique worldwide name of the VN_Port.	**detail**

show fibre-channel fip enode

Syntax
show fibre-channel fip enode *enode-mac*
<**brief** | **detail**>
<**vn-port-mac** *vn-port-mac*>

Release Information
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) information for a specified ENode or a specified VN_Port on an ENode.

Options
brief | detail—(Optional) Display the specified level of output.

enode-mac—Display information for the ENode specified by the MAC address.

vn-port-mac ***vn-port-mac***—(Optional) Display information only for the specified VN_Port.

Required Privilege Level

show fibre-channel fip fcf

Syntax

show fibre-channel fip fcf *fcf-mac*
<**brief** | **detail**>
<**fabric** *fabric-name*>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) information for a specified FCoE forwarder (FCF).

Options

brief | detail—(Optional) Display the specified level of output.

fabric *fabric-name*—(Optional) Display FCF information only for the specified fabric.

fcf-mac—Display information for the FCF specified by the MAC address.

Required Privilege Level

Output Fields

Table 424 on page 5340 lists the output fields for the **show fibre-channel fip fcf** command. Output fields are listed in the approximate order in which they appear.

Table 424: show fibre-channel fip fcf Output Fields

Field Name	Field Description	Level of Output
Fabric Name	Name of the fabric and in parentheses the fabric ID.	All
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the fabric.	**detail**
FKA-ADV-PERIOD	Period of time in milliseconds between FIP keepalive advertisements configured for the FC fabric.	**detail**

Table 424: show fibre-channel fip fcf Output Fields *(continued)*

Field Name	Field Description	Level of Output
Member	Information about an FCF that is a member of the fabric.	All
• **FCF-MAC**	MAC address used in discovery advertisements.	All
• **FKA-ADV-PERIOD**	Period of time in milliseconds between FIP keepalive advertisements configured for the FC interface.	**detail**
• **FKA-ADV-D-BIT**	Disable FIP keepalive advertisement monitoring bit. The state is always **off**.	**detail**
• **Type**	Type of interface: • **VF_Port Capable**—Interface can act as a VF_Port interface.	**detail**
ENode	Information about a connected FCoE node (ENode).	All
• **ENode-MAC**	MAC address of the connected ENode.	All
• **State**	Login state internal to Junos OS.	All
• **VN-Port-MAC**	MAC address of a VN_Port on the ENode.	**detail**
• **Session State**	Session state internal to Junos OS.	**detail**
• **Configured FKA-ADV**	User-configured FIP keepalive advertisement interval in milliseconds.	**detail**
• **Running FKA-ADV**	Runtime interval in seconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	**detail**
• **Configured VN-Port Timer**	Configured state of the VN_Port keepalive timer in seconds. This value is always 90 and is not user-configurable.	**detail**
• **Running VN-Port Timer**	Running state of the VN_Port keepalive timer in seconds.	**detail**

List of Sample Output show fibre-channel fip statistics on page 5348

Output Fields Table 426 on page 5346 lists the output fields for the **show fibre-channel fip statistics** command. Output fields are listed in the approximate order in which they appear.

Table 426: show fibre-channel fip statistics Output Fields

Field Name	Field Description
Fabric name	Name of the fabric.
Interface name	Name of the FCoE VLAN interface.

Table 426: show fibre-channel fip statistics Output Fields *(continued)*

Field Name		Field Description
FIP Message Type		Type of FIP message for the displayed row of statistics..
	• **MDS**	Number of multicast discovery solicitations.
	• **UDS**	Number of unicast discovery solicitations.
	• **FLOGI**	Number of fabric login (FLOGI) messages.
	• **FDISC**	Number of fabric discovery (FDISC) messages.
	• **LOGO**	Number of fabric logout (LOGO) messages.
	• **ENODE KA**	Number of ENode keepalive messages.
	• **VN_Port KA**	Number of VN_Port keepalive messages.
	• **MDA**	Number of multicast discovery advertisements.
	• **UDA**	Number of unicast discovery advertisements.
	• **FLOGI ACC**	Number of fabric login requests accepted.
	• **FLOGI RJT**	Number of fabric login requests rejected.
	• **FDISC ACC**	Number of fabric discovery requests accepted.
	• **FDISC RJT**	Number of fabric discovery requests rejected.
	• **LOGO ACC**	Number of logout requests accepted.
	• **LOGO RJT**	Number of logout requests rejected.
	• **CVL**	Number of clear virtual links (CVL) messages.
	• **CVL ALL**	Number of CVL all messages.
Received		Number of messages received.
Sent		Number of messages sent.
Rx errors		Number of receive errors.

Table 426: show fibre-channel fip statistics Output Fields *(continued)*

Field Name		Field Description
Dropped		Number of dropped messages. NOTE: One cause of dropped messages is that the system limits the number of discovery solicitations (MDS and UDS) it accepts to a maximum of 100 outstanding requests at any given time. If the system has 100 discovery solicitations outstanding, the system does not respond to new discovery solicitations. Instead, the system drops new discovery solicitations and reports the number of dropped discovery solicitations in this field. When there are fewer than 100 outstanding discovery solicitations, the system responds to new requests as usual with a discovery advertisement.
General Statistics	**Number of frames recvd with invalid src-mac**	Number of frames received that have an invalid source media access control (MAC) address.
	Number of frames recvd with invalid version	Number of FIP frames received with an Invalid FIP version.
	Number of frames recvd with invalid opcode	Number of FIP validation descriptors with an invalid opcode received.
	Number of frames recvd with invalid subcode	Number of FIP validation descriptors with an invalid subcode received.
	Number of frames recvd on inactive FCF	Number of frames received on a logical interface if FIP is not active on that logical interface (for example, if a WWN is not allocated to that logical interface).

Sample Output

show fibre-channel fip statistics

```
user@switch> show fibre-channel fip statistics
Fabric name: proxy2

Interface name: vlan.100
FIP Message type      Received     Sent     Rx errors   Dropped
MDS                   22236        0        0           17089

Output Fields Table 429 on page 5354 lists the output fields for the **show fibre-channel flogi statistics** command. Output fields are listed in the approximate order in which they appear.

Table 429: show fibre-channel flogi statistics Output Fields

Field Name	Field Description
Fabric	Name of the fabric.
FLOGI-Server Message type	Type of message: • **FLOGI**—Fabric login (FLOGI) messages. • **FDISC**—Fabric discovery (FDISC) messages. • **FLOGO**—Fabric logout messages. • **FLOGO-LS-ACC**—Fabric logout link service accept messages. • **LS-Accept**—Link service accept messages. • **LS-Reject**—Link service reject messages. • **invalid**—Invalid messages.
Received	Number of messages received for a given message type.
Sent	Number of messages sent for a given message type.
Fabric	Name of the fabric.
Rx errors	Number of receive errors for a given type of message.

Table 429: show fibre-channel flogi statistics Output Fields *(continued)*

Field Name		Field Description
General Statistics	• **Number of FC2 Header Parse Errors**	Number of errors parsing the FC-2 header.
	• **Number of FLOGI Parse Errors**	Number of errors parsing fabric login requests.
	• **Number of FDISC Parse Errors**	Number of errors parsing fabric discovery requests.
	• **Number of FLOGO Parse Errors**	Number of errors parsing fabric logout requests.
	• **Number of Logins Discarded as Domain-ID not available**	Number of discarded logins due to unavailability of a domain ID.
	• **Number of Logins Discarded as FCID not available**	Number of discarded logins due to the unavailability of a Fibre Channel ID.
	• **Number of FCID requests deferred**	Number of deferred FCID requests.
	• **Number of deferred FCID requests failed**	Number of deferred FCID requests that failed.

Sample Output

show fibre-channel flogi statistics

```
user@switch> show fibre-channel flogi statistics
Fabric: proxy2

FLOGI-Server Message type   Received       Sent   Rx errors
FLOGI                       2              0      0
FDISC                       2              0      0

Output Fields

Table 430 on page 5357 lists the output fields for the **show fibre-channel interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 430: show fibre-channel interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the FC interface.	All
Idx or **Index**	Interface index internal to Junos OS.	All
Type	Type of interface: • **FC**—Native FC interface • **FCOE**—Fibre Channel over Ethernet interface	All
Native Fabric-id	Identification number of the QFX Series fabric.	All
NPIV	N_Port ID virtualization (NPIV) state: **Yes** or **No**.	All

Table 430: show fibre-channel interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Config-Mode	User-configured port mode: • **F**—The port is configured as a VF_Port, an FCoE port connected to FCoE devices. • **NP**—The port is configured as a proxy N_Port (NP_Port), a native FC port connected to an FC switch.	All
Oper-Mode	Operational port mode: • **F**—The port is operating as a VF_Port, an FCoE port connected to FCoE devices. • **NP**—The port is operating as an NP_Port, a native FC port connected to an FC switch or an FCoE forwarder (FCF).	All
State	Interface state: **up** or **down**.	All
WWN	Unique worldwide name (WWN) of the port.	**detail**
FSM-State	Finite state machine state, internal to Junos OS.	**detail**
Class ID	Fibre Channel interface class ID, internal to Junos OS.	**detail**
BB_SC_N	Buffer-to-buffer state change number.	**detail**
Tx B2B credits	Number of buffer-to-buffer credits advertised by the neighbor switch that is connected to the FC interface.	**detail**
Fabric	Name of the fabric.	**detail**
Remote-MAC	Media access control (MAC) address of the remotely connected FCoE device VN_Port interface.	**detail**
Tagging	Not used. Value is shown as **untagged**.	**detail**
Mode	Logical interface (LIF) mode of operation.	**detail**
H/W token	Unique identifier for the FCoE VLAN interface, internal to Junos OS.	**detail**

Sample Output

show fibre-channel interfaces

```
user@switch> show fibre-channel interfaces
                                    Native                  Config  Oper
Interface           Idx   Type      Fabric-id   NPIV        Mode    Mode    State
fc-0/0/1.0          70    FC        200         YES         NP      NP      up
vlan.100            84    FCOE      200         YES         F       F       up
```

show fibre-channel interfaces detail

```
user@switch> show fibre-channel interfaces detail
Interface: fc-0/0/1.0, Index: 70, Type: FC, Native Fabric-id: 200
NPIV: YES, Config-Mode: NP, Oper-Mode: NP, State: up
WWN: 10:00:00:15:17:a9:98:64, FSM-State: up, Class ID: 1, BB_SC_N: 0

List of Sample Output show fibre-channel next-hops on page 5360

Output Fields Table 431 on page 5360 lists the output fields for the **show fibre-channel next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 431: show fibre-channel next-hops Output Fields

Field Name	Field Description
Type	Type of next hop internal to Junos OS.
State	State of the NP_Port interface: • **Active**—The interface is online. • **Deleted**—The interface is deleted.
Interface	Name of the interface.
Mac-Address	Media access control (MAC) address of the interface.
Index	Next-hop index identifier.
Ref-count	Reference count internal to Junos OS.
Flags	Flags internal to Junos OS.

Sample Output

show fibre-channel next-hops

```
user@switch> show fibre-channel next-hops
Type    State  Interface    Mac-Address         Index  Ref-count Flags
intf    Active fc-0/0/0.0                       0       1
ucast   Active vlan.100     00:15:17:a9:98:64   674     1        kernel, self
ucast   Active vlan.100     0e:fc:00:03:00:01   675     1        kernel, self
ucast   Active vlan.100     0e:fc:00:03:00:02   676     1        kernel, self
ucast   Active vlan.100     0e:fc:00:03:00:03   677     1        kernel, self
ucast   Active vlan.100     0e:fc:00:03:00:04   678     1        kernel, self
```

show fibre-channel routes

Syntax **show fibre-channel routes**
<**fabric** *fabric-name*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display Fibre Channel route information.

Options **fabric** ***fabric-name***—(Optional) Display output only for the specified fabric.

Output Fields Table 433 on page 5364 lists the output fields for the **show fibre-channel proxy fabric-state** command. Output fields are listed in the approximate order in which they appear.

Table 433: show fibre-channel proxy fabric-state Output Fields

Field Name	Field Description
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.
Proxy load balance algorithm	Load-balancing algorithm used on the FCoE-FC gateway FC fabric: • Simple—Load balancing is based on the weighted utilization (load) of the NP_Ports connected to an FC fabric. Each new FLOGI or FDISC is assigned to the least-loaded link. On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner. • ENode-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. On a link load rebalance, all sessions are logged out. When the sessions log in again, they are placed on active NP_Port interfaces in a balanced manner. • FLOGI-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.

Table 433: show fibre-channel proxy fabric-state Output Fields *(continued)*

Field Name	Field Description
Fabric WWN verification	Fabric worldwide name (WWN) verification check state on the FCoE-FC gateway fabric: • Yes—Fabric WWN verification check is enabled. • No—Fabric WWN verification check is disabled.
Auto load rebalance enabled	Automated link load rebalancing configuration for the FCoE-FC gateway fabric: • No—Automated load balancing is disabled (default state). • Yes—Automated load balancing is enabled.
Last rebalance start-time	Time that the last link load rebalance began on the FCoE-FC gateway fabric: • Never—The link load has never been rebalanced. • Timestamp value—Time the last link load rebalancing started.
Last rebalance end-time	Time that the last link load rebalance ended on the FCoE-FC gateway fabric: • Never—The link load has never been rebalanced. • Timestamp value—Time the last link load rebalancing ended.
Last rebalance trigger	Event that triggered the last link load rebalance on the FCoE-FC gateway fabric: • None—The link load has never been rebalanced. • Config-CLI—Configure (enable) automated load balancing. • Request-CLI—Rebalance requested from the CLI using the **request fibre-channel proxy load-rebalance fabric *fabric-name*** operational command. • Preview-CLI—Rebalancing *dry run* requested from the CLI using the **request fibre-channel proxy load-rebalance dry-run fabric *fabric-name*** operational command. Indicates that the switch completed the dry run. A dry run simulates a link load rebalance and displays a list of sessions that might be affected if you request an actual rebalance. • Link-up—New FC link (NP_Port) up on the FCoE-FC gateway fabric, which causes a rebalance to distribute sessions to the new link. • Restore-complete—If the FC process on the switch restarts, the switch attempts to restore the session state that existed before the restart. When automated rebalance is enabled, restore-complete indicates that the sessions have been restored and rebalanced.
Last rebalance trigger-time	Time that the last link load rebalance was triggered on the FCoE-FC gateway fabric: • Never—Link load rebalancing has never been triggered. • Timestamp value—Time the last link load rebalancing was triggered.

Table 433: show fibre-channel proxy fabric-state Output Fields *(continued)*

Field Name	Field Description
Last rebalance trigger-result	Result of the last trigger event on the FCoE-FC gateway fabric: • Never—Link load rebalancing has never been triggered. • Not-configured—Automated rebalancing is not configured on the FCoE-FC gateway fabric. • Not-required—Last rebalance trigger did not require rebalancing the link load (the link load was already balanced across the active NP_Port links). • In-progress—Link load rebalancing is in progress and has not finished yet. • Restore-in-progress—The switch is recovering from an FC process restart and is in the process of restoring the sessions to the active NP_Port links. • Success—Link load rebalancing was successful. • Logged-out-all—All sessions have been logged out. • Preview-complete—The switch has finished simulating a dry run rebalancing request from the CLI (**request fibre-channel proxy load-rebalance dry-run fabric *fabric-name*** operational command) and reported the sessions that might be affected if you request an actual link load rebalance. • Fabric-deletion-in-progress—FCoE-FC gateway fabric is in the process of being deleted. NOTE: A trigger event does not necessarily result in a rebalance action. Link load rebalancing only occurs if the NP_Port interface session load is not balanced at the time of the trigger event.

Sample Output

show fibre-channel proxy fabric-state

```
user@switch> show fibre-channel proxy fabric-state

Output Fields

Table 434 on page 5368 lists the output fields for the **show fibre-channel proxy login-table** command. Output fields are listed in the approximate order in which they appear.

Table 434: show fibre-channel proxy login-table Output Fields

Field Name	Field Description	Level of Output
Fabric	Name of the fabric.	All
Fabric-id	Fabric ID number.	All
F-Port	One of the following two values: • VF_Port interface connected to the Fibre Channel over Ethernet (FCoE) host, shown as the FCoE VLAN interface. • QFX Series FC port that is logged in to the FC switch, shown by a hyphen (-) to indicate that it is not the FCoE device VN_Port.	All
FCID	VN_Port Fibre Channel identifier provided by the Fibre Channel over Ethernet (FCoE) forwarder (FCF) or the Fibre Channel switch.	All

Table 434: show fibre-channel proxy login-table Output Fields *(continued)*

Field Name	Field Description	Level of Output
Port-WWN	Unique worldwide name (WWN) of the VN_Port.	All
Node-WWN	Unique WWN of the node hosting the VN_Ports.	**detail**
NP-Port	NP_Port interface connected to the FCoE forwarder (FCF) or the Fibre Channel switch.	All
Class	FLOGI service class.	**detail**
Fabric port WWN	Unique WWN of the fabric port (VF_Port).	**detail**
Fabric WWN	Unique WWN of the fabric generated by the FCF.	**detail**

Sample Output

show fibre-channel proxy login-table

```
user@switch> show fibre-channel proxy login-table

show fibre-channel proxy np-port

Syntax

show fibre-channel proxy np-port
<**brief | detail**>
<**fabric** ***fabric-name***>
<**interface** ***interface-name***>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Fibre Channel gateway fabric proxy Node Port (NP_Port) information.

Options

brief | detail—(Optional) Display the specified level of output.

fabric ***fabric-name***—(Optional) Display output only for the specified fabric.

interface ***interface-name***—(Optional) Display output only for the specified interface.

Required Privilege Level

List of Sample Output

show fibre-channel proxy np-port on page 5372
show fibre-channel proxy np-port detail on page 5372

Output Fields

Table 435 on page 5371 lists the output fields for the **show fibre-channel proxy np-port** command. Output fields are listed in the approximate order in which they appear.

Table 435: show fibre-channel proxy np-port Output Fields

Field Name	Field Description	Level of Output
Fabric	Name of the fabric.	All
Fabric-id	Fabric ID number.	All
NP-Port	NP_Port interface connected to the FCoE forwarder (FCF) or the Fibre Channel switch.	All
State	FCID state of the NP_Port interface.	All
Sessions	Number of active sessions on the NP_Port interface. A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.	All

Table 435: show fibre-channel proxy np-port Output Fields *(continued)*

Field Name	Field Description	Level of Output
Configured max login sessions	Configured maximum number of FIP login sessions permitted on the interface.	**detail**
Enodes	Number of ENodes with sessions on the NP_Port.	**detail**
LB state	Load-balancing state: • **On**—Load balancing is on • **Off**—Load balancing is off.	All
LB weight	Load balance weight, which reflects the port speed: • **2**—Port speed is 2 Gbps. • **4**—Port speed is 4 Gbps. • **8**—Port speed is 8 Gbps.	All
Ref-count	Reference count internal to Junos OS.	**detail**
Flags	Flags internal to Junos OS. NOTE: When an NP_Port interface reaches its configured maximum number of FIP sessions, the **Flags** field displays the flag **MAX-LOGINS-REACHED**.	**detail**

Sample Output

show fibre-channel proxy np-port

```
user@switch> show fibre-channel proxy np-port
Fabric: proxy1, Fabric-id: 10

List of Sample Output show fibre-channel proxy statistics on page 5375

Output Fields Table 436 on page 5374 lists the output fields for the **show fibre-channel proxy statistics** command. Output fields are listed in the approximate order in which they appear.

Table 436: show fibre-channel proxy statistics Output Fields

Field Name	Field Description
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.

Table 436: show fibre-channel proxy statistics Output Fields *(continued)*

Field Name		Field Description
NP-Port Transmit Command Statistics		Transmitted command statistics for the NP_Port.
	• **Command**	Type of command issued on the NP_Port: • **FLOGI**—Fabric login commands issued. • **FDISC**—Fabric discovery commands issued. • **LOGO**—Logout commands issued. • **Others**—Other commands issued.
	• **Tx**	Number of times the command type was transmitted.
	• **Rx-ACC**	Number of times the NP_Port transmitted a receive accept message for the command type.
	• **Rx-RJT**	Number of times the NP_Port transmitted a receive reject message for the command type.
	• **Abort**	Number of times the NP_Port transmitted an abort message for the command type.
NP-Port Receive Command Statistics		Received command statistics for the NP_Port.
	• **Command**	The type of command received on the NP_Port: • **LOGO**—Logout commands issued. • **Others**—Other commands issued.
	• **Rx**	Number of times the command type was received.
	• **Tx-ACC**	Number of times the NP_Port received a transmit accept message for the command type.
	• **Tx-RJT**	Number of times the NP_Port received a transmit reject message for the command type.
	• **Abort**	Number of times the NP_Port received an abort message for the command type.

Sample Output

show fibre-channel proxy statistics

```
user@switch> show fibre-channel proxy statistics
Fabric: proxy1, Fabric-id: 10

NP-Port Transmit Command Statistics:
Command         Tx        Rx-ACC    Rx-RJT    Abort
FLOGI           3         3         0         0
FDISC           3         3         0         0
LOGO            0         0         0         0
```

```
Others          0         0         0         0

NP-Port Receive Command Statistics:
Command         Rx        Tx-ACC    Tx-RJT    Abort
LOGO            0         0         0         0
Others          0         0         0         0
```

show fip snooping

Syntax
show fip snooping
<brief | detail>

Release Information
Command introduced in Junos OS Release 10.4 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display FIP snooping information.

Options
none—Display FIP snooping information.

brief | detail—(Optional) Display the specified level of output.

Required Privilege Level

show fip snooping detail on page 5380

Output Fields
Table 437 on page 5377 lists the output fields for the **show fip snooping** command. Output fields are listed in the approximate order in which they appear.

Table 437: show fip snooping Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Mode	(QFX Series only) Snooping mode enabled on the FCoE VLAN: • VN2VF Snooping—The FCoE VLAN is configured for FIP snooping between an ENode VN_Port and a switch VF_Port. • VN2VN Snooping—The FCoE VLAN is configured for VN_Port to VN_Port FIP snooping between ENode VN_Ports.	All

Table 437: show fip snooping Output Fields *(continued)*

Field Name	Field Description	Level of Output
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the VLAN.	All
FCF or **FCF-MAC**	MAC address of the FCF.	All
Session Count or **Active Sessions**	Current number of virtual link sessions with VN_Ports.	All
VN_Port Count	(QFX Series only) Number of VN_Ports active on an ENode.	**brief**
Configured FKA-ADV	FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258. For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.	**detail**
Running FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the FCF received. This value changes every time the FCF receives an FKA_ADV. For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.	**detail**
Beacon Period	(QFX Series only) Beacon period interval in milliseconds.	**detail**
VN2VN Mode	(QFX Series only) Mode of VN2VN_Port snooping: • Multi-Point—Multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN_Ports. This is analogous to the loop mode in traditional FC networks. • Point-to-Point—Two ENodes are connected to the network and form a single VN_Port to VN_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.	**detail**
ENode-MAC	MAC address of the connected FCoE node (ENode).	All
Interface	Interface connected to the ENode.	**detail**
VN-Port MAC	MAC address of a VN_Port on the ENode.	All

Table 437: show fip snooping Output Fields *(continued)*

Field Name	Field Description	Level of Output
FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF on behalf of the VN_Port (VN_Port FKA_ADV). This value changes every time the ENode sends a VN_Port FKA_ADV to the FCF.	**detail**
Active VN_Ports	(QFX Series only) Number of VN_Ports active on an ENode.	**detail**
Vlink far-end VN-Port-MAC	(QFX Series only) Media access control (MAC) address of the VN_Port at the other end of the virtual link.	**detail**

Sample Output

For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258. This value remains constant. For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.	**detail**
Running FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF. This value changes every time the ENode sends an FKA_ADV to the FCF. For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.	**detail**
VN-Port or **VN-Port-MAC**	MAC address of a VN_Port on the ENode.	All
FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF on behalf of the VN_Port (VN_Port FKA_ADV). This value changes every time the ENode sends a VN_Port FKA_ADV to the FCF.	**detail**
FCF or **FCF-MAC**	MAC address of the FCF to which the VN_Port is connected.	All
Beacon Period	(QFX Series only) Beacon period interval in milliseconds.	**detail**

Table 438: show fip snooping enode Output Fields *(continued)*

Field Name	Field Description	Level of Output
VN2VN Mode	(QFX Series only) Mode of VN2VN_Port snooping: • Multi-Point—Multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN_Ports. This is analogous to the loop mode in traditional FC networks. • Point-to-Point—Two ENodes are connected to the network and form a single VN_Port to VN_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.	**detail**
Vlink far-end VN-Port-MAC	(QFX Series only) Media access control (MAC) address of the VN_Port at the other end of the virtual link.	**detail**

Sample Output

show fip snooping enode

```
user@switch> show fip snooping enode 00:10:94:00:00:02
Enode : 00:10:94:00:00:02   VLAN : vlan1   Interface : xe-0/0/1
        VN-Port-MAC           FCF-MAC
        0E:FC:00:00:00:05     00:10:94:00:00:01

show fip snooping fcf

Syntax **show fip snooping fcf** *fcf-mac*
<**brief** | **detail**>
<**vlan** *vlan-name*>

Release Information Command introduced in Junos OS Release 10.4 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display FIP snooping FCoE forwarder (FCF) information.

Options **brief | detail**—(Optional) Display the specified level of output.

fcf-mac—Display information for the FCF specified by the MAC address.

vlan-name—(Optional) Display FIP snooping information for the FCF on only the specified VLAN.

Required Privilege Level view

show fip snooping statistics (VN2VN_Port Snooping) on page 5393

Output Fields
Table 441 on page 5391 lists the output fields for the **show fip snooping statistics** command. Output fields are listed in the approximate order in which they appear.

Table 441: show fip snooping statistics Output Fields

Field Name	Field Description
VLAN	Name of the VLAN for which a set of statistics is displayed.
Mode	(QFX Series only) Snooping mode enabled on the FCoE VLAN: • VN2VF Snooping—The FCoE VLAN is configured for FIP snooping between an ENode VN_Port and a switch VF_Port. • VN2VN Snooping—The FCoE VLAN is configured for VN_Port to VN_Port FIP snooping between ENode VN_Ports.
Number of MDS	Number of multicast discovery solicitation messages sent on the VLAN.
Number of UDS	Number of unicast discovery solicitation messages sent on the VLAN.

Table 441: show fip snooping statistics Output Fields *(continued)*

Field Name	Field Description
Number of FLOGI	Number of fabric logins on the VLAN.
Number of FDISC	Number of fabric discovery logins on the VLAN.
Number of LOGO	Number of fabric logouts on the VLAN.
Number of ENode-keep-alive	Number of ENode keepalive messages sent on the VLAN.
Number of VNPort-keep-alive	Number of VN_Port keepalive messages sent on the VLAN.
Number of MDA	Number of multicast discovery advertisement messages sent on the VLAN.
Number of UDA	Number of unicast discovery advertisement messages sent on the VLAN.
Number of FLOGI_ACC	Number of fabric logins accepted on the VLAN.
Number of FLOGI_RJT	Number of fabric logins rejected on the VLAN.
Number of FDISC_ACC	Number of fabric discoveries accepted on the VLAN.
Number of FDISC_RJT	Number of fabric discoveries rejected on the VLAN.
Number of LOGO_ACC	Number of fabric logouts accepted on the VLAN.
Number of LOGO_RJT	Number of fabric logouts rejected on the VLAN.
Number of CVL	Number of clear virtual links (CVL) actions on the VLAN.
Number of VN_Port Probes Req	(QFX Series only) Number of multicast N_Port_ID probes sent to the ALL-VN2VN-ENode-MACs multicast address on the VLAN.
Number of VN_Port Claim Notif	(QFX Series only) Number of multicast N_Port_ID claim notifications sent on the VLAN.
Number of VN_Port Beacons	(QFX Series only) Number of multicast beacons sent on the VLAN.
Number of VN_Port Probes Reply	(QFX Series only) Number of replies to N_Port_ID probes sent on the VLAN. Replies are unicast to the ENode MAC address of the probe requester.
Number of VN_Port Claim Reply	(QFX Series only) Number of replies to N_Port_ID claim notifications sent on the VLAN. Replies are unicast to the ENode MAC address of the claim notifier.

Sample Output

show fip snooping statistics (FIP Snooping)

```
user@switch> show fip snooping statistics

show fip vlan-discovery

Syntax **show fip vlan-discovery (enodes | statistics)**

Release Information Command introduced in Junos OS Release 12.1 for the QFX Series.

Description Display FCoE VLAN information from the Fibre Channel switch or FCoE forwarder (FCF).

Options **enodes**—Display VLAN discovery information for each ENode.

statistics—Display VLAN discovery information statistics.

Required Privilege Level view

<**vpn** *vpn-instance-name*>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Fibre Channel family forwarding table route information.

Options

brief | detail | extensive—(Optional) Display the specified level of output.

all—Display all routing forwarding tables.

destination ***destination-prefix***—Destination prefix.

interface-name ***interface-name***—Name of the interface.

label ***label***—Display route entries for the specified label name.

matching ***ip-prefix***—Display route entries for the specified IP prefix or length.

multicast—Display multicast routes.

summary—Display route count instead of details.

table ***routing-table-name***—Name of the routing table.

vlan ***vlan-name***—Name of the VLAN.

vpn ***vpn-instance-name***—Name of the VPN instance.

- Troubleshooting Dropped FIP Traffic on page 5407

Troubleshooting Dropped FCoE Traffic

Problem **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

Cause There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.
5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

Solution The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

   If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

   If you explicitly configured a forwarding class for FCoE traffic, ensure that:

   - You specified the **no-loss** packet drop attribute in the forwarding class configuration
   - The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
   - The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

   For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2500
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces** *interface-name*.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers** ***scheduler-name*** operational command (specify the scheduler for FCoE traffic as the ***scheduler-name***) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

   Use the **show configuration class-of-service traffic-control-profiles** ***traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the ***traffic-control-profile***) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.

7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class** ***fcoe-forwarding-class-name*** **queue-num** ***queue-number*** **no-loss**).

See "Example: Configuring CoS PFC for FCoE Traffic" on page 5113 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

Troubleshooting Fibre Channel Interface Deletion

Problem **Description:** You deleted a Fibre Channel (FC) interface at the **[edit interfaces]** hierarchy level, but the commit check fails so the interface is not deleted.

Cause You must first delete the FC interface from the FC fabric on the QFX Series before you can delete the FC interface at the **[edit interfaces]** hierarchy level. You must perform both operations to delete a FC interface.

Solution First delete the interface from the FC fabric and then delete the interface from the QFX Series:

1. Delete the FC interface from the FC fabric to which it belongs:

   ```
   [edit]
   user@switch# delete fc-fabrics fabric-name interface interface-name
   ```

   For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

   ```
   [edit]
   user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
   ```

2. Delete the FC interface at the **[edit interfaces]** hierarchy level:

   ```
   [edit]
   user@switch: delete interfaces interface-name
   ```

   For example, to delete the interface **fc-0/0/3.0** from the switch:

   ```
   [edit]
   user@switch: delete interfaces fc-0/0/3.0
   ```

Troubleshooting Dropped FIP Traffic

Problem **Description:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) traffic such as FIP VLAN discovery and notification frames is dropped on the QFX Series.

Cause The interface on which the FIP traffic is dropped does not have a native VLAN configured. FIP VLAN discovery and notification messages are exchanged as untagged packets on the native VLAN. (After the FCoE session with the Fibre Channel switch is established, FCoE traffic uses the FCoE VLAN.)

Solution Check to ensure that every 10-Gigabit Ethernet interface that connects to an FCoE device includes a native VLAN. Configure a native VLAN on all 10-Gigabit Ethernet interfaces that connect to FCoE devices.

NOTE: Make sure that the native VLAN you are using on the QFX Series is the same native VLAN that the FCoE devices use for Ethernet traffic.

To configure a native VLAN on an interface:

1. Set the interface port mode to **tagged-access** if you have not already done so:

   ```
   [edit]
   ```

```
user@switch# set interfaces interface unit unit family ethernet-switching port-mode
tagged-access
```

For example, to set the port mode to **tagged-access** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure a native VLAN on the interface:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching native-vlan-id
vlan-id
```

For example, to set the native VLAN ID to **1** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
```

3. Configure the native VLAN if it does not already exist:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

For example, to name the native VLAN **native** and use the VLAN ID **1**:

```
[edit]
user@switch# set vlans native vlan-id 1
```

Overview of Junos OS CoS for the QFX Series

When a network experiences congestion and delay, some packets must be dropped. Junos OS class of service (CoS) enables you to divide traffic into classes and set various levels of throughput and packet loss when congestion occurs. You have greater control over packet loss because you can configure rules tailored to your needs.

You can configure CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP) or IEEE 802.1p code-point bits of packets leaving an interface, thus allowing you to tailor packets for the network requirements of the remote peers.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, schedule the transmission service level for each queue, and manage congestion using a random early detection (RED) algorithm.

In designing CoS applications, you must carefully consider your service needs, and you must thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because QFX Series implements CoS in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet forwarding and switching performance.

NOTE: **CoS policies can be enabled or disabled on each switch interface. Also, each physical and logical interface on the switch can have associated custom CoS rules.**

When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.

This topic describes:

- CoS Standards on page 5412
- How Junos CoS Works on page 5413
- Default CoS Behavior on page 5414

CoS Standards

The following RFCs define the standards for the QFX Series CoS capabilities:

- RFC 2474, *Definition of the Differentiated Services Field in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 2698, *A Two Rate Three Color Marker*

QFX Series also supports the following data center bridging (DCB) standards to provide the CoS (and other characteristics) Fibre Channel requires for transmitting storage traffic over an Ethernet network:

- IEEE 802.1Qbb, priority-based flow control (PFC)
- IEEE 802.1Qaz, enhanced transmission selection (ETS)
- IEEE 802.1AB (LLDP) extension called Data Center Bridging Capability Exchange Protocol (DCBX)

How Junos CoS Works

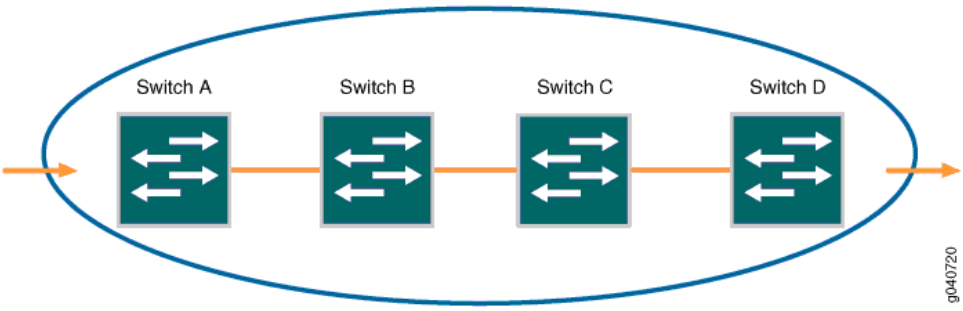
Junos CoS works by examining traffic entering at the edge of your network. The switch classifies traffic into defined service groups to provide the special treatment of traffic across the network. For example, you can send voice traffic across certain links and data traffic across other links. In addition, the data traffic streams can be serviced differently along the network path to ensure that higher-paying customers receive better service. As the traffic leaves the network at the far edge, you can reclassify the traffic to meet the policies of the targeted peer by rewriting the DSCP or IEEE 802.1 code-point bits.

To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings dictate which packets are transmitted first to the next downstream switch. Switches at the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.

In Figure 201 on page 5413, Switch A is receiving traffic. As each packet enters, Switch A examines the packet's current CoS settings and classifies the traffic into one of the groupings defined on the switch. This definition allows Switch A to prioritize its resources for servicing the traffic streams it receives. Switch A might alter the CoS settings (forwarding class and loss priority) of the packets to better match the defined traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packet according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can reclassify (rewrite) the CoS code-point bits of the packets before transmitting them.

Figure 201: Packet Flow Across the Network



Default CoS Behavior

If you do not configure CoS settings, the software performs some CoS functions to ensure that the system forwards traffic and protocol packets with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)

Before you upgrade to Junos OS Release 11.3, you must deactivate the CoS configuration if the CoS configuration includes any of the following features:

- **excess-rate** option
- **strict-high** or **high** priority queues
- Any of the Junos OS Release 11.1 or 11.2 default multidestination forwarding classes

CAUTION: **If your CoS configuration contains any of the features listed above and you attempt to upgrade from Junos OS Release 11.1 or 11.2 to a later version without first editing the configuration, the Junos OS might not restart.**

Junos OS Release 11.3 and later for QFX Series no longer supports the **excess-rate** statement, the **strict** priority option, or the default multidestination forwarding classes used in Junos OS Release 11.1 and 11.2. In addition, Junos OS Release 11.3 introduces new restrictions on how to configure and use **strict-high** priority queues.

This topic does not describe how to perform the software upgrade procedure. It describes how to deactivate your CoS configuration, edit your CoS configuration, and reactivate your CoS configuration at the appropriate times.

Use the following procedure to upgrade safely from Junos OS Release 11.1 or 11.2 to a later release:

1. Deactivate the CoS configuration *before* you upgrade the software:

   ```
   user@switch# deactivate class-of-service
   ```
2. Follow the upgrade procedure to Junos OS Release 11.3 or later software.
3. Make the following changes to the CoS configuration while the CoS configuration is still deactivated:

- Remove the **excess-rate** statement from the CoS configuration if you have used it at the **[edit class-of-service schedulers]** or **[edit class-of-service traffic-control-profiles]** hierarchy level.
- Remove the **strict-high** and **strict** priority queue configurations if you have used them at the **[edit class-of-service schedulers]** hierarchy level.
- Remove the default multidestination forwarding classes (**mcast-be**, **mcast-af**, **mcast-ef**, and **mcast-nc**) if you have used them at the **[edit class-of-service schedulers]**, **[edit class-of-service rewrite-rules]**, **[edit class-of-service classifiers]**, **[edit class-of-service scheduler-maps]**, or **[edit class-of-service forwarding-class-sets]** hierarchy level. Alternatively, you can change the mapping of the multidestination traffic to use the new default multidestination forwarding class (**mcast**).

4. If desired, configure **strict-high** priority queues in accordance with the Junos OS Release 11.3 or later configuration rules, and map multidestination traffic to the default multidestination forwarding class (**mcast**).
5. Activate the CoS configuration:

   ```
   user@switch# activate class-of-service
   ```
6. Commit the CoS configuration:

   ```
   user@switch# commit
   ```

NOTE: If you configured the transmit-rate option for any queues under the **[edit class-of-service schedulers]** hierarchy level, if the rate is configured as an exact rate in Mbps, we recommend that you reconfigure the transmit-rate option as a percentage. This is because the scheduler converts exact rates to percentages, and when the exact rate is below 1 Gbps, some granularity may be lost in the conversion. You can avoid this potential issue by specifying the transmit-rate option as a percentage.

Overview of CoS Upgrade Requirements to Junos OS Release 12.2

Before you upgrade to Junos OS Release 12.2, you might need to edit the class-of-service (CoS) configuration, because the way the QFX Series handles lossless forwarding classes has changed in Junos OS Release 12.2.

By default, the **fcoe** and **no-loss** forwarding classes are mapped to output queue 3 and output queue 4, respectively. These are the only two forwarding classes (and the only two queues) that support lossless transport.

In Junos OS Release 12.1 and earlier, explicitly setting the lossless **fcoe** and **no-loss** forwarding classes resulted in the same CoS behavior as using the default configuration. However, in Junos OS Release 12.2, the behavior when you explicitly configure the lossless forwarding classes differs from the behavior when you use the default forwarding classes.

NOTE: **The default behavior differs from the explicit configuration behavior even if the explicit configuration is exactly the same as the default configuration.**

- If you use the default forwarding class configuration for the lossless queues (the configuration does not include explicit setting of the **fcoe** or the **no-loss** forwarding classes), then the **fcoe** and **no-loss** queues behave as lossless queues.

  If your CoS configuration does not explicitly configure the **fcoe** and **no-loss** forwarding classes, you can upgrade from Junos OS Release 12.1 to Junos OS Release 12.2, and the behavior of the two lossless queues remains the lossless.

- If your configuration includes statements that explicitly configure the **fcoe** or the **no-loss** forwarding class (using the **[set class-of-service forwarding-classes class *class-name* queue-num *queue-number*]** statement), after you upgrade to Junos OS Release 12.2, those queues do *not* receive lossless treatment and behave as lossy (**best-effort**) queues.

  If your CoS configuration explicitly configures the **fcoe** and **no-loss** forwarding classes, to retain the lossless behavior of those queues, you need to remove the explicit configuration for these two forwarding classes from the CoS configuration *before* you upgrade.

If you upgrade to Junos OS Release 12.2 and the **fcoe** and **no-loss** forwarding classes are explicitly configured, then those two queues continue to be used, but the traffic is treated as lossy traffic, not lossless traffic. To make the queues for these two forwarding classes lossless, you must delete the explicit forwarding class configuration.

CAUTION: **If you explicitly configured the fcoe or the no-loss forwarding class and you upgrade to Junos OS Release 12.2, the system does not return an upgrade error or a commit error, or a generate a syslog message, to notify you that these forwarding classes are no longer lossless. Traffic mapped to**

these forwarding classes is not treated as lossless traffic until you remove the explicit forwarding class configuration.

Before you upgrade, delete the **fcoe** and **no-loss** forwarding classes from the explicit configuration to preserve the lossless behavior of traffic mapped to these forwarding classes.

- To delete the explicit **fcoe** forwarding class configuration:

```
[edit]
user@switch# delete class-of-service forwarding-class class fcoe queue-num 3
user@switch# commit
```

- To delete the explicit **no-loss** forwarding class configuration:

```
[edit]
user@switch# delete class-of-service forwarding-class class no-loss queue-num 4
user@switch# commit
```

NOTE: If you try to delete these forwarding classes and they have not been explicitly configured on the system, the system returns the message **warning: statement not found**. This simply means that there is no explicit configuration to delete and does not change the lossless behavior of the **fcoe** and **no-loss** forwarding classes.

After you delete the explicit configuration for the **fcoe** and **no-loss** forwarding classes, traffic mapped to those forwarding classes retains its lossless behavior after the upgrade to Junos OS Release 12.2.

Overview of CoS Upgrade Requirements to Junos OS Release 12.3 (QFX3500 and QFX3600 Switches) or to Junos OS Release 13.1 (QFabric Systems)

Before you upgrade to Junos OS Release 12.3 (QFX3500 and QFX3600 switches) or to Junos OS Release 13.1 (QFabric systems), you might need to edit the class-of-service (CoS) configuration, because the way the QFX Series handles lossless forwarding classes has changed from earlier Junos OS releases. (Throughout this document, changes introduced on standalone switches in Junos OS Release 12.3 are introduced on QFabric systems in Junos OS Release 13.1 unless otherwise noted.)

- Support for Six Lossless Forwarding Classes on page 5418
- Scheduling on QFabric System Node Device Fabric (fte) Ports on page 5419
- Strict-High Priority Scheduling on QFabric System Node Device Fabric (fte) Ports on page 5420

Support for Six Lossless Forwarding Classes

By default, the *fcoe* and *no-loss* forwarding classes are mapped to output queue 3 and output queue 4, respectively, and to IEEE 802.1p priority 3 (code point 011) and priority 4 (code point 100), respectively. These are the only two forwarding classes (and the only two queues) that support lossless transport in the default configuration.

If you use the default CoS configuration, you do not need to edit the CoS configuration after upgrading to Junos OS Release 12.3 (QFX3500 and QFX3600 switches) or to Junos OS Release 13.1 (QFabric system) because the default CoS configuration is backward-compatible.

Junos OS Release 12.3 increases the support for lossless forwarding classes (priorities) from two forwarding classes to six forwarding classes. To support configuring lossless forwarding classes, Junos OS Release 12.3 introduces a new option to forwarding class configuration: the *no-loss* packet drop attribute.

NOTE: The new *no-loss* packet drop attribute and the previously existing *no-loss* default forwarding class have the same name, but they are not the same. You can use the no-loss packet drop attribute on any unicast forwarding class.

If you explicitly configure any lossless forwarding class (including explicitly configuring the default fcoe and no-loss forwarding classes), you *must* specify the no-loss packet drop attribute to obtain lossless behavior. If you do not explicitly configure the fcoe and no-loss forwarding classes, those forwarding classes remain lossless.

The addition of the no-loss packet drop attribute to forwarding class configuration means that when you upgrade from an earlier release to Junos OS Release 12.3, the new software might not preserve the lossless forwarding class configuration of the fcoe and no-loss forwarding classes.

If you used the default forwarding class configuration for the fcoe and no-loss forwarding classes, the CoS configuration is backward-compatible. You do not have to do anything

to preserve the lossless behavior of traffic that uses those forwarding classes when you upgrade to Junos OS Release 12.3. (This is because the default configuration of these two forwarding classes includes the no-loss packet drop attribute.)

However, if you explicitly configured the fcoe or the no-loss forwarding class by including the **set forwarding-classes class *forwarding-class-name* queue-num *queue-number*** at the **[edit class-of-service]** hierarchy level, then those forwarding classes are no longer lossless, they are lossy. In Junos OS Release 12.3 and later, you must include the *no-loss* packet drop attribute in any explicit forwarding class configuration to configure a lossless forwarding class.

For example, before Junos OS Release 12.3, the following explicit configuration resulted in a lossless forwarding class:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3
```

However, in Junos OS Release 12.3, this configuration is lossy because it does not include the no-loss packet drop attribute. To preserve lossless behavior, after upgrading to Junos OS Release 12.3, you need to add the no-loss drop attribute:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3 no-loss
```

Alternatively, you can delete the explicit configuration before you upgrade to Junos OS Release 12.3 so that the system uses the default forwarding class, which is lossless:

```
user@switch# delete class-of-service forwarding-classes class fcoe queue-num 3
```

NOTE: The explicit configuration of other forwarding classes does not affect the lossless (or lossy) state of the fcoe and no-loss forwarding classes, because only the fcoe and no-loss forwarding classes are lossless forwarding classes before Junos OS Release 12.3. For example, if you explicitly configured the best-effort forwarding class but you used the default fcoe and no-loss forwarding classes in Junos OS Release 12.2, then when you upgrade to Junos OS Release 12.3, the fcoe and no-loss forwarding classes are still lossless (and the best-effort forwarding class retains its explicit configuration).

NOTE: To achieve lossless behavior for the traffic belonging to any forwarding class, you must also enable PFC on the IEEE 802.1p priority mapped to the forwarding class and ensure that DCBX exchanges the protocol TLVs for the application with the connected peer.

Scheduling on QFabric System Node Device Fabric (fte) Ports

Junos OS Release 13.1 introduces the ability to configure scheduling on the fabric (fte) ports of QFabric system Node devices. In earlier Junos OS releases, Node device fabric port scheduling was done by default, with no user configuration.

In Junos OS Release 13.1, the default fabric port scheduler configuration is similar to the default scheduler configuration on access interfaces. Similar to the access port default configuration, the default fabric port scheduler supports the five default forwarding

classes (best-effort, fcoe, no-loss, network-control, and mcast). If you configure any new forwarding classes, you must configure scheduling on the fabric ports to allocate bandwidth to those forwarding classes, just as you must configure scheduling on the access ports for user-defined forwarding classes.

Strict-High Priority Scheduling on QFabric System Node Device Fabric (fte) Ports

If a fabric interface handles strict-high priority traffic, you must define a separate fc-set (priority group) for strict-high priority traffic. Strict-high priority traffic cannot be mixed with traffic of other priorities in an fc-set. For example, you might choose to create different fc-sets for best effort, lossless, strict-high priority, and multidestination traffic.

Overview of CoS Changes Introduced in Junos OS Release 11.3

Junos OS Release 11.3 introduces many changes to class-of-service (CoS) functionality and to the CoS default values. This overview summarizes the changes, which other documents describe in detail.

NOTE: Some of the CoS changes are not backward compatible with Junos OS Releases 11.1 and 11.2. "Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)" on page 53 describes how to upgrade to Junos OS Release 11.3 if you have configured CoS on your QFX3500 switch.

This topic describes the following changes in CoS default values and behavior:

- CoS Default Value Changes on page 5420
- Queue Priority Configuration Changes on page 5425
- Minimum Guaranteed Bandwidth (Transmit Rate and Guaranteed Rate) Changes on page 5426
- Excess Rate Statement Disabled on page 5426
- Queue Scheduling (Low and Strict-High Priority Queues) on page 5427
- Multidestination Traffic Changes on page 5427

CoS Default Value Changes

The default values of the following CoS components have changed in Junos OS Release 11.3:

- Default Forwarding Classes on page 5421
- Default IEEE 802.1p Unicast Classifiers on page 5422
- Default IEEE 802.1p Multidestination Classifiers on page 5423
- Default Scheduler on page 5424

Default Forwarding Classes

In Junos OS Releases 11.1 and 11.2, there were eight default forwarding classes, four unicast default forwarding classes and four default multidestination (multicast, broadcast, and destination lookup fail) forwarding classes. Table 445 on page 5421 shows the old default forwarding classes and default queue mapping:

Table 445: Junos OS Release 11.1 and 11.2 Default Forwarding Classes and Queue Mapping

Default Forwarding Class	Description	Default Queue Mapping
best-effort (be)	Unicast best-effort traffic	0
no-loss	Unicast guaranteed delivery for TCP no-loss traffic	2
fcoe	Unicast guaranteed delivery for FCoE traffic	3
network-control	Unicast network control traffic	7
multicast-best-effort (mcast-be)	Multidestination best-effort traffic	8
multicast-expedited-forwarding (mcast-ef)	Multidestination low-loss, low-latency traffic	9
multicast-assured-forwarding (mcast-af)	Multidestination assured forwarding traffic	10
multicast-network-control (mcast-nc)	Multidestination network control traffic	11

Junos OS Release 11.3 changes the default forwarding classes and queue mapping in the following ways:

- Instead of eight default forwarding classes, there are five default forwarding classes.
- The same four unicast default forwarding classes remain valid, but the default queue mapping of the no-loss forwarding class has changed from queue 2 to queue 4.
- There is now only one default multidestination forwarding class instead of four default multidestination forwarding classes. All multidestination traffic is assigned by default to the default multidestination forwarding class.

NOTE: The rest of the forwarding class characteristics remain the same as before. For example, the QFX Series still supports 12 forwarding classes and 12 output queues. You can still configure a total of eight unicast forwarding classes and four multidestination forwarding classes. The unicast queues are still queues 0 through 7 and the multidestination queues are still queues 8 through 11. Unicast traffic must be mapped to unicast queues, and multidestination traffic must be mapped to multidestination queues. The queue to which a forwarding class is mapped determines whether the forwarding class is unicast or multidestination.

Table 446 on page 5422 shows the default forwarding classes and queue mapping in Junos OS 11.3 and later:

Table 446: Junos OS Release 11.3 Default Forwarding Classes and Queue Mapping

Default Forwarding Class	Description	Default Queue Mapping
best-effort (be)	Best-effort traffic class	0
fcoe	Guaranteed delivery for FCoE traffic	3
no-loss	Guaranteed delivery for TCP no-loss traffic	4
network-control (nc)	Network control traffic	7
mcast	Multicast traffic	8

Default IEEE 802.1p Unicast Classifiers

In Junos OS Release 11.1 and 11.2, there were default unicast classifiers only for best-effort and network-control traffic, as shown in Table 447 on page 5422:

Table 447: Junos OS Release 11.1 and 11.2 Default IEEE 802.1 Unicast Classifiers

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	best-effort	low
af11 (100)	best-effort	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Junos OS Release 11.3 introduces new default classifiers for FCoE and no-loss traffic, replacing the best-effort classifiers mapped to IEEE 802.1p code points 011 and 100, respectively, as shown in Table 448 on page 5422:

Table 448: Junos OS Release 11.3 Default IEEE 802.1 Unicast Classifiers

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low

Table 448: Junos OS Release 11.3 Default IEEE 802.1 Unicast Classifiers *(continued)*

Code Point	Forwarding Class	Loss Priority
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Default IEEE 802.1p Multidestination Classifiers

In Junos OS Release 11.1 and 11.2, there were default multidestination classifiers for best-effort and network-control traffic, as shown in Table 449 on page 5423:

Table 449: Junos OS Release 11.1 and 11.2 Default IEEE 802.1 Multidestination Classifiers

Code Point	Forwarding Class	Loss Priority
be (000)	mcast-be	low
be1 (001)	mcast-be	low
ef (010)	mcast-be	low
ef1 (011)	mcast-be	low
af11 (100)	mcast-be	low
af12 (101)	mcast-be	low
nc1 (110)	mcast-nc	low
nc2 (111)	mcast-nc	low

Junos OS Release 11.3 replaces the best-effort and network-control multidestination classifiers and maps all IEEE 802.1p code points to the new default multidestination forwarding class, as shown in Table 450 on page 5423:

Table 450: Junos OS Release 11.3 Default IEEE 802.1 Multidestination Classifiers

Code Point	Forwarding Class	Loss Priority
be (000)	mcast	low

Table 450: Junos OS Release 11.3 Default IEEE 802.1 Multidestination Classifiers *(continued)*

Code Point	Forwarding Class	Loss Priority
be1 (001)	mcast	low
ef (010)	mcast	low
ef1 (011)	mcast	low
af11 (100)	mcast	low
af12 (101)	mcast	low
nc1 (110)	mcast	low
nc2 (111)	mcast	low

Default Scheduler

In Junos OS Release 11.1 and 11.2, there were four default schedulers:

- Unicast best effort
- Unicast network control
- Multidestination best effort
- Multidestination network control

Table 451 on page 5424 shows the default scheduler configuration in Junos OS Release 11.1 and 11.2:

Table 451: Junos OS Release 11.1 and 11.2 Default Schedulers

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Rate (Extra Bandwidth Sharing)	Priority
Best-effort scheduler (queue 0)	75%	None	25%	Low
Network-control scheduler (queue 7)	5%	None	25%	Low
Best-effort multidestination scheduler (queue 8)	15%	None	25%	Low
Network-control multidestination scheduler (queue 11)	5%	None	25%	Low

Junos OS Release 11.3 replaces the four old classifiers with five new classifiers:

- Unicast best effort
- FCoE
- No loss
- Unicast network control
- Multidestination

There are now four different default unicast classifiers to provide default CoS for lossless queues (FCoE and no-loss traffic). Because there is only one default multidestination forwarding class in Junos OS Release 11.3, there is only one default multidestination classifier for all multidestination traffic. Also, the excess rate default value is removed from the scheduler because the **excess-rate** statement is no longer supported, as described elsewhere in this document. Table 452 on page 5425 shows the default scheduler configuration in Junos OS Releases 11.3:

Table 452: Default Schedulers

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority
Best-effort scheduler (queue 0)	5%	None	5%	Low
FCoE scheduler (queue 3)	35%	None	35%	Low
No-loss scheduler (queue 4)	35%	None	35%	Low
Network-control scheduler (queue 7)	5%	None	5%	Low
Multidestination scheduler (queue 8)	20%	None	20%	Low

NOTE: The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

Queue Priority Configuration Changes

In Junos OS Release 11.1 and 11.2, you could configure strict-high priority queues with a guaranteed minimum bandwidth and configure forwarding class sets (priority groups) with a mix of low priority and strict-high priority queues. In Junos OS Release 11.3 and later, these configurations are invalid, and several other changes have also been implemented:

- Priority configuration in Junos OS Release 11.1 and 11.2 provided three priority levels: **strict-high**, **high**, and **low**. In Junos OS Release 11.3, the **high** priority option has been removed. Only the **strict-high** and **low** priority options are valid in Release 11.3.
- Minimum guaranteed bandwidth (transmit rate) is not allowed on strict-high priority queues. Minimum guaranteed bandwidth (guaranteed rate) is not allowed on forwarding class sets that contain strict-high priority queues.
- You cannot configure a multidestination queue as a strict-high priority queue. You cannot configure a queue as a strict-high priority queue if it belongs to the multidestination forwarding class set.
- Only one forwarding class set can contain strict-high priority queues. If you want to configure a strict-high priority queue, you must also configure a separate forwarding class set for the strict-high priority queue. A forwarding class set cannot contain a mixture of low priority and strict-high priority queues.

The rest of the queue priority characteristics remain the same as before. For example, you can configure only one queue as a strict-high priority queue.

NOTE: If you have configured strict-high or high priority queues in Junos OS Release 11.1 or 11.2, the changes in Release 11.3 are not backward compatible. Please read "Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)" on page 53 before you upgrade to Release 11.3.

Minimum Guaranteed Bandwidth (Transmit Rate and Guaranteed Rate) Changes

The following restrictions have been placed on minimum guaranteed bandwidth configuration in Junos OS Release 11.3:

- You cannot configure a guaranteed minimum bandwidth (transmit rate) for strict-high priority queues.
- Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.
- You cannot configure a guaranteed minimum bandwidth (guaranteed rate) for forwarding class sets that include strict-high priority queues.
- For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

Excess Rate Statement Disabled

The **excess-rate** statement has been disabled in Junos OS Release 11.3. Excess rate was used to specify the way extra bandwidth was shared among queues.

The **excess-rate** statement was used at the **[edit class-of-service schedulers]** hierarchy level for queue scheduling configuration and at the **[edit class-of-service traffic-control-profiles]** hierarchy level for forwarding class set scheduling configuration.

In Junos OS Release 11.3, extra bandwidth sharing among queues is proportional to the minimum guaranteed bandwidth (transmit rate) of the queue. Extra bandwidth sharing among forwarding class sets (priority groups) is proportional to the minimum guaranteed bandwidth (guaranteed rate) of the forwarding class set.

NOTE: If you have configured the excess-rate option in Junos OS Release 11.1 or 11.2, the changes in Release 11.3 are not backward compatible. Please read "Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)" on page 53 before you upgrade to Release 11.3.

Queue Scheduling (Low and Strict-High Priority Queues)

In Junos OS Release 11.1 and 11.2, if you configured a guaranteed minimum bandwidth (transmit rate) for low-priority queues, the low-priority queues received their guaranteed minimum bandwidth from the same bandwidth pool as the strict-high priority queue, using round-robin scheduling. Until the minimum bandwidth requirements of all queues were met, the strict-high priority queue and low-priority queues that had a guaranteed minimum bandwidth were treated equally. After the minimum bandwidth requirements of all queues were met, the strict-high priority queue received as much of the leftover bandwidth as it needed. This meant that the only way to ensure that a strict-high priority queue received all of the bandwidth it needed was not to configure a guaranteed minimum bandwidth for other queues.

In Junos OS Release 11.3 and later, queue scheduling has changed so that queues receive bandwidth in the following sequence:

1. The strict-high priority queue receives all of the bandwidth it needs before any other queue is served. The strict-high priority queue can take the full port bandwidth if necessary and can starve other queues on the port.
2. The guaranteed minimum bandwidth (transmit rate) of low-priority queues is served until the minimum is met or the queues are empty.
3. All other low-priority queues and needs that exceed the minimum bandwidth are served.

Multidestination Traffic Changes

The changes to the default forwarding classes and classifiers affects multidestination traffic handling in Junos OS Release 11.3:

- The number of default multidestination forwarding classes has been reduced from four default multidestination forwarding classes in Junos OS Release 11.1 and 11.2 to one default multidestination in Release 11.3 (see Table 446 on page 5422).
- The default classifier configuration for multidestination traffic has changed so that there is now one default classifier for all multidestination traffic (see Table 450 on page 5423).
- By default, all IEEE 802.1p code points map to the default multidestination forwarding class.

- The default scheduler for multidestination traffic has changed so that there is now one default scheduler for all multidestination traffic (see Table 452 on page 5425).
- You cannot configure multidestination queues as strict-high priority queues and you cannot include strict-high priority queues in a forwarding class set that contains multidestination queues.

Overview of CoS Changes Introduced in Junos OS Release 12.2

Junos OS Release 12.2 introduces some changes to class-of-service (CoS) functionality and to the CoS default values. This overview summarizes the changes, which other documents describe in detail.

This topic describes the following changes in CoS default values and behavior:

- Lossless Forwarding Classes (fcoe and no-loss) on page 5428
- Default MTU for Headroom Buffer Calculation for Lossless Forwarding Classes on page 5429
- CoS for Layer 3 Physical Interfaces on page 5429
- DSCP IPv6 Classifiers and Rewrite Rules on page 5429

Lossless Forwarding Classes (fcoe and no-loss)

The way the QFX Series handles lossless forwarding classes (the **fcoe** and **no-loss** forwarding classes) changes in Junos OS Release 12.2. In Junos OS Release 12.2 and in earlier releases, by default, the **fcoe** and **no-loss** forwarding classes are mapped to output queue 3 and output queue 4, respectively. These are the only two forwarding classes (and the only two queues) that support lossless transport.

In earlier releases, explicitly setting the lossless **fcoe** and **no-loss** forwarding classes resulted in the same CoS behavior as using the default configuration. However, in Junos OS Release 12.2, the behavior when you explicitly configure the lossless forwarding classes differs from the behavior when you use the default forwarding classes.

NOTE: **The default behavior differs from the explicit configuration behavior even if the explicit configuration is exactly the same as the default configuration.**

If you use the default forwarding class settings for the lossless queues (the configuration does not include explicit setting of the **fcoe** or the **no-loss** forwarding classes), then the **fcoe** and **no-loss** queues behave as lossless queues. When you upgrade to Junos OS Release 12.2, traffic assigned to the **fcoe** and **no-loss** queues continues to be treated as lossless traffic.

If your configuration explicitly sets the **fcoe** or the **no-loss** forwarding class (**set class-of-service forwarding-classes class *class-name* queue-num *queue-number***), after you upgrade to Junos OS Release 12.2, those queues do *not* receive lossless treatment and behave as lossy (**best-effort**) queues. To retain lossless treatment of the **fcoe** and **no-loss** queues, delete the explicit lossless forwarding class configuration before you upgrade to Junos OS Release 12.2.

CAUTION: **If you explicitly configured the fcoe or the no-loss forwarding class, and you upgrade to Junos OS Release 12.2, the system does not return an upgrade error or a commit error, or a generate a syslog message, to notify you that these forwarding classes are no longer lossless. Traffic mapped to these forwarding classes is not treated as lossless traffic until you remove the explicit forwarding class configuration.**

Default MTU for Headroom Buffer Calculation for Lossless Forwarding Classes

The default maximum transmission unit (MTU) the system uses for buffer headroom calculation is 2500 bytes for traffic classified into the **fcoe** forwarding class or the **no-loss** forwarding class.

In Junos OS Release 12.2, the default MTU used for buffer headroom calculation for the **fcoe** and **no-loss** forwarding classes remains 2500 bytes. However, if the buffer is filled, in Junos OS Release 12.2 you might experience commit failures.

CoS for Layer 3 Physical Interfaces

Before Junos OS Release 12.2, the QFX Series supported only Layer 2 CoS. Junos OS Release 12.2 introduces CoS support for Layer 3 traffic at the physical interface level.

If a physical Layer 3 interface has at least one logical interface configured on it, you can configure Layer 3 CoS for the physical interface. The CoS configured on the physical interface applies to all of the logical Layer 3 interfaces on that physical interface. The system does not support Layer 3 CoS configuration on individual Layer 3 logical interfaces.

DSCP IPv6 Classifiers and Rewrite Rules

Junos OS Release 12.2 introduces support for DSCP IPv6 classifiers and rewrite rules. The existing DSCP IP default classifier is now also the DSCP IPv6 default classifier.

You can configure and apply DSCP IPv6 classifiers and DSCP IPv6 rewrite rules to Layer 2 logical interfaces and to Layer 3 physical interfaces.

NOTE: DSCP IPv6 classifiers are not supported for multidestination (multicast, broadcast, and destination lookup fail) traffic.

Overview of Policers

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

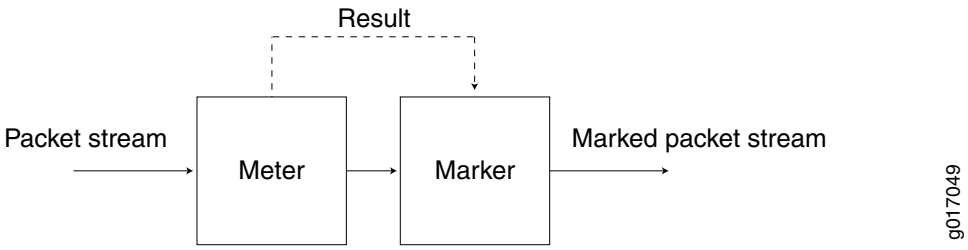
Policer Overview

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. Figure 171 on page 4664 illustrates this process.

Figure 202: Flow of Tricolor Marking Policer Operation



After you name and configure a policer, you use it by specifying it as an action in one or more firewall filters.

Policer Types

A switch supports three types of policers:

- Single-rate two-color marker—A two-color policer (or "policer" when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

  You can specify this type of policer in an ingress or egress firewall.

  NOTE: **A two-color policer is most useful for metering traffic at the port (physical interface) level.**

- Single-rate three-color marker—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

  You can specify this type of policer in an ingress or egress firewall.

  NOTE: **A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.**

- Two-rate three-color marker—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

NOTE: A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See Table 365 on page 4666 for information about how metering results are applied for each of these policer types.

Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. Table 365 on page 4666 describes the policer actions.

Table 453: Policer Actions

Policer	Marking	Implicit Action	Configurable Action
Single-rate two-color	Green (conforming)	Assign low loss priority	None
	Red (nonconforming)	None	Discard
Single-rate three-color	Green (conforming)	Assign low loss priority	None
	Yellow (above the CIR and CBS)	Assign medium-high loss priority	None
	Red (above the EBS)	Assign high loss priority	Discard
Two-rate three-color	Green (conforming)	Assign low loss priority	None
	Yellow (above the CIR and CBS)	Assign medium-high loss priority	None
	Red (above the PIR and PBS)	Assign high loss priority	Discard

NOTE: If you specify a policer in an egress firewall filter, the only supported action is discard.

Policer Colors

Single-rate and two-rate three-color policers can operate in two modes:

- Color-blind—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- Color-aware—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in TCAM. If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented in “Planning the Number of Firewall Filters to Create” on page 4658 to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

Suggested Naming Convention for Policers

We recommend that you use the naming convention ***policertypeTCM#-color type*** when configuring three-color policers and ***policer#*** when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named **srTCM1-ca**. The second two-rate, color-blind three-color configured would be named **trTCM2-cb**. The elements of this naming convention are explained below:

- sr (single-rate)
- tr (two-rate)
- TCM (tricolor marking)
- 1 or 2 (number of marker)
- ca (color-aware)
- cb (color-blind)

Policer Counters

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

Policer Algorithms

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

How Many Policers are Supported?

You can configure and commit the following numbers of policers on QFX3500 and QFX3600 standalone switches and QFabric Node devices:

- Two-color policers used in ingress firewall filters: 767
- Three-color policers used in ingress firewall filters: 767
- Two-color policers used in egress firewall filters: 1022
- Three-color policers used in egress firewall filters: 512

Policers can Limit Egress Firewall Filters

The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.

- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

- Rewrite Rules on page 5439

Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers and rewrite rules.

Policers

Policers limit traffic of a certain class to a specified bandwidth and burst size. Packets exceeding the policer limits can be discarded, or can be assigned to a different forwarding

class, a different loss priority, or both. You define policers with filters that you can associate with input interfaces.

Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. In Junos OS, *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate (BA) or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.
- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

You can create unicast classifiers for unicast traffic and multidestination classifiers for multicast, broadcast, and destination lookup fail traffic. You cannot assign unicast traffic and multidestination traffic to the same classifier.

You can apply unicast classifiers to one or more interfaces. Multidestination classifiers apply to all of the switch interfaces and cannot be applied to individual interfaces.

Forwarding Classes

Forwarding classes group packets for transmission and CoS. You assign each packet to an output queue based on the packet's forwarding class. Forwarding classes affect the forwarding, scheduling, and rewrite marking policies applied to packets as they transit the switch.

The switch provides five default forwarding classes:

- fcoe—Fibre Channel over Ethernet traffic
- no-loss—Lossless traffic
- be—Best-effort traffic
- nc—Network control traffic
- mcast—Multicast traffic

The switch supports a total of 12 forwarding classes (8 unicast forwarding classes and 4 multicast forwarding classes), which provide flexibility in classifying traffic.

Forwarding Class Sets

You can group forwarding classes (output queues) into *forwarding class sets* in order to apply CoS to groups of traffic that require similar treatment. Forwarding class sets map traffic into priority groups to support enhanced transmission selection (ETS, described in IEEE 802.1Qaz).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set. For example, you can configure different forwarding class sets to apply CoS to unicast groups of local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and configure another group for multicast traffic.

Within each forwarding class set, you can configure special CoS treatment for the traffic mapped to each individual queue. This provides the ability to configure CoS in a two-tier hierarchical manner. At the forwarding class set tier, you configure CoS for groups of traffic using a *traffic control profile*. At the queue tier, you configure CoS for individual output queues within a forwarding class set using a *scheduler* that you map to a queue (forwarding class) using a *scheduler map*.

Flow Control (Ethernet PAUSE and Priority-Based Flow Control)

Ethernet PAUSE (described in IEEE 802.3X) is a link-level flow control mechanism. During periods of network congestion, Ethernet PAUSE stops all traffic on a full-duplex Ethernet link for a period of time specified in the PAUSE message.

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is part of the IEEE data center bridging (DCB) specifications for creating a lossless Ethernet environment to transport loss-sensitive flows such as Fibre Channel over Ethernet (FCoE) traffic.

PFC is a link-level flow control mechanism similar to Ethernet PAUSE. However, Ethernet PAUSE stops all traffic on a link for a period of time. PFC decouples the pause function from the physical link and divides the traffic on the link into eight priorities (3-bit IEEE 802.1p code points). You can think of the eight priorities as eight “lanes” of traffic. You can apply pause selectively to the traffic on any priority without pausing the traffic on other priorities on the same link.

The granularity that PFC provides allows you to configure different levels of CoS for different types of traffic on the link. You can create lossless lanes for traffic such as FCoE, LAN backup, or management, while using standard frame-drop methods of congestion management for IP traffic on the same link.

NOTE: **If you transport FCoE traffic, you must enable PFC on the priority assigned to FCoE traffic (usually code point 011 on interfaces that carry FCoE traffic).**

Tail-Drop Profiles

A tail-drop profile (drop profile) defines parameters that enable the network to drop packets during periods of congestion. A drop profile defines the conditions under which packets of different loss priorities drop, by determining the probability of dropping a packet for each loss priority when output queues become congested. Drop profiles essentially set a value for a level of queue fullness—when the queue fills to the level of the queue fullness value, packets drop.

You can associate different drop profiles with different loss priorities to set the probability of dropping packets. You can apply a drop profile for each loss priority to a forwarding

class (output queue) by applying a drop profile to a scheduler, and then mapping the scheduler to a forwarding class using a scheduler map. When the queue mapped to the forwarding class experiences congestion, the drop profile determines the level of packet drop for traffic of each loss priority in that queue.

Loss priority affects the scheduling of a packet without affecting the packet's relative ordering. Typically you mark packets exceeding a particular service level with a high loss priority.

Schedulers

Each switch interface has multiple queues assigned to store packets. The switch determines which queue to service based on a particular method of scheduling. This process often involves determining the sequence in which different types of packets should be transmitted.

You can define the priority (**priority**), minimum bandwidth (**transmit-rate**), maximum bandwidth (**shaping-rate**), and tail-drop profiles to be applied to a particular queue for packet transmission. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.

A scheduler map associates a specified forwarding class with a scheduler configuration. You can associate up to four user-defined scheduler maps with the interfaces.

Rewrite Rules

A *rewrite rule* sets the appropriate CoS bits in the outgoing packet. This allows the next downstream device to classify the packet into the appropriate service group. Rewriting (marking) outbound packets is useful when the switch is at the border of a network and must change the CoS values to meet the policies of the targeted peer.

NOTE: Ingress firewall filters can also rewrite forwarding class and loss priority values.

Understanding CoS Packet Flow

When a packet traverses a QFX Series Node device, the Node device provides the appropriate level of service to the packet using either default class of service (CoS) settings or CoS settings that you configure. On ingress ports, the Node device classifies packets into appropriate forwarding classes and assigns a loss priority to the packets. On egress ports, the Node device applies packet scheduling and (if you have configured them) rewrite rules to re-mark packets.

On the QFX Series, you can configure CoS on Layer 2 logical interfaces, and you can configure CoS on Layer 3 physical interfaces if you have defined at least one logical interface on the Layer 3 physical interface. You cannot configure CoS on Layer 2 physical interfaces and Layer 3 logical interfaces.

For Layer 2 traffic, either use the default CoS settings or configure CoS on each logical interface. You can apply different CoS settings to different Layer 2 logical interfaces.

For Layer 3 traffic, either use the default CoS settings or configure CoS on the physical interface (not on the logical unit). The QFX Series uses the CoS applied on the physical Layer 3 interface for all logical Layer 3 interfaces configured on the physical Layer 3 interface.

The QFX Series applies to CoS to packets as they flow through the system:

- An interface has one or more classifiers of different types applied to it (configure this at the **[edit class-of-service interfaces]** hierarchy level). The classifier types are based on the portion of the incoming packet that the classifier examines (IEEE 802.1p code point bits or DSCP code point bits).
- When a packet enters an ingress port, the classifier assigns the packet to a forwarding class and a loss priority based on the code point bits of the packet (configure this at the **[edit class-of-service classifiers]** hierarchy level).
- The QFX Series assigns each forwarding class to an output queue (configure this at the **[edit class-of-service forwarding-classes]** hierarchy level).
- Input (and output) policers meter traffic and can change the forwarding class and loss priority if a traffic flow exceeds its service level.
- A scheduler map is applied to each interface. When a packet exits an egress port, the scheduler map controls how it is treated (configure this at the **[edit class-of-service interfaces]** hierarchy level). A scheduler map assigns schedulers to forwarding classes (configure this at the **[edit class-of-service scheduler-maps]** hierarchy level).
- A scheduler defines how traffic is treated at the egress interface output queue (configure this at the **[edit class-of-service schedulers]** hierarchy level). You control the transmit rate, shaping rate, priority, and drop profile of each forwarding class by mapping schedulers to forwarding classes in scheduler maps, then applying scheduler maps to interfaces.

- A drop-profile defines how aggressively to drop packets that are mapped to a particular scheduler (configure this at the **[edit class-of-service drop-profiles]** hierarchy level).
- A rewrite rule takes effect as the packet leaves an interface that has a rewrite rule configured (configure this at the **[edit class-of-service rewrite-rules]** hierarchy level). The rewrite rule writes information to the packet (for example, a rewrite rule can re-mark the code point bits of outgoing traffic) according to the forwarding class and loss priority of the packet.

Figure 203 on page 5441 is a high-level flow diagram of how packets from various sources enter QFX Series interfaces, are classified at the ingress, and then scheduled (provided bandwidth) at the egress queues.

Figure 203: CoS Classifier, Queues, and Scheduler

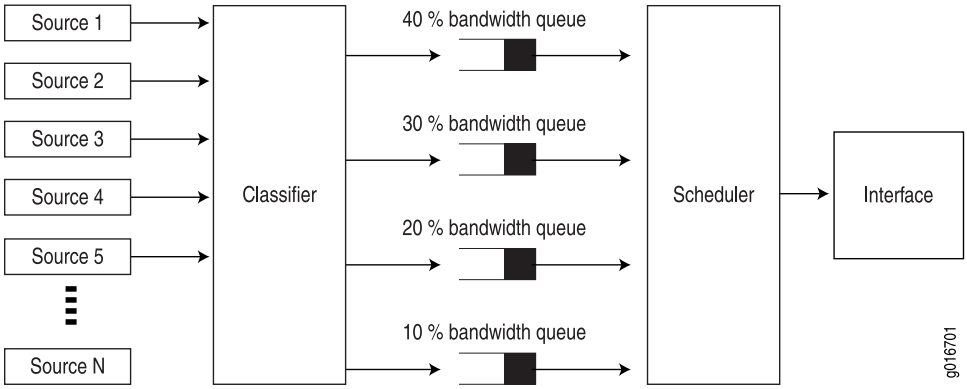

Figure 204 on page 5441 shows the packet flow through the CoS components that you can configure.

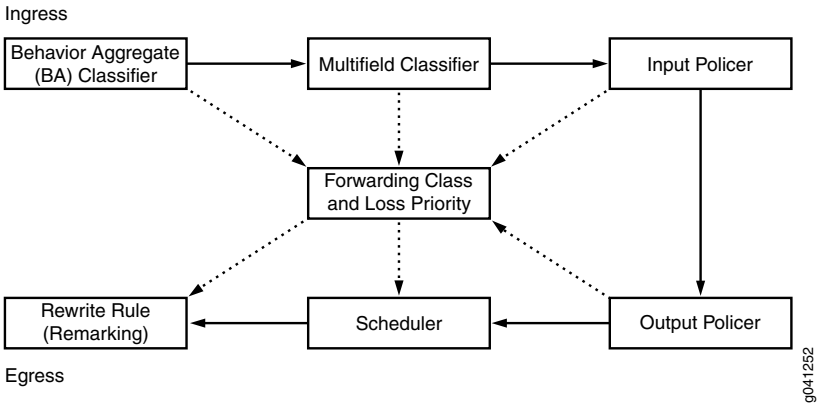
Figure 204: Packet Flow Through Configurable CoS Components



The middle box ("Forwarding Class and Loss Priority") represents two values that you can use on ingress and egress interfaces. The system uses these values for classifying traffic on ingress interfaces and for rewrite rule re-marking on egress interfaces. Each outer box represents a process component. The components in the top row apply to incoming packets. The components in the bottom row apply to outgoing packets.

The solid-line arrows show the direction of packet flow from ingress to egress. The dotted-line arrows show inputs and outputs or show settings and actions based on those settings.

For example, the BA classifier sets the forwarding class and loss priority of incoming packets, so the forwarding class and loss priority are outputs of the classifier and the arrow points away from the classifier. The scheduler receives the forwarding class and loss priority settings, and queues the outgoing packets based on those settings, so the arrow points toward the scheduler.

CoS Inputs and Outputs Overview

Some CoS components map one set of values to another set of values. Each mapping contains one or more inputs and one or more outputs. When you configure a mapping, you set the outputs for a given set of inputs, as shown in Table 454 on page 5442.

Table 454: CoS Mappings—Inputs and Outputs

CoS Mappings	Inputs	Outputs	Comments
classifiers	code-points	forwarding-class, loss-priority	The map sets the forwarding class and packet loss priority (PLP) for a specific set of code points.
drop-profile-map	***loss-priority***, protocol	drop-profile	The map sets the drop profile for a specific PLP and protocol type.
rewrite-rules	loss-priority, forwarding-class	code-points	The map sets the code points for a specific forwarding class and PLP.
rewrite-value (Fibre Channel Interfaces)	forwarding-class	code-point	The map sets the code point for the forwarding class specified in the fixed classifier attached to the native Fibre Channel (NP_Port) interface.

Understanding Default CoS Settings

If you do not configure CoS settings on the QFX Series, Junos OS performs some CoS functions to ensure that traffic and protocol packets are forwarded with minimum delay when the network experiences congestion. Some default mappings are automatically applied to each logical interface that you configure.

You can display default CoS settings by issuing the **show class-of-service** operational mode command.

This topic describes the default configurations for the following CoS components:

- Default Forwarding Classes and Queue Mapping on page 5443
- Default Forwarding Class Sets (Priority Groups) on page 5444
- Default Code-Point Aliases on page 5444
- Default Classifiers on page 5446
- Default Rewrite Rules on page 5449
- Default Drop Profile on page 5449
- Default Schedulers on page 5449
- Default Scheduler Maps on page 5449
- Default Shared Buffer Configuration on page 5450

Default Forwarding Classes and Queue Mapping

Table 455 on page 5443 shows the default mapping of the default forwarding classes to queues and packet drop attribute.

Table 455: Default Forwarding Classes and Queue Mapping

Default Forwarding Class	Description	Default Queue Mapping	Packet Drop Attribute
best-effort (be)	Best-effort traffic class (priority 0, IEEE 802.1p code point 000)	0	drop
fcoe	Guaranteed delivery for FCoE traffic (priority 3, IEEE 802.1p code point 011)	3	no-loss
no-loss	Guaranteed delivery for TCP no-loss traffic (priority 4, IEEE 802.1p code point 100)	4	no-loss

Table 455: Default Forwarding Classes and Queue Mapping *(continued)*

Default Forwarding Class	Description	Default Queue Mapping	Packet Drop Attribute
network-control (nc)	Network control traffic (priority 7, IEEE 802.1p code point 111)	7	drop
mcast	Multidestination traffic	8	drop NOTE: You cannot configure multidestination forwarding classes as no-loss (lossless) traffic classes.

Default Forwarding Class Sets (Priority Groups)

If you do not explicitly configure forwarding class sets, the system automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The system assigns 100 percent of the port output bandwidth to the default forwarding class set.

Ingress traffic is classified based on the default classifier settings. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings. Forwarding classes that are not part of the default scheduler receive no bandwidth.

The default forwarding class set is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange (DCBX) protocol advertisement.

Default Code-Point Aliases

Table 456 on page 5444 shows the default mapping of code-point aliases to IEEE code points.

Table 456: Default IEEE 802.1 Code-Point Aliases

CoS Value Types	Mapping
be	000
be1	001

Default Classifiers

The QFX Series applies default unicast IEEE 802.1, unicast DSCP, and multidestination classifiers to each interface that does not have explicitly configured classifiers. If you explicitly configure one type of classifier but not other types of classifiers, the system uses only the configured classifier and does not use default classifiers for other types of traffic. There are two different default unicast IEEE 802.1 classifiers, a trusted classifier for ports that are in trunk mode or tagged-access mode, and an untrusted classifier for ports that are in access mode.

Table 458 on page 5446 shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode.

Table 458: Default IEEE 802.1 Unicast Classifiers for Ports in Trunk Mode or Tagged Access Mode (Trusted Classifier)

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low

cs5 (101000)	best-effort	low
nc1 (110000)	network-control	low
nc2 (111000)	network-control	low

NOTE: There are no default DSCP IP or IPv6 classifiers for multidestination traffic. DSCP IPv6 classifiers are not supported for multidestination traffic.

Default Rewrite Rules

There are no default rewrite rules. If you do not explicitly configure rewrite rules, the switch does not reclassify egress traffic.

Default Drop Profile

Table 462 on page 5449 shows the default drop profile configuration.

Table 462: Default Drop Profile

Fill Level	Drop Probability
100	100

Default Schedulers

Table 463 on page 5449 shows the default scheduler configuration.

Table 463: Default Schedulers

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
Best-effort scheduler (queue 0)	5%	None	5%	low	5%
FCoE scheduler (queue 3)	35%	None	35%	low	35%
No-loss scheduler (queue 4)	35%	None	35%	low	35%
Network-control scheduler (queue 7)	5%	None	5%	low	5%
Multidestination scheduler (queue 8)	20%	None	20%	low	20%

NOTE: The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

Default Scheduler Maps

Table 464 on page 5449 shows the default mapping of forwarding classes to schedulers.

Table 464: Default Scheduler Maps

Forwarding Class	Scheduler
best-effort	Default BE scheduler

Understanding Host Inbound Traffic Classification

The destination address of traffic that enters the switch can be an external device such as another switch, a router, or a server, or the destination can be the host (the switch Routing Engine or CPU). When the destination is an external device, the DSCP and IEEE 802.1p code-point bits of incoming traffic are preserved as the traffic travels through the switch to the egress port. At the egress port, the code-point bits are either preserved when the packets are sent to the next hop or they are rewritten according to the rewrite rule attached to the egress interface.

When the destination of incoming traffic is the host, DSCP bits are preserved. However, IEEE 802.1p bits are not preserved. The IEEE 802.1p bits of traffic destined for the host are set to zero (0). This does not affect system behavior because the switch prioritizes traffic destined for the host based on the protocol type. For example, the switch gives a higher priority to BPDU traffic than to ping traffic.

Understanding Host Routing Engine Outbound Traffic Queues and Defaults

The host Routing Engine and CPU generate outbound traffic that is transmitted using different protocols. You cannot configure a classifier to map different types of outbound traffic that the host generates to forwarding classes (queues). The traffic that the host generates is assigned to forwarding classes by default as shown in Table 467 on page 5452.

If you want to separate host outbound traffic from other traffic or if you want to assign that traffic to a particular queue, you can configure a single forwarding class for all traffic that the host generates. If you configure a forwarding class for outbound host traffic, that forwarding class is used globally for all traffic generated by the host. (That is, the host outbound traffic is mapped to the selected queue on all egress interfaces.) Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

Whether you use the default host outbound traffic forwarding class configuration or configure a forwarding class for all host outbound traffic, the configuration applies to all Layer 2 and Layer 3 protocols and to all application-level traffic such as FTP and ping operations.

If you configure a queue for host outbound traffic, the queue must be properly configured on all interfaces.

NOTE: **Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the fcoe queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (fcoe) across the Interconnect device (fabric) and the egress Node device.**

By default, traffic generated by the host is sent to the best effort queue (queue 0) or to the network control queue (queue 7). Table 467 on page 5452 lists the default host traffic to output queue mapping.

Table 467: Routing Engine Protocol Default Queue Mapping

Routing Engine Protocol	Default Queue Mapping
Address Resolution Protocol (ARP) reply	Queue 0
ARP request	Queue 0
Border Gateway Protocol (BGP)	Queue 0
BGP TCP Retransmission	Queue 7
Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP)	Queue 3
File Transfer Protocol (FTP)	Queue 0
Internet Control Message Protocol (ICMP) reply	Queue 0
ICMP request	Queue 0
Internet Group Management Protocol (IGMP) query	Queue 7

Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs) and IEEE 802.1 bits to associate incoming packets with a particular CoS servicing level. You can assign a meaningful name or alias to the CoS values and use that alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure alias names for user-defined classifiers. If the value of an alias changes, it alters the behavior of any classifier that references it.

You can configure code-point aliases for the following type of CoS markers:

- dscp or dscp-ipv6—Handles incoming IP and IPv6 packets.
- ieee-802.1—Handles Layer 2 CoS.

This topic covers:

- Default Code-Point Aliases on page 5453

Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and a loss priority, and assign packets to output queues based on the associated forwarding class. There are three general types of classifiers:

- Behavior aggregate (BA) classifiers—DSCP and DSCP IPv6 classify IP and IPv6 traffic, and IEEE 802.1p classifiers classify all other traffic.
- Fixed classifiers—Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield (MF) classifiers—MF classifiers classify traffic based on more than one field in the packet header and take precedence over BA and fixed classifiers.

- Interfaces and Output Queues on page 5455
- Behavior Aggregate Classifiers on page 5456
- Fixed Classifiers on Ethernet Interfaces on page 5459
- Fixed Classifiers on Native Fibre Channel Interfaces (NP_Ports) on page 5459
- Multifield Classifiers on page 5459
- Packet Classification for Routed VLAN Interfaces (RVIs) on page 5460

Interfaces and Output Queues

On Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and link aggregation (LAG) interfaces, you can apply classifiers to Layer 2 logical interfaces and to Layer 3 physical interfaces if the Layer 3 physical interface has at least one defined logical interface. Classifiers applied to Layer 3 physical interfaces are used on all logical interfaces on that physical interface. "Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces" on page 5460 describes the interaction between classifiers and interfaces in greater detail.

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification is performed. If the

two classification results conflict, the MF classification result overrides the BA classification result.

You cannot configure a fixed classifier and a BA classifier on the same interface.

You can configure both a DSCP or a DSCP IPv6 classifier and an IEEE 802.1p classifier on the same interface. IP traffic uses the DSCP or DSCP IPv6 classifier. All other traffic uses the IEEE classifier. You can configure only one DSCP classifier on a physical interface (either one DSCP classifier or one DSCP IPv6 classifier, but not both).

You can create unicast BA classifiers for unicast traffic and multicast BA classifiers for multidestination traffic, which includes multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot assign unicast traffic and multidestination traffic to the same BA classifier.

On each interface, the switch has separate output queues for unicast traffic and for multidestination traffic:

- The switch supports 12 output queues, with 8 queues dedicated to unicast traffic and 4 queues dedicated to multidestination traffic.
- Queues 0 through 7 are unicast traffic queues. You can apply only unicast BA classifiers to unicast queues. A unicast BA classifier should contain only forwarding classes that are mapped to unicast queues.
- Queues 8 through 11 are multidestination traffic queues. You can apply only multidestination BA classifiers to multidestination queues. A multidestination BA classifier should contain only forwarding classes that are mapped to multidestination queues.

You can apply unicast classifiers to one or more interfaces. Multidestination classifiers apply to all of the switch interfaces and cannot be applied to individual interfaces. Use the DSCP multidestination classifier for both IP and IPv6 multidestination traffic. The DSCP IPv6 classifier is not supported for multidestination traffic.

Behavior Aggregate Classifiers

The behavior aggregate classifier maps a class-of-service (CoS) value to a forwarding class and loss priority. The forwarding class determines the output queue. A scheduler uses the loss priority to control packet discard during periods of congestion by associating different drop profiles with different loss priorities.

The switch supports two types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ (IP and IPv6)
- IEEE 802.1p CoS bits

BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore, core devices, which handle high traffic volumes, are normally configured to perform BA classification.

Unicast and multicast traffic cannot share the same classifier. You can map unicast traffic and multicast traffic to the same classifier CoS value, but the unicast traffic must

belong to a unicast classifier and the multicast traffic must belong to a multidestination classifier.

Default Behavior Aggregate Classification

Juniper Networks Junos OS automatically assigns implicit default classifiers to all logical interfaces based on the type of interface. Table 470 on page 5457 lists different types of interfaces and the corresponding implicit default BA classifiers.

Table 470: Default BA Classification

Type of Interface	Default BA Classification
Layer 2 interface in trunk mode or in tagged-access mode	**ieee8021p-default**
Layer 3 interface	**dscp-default**
Layer 2 interface in access mode	**ieee8021p-untrusted**

NOTE: There are default BA classifiers for the **best-effort**, **fcoe**, **no-loss**, **network-control**, and **mcast** forwarding classes.

When you explicitly associate a unicast classifier with a logical interface, you are overriding the default unicast classifier with the explicit unicast classifier.

NOTE: You can apply only one classifier of each type, DSCP and IEEE 802.1p, to a Layer 2 interface. If both types of classifiers are present, DSCP classifiers take precedence over IEEE 802.1p classifiers.

Importing a Classifier

You can use any existing classifier, including the default classifiers, as the basis for defining a new classifier. You accomplish this using the **import** statement.

The imported classifier is used as a template and is not modified. The modifications you make become part of a new classifier (and a new template) identified by the name of the new classifier. Whenever you commit a configuration that assigns a new class-name and loss-priority value to a code-point alias or set of bits, it replaces that entry in the new classifier template. As a result, you must explicitly specify every CoS value in every designation that requires modification.

Multidestination Classifiers

Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. You can configure both a DSCP multidestination classifier and an IEEE multidestination classifer. IP and IPv6 traffic use the DSCP classifier, and all other traffic uses the IEEE classifier.

DSCP IPv6 multidestination classifiers are not supported, so IPv6 traffic uses the DSCP multidestination classifier.

The default multidestination classifier is the IEEE 802.1p multidestination classifier.

PFC Priorities

The eight IEEE 802.1p code points correspond to the eight priorities that priority-based flow control (PFC) uses to differentiate traffic classes for lossless transport. When you map a forwarding class (which maps to an output queue) to an IEEE 802.1p CoS value, the IEEE 802.1p CoS value identifies the priority.

Although you can map a priority to any output queue (by mapping the priority to a forwarding class), we recommend that the priority and the unicast forwarding class match in a one-to-one correspondence in which priority 0 is assigned to queue 0, priority 1 is assigned to queue 1, and so on, as shown in Table 471 on page 5458. A one-to-one correspondence of queue and priority numbers makes it easier to configure and maintain the mapping of forwarding classes to priorities and queues.

Table 471: Default IEEE 802.1p Code Point to PFC Priority, Output Queue, and Forwarding Class Mapping

IEEE 802.1p Code Point	PFC Priority	Unicast Output Queue	Forwarding Class and Packet Drop Attribute
000	0	0	best-effort (drop)
001	1	1	best-effort (drop)
010	2	2	best-effort (drop)
011	3	3	fcoe (no-loss)
100	4	4	no-loss (no-loss)
101	5	5	best-effort (drop)
110	6	6	network-control (drop)
111	7	7	network-control (drop)

NOTE: By convention, deployments with converged server access typically use IEEE 802.1p priority 3 (011) for FCoE traffic. The default mapping of the fcoe forwarding class is to queue 3. Apply priority-based flow control (PFC) to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE requires. We recommend that you use priority 3 for FCoE traffic unless your network architecture requires that you use a different priority.

Fixed Classifiers on Ethernet Interfaces

Fixed classifiers map all traffic on an interface to a forwarding class and a loss priority. (As opposed to BA classifiers, which map traffic into multiple different forwarding classes based on the CoS field value in the packet header.) The forwarding class determines the output queue. Incoming traffic of all IEEE 802.1p priorities is classified into the forwarding class specified in the fixed classifier. A scheduler uses the loss priority to control packet discard during periods of congestion by associating different drop profiles with different loss priorities.

You cannot configure a fixed classifier and a BA classifier on the same interface. If you configure a fixed classifier on an interface, you cannot configure a DSCP or an IEEE classifier on that interface. If you configure a DSCP classifier, an IEEE classifier, or both classifiers on an interface, you cannot configure a fixed classifier on that interface.

To switch from a fixed classifier to a BA classifier or to switch from a BA classifier to a fixed classifier, deactivate the existing classifier attachment on the interface, and then attach the new classifier to the interface.

NOTE: If you configure a fixed classifier that classifies all incoming traffic into the **fcoe** forwarding class (or any forwarding class designed to handle FCoE traffic), you must ensure that all traffic that enters the interface is FCoE traffic and is tagged with the FCoE IEEE 802.1p code point (priority).

Fixed Classifiers on Native Fibre Channel Interfaces (NP_Ports)

Applying a fixed classifier to a native Fibre Channel (FC) interface (NP_Port) is a special case. By default, native FC interfaces classify incoming traffic from the FC SAN into the **fcoe** forwarding class and map the traffic to IEEE 802.1p priority 3 (code point 011). When you apply a fixed classifier to an FC interface, you also configure a priority rewrite value for the interface. The FC interface uses the priority rewrite value as the IEEE 802.1p tag value for all incoming packets instead of the default value of 3.

For example, if you specify a priority rewrite value of 5 (code point 101) for an FC interface, the interface tags all incoming traffic from the FC SAN with priority 5 and classifies the traffic into the forwarding class specified in the fixed classifier.

NOTE: The forwarding class specified in the fixed classifier on FC interfaces must be a lossless forwarding class.

Multifield Classifiers

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of DiffServ code point (DSCP) support in end-user applications. On a switch at the edge of a network, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, a classifier performs matching operations on the selected fields against a configured value.

Packet Classification for Routed VLAN Interfaces (RVIs)

You cannot apply classifiers directly to routed VLAN interfaces (RVIs) because the members of RVIs are VLANs, not ports. However, you can apply classifiers to the VLAN port members of an RVI. You can also apply MF classifiers to RVIs.

Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces

At ingress interfaces, classifiers group incoming traffic into classes based on the IEEE 802.1p or DSCP class of service (CoS) code point bits in the packet header. At egress interfaces, you can use rewrite rules to change (re-mark) the code point bits before the interface forwards the packets. At ingress interfaces, classifiers group incoming traffic into classes based on the IEEE 802.1p or DSCP CoS code point bits in the packet header. At egress interfaces, rewrite rules can change (re-mark) the code point bits before the interface forwards the packets.

You can apply classifiers and rewrite rules to interfaces to control the level of CoS applied to each packet as it traverses the system and the network. This topic describes:

- Supported Classifier and Rewrite Rule Types on page 5461
- Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration on page 5462
- Default Classifiers on page 5463
- Default Rewrite Rules on page 5464
- Classifier Precedence on page 5464
- Classifier Behavior and Limitations on page 5465
- Rewrite Rule Precedence and Behavior on page 5466
- Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration on page 5466

Supported Classifier and Rewrite Rule Types

Table 472 on page 5461 shows the types of classifiers and rewrite rules that the QFX Series supports:

Table 472: Supported Classifiers and Rewrite Rules

Classifier or Rewrite Rule Type	Description
Fixed classifier	Classifies all ingress traffic on a physical interface into one fixed forwarding class, regardless of the CoS bits in the packet header.
DSCP and DSCP IPv6 unicast classifiers	Classifies IP and IPv6 traffic into forwarding classes and assigns loss priorities to the traffic.
IEEE 802.1p unicast classifier	Classifies Ethernet traffic into forwarding classes and assigns loss priorities to the traffic.
DSCP multidestination classifier (also used for IPv6 multidestination traffic)	Classifies IP and IPv6 multicast, broadcast, and destination lookup fail (DLF) traffic into multidestination forwarding classes. Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces.
IEEE 802.1p multidestination classifier	Classifies Ethernet multicast, broadcast, and destination lookup fail (DLF) traffic into multidestination forwarding classes. Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces.
DSCP and DSCP IPv6 rewrite rules	Re-marks the DSCP code points of IP and IPv6 packets before forwarding the packets.
IEEE 802.1p rewrite rule	Re-marks the IEEE 802.1p code points of Ethernet packets before forwarding the packets.

NOTE: On native Fibre Channel (FC) interfaces (NP_Ports) only, you can specify a rewrite value to set the IEEE 802.1p code point of incoming FC traffic when the NP_Port encapsulates the FC packet in Ethernet before forwarding it to the FCoE network (see "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5524).

DSCP and IEEE classifiers are behavior aggregate (BA) classifiers. Multidestination classifiers apply to all interfaces; you cannot apply them to individual interfaces.

Classifying packets into forwarding classes assigns packets to the output queues associated with the forwarding classes. Classifying traffic into a forwarding class associates the CoS scheduling for the forwarding class with that traffic.

NOTE: In addition to BA classifiers and fixed classifiers, which classify traffic based on the CoS field in the packet header, you can use firewall filters to configure multifield (MF) classifiers. MF classifiers classify traffic based on more than one field in the packet header and take precedence over BA and fixed classifiers.

Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration

To apply a classifier to incoming traffic or a rewrite rule to outgoing traffic, you need to apply the classifier or rewrite rule to one or more interfaces. When you apply a classifier or rewrite rule to an interface, the interface uses the classifier to group incoming traffic into forwarding classes and uses the rewrite rule to re-mark the CoS code point value of each packet before it leaves the system.

Not all interfaces types support all types of CoS configuration. This section describes:

- Interface Types That Support Classifier and Rewrite Rule Configuration on page 5462
- Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support on page 5462
- Routed VLAN Interfaces (RVIs) on page 5463

Interface Types That Support Classifier and Rewrite Rule Configuration

You can apply classifiers to all Ethernet interfaces. For Layer 3 LAGs, configure BA or fixed classifiers on the LAG (ae) interface. The classifier configured on the LAG is valid on all of the LAG member interfaces.

You can apply fixed classifiers to native FC interfaces (NP_Ports). You cannot apply other types of classifiers or rewrite rules to native FC interfaces. You can rewrite the value of the IEEE 802.1p code point of incoming FC traffic when the interface encapsulates it in Ethernet before forwarding it to the FCoE network as described in "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5524.

Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support

The QFX Series Ethernet ports can function as:

- Layer 2 physical interfaces (family ethernet-switching)
- Layer 2 logical interfaces (family ethernet-switching)
- Layer 3 physical interfaces (family inet/inet6)
- Layer 3 logical interfaces (family inet/inet6)

You can apply CoS classifiers and rewrite rules only to the following interfaces:

- Layer 2 logical interfaces
- Layer 3 physical interfaces if at least one logical Layer 3 interface is configured on the physical interface

NOTE: The CoS you configure on a Layer 3 physical interface is applied to all of the Layer 3 logical interfaces on that physical interface. This means that each Layer 3 interface uses the same classifiers and rewrite rules for all of the Layer 3 traffic on that interface.

You cannot apply classifiers or rewrite rules to Layer 2 physical interfaces or to Layer 3 logical interfaces. Table 473 on page 5463 shows on which interfaces you can configure and apply classifiers and rewrite rules.

Table 473: Ethernet Interface Support for Classifier and Rewrite Rule Configuration

CoS Classifiers and Rewrite Rules	Layer 2 Physical Interfaces	Layer 2 Logical Interfaces	Layer 3 Physical Interfaces (If at Least One Logical Layer 3 Interface Is Defined)	Layer 3 Logical Interfaces
Fixed classifier	No	Yes	Yes	No
DSCP classifier	No	Yes	Yes	No
DSCP IPv6 classifier	No	Yes	Yes	No
IEEE 802.1p classifier	No	Yes	Yes	No
DSCP rewrite rule	No	Yes	Yes	No
DSCP IPv6 rewrite rule	No	Yes	Yes	No
IEEE 802.1p rewrite rule	No	Yes	Yes	No

NOTE: IEEE 802.1p and DSCP multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. No DSCP IPv6 multidestination classifier is supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

Routed VLAN Interfaces (RVIs)

You cannot apply classifiers and rewrite rules directly to routed VLAN interfaces (RVIs) because the members of RVIs are VLANs, not ports. However, you can apply classifiers and rewrite rules to the VLAN port members of an RVI. You can also apply MF classifiers to RVIs.

Default Classifiers

If you do not explicitly configure classifiers on an Ethernet interface, the QFX Series applies default classifiers (see "Understanding Default CoS Settings" on page 5443) so that the traffic receives basic CoS treatment. The factors that determine the default classifier applied to the interface include the interface type (Layer 2 or Layer 3), the port mode

(trunk, tagged-access, or access), and whether logical interfaces have been configured. The system applies a default classifier using the following rules:

- If the physical interface has at least one Layer 3 logical interface configured, it uses the default DSCP classifier.
- If the physical interface has a Layer 2 logical interface in trunk mode or tagged-access mode, it uses the default trusted classifier.
- If the physical interface has a Layer 2 logical interface in access mode, it uses the default untrusted classifier.
- If the physical interface has no logical interface configured, no default classifier is applied.
- The default multidestination classifier is the IEEE 802.1p multidestination classifier.

Default Rewrite Rules

No default rewrite rules are applied to interfaces. If you want to re-mark packets at the egress interface, you must explicitly configure a rewrite rule.

Classifier Precedence

You can apply multiple unicast classifiers (MF, fixed, IEEE 802.1p, or DSCP) to a physical or logical Ethernet interface to handle different types of traffic. When you apply more than one classifier to an interface, the system uses an order of precedence to determine which classifier to use on physical and logical interfaces:

- Unicast Classifier Precedence on Physical Ethernet Interfaces on page 5464
- Unicast Classifier Precedence on Logical Ethernet Interfaces on page 5465

Unicast Classifier Precedence on Physical Ethernet Interfaces

The precedence of unicast classifiers on physical interfaces, from the highest-priority classifier to the lowest-priority classifier, is:

- MF classifier on a logical interface (no classifier has a higher priority than MF classifiers)
- Fixed classifier on the physical interface
- DSCP or DSCP IPv6 classifier on the physical interface
- IEEE 802.1p classifier on the physical interface

You can apply both a DSCP classifier and an IEEE 802.1p classifier on a physical interface. When both a DSCP and an IEEE classifier are on an interface, IP traffic uses the DSCP classifier, and all other traffic uses the IEEE classifier.

NOTE: You cannot apply a fixed classifier and a DSCP or IEEE classifier to the same interface. If a DSCP classifier, an IEEE classifier, or both are on an interface, you cannot apply a fixed classifier to that interface unless you first delete the DSCP and IEEE classifiers. If a fixed classifier is on an interface, you cannot apply a DSCP classifier or an IEEE classifier unless you first delete the fixed classifier.

Unicast Classifier Precedence on Logical Ethernet Interfaces

The precedence of unicast classifiers on logical interfaces, from the highest priority classifier to the lowest priority classifier, is:

- MF classifier on a logical interface (no classifier has a higher priority than MF classifiers)
- Fixed classifier on the logical interface
- DSCP or DSCP IPv6 classifier on the physical interface
- IEEE 802.1p classifier on the physical interface

You can apply both a DSCP classifier and an IEEE 802.1p classifier on a logical interface. When both a DSCP and an IEEE classifier are on an interface, IP traffic uses the DSCP classifier, and all other traffic uses the IEEE classifier.

Classifier Behavior and Limitations

Consider the following behaviors and constraints when you apply classifiers to physical and logical Ethernet interfaces:

- You can configure only one DSCP classifier (IP or IPv6) on a physical interface. You cannot configure both types of DSCP classifier on one physical interface. Both IP and IPv6 traffic use whichever DSCP classifier is configured on the interface.
- When you configure a DSCP or a DSCP IPv6 classifier on a physical interface and the physical interface has at least one logical Layer 3 interface, all packets (IP, IPv6, and non-IP) use that classifier.
- An interface with both a DSCP classifier (IP or IPv6) and an IEEE 802.1p classifier uses the DSCP classifier for IP and IPv6 packets, and uses the IEEE classifier for all other packets.
- Fixed classifiers and BA classifiers (DSCP and IEEE classifiers) are not permitted simultaneously on an interface. If you configure a fixed classifier on an interface, you cannot configure a DSCP or an IEEE classifier on that interface. If you configure a DSCP classifier, an IEEE classifier, or both classifiers on an interface, you cannot configure a fixed classifier on that interface.
- When you configure an IEEE 802.1p classifier on a physical interface and a DSCP classifier is not explicitly configured on that interface, the interface uses the IEEE classifier for all types of packets. No default DSCP classifier is applied to the interface. (In this case, if you want a DSCP classifier on the interface, you must explicitly configure it.)

- The system does not apply a default classifier to a physical interface until you create a logical interface on that physical interface. If you configure a Layer 3 logical interface, the system uses the default DSCP classifier. If you configure a Layer 2 logical interface, the system uses the default IEEE 802.1p trusted classifier if the port is in trunk mode or tagged-access mode, or the default IEEE 802.1p untrusted classifier if the port is in access mode.
- MF classifiers configured on logical interfaces take precedence over BA and fixed classifiers. (Use firewall filters to configure MF classifiers.) When BA or fixed classifiers are present on an interface, you can still configure an MF classifier on that interface.

Rewrite Rule Precedence and Behavior

The following rules apply on both physical and logical Ethernet interfaces for rewrite rules:

- If you configure both one DSCP (or DSCP IPv6) rewrite rule and one IEEE 802.1p rewrite rule on an interface, both rewrite rules take effect. Traffic with IP and IPv6 headers use the DSCP rewrite rule, and traffic with a VLAN tag uses the IEEE rewrite rule.
- If you do not explicitly configure a rewrite rule, there is no default rewrite rule, so the system does not apply any rewrite rule to the interface.
- You can apply a DSCP rewrite rule or a DSCP IPv6 rewrite rule to an interface, but you cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface. Both IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6.

Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration

You can apply classifiers and rewrite rules only on Layer 2 logical interfaces and Layer 3 physical interfaces (if the Layer 3 physical interface has at least one defined logical interface). This section focuses on BA classifiers, but the interaction between BA classifiers and interfaces described in this section also applies to fixed classifiers and rewrite rules.

There are two components to applying classifiers or rewrite rules to interfaces:

1. Setting the interface family (inet, inet6, or ethernet-switching; ethernet-switching is the default interface family) in the **[edit interfaces]** configuration hierarchy.
2. Applying a classifier or rewrite rule to the interface in the **[edit class-of-service]** hierarchy.

These are separate operations that can be set and committed at different times. Because the type of classifier or rewrite rule you can apply to an interface depends on the interface family configuration, the system performs checks to ensure that the configuration is valid. The method the system uses to notify you of an invalid configuration depends on the **set** operation that causes the invalid configuration.

When applying the classifier or rewrite rule to the interface in the **[edit class-of-service]** hierarchy causes an invalid configuration, the system rejects the configuration and returns a commit check error.

When setting the interface family in the **[edit interfaces]** configuration hierarchy causes an invalid configuration, the system creates a syslog error message. When you receive the error message, you need to remove the classifier or rewrite rule configuration from the logical interface and apply it to the physical interface, or remove the classifier or rewrite rule configuration from the physical interface and apply it to the logical interface. For classifiers, if you do not take action to correct the error, the system programs the default classifier for the interface family on the interface. (There are no default rewrite rules. If the commit check fails, no rewrite rule is applied to the interface.)

Two scenarios illustrate these situations:

- Scenario 1: Applying a Classifier to an Ethernet Interface Causes a Commit Check Error on page 5467
- Scenario 2: Configuring the Ethernet Interface Family Causes a Syslog Error on page 5468

NOTE: Both of these scenarios also apply to fixed classifiers and rewrite rules.

Scenario 1: Applying a Classifier to an Ethernet Interface Causes a Commit Check Error

In Scenario 1, we set the interface family, and then specify an invalid classifier.

1. Set and commit the interface as a Layer 3 (family **inet**) interface:

   ```
   [edit interfaces]
   user@switch# set xe-0/0/20 unit 0 family inet
   user@switch# commit
   ```

   This commit operation succeeds.

2. Set and commit a DSCP classifier on the logical interface (this example uses a DSCP classifier named **dscp1**):

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
   user@switch# commit
   ```

   This configuration is not valid, because it attempts to apply a classifier to a Layer 3 logical interface. Because the failure is caused by the class-of-service configuration and not by the interface configuration, the system rejects the commit operation and issues a commit error, not a syslog message.

   Note that the commit operation succeeds if you apply the classifier to the physical Layer 3 interface as follows:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 classifiers dscp dscp1
   user@switch# commit
   ```

   Because the logical unit is not specified, the classifier is applied to the physical Layer 3 interface in a valid configuration, and the commit check succeeds.

Scenario 2: Configuring the Ethernet Interface Family Causes a Syslog Error

In Scenario 2, we set the classifier first, then set an invalid interface type.

1. Set and commit a DSCP classifier on a Layer 3 logical interface, assuming that the interface has no existing configuration:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
   user@switch# commit
   ```

   This commit succeeds. Because no explicit configuration existed on the interface, it is by default a Layer 2 (**family ethernet-switching**) interface. Layer 2 logical interfaces support BA classifiers, so applying the classifier is a valid configuration.

2. Set and commit the interface as a Layer 3 interface (family **inet**) interface:

   ```
   [edit interfaces]
   user@switch# set xe-0/0/20 unit 0 family inet
   user@switch# commit
   ```

   This configuration is not valid because it attempts to change an interface from Layer 2 (**family ethernet-switching**) to Layer 3 (**family inet**) when a classifier has already been applied to a logical interface. Layer 3 logical interfaces do not support classifiers. Because the failure is caused by the interface configuration and not by the class-of-service configuration, the system does not issue a commit error, but instead issues a syslog message.

   When the system issues the syslog message, it programs the default classifier for the interface type on the interface. In this scenario, the interface has been configured as a Layer 3 interface, so the system applies the default DSCP profile to the physical Layer 3 interface.

   In this scenario, to install a configured DSCP classifier, you remove the misconfigured classifier from the Layer 3 logical interface and apply it to the Layer 3 physical interface. For example:

   ```
   [edit]
   user@switch# delete class-of-service interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
   user@switch# commit
   user@switch# set class-of-service interfaces xe-0/0/20 classifiers dscp dscp1
   user@switch# commit
   ```

Understanding CoS Forwarding Classes

Forwarding classes group traffic and assign the traffic to output queues. Each forwarding class is mapped to an output queue. Classification identifies the output queue for each incoming packet by mapping the packet code point bits to forwarding classes. The forwarding class to queue mapping defines the output queue used for the packet.

A classifier must associate each packet with one of the following five default forwarding classes or with a user-configured forwarding class in order to assign an output queue to the packet:

- fcoe—Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic.
- no-loss—Guaranteed delivery for TCP lossless traffic.
- best-effort—Provides best-effort delivery without a service profile. Loss priority is typically not carried in a class-of-service (CoS) value.
- network-control—Supports protocol control and is typically high priority.
- mcast—Provides no service profile for multidestination (multicast, broadcast, and destination lookup fail) packets.

The switch supports up to 12 forwarding classes, thus enabling flexible, differentiated, packet classification. For example, you can configure multiple classes of best-effort traffic such as **best-effort**, **best-effort1**, and **best-effort2**.

The switch supports up to 12 output queues: 8 output queues for unicast traffic (queues 0 through 7) and 4 output queues for multidestination traffic (queues 8 through 11). Forwarding classes mapped to unicast queues are associated with unicast traffic, and forwarding classes mapped to multidestination queues are associated with multidestination traffic. You cannot map unicast and multidestination traffic to the same queue. You cannot map a strict-high priority queue to a multidestination forwarding class (queues 8 through 11 do not support strict-high priority configuration).

- Default Forwarding Classes on page 5469
- Forwarding Class Configuration Rules on page 5471
- Lossless Transport Support on page 5472

Default Forwarding Classes

Table 474 on page 5470 shows the four default forwarding classes defined for unicast traffic, and Table 475 on page 5471 shows the four default forwarding classes defined for multicast traffic.

If desired, you can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. CoS configurations can be

quite complicated, so unless it is required by your scenario, we recommend that you not alter the default class names or queue number associations.

Table 474: Default Forwarding Classes for Unicast Packets

Forwarding Class Name	Default Queue Mapping	Comments
best-effort (be)	0	The software does not apply any special CoS handling to packets with 000000 in the DiffServ field. This is a backward compatibility feature. These packets are usually dropped under congested network conditions. By default, this is a lossy forwarding class with a packet drop attribute of **drop**.
fcoe	3	The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end to end for packets in this service class. The software accepts excess traffic in this class, but in contrast to the assured forwarding class, the out-of-profile expedited-forwarding class packets can be forwarded out of sequence or dropped. NOTE: By convention, deployments with converged server access typically use IEEE 802.1p priority 3 (011) for FCoE traffic. The default mapping of the **fcoe** forwarding class is to queue 3. Apply priority-based flow control (PFC) to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE requires. We recommend that you use priority 3 for FCoE traffic unless your network architecture requires that you use a different priority. By default, this is a lossless forwarding class with a packet drop attribute of **no-loss**.
no-loss	4	The software offers a high level of assurance that the packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define. The software accepts excess traffic, but it applies a tail-drop profile to determine if the excess packets are dropped and not forwarded. Up to two drop probabilities (low and high) are defined for this service class. By default, this is a lossless forwarding class with a packet drop attribute of **no-loss**.
network-control (nc)	7	The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.) Typically, these packets represent routing protocol hello or keepalive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard. By default, this is a lossy forwarding class with a packet drop attribute of **drop**.

Table 475: Default Forwarding Classes for Multicast Packets

Forwarding Class Name	Default Queue Mapping	Comments
mcast	8	The software does not apply any special CoS handling to the multidestination packets. These packets are usually dropped under congested network conditions. By default, this is a lossy forwarding class with a packet drop attribute of **drop**.

NOTE: Mirrored traffic is always sent to the queue that corresponds to the multidestination forwarding class. The switched copy of the mirrored traffic is forwarded with the priority determined by the behavior aggregate classification process.

Forwarding Class Configuration Rules

Take the following rules into account when you configure forwarding classes:

- Queue Assignment Rules on page 5471
- Scheduling Rules on page 5471
- Rewrite Rules on page 5472

Queue Assignment Rules

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. The commit operation fails with a detailed message that states the total number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that appears in the default configuration is the forwarding class currently associated with that queue.
- Only unicast forwarding classes can be mapped to unicast queues (0 through 7), and only multidestination forwarding classes can be mapped to multidestination queues (8 through 11).
- Strict-high priority queues cannot be mapped to multidestination forwarding classes. (Strict-high priority traffic cannot be mapped to queues 8 through 11).
- If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

Scheduling Rules

When you define a forwarding class that is used on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you

must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

Rewrite Rules

On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

Lossless Transport Support

The QFX Series supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p code point of lossless forwarding classes. The following limitations apply to support lossless transport:

- The external cable length from the QFX3500 or QFabric system Node device to other devices cannot exceed 300 meters.
- The internal cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.
- For FCoE traffic, the interface maximum transmission unit (MTU) must be at least 2180 bytes to accommodate the packet payload, headers, and checks.
- Changing any portion of a PFC configuration on a port blocks the entire port until the change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Changing the PFC configuration means any change to a congestion notification profile that is configured on a port (enabling or disabling PFC on a code point, changing the MRU or cable-length value, or specifying an output flow control queue). Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

NOTE: Junos OS Release 12.2 introduces changes to the way the QFX Series handles lossless forwarding classes (the **fcoe** and **no-loss** forwarding classes).

In Junos OS Release 12.1, both explicitly configuring the **fcoe** and **no-loss** forwarding classes, and using the default configuration for these forwarding classes, resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the **fcoe** or the **no-loss** forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (**best-effort**) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the **fcoe** or the **no-loss** forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the explicit **fcoe** and **no-loss** forwarding class configuration before you upgrade to Junos OS Release 12.2.

See "Overview of CoS Changes Introduced in Junos OS Release 12.2" on page 5428 for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the **fcoe** and **no-loss** forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new **no-loss** packet drop attribute or the forwarding class is lossy.

Understanding CoS Forwarding Class Sets (Priority Groups)

A forwarding class set is the Junos OS configuration construct that equates to a priority group in enhanced transmission selection (ETS, described in IEEE 802.1Qaz). The switch implements ETS using a two-tier hierarchical scheduler.

A priority group is a group of queues (priorities). Mapping a forwarding class to a queue defines the traffic for that queue, so a priority equates to a queue (forwarding class). The queues in a priority group share the port bandwidth allocated to that priority group. The traffic for queues in one priority group usually share similar traffic-handling requirements.

You can configure up to three unicast forwarding class sets and one multicast forwarding class set. Only unicast forwarding classes can belong to unicast forwarding class sets. Only multicast forwarding classes can belong to the multicast forwarding class set.

If you configure a strict-high priority queue, you must observe the following rules when configuring forwarding class sets:

- You must create a separate forwarding class set for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multidestination forwarding class set.
- You cannot configure a guaranteed minimum bandwidth (guaranteed rate) for a forwarding class set that includes a strict-high priority queue. (You also cannot configure a guaranteed minimum bandwidth for a strict-high queue.)

You must use hierarchical scheduling to define CoS for output queues. The two-tier hierarchical scheduler defines bandwidth resources for the priority group, and then allocates those resources among the priorities that belong to the priority group.

If you do not explicitly configure forwarding class sets, the system automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The system assigns 100 percent of the port output bandwidth to the default forwarding class set. Ingress traffic is classified based on the default classifier settings. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings. Forwarding classes that are not part of the default scheduler receive no bandwidth. The default priority group is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange Protocol (DCBX) advertisement.

When you explicitly configure forwarding class sets and map them to an interface, any forwarding class that you do not map to a forwarding class set receives no guaranteed bandwidth on that interface. Forwarding classes that belong to the default forwarding class set might receive bandwidth if the other forwarding class sets are not using all of the port bandwidth. However, the amount of bandwidth forwarding classes that are not in explicitly configured forwarding class sets receive is not guaranteed. The bandwidth

for the default forwarding class depends on whether extra port bandwidth is available and therefore is not deterministic.

To guarantee bandwidth for forwarding classes in a predictable manner, be sure to map all forwarding classes that you expect to carry traffic on an interface to a forwarding class set and map the forwarding class set to the interface.

Understanding Default CoS Scheduling and Classification

If you do not configure hierarchical scheduling on an interface, the switch uses the default classifiers for ingress traffic and the default schedulers for egress traffic. Default scheduling and classification handle all traffic types (best-effort, FCoE, no-loss, network-control, and multidestination traffic).

Hierarchical scheduling groups egress queues (priorities, configured as forwarding classes) into priority groups (forwarding class sets). If you use only the default traffic scheduling and classification, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default classifier settings. The default priority group is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange (DCBX) protocol advertisement.

NOTE: If you explicitly configure one or more priority groups on an interface, any forwarding class that is not assigned to a priority group on that interface receives *no bandwidth*. This means that if you configure hierarchical scheduling on an interface, every forwarding class (priority) that you want to forward traffic on that interface must belong to a forwarding class set (priority group).

The following sections describe:

- Default Classification on page 5475
- Default Scheduling on page 5478
- Default DCBX Advertisement on page 5479
- Default Scheduling and Classification Summary on page 5479

Default Classification

The default classifiers assign unicast and multicast best-effort and network-control ingress traffic to forwarding classes and loss priorities. The QFX Series applies default unicast IEEE 802.1, unicast DSCP, and multidestination classifiers to each interface that

does not have explicitly configured classifiers. If you explicitly configure one type of classifier but not other types of classifiers, the system uses only the configured classifier and does not use default classifiers for other types of traffic. There are two different default unicast IEEE 802.1 classifiers, a trusted classifier for ports that are in trunk mode or tagged-access mode, and an untrusted classifier for ports that are in access mode.

Table 476 on page 5476 shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode.

Table 476: Default IEEE 802.1 Unicast Classifiers for Ports in Trunk Mode or Tagged-Access Mode (Trusted Classifier)

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Table 477 on page 5476 shows the default mapping of IEEE 802.1p code-point values to unicast forwarding classes and loss priorities for ports in access mode (all incoming traffic is mapped to best-effort forwarding classes).

Table 477: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier)

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low
010	best-effort	low
011	best-effort	low
100	best-effort	low
101	best-effort	low

Table 477: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier) *(continued)*

Code Point	Forwarding Class	Loss Priority
110	best-effort	low
111	best-effort	low

Table 478 on page 5477 shows the default mapping of IEEE 802.1 code-point values to multidestination (multicast, broadcast, and destination lookup fail traffic) forwarding classes and loss priorities.

Table 478: Default IEEE 802.1 Multidestination Classifiers

Code Point	Forwarding Class	Loss Priority
be (000)	mcast	low
be1 (001)	mcast	low
ef (010)	mcast	low
ef1 (011)	mcast	low
af11 (100)	mcast	low
af12 (101)	mcast	low
nc1 (110)	mcast	low
nc2 (111)	mcast	low

Table 479 on page 5477 shows the default mapping of DSCP code-point values to unicast forwarding classes and loss priorities for DSCP IP and DCSP IPv6.

Table 479: Default DSCP IP and IPv6 Unicast Classifiers

Code Point	Forwarding Class	Loss Priority
ef (101110)	best-effort	low
af11 (001010)	best-effort	low
af12 (001100)	best-effort	low
af13 (001110)	best-effort	low
af21 (010010)	best-effort	low
af22 (010100)	best-effort	low

Table 479: Default DSCP IP and IPv6 Unicast Classifiers *(continued)*

Code Point	Forwarding Class	Loss Priority
af23 (010110)	best-effort	low
af31 (011010)	best-effort	low
af32 (011100)	best-effort	low
af33 (011110)	best-effort	low
af41 (100010)	best-effort	low
af42 (100100)	best-effort	low
af43 (100110)	best-effort	low
be (000000)	best-effort	low
cs1 (001000)	best-effort	low
cs2 (010000)	best-effort	low
cs3 (011000)	best-effort	low

cs5 (101000)	best-effort	low
nc1 (110000)	network-control	low
nc2 (111000)	network-control	low

NOTE: There are no default DSCP IP or IPv6 multidestination classifiers for multidestination traffic. DSCP IPv6 multidestination classifiers are not supported for multidestination traffic.

Default Scheduling

The default schedulers allocate egress bandwidth resources to unicast and multicast best-effort and network-control egress traffic as shown in Table 480 on page 5478:

Table 480: Default Scheduler Configuration

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
Best-effort scheduler (queue 0)	5%	None	5%	low	5%

Table 480: Default Scheduler Configuration *(continued)*

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
FCoE scheduler (queue 3)	35%	None	35%	low	35%
No-loss scheduler (queue 4)	35%	None	35%	low	35%
Network-control scheduler (queue 7)	5%	None	5%	low	5%
Multidestination scheduler (queue 8)	20%	None	20%	low	20%

NOTE: **The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.**

Default DCBX Advertisement

When you configure hierarchical scheduling on an interface, DCBX advertises each priority group, the priorities in each priority group, and the bandwidth properties of each priority and priority group.

If you do not configure hierarchical scheduling on an interface, DCBX advertises the automatically created default priority group and its priorities. DCBX also advertises the default bandwidth allocation of the priority group, which is 100 percent of the port bandwidth.

Default Scheduling and Classification Summary

If you do not configure hierarchical scheduling on an interface:

- Default classifiers classify ingress traffic.
- Default schedulers schedule egress traffic.
- DCBX advertises a single default priority group with 100 percent of the port bandwidth allocated to that priority group. All priorities (forwarding classes) are assigned to the default priority group and receive bandwidth based on their default schedulers. The default priority group is generated automatically and is not user-configurable.

Understanding CoS Hierarchical Port Scheduling (ETS)

Scheduling defines the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the queue priority, and the drop profiles associated with the queue.

Hierarchical port scheduling is a two-tier process that provides better port bandwidth utilization and greater flexibility to allocate resources to queues and to groups of queues. Hierarchical scheduling includes the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz).

The two tiers used in hierarchical scheduling are priorities and priority groups, as shown in Table 481 on page 5481.

Table 481: Hierarchical Scheduling Tiers

Junos OS Configuration Construct	Equivalent ETS Construct	Description
Forwarding class	Priority	Think about priorities (forwarding classes) as output queues. You map forwarding classes to queues, so each forwarding class is in essence an output queue. When you use a classifier to map a forwarding class to an IEEE 802.1p code point, the code point identifies that traffic's priority for priority-based flow control (PFC). Thus the forwarding class, the queue mapped to the forwarding class, and the priority mapped to the forwarding class all identify the same traffic.
Forwarding class set	Priority group	Priority groups (forwarding class sets) are groups of priorities. Forwarding class membership in a forwarding class set defines the priority group to which each priority belongs. You can configure up to three unicast priority groups and one multicast forwarding class set.

NOTE: If you explicitly configure one or more priority groups on an interface, any priority that is not assigned to a priority group on that interface is assigned to an automatically generated default priority group and receives *no bandwidth*. This means that if you configure hierarchical scheduling on an interface, every forwarding class that you want to forward traffic on that interface must belong to a forwarding class set.

This topic describes:

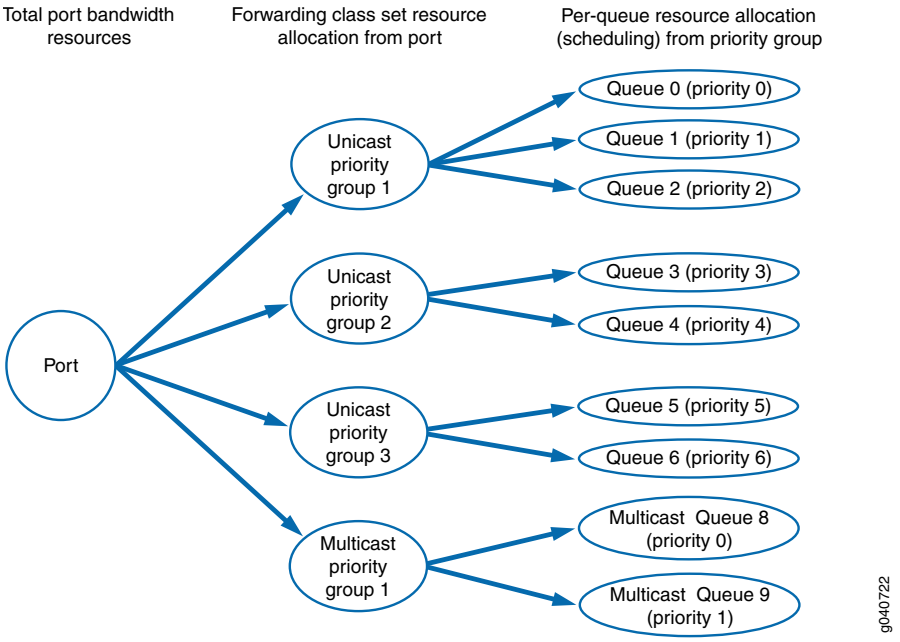
- Default Hierarchical Scheduling on page 5485

Hierarchical Scheduling and ETS

Two-tier hierarchical scheduling enables you to manage bandwidth efficiently by enabling you to define the CoS properties for each priority group and for each priority. One tier of the hierarchical scheduler allocates port bandwidth to a priority group. The other tier of the hierarchical scheduler determines the portion of the priority group bandwidth that a queue can use.

The CoS properties you configure for a priority group define the port bandwidth resources available to the queues in that priority group. The CoS properties you configure for each queue specify the portion or percentage of the total bandwidth configured for the priority group that is available to the queue. Figure 205 on page 5482 shows the relationship of port resource allocation to priority groups and priority group resource allocation to queues (priorities).

Figure 205: Hierarchical Scheduling Tiers



If a queue is not using its allocated bandwidth, ETS shares the unused bandwidth among the other queues in the priority group. If link bandwidth is available or if a priority group on a link is not using its allocated bandwidth, ETS shares the unused bandwidth with other priority groups on the link. In this way ETS improves link bandwidth utilization and provides each queue with the maximum bandwidth. Priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.

NOTE: The available link bandwidth is the bandwidth remaining after servicing strict-high priority flows.

ETS Advertisement in DCBX

When you configure hierarchical scheduling on a port, Data Center Bridging Capability Exchange Protocol (DCBX) advertises:

- Each priority group
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

When you configure hierarchical scheduling on a port, any priority that is not part of an explicitly configured priority group is assigned to the automatically generated default priority group and receives no bandwidth. The default priority group is transparent. It does not appear in the configuration.

Hierarchical Scheduling Process

Hierarchical scheduling consists of multiple configuration steps that create the priorities and the priority groups, schedule their resources, and assign them to interfaces. The steps below correspond to the six blocks in the packet flow diagram shown in Figure 206 on page 5484:

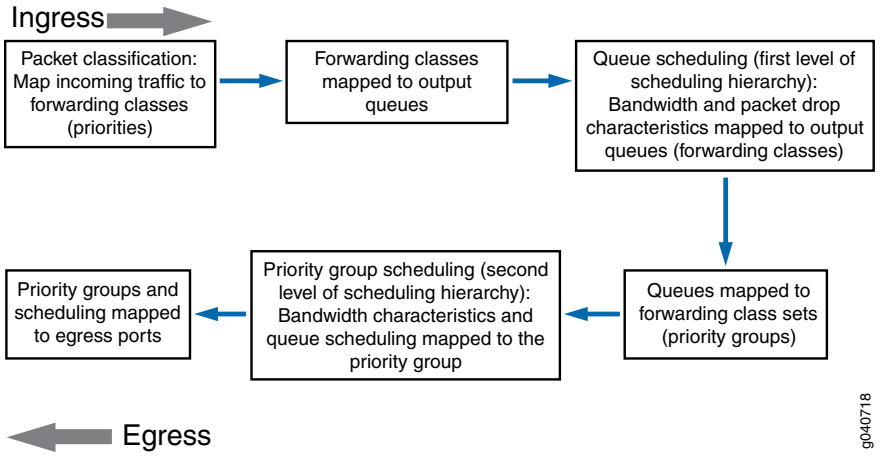
1. Packet classification:
   - Classify incoming traffic into priorities. This consists of either using the default classifiers or configuring classifiers to map IEEE 802.1p code points and loss priorities to the forwarding classes.
   - Apply the classifiers to ingress interfaces. This groups incoming traffic into forwarding classes (priorities) by mapping code points to forwarding classes and loss priorities on the specified interface.
2. Configure the output queues for the forwarding classes (priorities). This consists of either using the default forwarding classes and forwarding-class-to-queue mapping or creating your own forwarding classes and mapping them to queues.
3. Allocate resources to the forwarding classes:
   - Define resources for the priorities. This consists of configuring schedulers to set minimum guaranteed bandwidth, maximum bandwidth, drop profiles for Weighted Random Early Detection (WRED), and bandwidth priority to apply to a forwarding class. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.
   - Map resources to priorities. This consists of mapping forwarding classes to schedulers by using a scheduler map.
4. Configure priority groups. This consists of mapping forwarding classes (priorities) to forwarding class sets (priority groups) to define the priorities that belong to each priority group.
5. Define resources for the priority groups. This consists of configuring traffic control profiles to set minimum guaranteed bandwidth and maximum bandwidth for a priority group. Traffic control profiles also specify a scheduler map, which defines the resources

(schedulers) for the priorities in the priority group. Extra port bandwidth is shared among priority groups in proportion to the minimum guaranteed bandwidth of each priority group.

The traffic control profile bandwidth settings determine the port resources available to the priority group, and the schedulers specified in the scheduler map determine the amount of the priority group resources that each priority receives.

6. Apply the hierarchical scheduling to a port. This consists of attaching one or more priority groups to a port interface. For each priority group, you also attach a traffic control profile. Different priority groups on the same port can use different traffic control profiles.

Figure 206: Hierarchical Scheduling Packet Flow



Strict-High Priority Queues and Hierarchical Scheduling

If you configure a strict-high priority queue, you must observe the following rules:

- You must create a separate forwarding class set (priority group) for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multidestination forwarding class set.

NOTE: On a QFabric system, if a fabric (fte) interface handles strict-high priority traffic, you must define a separate fc-set (priority group) for strict-high priority traffic. Strict-high priority traffic cannot be mixed with traffic of other priorities in an fc-set. For example, you might choose to create different fc-sets for best effort, lossless, strict-high priority, and multidestination traffic.

Default Hierarchical Scheduling

If you do not explicitly configure hierarchical scheduling, the switch uses the default settings:

- The switch automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The switch assigns 100 percent of the port output bandwidth to the default forwarding class set. The default forwarding class set is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange Protocol (DCBX) advertisement.
- Ingress traffic is classified based on the default classifier settings.
- The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings.

Understanding CoS Output Queue Schedulers

Output queue scheduling defines the class-of-service (CoS) properties of output queues (priorities). Queue scheduling works with priority group scheduling to create a two-tier hierarchical scheduler. The hierarchical scheduler allocates bandwidth to a group of queues (priority group), and queue scheduling determines the portion of the priority group's bandwidth that a particular queue can use.

Scheduler maps associate queue schedulers with forwarding classes (output queues). You can associate each scheduler map with a traffic control profile, and then associate each traffic control profile with a forwarding class set (priority group) and a port interface. In conjunction with the priority group scheduling configured in the traffic control profile, queue scheduling configures the output queues, packet schedulers, and tail-drop processes that operate according to this mapping.

NOTE: **When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.**

Output Queue Scheduling Components

Table 482 on page 5486 provides a quick reference to the scheduler components you can configure to determine the bandwidth properties of output queues, and Table 483 on page 5487 provides a quick reference to some related scheduling configuration components.

Table 482: Output Queue Scheduler Components

Output Queue Scheduler Component	Description
Priority	Sets the scheduling priority applied to the queue.
Shaping rate	Sets the maximum bandwidth the queue can consume.

Table 482: Output Queue Scheduler Components *(continued)*

Output Queue Scheduler Component	Description
Transmit rate	Sets the minimum guaranteed bandwidth for the queue. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.
Drop profile	Sets the probability of dropping packets as the queue fills up.
Loss priority	Sets the traffic loss priority to which a drop profile applies.
Drop profile map	Maps a drop profile to a loss priority.
Buffer size	Sets the size of the queue buffer.

Table 483: Other Scheduling Components

Other Scheduling Components	Description
Scheduler map	Maps schedulers to queues (forwarding classes, also called priorities).
Forwarding class	Maps traffic to a queue (priority).
Traffic control profile	Sets scheduling for the forwarding class set (priority group) and associates a scheduler map with the forwarding class set to apply queue scheduling to the forwarding classes in the forwarding class set. Extra port bandwidth is shared among forwarding class sets in proportion to the minimum guaranteed bandwidth of each forwarding class set.
Forwarding class set	Name of a priority group. You map forwarding classes to priority groups. A forwarding class set consists of one or more forwarding classes.

Default Schedulers

Each forwarding class requires an associated scheduler. The default configuration uses only four forwarding classes, unicast best-effort (queue 0), unicast network-control (queue 3), multicast best-effort (queue 8), and multicast network control (queue 11). You can use the default schedulers or you can define new schedulers for these four forwarding classes. For any other forwarding class, you must explicitly configure a scheduler.

Table 484 on page 5487 shows the default schedulers.

Table 484: Default Schedulers

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
Best-effort scheduler (queue 0)	5%	None	5%	Low	5%

Table 484: Default Schedulers *(continued)*

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
FCoE scheduler (queue 3)	35%	None	35%	Low	35%
No-loss scheduler (queue 4)	35%	None	35%	Low	35%
Network-control scheduler (queue 7)	5%	None	5%	Low	5%
Multidestination scheduler (queue 8)	20%	None	20%	Low	20%

NOTE: **The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.**

There are no resources assigned by default to queues 1, 2, 5, 6, 9, 10, and 11. You can define new unicast forwarding classes to assign to queues 1, 2, 5, and 6, and new multidestination forwarding classes to assign to queues 9, 10, and 11, which do not have default mappings to a forwarding class. You can assign resources to these queues manually using schedulers. In addition, you can change the default forwarding-class-to-queue mappings and the default schedulers.

By default, each queue can exceed the assigned bandwidth if additional bandwidth is available from other queues in the forwarding class set. When a forwarding class does not fully use the allocated minimum transmission bandwidth (transmit rate), other forwarding classes in the forwarding class set can use the remaining bandwidth if those forwarding classes receive more traffic than their allocated bandwidth.

Transmit Rate (Minimum Guaranteed Bandwidth)

The transmit rate determines the minimum guaranteed bandwidth for each forwarding class. It also determines how much excess (extra) bandwidth each low-priority queue can share; each queue shares extra bandwidth in proportion to its transmit rate. You specify the rate in bits per second as a fixed value such as 1 Mbps or as a percentage of the total forwarding class set minimum guaranteed bandwidth (the guaranteed rate set in the traffic control profile). Either the default scheduler or a scheduler you configure allocates a portion of the outgoing interface bandwidth to each forwarding class.

NOTE: For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

The allocated bandwidth can exceed the configured minimum rate if additional bandwidth is available from other queues in the forwarding class set. In case of congestion, the configured transmit rate is guaranteed for the queue. This property enables you to ensure that each queue receives the amount of bandwidth appropriate to its level of service.

NOTE: Configuring the minimum guaranteed bandwidth (transmit rate) for a forwarding class does not work unless you also configure the minimum guaranteed bandwidth (guaranteed rate) for the forwarding class set in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

Sharing Extra Bandwidth

Extra bandwidth is available to low-priority queues when the minimum guaranteed bandwidth of the queues does not use the full amount of forwarding class set bandwidth. This extra bandwidth is shared among the forwarding classes in the set based on the minimum guaranteed bandwidth of each queue.

For example, in a forwarding class set, Queue A has a transmit rate of 1 Gbps, Queue B has a transmit rate of 1 Gbps, and Queue C has a transmit rate of 2 Gbps. After servicing the minimum guaranteed bandwidth of these queues, the forwarding class set has an extra 2 Gbps of bandwidth available, and all three queues still have packets to forward. The queues receive the extra bandwidth in proportion to their transmit rates, so Queue A receives an extra 500 Mbps, Queue B receives an extra 500 Mbps, and Queue C receives an extra 1 Gbps.

Shaping Rate (Maximum Bandwidth)

The shaping rate determines the maximum bandwidth each forwarding class can consume. You specify the rate in bits per second as a fixed value such as 3 Mbps or as a percentage of the total forwarding class set maximum bandwidth (the shaping rate set in the traffic control profile).

The maximum bandwidth for a queue depends on the total bandwidth available to the forwarding class set to which the queue belongs and how much bandwidth the other queues in the forwarding class set consume.

NOTE: In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets. A strict-high priority queue (or several queues with higher priorities than the starved queue) can consume all of the port bandwidth and prevent another queue from transmitting packets. To prevent a queue from being starved for bandwidth, you can configure a shaping rate on the queue or queues to prevent them from consuming all of the port bandwidth.

Scheduling Priority

Scheduling priority determines the order in which an output interface transmits traffic from the queues, thus ensuring that queues containing important traffic receive better access to the outgoing interface. The priority setting in the scheduler determines the priority for the queue.

Two levels of scheduling priority are supported:

- Low—Low-priority queues transmit traffic based on the weighted round robin (WRR) algorithm. The scheduler first determines if an individual queue is within its defined bandwidth profile. The scheduler then regularly reevaluates whether each individual queue is within its defined bandwidth profile and compares the amount of data the queue transmits to the amount of bandwidth the scheduler allocates to the queue. When the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out of profile when its transmitted amount is larger than its allocated amount. Out of profile queue data is transmitted only if bandwidth is available. Otherwise, it is buffered if buffer space is available. If no buffer space is available, the traffic may be dropped.

- Strict-high—You can configure only one queue as **strict-high** priority. The other 11 queues are **low** priority.

  The **strict-high** priority queue receives preferential treatment over the low-priority queues. The **strict-high** priority queue receives all of its configured bandwidth before low-priority queues are serviced. Low-priority queues do not transmit traffic until the strict-high priority queue is empty. Carefully consider how much bandwidth you want to allocate to the **strict-high** priority queue to avoid starving the low-priority queues.

  If you configure a strict-high priority queue, you must observe the following rules:

  - You must create a separate forwarding class set (priority group) for the strict-high priority queue.
  - Only one forwarding class set can contain strict-high priority queues.
  - Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.

- A strict-high priority queue cannot belong to a multidestination forwarding class set.
- You cannot configure a minimum guaranteed bandwidth for a strict-high priority queue. (You cannot configure a transmit rate for a strict-high priority queue scheduler, and you cannot configure a guaranteed rate for a forwarding class set that has a strict-high priority queue.)

Junos OS performs priority queueing using the following steps:

1. Services the strict-high priority queue before any other queues are served
2. Services the minimum bandwidth (transmit rate) of low-priority queues until the minimum is met or the queues are empty
3. Services all other low-priority queues and needs that exceed the minimum bandwidth

Scheduler Drop-Profile Maps

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type:

- PLP—Low, medium-high, high. You configure the PLP during classifier configuration. When you use a scheduler map to associate a forwarding class with a scheduler, you can use a drop-profile map to map different drop profiles to the forwarding class for different PLPs.
- Protocol type—Drop profiles match all protocol types.

Buffer Size

Most of the total system buffer space is divided into two buffer pools, shared buffers and dedicated buffers. Shared buffers are a global pool that the ports share dynamically as needed. Dedicated buffers are a reserved portion of the buffer pool that is distributed evenly to all of the ports. Each port receives an equal allocation of dedicated buffer space. The dedicated buffer allocation to ports is not configurable because it is reserved for the ports.

The queue buffers are allocated from the dedicated buffer pool assigned to the port. By default, ports divide their allocation of dedicated buffers among the egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (**transmit-rate**) for traffic. Only the queues included in the default scheduler receive dedicated buffers.

If you do not use the default configuration, you can explicitly configure the queue buffer size in either of two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is mapped to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining port dedicated buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit

scheduler means no dedicated buffer allocation for the queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

NOTE: **The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.**

For a complete discussion about queue buffer configuration in the context of ingress and egress port buffer configuration, see "Understanding CoS Buffer Configuration" on page 5527.

Scheduler Maps

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map, associate the scheduler map with a traffic control profile, and then associate the traffic control profile with an interface and a forwarding class set.

You can associate up to four user-defined scheduler maps with traffic control profiles.

Understanding CoS Priority Group Scheduling

Priority group scheduling defines the class-of-service (CoS) properties of a group of output queues (priorities). Priority group scheduling works with output queue scheduling to create a two-tier hierarchical scheduler. The hierarchical scheduler allocates bandwidth to a group of queues (a priority group, called a forwarding class set in Junos OS configuration). Queue scheduling determines the portion of the priority group bandwidth that the particular queue can use.

You configure priority group scheduling in a traffic control profile and then associate the traffic control profile with a forwarding class set and an interface. You attach a scheduler map to the traffic control profile to specify the queue scheduling characteristics.

NOTE: When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

Priority Group Scheduling Components

Table 485 on page 5493 provides a quick reference to the traffic control profile components you can configure to determine the bandwidth properties of priority groups, and Table 486 on page 5494 provides a quick reference to some related scheduling configuration components.

Table 485: Priority Group Scheduler Components

Traffic Control Profile Component	Description
Guaranteed rate	Sets the minimum guaranteed port bandwidth for the priority group. Extra port bandwidth is shared among priority groups in proportion to the guaranteed rate of each priority group on the port.
Shaping rate	Sets the maximum port bandwidth the priority group can consume.
Scheduler map	Maps schedulers to queues (forwarding classes, also called priorities). This determines the portion of the priority group bandwidth that a queue receives.

Table 486: Other Scheduling Components

Other Scheduling Components	Description
Forwarding class	Maps traffic to a queue (priority).
Forwarding class set	Name of a priority group. You map forwarding classes to priority groups. A forwarding class set consists of one or more forwarding classes.
Scheduler	Sets the bandwidth and scheduling priority of individual queues (forwarding classes).

Default Traffic Control Profile

There is no default traffic control profile.

Guaranteed Rate (Minimum Guaranteed Bandwidth)

The guaranteed rate determines the minimum guaranteed bandwidth for each priority group. It also determines how much excess (extra) port bandwidth the priority group can share; each priority group shares extra port bandwidth in proportion to its guaranteed rate. You specify the rate in bits per second as a fixed value such as 3 Mbps or as a percentage of the total port bandwidth.

The minimum transmission bandwidth can exceed the configured rate if additional bandwidth is available from other priority groups on the port. In case of congestion, the configured guaranteed rate is guaranteed for the priority group. This property enables you to ensure that each priority group receives the amount of bandwidth appropriate to its level of service.

NOTE: Configuring the minimum guaranteed bandwidth (transmit rate) for a forwarding class does not work unless you also configure the minimum guaranteed bandwidth (guaranteed rate) for the forwarding class set in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

You cannot configure a guaranteed rate for forwarding class sets that include strict-high priority queues.

Sharing Extra Bandwidth

Extra bandwidth is available to priority groups when the priority groups do not use the full amount of available port bandwidth. This extra port bandwidth is shared among the priority groups based on the minimum guaranteed bandwidth of each priority group.

For example, Port A has three priority groups: fc-set-1, fc-set-2, and fc-set-3. Fc-set-1 has a guaranteed rate of 2 Gbps, fc-set-2 has a guaranteed rate of 2 Gbps, and fc-set-3 has a guaranteed rate of 4 Gbps. After servicing the minimum guaranteed bandwidth of these priority groups, the port has an extra 2 Gbps of available bandwidth, and all three priority groups have still have packets to forward. The priority groups receive the extra bandwidth in proportion to their guaranteed rates, so fc-set-1 receives an extra 500 Mbps, fc-set-2 receives an extra 500 Mbps, and fc-set-3 receives an extra 1 Gbps.

Shaping Rate (Maximum Bandwidth)

The shaping rate determines the maximum bandwidth the priority group can consume. You specify the rate in bits per second as a fixed value such as 5 Mbps or as a percentage of the total port bandwidth.

The maximum bandwidth for a priority group depends on the total bandwidth available on the port and how much bandwidth the other priority groups on the port consume.

Scheduler Maps

A scheduler map maps schedulers to queues. When you associate a scheduler map with a traffic control profile, then associate the traffic control profile with an interface and a forwarding class set, the scheduling defined by the scheduler map determines the portion of the priority group resources that each individual queue can use.

You can associate up to four user-defined scheduler maps with traffic control profiles.

Understanding CoS Traffic Control Profiles

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth that you assign to the forwarding class set in the traffic control profile.

This two-tier hierarchical scheduling architecture provides flexibility in allocating resources among queues and:

- Assigns a portion of port bandwidth to a priority group. You define the port resources for the priority group in a traffic control profile.
- Allocates priority group bandwidth among the queues that belong to the priority group. A scheduler map attached to the traffic control profile defines the amount of the priority group's resources that each queue can use.

Attaching a priority group and traffic control profile to a port defines the hierarchical scheduling properties of the group and the queues that belong to the group.

The ability to create priority groups supports enhanced transmission selection (ETS, described in IEEE 802.1Qaz). When a priority group does not use its allocated port bandwidth, ETS shares the excess port bandwidth among other priority groups on the port in proportion to their guaranteed minimum bandwidth (guaranteed rate). This utilizes the port bandwidth better than scheduling schemes that require setting strict priorities that reserve bandwidth for all groups whether it is needed or not. ETS allows traffic groups that need extra bandwidth to use it if the bandwidth is available, while preserving the ability to specify the minimum guaranteed bandwidth for traffic groups.

Traffic control profiles define the following CoS properties for priority groups:

- Minimum guaranteed bandwidth—Also known as the committed information rate (CIR). This is the minimum amount of port bandwidth the priority group receives. Priorities in the priority group receive their minimum guaranteed bandwidth as a portion of the priority group's minimum guaranteed bandwidth. The **guaranteed-rate** statement defines the minimum guaranteed bandwidth.

  NOTE: **You cannot apply a traffic control profile with a minimum guaranteed bandwidth to a priority group that includes strict-high priority queues.**

- Shared excess (extra) bandwidth—When the priority groups on a port do not consume the full amount of bandwidth allocated to them or there is unallocated link bandwidth available, priority groups can contend for that extra bandwidth if they need it. Priorities in the priority group contend for extra bandwidth as a portion of the priority group's extra bandwidth. The amount of extra bandwidth for which a priority group can contend is proportional to the priority group's guaranteed minimum bandwidth (guaranteed rate).

- Maximum bandwidth—Also known as peak information rate (PIR). This is the maximum amount of port bandwidth the priority group receives. Priorities in the priority group receive their maximum bandwidth as a portion of the priority group's maximum bandwidth. The **shaping-rate** statement defines the maximum bandwidth.
- Queue scheduling—Each traffic control profile includes a scheduler map. The scheduler map maps priorities (forwarding classes) to schedulers to define the scheduling characteristics of the individual priorities in the priority group. The resources scheduled for each priority represent portions of the resources that the traffic control profile schedules for the entire priority group, not portions of the total link bandwidth. The **scheduler-maps** statement defines the mapping of forwarding classes to schedulers.

Understanding CoS Priority Group and Queue Guaranteed Rates (Minimum Bandwidth)

You can set a guaranteed minimum bandwidth for individual forwarding classes (queues) and for groups of forwarding classes called forwarding class sets (priority groups). Setting a minimum guaranteed bandwidth ensures that priority groups and queues receive the bandwidth required to support the expected traffic.

This topic covers:

- Guaranteeing Bandwidth Using Hierarchical Scheduling on page 5497
- Priority Group Guaranteed Rate (Minimum Bandwidth) on page 5499
- Queue Transmit Rate (Minimum Bandwidth) on page 5499

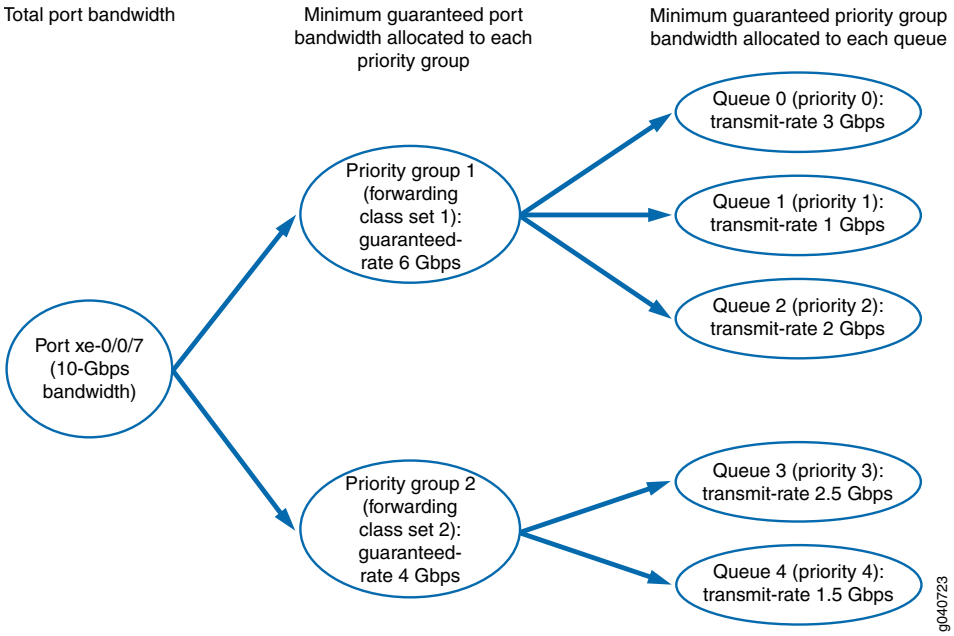
Guaranteeing Bandwidth Using Hierarchical Scheduling

The **guaranteed-rate** value for the priority group defines the minimum amount of bandwidth allocated to a forwarding class set on a port, whereas the **transmit-rate** value of the queue defines the minimum amount of bandwidth allocated to a particular queue in a priority group. The queue bandwidth is a portion of the priority group bandwidth.

NOTE: You cannot configure a minimum guaranteed bandwidth (transmit rate) for a forwarding class that is mapped to a strict-high priority queue, and you cannot configure a minimum guaranteed bandwidth (guaranteed rate) for a priority group that includes strict-high priority queues.

Figure 207 on page 5498 shows how the total port bandwidth is allocated to priority groups (forwarding class sets) based on the guaranteed rate of each priority group. It also shows how the guaranteed bandwidth of each priority group is allocated to the queues in the priority group based on the transmit rate of each queue.

Figure 207: Allocating Guaranteed Bandwidth Using Hierarchical Scheduling



The sum of the priority group guaranteed rates cannot exceed the total port bandwidth. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

The sum of the queue transmit rates cannot exceed the total guaranteed rate of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

NOTE: You must set both the priority group **guaranteed-rate** value and the queue **transmit-rate** value in order to configure the minimum bandwidth for individual queues. If you set the **transmit-rate** value but do not set the **guaranteed-rate** value, the configuration fails.

You can set the **guaranteed-rate** value for a priority group without setting the **transmit-rate** value for individual queues in the priority group. However, queues that do not have a configured **transmit-rate** value can become starved for bandwidth if other higher-priority queues need the priority group's bandwidth. To avoid starving a queue, it is a good practice to configure a **transmit-rate** value for most queues.

If you configure the guaranteed rate of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

Priority Group Guaranteed Rate (Minimum Bandwidth)

Setting a priority group **guaranteed-rate** enables you to reserve a portion of the port bandwidth for the forwarding classes (queues) in that forwarding class set. The minimum bandwidth (**guaranteed-rate**) that you configure for a priority group sets the minimum bandwidth available to all of the forwarding classes in the forwarding class set.

The combined **guaranteed-rate** value of all of the forwarding class sets associated with an interface cannot exceed the amount of bandwidth available on that interface.

You configure the priority group **guaranteed-rate** in the traffic control profile. You cannot apply a traffic control profile that has a guaranteed rate to a priority group that includes strict-high priority queues.

Queue Transmit Rate (Minimum Bandwidth)

Setting a queue **transmit-rate** enables you to reserve a portion of the priority group bandwidth for the individual queue. For example, a queue that handles Fibre Channel over Ethernet (FCoE) traffic might require a minimum rate of 4 Gbps to ensure the class of service that storage area network (SAN) traffic requires.

The priority group **guaranteed-rate** sets the aggregate minimum amount of bandwidth available to the queues that belong to the priority group. The cumulative total minimum bandwidth the queues consume cannot exceed the minimum bandwidth allocated to the priority group to which they belong. (The combined transmit rates of the queues in a priority group cannot exceed the priority group's guaranteed rate.)

You must configure the **guaranteed-rate** value of the priority group in order to set a **transmit-rate** value for individual queues that belong to the priority group. The reason is that if there is no guaranteed bandwidth for a priority group, there is no way to guarantee bandwidth for queues in that priority group.

You configure the queue **transmit-rate** in the scheduler configuration. You cannot configure a transmit rate for strict-high priority queues.

Understanding CoS Priority Group Shaping and Queue Shaping (Maximum Bandwidth)

If the amount of traffic on an interface exceeds the maximum bandwidth of the interface, it leads to congestion. You can use priority group (forwarding class set) shaping and queue shaping to manage the excess traffic and avoid congestion.

The maximum bandwidth sets the most bandwidth a priority group or a queue can use after all of the priority group and queue minimum bandwidth requirements are met, even if more bandwidth is available.

This topic covers:

- Priority Group Shaping on page 5500
- Queue Shaping on page 5500
- Shaping Maximum Bandwidth Using Hierarchical Scheduling on page 5501

Priority Group Shaping

Priority group shaping enables you to shape the aggregate traffic of a forwarding class set on a port to a maximum rate that is less than the line or port rate. The maximum bandwidth (**shaping-rate**) that you configure for a priority group sets the maximum bandwidth available to all of the forwarding classes (queues) in the forwarding class set.

If a port has more than one priority group and the combined **shaping-rate** value of the priority groups is greater than the amount of port bandwidth available, the bandwidth is shared proportionally among the priority groups.

You configure the priority group **shaping-rate** in the traffic control profile.

Queue Shaping

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-high priority queue so that the strict-priority queue does not lock out (or starve) low-priority queues. Similarly, for any queue, you can configure queue shaping (**shaping-rate**) to set the maximum bandwidth for a particular queue.

The **shaping-rate** value of the priority group sets the aggregate maximum amount of bandwidth available to the queues that belong to the priority group. The cumulative total bandwidth the queues consume cannot exceed the maximum bandwidth of the priority group to which they belong on a port.

If a priority group has more than queue and the combined **shaping-rate** value of the queues is greater than the amount of bandwidth available to the priority group, the bandwidth is shared proportionally among the queues.

You configure the queue **shaping-rate** in the scheduler configuration.

Shaping Maximum Bandwidth Using Hierarchical Scheduling

Priority group shaping defines the maximum bandwidth allocated to a forwarding class set on a port, whereas queue shaping defines a limit on maximum bandwidth usage per queue. The queue bandwidth is a portion of the priority group bandwidth.

Figure 208 on page 5501 shows how the port bandwidth is allocated to priority groups (forwarding class sets) based on the shaping rate of each priority group, and how the bandwidth of each priority group is allocated to the queues in the priority group based on the shaping rate of each queue.

Figure 208: Setting Maximum Bandwidth Using Hierarchical Scheduling

Understanding CoS Scheduling Behavior and Configuration Considerations

Many factors affect scheduling configuration and bandwidth requirements, including:

- When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.
- When you define a forwarding class that will be used on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:
  - Mapping a scheduler to the forwarding class in a scheduler map
  - Including the forwarding class in a forwarding class set
  - Associating the scheduler map with a traffic control profile
  - Attaching the traffic control profile to a forwarding class set and an interface
- On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.
- For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.
- Configuring the minimum guaranteed bandwidth (**transmit-rate**) for a queue (forwarding class) does not work unless you also configure the minimum guaranteed bandwidth (**guaranteed-rate**) for the priority group (forwarding class set) in the traffic control profile.

  Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.) If you configure transmit rates whose sum exceeds the guaranteed rate of the forwarding class set, the commit check fails and the system rejects the configuration.
- The sum of the priority group guaranteed rates cannot exceed the total port bandwidth. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

- If you configure the **guaranteed-rate** of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.
- There are several factors to consider if you want to configure strict-high priority queues:
  - You cannot configure a minimum guaranteed bandwidth (**transmit-rate**) for a strict-high priority queue. You cannot configure a minimum guaranteed bandwidth (**guaranteed-rate**) for a forwarding class set that includes a strict-high priority queue.
  - You must create a separate forwarding class set for the strict-high priority queue.
  - Only one forwarding class set can contain strict-high priority queues.
  - Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
  - A strict-high priority queue cannot belong to a multidestination forwarding class set.
- In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets. Failure of a queue to transmit packets for 12 consecutive seconds may be due to:
  - A strict-high priority queue consuming all of the port bandwidth
  - Several queues consuming all of the port bandwidth
  - Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
  - Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

  If the cause is a strict-high priority queue consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the strict-high priority queue and prevent it from using all of the port bandwidth. To configure rate shaping, include the **shaping-rate (*rate* | percent *percentage*)** statement at the **[edit class-of-service schedulers *scheduler-name*]** hierarchy level and apply the shaping rate to the strict-high priority scheduler.

  If several queues consume all of the port bandwidth, you can use a scheduler to rate shape those queues and prevent them from using all of the port bandwidth.
- For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.
- When you set the maximum bandwidth for a queue or for a priority group (**shaping-rate**) at 100 Kbps or lower, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate**.
- Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the

ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

NOTE: **Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.**

- On an ingress port, do not configure classifiers that map the same IEEE 802.1p code point to both a multidestination traffic flow and a lossless unicast traffic flow (such as the default lossless **fcoe** or **no-loss** forwarding classes). Any code point used for multidestination traffic on a port should not be used to classify unicast traffic into a lossless forwarding class on the same port.

  If a multidestination traffic flow and a lossless unicast traffic flow use the same code point on a port, the multidestination traffic is treated the same way as the lossless traffic. For example, if priority-based flow control (PFC) is applied to the lossless traffic, the multidestination traffic of the same code point is also paused. During periods of congestion, treating multidestination traffic the same as lossless unicast traffic can create ingress port congestion for the multidestination traffic and affect the multidestination traffic on all of the egress ports the multidestination traffic uses.

  For example, the following configuration can cause ingress port congestion for the multidestination flow:

  1. For unicast traffic, IEEE 802.1p code point 011 is classified into the **fcoe** forwarding class:

     ```
     user@switch# set class-of-service classifiers ieee-802.1 ucast_cl forwarding-class fcoe loss-priority low code-points 011
     ```

  2. For multidestination traffic, IEEE 802.1p code point **011** is classified into the **mcast** forwarding class:

     ```
     user@switch# set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast loss-priority low code-points 011
     ```

  3. The unicast classifier that maps traffic with code point **011** to the **fcoe** forwarding class is mapped to interface **xe-0/0/1**:

     ```
     user@switch# set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast_cl
     ```

  4. The multidestination classifier that maps traffic with code point **011** to the **mcast** forwarding class is mapped to all interfaces (multidestination traffic maps to all interfaces and cannot be mapped to individual interfaces):

     ```
     user@switch# set class-of-service multi-destination classifiers ieee-802.1 mcast-cl
     ```

Because the same code point (**011**) maps unicast traffic to a lossless traffic flow and also maps multidestination traffic to a multidestination traffic flow, the multidestination traffic flow might experience ingress port congestion during periods of congestion.

To avoid ingress port congestion, do not map the code point used by the multidestination traffic to lossless unicast traffic. For example:

1. Instead of classifying code point **011** into the **fcoe** forwarding class, classify code point **011** into the **best-effort** forwarding class:

   `user@switch#` **set class-of-service classifiers ieee-802.1 ucast_cl forwarding-class best-effort loss-priority low code-points 011**
2. `user@switch#` **set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast loss-priority low code-points 011**
3. `user@switch#` **set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast_cl**
4. `user@switch#` **set class-of-service multi-destination classifiers ieee-802.1 mcast-cl**

   Because the code point **011** does not map unicast traffic to a lossless traffic flow, the multidestination traffic flow does not experience ingress port congestion during periods of congestion.

The best practice is to classify unicast traffic with IEEE 802.1p code points that are also used for multidestination traffic into best-effort forwarding classes.

Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows

Junos OS Release 12.3 increased support for lossless priorities from two lossless forwarding classes to up to six lossless forwarding classes on QFX3500 and QFX3600 switches. (Junos OS Release 13.1 introduced the same support on QFabric systems; throughout this document, features introduced on standalone switches in Junos OS Release 12.3 are introduced on QFabric systems in Junos OS Release 13.1 unless otherwise noted.) Each forwarding class is mapped to an IEEE 802.1p code point (priority).

Earlier Junos OS software releases supported two lossless forwarding classes, the default *fcoe* and *no-loss* forwarding classes, which are mapped by default to IEEE 802.1p priorities 3 (code point 011) and 4 (code point 100), respectively. Junos OS Release 12.3 also introduced a new output stanza in the congestion notification profile (CNP) to configure priority-based flow control (PFC) on output queues.

The default configuration is the same as the default configuration in Junos OS Release 12.2 and is backward-compatible. If you need only two (or fewer) lossless forwarding classes, use the default configuration. If you need more than two lossless forwarding classes, you can use the two default forwarding classes and configure additional lossless forwarding classes. If you do not want to use the default lossless forwarding classes, you can change them or use only the lossless forwarding classes that you explicitly configure.

- Lossless Transport Features Introduced in Junos OS Release 12.3 on page 5506
- Default Lossless Priority Configuration on page 5507
- Configuring Lossless Priorities on page 5509
- Backward Compatibility with Junos OS Releases Earlier Than Release 12.3 on page 5522
- Configuration Rules and Recommendations on page 5523

Lossless Transport Features Introduced in Junos OS Release 12.3

Support for lossless transport introduced in Junos OS Release 12.3 includes:

- Configuring up to six lossless forwarding classes.
- Configuring PFC pause on output queues to program the output queues that can respond to PFC pause messages received from the connected peer. The priorities you pause on output queues must match the priorities on which you enable PFC on the corresponding ingress interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101), then you must also enable pause on priorities 3 and 5 on the corresponding ingress interfaces. Configuring flow control on the output queues and enabling PFC on the corresponding input queues allows you to pause up to six priorities (forwarding classes).
- Controlling the headroom buffer on Ethernet interfaces by configuring the maximum receive unit (MRU) size for the traffic mapped to an IEEE 802.1p priority (configured per priority) and the length of the attached cable (configured per interface). The MRU size can range up to full jumbo packet size (9216 bytes).
- Remapping (rewriting) IEEE 802.1p priorities on native Fibre Channel (FC) interfaces when the system is acting as an FCoE-FC gateway. If the Ethernet (FCoE) network uses a different IEEE 802.1p priority than priority 3 (011) for FCoE traffic, then you can

use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that different priority (see "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5524).

Lossless transport still requires configuring previously existing features, including enabling PFC on the lossless priorities on ingress interfaces, and configuring classifiers to classify incoming traffic into lossless forwarding classes based on the IEEE 802.1p priority tag of the packet.

NOTE: If you expect a large amount of lossless traffic on your network and configure multiple lossless traffic classes, ensure that you reserve enough scheduling resources (bandwidth) and lossless headroom buffer space to support the lossless flows. ("Understanding CoS Buffer Configuration" on page 5527 describes how to configure buffers and provides a recommended buffer configuration for networks with larger amounts of lossless traffic.)

Default Lossless Priority Configuration

If you do not explicitly configure forwarding classes, the system uses the default forwarding class configuration, which provides two default lossless forwarding classes (*fcoe* and *no-loss*). (If you change the forwarding class configuration on a QFX Series switch or on a QFabric Node device, the changes apply to all traffic on that device because forwarding classes are global to a particular device.)

If you do not explicitly configure classifiers, and you do not explicitly configure flow control to pause output queues (configured in the output stanza of the CNP), the default classifier and the default output queue pause configuration are applied to all Ethernet interfaces on QFX Series switches and Node devices. You can override the default classifier and the default output queue pause configuration on a per-interface basis by applying an explicit configuration to an Ethernet interface. The default configuration is used on all Ethernet interfaces that do not have an explicit configuration.

NOTE: If you do not configure flow control on output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause in the output stanza of the CNP.

In the default configuration, only queue 3 and queue 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza of the CNP. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza of the CNP.

The default configuration is the same as the default configuration in software releases earlier than Junos OS Release 12.3, and provides the same lossless behavior:

- There are two default lossless forwarding classes (the no-loss packet drop attribute is applied automatically):
  fcoe—Mapped to output queue 3
  no-loss—Mapped to output queue 4
- The default classifier maps the fcoe forwarding class to IEEE 802.1p priority 3 (011) and the no-loss forwarding class to IEEE 802.1p priority 4 (100)
- Priority-based flow control (PFC) is enabled on Ethernet interface output queues 3 and 4 when those queues carry lossless traffic (traffic that is mapped to the fcoe and no-loss forwarding classes, respectively). In Junos OS software releases earlier than Release 12.3, output queue flow control was not user-configurable.

  On native FC interfaces (NP_Ports), default flow control is enabled on output queue 3 (IEEE 802.1p priority 3) for FCoE/FC traffic.
- PFC must be enabled explicitly on the lossless IEEE 802.1p priorities (code points) on ingress Ethernet interfaces; no default PFC configuration is applied at ingress interfaces. If you do not enable PFC on lossless priorities, those priorities might experience packet loss during periods of congestion. For example, if you want lossless FCoE traffic and you are using the default fcoe forwarding class, you use a CNP to enable PFC on priority 3 (code point 011), and apply that CNP to all ingress interfaces that carry FCoE traffic.
- On Ethernet ports, PFC buffer calculations use the following default values to determine the headroom buffer size:
  Cable length—100 meters (approximately 328 feet)
  MRU for priority 3 traffic—2500 bytes
  MRU for priority 4 traffic—9216 bytes
  Maximum transmission unit (MTU)—1522 (or the configured MTU value for the interface)

  

  NOTE: **If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.**
- DCBX is enabled on all interfaces in autonegotiation mode, and automatically exchanges FCoE application protocol type, length, and values (TLVs) on interfaces that carry FCoE traffic. However, if you explicitly configure DCBX protocol TLV exchange for any application, then you must explicitly configure protocol TLV exchange for every application for which you want DCBX to exchange TLVs, including FCoE.

The default CoS configuration is backward-compatible with the *default* CoS configuration of software releases before Junos OS Release 12.3. If you explicitly configure lossless transport, ensure that the input and output queues corresponding to the lossless forwarding classes are explicitly configured for PFC pause.

NOTE: If you *explicitly* configured the lossless fcoe or no-loss forwarding classes before upgrading from a release earlier than Junos OS Release 12.3, those forwarding classes are *not* lossless after the upgrade to Junos OS Release 12.3 or later. To regain lossless behavior, you can delete the explicit configuration and use the default lossless forwarding classes, or you can use the no-loss packet drop attribute introduced in Junos OS Release 12.3 to configure the forwarding classes for lossless behavior.

Table 487 on page 5509 summarizes the default unicast forwarding classes and their mapping to output queues, IEEE 802.1p priorities, and drop attributes.

Table 487: Mapping of Default Unicast Forwarding Class to Queue, IEEE 802.1p Priority, and Drop Attribute

Forwarding Class Name	Output Queue	Priority	Drop Attribute
best-effort	0	0	drop
fcoe	3	3	no-loss
no-loss	4	4	no-loss
network-control	7	7	drop

There is one default multidestination forwarding class named *mcast* for multicast, broadcast, and destination lookup fail (DLF) traffic that is mapped to output queue 8 with a drop attribute of drop. (Incoming multidestination traffic on all IEEE 802.1p priorities is mapped to the mcast forwarding class by default.)

Configuring Lossless Priorities

Configuring more than two lossless priorities (forwarding classes), or changing the default mapping of lossless forwarding classes to priorities and paused output queues, requires explicit configuration. Configuring lossless priorities includes:

- Configuring forwarding classes with the no-loss packet drop attribute
- Using a CNP to configure PFC on ingress interfaces and flow control (PFC) on egress interfaces
- Configuring a classifier to map IEEE 802.1p priorities (code points) to the correct forwarding classes (the forwarding classes for which you want lossless transport)

In addition, on Ethernet interfaces, DCBX must exchange the appropriate application protocol TLVs for the lossless traffic, and when the switch acts as an FCoE-FC gateway, you need to remap the FCoE priority on native FC interfaces if your network uses a priority other than 3 (IEEE code point 011) for FCoE traffic. This section describes:

- Configuring Lossless Forwarding Classes (Packet Drop Attribute) on page 5510
- Congestion Notification Profiles (PFC Configuration) on page 5511

- Configuring DCBX (Application Protocol TLV Exchange) on page 5517
- Fate Sharing Among Traffic Classes on page 5518
- Transit Switch Configuration Versus FCoE-FC Gateway Configuration on page 5519
- Configuration Results and Commit Checks on page 5520

Configuring Lossless Forwarding Classes (Packet Drop Attribute)

Junos OS Release 12.3 introduced the *no-loss* parameter for forwarding class configuration. (Although it uses the same name, this is not the no-loss default forwarding class. It is a packet drop attribute you can specify to configure any unicast forwarding class as a lossless forwarding class.)

You can configure up to six forwarding classes (depending on system architecture and the availability of system resources) as lossless forwarding classes by including the **no-loss** drop attribute at the **[edit class-of-service forwarding-classes class *forwarding-class-name* queue-num *queue-number*]** hierarchy level.

If you do not explicitly configure the fcoe or no-loss forwarding classes, they include the no-loss drop attribute by default. If you explicitly configure the fcoe or no-loss forwarding classes and you want to retain their lossless behavior, you must include the no-loss drop attribute in the configuration.

NOTE: **All forwarding classes mapped to the same output queue must have the same packet drop attribute. (All forwarding classes mapped to the same output queue must be either lossy or lossless. You cannot map a lossy and a lossless forwarding class to the same queue.)**

To avoid fate sharing (different flows receiving the same CoS treatment), use a one-to-one mapping of lossless forwarding classes to IEEE 802.1p code points (priorities) and queues. (Each forwarding class should be mapped to a different queue and classified into a different priority.) The classifier attached to the interface determines the forwarding class to priority mapping.

The fcoe and no-loss forwarding classes are special cases, because in the default configuration, they are configured for lossless behavior (providing that you also enable PFC on the priorities mapped to the fcoe and no-loss forwarding classes in the CNP input stanza).

Table 488 on page 5511 summarizes the possible configurations of the fcoe and no-loss forwarding classes in Junos OS Release 12.3 and later, and the result of those configurations in terms of lossless traffic behavior. It is assumed that PFC, DCBX, and classifiers are properly configured.

Table 488: FCoE and No-Loss Forwarding Class Configuration in Junos OS Release 12.3

Explicit (User-Configured) or Default Forwarding Class Configuration	Packet Drop Attribute	Result and Notes
Default	Default	The fcoe and no-loss forwarding classes are lossless. NOTE: Even if you explicitly configure other forwarding classes (lossy or lossless forwarding classes), the fcoe and no-loss forwarding classes remain lossless because they are not explicitly configured.
Explicit	Not specified in the explicit forwarding class configuration	The fcoe and no-loss forwarding classes are lossy because they do not include the no-loss drop attribute.
Explicit	No-loss	The fcoe and no-loss forwarding classes are lossless.
Explicit, configured in Junos OS Release 12.2 or earlier	Not specified (packet drop attribute was not available before Junos OS Release 12.3)	The fcoe and no-loss forwarding classes are lossy in Junos OS Release 12.3 and later because they do not include the no-loss drop attribute. NOTE: To retain lossless behavior, before you upgrade to Junos OS Release 12.3, delete the explicit configuration so that the system uses the default configuration. Alternatively, you can reconfigure the forwarding classes with the no-loss packet drop attribute after upgrading to Junos OS Release 12.3 or later.

For all other forwarding classes, you must explicitly configure lossless transport by specifying the no-loss packet drop attribute, because the default configuration for all other forwarding classes is lossy.

Congestion Notification Profiles (PFC Configuration)

Use CNPs to configure lossless PFC characteristics on input and output interfaces.

The input stanza of a CNP enables PFC on specified IEEE 802.1p priorities (code points) and fine-tunes headroom buffer settings by configuring the maximum receive unit (MRU) value and cable length on ingress interfaces.

The output stanza of a CNP enables PFC (flow control) on output queues for specified IEEE 802.1p priorities so that the queues can respond to PFC pause messages from the connected peer on the priority of your choice. (By default, output queues 3 and 4 respond to received PFC messages when those queues carry lossless traffic in the fcoe and no-loss forwarding classes, respectively.)

To achieve lossless transport, the priority paused at the ingress interfaces must match the priority paused at the egress interfaces for a given traffic flow. For example, if you configure ingress interfaces to pause traffic tagged with IEEE 802.1p priority 5 (code point 101) and priority 5 traffic is mapped to output queue 5, then you must also configure the corresponding output interfaces to pause priority 5 on queue 5. In addition, the forwarding class mapped to queue 5 must be configured as a lossless forwarding class (using the no-loss drop attribute).

CAUTION: Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.
  3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.
- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

Configuring Input Interface Flow Control (PFC and Headroom Buffer Calculation)

On Ethernet interfaces, the input stanza of the CNP enables PFC on specified priorities so that the ingress interface can send a pause message to the connected peer during periods of congestion. Input CNPs also fine-tune the headroom buffers used for PFC support by allowing you to configure the MRU value and cable length (if you do not want to use the default configuration).

Headroom buffers support lossless transport by storing the traffic that arrives at an interface after the interface sends a PFC flow control message to pause incoming traffic.

Until the connected peer receives the flow control message and pauses traffic, the interface continues to receive traffic and must buffer it (and the traffic that is still on the wire after the peer pauses) to prevent packet loss.

The system uses the MRU and the length of the attached physical cable to calculate buffer headroom allocation. The default configuration values are:

- MRU for priority 3 traffic—2500 bytes
- MRU for priority 4 traffic—9216 bytes
- Cable length—100 meters (approximately 328 feet)

NOTE: If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not explicitly configure an MRU value, the default MRU value is 2500 bytes.

You can fine-tune the MRU and the cable length to adjust the size of the headroom buffer on an interface. The QFX Series has a shared global buffer pool and dynamically allocates headroom buffer space to lossless queues as needed.

A lower MRU or a shorter cable length reduces the amount of headroom buffer required on an interface and leaves more headroom buffer space for other interfaces. A higher MRU or a longer cable length increases the amount of headroom buffer space required on an interface and leaves less headroom buffer space for other interfaces.

In many cases, you can better utilize the headroom buffers by reducing the MRU value (for example, an MRU of 2180 is sufficient for most FCoE networks) and by reducing the cable length value if the physical cable is less than 100 meters long.

NOTE: When you configure the headroom buffers by changing the MRU or the cable length, and commit the configuration, the system performs a commit check and rejects the configuration if sufficient headroom buffer space is not available.

However, the system does not perform a commit check but instead returns a syslog error if:

- The buffers are configured on a LAG interface.
- The default classifier is used on the interface (instead of a user-configured classifier).
- The interface has not been created yet.

Configuring Output Interface Flow Control (PFC)

On Ethernet interfaces, you can use the output stanza of the CNP to configure flow control on unicast output queues and enable PFC pause response on specified IEEE 802.1p

priorities. By default, output queues 3 and 4 are enabled for PFC pause on priorities 3 (IEEE 802.1p code point 011) and 4 (IEEE 802.1p code point 100). The default PFC pause response supports the default lossless forwarding class configuration, which maps the fcoe forwarding class to queue 3 and priority 3, and maps the no-loss forwarding class to queue 4 and priority 4.

Configuring PFC on output queues enables you to pause any priority on any unicast output queue on any Ethernet interface. Output flow control enables you to use more than two output queues to support lossless traffic flows (you can configure up to six lossless forwarding classes and map them to different output queues that are enabled for PFC pause). Output queue flow control also enables you to support multiple lossless forwarding classes (each mapped to a different priority and output queue) for one class of traffic.

NOTE: **Output flow control only works when PFC is enabled in the CNP input stanza on the corresponding priorities on the interface.**

For example, if the converged Ethernet network uses two different priorities for FCoE traffic (for example, priority 3 and priority 5), then you can classify those priorities into different lossless forwarding classes that are mapped to different output queues by:

1. Configuring two lossless forwarding classes for FCoE traffic, with each forwarding class mapped to a different output queue. For example, you could use the default fcoe forwarding class, which is mapped to queue 3, and you could configure a second lossless forwarding class called fcoe1 and map it to queue 5. The fcoe forwarding class is for priority 3 FCoE traffic (code point 011), and the fcoe1 forwarding class is for priority 5 (code point 101) FCoE traffic.
2. Configuring a classifier that maps each forwarding class to the desired IEEE 802.1p code point (priority). If FCoE traffic on both priorities uses one interface, the classifier must classify both forwarding classes to the correct priorities. If FCoE traffic of different priorities uses different interfaces, the classifier configuration on each interface must map the correct priority to the corresponding lossless forwarding class.
3. Applying the classifier to the interfaces that carry FCoE traffic. The classifier determines the mapping of forwarding classes to priorities on each interface.

To configure lossless transport for these forwarding classes, you also need to:

- Enable PFC on the two priorities (3 and 5 in this example) at the ingress interfaces in the CNP input stanza.
- Configure PFC on the output queues and priorities for the forwarding classes in the CNP output stanza so that the interface can respond to pause messages received from the connected peer.

NOTE: When you configure the CNP on an interface, all ingress and egress traffic is blocked until the configuration is implemented, then the interface is unblocked and traffic resumes. During the time the interface is blocked, all queues on the interface experience packet loss.

- Configure DCBX to exchange application protocol TLVs on both FCoE priorities.

NOTE: If you do not configure flow control to pause output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer, and you must explicitly enable PFC on the corresponding priorities in the CNP input stanza to achieve lossless behavior.

If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause. For example, if you explicitly configure flow control on output queue 5, the default configuration is no longer valid, and only output queue 5 is enabled for PFC pause. Output queues 3 and 4 are no longer enabled for PFC pause, so traffic using those queues no longer responds to PFC pause messages even if the corresponding forwarding class is configured with the no-loss drop attribute. To retain the pause configuration on output queues 3 and 4 and configure flow control on queue 5, you need to explicitly configure flow control on queues 3, 4, and 5.

You cannot configure flow control to pause a multidestination output queue. You can configure flow control to pause only unicast output queues.

Output Interface Flow Control Profiles

Configuring the CNP output stanza creates an output flow control profile that tells egress ports the queues on which the Ethernet interface should respond to PFC pause messages. Although you can create an unlimited number of CNPs that contain input stanzas only, the number of CNPs that you can configure with output stanzas is limited:

- For QFX3500 and QFX3600 standalone switches that are not part of a QFabric system, you can configure up to two output interface flow control profiles. (You can configure up to two CNPs with output stanzas.)
- For QFabric systems, you can configure one output interface flow control profile per Node device. (You can configure one CNP with an output stanza per Node device.)

There are a total of four output flow control profiles.

The system has a default output flow control profile that is applied to all Ethernet interfaces when the CNP attached to the interface has only an input stanza and does

not include an output stanza. The default profile responds to PFC pause messages received on queue 3 (for priority 3, for the default fcoe forwarding class) and on queue 4 (for priority 4, for the default no-loss forwarding class), and is effective only if PFC is configured on those priorities in the CNP input stanza.

Additionally, the system has two internal output flow control profiles that it applies automatically to fabric (FTE) ports and to native FC interfaces (NP_Ports). When the QFX3500 switch or the QFX3600 switch is not part of a QFabric system, the profile normally used for FTE ports is available for user configuration and provides a second user-configurable profile. (That is why standalone QFX3500 and QFX3600 switches have two user-configurable output flow control profiles, but QFX3500 and QFX3600 switches that are part of a QFabric have only one user-configurable output flow control profile.)

Because one output CNP can configure PFC pause response on multiple output queues (priorities), one user-configurable output CNP is usually flexible enough to specify the desired PFC response on all programmed interfaces.

NOTE: **Each port can use one output flow control profile. You cannot apply more than one profile to one port.**

Output flow control profiles can be expressed in table format. For example, Table 489 on page 5516 shows the default output flow control profile that pauses priorities 3 and 4 on queues 3 and 4 (remember that PFC must also be enabled on code points 3 and 4 in the CNP input stanza in order for PFC to work):

Table 489: Default Output Flow Control Profile

IEEE 802.1p Priority Specified in Received PFC Frame	Paused Output Queue
0 (000)	—
1 (001)	—
2 (010)	—
3 (011)	3
4 (100)	4
5 (101)	—
6 (110)	—
7 (111)	—

Table 490 on page 5517 is an example of a user-configured output flow control profile. Using the example from the preceding section, the CNP output stanza configures flow control on output queue 5, and also explicitly configures output flow control on queues

3 and 4 for the fcoe and no-loss forwarding classes. (If you explicitly configure an output CNP, you must explicitly configure every output queue that you want to respond to PFC messages, because the user-configured profile overrides the default profile. If this example did not include queues 3 and 4, those queues would no longer respond to received PFC messages.)

Table 490: User-Configred Output Flow Control Profile

IEEE 802.1p Priority Specified in Received PFC Frame	Paused Output Queue
0 (000)	—
1 (001)	—
2 (010)	—
3 (011)	3
4 (100)	4
5 (101)	5
6 (110)	—
7 (111)	—

Remember that you must also enable PFC on code points 3, 4, and 5 in the CNP input stanza for this configuration to work. When you configure the CNP on an interface, all ingress and egress traffic is blocked until the configuration is implemented, then the interface is unblocked and traffic resumes. During the time the interface is blocked, all queues on the interface experience packet loss.

Configuring DCBX (Application Protocol TLV Exchange)

For applications that require lossless transport, DCBX exchanges application protocol TLVs with the connected peer interface. By default, DCBX advertises FCoE application protocol TLVs on all interfaces that are enabled for DCBX, and by default, DCBX is enabled on all interfaces. DCBX advertises no other applications by default.

For each application (for example, iSCSI) that you want to configure for lossless transport, you must enable the interfaces which carry that application traffic to exchange DCBX protocol TLVs with the connected peer. The TLV exchange allows the peer interfaces to negotiate a compatible configuration to support the application.

If you configure DCBX to advertise any application, the default DCBX advertisement is overridden, and DCBX advertises only the configured applications. If you want an interface to advertise only the FCoE application, you do not have to configure DCBX application protocol TLV exchange; instead, you can use the default configuration.

If you want DCBX to advertise other applications, you must explicitly configure an application map and apply it to the interfaces on which you want to exchange protocol TLVs for those applications. If you want to exchange FCoE application protocol TLVs in

addition to other application protocol TLVs, you must also explicitly configure the FCoE application in the application map. "Understanding DCBX Application Protocol TLV Exchange" on page 5060 describes how application mapping works.

NOTE: Lossless transport also requires that you enable PFC on the correct priority (IEEE 802.1p code point) on the ingress interfaces using an input CNP. If the priority you pause at the ingress interfaces is not mapped to queue 3 or queue 4 (the two output queues that are enabled for PFC pause flow control by default), then you must also enable the output queues that correspond to paused input priorities to pause using the output stanza of the CNP.

Fate Sharing Among Traffic Classes

You can configure different lossless (or lossy) traffic flows to share fate—that is, to receive the same CoS treatment.

Fate sharing is not desirable for I/O convergence. Instead of independent control of the fate of each type of flow, different types of flows receive the same treatment. Fate sharing is particularly undesirable for lossless flows. If one lossless flow experiences congestion and must be paused, that affects flows that share fate with the congested flow even if the other flows are not experiencing congestion, and also can cause ingress port congestion. If your network requires that all 802.1p priorities be lossless, you can achieve that by allowing some fate sharing among the eight priorities by spreading them across up to six lossless forwarding classes.

If the number of lossless priorities is less than or equal to the number of configured lossless forwarding classes, then you can avoid fate sharing by configuring a one-to-one mapping of forwarding classes to IEEE 802.1p code points (priorities) and output queues. (Each forwarding class should be mapped to a different output queue and classified to a different priority.)

If you want to configure different traffic flows to share fate, the QFX Series supports two fate-sharing configurations: mapping one forwarding class to more than one IEEE 802.1p code point (priority), and mapping two forwarding classes to the same output queue:

1. If you map one lossless forwarding class to more than one priority, the traffic tagged with each of the priorities uses the same CoS properties associated (the CoS properties associated with the forwarding class). For example, configuring a forwarding class called fc1, mapping it to queue 1, and mapping it to code points 101 and 110 using a classifier named classify1 results in the traffic tagged with priorities 101 and 110 sharing fate:

   ```
   user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
   user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
   loss-priority low code-points 101
   user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
   loss-priority low code-points 110
   ```

In this case, if the traffic mapped to either priority experiences congestion, both priorities are paused because they are mapped to the same forwarding class and are therefore treated similarly.

2. If you map multiple lossless forwarding classes to the same output queue, the traffic mapped to the forwarding classes uses the same output queue. This increases the amount of traffic the queue needs to buffer and forward, and can create congestion that affects all of the traffic flows that are mapped to the queue. For example, configuring two forwarding classes called fc1 and fc2, mapping both forwarding classes to queue 1, and mapping the forwarding classes to code points 101 and 110 (respectively) using a classifier named classify1 results in the traffic tagged with priorities 101 and 110 sharing fate on the same output queue:

```
user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
user@switch# set class-of-service forwarding-classes class fc2 queue-num 1 no-loss
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
loss-priority low code-points 101
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc2
loss-priority low code-points 110
```

   in this case, even though the two forwarding classes use different IEEE 802.1p priorities, if one forwarding class experiences congestion, it affects the other forwarding class. The reason is that if the output queue is paused because of congestion on either forwarding class, all traffic that uses that queue is paused. Since both forwarding classes are mapped to the queue, the traffic mapped to both forwarding classes is paused.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

Transit Switch Configuration Versus FCoE-FC Gateway Configuration

On a transit switch (all Ethernet ports, no native FC ports) that forwards FCoE traffic (or other traffic that requires lossless transport across the Ethernet network), the configuration of classifiers, lossless forwarding classes, DCBX, and PFC on ingress and egress interfaces to support lossless transport is as described in this document.

When the QFX Series acts as an FCoE-FC gateway, the system uses native FC interfaces (NP_Ports) to connect to the FC switch (or FCoE forwarder) at the FC network edge. You cannot apply CNPs or DCBX to native FC interfaces, only to Ethernet interfaces.

On an FCoE-FC gateway, the Ethernet interface configuration of classifiers, DCBX, and PFC is the same as the Ethernet interface configuration on a transit switch. The configuration of lossless forwarding classes is also the same.

However, supporting lossless transport on native FC interfaces requires that you rewrite the IEEE 802.1p priority value *if* your network uses any priority other than 3 (IEEE code point 011) for FCoE traffic. If your network uses priority 3 for FCoE traffic, you can and should use the default configuration on native FC interfaces.

By default, native FC interfaces tag packets with priority 3 when they encapsulate the incoming FC packets in Ethernet. If your FCoE network uses a different priority than 3 for FCoE traffic, you need to rewrite the priority value to the value that your network uses on the FC interface, classify the FCoE traffic to the correct priority on the Ethernet interfaces, and enable PFC on the correct priority on the Ethernet interfaces, as described in "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5524.

Configuration Results and Commit Checks

Different configurations of forwarding classes and their drop attributes, classifiers, CNPs (PFC flow control), and Ethernet PAUSE (IEEE 802.3X flow control) result in different system behaviors.

Table 491 on page 5520 describes the results of the possible lossless transport configurations in each case. The assumption in the *Result* column is that the system's buffer headroom calculation resulted in a successful configuration.

However, if the system calculates that there is insufficient buffer space to support the configuration, a commit check prevents you from committing the configuration on an individual Ethernet interface. For LAG interfaces, the system does not issue a commit check error but instead issues a syslog message.

NOTE: **After you configure lossless transport for a LAG interface, be sure to check the syslog messages to confirm that the commit was successful.**

Table 491: Results of Lossless Priority Configuration

Classifier Configuration	Congestion Notification Profile Configuration	Ethernet PAUSE (IEEE 802.3X) Configuration	Result
None (default classifier)	None	None	System default configuration. No flows are lossless. To achieve lossless behavior for the default fcoe and no-loss forwarding classes, you must configure a CNP to enable PFC on their IEEE 802.1p code points (011 and 100 respectively).
Classifier with no lossless forwarding classes	None	None	No lossless traffic flows are configured; all traffic is best effort.
Classifier with at least one lossless forwarding class	None	None	Because no CNP is attached to interfaces, PFC is not enabled on the code point of the lossless traffic and no headroom buffer is allocated to the lossless queue, so packets can drop during periods of congestion. This configuration does not achieve lossless behavior.

Table 491: Results of Lossless Priority Configuration *(continued)*

Classifier Configuration	Congestion Notification Profile Configuration	Ethernet PAUSE (IEEE 802.3X) Configuration	Result
None (default classifier)	PFC enabled on the fcoe and no-loss forwarding class code points (priorities)	None	The default classifier classifies traffic into two lossless forwarding classes, fcoe and no-loss. The CNP enables PFC on the priorities mapped to both lossless forwarding classes, resulting in lossless behavior for traffic mapped to the fcoe and no-loss forwarding classes.
None (default classifier)	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length. The system does not calculate buffer headroom for individual output queues. Because Ethernet PAUSE is enabled on the link instead of PFC being enabled on the lossless priorities, the entire link is paused during periods of congestion. This configuration results in lossless behavior for all of the forwarding classes on the link, but because all traffic is paused, this can cause greater overall network congestion.
Classifier with at least one lossless forwarding class	PFC enabled on the lossless forwarding class code points (priorities)	None	Headroom buffer allocated only to priorities that are mapped to the lossless forwarding classes and on which PFC is enabled. This configuration achieves lossless behavior for the lossless forwarding classes.
Classifier with no lossless forwarding classes	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.
Classifier with at least one lossless forwarding class	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.
Classifier with at least one lossless forwarding class	PFC enabled on the lossless forwarding class code points (priorities)	Flow control enabled on a *different* interface than the interface with the CNP	The system checks the available buffer space for both the PFC-enabled priorities and for the other link. If sufficient buffer space is available, the lossless forwarding classes configured with PFC on one interface and also all of the traffic on the link with Ethernet PAUSE enabled achieve lossless behavior.

NOTE: If you attempt to configure both PFC and Ethernet PAUSE on a link, the system returns a commit error. PFC and Ethernet PAUSE are mutually exclusive configurations on an interface.

Backward Compatibility with Junos OS Releases Earlier Than Release 12.3

The addition of the no-loss packet drop attribute to forwarding class configuration means that when you upgrade from an earlier release to Junos OS Release 12.3, the new software might not preserve the lossless forwarding class configuration of the fcoe and no-loss forwarding classes.

If you used the default forwarding class configuration for the fcoe and no-loss forwarding classes, the CoS configuration is backward-compatible. You do not have to do anything to preserve the lossless behavior of traffic that uses those forwarding classes when you upgrade to Junos OS Release 12.3. (This is because the default configuration of these two forwarding classes includes the no-loss packet drop attribute.)

However, if you explicitly configured the fcoe or the no-loss forwarding class by including the **set forwarding-classes class *forwarding-class-name* queue-num *queue-number*** statement at the **[edit class-of-service]** hierarchy level, then those forwarding classes are no longer lossless, they are lossy. (They are lossy because explicit configuration in releases earlier than Junos OS Release 12.3 did not use the no-loss packet drop attribute.) In Junos OS Release 12.3 and later, you must include the no-loss packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

For example, before Junos OS Release 12.3, the following explicit configuration resulted in a lossless forwarding class:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3
```

However, in Junos OS Release 12.3, this configuration is lossy because it does not include the no-loss packet drop attribute. To preserve lossless behavior, after upgrading to Junos OS Release 12.3, you need to add the no-loss drop attribute:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3 no-loss
```

Alternatively, you can delete the explicit configuration before you upgrade to Junos OS Release 12.3 so that the system uses the default forwarding class, which is lossless:

```
user@switch# delete class-of-service forwarding-classes class fcoe queue-num 3
```

NOTE: The explicit configuration of other forwarding classes does not affect the lossless (or lossy) state of the fcoe and no-loss forwarding classes, because only the fcoe and no-loss forwarding classes were lossless forwarding classes before Junos OS Release 12.3. For example, if you explicitly configured the best-effort forwarding class but you used the default fcoe and no-loss forwarding classes in Junos OS Release 12.2, then when you upgrade to Junos OS Release 12.3, the fcoe and no-loss forwarding classes are still lossless (and the best-effort forwarding classes retains its explicit configuration).

NOTE: To achieve lossless behavior for the traffic belonging to any forwarding class, you must also use a CNP to enable PFC on the IEEE 802.1p priority mapped to the forwarding class and apply the CNP to the relevant interfaces, and ensure that DCBX exchanges the protocol TLVs for the application with the connected peer.

Configuration Rules and Recommendations

Keep in mind the following configuration rules and recommendations when you configure lossless traffic flows:

- You can configure a maximum of six lossless forwarding classes (forwarding classes with the no-loss packet drop attribute).
- All forwarding classes that you map to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes must be lossless).
- You cannot configure flow control to pause a multidestination output queue. You can configure PFC flow control only to pause unicast output queues.
- Forwarding classes mapped to multidestination queues (queues 8 through 11) cannot have the no-loss packet drop attribute. (Multidestination forwarding classes cannot be configured as lossless forwarding classes.)
- Do not configure weighted random early detection (WRED) on lossless forwarding classes. (Do not associate a drop profile with a forwarding class that has the no-loss packet drop attribute.)

Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway

When the QFX Series acts as an FCoE-FC gateway, it connects an Ethernet network that carries Fibre Channel over Ethernet (FCoE) traffic to a Fibre Channel (FC) network. Ethernet interfaces connect to the FCoE network. Native FC interfaces (NP_Ports) connect to the FC network.

FCoE traffic typically uses IEEE 802.1p priority 3 (code point 011). The QFX Series default configuration maps priority 3 traffic to the FCoE forwarding class. If your FCoE network uses priority 3 for FCoE traffic, you do not need to remap priorities, because the default configuration maps priority 3 to the FCoE forwarding class. (But you do need to enable PFC on IEEE 802.1p code point 3 on the Ethernet interfaces to achieve lossless behavior.)

However, if the FCoE network uses a different IEEE 802.1p priority than priority 3 for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that priority (and classified to that priority on the FCoE Ethernet interfaces in the ingress classifier). You specify the lossless forwarding class used for the FCoE traffic by configuring a fixed classifier and applying it to the native FC (NP_Port) interface. All traffic received from the FC SAN on that NP_Port interface is classified into the forwarding class specified in the fixed classifier.

When native FC interfaces on the FCoE-FC gateway encapsulate incoming FC traffic in Ethernet to create FCoE frames, by default they assign IEEE 802.1p code point 011 to the FCoE traffic, forward the traffic internally to the gateway Ethernet interfaces, and then forward the traffic to the FCoE network. Setting a rewrite value for the IEEE 802.1p code point configures the gateway native FC interface to assign the rewrite value priority to the FCoE frames when the native FC interface forwards the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

You can configure one rewrite value per native FC interface. Each native FC interface can use a different rewrite value.

- Priority Remapping Configuration on page 5524
- Configuration Rules on page 5525
- Fate Sharing on page 5526

Priority Remapping Configuration

Native FC interfaces on an FCoE-FC gateway receive native FC traffic from the FC SAN and encapsulate it in Ethernet to create FCoE frames. Priority remapping enables you to map the encapsulated FC traffic (the FCoE traffic) to any IEEE 802.1p priority. (This is similar to the rewrite rules you can configure to remap forwarding classes to code points

on Ethernet egress interfaces, but the rewrite takes place at the ingress FC interface so that the QFX Series uses the correct priority for FCoE traffic on the converged Ethernet network.)

To support lossless traffic flows, you must configure the remapped priority correctly on the native FC interfaces and also on the Ethernet interfaces that connect to the FCoE network. Achieving lossless behavior for FCoE traffic when you remap the FCoE priority requires configuring:

- A lossless forwarding class for FCoE traffic (or using the default *fcoe* forwarding class)
- A behavior aggregate (BA) classifier on the FCoE Ethernet interfaces to map the FCoE forwarding class to the IEEE 802.1p code points (priority) used for FCoE traffic on the FCoE network (the ingress classifier priority for the forwarding class must be the same as the rewrite value priority)
- A fixed classifier on the FCoE-FC gateway FC interface that maps all traffic from the FC network into the lossless FCoE forwarding class (the forwarding class must be lossless)
- A priority rewrite value that remaps the IEEE 802.1p code point on the FCoE-FC gateway FC interface to the priority used for FCoE traffic on the FCoE network
- An input congestion notification profile (CNP) to enable priority-based flow control (PFC) on the FCoE code point (the code point used as the rewrite value) at the Ethernet ingress interfaces

The ingress and egress configurations must match to achieve lossless behavior. The priority and the forwarding class specified in the BA classifier and in the CNP on the Ethernet ingress interfaces must match the fixed classifier and rewrite value on the FC interfaces. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

For example, if you configure a lossless forwarding class named *my_fcoe_fc* and your Ethernet network uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic, then:

- The forwarding class configuration, the BA classifier, and the fixed classifier all specify *my_fcoe_fc* as the forwarding class
- The BA classifier, the input CNP, and the rewrite value all specify the IEEE 802.1p code point 101

Configuration Rules

The following configuration rules apply when you remap priorities on an FCoE-FC gateway:

- Each native FC interface (NP_Port) supports one IEEE 802.1p priority value. The interface rewrites the IEEE 802.1p code point of all incoming traffic on the interface to the rewrite value. (The FC interface uses either the default value of 3 or the rewrite value for all incoming traffic.)
- Ports in the same FCoE-FC gateway local fc-fabric must use the same rewrite value. For example, if ports fc-0/0/0 and fc-0/0/1 are in the same local FCoE-FC gateway

fabric, they must use the same rewrite value. If you attempt to commit a configuration that uses different IEEE 802.1p priority rewrite values, the system returns a commit error.

- Ports in different FCoE-FC gateway local fc-fabrics can use different rewrite values. An example scenario is:
  - Interfaces fc-0/0/0 and fc-0/0/1 are in FCoE-FC gateway fc-fabric *my_fc_fab1*.
  - Interfaces fc-0/0/4 and fc-0/0/5 are in FCoE-FC gateway fc-fabric *my_fc_fab2*.

  In this scenario, interfaces fc-0/0/0 and fc-0/0/1 must use the same rewrite value because they belong to the same local FC fabric on the gateway. Interfaces fc-0/0/4 and fc-0/0/5 also must use the same rewrite value because they belong to the same local FC fabric. However, the rewrite value you use for interfaces fc-0/0/0 and fc-0/0/1 can be different than the rewrite value you use for interfaces fc-0/0/4 and fc-0/0/5 because the interfaces belong to different local FC fabrics.
- You can apply the rewrite value only to native FC interfaces; you cannot apply the rewrite value configuration to Ethernet interfaces.
- The forwarding class specified in the fixed classifier on the native FC interface must be a lossless forwarding class. You cannot apply a fixed classifier to a native FC interface unless the associated forwarding class is lossless. (The forwarding class must be one of the two default lossless forwarding classes, or you must explicitly configure the forwarding class with the *no-loss* drop attribute.)
- The lossless forwarding class and IEEE 802.1p priority configuration must match on the FCoE-FC gateway native FC interfaces and Ethernet interfaces:
  - The same IEEE 802.1p priority (code point) must be paused on the Ethernet ingress interfaces, classified to the lossless forwarding class used in the native FC interface fixed classifier, and set as the rewrite value on the native FC interfaces.
  - The same lossless forwarding class must be used in the fixed classifier on the native FC interfaces and in the classifier configuration on the Ethernet interfaces.

Fate Sharing

To ensure that congestion on one interface does not affect the fate of traffic on a native FC interface on which you remap priorities, avoid fate sharing (different traffic flows receiving the same CoS treatment) configurations.

You can avoid fate sharing by ensuring that the remapping priority (code point) on the native FC interface is classified only to the forwarding class used in the fixed classifier on all other interfaces. For example, if you configure a fixed classifier on an FC interface that classifies all of the traffic into lossless forwarding class myfcoe1 and remaps the priority to priority 5 (IEEE 802.1p code point 101), then in all other classifier configurations on all other interfaces, priority 5 should always be classified to forwarding class myfcoe1. If you classify priority 6 on another interface to forwarding class myfcoe1, then congestion on priority 6 traffic affects priority 5 traffic unfairly.

Understanding CoS Buffer Configuration

Each QFX3500 and QFX3600 switch has 9 MB of Packet Forwarding Engine (PFE) wide common packet buffer memory that is used to store packets on interface queues. The buffer memory has separate ingress and egress accounting to make accept, drop, or pause decisions. Because the switch has a single pool of memory with separate ingress and egress accounting, the full amount of buffer memory is available from both the ingress and the egress perspective. Packets are accounted for as they enter and leave the switch, but there is no concept of a packet arriving at an ingress buffer and then being moved to an egress buffer.

The buffers are divided into two pools from both an ingress and an egress perspective:

1. *Shared buffers* are a global memory pool that the switch allocates dynamically to ports as needed, so the buffers are shared among the switch ports.
2. *Dedicated buffers* are a memory pool divided equally among the switch ports. Each port receives a minimum guaranteed amount of buffer space, dedicated to each port, not shared among ports.

NOTE: **Lossless traffic is traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link enabled for Ethernet PAUSE (IEEE 802.3x).**

The switch reserves nonconfigurable buffer space to ensure that ports and queues receive a minimum memory allocation. You can configure how the system uses the rest of the buffer space to optimize the allocation for your mix of network traffic. You can configure the percentage of available buffer space used as shared buffer space versus dedicated buffer space. You can also configure how shared buffer space is allocated to different types of traffic. You can optimize the buffer settings for the traffic on your network.

The default buffer configuration is designed for networks that have a balance of best-effort and lossless traffic.

The default class-of-service configuration provides two lossless forwarding classes (**fcoe** and **no-loss**), a best-effort unicast forwarding class, a network control traffic forwarding class, and one multidestination (multicast, broadcast, and destination lookup fail) forwarding class. Each default forwarding class maps to a different default output queue. The default configuration allocates the buffers in a manner that supports a moderate amount of lossless traffic while still providing the ability to absorb bursts in best-effort traffic transmission.

Changing the buffer settings changes the abilities of the buffers to absorb traffic bursts and handle lossless traffic. For example, networks with mostly best-effort traffic require allocating most of the shared buffer space to best-effort buffers. This provides deep, flexible buffers that can absorb traffic bursts with minimal packet loss, at the expense of buffer availability for lossless traffic.

Conversely, networks with mostly lossless traffic require allocating most of the shared buffer space to lossless headroom buffers. This prevents packet loss on lossless flows at the expense of absorbing bursty best-effort traffic efficiently.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

This topic describes the buffer architecture and settings:

- Buffer Pools on page 5528
- Default Buffer Pool Values on page 5536
- Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios on page 5538
- Optimizing the Buffer Configuration on page 5542

Buffer Pools

From both an ingress and an egress perspective, the 9-MB buffer is split into two main pools, a shared buffer pool and a dedicated buffer pool that ensures a minimum allocation to each port. You can configure the amount of buffer space allocated to each of the two pools. A portion of the buffer space is reserved so that there is always a minimum amount of shared and dedicated buffer space available to each port.

- Shared buffer pool—A global memory space that all of the ports on the switch share dynamically as they need buffers. The shared buffer pool is further partitioned into buffers for best-effort unicast, best-effort multidestination (broadcast, multicast, and destination lookup fail), and PFC (lossless) traffic types. You can allocate global shared memory space to buffer partitions to better support different mixes of network traffic. The larger the shared buffer pool, the better the switch can absorb traffic bursts because more shared memory is available for the traffic.
- Dedicated buffer pool—A reserved global memory space allocated equally to each port. The switch reserves a minimum dedicated buffer pool that is not user-configurable. You can divide the dedicated buffer allocation for a port among the port queues on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic.)

  A larger dedicated buffer pool means a larger amount of dedicated buffer space for each port, so congestion on one port is less likely to affect traffic on another port because the traffic does not need to use as much shared buffer space. However, the larger the dedicated buffer pool, the less bursty traffic the switch can handle because there is less dynamic shared buffer memory.

You can configure the way the available unreserved portion of the buffer space is allocated to the global shared buffer pool and to the dedicated shared buffer pool by configuring the ingress and egress shared buffer percentages.

By default, 100 percent of the available unreserved buffer space is allocated to the shared buffer pool. If you change the percentage of space allocated to the shared buffer, the available buffer space that is not allocated to the shared buffer is allocated to the dedicated buffer. For example, if you configure the ingress shared buffer pool as 80 percent, the remaining 20 percent of the available buffer space is allocated to the dedicated buffer pool and divided equally across the ports.

NOTE: **When 100 percent of the available (user-configurable) buffers are allocated to the shared buffer pool, the switch still reserves a minimum dedicated buffer pool.**

You can separately configure ingress and egress shared buffer pool allocations. You can also partition the ingress and egress shared buffer pool to allocate percentages of the shared buffer pool to specific types of traffic. If you do not use the default configuration or one of the recommended configurations, pay particular attention to the ingress configuration of the lossless and lossless headroom buffers (these buffers handle PFC pause during periods of congestion) and to the egress configuration of the best-effort buffers to handle incast congestion (multiple synchronized sources sending data to the same receiver in parallel).

In addition to the shared buffer pool and the dedicated buffer pool, there is also a small ingress global headroom buffer pool that is reserved and is not configurable.

When contention for buffer space occurs, the switch uses an internal algorithm to ensure that the buffer pools are distributed fairly among competing flows. When traffic for a given flow exceeds the amount of dedicated port buffer reserved for that flow, the flow begins to consume memory from the dynamic shared buffer pool. Competing flows compete for shared buffer memory with other flows that also have exhausted their dedicated buffers. When there is no congestion, there are no competing flows.

Buffer Handling of Lossless Flows (PFC) Versus Ethernet PAUSE

When we discuss lossless buffers in the following sections, we mean buffers that handle traffic on which you enable PFC to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x). The lossless ingress and egress shared buffers, and the ingress lossless headroom shared buffer, are used only for traffic on which you enable PFC.

NOTE: To support lossless flows, you must configure the appropriate data center bridging capabilities (PFC, DCBX, or ETS) and scheduling properties.

Shared Buffer Pool and Partitions

The shared buffer pool is a global memory space that all of the ports on the switch share dynamically as they need buffers. The switch uses the shared buffer pool to absorb traffic bursts after the dedicated buffer pool for a port is exhausted.

You can divide both the ingress shared buffer pool and the egress shared buffer pool into three partitions to allocate percentages of each buffer pool to different types of traffic. When you partition the ingress or egress shared buffer pool:

- If you explicitly configure one ingress shared buffer partition, you must explicitly configure all three ingress shared buffer partitions. (You either explicitly configure all three ingress partitions or you use the default setting for all three ingress partitions.)

  If you explicitly configure one egress shared buffer partition, you must explicitly configure all three egress shared buffer partitions. (You either explicitly configure all three egress partitions or you use the default setting for all three egress partitions.)

  The switch returns a commit error if you do not explicitly configure all three partitions when configuring the ingress or egress shared buffer partitions.

- The combined percentages of the three ingress shared buffer partitions must total exactly 100 percent.

  The combined percentages of the three egress shared buffer partitions must total exactly 100 percent.

  When you explicitly configure ingress or egress shared buffer partitions, the switch returns a commit error if the total percentage of the three partitions does not equal 100 percent.

- If you explicitly partition one set of shared buffers, you do not have to explicitly partition the other set of shared buffers. For example, you can explicitly configure the ingress shared buffer partitions and use the default egress shared buffer partitions. However, if you change the buffer partitions for the ingress buffer pool to match the expected types of traffic flows, you would probably also want to change the buffer partitions for the egress buffer pool to match those traffic flows.

You can configure the percentage of available unreserved buffer space allocated to the shared buffer pool. Space that you do not allocate to the shared buffer pool is added to the dedicated buffer pool and divided equally among the ports. The default configuration allocates 100 percent of the unreserved ingress and egress buffer space to the shared buffers.

Configuring the ingress and egress shared buffer pool partitions enables you to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic.

Ingress Shared Buffer Pool Partitions

You can configure three ingress buffer pool partitions:

- Lossless buffers—Shared buffer pool for all lossless ingress traffic. The recommended minimum value for lossless buffers is 5 percent.
- Lossless headroom buffers—Shared buffer pool for packets received while a pause is asserted. If PFC is enabled on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers for which the recommended value can be less than 5 percent.)
- Lossy buffers—Shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The recommended minimum value for best-effort buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and best-effort buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. If you explicitly configure an ingress shared buffer partition, you must explicitly configure all three ingress buffer partitions, even if the lossless headroom buffer partition has a value of 0 (zero) percent.

Egress Shared Buffer Pool Partitions

You can configure three egress buffer pool partitions:

- Lossless buffers—Shared buffer pool for all lossless egress queues. The recommended minimum value for lossless buffers is 5 percent.
- Lossy buffers—Shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The recommended minimum value for best-effort buffers is 5 percent.
- Multicast buffers—Shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The recommended minimum value for multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and should have a value of at least 5 percent. If you explicitly configure an egress shared buffer partition, you must explicitly configure all three egress buffer partitions, and each partition should have a value of at least 5 percent.

Dedicated Port Buffer Pool and Buffer Allocation to Queues

The global dedicated buffer pool is memory that is allocated equally to each port, so each port receives a guaranteed minimum amount of buffer space. Dedicated buffers

are not shared among ports. Each port receives an equal proportion of the dedicated buffer pool.

The amount of dedicated buffer space is not user-configurable and depends on the percentage of available nonreserved buffers allocated to the shared buffers. (The dedicated buffer space is equal to the minimum reserved port buffers plus the remainder of the available nonreserved buffers that are not allocated to the shared buffer pool.)

When traffic enters and exits the switch, the switch ports use their dedicated buffers to store packets. If the dedicated buffers are not sufficient to handle the traffic, the switch uses shared buffers. The only way to increase the dedicated buffer pool is to decrease the shared buffer pool from its default value of 100 percent of available unreserved buffers.

NOTE: If 100 percent of the available unreserved buffers are allocated to the shared buffer pool, the switch still reserves a minimum dedicated buffer pool.

The larger the shared buffer pool, the better the burst absorption across the ports. The larger the dedicated buffer pool, the larger the amount of dedicated buffer space for each port. The greater the dedicated buffer space, the less likely that congestion on one port can affect traffic on another port, because the traffic does not need to use as much shared buffer space.

Allocating Dedicated Port Buffers to Queues

You can divide the dedicated buffer allocation for an egress port among the port queues by including the **buffer-size** statement in the scheduler configuration. This enables you to control the egress port dedicated buffer allocation on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic, or to stop the port from reserving buffers for queues that do not carry traffic.) Egress dedicated port buffer allocation is a hierarchical structure that allocates a global dedicated buffer pool evenly among ports, and then divides the allocation for each port among the port queues.

By default, ports divide their allocation of dedicated buffers among their egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (the **transmit-rate** option) for traffic. Only the queues included in the default scheduler receive bandwidth and dedicated buffers, in the proportions shown in Table 492 on page 5532:

Table 492: Default Dedicated Buffer Allocation to Egress Queues (Based on Default Scheduler)

Forwarding Class	Queue	Minimum Guaranteed Bandwidth (transmit-rate)	Proportion of Reserved Dedicated Port Buffers
best-effort	0	5%	5%
fcoe	3	35%	35%

Table 492: Default Dedicated Buffer Allocation to Egress Queues (Based on Default Scheduler) *(continued)*

Forwarding Class	Queue	Minimum Guaranteed Bandwidth (transmit-rate)	Proportion of Reserved Dedicated Port Buffers
no-loss	4	35%	35%
network-control	7	5%	5%
mcast	8	20%	20%

In the default configuration, no egress queues other than the ones shown in Table 492 on page 5532 receive an allocation of dedicated port buffers.

NOTE: The switch uses hierarchical scheduling to control port and queue bandwidth allocation, as described in "Understanding CoS Hierarchical Port Scheduling (ETS)" on page 5481 and shown in "Example: Configuring CoS Hierarchical Port Scheduling (ETS)" on page 5606. For egress queue buffer size configuration, when you attach a traffic control profile (includes the queue scheduler information) to a port, the dedicated egress buffers on the port are divided among the queues as configured in the scheduler.

If you do not want to use the default allocation of dedicated port buffers to queues, use the **buffer-size** option in the scheduler that is attached to the port to configure the queue allocation. You can configure the dedicated buffer allocation to queues in two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is attached to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining dedicated port buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit scheduler for a queue means no dedicated buffer allocation for that queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

NOTE: The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

Configuring Dedicated Port Buffer Allocation to Queues

In a port configuration that includes multiple forwarding class sets, with multiple forwarding classes mapped to multiple schedulers, the allocation of port dedicated buffers to queues depends on the mix of queues with buffer sizes configured as explicit percentages and queues configured with (or defaulted to) the **remainder** option.

The best way to demonstrate how using the percentage and remainder options affects dedicated port buffer allocation to queues is by showing an example of queue buffer allocation, and then showing how the queue buffer allocation changes when you add another forwarding class (queue) to the port.

Table 493 on page 5534 shows an initial configuration that includes four forwarding class sets, the five default forwarding classes (mapped to the five default queues for those forwarding classes), the **buffer-size** option configuration, and the resulting buffer allocation for each queue. Table 494 on page 5535 shows the same configuration after we add another forwarding class (best-effort-2, mapped to queue 1) to the best-effort forwarding class set. Comparing the buffer allocations in each table shows you how adding another queue affects buffer allocation when you use remainders and explicit percentages to configure the buffer allocation for different queues.

Table 493: Egress Queue Dedicated Buffer Allocation (Example 1)

Forwarding Class Set (Priority Group)	Forwarding Class	Queue	Scheduler Buffer Size Configuration	Buffer Allocation per Queue (Percentage)
fc-set-be	best-effort	0	10%	10%
fc-set-lossless	fcoe	3	20%	20%
	no-loss	4	40%	40%
fc-set-strict-high	network-control	7	remainder	15%
fc-set-mcast	mcast	8	remainder	15%

In this first example, 70 percent of the egress port dedicated buffer pool is explicitly allocated to the best-effort, fcoe, and no-loss queues. The remaining 30 percent of the port dedicated buffer pool is split between the two queues that use the **remainder** option (network-control and mcast), so each queue receives 15 percent of the dedicated buffer pool.

Now we add another forwarding class (queue) to the best-effort priority group (fc-set-be) and configure it with a buffer size of *remainder* instead of configuring a specific percentage. Because a third queue now shares the remaining dedicated buffers, the queues that share the remainder receive fewer dedicated buffers, as shown in Table 494 on page 5535. The queues with explicitly configured percentages receive the configured percentage of dedicated buffers.

Table 494: Egress Queue Dedicated Buffer Allocation with Another Remainder Queue (Example 2)

Priority Group (fc-set)	Forwarding Class	Queue	Scheduler Buffer Size Configuration	Buffer Allocation per Queue (Percentage)
fc-set-be	best-effort	0	10%	10%
	best-effort-2	1	remainder	10%
fc-set-lossless	fcoe	3	20%	20%
	no-loss	4	40%	40%
fc-set-strict-high	network-control	7	remainder	10%
fc-set-mcast	mcast	8	remainder	10%

The two tables show how the port divides the dedicated buffer space that remains after servicing the queues that have an explicitly configured percentage of dedicated buffer space.

Trade-off Between Shared Buffer Space and Dedicated Buffer Space

The trade-off between shared buffer space and dedicated buffer space is:

- Shared buffers provide better absorption of traffic bursts because there is a larger pool of dynamic buffers that ports can use as needed to handle the bursts. However, all flows that exhaust their dedicated buffer space compete for the shared buffer pool. A larger shared buffer pool means a smaller dedicated buffer pool, and therefore more competition for the shared buffer pool because more flows exhaust their dedicated buffer allocation. Too much shared buffer space results in no single flow receiving very much shared buffer space, to maintain fairness when many flows contend for that space.
- Dedicated buffers provide guaranteed buffer space to each port. The larger the dedicated buffer pool, the less likely that congestion on one port affects traffic on another port, because the traffic does not need to use as much shared buffer space. However, less shared buffer space means less ability to dynamically absorb traffic bursts.

For optimal burst absorption, the switch needs enough dedicated buffer space to avoid persistent competition for the shared buffer space. When fewer flows compete for the shared buffers, the flows that need shared buffer space to absorb bursts receive more of the shared buffer because fewer flows exhaust their dedicated buffer space.

The default configuration and all of the recommended configurations allocate 100 percent of the user-configurable memory space to the global shared buffer pool because the amount of space reserved for dedicated buffers provides enough space to avoid persistent competition for dynamic shared buffers. This results in fewer flows competing for the shared buffers, so the competing flows receive more of the buffer space.

Order of Buffer Consumption

The total buffer pool is divided into ingress and egress shared buffer pools and dedicated buffer pools. When traffic flows through the switch, the buffer space is used in a particular order that depends on the type of traffic.

On ingress, the order of buffer consumption is:

- Best-effort unicast traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)
- Lossless unicast traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Lossless headroom buffers
  4. Global headroom buffers (very small)
- Multidestination traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)

On egress, the order of buffer consumption is the same for unicast best-effort, lossless unicast, and multidestination traffic:

- Dedicated buffers
- Shared buffers

In all cases on all ports, the switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for the port or queue is exhausted. This reserves the maximum amount of dynamic shared buffer space to absorb traffic bursts.

Default Buffer Pool Values

You can view the default or configured ingress and egress buffer pool values in KB units using the **show class-of-service shared-buffer** operational command. You can view the configured shared buffer pool values in percent units using the **show configuration class-of-service shared-buffer** operational command.

This section provides the default total buffer, shared buffer, and dedicated buffer values for QFX3500 and QFX3600 switches.

- Total Buffer Pool Size on page 5537
- Shared Buffer Pool Default Values on page 5537
- Dedicated Buffer Pool Default Values on page 5538

Total Buffer Pool Size

The total buffer pool is common memory that has separate ingress and egress accounting, so the full buffer pool is available from both the ingress and egress perspective. The total buffer pool size is not configurable.

For ingress and egress buffer pools, the total buffer pool size is 9 MB (9360 KB).

Shared Buffer Pool Default Values

This section describes the default values in percent and in KB for the shared ingress and shared egress buffers.

- Shared Ingress Buffer Default Values on page 5537
- Shared Egress Buffer Default Values on page 5537

Shared Ingress Buffer Default Values

Table 495 on page 5537 shows the default ingress shared buffer allocation values in KB units for QFX3500 and QFX3600 switches.

Table 495: Default Shared Ingress Buffer Values (KB)

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
7202 KB	648.18 KB	3240.9 KB	3312.92 KB

Table 496 on page 5537 shows the default ingress shared buffer allocation values as percentages for QFX3500 and QFX3600. (If you change the default shared buffer allocation, you configure the change as a percentage.)

Table 496: Default Shared Ingress Buffer Values (Percentage)

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	9%	45%	46%

Shared Egress Buffer Default Values

Table 497 on page 5538 shows the default egress shared buffer allocation values in KB units.

Table 497: Default Shared Egress Buffer Values (KB)

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
6656 KB	3328 KB	2063.36 KB	1264.64 KB

Table 498 on page 5538 shows the default egress shared buffer allocation values as percentages.

Table 498: Default Shared Egress Buffer Values (Percentage)

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	50%	31%	19%

Dedicated Buffer Pool Default Values

The system reserves ingress and egress dedicated buffer pools that are divided equally among the switch ports. By default, the system allocates 100 percent of the available unreserved buffer space to the shared buffer pool. If you reduce the percentage of available unreserved buffer space allocated to the shared buffer pool, the remaining unreserved buffer space is added to the dedicated buffer pool allocation. You configure the amount of dedicated buffer pool space by reducing (or increasing) the percentage of buffer space allocated to the shared buffer pool. You do not directly configure the dedicated buffer pool allocation.

The default dedicated buffer pool values for QFX3500 and QFX3600 switches in KB units are:

- Ingress dedicated buffer—2158 KB
- Egress dedicated buffer—2704.0 KB

Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios

The way you configure the shared buffer pool depends on the mix of traffic on your network. This section provides shared buffer configuration recommendations for five basic network traffic scenarios:

- Balanced traffic—The network carries a balanced mix of unicast best-effort, lossless, and multicast traffic. (This is the default configuration.)
- Best-effort unicast traffic—The network carries mostly unicast best-effort traffic.
- Best-effort traffic with Ethernet PAUSE (IEEE 802.3X) enabled—The network carries mostly best-effort traffic with Ethernet PAUSE enabled on the links.
- Best-effort multicast traffic—The network carries mostly multicast best-effort traffic.
- Lossless traffic—The network carries mostly lossless traffic (traffic on which PFC is enabled).

NOTE: Lossless traffic is defined as traffic on which you enable PFC to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link on which you enable Ethernet PAUSE. Start with the recommended profiles for each network traffic scenario, and adjust them if necessary for your network traffic conditions.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete. This includes changing the default configuration to one of the recommended configurations.

Start with the recommended shared buffer configuration for your network traffic conditions:

- Balanced Traffic (Default Configuration) on page 5539
- Best-Effort Unicast Traffic on page 5540
- Ethernet PAUSE Traffic on page 5540
- Best-Effort Multicast (Multidestination) Traffic on page 5541
- Lossless Traffic on page 5541

Balanced Traffic (Default Configuration)

The default shared buffer configuration is optimized for networks that carry a balanced mix of best-effort unicast, lossless, and multidestination (multicast, broadcast, and destination lookup fail) traffic. The default class-of-service (CoS) configuration is also optimized for networks that carry a balanced mix of traffic.

We recommend that you use the default shared buffer configuration for networks that carry a balanced mix of traffic, especially if you are using the default CoS settings. Table 499 on page 5539 shows the default ingress shared buffer allocations:

Table 499: Default Ingress Shared Buffer Configuration

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	9%	45%	46%

Table 500 on page 5539 shows the default egress shared buffer allocations:

Table 500: Default Egress Shared Buffer Configuration

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	50%	31%	19%

Best-Effort Unicast Traffic

If your network carries mostly best-effort (lossy) unicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see Table 501 on page 5540) and egress shared buffer settings (see Table 502 on page 5540):

Table 501: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	5%	0%	95%

Table 502: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	75%	20%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic" on page 5748 for an example that shows you how to configure the recommended buffer settings shown in Table 501 on page 5540 and Table 502 on page 5540.

Ethernet PAUSE Traffic

If your network carries mostly best-effort (lossy) traffic *and* enables Ethernet PAUSE on links, then the default shared buffer configuration allocates too much buffer space to the shared ingress buffer (Ethernet PAUSE traffic uses the dedicated buffers instead of shared buffers) and not enough space to the lossless-headroom buffers. We recommend that you use the following ingress shared buffer settings (see Table 503 on page 5540) and egress shared buffer settings (see Table 504 on page 5541):

Table 503: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Traffic and Ethernet PAUSE Enabled

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
70%	5%	80%	15%

Table 504: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Traffic and Ethernet PAUSE Enabled

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	75%	20%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled" on page 5754 for an example that shows you how to configure the recommended buffer settings shown in Table 501 on page 5540 and Table 502 on page 5540.

Best-Effort Multicast (Multidestination) Traffic

If your network carries mostly best-effort (lossy) multicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see Table 505 on page 5541) and egress shared buffer settings (see Table 506 on page 5541):

Table 505: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best -Effort Multicast Traffic

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	5%	0%	95%

Table 506: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Multicast Traffic

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	20%	75%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic" on page 5759 for an example that shows you how to configure the recommended buffer settings shown in Table 505 on page 5541 and Table 506 on page 5541.

Lossless Traffic

If your network carries mostly lossless traffic, then the default shared buffer configuration allocates too much buffer space to support best-effort traffic. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see Table 507 on page 5542) and egress shared buffer settings (see Table 508 on page 5542):

Table 507: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Lossless Traffic

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	15%	80%	5%

Table 508: Recommended Egress Shared Buffer Configuration for Networks with Mostly Lossless Traffic

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	90%	5%	5%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic" on page 5764 for an example that shows you how to configure the recommended buffer settings shown in Table 507 on page 5542 and Table 508 on page 5542.

Optimizing the Buffer Configuration

Instead of using the default buffer configuration or one of the recommended buffer configurations, you can optimize the buffer configuration to best support the mix of traffic on your network:

- Optimizing Buffer Configuration on page 5542
- General Rules and Considerations on page 5543

Optimizing Buffer Configuration

If you feel that the recommended shared buffer configurations are not optimized enough for your network, adjust the settings gradually to fine-tune the shared buffer allocation. Use caution when adjusting the shared buffer configuration, not just when you fine-tune the ingress and egress buffer partitions, but also when you fine-tune the total ingress and egress shared buffer percentage. (Remember that if you allocate less than 100 percent of the available buffers to the shared buffers, the remaining buffers are added to the dedicated buffers). Tuning the buffers incorrectly can cause problems such as ingress port congestion.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

The relationship between the sizes of the ingress buffer pool and the egress buffer pool affects when and where packets are dropped. The buffer pool sizes include the shared buffers and the dedicated buffers. In general, if there are more ingress buffers than egress buffers, the switch can experience ingress port congestion because egress queues fill before ingress queues can empty.

Use the show class-of-service shared-buffer operational command to see the sizes in kilobytes (KB) of the dedicated and shared buffers and of the shared buffer partitions.

For best-effort traffic (unicast and multidestination), the combined ingress lossy shared buffer partition and ingress dedicated buffers must be *less than* the combined egress lossy and multicast shared buffer partitions plus the egress dedicated buffers. This prevents ingress port congestion by ensuring that egress best-effort buffers are deeper than ingress best-effort buffers, and ensures that if packets are dropped, they are dropped at the egress queues. (Packets dropping at the ingress prevents the egress schedulers from working properly.)

For lossless traffic (traffic on which you enable PFC), the combined ingress lossless shared buffer partition and a reasonable portion of the ingress headroom buffer partition, plus the dedicated buffers, must be *less than* the total egress lossless shared buffer partition and dedicated buffers. (A reasonable portion of the ingress headroom buffer is approximately 20 to 25 percent of the buffer space, but this varies depending on how much buffer headroom is required to support the lossless traffic.) When these conditions are met, if there is ingress port congestion, the ingress port congestion triggers PFC on the ingress port to prevent packet loss. If the total lossless ingress buffers exceed the total lossless egress buffers, packets could be dropped at the egress instead of PFC being applied at the ingress to prevent packet loss.

NOTE: If you commit a buffer configuration for which the switch does not have sufficient resources, the switch might log an error instead of returning a commit error. After you commit a buffer configuration, check the syslog messages to ensure that the new buffer configuration did not fail to commit.

If the buffer configuration commits but you receive a syslog message that indicates the configuration cannot be implemented, you can:

- Reconfigure the buffers or reconfigure other parameters (for example, the PFC configuration, which affects the need for lossless headroom buffers and lossless buffers—the more priorities you pause, the more lossless and lossless headroom buffer space you need), then attempt the commit operation again.
- Roll back the switch to the last successful configuration.

If you receive a syslog message that says the buffer configuration cannot be implemented, you must take corrective action. If you do not fix the configuration or roll back to a previous successful configuration, the system behavior is unpredictable.

General Rules and Considerations

Keep the following rules and considerations in mind when you configure the buffers:

- Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.
- If you configure the ingress or egress shared buffer percentages as less than 100 percent, the remaining percentage of buffer space is added to the dedicated buffer pool.
- The sum of all of the ingress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent except the lossless headroom buffer, which can have a value of 0 percent.
- The sum of all of the egress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent.
- Lossless and lossless headroom shared buffers serve traffic on which you enable PFC, and do not serve traffic subject to Ethernet PAUSE.
- The switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for a port or queue is exhausted.
- Too little dedicated buffer space results in too much competition for shared buffer space.
- Too much dedicated buffer space results in poorer burst absorption because there is less available shared buffer space.
- Always check the syslog messages after you commit a new buffer configuration.
- The optimal buffer configuration for your network depends on the types of traffic on the network. If your network carries less traffic of a certain type (for example, lossless traffic), then you can reduce the size of the buffers allocated to that type of traffic (for example, you can reduce the sizes of the lossless and lossless headroom buffers).

Understanding CoS Tail-Drop Profiles

When the number of packets queued is greater than the ability of the switch to empty an output queue, the queue requires a method for determining which packets to drop to relieve the congestion. Weighted random early detection (WRED) drop profiles define the drop probability of packets as the output queue fills. During periods of congestion, as the output queue fills, the switch drops incoming packets as determined by a drop profile until the output queue becomes less congested.

Depending on the drop probabilities, a drop profile can drop many packets long before the buffer becomes full, or it can drop only a few packets even if the buffer is almost full.

You configure drop profiles in the drop profile section of the class-of-service (CoS) configuration hierarchy. You apply drop profiles using a drop profile map in each scheduler configuration. For each scheduler, you can configure separate drop profiles for each combination of loss priority (low, medium-high, and high) and protocol.

Drop profiles define the meaning of each of the loss priorities by setting the values for when to drop packets and the probability that packets will drop.

You can configure a maximum of 32 drop profiles.

NOTE: **You cannot apply drop profiles to multidestination (multicast) queues.**

Do not apply drop profiles to lossless flows such as FCoE traffic, because the corresponding queues require lossless behavior. Use priority-based flow control (PFC) to prevent packet drop.

- Drop Profile Parameters on page 5545
- Default Drop Profile on page 5546
- Packet Drop Method on page 5547
- Drop Profile Maps on page 5548
- Congestion Prevention on page 5548

Drop Profile Parameters

Drop profiles specify two values:

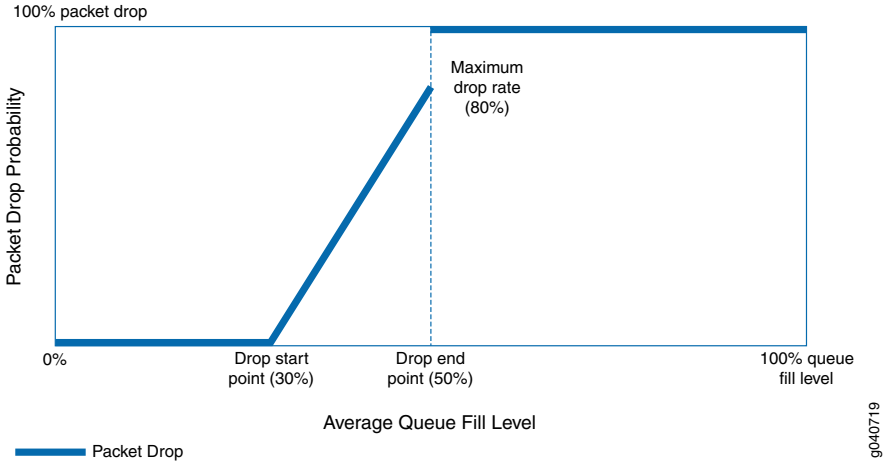
- Fill level—The queue fullness value, which represents a percentage of the memory used to store packets in relation to the total amount of memory allocated to the queue.
- Drop probability—The percentage value that corresponds to the likelihood that an individual packet is dropped.

You set two queue fill levels and two drop probabilities in each drop profile. The two fill levels and the two drop probabilities create two pairs of values. The first fill level and the first drop probability create one value pair and the second fill level and the second drop probability create the second value pair.

The first fill level value specifies the percentage of queue fullness at which packets begin to drop, known as the drop start point. Until the queue reaches this level of fullness, no packets are dropped. The second fill level value specifies the percentage of queue fullness at which all packets are dropped, known as the drop end point.

The first drop probability value is always **0** (zero). This pairs with the drop start point and specifies that until the queue fullness level reaches the first fill level, no packets drop. When the queue fullness exceeds the drop start point, packets begin to drop until the queue exceeds the second fill level, when all packets drop. The second drop probability value, known as the maximum drop rate, specifies the likelihood of dropping packets when the queue fullness reaches the drop end point. As the queue fills from the drop start point to the drop end point, packets drop in a smooth, linear pattern (called an interpolated graph) as shown in Figure 209 on page 5546. After the drop end point, all packets drop.

Figure 209: Tail-Drop Profile Packet Drop



The thick line in Figure 209 on page 5546 shows the packet drop characteristics for a sample tail-drop profile. At the drop start point, the queue reaches a fill level of 30 percent. At the drop end point, the queue fill level reaches 50 percent, and the maximum drop rate is 80 percent.

No packets drop until the queue fill level reaches the drop start point of 30 percent. When the queue reaches the 30 percent fill level, packets begin to drop. As the queue fills, the percentage of packets dropped increases in a linear fashion. When the queue fills to the drop end point of 50 percent, the rate of packet drop has increased to the maximum drop rate of 80 percent. When the queue fill level exceeds the drop end point of 50 percent, all of the packets drop until the queue fill level drops below 50 percent.

Default Drop Profile

If you do not configure default profiles and apply them to queue schedulers, the switch uses the default drop profile for lossy traffic classes. In the default drop profile, when the fill level is 0 percent, the drop probability is 0 percent. When the fill level is 100 percent, the drop probability is 100 percent. As soon as packets arrive on a queue, the default profile might begin to drop packets.

Packet Drop Method

When a packet reaches the head of the queue, the switch generates a random number between 0 and 100. The switch plots the random number against the drop profile using the current fullness of the queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped.

To create the linear drop pattern from the drop start point to the drop end point, the drop probabilities are derived using a linear approximation with eight sections, or steps, from the minimum queue fill level to the maximum queue fill level. The fill levels are divided into the eight sections equally, starting at the minimum fill level and ending at the maximum fill level. As the queue fills, the percentage of dropped packets increases. The percentage of packets dropped is based on the maximum drop rate.

For example, the default drop profile (which specifies a maximum drop rate of 100 percent) has the following drop probabilities at each section, or step, in the eight-section linear drop pattern:

- First section—The minimum drop probability is 6.25 percent of the maximum drop rate. The maximum drop probability is 12.5 percent of the maximum drop rate.
- Second section—The minimum drop probability is 18.75 percent of the maximum drop rate. The maximum drop probability is 25 percent of the maximum drop rate.
- Third section—The minimum drop probability is 30.25 percent of the maximum drop rate. The maximum drop probability is 37.5 percent of the maximum drop rate.
- Fourth section—The minimum drop probability is 43.75 percent of the maximum drop rate. The maximum drop probability is 50 percent of the maximum drop rate.
- Fifth section—The minimum drop probability is 56.25 percent of the maximum drop rate. The maximum drop probability is 62 percent of the maximum drop rate.
- Sixth section—The minimum drop probability is 68.75 percent of the maximum drop rate. The maximum drop probability is 75.5 percent of the maximum drop rate.
- Seventh section—The minimum drop probability is 81.25 percent of the maximum drop rate. The maximum drop probability is 87.5 percent of the maximum drop rate.
- Eighth section—The minimum drop probability is 92.75 percent of the maximum drop rate. The maximum drop probability is 100 percent of the maximum drop rate.

Packets drop even when there is no congestion, because packet drops begin at the drop start point regardless of whether congestion exists on the port. The default drop profile example represents the worst-case scenario, because the drop start point fill level is 0 percent, so packet drop begins when the queue starts to receive packets.

You can specify when packets begin to drop by configuring a drop start point at a fill level greater than 0 percent. For example, if you configure a drop profile that has a drop start point of 30 percent, packets do not drop until the queue is 30 percent full.

The smaller the gap between the minimum drop rate (which is always 0) and the maximum drop rate, the smaller the gap between the minimum drop probability and the

maximum drop probability at each section (step) of the linear drop pattern. The default drop profile, which has the maximum gap between the minimum drop rate (0 percent) and the maximum drop rate (100 percent), has the highest gap between the minimum drop probability and the maximum drop probability at each step. Configuring a lower maximum drop rate for a drop profile reduces the gap between the minimum drop probability and the maximum drop probability.

Drop Profile Maps

Drop profile maps are part of scheduler configuration. A drop profile map maps a drop profile to a loss priority and a protocol. Specifying the drop profile map in a scheduler associates the drop profile with the queues (forwarding classes) that you map to the scheduler in a scheduler map.

You configure loss priority for a queue in the classifier section of the CoS configuration hierarchy, and the loss priority is applied to the queue at the ingress interface.

Each scheduler can have multiple drop profile maps, one for each combination of loss priority and protocol.

Congestion Prevention

Configuring drop profiles on output queues prevents them from impacting other queues on the egress ports. If you do not configure drop profiles and map them to output queues, output queues without drop profiles can impact output queues on other egress ports, even if those queues are not experiencing congestion.

For example, if an ingress port forwards traffic to more than one egress port, and at least one of the egress ports experiences congestion, that can cause ingress port congestion. Ingress port congestion (ingress buffer exceeds its resource allocation) can cause frames to drop at the ingress port instead of at the egress port. Ingress port frame drop affects all of the egress ports to which the congested ingress port forwards traffic, not just the congested egress port.

NOTE: **Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.**

Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. Rewrite rules set the value of the CoS bits within the header of the outgoing packet. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header. Rewrite rules must be assigned to an interface for rewrites to be activated.

You can apply (bind) one DSCP or DSCP IPv6 rewrite rule and one IEEE 802.1p rewrite rule to each interface as described in "Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces" on page 5460.

You cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface; each interface supports only one DSCP rewrite rule. Both IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6.

NOTE: There are no default rewrite rules.

You can look at behavior aggregate (BA) classifiers and rewrite rules as two sides of the same coin. A BA classifier reads the CoS bits of incoming packets and classifies the packets into forwarding classes, then the system applies the CoS configured for the forwarding class to those packets. Rewrite rules rewrite the CoS bits just before the packets leave the system so that the next switch can apply the appropriate level of CoS to the packets. When you apply a rewrite rule to an interface, the rewrite rule is the last CoS action performed on the packet before it is forwarded.

Rewrite rules alter CoS values in outgoing packets on the outbound interfaces of an edge switch to accommodate the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

NOTE: On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

QFX Series does not have default rewrite rules. If you want to apply a rewrite rule to outgoing packets, you must explicitly configure the rewrite rule.

NOTE: Rewrite rules are applied *before* the egress filter is matched to traffic. Because the code point rewrite occurs before the egress filter is matched to traffic, the egress filter match is based on the rewrite value, not on the original code point value in the packet.

For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

Understanding DCB Features and Requirements

Data center bridging (DCB) is a set of enhancements to the IEEE 802.1 bridge specifications. DCB modifies and extends Ethernet behavior to support I/O convergence in the data center. I/O convergence includes but is not limited to the transport of Ethernet LAN traffic and Fibre Channel (FC) storage area network (SAN) traffic on the same physical Ethernet network infrastructure.

A converged architecture saves cost by reducing the number of networks and switches required to support both types of traffic, reducing the number of interfaces required, reducing cable complexity, and reducing administration activities.

The Juniper Networks QFX Series supports the DCB features required to transport converged Ethernet and FC traffic while providing the class-of-service (CoS) and other characteristics FC requires for transmitting storage traffic. To accommodate FC traffic, DCB specifications provide:

- A flow control mechanism called priority-based flow control (PFC, described in IEEE 802.1Qbb) to help provide lossless transport.
- A discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network, called Data Center Bridging Capability Exchange protocol (DCBX), which is an extension of Link Layer Data Protocol (LLDP, described in IEEE 802.1AB).
- A bandwidth management mechanism called enhanced transmission selection (ETS, described in IEEE 802.1Qaz).
- A congestion management mechanism called quantized congestion notification (QCN, described in IEEE 802.1Qau).

The switch supports the PFC, DCBX, and ETS standards but does not support QCN. The switch also provides the high-bandwidth interfaces (10-Gbps minimum) required to support DCB and converged traffic.

This topic describes the DCB standards and requirements the switch supports:

- Lossless Transport on page 5551
- ETS on page 5552
- DCBX on page 5552

Lossless Transport

FC traffic requires lossless transport (defined as no frames dropped because of congestion). Standard Ethernet does not support lossless transport, but the DCB extensions to Ethernet along with proper buffer management enable an Ethernet network to provide the level of class of service (CoS) necessary to transport FC frames encapsulated in Ethernet over an Ethernet network.

This section describes these factors in creating lossless transport over Ethernet:

- PFC on page 5551
- Buffer Management on page 5551
- Physical Interfaces on page 5551

PFC

PFC is a link-level flow control mechanism similar to Ethernet PAUSE (described in IEEE 802.3x). Ethernet PAUSE stops all traffic on a link for a period of time. PFC enables you to divide traffic on a link into eight priorities and stop the traffic of a selected priority without stopping the traffic assigned to other priorities on the link.

Pausing the traffic of a selected priority enables you to provide lossless transport for traffic assigned that priority and at the same time use standard lossy Ethernet transport for the rest of the link traffic.

Buffer Management

Buffer management is critical to the proper functioning of PFC, because if buffers are allowed to overflow, frames are dropped and transport is not lossless.

For each lossless flow priority, the switch requires sufficient buffer space to:

- Store frames sent during the time it takes to send the PFC pause frame across the cable between devices.
- Store the frames that are already on the wire when the sender receives the PFC pause frame.

The propagation delay due to cable length and speed, as well as processing speed, determines the amount of buffer space needed to prevent frame loss due to congestion.

The switch automatically sets the threshold for sending PFC pause frames to accommodate delay from cables as long as 150 meters (492 feet) and to accommodate large frames that might be on the wire when the switch sends the pause frame. This ensures that the switch sends pause frames early enough to allow the sender to stop transmitting before the receive buffers on the switch overflow.

Physical Interfaces

The switch supports 10-Gbps, full-duplex interfaces. The switch enables DCB capability only on 10-Gbps (or faster) Ethernet interfaces.

ETS

PFC divides traffic into up to eight separate streams (priorities, configured on the switch as forwarding classes) on a physical link. ETS enables you to manage the link bandwidth by:

- Grouping the priorities into priority groups (configured on the switch as forwarding class sets).
- Specifying the bandwidth available to each of the priority groups as a percentage of the total available link bandwidth.
- Allocating the bandwidth to the individual priorities in the priority group.

The available link bandwidth is the bandwidth remaining after servicing strict priority flows.

Managing link bandwidth with ETS provides several advantages:

- There is uniform management of all types of traffic on the link, both congestion-managed traffic and standard Ethernet traffic.
- When a priority group does not use all of its allocated bandwidth, other priority groups on the link can use that bandwidth as needed.

  When a priority in a priority group does not use all of its allocated bandwidth, other priorities in the group can use that bandwidth.

  The result is better bandwidth utilization, because priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.
- You can assign traffic types with different service needs to different priorities so that each traffic type receives appropriate treatment.
- Strict priority traffic retains its allocated bandwidth.

DCBX

DCB devices use DCBX to exchange configuration information with directly connected peers (switches and endpoints such as servers). DCBX is an extension of LLDP. If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit fails.

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for PFC, ETS, and for Layer 2 and Layer 4 applications such as FCoE and iSCSI. DCBX is enabled or disabled on a per-interface basis.

Understanding CoS Flow Control (Ethernet PAUSE and PFC)

Flow control supports lossless transmission by regulating traffic flows to avoid dropping frames during periods of congestion. Flow control stops and resumes the transmission of network traffic between two connected peer nodes on a full-duplex Ethernet physical link. Controlling the flow by pausing and restarting it prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

The QFX Series supports two methods of flow control:

- IEEE 802.3X Ethernet PAUSE
- IEEE 802.1Qbb priority-based flow control (PFC)

Ethernet PAUSE and PFC are link-level flow control mechanisms.

Ethernet PAUSE pauses transmission of all traffic on a physical Ethernet link.

PFC decouples the pause function from the physical Ethernet link and enables you to divide traffic on one link into eight priorities. You can think of the eight priorities as eight "lanes" of traffic that are mapped to forwarding classes and output queues. Each priority is mapped to a 3-bit IEEE 802.1p CoS code point flag in the VLAN header. You can enable PFC on one or more priorities (IEEE 802.1p code points) on a link. When PFC-enabled traffic is paused on a link, traffic that is not PFC-enabled continues to flow (or is dropped if congestion is severe enough).

Use Ethernet PAUSE when you want to prevent packet loss on all of the traffic on a link. Use PFC to prevent traffic loss only on specified types of traffic (for example, Fibre Channel over Ethernet traffic).

NOTE: **Depending on the amount of traffic on a link or assigned to a priority, pausing traffic can cause ingress port congestion and spread congestion through the network.**

Attempting to configure both Ethernet PAUSE and PFC on a link causes a commit error. Ethernet PAUSE and PFC are mutually exclusive configurations on an interface.

By default, all forms of flow control are disabled. You must explicitly enable flow control on interfaces to pause traffic.

- Ethernet PAUSE on page 5554
- PFC on page 5558
- Lossless Transport Support Summary on page 5562

Ethernet PAUSE

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends Ethernet PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface

responds to Ethernet PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends an Ethernet PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the Ethernet PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives an Ethernet PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the Ethernet PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

  In this scenario, if Node B sends an Ethernet PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

Symmetric flow control means an interface has the same Ethernet PAUSE configuration in both directions. The Ethernet PAUSE generation and Ethernet PAUSE response functions are both configured as enabled, or they are both disabled. You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

Asymmetric flow control allows you to configure the Ethernet PAUSE functionality in each direction independently on an interface. The configuration for generating Ethernet PAUSE messages and for responding to Ethernet PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. You configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. Asymmetric flow control overrides and disables symmetric flow control. (If PFC is configured on an interface, the PFC configuration overrides Ethernet PAUSE flow control.) The QFX Series supports both symmetric and asymmetric flow control.

- Symmetric Flow Control on page 5555
- Asymmetric Flow Control on page 5556

Symmetric Flow Control

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send Ethernet PAUSE messages and respond to them (flow control is enabled), or the interface cannot send Ethernet PAUSE messages or respond to them (flow control is disabled).

When you enable symmetric flow control on an interface, the Ethernet PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the interface can perform any Ethernet PAUSE functions that the connected peer can

perform. (When symmetric flow control is disabled, the interface does not send or respond to Ethernet PAUSE messages.)

Asymmetric Flow Control

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends Ethernet PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to Ethernet PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits Ethernet PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to Ethernet PAUSE messages:

- Receive buffers on—Enable Ethernet PAUSE transmission (generate and send Ethernet PAUSE frames)
- Transmit buffers on—Enable Ethernet PAUSE reception (respond to received Ethernet PAUSE frames)

You must explicitly set the flow control for both the receive buffer and the transmit buffer (**on** or **off**) to configure asymmetric Ethernet PAUSE. Table 393 on page 5066 describes the configured flow control state when you set the receive (Rx) and transmit (Tx) buffers on an interface:

Table 509: Asymmetric Ethernet PAUSE Flow Control Configuration

Receive (Rx) Buffer	Transmit (Tx) Buffer	Configured Flow Control State
On	**Off**	Interface generates and sends Ethernet PAUSE messages. Interface does not respond to Ethernet PAUSE messages (interface continues to transmit even if peer requests that the interface stop sending traffic).
Off	**On**	Interface responds to Ethernet PAUSE messages received from the connected peer, but does not generate or send Ethernet PAUSE messages. (The interface does not request that the connected peer stop sending traffic.)
On	**On**	Same functionality as symmetric Ethernet PAUSE. Interface generates and sends Ethernet PAUSE messages and responds to received Ethernet PAUSE messages.
Off	**Off**	Ethernet PAUSE flow control is disabled.

The configured flow control is the Ethernet PAUSE state configured on the interface.

On 1-Gigabit Ethernet interfaces, the QFX Series supports autonegotiation of Ethernet PAUSE with the connected peer. (The QFX Series does not support autonegotiation on 10-Gigabit Ethernet interfaces.) Autonegotiation enables the interface to exchange state advertisements with the connected peer so that the two devices can agree on the Ethernet PAUSE configuration. Each interface advertises its flow control state to the connected peer using a combination of the Ethernet PAUSE and ASM_DIR bits, as described in Table 394 on page 5067:

Table 510: Flow Control State Advertised to the Connected Peer (Autonegotiation)

Rx Buffer State	Tx Buffer State	PAUSE Bit	ASM_DIR Bit	Description
Off	Off	0	0	The interface advertises no Ethernet PAUSE capability. This is equivalent to disabling flow control on an interface.
On	On	1	0	The interface advertises symmetric flow control (both the transmission of Ethernet PAUSE messages and the ability to receive and respond to Ethernet PAUSE messages).
On	Off	0	1	The interface advertises asymmetric flow control (the transmission of Ethernet PAUSE messages, but not the ability to receive and respond to Ethernet PAUSE messages).
Off	On	1	1	The interface advertises both symmetric and asymmetric flow control. Although the interface does not generate and send Ethernet PAUSE requests to the peer, the interface supports both symmetric and asymmetric Ethernet PAUSE configuration on the peer because the peer is not affected if the peer does not receive Ethernet PAUSE requests. (If the interface responds to the peer's Ethernet PAUSE requests, that is sufficient to support either symmetric or asymmetric flow control on the peer.)

The flow control configuration on each switch interface interacts with the flow control configuration of the connected peer. Each peer advertises its state to the other peer. The interaction of the flow control configuration of the peers determines the flow control behavior (resolution) between them, as shown in Table 395 on page 5068. The first four columns show the Ethernet PAUSE configuration on the local QFX Series and on the connected peer (also known as the link partner). The last two columns show the Ethernet PAUSE resolution that results from the local and peer configurations on each interface. This illustrates how the Ethernet PAUSE configuration of each interface affects the Ethernet PAUSE behavior on the other interface.

NOTE: In the Resolution columns of the table, disabling Ethernet PAUSE transmit means that the interface receive buffers do not generate and send Ethernet PAUSE messages to the peer. Disabling Ethernet PAUSE receive means that the interface transmit buffers do not respond to Ethernet PAUSE messages received from the peer.

Table 511: Asymmetric Ethernet PAUSE Behavior on Local and Peer Interfaces

Local Interface (QFX Series)		Peer Interface			
PAUSE Bit	ASM_DIR Bit	PAUSE Bit	ASM_DIR Bit	Local Resolution	Peer Resolution
0	0	Don't care	Don't care	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
0	1	0	Don't care	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
0	1	1	0	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
0	1	1	1	Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive	Disable Ethernet PAUSE transmit and enable Ethernet PAUSE receive
1	0	0	Don't care	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
1	0	1	Don't care	Enable Ethernet PAUSE transmit and receive	Enable Ethernet PAUSE transmit and receive
1	1	0	0	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
1	1	0	1	Enable Ethernet PAUSE receive and disable Ethernet PAUSE transmit	Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive
1	1	Don't care	Don't care	Enable Ethernet PAUSE transmit and receive	Enable Ethernet PAUSE transmit and receive

NOTE: For your convenience, Table 395 on page 5068 replicates Table 28B-3 of Section 2 of the IEEE 802.X specification.

PFC

PFC is a lossless transport and congestion relief feature that works by providing granular link-level flow control for each IEEE 802.1p code point (priority) on a full-duplex Ethernet link. When the receive buffer on a switch interface fills to a threshold, the switch transmits

a pause frame to the sender (the connected peer) to temporarily stop the sender from transmitting more frames. The buffer threshold must be low enough so that the sender has time to stop transmitting frames and the receiver can accept the frames already on the wire before the buffer overflows. The switch automatically sets queue buffer thresholds to prevent frame loss.

When congestion forces one priority on a link to pause, all of the other priorities on the link continue to send frames. Only frames of the paused priority are not transmitted. When the receive buffer empties below another threshold, the switch sends a message that starts the flow again.

You configure PFC using a congestion notification profile (CNP). A CNP has two parts:

- Input—Specify the code point (or code points) on which to enable PFC, and optionally specify the maximum receive unit (MRU) and the cable length between the interface and the connected peer interface.
- Output—Specify the output queue or output queues that respond to pause messages from the connected peer.

You apply a PFC configuration by configuring a CNP on one or more interfaces. Each interface that uses a particular CNP is enabled to pause traffic with the priorities (code points) specified in that CNP. You can configure one CNP on an interface, and you can configure different CNPs on different interfaces. When you configure a CNP on an interface, ingress traffic that is mapped to a priority that the CNP enables for PFC is paused whenever the queue buffer fills to the pause threshold. (The pause threshold is not user-configurable.)

Configure PFC for a priority end to end along the entire data path to create a lossless lane of traffic on the network. You can selectively pause the traffic in any queue without pausing the traffic for other queues on the same link. You can create lossless lanes for traffic such as Fibre Channel over Ethernet (FCoE), LAN backup, or management, while using standard frame-drop congestion management for IP traffic on the same link.

Potential consequences of link-level flow control are:

- Ingress port congestion (configuring too many lossless flows can cause ingress port congestion)
- A paused priority that causes upstream devices to pause the same priority, thus spreading congestion back through the network

By definition, PFC supports symmetric pause only (as opposed to Ethernet PAUSE, which supports symmetric and asymmetric pause). With symmetric pause, a device can:

- Transmit pause frames to pause incoming traffic. (You configure this using the input stanza of a congestion notification profile.)
- Receive pause frames and stop sending traffic to a device whose buffer is too full to accept more frames. (You configure this using the output stanza of a congestion notification profile.)

Receiving a PFC frame from a connected peer pauses traffic on egress queues based on the IEEE 802.1p priorities that the PFC pause frame identifies. The priorities are 0 through 7. By default, the priorities map to queue numbers 0 through 7, respectively, and to specific forwarding classes, as shown in Table 396 on page 5070:

Table 512: Default PFC Priority to Queue and Forwarding Class Mapping

IEEE 802.1p Priority (Code Point)	Queue	Forwarding Class
0 (000)	0	best-effort
1 (001)	1	best-effort
2 (010)	2	best-effort
3 (011)	3	fcoe
4 (100)	4	no-loss
5 (101)	5	best-effort
6 (110)	6	network-control
7 (111)	7	network-control

For example, a received PFC pause frame that pauses priority 3 pauses output queue 3. If you do not want to use the default configuration, you can configure customized mapping of priorities to queues and forwarding classes.

NOTE: By convention, deployments with converged server access typically use IEEE 802.1p priority 3 for FCoE traffic. The default forwarding class configuration sets the **fcoe** forwarding class as a lossless forwarding class that is mapped to queue 3. The default classifier maps incoming priority 3 traffic to the **fcoe** forwarding class. *However, you must apply PFC to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE traffic requires.*

If your network uses priority 3 for FCoE traffic, we recommend that you use the default configuration. If your network uses a priority other than 3 for FCoE traffic, you can configure lossless FCoE transport on any IEEE 80.21p priority as described in "Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows" on page 5506 and "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5524.

You enable PFC on a priority by:

1. Specifying the IEEE 802.1p code point to pause in the input stanza of a CNP
2. Applying the CNP to the ingress interfaces on which you want to pause the traffic

CAUTION: Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.
  3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.
- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

When you associate the CNP with an interface, the interface uses PFC to send pause requests when the output queue buffer for the lossless traffic fills to the pause threshold.

Although unicast traffic and multidestination (multicast, broadcast, and destination lookup fail) traffic must use different classifiers, you can map a unicast queue (queue 0 through 7) and a multidestination queue (queue 8, 9, 10, or 11) to the same PFC priority so that both unicast and multicast traffic use that priority. Do not map multidestination traffic to lossless priorities. Starting with Junos OS Release 12.3, you can map one priority to multiple output queues.

NOTE: You can attach a maximum of one CNP to an interface, but you can create an unlimited number of CNPs that explicitly configure only the input stanza and use the default output stanza.

The output stanza of the CNP maps to a profile that interfaces use to respond to pause messages received from the connected peer. On standalone QFX3500 switches and QFX3600 switches, you can create two CNPs with an explicitly configured output stanza.

When a QFX3500 switch or a QFX3600 switch is a Node device in a QFabric system, you can create one CNP with an explicitly configured output stanza. (One fewer profile is available on QFabric systems because the system needs a default profile for fabric interfaces, which are not used as fabric interfaces when the switches are not part of a QFabric system. "Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows" on page 5506 describes configuring output flow control.

Lossless Transport Support Summary

The QFX Series supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p priorities (code points) mapped to lossless forwarding classes.

CAUTION: Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

The following limitation applies to support lossless transport on QFabric systems only:

- The internal fiber cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.

The default CoS configuration provides two lossless forwarding classes, *fcoe* and *no-loss*. If you explicitly configure lossless forwarding classes, you must include the **no-loss** packet drop attribute to enable lossless behavior, or the traffic is not lossless. For both default and explicit lossless forwarding class configuration, you must configure CNP input stanzas to enable PFC on the priority of the lossless traffic and apply the CNPs to ingress interfaces.

NOTE: Junos OS Release 12.2 introduced changes to the way the QFX Series handles lossless forwarding classes (including the default **fcoe** and **no-loss** forwarding classes).

In Junos OS Release 12.1, either explicitly configuring the **fcoe** and **no-loss** forwarding classes or using the default configuration for these forwarding classes resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the **fcoe** or the **no-loss** forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the **fcoe** or the **no-loss** forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the the explicit **fcoe** and **no-loss** forwarding class configuration before you upgrade to Junos OS Release 12.2.

See "Overview of CoS Changes Introduced in Junos OS Release 12.2" on page 5428 for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the **fcoe** and **no-loss** forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new **no-loss** packet drop attribute or the forwarding class is lossy.

"Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows" on page 5506 provides detailed information about the explicit configuration of lossless priorities and about the default configuration of lossless priorities, including the input and output stanzas of the CNP.

NOTE: PFC and Ethernet PAUSE are used only on Ethernet interfaces. Fabric (fte) ports on QFabric systems (Node device fabric ports and Interconnect device fabric ports) use link-layer flow control (LLFC) to ensure the appropriate treatment of lossless traffic.

Understanding DCBX

Data Center Bridging Capability Exchange protocol (DCBX) is an extension of Link Layer Data Protocol (LLDP). If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails. Data center bridging (DCB) devices use DCBX to exchange configuration information with directly connected peers.

This topic describes:

- DCBX Basics on page 5564
- DCBX Modes and Support on page 5565
- DCBX Attribute Types on page 5568
- DCBX Application Protocol TLV Exchange on page 5569
- DCBX and PFC on page 5570
- DCBX and ETS on page 5571

DCBX Basics

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for priority-based flow control (PFC), Layer 2 and Layer 4 applications such as FCoE and iSCSI, and ETS. DCBX is enabled or disabled on a per-interface basis.

By default, for PFC and ETS, DCBX automatically negotiates administrative state and configuration with each interface's connected peer. To enable DCBX negotiation for applications, you must configure the applications, map them to IEEE 802.1p code points in an application map, and apply the application map to interfaces.

The FCoE application only needs to be included in an application map when you want an interface to exchange type, length, and values (TLVs) for other applications in addition to FCoE. If FCoE is the only application you want an interface to advertise, then you do not need to use an application map. For ETS, DCBX pushes the switch configuration to peers if they are set to learn the configuration from the switch (unless you disable sending the ETS recommendation TLV on interfaces in IEEE DCBX mode).

You can override the default behavior for PFC, for ETS, or for all applications mapped to an interface by turning off autonegotiation to force an interface to enable or disable that feature. You can also disable DCBX autonegotiation for applications on an interface by excluding those applications from the application map you apply to that interface or by deleting the application map from the interface.

The default autonegotiation behavior for applications that are mapped to an interface is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

During negotiation of capabilities, the switch can push the PFC configuration to an attached peer if the peer is configured as “willing” to learn the PFC configuration from other peers. The Juniper Networks switch does not support self autoprovisioning and does not change its configuration during autonegotiation to match the peer configuration. (The Juniper switch is not “willing” to learn the PFC configuration from peers.)

NOTE: When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors, so that the switch can interoperate with a wider variety of converged network adapters (CNAs) and Layer 2 switches that support DCBX.

DCBX Modes and Support

This section describes DCBX support on the QFX Series:

- DCBX Modes (Versions) on page 5565
- Autonegotiation on page 5567
- CNA Support for DCBX Modes on page 5568
- Interface Support for DCBX on page 5568

DCBX Modes (Versions)

The QFX Series supports the two most common DCBX modes:

- IEEE DCBX—The newest DCBX version. Different TLVs have different subtypes (for example, the subtype for the ETS configuration TLV is 9); the IEEE DCBX Organizationally Unique Identifier (OUI) is 0x0080c2.
- DCBX version 1.01—The Converged Enhanced Ethernet (CEE) version of DCBX. It has a subtype of 2 and an OUI of 0x001b21.

IEEE DCBX and DCBX version 1.01 differ mainly in frame format. DCBX version 1.01 uses one TLV that includes all DCBX attribute information, which is sent as sub-TLVs. IEEE DCBX uses a unique TLV for each DCB attribute.

NOTE: The QFX Series does not support pre-CEE (pre-DCB) DCBX versions. Unsupported older versions of DCBX have a subtype of 1 and an OUI of 0x001b21. The QFX Series drops LLDP frames that contain pre-CEE DCBX TLVs.

Table 392 on page 5053 summarizes the differences between IEEE DCBX and DCBX version 1.01, including show command output:

Table 513: Summary of Differences Between IEEE DCBX and DCBX Version 1.01

Characteristic	IEEE DCBX	DCBX Version 1.01
OUI	0x0080c2	0x001b21
Frame Format	Sends a separate, unique TLV for each DCBX attribute. For example, IEEE DCBX uses separate TLVs for ETS, PFC, and each application. Configuration and Recommendation information is sent in different TLVs	Sends one TLV that includes all DCBX attribute information organized in sub-TLVs. The "willing" bit determines whether or not an interface can change its configuration to match the connected peer.
Symmetric/asymmetric configuration with peer	Asymmetric or symmetric	Symmetric only
Differences in the **show dcbx interface** ***interface-name*** operational command	• Synchronization information is not shown because symmetric configuration is not required. • Operational state information is not shown because the operational states do not have to be symmetric. • TLV type is shown because unique TLVs are sent for each DCBX attribute. • ETS peer Configuration TLV and Recommendation TLV information is shown separately because they are different TLVs.	• Synchronization information is shown because symmetric configuration is required. • Operational state information is shown because the operational states do have to be symmetric. • TLV type is not shown because one TLV is used for all attribute information. • Recommendation TLV is not sent (DCBX Version 1.01 uses the "willing" bit to determine whether or not an interface uses the peer interface configuration).

For more information about how each DCBX mode exchanges TLVs, see the following specifications:

- For DCBX version 1.01—http://www.ieee802.org/1/files/public/docs2008/az-wadekar-dcbx-capability-exchange-discovery-protocol-1108-v1.01.pdf
- For IEEE DCBX—http://www.ieee802.org/1/files/private/az-drafts/d2/802-1az-d2-4.pdf

NOTE: As of Junos OS Release 12.2, this document is located in a private area of the IEEE website, and access requires a password from the IEEE organization. If you are not an IEEE member, you might not be able to access this document until it moves to the public area of the IEEE website.

You can configure interfaces to use the following DCBX modes:

- IEEE DCBX—The interface uses IEEE DCBX regardless of the configuration on the connected peer.
- DCBX version 1.01—The interface uses DCBX version 1.01 regardless of the configuration on the connected peer.
- Autonegotiation—The interface automatically negotiates with the connected peer to determine the DCBX version the peers use. Autonegotiation is the default DCBX mode.

If you configure a DCBX mode on an interface, the interface ignores DCBX protocol data units (PDUs) it receives from the connected peer if the PDUs do not match the DCBX version configured on the interface. For example, if you configure an interface to use IEEE DCBX and the connected peer sends DCBX version 1.01 LLDP PDUs, the interface ignores the version 1.01 PDUs. If you configure an interface to use DCBX version 1.01 and the peer sends IEEE DCBX LLDP PDUs, the interface ignores the IEEE DCBX PDUs.

NOTE: On interfaces that use the IEEE DCBX mode, the **show dcbx neighbors interface *interface-name*** operational command does not include application, PFC, or ETS operational state in the output.

Autonegotiation

Autonegotiation is the default DCBX mode. Each interface automatically negotiates with its connected peer to determine the DCBX version that both interfaces use to exchange DCBX information.

When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives one IEEE DCBX PDU from the peer, the interface sets the DCBX mode as IEEE DCBX. If the interface receives three DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.

Autonegotiation works slightly differently on QFX3500 switches and QFabric systems:

- QFX3500 switch—When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives an IEEE DCBX TLV from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.
- QFabric system—When an interface connects to its peer interface, the interface advertises DCBX version 1.01 TLVs to the peer. If the interface receives an IEEE DCBX TLVs from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface

receives three consecutive DCBX version 1.01 TLVs from the peer, the interface retains DCBX version 1.01 as the DCBX mode.

NOTE: If the link flaps or the LLDP process restarts, the interface starts the autonegotiation process again. The interface does not use the last received DCBX communication mode.

CNA Support for DCBX Modes

Different CNA vendors support different versions and capabilities of DCBX. The DCBX configuration you use on QFX Series interfaces depends on the DCBX features that the CNAs in your network support.

Interface Support for DCBX

You can configure DCBX on 10-Gigabit Ethernet interfaces and on link aggregation group (LAG) interfaces whose member interfaces are all 10-Gigabit Ethernet interfaces.

DCBX Attribute Types

DCBX has three attribute types:

- Informational—These attributes are exchanged using LLDP, but do not affect DCBX state or operation; they only communicate information to the peer. For example, application priority TLVs are informational TLVs.
- Asymmetric—The values for these types of attributes do not have to be the same on the connected peer interfaces. Peers exchange asymmetric attributes when the attribute values can differ on each peer interface. The peer interface configurations might match or they might differ. For example, ETS Configuration and Recommendation TLVs are asymmetric TLVs.
- Symmetric—The intention is that the values for these types of attributes should be the same on both of the connected peer interfaces. Peer interfaces exchange symmetric attributes to ensure symmetric DCBX configuration for those attributes. For example, PFC Configuration TLVs are symmetric TLVs.

The following sections describe asymmetric and symmetric DCBX attributes:

- Asymmetric Attributes on page 5568
- Symmetric Attributes on page 5569

Asymmetric Attributes

DCBX passes asymmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features). The resulting configuration for an attribute might be different on each peer, so the parameters configured on one interface might not match the parameters on the connected peer interface.

There are two types of asymmetric attribute TLVs:

- Configuration TLV—Configuration TLVs communicate the current operational state and the state of the “willing” bit. The “willing” bit communicates whether or not the

interface is willing to accept and use the configuration from the peer interface. If an interface is “willing,” the interface uses the configuration it receives from the peer interface. (The peer interface configuration can override the configuration on the “willing” interface.) If an interface is “not willing”, the configuration on the interface cannot be overridden by the peer interface configuration.

- Recommendation TLV—Recommendation TLVs communicate the parameters the interface recommends that the connected peer interface should use. When an interface sends a Recommendation TLV, if the connected peer is “willing,” the connected peer changes its configuration to match the parameters in the Recommendation TLV.

Symmetric Attributes

DCBX passes symmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features), with the objective that both interfaces should use the same configuration. The intent is that the parameters configured on one interface should match the parameters on the connected peer interface.

There is one type of symmetric attribute TLV, the Configuration TLV. As with asymmetric attributes, symmetric attribute Configuration TLVs communicate the current operational state and the state of the “willing” bit. “Willing” interfaces use the peer interface parameter values for the attribute. (The attribute configuration of the peer overrides the configuration on the “willing” interface.)

DCBX Application Protocol TLV Exchange

DCBX advertises the switch’s capabilities for Layer 2 applications such as FCoE and Layer 4 applications such as iSCSI:

- Application Protocol TLV Exchange on page 5569
- FCoE Application Protocol TLV Exchange on page 5569
- Disabling Application Protocol TLV Exchange on page 5570

Application Protocol TLV Exchange

For all applications, DCBX advertises the application’s state and IEEE 802.1p code points on the interfaces to which the application is mapped. If an application is not mapped to an interface, that interface does not advertise the application’s TLVs. There is an exception for FCoE application protocol TLV exchange when FCoE is the only application you want DCBX to advertise on an interface.

FCoE Application Protocol TLV Exchange

Protocol TLV exchange for the FCoE application depends on whether FCoE is the only application you want the interface to advertise or whether you want the interface to exchange other application TLVs in addition to FCoE TLVs.

If FCoE is the only application you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)

- Does *not* have an application map

NOTE: If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

If you want DCBX to advertise FCoE and other applications on an interface, you must specify all of the applications, including FCoE, in an application map, and apply the application map to the desired interfaces.

NOTE: If an application map is applied to an interface, the FCoE application must be explicitly configured in the application map, or the interface does not exchange FCoE TLVs.

When DCBX advertises the FCoE application, it advertises the FCoE state and IEEE 802.1p code points. If a peer device connected to a switch interface does not support FCoE, DCBX uses autonegotiation to mark the interface as "FCoE down," and FCoE is disabled on that interface.

Disabling Application Protocol TLV Exchange

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface** *interface-name* **applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

DCBX and PFC

After you enable PFC on a switch interface, DCBX uses autonegotiation to control the operational state of the PFC functionality.

If the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled. (PFC must be symmetrical.)

If the peer advertises that it is "willing" to learn its PFC configuration from the switch, DCBX pushes the switch's PFC configuration to the peer and does not check the peer's administrative state.

You can manually override DCBX control of the PFC operational state on a per-interface basis by disabling autonegotiation. If you disable autonegotiation on an interface on which you have configured PFC, then PFC is enabled on that interface regardless of the peer configuration. To disable PFC on an interface, do not configure PFC on that interface.

DCBX and ETS

This section describes:

- Default DCBX ETS Advertisement on page 5571
- ETS Advertisement and Peer Configuration on page 5571
- ETS Recommendation TLV on page 5572

Default DCBX ETS Advertisement

If you do not configure ETS on an interface, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The default priority group is transparent. It does not appear in the configuration and is used for DCBX advertisement. DCBX advertises the default priority group, its priorities, and the assigned bandwidth.

If you configure ETS on an interface, DCBX advertises:

- Each priority group on the interface
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

Any priority on that interface that is not part of an explicitly configured priority group (forwarding class set) is assigned to the automatically generated default priority group and receives no bandwidth. If you configure ETS on an interface, every forwarding class (priority) on that interface for which you want to forward traffic must belong to a forwarding class set (priority group).

ETS Advertisement and Peer Configuration

DCBX does not control the switch's ETS (hierarchical scheduling) operational state. If the connected peer is configured as "willing," DCBX pushes the switch's ETS configuration to the switch's peers if the ETS Recommendation TLV is enabled (it is enabled by default). If the peer does not support ETS or is not consistently provisioned with the switch, DCBX does not change the ETS operational state on the switch. The ETS operational state remains enabled or disabled based only on the switch hierarchical scheduling configuration and is enabled by default.

When ETS is configured, DCBX advertises the priority groups, the priorities in the priority groups, and the bandwidth configuration for the priority groups and priorities. Any priority (essentially a forwarding class or queue) that is not part of a priority group has no scheduling properties and receives no bandwidth.

You can manually override whether DCBX advertises the ETS state to the peer on a per-interface basis by disabling autonegotiation. This does not affect the ETS state on the switch or on the peer , but it does prevent the switch from sending the Recommendation TLV or the Configuration TLV to the connected peer. To disable ETS on an interface, do not configure priority groups (forwarding class sets) on the interface.

ETS Recommendation TLV

The ETS Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," it changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV by including the **no-recommendation-tlv** statement at the **[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]** hierarchy level.

NOTE: You can disable the ETS Recommendation TLV only when the DCBX mode on the interface is IEEE DCBX. Disabling the ETS Recommendation TLV has no effect if the DCBX mode on the interface is DCBX version 1.01. (IEEE DCBX uses separate application attribute TLVs, but DCBX version 1.01 sends all application attributes in the same TLV and uses sub-TLVs to separate the information.)

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is "willing," the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

For example, if you want a CNA connected to a switch interface to have different bandwidth allocations than the switch ETS configuration, you can disable the ETS Recommendation TLV and configure the CNA for the desired bandwidth. The switch interface and the CNA exchange configuration parameters, but the CNA does not change its configuration to match the switch interface configuration.

Understanding DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers. DCBX also advertises the capabilities of applications on interfaces by exchanging application protocol information through application type, length, and value (TLV) elements. DCBX is an extension of Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

Setting up application protocol exchange consists of:

- Defining applications
- Mapping the applications to IEEE 802.1p code points in an *application map*
- Configuring classifiers to prioritize incoming traffic and map the incoming traffic to the application by the traffic code points
- Applying the application maps and classifiers to interfaces

You need to explicitly define the applications that you want an interface to advertise. The FCoE application is a special case (see "Applications" on page 5060) and only needs to be defined on an interface if you want DCBX to exchange application protocol TLVs for other applications in addition to FCoE on that interface.

You also need to explicitly map all defined applications that you want an interface to advertise to IEEE 802.1p code points in an application map. The FCoE application is a special case (see "Application Maps" on page 5061) and only requires inclusion in an application map when you want an interface to use DCBX for other applications in addition to FCoE, as described later in this topic.

This topic describes:

- Applications on page 5573
- Application Maps on page 5574
- Classifying and Prioritizing Application Traffic on page 5575
- Enabling Interfaces to Exchange Application Protocol Information on page 5576
- Disabling DCBX Application Protocol Exchange on page 5576

Applications

Before an interface can exchange application protocol information, you need to define the applications that you want to advertise, except FCoE if FCoE is the only application that you want the interface to advertise.

NOTE: If FCoE is the only application that you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class and applied to the interface)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

If you apply an application map to an interface, then all applications that you want DCBX to advertise must be defined and configured in the application map, including the FCoE application.

If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

You can define:

- Layer 2 applications by EtherType
- Layer 4 applications by a combination of protocol (TCP or UDP) and destination port number

The EtherType is a two-octet field in the Ethernet frame that denotes the protocol encapsulated in the frame. For a list of common EtherTypes, see http://standards.ieee.org/develop/regauth/ethertype/eth.txt on the IEEE standards organization website. For a list of port numbers and protocols, see the *Service Name and Transport Protocol Port Number Registry* at http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml on the Internet Assigned Numbers Authority (IANA) website.

You must explicitly define each application that you want to advertise, except FCoE. The FCoE application is defined by default (EtherType 0x8906).

Application Maps

An application map maps defined applications to one or more IEEE 802.1p code points. Each application map contains one or more applications. DCBX includes the configured application code points in the protocol TLVs exchanged with the connected peer.

To exchange protocol TLVs for an application, you must include the application in an application map. The FCoE application is a special case:

- If you want DCBX to exchange application protocol TLVs for more than one application on a particular interface, you must configure the applications, define an application map to map the applications to code points, and apply the application map to the interface. In this case, you must also define the FCoE application and add it to the application map.

This is the same process and treatment required for all other applications. In addition, for DCBX to exchange FCoE application TLVs, you must enable priority-based flow control (PFC) on the FCoE priority (the FCoE IEEE 802.1p code point) on the interface.

- If FCoE is the only application that you want DCBX to advertise on an interface, then you do not need to configure an application map and apply it to the interface. By default, when an interface has no application map, and the interface carries traffic mapped to the FCoE forwarding class, and PFC is enabled on the FCoE priority, the interface advertises FCoE TLVs (autonegotiation mode). DCBX exchanges FCoE application protocol TLVs by default until you apply an application map to the interface, remove the FCoE traffic from the interface (you can do this by removing the or editing the classifier for FCoE traffic), or disable PFC on the FCoE priority.

  If you apply an application map to an interface that did not have an application map and was exchanging FCoE application TLVs, and you do not include the FCoE application in the application map, the interface stops exchanging FCoE TLVs. Every interface that has an application map must have FCoE included in the application map (and PFC enabled on the FCoE priority) in order for DCBX to exchange FCoE TLVs.

Mapping an application to code points does two things:

- Maps incoming traffic with the same code points to that application
- Allows you to configure classifiers that map incoming application traffic, by code point, to a forwarding class and a loss priority, in order to apply class of service (CoS) to application traffic and prioritize application traffic

You apply an application map to an interface to enable DCBX application protocol exchange on that interface for each application specified in the application map. All of the applications that you want an interface to advertise must be configured in the application map that you apply to the interface, with the previously noted exception for the FCoE application when FCoE is the only application for which you want DCBX to exchange protocol TLVs on an interface.

Classifying and Prioritizing Application Traffic

When traffic arrives at an interface, the interface classifies the incoming traffic based on its code points. Classifiers map code points to loss priorities and forwarding classes. The loss priority prioritizes the traffic. The forwarding class determines the traffic output queue and CoS service level.

When you map an application to an IEEE 802.1p code point in an application map and apply the application map to an interface, incoming traffic on the interface that matches the application code points is mapped to the appropriate application. The application receives the loss priority and the CoS associated with the forwarding class for those code points, and is placed in the output queue associated with the forwarding class.

You can use the default classifier or you can configure a classifier to map the application code points defined in the application map to forwarding classes and loss priorities.

Enabling Interfaces to Exchange Application Protocol Information

Each interface with the **fcoe** forwarding class and PFC enabled on the FCoE code point is enabled for FCoE application protocol exchange by default until you apply an application map to the interface. If you apply an application map to an interface and you want that interface to exchange FCoE application protocol TLVs, you must include the FCoE application in the application map. (In all cases, to achieve lossless transport, you must also enable PFC on the FCoE code point or code points.)

Except when FCoE is the only protocol you want DCBX to advertise on an interface, interfaces on which you want to exchange application protocol TLVs must include the following two items:

- The application map that contains the application(s)
- A classifier

NOTE: **You must also enable PFC on the code point of any traffic for which you want to achieve lossless transport.**

Disabling DCBX Application Protocol Exchange

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable sending the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers.

Understanding CoS Fabric Forwarding Class Sets

Fabric forwarding class sets (fabric fc-sets) are similar to the fc-sets (priority groups) you configure on Node devices. The major differences are:

1. Fabric fc-sets group traffic for transport across the QFX3008-I or QFX3600-I Interconnect device (the fabric). Node device fc-sets group traffic on a Node device for transport across that Node device.
2. Fabric fc-sets are global. They apply to the entire fabric. Node device fc-sets apply only to the Node device on which they are configured.
3. You can configure class of service (CoS) scheduling for Node device fc-sets, but you cannot configure CoS for fabric fc-sets.
4. Fabric fc-sets map to Interconnect device fabric output queues statically—you cannot configure the mapping of fabric fc-sets to fabric output queues. All traffic in a fabric fc-set maps to the same output queue.

   Node device fc-sets include forwarding classes that map to Node device output queues, and you can configure the mapping of forwarding classes to output queues (or you can use the default mapping). Because output queues are mapped to forwarding classes, different classes of traffic in a Node device fc-set can be mapped to different output queues.

Node device fc-sets consist of forwarding classes containing traffic that requires similar CoS treatment. (Forwarding classes are default forwarding classes or user-defined forwarding classes.) You can configure CoS for each fc-set to determine how the traffic of its forwarding classes is scheduled on a Node device.

When traffic exits a Node device interface and enters an Interconnect device fabric interface, the Interconnect device uses the same forwarding classes to group traffic. The forwarding classes are mapped to global fabric fc-sets for transport across the fabric. Like fc-sets on a Node device, fabric fc-sets also contain traffic that requires similar CoS treatment. Unlike fc-sets on a Node device, you cannot configure CoS on fabric fc-sets.

Fabric fc-sets reside on the Interconnect device and are global to the QFabric system. Fabric fc-sets apply to all traffic that traverses the fabric. The mapping of forwarding classes to fabric fc-sets is global and applies to all forwarding classes with traffic that traverses the fabric from all connected Node devices. You can change the mapping of forwarding classes to fabric fc-sets. All mapping changes you make are global. For example, if you change the fabric fc-set to forwarding class mapping of the default best-effort forwarding class, then every Node device's best-effort forwarding class traffic that traverses the fabric is mapped to that fabric fc-set.

This topic describes:

- Default Fabric Forwarding Class Sets on page 5579
- Fabric Forwarding Class Set Configuration and Implementation on page 5582
- Fabric Forwarding Class Set Scheduling (CoS) on page 5584
- Support for Flow Control and Lossless Transport Across the Fabric on page 5586

- Viewing Fabric Forwarding Class Set Information on page 5588
- Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences on page 5590

Default Fabric Forwarding Class Sets

Interconnect devices have 12 default fabric fc-sets, including five visible default fabric fc-sets, four for unicast traffic and one for multidestination (multicast, broadcast, and destination lookup failure) traffic.

There are also seven hidden default fabric fc-sets. There are three hidden default fabric fc-sets for multidestination traffic that you can use if you want to map different multidestination forwarding classes to different multidestination fabric fc-sets. There are four hidden default fabric fc-sets for lossless traffic that you can use to map different lossless forwarding classes (priorities) to different lossless fabric fc-sets.
Table 117 on page 1239 shows the default fabric fc-sets:

Table 514: Default Fabric Forwarding Class Sets

Fabric Forwarding Class Set Name	Characteristics
fabric_fcset_be	Transports best-effort unicast traffic across the fabric.
fabric_fcset_strict_high	Transports unicast traffic that has been configured with **strict-high** priority and in the **network-control** forwarding class across the fabric. This fabric fc-set receives as much bandwidth across the fabric as it needs to service the traffic in the group up to the entire fabric interface bandwidth. For this reason, exercise caution when mapping traffic to this fabric fc-set to avoid starving other traffic.
fabric_fcset_noloss1	Transports unicast traffic in the default **fcoe** forwarding class across the fabric.
fabric_fcset_noloss2	Transports unicast traffic in the default **no-loss** forwarding class across the fabric.
fabric_fcset_noloss3	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.
fabric_fcset_noloss4	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.
fabric_fcset_noloss5	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.

Table 514: Default Fabric Forwarding Class Sets *(continued)*

Fabric Forwarding Class Set Name	Characteristics
fabric_fcset_noloss6	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.
fabric_fcset_multicast1	Transports multidestination traffic in the **mcast** forwarding class across the fabric. This fabric fc-set is valid only for multidestination forwarding classes.
fabric_fcset_multicast2	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multidestination forwarding classes.
fabric_fcset_multicast3	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multidestination forwarding classes.
fabric_fcset_multicast4	(Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multidestination forwarding classes.

The five default forwarding classes (**best-effort**, **fcoe**, **no-loss**, **network-control**, and **mcast**) are mapped to the fabric fc-sets by default as shown in Table 118 on page 1240.

Table 515: Default Forwarding Class to Fabric Forwarding Class Set Mapping

Forwarding Class	Fabric Forwarding Class Set	Fabric Output Queue	Maximum MTU Supported for Lossless Operation
best-effort	fabric_fcset_be	0	NA
network-control	fabric_fcset_strict_high	7	NA
fcoe	fabric_fcset_noloss1	1	9K
no-loss	fabric_fcset_noloss2	2	9K
mcast	fabric_fcset_multicast1	8	NA
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss3	3	9k

Table 515: Default Forwarding Class to Fabric Forwarding Class Set Mapping *(continued)*

Forwarding Class	Fabric Forwarding Class Set	Fabric Output Queue	Maximum MTU Supported for Lossless Operation
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss4	4	9k
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss5	5	9k
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_noloss6	6	9k
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_multicast2	9	NA
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_multicast3	10	NA
No forwarding classes are mapped by default to this hidden fabric fc-set.	fabric_fcset_multicast4	11	NA

The maximum fiber cable length between the QFabric system Node device and the QFabric system Interconnect device is 150 meters.

TIP: If you explicitly configure lossless forwarding classes, we recommend that you map each user-configured lossless forwarding class to an unused fabric fc-set (fabric_fcset_noloss3 through fabric_fcset_noloss6) on a one-to-one basis: one lossless forwarding class mapped to one lossless fabric fc-set.

The reason for one-to-one mapping is to avoid fate sharing of lossless flows. Because each fabric fc-set is mapped statically to an output queue, when you map more than one forwarding class to a fabric fc-set, all of the traffic in all of the forwarding classes that belong to the fabric fc-set uses the same output queue. If that output queue becomes congested due to congestion caused by one of the flows, the other flows are also affected. (They share fate because the flow that congests the output queue affects flows that are not experiencing congestion.)

However, it is important to understand that fabric_fcset_noloss1 and fabric_fcset_noloss2 have a scheduling weight of 35, while the other fabric fc-sets have a scheduling weight of 1. The scheduling weights mean that fabric_fcset_noloss1 and fabric_fcset_noloss2 receive most of the bandwidth available to lossless fabric fc-sets if the amount of traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2 requires the bandwidth.

If you believe that the traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2 will consume most of that bandwidth, then you should place all lossless traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2. If you believe that the traffic on fabric_fcset_noloss1 and fabric_fcset_noloss2 will <emphasis>not</emphasis> consume most of that bandwidth, then you can map lossless forwarding classes in a one-to-one manner to lossless fabric fc-sets to avoid fate sharing.

If you want to map different multidestination forwarding classes to different multidestination fabric fc-sets, use one or more of the hidden multidestination fabric fc-sets.

NOTE: The global mapping of forwarding classes to fabric fc-sets is independent of the mapping of forwarding classes to Node device fc-sets. Global mapping of forwarding classes to fabric fc-sets occurs only on the Interconnect device. The Node device mapping of forwarding classes to fc-sets does not affect the global mapping of forwarding classes to fabric fc-sets on the Interconnect device, and vice versa.

When you define new forwarding classes on a Node device, you explicitly map those forwarding classes to Node device fc-sets. However, new (user-created) forwarding classes are mapped by default to fabric fc-sets. (You can override the default mapping if you want to configure the forwarding class to fabric fc-set mapping explicitly, as described in the next section.)

By default:

- All best-effort traffic forwarding classes that you create are mapped to the **fabric_fcset_be** fabric fc-set.
- All lossless traffic forwarding classes that you create are mapped to the **fabric_fcset_noloss1** or **fabric_fcset_noloss2** fabric fc-set.
- All multidestination traffic forwarding classes that you create are mapped to the **fabric_fcset_multicast1** fabric fc-set.
- All **strict-high** priority traffic and **network-control** forwarding classes that you create are mapped to the **fabric_fcset_strict_high** fabric fc-set.

Fabric Forwarding Class Set Configuration and Implementation

You can map forwarding classes to fabric fc-sets, but no other attributes of fabric fc-sets are user-configurable, including CoS. This section describes:

- Mapping Forwarding Classes to Fabric Forwarding Class Sets on page 5583
- Fabric Forwarding Class Set Implementation on page 5583

Mapping Forwarding Classes to Fabric Forwarding Class Sets

If you do not want to use the default mapping of forwarding classes to fabric fc-sets, you can map forwarding classes to fabric fc-sets the same way as you map forwarding classes to Node device fc-sets. To do this, use exactly the same statement that you use to map forwarding classes to fc-sets, but instead of specifying a Node device fc-set name, specify a fabric fc-set name.

NOTE: The global mapping of forwarding classes to fabric fc-sets does not affect the mapping of forwarding classes to Node device fc-sets. The global forwarding class mapping to fabric fc-sets pertains to the traffic only when it enters, traverses, and exits the fabric. The forwarding class mapping to fc-sets on a Node device is valid within that Node device.

Mapping forwarding classes to fabric fc-sets does not affect the scheduling configuration of the forwarding classes or fc-sets on Node devices. Fabric fc-set scheduling (which is not user-configurable) pertains to traffic only when it enters, traverses, and exits the Interconnect device fabric.

If you change the mapping of a forwarding class to a fabric fc-set, the new mapping is global and applies to all traffic in that forwarding class, regardless of which Node device forwards the traffic to the Interconnect device.

- To assign one or more forwarding classes to a fabric fc-set:

  ```
  [edit class-of-service]
  user@switch# set forwarding-class-sets fabric-forwarding-class-set-name class forwarding-class-name
  ```

  For example, to map a user-defined forwarding class named **best-effort-2** to the fabric fc-set **fabric_fcset_be**:

  ```
  [edit class-of-service]
  user@switch# set forwarding-class-sets fabric_fcset_be class best-effort-2
  ```

NOTE: Because fabric fc-set configuration is global, in this example all forwarding classes with the name **best-effort-2** on all of the Node devices attached to the fabric use the **fabric_fcset_be** fabric fc-set to transport traffic across the fabric.

Fabric Forwarding Class Set Implementation

The following rules apply to fabric fc-sets:

- You cannot create new fabric fc-sets. Only the twelve default fabric fc-sets are available.
- You cannot delete a default fabric fc-set.
- You cannot attach a fabric fc-set to a Node device interface. Fabric fc-sets are used only on the Interconnect device fabric, not on Node devices.

- You can map only multidestination forwarding classes to multidestination fabric fc-sets.
- You cannot map multidestination forwarding classes to unicast fabric fc-sets.
- You cannot map unicast forwarding classes to multidestination fabric fc-sets.
- You cannot configure CoS for fabric fc-sets. (However, default CoS scheduling properties are applied to traffic on the fabric, and the fabric interfaces use link layer flow control (LLFC) for flow control.)

Fabric Forwarding Class Set Scheduling (CoS)

Although fabric fc-set CoS is not user-configurable, CoS is applied to traffic on the fabric. (In addition, fabric interfaces use LLFC to ensure lossless transport for lossless traffic flows.) This section describes how the fabric applies CoS scheduling to traffic:

- Class Groups for Fabric Forwarding Class Sets on page 5584
- Class Group Scheduling on page 5584
- QFabric System CoS on page 5586

Class Groups for Fabric Forwarding Class Sets

To transport traffic across the fabric, the QFabric system organizes the fabric fc-sets into three classes called *class groups*. The three class groups are:

- **Strict-high priority**—All traffic in the fabric fc-set **fabric_fcset_strict_high**. This class group includes the traffic in **strict-high** priority and **network-control** forwarding classes and in any forwarding classes you create on a Node device that consist of **strict-high** priority or **network-control** forwarding class traffic.
- **Unicast**—All traffic in the fabric fc-sets **fabric_fcset_be**, **fabric_fcset_noloss1**, and **fabric_fcset_noloss2**. This class group includes the traffic in the **best-effort**, **fcoe**, and **no-loss** forwarding classes and in any forwarding classes you create on a Node device that consist of best-effort or lossless traffic. If you use any of the hidden no loss fabric fc-sets (**fabric_fcset_noloss3**, **fabric_fcset_noloss4**, **fabric_fcset_noloss5**, or **fabric_fcset_noloss6**), that traffic is part of this class group.
- **Multidestination**—All traffic in the fabric fc-set **fabric_fcset_multicast1**. This class group includes the traffic in the **mcast** forwarding class and in any forwarding classes you create on a Node device that consist of multidestination traffic. If you use any of the hidden multidestination fabric fc-sets (**fabric_fcset_multicast2**, **fabric_fcset_multicast3**, or **fabric_fcset_multicast4**), that traffic is also classified as part of this class group.

Class Group Scheduling

You cannot configure CoS for class groups or for fabric fc-sets (that is, you cannot attach a traffic control profile to a fabric fc-set—you attach traffic control profiles to Node device fc-sets to apply scheduling to the traffic that belongs to the Node device fc-set). By default, the fabric uses weighted round-robin (WRR) scheduling in which each class group receives a portion of the total available fabric bandwidth based on its type of traffic, as shown in Table 119 on page 1245:

Table 516: Class Group Scheduling Properties and Membership

Class Group	Fabric fc-sets	Forwarding Classes (Default Mapping)	Class Group Scheduling Properties (Weight)
Strict-high priority	**fabric_fcset_strict_high**	• All **strict-high** priority forwarding classes • **network-control**	Traffic in the strict-high priority class group is served first. This class group receives all of the bandwidth it needs to empty its queues and therefore can starve other types of traffic during periods of high-volume strict-high priority traffic. Plan carefully and use caution when determining how much traffic to configure as strict-high priority traffic.
Unicast	• **fabric_fcset_be** • **fabric_fcset_noloss1** • **fabric_fcset_noloss2** Includes the hidden lossless fabric fc-sets if used: • **fabric_fcset_noloss3** • **fabric_fcset_noloss4** • **fabric_fcset_noloss5** • **fabric_fcset_noloss6**	• **best-effort** • **fcoe** • **no-loss** NOTE: No forwarding classes are mapped to the hidden lossless fabric_fcsets by default.	Traffic in the unicast class group receives an 80% weight in the WRR calculations. After the strict-high priority class group has been served, the unicast class group receives 80% of the remaining fabric bandwidth. (If more bandwidth is available, the unicast class group can use more bandwidth.)
Multidestination	**fabric_fcset_multicast1** Includes the hidden multidestination fabric fc-sets if used: • **fabric_fcset_multicast2** • **fabric_fcset_multicast3** • **fabric_fcset_multicast4**	• **mcast** NOTE: No forwarding classes are mapped to the hidden multidestination fabric_fcsets by default.	Traffic in the multidestination class group receives a 20% weight in the WRR calculations. After the strict-high priority class group has been served, the multidestination class group receives 20% of the remaining fabric bandwidth. (If more bandwidth is available, the multidestination class group can use more bandwidth.)

The fabric fc-sets within each class group are weighted equally and receive bandwidth using round-robin scheduling. For example:

- If the unicast class group has three member fabric fc-sets, **fabric_fcset_be**, **fabric_fcset_noloss1**, and **fabric_fcset_noloss2**, then each of the three fabric fc-sets receives one-third of the bandwidth available to the unicast class group.
- If the multidestination class group has one member fc-set, **fabric_fcset_multicast1**, then that fc-set receives all of the bandwidth available to the multidestination class group.
- If the multidestination class group has two member fc-sets, **fabric_fcset_multicast1** and **fabric_fcset_multicast2**, then each of the two fabric fc-sets receives one-half of the bandwidth available to the multidestination class group.

QFabric System CoS

When traffic enters and exits the same Node device, CoS works the same as it works on a standalone QFX3500 switch.

However, when traffic enters a Node device, crosses the Interconnect device, and then exits a different Node device, CoS is applied differently:

1. Traffic entering the ingress Node device receives the CoS configured at the Node ingress (packet classification, congestion notification profile for PFC).
2. When traffic goes from the ingress Node device to the Interconnect device, the fabric fc-set CoS is applied as described in the discussion of fabric forwarding class set scheduling.
3. When traffic goes from the Interconnect device to the egress Node device, the egress Node device applies CoS at the egress port (egress queue scheduling, WRED, IEEE 802.1p or DSCP code-point rewrite).

Support for Flow Control and Lossless Transport Across the Fabric

The Interconnect device incorporates flow control mechanisms to support lossless transport during periods of congestion on the fabric. To support the priority-based flow control (PFC) feature on the Node devices, the fabric interfaces use LLFC to support lossless transport for up to six IEEE 802.1p priorities when the following two configuration constraints are met:

1. The IEEE 802.1p priority used for the traffic that requires lossless transport is mapped to a lossless forwarding class on the Node devices.
2. The lossless forwarding class must be mapped to a lossless fabric fc-set on the Interconnect device (**fabric_fcset_noloss1**, **fabric_fcset_noloss2**, **fabric_fcset_noloss3**, **fabric_fcset_noloss4**, **fabric_fcset_noloss5**, or **fabric_fcset_noloss6**).

When traffic meets the two configuration constraints, the fabric propagates the back pressure from the egress Node device across the fabric to the ingress Node device during periods of congestion. However, to achieve end-to-end lossless transport across the switch, you must also configure a congestion notification profile to enable PFC on the Node device ingress ports.

For all other combinations of IEEE 802.1p priority to forwarding class mapping and all other combinations of forwarding class to fabric fc-set mapping, the congestion control mechanism is normal packet drop. For example:

- **Case 1**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 2**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.

- **Case 3**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_noloss2** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 4**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 5**—If the IEEE 802.1p priority **5** is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 6**—If the IEEE 802.1p priority **5** is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is packet drop.

NOTE: Lossless transport across the fabric also must meet the following two conditions:

1. The maximum cable length between the Node device and the Interconnect device is a 150 meters of fiber cable.
2. The maximum frame size is 9216 bytes.

If the MTU is 9216 KB, in some cases the QFabric system supports only five lossless forwarding classes instead of six lossless forwarding classes because of headroom buffer limitations.

The number of IEEE 802.1p priorities (forwarding classes) the QFabric system can support for lossless transport across the Interconnect device fabric depends on several factors:

- Approximate fiber cable length—The longer the fiber cable that connects Node device fabric (FTE) ports to the Interconnect device fabric ports, the more data the connected ports need to buffer when a pause is asserted. (The longer the fiber cable, the more frames are traversing the cable when a pause is asserted. Each port must be able to store all of the “in transit” frames in the buffer to preserve lossless behavior and avoid dropping frames.)
- MTU size—The larger the maximum frame sizes the buffer must hold, the fewer frames the buffer can hold. The larger the MTU size, the more buffer space each frame consumes.
- Total number of Node device fabric ports connected to the Interconnect device—The higher the number of connected fabric ports, the more headroom buffer space the Node device needs on those fabric ports to support the lossless flows that traverse the Interconnect device. Because more buffer space is used on the Node device fabric ports, less buffer space is available for the Node device access ports, and a lower total number of lossless flows are supported.

The QFabric system supports six lossless priorities (forwarding classes) under most conditions. The priority group headroom that remains after allocating headroom to lossless flows is sufficient to support best-effort and multidestination traffic.

Table 120 on page 1248 shows how many lossless priorities the QFabric system supports under different conditions (fiber cable lengths and MTUs) in cases when the QFabric system supports fewer than six lossless priorities. The number of lossless priorities is the same regardless of how many Node device FTE ports are connected to the Interconnect device. However, the higher the number of FTE ports connected to the Interconnect device, the lower the number of total lossless flows supported. In all cases that are not shown in Table 120 on page 1248, the QFabric system supports six lossless priorities.

NOTE: The system does not perform a configuration commit check that compares available system resources with the number of lossless forwarding classes configured. If you commit a configuration with more lossless forwarding classes than the system resources can support, frames in lossless forwarding classes might be dropped.

Table 517: Lossless Priority (Forwarding Class) Support for QFX3500 and QFX3600 Node Devices When Fewer than Six Lossless Priorities Are Supported

MTU in Bytes	Fiber Cable Length in Meters (Approximate)	Maximum Number of Lossless Priorities (Forwarding Classes) on the Node Device
9216 (9K)	100	5
9216 (9K)	150	5

NOTE: The total number of lossless flows decreases as resource consumption increases. For a Node device, the higher the number of FTE ports connected to the Interconnect device, the larger the MTU, and the longer the fiber cable length, the fewer total lossless flows the QFabric system can support.

Viewing Fabric Forwarding Class Set Information

You can display information about fabric fc-sets using the same CLI command you use to display information about Node device fc-sets:

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: fabric_fcset_be, Type: fabric-type, Forwarding class set
index: 1
  Forwarding class                        Index
  best-effort                               0

Forwarding class set: fabric_fcset_mcast1, Type: fabric-type, Forwarding class
set index: 5
  Forwarding class                        Index
  mcast                                     8
```

```
Forwarding class set: fabric_fcset_mcast2, Type: fabric-type, Forwarding class
set index: 6

Forwarding class set: fabric_fcset_mcast3, Type: fabric-type, Forwarding class
set index: 7

Forwarding class set: fabric_fcset_mcast4, Type: fabric-type, Forwarding class
set index: 8

Forwarding class set: fabric_fcset_noloss1, Type: fabric-type, Forwarding class
set index: 2
  Forwarding class                      Index
  fcoe                                    1

Forwarding class set: fabric_fcset_noloss2, Type: fabric-type, Forwarding class
set index: 3
  Forwarding class                      Index
  no-loss                                 2

Forwarding class set: fabric_fcset_noloss3, Type: fabric-type, Forwarding class
set index: 9

Forwarding class set: fabric_fcset_noloss4, Type: fabric-type, Forwarding class
set index: 10

Forwarding class set: fabric_fcset_noloss5, Type: fabric-type, Forwarding class
set index: 11

Forwarding class set: fabric_fcset_noloss6, Type: fabric-type, Forwarding class
set index: 12

Forwarding class set: fabric_fcset_strict_high, Type: fabric-type, Forwarding
class set index: 4
  Forwarding class                      Index
  network-control                         3
```

Table 121 on page 1249 describes the meaning of the **show class-of-service forwarding-class-set** output fields when you display fabric fc-set information.

Table 518: show class-of-service forwarding-class-set Command Output Fields

Field Name	Field Description
Forwarding class set	Name of the fabric forwarding class set.
Type	Type of forwarding class set: • Fabric-type—Fabric fc-set • Normal-type—Node device fc-set
Forwarding class set index	Index of this forwarding class set.
Forwarding class	Name of a forwarding class.
Index	Index of the forwarding class.

Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences

Table 122 on page 1250 summarizes the differences between fabric fc-sets and Node device fc-sets:

Table 519: Summary of Differences Between Fabric fc-sets and Node Device fc-sets

Characteristic	Fabric fc-set	Node device fc-set
Location	QFX3008-I or QFX3600-I Interconnect device (the fabric).	QFabric system Node device.
Global or Node-device specific	Global, valid for the entire fabric.	Local to the Node device on which the fc-set is configured.
Ability to create (define) a new fc-set	No. Use the 12 default fabric fc-sets provided.	Yes.
Ability to configure CoS	Default CoS settings only. CoS is not user-configurable.	User-configurable using traffic control profiles.
Ability to map forwarding classes to an fc-set	Yes. Mapping is global and applies to all forwarding classes across Interconnect device fabric (traffic from all connected Node devices).	Yes. Mapping is local to a Node device and applies only to the forwarding classes on the Node device.

Understanding CoS Scheduling on QFabric System Node Device Fabric (fte) Ports

Beginning with Junos OS Release 13.1, you can configure two-tier hierarchical scheduling (enhanced transmission selection, IEEE 802.1Qaz) on the fabric (fte) ports of QFabric system Node devices. Configuring CoS on Node device fabric interfaces provides increased control over traffic scheduling and helps to ensure predictable bandwidth consumption.

You can configure CoS on the following QFabric system interface types:

- Node device access interfaces (xe interfaces)—Schedule traffic on the output queues of the 10-Gigabit Ethernet access ports using standard Node device CoS scheduling configuration components, as described elsewhere in the QFX Series documentation. You can configure different scheduling for different ports and output queues.
- Node device fabric interfaces (fte interfaces)—Schedule traffic on the output queues of the 40-Gbps fabric interfaces that connect a Node device to a QFX3008-I or a QFX3600-I Interconnect device using standard Node device CoS scheduling configuration components. You can configure different scheduling for different interfaces and output queues.

This topic describes:

- Hierarchical Scheduling Architecture on QFabric System Node Devices on page 5591
- Default Scheduling on Node Device Fabric Interfaces on page 5592
- Configuring Scheduling on Node Device Fabric Interfaces on page 5593

Hierarchical Scheduling Architecture on QFabric System Node Devices

CoS architecture on Node device access interfaces is the same as CoS architecture on standalone switch access interfaces. CoS architecture on Node device fabric interfaces is also the same as the CoS architecture on the access interfaces. You apply schedulers to queues (priorities), fc-sets (priority groups), and interfaces in the same hierarchical manner as described in "Understanding CoS Hierarchical Port Scheduling (ETS)" on page 5481.

You configure scheduling on Node device fabric interfaces (fte interfaces) using the same statements and configuration constructs that you use to configure scheduling on Node device access interfaces (xe interfaces). For example, on Node device fabric interfaces you can:

- Define up to four fc-sets (three unicast, one multidestination)

NOTE: **If the fabric interface handles strict-high priority traffic, you must define a separate fc-set (priority group) for strict-high priority traffic. Strict-high priority traffic cannot be mixed with traffic of other priorities in an fc-set. For example, you might choose to create different fc-sets for best-effort, lossless, strict-high priority, and multidestination traffic.**

- Map forwarding classes to fc-sets

- Configure scheduling for each forwarding class (scheduler)
- Configure scheduling for each fc-set (traffic control profile)

The differences in configuring CoS on Node device fabric interfaces compared to configuring CoS on Node device access interfaces are:

- You specify a Node device *fabric* interface instead of a Node device *access* interface when you apply CoS to an interface.
- You cannot attach classifiers, congestion notification profiles, or rewrite rules to fabric interfaces. Also, you cannot configure buffer settings on fabric interfaces. You can only attach fc-sets and traffic control profiles.

Default Scheduling on Node Device Fabric Interfaces

Default scheduling on Node device fabric interfaces is the same as default scheduling on Node device access interfaces. Only the default forwarding classes (best-effort, network-control, fcoe, no-loss, and multidestination) receive port bandwidth, based on the default minimum guaranteed bandwidth (transmit rate) scheduler settings for each default forwarding class.

To transport traffic on Node device fabric interfaces, the system organizes the default forwarding classes into three *class groups*. Class groups are not user-configurable. The three class groups are:

- **Unicast**—All traffic in the default forwarding classes **best-effort**, **network-control**, **fcoe**, and **no-loss** belong to this default class group.
- **Multidestination**—All traffic in the default forwarding class **mcast** belongs to this default class group.
- **Strict-high priority**—There is no default strict-high priority forwarding class, so there is no default strict-high priority class group and there is no default configuration for strict-high priority traffic.

NOTE: If you configure strict-high priority forwarding classes, you must also configure an fc-set (priority group) for strict-high priority traffic, map the strict-high priority forwarding classes to the strict-high priority fc-set, create a scheduler for the strict-high priority traffic and map it to the strict-high priority forwarding classes, create a traffic control profile for the strict-high priority traffic, and apply the strict-high priority fc-set and traffic control profile to the appropriate fabric interfaces.

The default forwarding classes receive port bandwidth based on their default transmit rate settings (weights). Forwarding classes that are not default forwarding classes receive no default bandwidth.

Default class group scheduling uses weighted round-robin (WRR) scheduling, in which each class group receives a portion of the total available fabric interface bandwidth based on the class group traffic type, as shown in Table 520 on page 5593. Within each

class group, the scheduler bandwidth allocation for individual forwarding classes is based on the default transmit rate for each forwarding class.

Table 520: Class Group Default Scheduling Properties and Membership on Node Device Fabric Interfaces

Class Group	Forwarding Class Mapping and Bandwidth Allocation (Default Transmit Rate)	Class Group Scheduling Properties (Weight)
Unicast	• **best-effort** (5%) • **fcoe** (35%) • **no-loss** (35%) • **network-control** (5%)	Traffic in the unicast class group receives an 80% weight in the weighted round-robin (WRR) calculations. After the strict-high priority class group has been served, the unicast class group receives 80% of the remaining fabric bandwidth. (If more bandwidth is available, the unicast class group can use more bandwidth.)
Multidestination	• **mcast** (20%)	Traffic in the multidestination class group receives a 20% weight in the WRR calculations. After the strict-high priority class group has been served, the multidestination class group receives 20% of the remaining fabric bandwidth. (If more bandwidth is available, the multidestination class group can use more bandwidth.)

NOTE: Strict-high priority traffic is served first, before any other traffic is served. Strict-high priority traffic receives all of the bandwidth it needs to empty its queues and therefore can starve other types of traffic during periods of high-volume strict-high priority traffic. Plan carefully and use caution when determining how much traffic to configure as strict-high priority traffic.

Configuring Scheduling on Node Device Fabric Interfaces

If you do not want to use default CoS scheduling on Node device fabric interfaces, you can configure two-tier hierarchical scheduling (ETS) the same way that you configure ETS on Node device access interfaces.

- Similarities Between Node Device Fabric Interface and Access Interface Scheduling on page 5593
- Differences Between Node Device Fabric Interface and Access Interface Scheduling on page 5594

Similarities Between Node Device Fabric Interface and Access Interface Scheduling

Configuring scheduling on a Node device fabric interface is similar to configuring scheduling on an access interface in many ways. In both cases, you configure:

- Schedulers to specify the output scheduling for forwarding class traffic
- Scheduler maps to map schedulers to forwarding classes
- Forwarding classes (or use the default forwarding classes)

- Forwarding class sets (groups of forwarding classes that require similar CoS treatment)
- A separate fc-set for strict-high priority traffic (an fc-set cannot contain a mix of strict-high priority traffic and traffic with a different priority)
- Traffic control profiles to specify the output scheduling for fc-sets
- Traffic control profile and fc-set mapping to interfaces

On Node device fabric interfaces, you configure ETS in the same way, and ETS works the same way as on Node device access interfaces

In addition, strict-high priority queues are served first, and then the remaining port bandwidth is allocated to other traffic.

Differences Between Node Device Fabric Interface and Access Interface Scheduling

Configuring scheduling on a Node device fabric interface differs from configuring scheduling on an access interface in several ways. On fabric interfaces:

- You cannot attach classifiers.
- You cannot attach congestion notification profiles (flow control is applied automatically to lossless forwarding classes).
- You cannot attach rewrite rules.
- You cannot configure buffer settings.
- You specify a Node device fabric interface name instead of a Node device access interface name when you apply CoS to an interface.

Understanding Default CoS Scheduling on QFabric System Interconnect Devices (Junos OS Release 13.1 and Later Releases)

The default class-of-service (CoS) properties on the QFabric system Interconnect device interfaces are optimized to best utilize the fabric resources. You cannot configure CoS properties on QFabric System Interconnect device interfaces.

- Hierarchical CoS Architecture Across a QFabric System Interconnect Device on page 5595
- Default CoS on Interconnect Device Fabric Interfaces on page 5597

Hierarchical CoS Architecture Across a QFabric System Interconnect Device

Because Interconnect devices support traffic from multiple Node devices that have multiple CoS configurations, CoS on Interconnect device fabric interfaces differs from CoS on Node device access and fabric interfaces.

The hierarchical CoS scheduling structure on the Interconnect device interfaces consists of two tiers:

1. Fabric forwarding class sets—Similar to fc-sets on Node devices, fabric fc-sets group traffic for transport across the Interconnect device fabric. Fabric fc-sets are global and apply to all traffic that crosses the fabric from all Node devices. See "Understanding CoS Fabric Forwarding Class Sets" on page 1238 for a detailed description of fabric fc-sets.
2. Class groups—Fabric fc-sets are grouped into class groups for transport across the Interconnect device.

Node devices and Interconnect devices each have a two-tier hierarchical CoS scheduling architecture. The architectures are slightly different, but each tier of the scheduling hierarchy performs analogous functions, as shown in Table 521 on page 5595.

Table 521: Hierarchical Scheduler Architecture on Node Devices and Interconnect Devices

Bandwidth Pool	Bandwidth Configuration on Node Devices	Bandwidth Configuration on Interconnect Devices
Port—Entire amount of bandwidth available to traffic on a port.	Access (xe) or fabric (fte) interfaces	Fabric (fte) or Clos fabric (bfte) interfaces
Priority group—Group of traffic types that requires similar CoS treatment. Each priority group receives a portion of the total available port bandwidth.	Forwarding class set (fc-set)	Class group
Priority—Most granular tier of bandwidth allocation. Each priority receives a portion of the total available priority group bandwidth.	Forwarding class (mapped to output queue)	Fabric fc-set (mapped to output queue)

Fabric FC-Sets

Fabric fc-sets are groups of forwarding classes that receive similar CoS treatment across the Interconnect device. Fabric fc-sets are global to the QFabric system and apply to all traffic that traverses the fabric, from all connected Node devices. The CoS on a fabric fc-set applies to all the traffic that belongs to that fabric fc-set.

For example, a fabric fc-set that includes the **best-effort** forwarding class handles all of the **best-effort** traffic from all of the connected Node devices that traverses the Interconnect device fabric.

There are 12 default fabric fc-sets, including 5 visible fabric fc-sets and 7 hidden fabric fc-sets. The five visible fabric fc-sets have forwarding classes mapped to them by default. By default, the seven hidden fabric fc-sets do not carry traffic, but you can map forwarding classes to the hidden fabric fc-sets if you want to use them.

You can configure the forwarding class membership of each fabric fc-set. However, you cannot create new fabric fc-sets, and you cannot delete the 12 default fabric fc-sets.

Each fabric fc-set is mapped to an output queue. Each fabric interface has 12 output queues, one for each of the 12 fabric fc-sets. The traffic from all of the forwarding classes mapped to a fabric fc-set uses that fabric fc-set's output queue.

Fabric fc-sets are grouped into class groups for transport across the Interconnect device.

Class Groups for Fabric FC-Sets

To transport traffic across the fabric, the fabric organizes the fabric fc-sets into three classes called *class groups*. Class groups are not user-configurable. The three class groups are:

- **Strict-high priority**—All traffic in the fabric fc-set **fabric_fcset_strict_high**. This class group includes the traffic in **strict-high** priority and **network-control** forwarding classes, and in any forwarding classes you create on a Node device that consist of **strict-high** priority traffic.
- **Unicast**—All traffic in the fabric fc-sets **fabric_fcset_be**, **fabric_fcset_noloss1**, and **fabric_fcset_noloss2**. This class group includes the traffic in the **best-effort**, **fcoe**, and **no-loss** forwarding classes, and the traffic in any forwarding classes you create on a Node device that consist of best-effort or lossless traffic. If you use any of the hidden no loss fabric fc-sets (**fabric_fcset_noloss3**, **fabric_fcset_noloss4**, **fabric_fcset_noloss5**, or **fabric_fcset_noloss6**), that traffic is part of this class group.
- **Multidestination**—All traffic in the fabric fc-set **fabric_fcset_multicast1**. This class group includes the traffic in the **mcast** forwarding class and in any forwarding classes you create on a Node device that consist of multidestination traffic. If you use any of the hidden multidestination fabric fc-sets (**fabric_fcset_multicast2**, **fabric_fcset_multicast3**, or **fabric_fcset_multicast4**), that traffic is part of this class group.

Default CoS on Interconnect Device Fabric Interfaces

The Interconnect device interfaces use the default CoS configuration as described in these sections:

- Default Class Group Scheduling on page 5597
- Default Fabric FC-Set Scheduling on page 5598
- Default Class Group and Fabric FC-Set Scheduling Example on page 5600
- Default PFC and Lossless Transport Across the Interconnect Device on page 5602

Default Class Group Scheduling

Default class group bandwidth scheduling is analogous to default fc-set (priority group) scheduling on a Node device. Default class group scheduling uses weighted round-robin (WRR) scheduling, in which each class group receives a portion of the total available fabric interface bandwidth, based on the class group's traffic type, as shown in Table 119 on page 1245:

Table 522: Class Group Default Scheduling Properties and Membership

Class Group	Fabric fc-sets	Forwarding Classes (Default Mapping)	Class Group Scheduling Properties (Weight)
Strict-high priority	**fabric_fcset_strict_high**	• All **strict-high** priority forwarding classes • **network-control**	Traffic in the strict-high priority class group is served first. This class group receives all of the bandwidth it needs to empty its queues and therefore can starve other types of traffic during periods of high-volume strict priority traffic. Plan carefully and use caution when determining how much traffic to configure as strict-high priority traffic.
Unicast	• **fabric_fcset_be** • **fabric_fcset_noloss1** • **fabric_fcset_noloss2** Includes the hidden lossless fabric fc-sets if used: • **fabric_fcset_noloss3** • **fabric_fcset_noloss4** • **fabric_fcset_noloss5** • **fabric_fcset_noloss6**	• **best-effort** • **fcoe** • **no-loss** NOTE: No forwarding classes are mapped to the hidden lossless fabric_fcsets by default.	Traffic in the unicast class group receives an 80% weight in the weighted round-robin (WRR) calculations. After the strict-high priority class group has been served, the unicast class group receives 80% of the remaining fabric bandwidth. (If more bandwidth is available, the unicast class group can use more bandwidth.)

Table 522: Class Group Default Scheduling Properties and Membership *(continued)*

Class Group	Fabric fc-sets	Forwarding Classes (Default Mapping)	Class Group Scheduling Properties (Weight)
Multidestination	**fabric_fcset_multicast1** Includes the hidden multidestination fabric fc-sets if used: • **fabric_fcset_multicast2** • **fabric_fcset_multicast3** • **fabric_fcset_multicast4**	• **mcast** NOTE: No forwarding classes are mapped to the hidden multidestination fabric_fcsets by default.	Traffic in the multidestination class group receives a 20% weight in the WRR calculations. After the strict-high priority class group has been served, the multidestination class group receives 20% of the remaining fabric bandwidth. (If more bandwidth is available, the multidestination class group can use more bandwidth.)

Only the five visible fabric fc-sets have traffic mapped to them by default. The fabric fc-sets within each class group are weighted by their transmit rates (guaranteed minimum bandwidth), and they receive bandwidth from the class group's total bandwidth using weighted round-robin (WRR) scheduling.

Default Fabric FC-Set Scheduling

Default fabric fc-set bandwidth scheduling is analogous to default forwarding class (priority) scheduling on a Node device. Each fabric fc-set receives a guaranteed minimum percentage of the port bandwidth that the class group receives. The guaranteed minimum percentage is called the *transmit rate*.

Table 523 on page 5598 shows the default transmit rate for each of the default fabric fc-sets.

Table 523: Default Fabric FC-Set Scheduler Configuration

Default Fabric FC-Set	Transmit Rate (Percentage of Class Group Bandwidth)
fabric_fcset_strict_high	N/A Strict-high priority traffic is served first, before any other traffic is served. Strict-high priority traffic receives all of the bandwidth it needs to empty its queues and therefore can starve other types of traffic during periods of high-volume strict priority traffic. Plan carefully and use caution when determining how much traffic to configure as strict-high priority traffic.
fabric_fcset_noloss1	35%
fabric_fcset_noloss2	35%
fabric_fcset_be	10%
fabric_fcset_multicast1	20%

Each fabric fc-set belongs to a class group. Each class group receives a portion of the total available port bandwidth. Each fabric fc-set in a class group receives a portion of

the total available class group bandwidth based on the transmit rate (weight) of the fabric fc-set.

Traffic in fabric_fcset_strict_high does not have a default transmit rate because fabric_fcset_strict_high receives all of the bandwidth needed to empty its queue before other queues are served. Traffic in the remaining fabric fc-sets receive bandwidth in a ratio proportional to the default transmit rate of each fabric fc-set.

Each of the following hidden fabric fc-sets receives a default scheduling weight of 1:

- fabric_fcset_noloss3
- fabric_fcset_noloss4
- fabric_fcset_noloss5
- fabric_fcset_noloss6
- fabric_fcset_multicast2
- fabric_fcset_multicast3
- fabric_fcset_multicast4

You must explicitly map forwarding classes to hidden fabric fc-sets if you want to use the hidden fabric fc-sets.

CAUTION: Bandwidth is allocated to fabric fc-sets based on scheduling weight. The scheduling weights of the visible (default) fabric fc-sets are the same as their transmit rates, so in the unicast class group, fabric_fcset_noloss1 and fabric_fcset_noloss2 each have a weight of 35 and fabric_fcset_be has a weight of 10. In the multidestination class group, the default fabric_fcset_multicast1 has a weight of 20. The hidden multicast and noloss fabric fc-sets each have a scheduling weight of 1.

The scheduling weights mean that when the visible fabric fc-sets are fully utilizing their allocated bandwidth:

- The hidden noloss fc-sets (fabric_fcset_noloss3, fabric_fcset_noloss4, fabric_fcset_noloss5, and fabric_fcset_noloss6) receive bandwidth at a proportional rate of 1:35 compared to the default noloss fc-sets.
- The hidden multicast fc-sets (fabric_fcset_multicast2, fabric_fcset_multicast3, and fabric_fcset_multicast4) receive bandwidth at a proportional rate of 1:20 compared to the default multicast fc-sets.

If you map traffic to a hidden fabric fc-set, that fabric fc-set receives the proportional amount of class group bandwidth that corresponds to its scheduling weight (1). The amount of bandwidth allocated to a hidden fabric fc-set depends on how much bandwidth the other fc-sets in the same class group consume. When the visible fabric fc-sets fully utilize their bandwidth, hidden fabric fc-sets receive only their minimum weight in bandwidth.

(However, even a low scheduling weight results in a relatively large absolute bandwidth allocation because each fabric port is a 40-Gbps port.)

For example, if fabric_fcset_noloss1 and fabric_fcset_noloss2 each consume all of the 35 percent of bandwidth allocated to them, and fabric_fcset_be consumes all of the 10 percent of bandwidth allocated to it, then fabric_fcset_noloss3, fabric_fcset_noloss4, fabric_fcset_noloss5, and fabric_fcset_noloss6 receive bandwidth at a rate of 1:80 compared to the visible noloss fabric fc-sets. (If the visible fabric fc-sets do not use all of their allocated bandwidth, then the hidden fabric fc-sets receive more bandwidth.)

Another example is if we map lossless traffic to fabric_fcset_noloss3 and to fabric_fcset_noloss4. Fabric_fcset_noloss1 uses 10 percent of its 35 percent allocation of unicast class group bandwidth. Fabric_fcset_noloss2 uses 15 percent of its 35 percent allocation of unicast class group bandwidth. Fabric_fcset_be uses 5 percent of its allocated bandwidth. Fabric_fcset_noloss3 and fabric_fcset_noloss4 can use the remaining unicast class group bandwidth allocated to lossless traffic. However, if the traffic on fabric_fcset_noloss1, fabric_fcset_noloss2, or fabric_fcset_be increases, the bandwidth allocated to the hidden fabric fc-sets decreases.

Similarly, if you map traffic to a hidden multidestination fabric fc-set (fabric_fcset_multicast2, fabric_fcset_multicast3, fabric_fcset_multicast4), that multidestination fabric fc-set receives the proportional amount of class group bandwidth that corresponds to its scheduling weight (1). The amount of bandwidth allocated to a hidden multidestination fabric fc-set depends on how much bandwidth the other fc-sets in the multidestination class group consume. When fabric_fcset_multicast1 (the visible fabric fc-set) fully utilizes its bandwidth, hidden fabric fc-sets receive only their minimum weight in bandwidth. For example, if fabric_fcset_multicast1 uses its full bandwidth allocation, then the hidden multidestination fabric fc-sets receive bandwidth at a rate of 1:20 compared to fabric_fcset_multicast1.

Default Class Group and Fabric FC-Set Scheduling Example

The following example shows how default scheduling allocates the total port bandwidth among the class groups and their fabric fc-sets. In the example, traffic is mapped to each of the forwarding classes in the five visible fabric fc-sets, and the strict-high priority class group consumes an average of 10 percent of the 40-Gbps fabric interface bandwidth (4 gigabits), leaving 90 percent of the fabric interface bandwidth (36 gigabits) for the remaining class groups.

In this scenario, by default, the strict-high priority class group includes one fabric fc-set (fabric_fcset_strict_high), the unicast class group includes three fabric fc-sets (fabric_fcset_be, fabric_fcset_noloss1, and fabric_fcset_noloss2), and the multidestination class group includes one fabric fc-set (fabric_fcset_multicast1). Each individual fabric fc-set receives the following treatment:

- Strict-high priority class group (fabric_fcset_strict_high)—This group is assumed to average 10 percent (4 gigabits) for the purposes of this example. Because the strict-high priority class group is served first and receives all of the bandwidth it requires to empty its queue, in real networks the amount of required bandwidth fluctuates and affects the amount of bandwidth available to the other class groups.

  

  TIP: To prevent strict-high priority traffic from using too much bandwidth, you can set a maximum bandwidth limit by configuring a scheduler shaping rate for the fabric_fcset_strict_high fabric fc-set.

- Unicast class group (fabric_fcset_be, fabric_fcset_noloss1, and fabric_fcset_noloss2)—Each of these fabric fc-sets receives a weighted portion of the 80 percent of the total port bandwidth available after the strict-high traffic has been served. The weight corresponds to the transmit rate of each fabric fc-set. The following calculations show the minimum port bandwidth allocated to each of the unicast class group fabric fc-sets:

  - fabric_fcset_be

    10 / (35 + 35 + 10)% of 80% of the available port bandwidth (12.5 percent of 80 percent of port bandwidth)

    The 10 that is the numerator in 10 / (35 + 35 + 10) is the percentage of bandwidth allocated to the fabric_fcset_be by the transmit rate weight. The (35 + 35 + 10) in the denominator sums the percentage of bandwidth (transmit rate weights) allocated to each of the three fabric fc-sets in the unicast class group.

    The 80 percent represents 80 percent of the port bandwidth available after strict-high priority traffic is served (36 gigabits).

    The resulting equation is:

    10 / (35 + 35 + 10)% x (0.8 x 36 gigabits) = approximately 3.6 gigabits

  - fabric_fcset_noloss1 and fabric_fcset_noloss2

    The default minimum bandwidth for the two visible lossless fabric fc-sets is the same because both of these fabric fc-sets have the same transmit rate weight.

    35 / (35 + 35 + 10)% of 80% of the port bandwidth (43.75 percent of 80 percent of port bandwidth)

    The 35 that is the numerator in 35 / (35 + 35 + 10) is the percentage of bandwidth allocated to each of the noloss fabric fc-sets by the transmit rate weight. The (35 + 35 + 10) in the denominator sums the percentage of bandwidth (transmit rate weights) allocated to each of the three fabric fc-sets in the unicast class group.

    The 80 percent represents 80 percent of the port bandwidth available after strict-high priority traffic is served (36 gigabits).

    The resulting equation is:

    35 / (35 + 35 + 10)% x (0.8 x 36 gigabits) = approximately 12.6 gigabits

- Multidestination class group (fabric_fcset_multicast1)—Because only one fabric fc-set is configured by default in the multidestination class group, it receives 100 percent of the 20 percent of the total port bandwidth available to the multidestination class group after the strict-high traffic has been served:

  100 / (100)% of 20% of the available port bandwidth (100 percent of 20 percent of available port bandwidth)

  The resulting equation is:

  100 / 100% x (0.2 x 36 gigabits) = approximately 7.2 gigabits

Default PFC and Lossless Transport Across the Interconnect Device

The Interconnect device incorporates flow control mechanisms to support lossless transport during periods of congestion on the fabric. To support the priority-based flow control (PFC) feature on the Node devices, the Interconnect device fabric supports lossless transport for up to six IEEE 802.1p priorities when the following two configuration constraints are met:

1. The IEEE 802.1p priority used for the traffic that requires lossless transport is mapped to a lossless forwarding class (a forwarding class configured with the **no-loss** parameter or the default **fcoe** or **no-loss** forwarding class).
2. The lossless forwarding class must be mapped to one of the lossless fabric fc-sets (**fabric_fcset_noloss1**, **fabric_fcset_noloss2**, **fabric_fcset_noloss3**, **fabric_fcset_noloss4**, **fabric_fcset_noloss5**, or **fabric_fcset_noloss6**). If you do not explicitly map lossless forwarding classes to fabric fc-sets, lossless forwarding classes are mapped by default to lossless fabric fc-sets **fabric_fcset_noloss1** and **fabric_fcset_noloss2**.

When traffic meets these two constraints, the fabric propagates back-pressure from egress queues during periods of congestion. However, to achieve end-to-end lossless transport across the QFabric system, you must also configure a congestion notification profile to enable PFC on the Node device ingress interfaces. To achieve end-to-end lossless transport across the network, you must configure PFC on all of the devices in the lossless traffic path.

For all other combinations of IEEE 802.1p priority to forwarding class mapping and all other combinations of forwarding class to fabric fc-set mapping, the default congestion control mechanism is normal packet drop. For example:

- **Case 1**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 2**—If the IEEE 802.1p priority **5** is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop, and the traffic does not receive lossless treatment.
- **Case 3**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_noloss2** fabric fc-set, then the congestion control mechanism is PFC.

- **Case 4**—If the IEEE 802.1p priority **5** is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop, and the traffic does not receive lossless treatment.
- **Case 5**—If the IEEE 802.1p priority **5** is mapped to the lossy **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 6**—If the IEEE 802.1p priority **5** is mapped to the lossy **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric_fcset_noloss1** fabric fc-set, then the congestion control mechanism is packet drop.

NOTE: Lossless transport across the fabric must also meet the following two conditions:

1. The maximum cable length between the Node device and the Interconnect device is 150 meters of fiber cable.
2. The maximum frame size is 9216 bytes.

If the MTU is 9216 KB, in some cases the QFabric system supports only five lossless forwarding classes instead of six lossless forwarding classes because of headroom buffer limitations.

The number of IEEE 802.1p priorities (forwarding classes) the QFabric system can support for lossless transport across the Interconnect device fabric depends on several factors:

- Approximate fiber cable length—The longer the fiber cable that connects Node device fabric (FTE) ports to the Interconnect device fabric ports, the more data the connected ports need to buffer when a pause is asserted. (The longer the fiber cable, the more frames are traversing the cable when a pause is asserted. Each port must be able to store all of the “in transit” frames in the buffer to preserve lossless behavior and avoid dropping frames.)
- MTU size—The larger the maximum frame sizes the buffer must hold, the fewer frames the buffer can hold. The larger the MTU size, the more buffer space each frame consumes.
- Total number of Node device fabric ports connected to the Interconnect device—The higher the number of connected fabric ports, the more headroom buffer space the Node device needs on those fabric ports to support the lossless flows that traverse the Interconnect device. Because more buffer space is used on the Node device fabric ports, less buffer space is available for the Node device access ports, and a lower total number of lossless flows are supported.

The QFabric system supports six lossless priorities (forwarding classes) under most conditions. The priority group headroom that remains after allocating headroom to lossless flows is sufficient to support best-effort and multidestination traffic.

Table 120 on page 1248 shows how many lossless priorities the QFabric system supports under different conditions (fiber cable lengths and MTUs) in cases when the QFabric system supports fewer than six lossless priorities. The number of lossless priorities is the same regardless of how many Node device FTE ports are connected to the Interconnect device. However, the higher the number of FTE ports connected to the Interconnect device, the lower the number of total lossless flows supported. In all cases that are not shown in Table 120 on page 1248, the QFabric system supports six lossless priorities.

NOTE: The system does not perform a configuration commit check that compares available system resources with the number of lossless forwarding classes configured. If you commit a configuration with more lossless forwarding classes than the system resources can support, frames in lossless forwarding classes might be dropped.

Table 524: Lossless Priority (Forwarding Class) Support for QFX3500 and QFX3600 Node Devices When Fewer than Six Lossless Priorities Are Supported

MTU in Bytes	Fiber Cable Length in Meters (Approximate)	Maximum Number of Lossless Priorities (Forwarding Classes) on the Node Device
9216 (9K)	100	5
9216 (9K)	150	5

NOTE: The total number of lossless flows decreases as resource consumption increases. For a Node device, the higher the number of FTE ports connected to the Interconnect device, the larger the MTU, and the longer the fiber cable length, the fewer total lossless flows the QFabric system can support.

Example: Configuring CoS Hierarchical Port Scheduling (ETS)

Hierarchical port scheduling defines the class-of-service (CoS) properties of output queues, which are mapped to forwarding classes (forwarding classes are mapped to IEEE 802.1p priorities, so mapping queues to forwarding classes also maps queues to priorities). Hierarchical port scheduling enables you to group priorities that require similar CoS resources into priority groups. You define the port bandwidth resources for a priority group, and you define the amount of the priority group's resources that each priority in the group can use.

Hierarchical port scheduling is the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz). One major benefit of hierarchical port scheduling is greater port bandwidth utilization. If a priority group on a port does not use all of its allocated bandwidth, other priority groups on that port can use that bandwidth. Also, if a priority within a priority group does not use its allocated bandwidth, other priorities within that priority group can use that bandwidth.

Configuring hierarchical scheduling is a multistep procedure that includes:

- Mapping forwarding classes to queues
- Defining forwarding class sets (priority groups)
- Defining behavior aggregate classifiers
- Configuring priority-based flow control (PFC) for lossless priorities (queues)
- Applying classifiers and PFC configuration to ingress interfaces
- Defining drop profiles
- Defining schedulers
- Mapping forwarding classes to schedulers
- Defining traffic control profiles
- Assigning priority groups and traffic control profiles to egress ports

This example describes how to configure hierarchical scheduling:

- Requirements on page 5607
- Overview on page 5607

- Configuration on page 5610
- Verification on page 5618

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Keep the following considerations in mind when you plan the port bandwidth allocation for priority groups and for individual priorities:

- How much traffic and what types of traffic you expect to traverse the system.
- How you want to divide different types of traffic into priorities (forwarding classes, also called queues) to apply different CoS treatment to the traffic. Dividing traffic into priorities includes:
  - Mapping the code points of ingress traffic to forwarding classes using behavior aggregate (BA) classifiers. This classifies incoming traffic into the appropriate forwarding class.
  - Mapping forwarding classes to output queues. This defines the output queue for each type of traffic.
  - Attaching the BA classifier to the desired ingress interfaces so that incoming traffic maps to the desired forwarding classes and queues.
- How you want to organize priorities into priority groups (forwarding class sets).

  Traffic that requires similar treatment usually belongs in the same priority group. To do this, place forwarding classes that require similar bandwidth, loss, and other characteristics in the same forwarding class set. For example, you can map all types of best-effort traffic forwarding classes into one forwarding class set.
- How much of the port bandwidth you want to allocate to each priority group and to each of the priorities in each priority group. The following considerations apply to bandwidth allocation:
  - Estimate how much traffic you expect in each forwarding class (output queue) and how much traffic you expect in each forwarding class set (the aggregate amount of traffic in the forwarding classes that belong to the forwarding class set).
  - The combined minimum guaranteed bandwidth of the priorities (forwarding classes) in a priority group should not exceed the minimum guaranteed bandwidth of the priority group. The transmit rate scheduler parameter defines the minimum guaranteed bandwidth for forwarding classes. Scheduler maps associate schedulers with forwarding classes.
  - The combined minimum guaranteed bandwidth of the priority groups (forwarding class sets) on a port should not exceed the port's total bandwidth. Traffic control profiles define the minimum bandwidth for a forwarding class set. Associating a

scheduler map with a traffic control profile sets the scheduling for the individual forwarding classes in the forwarding class set.

This example creates hierarchical port scheduling by defining priority groups for best effort, guaranteed delivery, and high-performance computing (HPC) traffic. Each priority group includes priorities that need to receive similar CoS treatment. Each priority group and each priority within each priority group receive the CoS resources needed to service their flows. Lossless priorities use PFC to prevent packet loss when the network experiences congestion.

Topology

Table 525 on page 5608 shows the configuration components for this example.

Table 525: Components of the Hierarchical Port Scheduling (ETS) Configuration Topology

Property	Settings
Hardware	QFX3500 switch
Mapping of forwarding classes (priorities) to queues	**best-effort** to queue **0** **be** to queue **1** **fcoe** (Fibre Channel over Ethernet) to queue **3** **no-loss** to queue **4** **hpc** (high-performance computing) to queue **5** **network-control** to queue **7** NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.
Forwarding class sets (priority groups)	**best-effort-pg**: contains forwarding classes **best-effort**, **be**, and **network control** **guar-delivery-pg**: contains forwarding classes **fcoe** and **no-loss** **hpc-pg**: contains forwarding class **hpc**
Behavior aggregate classifier (maps forwarding classes and loss priorities to incoming packets by IEEE 802.1 code point)	Name—**hsclassifier1** Code point mapping: • **000** to forwarding class **best-effort** and loss priority **low** • **001** to forwarding class **be** and loss priority **high** • **011** to forwarding class **fcoe** and loss priority **low** • **100** to forwarding class **no-loss** and loss priority **low** • **101** to forwarding class **hpc** and loss priority **low** • **110** to forwarding class **network-control** and loss priority **low**

Drop profiles NOTE: The **fcoe** and **no-loss** priorities (queues) do not use drop profiles because they are lossless traffic classes.	**dp-be-low**: drop start point **25**, drop end point **50**, maximum drop rate **80** **dp-be-high**: drop start point **10**, drop end point **40**, maximum drop rate **100** **dp-hpc**: drop start point **75**, drop end point **90**, maximum drop rate **75** **dp-nc**: drop start point **80**, drop end point **100**, maximum drop rate **100**
Queue schedulers	**be-sched**: minimum bandwidth **3g**, maximum bandwidth **100**%, priority **low**, drop profiles **dp-be-low** and **dp-be-high** **fcoe-sched**: minimum bandwidth **2.5g**, maximum bandwidth **100**%, priority **low** **hpc-sched**: minimum bandwidth **2g**, maximum bandwidth **100**%, priority **low**, drop profile **dp-hpc** **nc-sched**: minimum bandwidth **500m**, maximum bandwidth **100**%, priority **low**, drop profile **dp-nc** **nl-sched**: minimum bandwidth **2g**, maximum bandwidth **100**%, priority **low**
Forwarding class-to-scheduler mapping	Scheduler map **be-map**: Forwarding class **best-effort**, scheduler **be-sched** Forwarding class **be**, scheduler **be-sched** Forwarding class **network-control**, scheduler **nc-sched** Scheduler map **gd-map**: Forwarding class **fcoe**, scheduler **fcoe-sched** Forwarding class **no-loss**, scheduler **nl-sched** Scheduler map **hpc-map**: Forwarding class **hpc**, scheduler **hpc-sched**
Traffic control profiles	**be-tcp**: scheduler map **be-map**, minimum bandwidth **3.5g**, maximum bandwidth **100**% **gd-tcp**: scheduler map **gd-map**, minimum bandwidth **4.5g**, maximum bandwidth **100**% **hpc-tcp**: scheduler map **hpc-map**, minimum bandwidth **2g**, maximum bandwidth **100**%
Interfaces	This example configures hierarchical port scheduling on interfaces **xe-0/0/20** and **xe-0/0/21**. Because traffic is bidirectional, you apply the ingress and egress configuration components to both interfaces: • Classifier Name—**hsclassifier1** • Forwarding class sets—**best-effort-pg**, **guar-deliver-pg**, **hpc-pg** • Congestion notification profile—**gd-cnp**

Figure 210 on page 5610 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example. You can perform the configuration steps in a different sequence if you want.

Figure 210: Hierarchical Port Scheduling Components Block Diagram

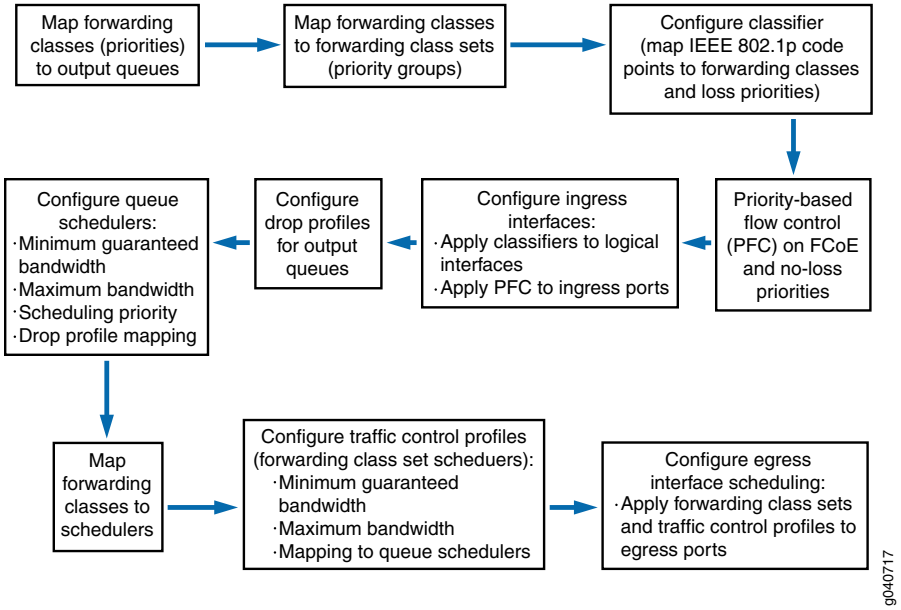

Figure 211 on page 5610 shows a block diagram of the hierarchical scheduling packet flow from ingress to egress.

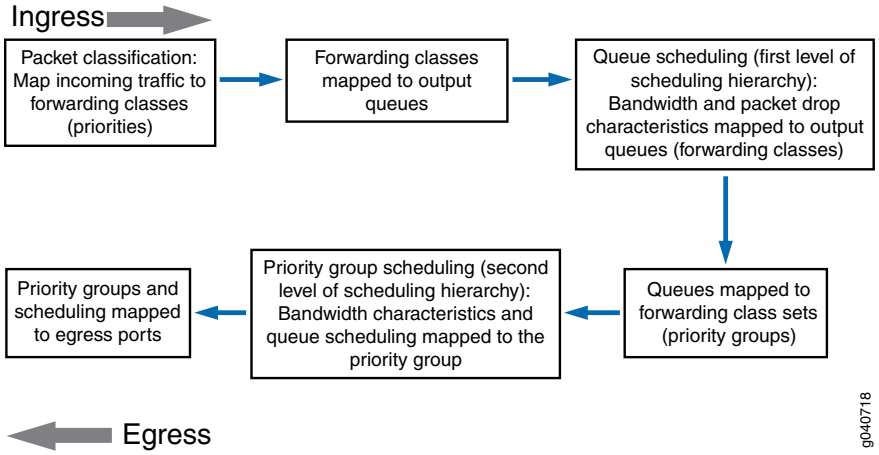
Figure 211: Hierarchical Port Scheduling Packet Flow Block Diagram



Configuration

CLI Quick Configuration

To quickly configure hierarchical port scheduling, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network

configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set forwarding-classes class best-effort queue-num 0
set forwarding-classes class be2 queue-num 1
set forwarding-classes class hpc queue-num 5
set forwarding-classes class network-control queue-num 7
set forwarding-class-sets best-effort-pg class best-effort
set forwarding-class-sets best-effort-pg class be2
set forwarding-class-sets best-effort-pg class network-control
set forwarding-class-sets guar-delivery-pg class fcoe
set forwarding-class-sets guar-delivery-pg class no-loss
set forwarding-class-sets hpc-pg class hpc
set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort loss-priority low code-points

set interfaces xe-0/0/21 forwarding-class-set guar-delivery-pg output-traffic-control-profile
gd-tcp
set interfaces xe-0/0/21 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp
```

Step-by-Step Procedure

To perform a step-by-step configuration of the forwarding classes (priorities), forwarding class sets (priority groups), classifiers, queue schedulers, PFC, traffic control profiles, and interfaces to set up hierarchical port scheduling (ETS):

1. Configure the forwarding classes (priorities) and map them to unicast output queues (do not explicitly map the **fcoe** and **no-loss** forwarding classes to output queues; use the default configuration):

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class best-effort queue-num 0
   user@switch# set forwarding-classes class be2 queue-num 1
   user@switch# set forwarding-classes class hpc queue-num 5
   user@switch# set forwarding-classes class network-control queue-num 7
   ```

2. Configure forwarding class sets (priority groups) to group forwarding classes (priorities) that require similar CoS treatment:

   ```
   [edit class-of-service]
   user@switch# set forwarding-class-sets best-effort-pg class best-effort
   user@switch# set forwarding-class-sets best-effort-pg class be2
   user@switch# set forwarding-class-sets best-effort-pg class network-control
   user@switch# set forwarding-class-sets guar-delivery-pg class fcoe
   user@switch# set forwarding-class-sets guar-delivery-pg class no-loss
   user@switch# set forwarding-class-sets hpc-pg class hpc
   ```

3. Configure a classifier to set the loss priority and IEEE 802.1 code points assigned to each forwarding class at the ingress:

   ```
   [edit class-of-service]
   user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort
   loss-priority low code-points 000
   user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority
   high code-points 001
   user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority
   low code-points 011
   user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority
   low code-points 100
   user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low
   code-points 101
   user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control
   loss-priority low code-points 110
   ```

4. Configure a congestion notification profile to enable PFC on the FCoE and no-loss queue IEEE 802.1 code points:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011
   pfc
   user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100
   pfc
   ```

5. Assign the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 hsclassifier1
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 hsclassifier1
```

6. Apply the PFC configuration to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile gd-cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile gd-cnp
```

7. Configure the drop profile for the best-effort low loss-priority queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-be-low interpolate fill-level 25 fill-level 50
drop-probability 0 drop-probability 80
```

8. Configure the drop profile for the best-effort high loss-priority queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-be-high interpolate fill-level 10 fill-level 40
drop-probability 0 drop-probability 100
```

9. Configure the drop profile for the network-control queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-nc interpolate fill-level 80 fill-level 100 drop-probability
0 drop-probability 100
```

10. Configure the drop profile for the high-performance computing queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-hpc interpolate fill-level 75 fill-level 90 drop-probability
0 drop-probability 75
```

11. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profiles for the best-effort queue:

```
[edit class-of-service]
user@switch# set schedulers be-sched priority low transmit-rate 3g
user@switch# set schedulers be-sched shaping-rate percent 100
user@switch# set schedulers be-sched drop-profile-map loss-priority low protocol any
drop-profile dp-be-low
user@switch# set schedulers be-sched drop-profile-map loss-priority high protocol any
drop-profile dp-be-high
```

12. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 2500m
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

13. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the high-performance computing queue:

```
[edit class-of-service]
user@switch# set schedulers hpc-sched priority low transmit-rate 2g
user@switch# set schedulers hpc-sched shaping-rate percent 100
user@switch# set schedulers hpc-sched drop-profile-map loss-priority low protocol any
drop-profile dp-hpc
```

14. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the network-control queue:

```
[edit class-of-service]
user@switch# set schedulers nc-sched priority low transmit-rate 500m
user@switch# set schedulers nc-sched shaping-rate percent 100
user@switch# set schedulers nc-sched drop-profile-map loss-priority low protocol any
drop-profile dp-nc
```

15. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the no-loss queue:

```
[edit class-of-service]
user@switch# set schedulers nl-sched priority low transmit-rate 2g
user@switch# set schedulers nl-sched shaping-rate percent 100
```

16. Map the schedulers to the appropriate forwarding classes (queues):

```
[edit class-of-service]
user@switch# set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
user@switch# set scheduler-maps be-map forwarding-class be2 scheduler be-sched
user@switch# set scheduler-maps be-map forwarding-class network-control scheduler
nc-sched
user@switch# set scheduler-maps gd-map forwarding-class fcoe scheduler fcoe-sched
user@switch# set scheduler-maps gd-map forwarding-class no-loss scheduler nl-sched
user@switch# set scheduler-maps hpc-map forwarding-class hpc scheduler hpc-sched
```

17. Define the traffic control profile for the best-effort priority group (queue scheduler to mapping, minimum guaranteed bandwidth, and maximum bandwidth):

```
[edit class-of-service]
user@switch# set traffic-control-profiles be-tcp scheduler-map be-map guaranteed-rate
3500m
user@switch# set traffic-control-profiles be-tcp shaping-rate percent 100
```

18. Define the traffic control profile for the guaranteed delivery priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):

```
[edit class-of-service]
user@switch# set traffic-control-profiles gd-tcp scheduler-map gd-map guaranteed-rate
4500m
user@switch# set traffic-control-profiles gd-tcp shaping-rate percent 100
```

19. Define the traffic control profile for the high-performance computing priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):

```
[edit class-of-service]
user@switch# set traffic-control-profiles hpc-tcp scheduler-map hpc-map guaranteed-rate
2g
user@switch# set traffic-control-profiles hpc-tcp shaping-rate percent 100
```

20. Apply the three priority groups (forwarding class sets) and the appropriate traffic control profiles to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 forwarding-class-set best-effort-pg
output-traffic-control-profile be-tcp
user@switch# set interfaces xe-0/0/20 forwarding-class-set guar-delivery-pg
output-traffic-control-profile gd-tcp
user@switch# set interfaces xe-0/0/20 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

```
user@switch# set interfaces xe-0/0/21 forwarding-class-set best-effort-pg
output-traffic-control-profile be-tcp
user@switch# set interfaces xe-0/0/21 forwarding-class-set guar-delivery-pg
output-traffic-control-profile gd-tcp
user@switch# set interfaces xe-0/0/21 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** and **no-loss** lossless forwarding classes):

```
user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 hsclassifier1 {
    forwarding-class best-effort {
      loss-priority low code-points 000;
    }
    forwarding-class be2 {
      loss-priority high code-points 001;
    }
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
    forwarding-class no-loss {
      loss-priority low code-points 100;
    }
    forwarding-class hpc {
      loss-priority low code-points 101;
    }
    forwarding-class network-control {
      loss-priority low code-points 110;
    }
  }
  drop-profiles {
    dp-be-low {
      interpolate {
        fill-level [ 25 50 ];
        drop-probability [ 0 80 ];
      }
    }
    dp-be-high {
      interpolate {
        fill-level [ 10 40 ];
        drop-probability [ 0 100 ];
      }
    }
    dp-hpc {
      interpolate {
        fill-level [ 75 90 ];
        drop-probability [ 0 75 ];
      }
    }
    dp-nc {
      interpolate {
```

```
        fill-level [ 80 100 ];
        drop-probability [ 0 100 ];
      }
    }
  }

```

TIP: To quickly configure the interfaces, issue the load merge terminal command, and then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the hierarchical port scheduling components have been created and are operating properly, perform these tasks:

- Verifying That the Forwarding Classes (Priorities) Have Been Created on page 5619
- Verifying That the Forwarding Class Sets (Priority Groups) Have Been Created on page 5619
- Verifying That the Classifier Has Been Created on page 5620
- Verifying That Priority-Based Flow Control Has Been Enabled on page 5620
- Verifying That the Output Queue Schedulers Have Been Created on page 5621
- Verifying That the Drop Profiles Have Been Created on page 5624

- Verifying That the Priority Group Output Schedulers (Traffic Control Profiles) Have Been Created on page 5625
- Verifying the Interface Configuration on page 5626

Verifying That the Forwarding Classes (Priorities) Have Been Created

Purpose Verify that the forwarding classes have been created and mapped to the correct queues. (The system shows only the explicitly configured forwarding classes. It does not show default forwarding classes such as **fcoe** and **no-loss**.)

Action List the forwarding classes using the operational mode command **show class-of-service forwarding-class**:

```
user@switch> show class-of-service forwarding-class
Forwarding class                          ID      Queue  Policing priority  No-Loss

  best-effort                             0         0         normal        Disabled

  be2                                     1         3         normal        Disabled

  hpc                                     2         4         normal        Disabled

  network-control                         3         7         normal        Disabled

  mcast                                   8         8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command lists all of the configured forwarding classes, the internal identification number of each forwarding class, the queues that are mapped to the forwarding classes, the policing priority, and whether the forwarding class is lossless (no-loss packet drop attribute enabled) or lossy forwarding class (no-loss packet drop attribute disabled). The command output shows that:

- Forwarding class **best-effort** maps to queue **0** and is lossy
- Forwarding class **be2** maps to queue **1** and is lossy
- Forwarding class **hpc** maps to queue **5** and is lossy
- Forwarding class **network-control** maps to queue **7** and is lossy

In addition, the command lists the default multicast (multidestination) forwarding class and the default queue to which it is mapped.

Verifying That the Forwarding Class Sets (Priority Groups) Have Been Created

Purpose Verify that the priority groups have been created and that the correct priorities (forwarding classes) belong to the appropriate priority group.

Action List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set**:

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: best-effort-pg, Type: normal-type, Forwarding class set
index: 19907
  Forwarding class                        Index
  best-effort                               0
```

```
  be2                                     1
  network-control                         5

Forwarding class set: guar-delivery-pg, Type: normal-type, Forwarding class set
index: 43700
  Forwarding class                      Index
  fcoe                                    2
  no-loss                                 3

Forwarding class set: hpc-pg, Type: normal-type, Forwarding class set index: 60758

  Forwarding class                      Index
  hpc                                     4
```

Meaning The **show class-of-service forwarding-class-set** command lists all of the configured forwarding class sets (priority groups), the forwarding classes (priorities) that belong to each priority group, and the internal index number of each priority group. The command output shows that:

- The forwarding class set **best-effort-pg** includes the forwarding classes **best-effort**, **be2**, and **network-control**.
- The forwarding class set **guar-delivery-pg** includes the forwarding classes **fcoe** and **no-loss**.
- The forwarding class set **hpc-pg** includes the forwarding class **hpc**.

Verifying That the Classifier Has Been Created

Purpose Verify that the classifier maps forwarding classes to the correct IEEE 802.1p code points and packet loss priorities.

Action List the classifier configured for hierarchical port scheduling using the operational mode command **show class-of-service classifier name hsclassifier1**:

```
user@switch> show class-of-service classifier name hsclassifier1
Classifier: hsclassifier1, Code point type: ieee-802.1, Index: 43607
  Code point         Forwarding class                   Loss priority
  000                best-effort                        low
  001                be2                                high
  011                fcoe                               low
  100                no-loss                            low
  101                hpc                                low
  110                network-control                    low
```

Meaning The **show class-of-service classifier name hsclassifier1** command lists all of the IEEE 802.1p code points and the loss priorities mapped to all of the forwarding classes in the classifier. The command output shows that the forwarding classes **best-effort**, **be2**, **no-loss**, **fcoe**, **hpc**, and **network-control** have been created and mapped to IEEE 802.1p code points and loss priorities.

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the correct priorities for lossless transport.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Type: Input, Name: gd-cnp, Index: 51687
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2500
  100          Enabled      2500
  101          Disabled
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
               6
  111
               7
```

Meaning The **show class-of-service congestion-notification** command lists all of the congestion notification profiles and the IEEE 802.1p code points with PFC enabled. The command output shows that PFC is enabled for code points **011** (**fcoe** priority and queue) and **100** (**no-loss** priority and queue) for the **gd-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying That the Output Queue Schedulers Have Been Created

Purpose Verify that the output queue schedulers have been created with the correct bandwidth parameters and priorities, mapped to the correct queues, and mapped to the correct drop profiles.

Action List the scheduler maps using the operational mode command **show class-of-service scheduler-map**:

```
user@switch> show class-of-service scheduler-map
Scheduler map: be-map, Index: 64023

  Scheduler: be-sched, Forwarding class: best-effort, Index: 13005
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
```

```
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         55387    dp-be-low
      Medium high     any             1    <default-drop-profile>
      High            any          4369    dp-be-high

  Scheduler: be-sched, Forwarding class: be2, Index: 13005
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         55387    dp-be-low
      Medium high     any             1    <default-drop-profile>
      High            any          4369    dp-be-high

  Scheduler: nc-sched, Forwarding class: network-control, Index: 45740
    Transmit rate: 500000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         44207    dp-nc
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>

Scheduler map: gd-map, Index: 61447

  Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
    Transmit rate: 2500000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         44207    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>

  Scheduler: nl-sched, Forwarding class: no-loss, Index: 29359
    Transmit rate: 2000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         44207    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>

Scheduler map: hpc-map, Index: 56941
```

```
Scheduler: hpc-sched, Forwarding class: hpc, Index: 55900
  Transmit rate: 2000000000 bps, Rate Limit: none, Buffer size: remainder,
  Buffer Limit: none, Priority: low
  Excess Priority: unspecified
  Shaping rate: 100 percent,
  drop-profile-map-set-type: mark
  Drop profiles:
    Loss priority   Protocol    Index    Name
    Low             any         57716    dp-hpc
    Medium high     any             1    <default-drop-profile>
    High            any             1    <default-drop-profile>
```

Meaning The **show class-of-service scheduler-map** command lists all of the configured scheduler maps. For each scheduler map, the command output includes:

- The name of the scheduler map (**scheduler-map** field)
- The name of the scheduler (**scheduler** field)
- The forwarding classes mapped to the scheduler (**forwarding-class** field)
- The minimum guaranteed queue bandwidth (**transmit-rate** field)
- The scheduling priority (**priority** field)
- The maximum bandwidth in the priority group the queue can consume (**shaping-rate** field)
- The drop profile loss priority (**loss priority** field) for each drop profile name (**name** field)

The command output shows that:

- The scheduler map **be-map** has been created and has these properties:
  - There are two schedulers, **be-sched** and **nc-sched**.
  - The scheduler **be-sched** has two forwarding classes, **best-effort** and **be2**.
  - Scheduler **be-sched** forwarding classes **best-effort** and **be2** share a minimum guaranteed bandwidth of **3000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and use the drop profile **dp-be-low** for low loss-priority traffic, the default drop profile for medium-high loss-priority traffic, and the drop profile **dp-be-high** for high loss-priority traffic.
  - The scheduler **nc-sched** has one forwarding class, **network-control**.
  - The **network-control** forwarding class has a minimum guaranteed bandwidth of **500000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-nc** for low loss-priority traffic and the default drop profile for medium-high and high loss priority traffic.
- The scheduler map **gd-map** has been created and has these properties:
  - There are two schedulers, **fcoe-sched** and **nl-sched**.
  - The scheduler **fcoe-sched** has one forwarding class, **fcoe**.

  - The **fcoe** forwarding class has a minimum guaranteed bandwidth of **2500000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
  - The scheduler **nl-sched** has one forwarding class, **no-loss**.
  - The **no-loss** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
- The scheduler map **hpc-map** has been created and has these properties:
  - There is one scheduler, **hpc-sched**.
  - The scheduler **hpc-sched** has one forwarding class, **hpc**.
  - The **hpc** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-hpc** for low loss-priority traffic and the default drop profile for medium-high and high loss-priority traffic.

Verifying That the Drop Profiles Have Been Created

Purpose Verify that the drop profiles **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc** have been created with the correct fill levels and drop probabilities.

Action List the drop profiles using the operational mode command **show configuration class-of-service drop-profiles**:

```
user@switch> show configuration class-of-service drop-profiles
dp-be-low {
    interpolate {
        fill-level [ 25 50 ];
        drop-probability [ 0 80 ];
    }
}
dp-be-high {
    interpolate {
        fill-level [ 10 40 ];
        drop-probability [ 0 100 ];
    }
}
dp-hpc {
    interpolate {
        fill-level [ 75 90 ];
        drop-probability [ 0 75 ];
    }
}
dp-nc {
    interpolate {
        fill-level [ 80 100 ];
        drop-probability [ 0 100 ];
    }
```

Meaning The **show configuration class-of-service drop-profiles** command lists the drop profiles and their properties. The command output shows that there are four drop profiles configured, **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc**. The output also shows that:

- For **dp-be-low**, the drop start point (the first fill level) is when the queue is 25 percent filled, the drop end point (the second fill level) occurs when the queue is 50 percent filled, and the drop probability at the drop end point is 80 percent.
- For **dp-be-high**, the drop start point (the first fill level) is when the queue is 10 percent filled, the drop end point (the second fill level) occurs when the queue is 40 percent filled, and the drop probability at the drop end point is 100 percent.
- For **dp-hpc**, the drop start point (the first fill level) is when the queue is 75 percent filled, the drop end point (the second fill level) occurs when the queue is 90 percent filled, and the drop probability at the drop end point is 75 percent.
- For **dp-nc**, the drop start point (the first fill level) is when the queue is 80 percent filled, the drop end point (the second fill level) occurs when the queue is 100 percent filled, and the drop probability at the drop end point is 100 percent.

Verifying That the Priority Group Output Schedulers (Traffic Control Profiles) Have Been Created

Purpose Verify that the traffic control profiles **be-tcp**, **gd-tcp**, and **hpc-tcp** have been created with the correct bandwidth parameters and scheduler mapping.

Action List the traffic control profiles using the operational mode command **show class-of-service traffic-control-profile**:

```
user@switch> show class-of-service traffic-control-profile
Traffic control profile: be-tcp, Index: 40535
  Shaping rate: 100 percent
  Scheduler map: be-map
  Guaranteed rate: 3500000000

Traffic control profile: gd-tcp, Index: 37959
  Shaping rate: 100 percent
  Scheduler map: gd-map
  Guaranteed rate: 4500000000

Traffic control profile: hpc-tcp, Index: 47661
  Shaping rate: 100 percent
  Scheduler map: hpc-map
  Guaranteed rate: 2000000000
```

Meaning The **show class-of-service traffic-control-profile** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**traffic-control-profile**)
- The maximum port bandwidth the priority group can consume (**shaping-rate**)
- The scheduler map associated with the traffic control profile (**scheduler-map**)
- The minimum guaranteed priority group port bandwidth (**guaranteed-rate**)

The command output shows that:

- The traffic control profile **be-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **be-map**, and has a minimum guaranteed bandwidth of **3500000000 bps**.
- The traffic control profile **gd-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **gd-map**, and has a minimum guaranteed bandwidth of **4500000000 bps**.
- The traffic control profile **hpc-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **hpc-map**, and has a minimum guaranteed bandwidth of **2000000000 bps**.

Verifying the Interface Configuration

Purpose Verify that the classifier, the congestion notification profile, and the forwarding class sets are configured on interfaces **xe-0/0/20** and **xe-0/0/21**.

Action List the interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hsclassifier1;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/21
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hsclassifier1;
    }
}
```

Meaning The **show configuration class-of-service interfaces *interface-name*** command shows that each interface includes the forwarding class sets **best-effort-pg**, **guar-delivery-pg**, and **hpc-pg**, congestion notification profile **gd-cnp**, and the IEEE 802.1p classifier **hsclassifier1**.

Example: Configuring CoS PFC for FCoE Traffic

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.
- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless fcoe forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

This example describes how to configure PFC for FCoE traffic:

- Requirements on page 5628
- Overview on page 5628
- Configuration on page 5630
- Verification on page 5633

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).

- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

Topology

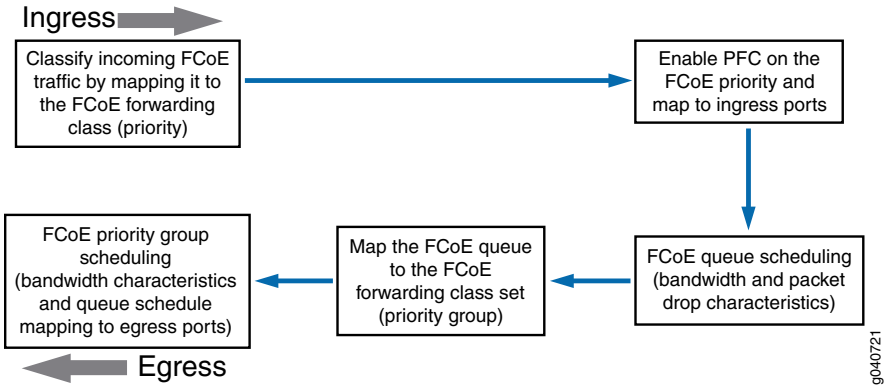
Table 405 on page 5114 shows the configuration components for this example.

Table 526: Components of the PFC for FCoE Traffic Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Behavior aggregate classifier (maps the FCoE forwarding class to incoming packets by IEEE 802.1 code point)	Code point **011** to forwarding class **fcoe** and loss priority **low** Ingress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**
PFC congestion notification profile	**fcoe-cnp**: Code point **011** Ingress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**
FCoE queue scheduler	**fcoe-sched**: Minimum bandwidth **3g** Maximum bandwidth **100**% Priority **low**
Forwarding class-to-scheduler mapping	Scheduler map **fcoe-map**: Forwarding class **fcoe** Scheduler **fcoe-sched**
Forwarding class set (FCoE priority group)	**fcoe-pg**: Forwarding class **fcoe** Egress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**
Traffic control profile	**fcoe-tcp**: Scheduler map **fcoe-map** Minimum bandwidth **3g** Maximum bandwidth **100**%

Figure 196 on page 5115 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

Figure 212: PFC for FCoE Traffic Configuration Components Block Diagram



Configuration

CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100
set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
```

Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:

   ```
   [edit class-of-service]
   user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
   ```

2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point **011**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

3. Apply the PFC configuration to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
```

4. Assign the classifier to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
```

5. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

6. Map the FCoE forwarding class to the FCoE scheduler:

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

7. Configure the forwarding class set for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

8. Define the traffic control profile for the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
classifiers {
   ieee-802.1 fcoe-classifier {
      forwarding-class fcoe {
         loss-priority low code-points 011;
      }
```

```
}
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}

        }
      }
    }
  }
  scheduler-maps {
    fcoe-map {
      forwarding-class fcoe scheduler fcoe-sched;
    }
  }
  schedulers {
    fcoe-sched {
      transmit-rate 3000000000;
      shaping-rate percent 100;
      priority low;
    }
  }
```

TIP: To quickly configure the interfaces, issue the load merge terminal command and then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- Verifying That Priority-Based Flow Control Has Been Enabled on page 5633
- Verifying the Ingress Interface PFC Configuration on page 5634

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the FCoE queue to enable lossless transport.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Type: Input, Name: fcoe-cnp, Index: 51697
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2500
  100          Disabled
  101          Disabled
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
               6
  111
               7
```

Meaning The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point **011** for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying the Ingress Interface PFC Configuration

Purpose Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

Action List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces** commands list the congestion notification profile that is mapped to the interface (**fcoe-cnp**) and the IEEE 802.1p classifier associated with the interface (**fcoe-classifier**).

Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX3500 switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree protocol (STP).

You can use an MC-LAG to provide a redundant aggregation layer for Fiber Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX3500 switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

NOTE: This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two QFX3500 switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the QFX3500 switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see "Example: Configuring Multichassis Link Aggregation" on page 2462. However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

QFX3500 Node devices support MC-LAGs. QFabric system Node devices do not support MC-LAGs.

This topic describes:

- Requirements on page 5636
- Overview on page 5636
- Configuration on page 5641
- Verification on page 5649

Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX3500 Switches that provide FCoE server access in transit switch mode, and connect to the MC-LAG switches. These switches can be standalone QFX3500 switches or they can be Node devices in a QFabric system.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 12.2 or later for the QFX Series.

Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX3500 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).

  NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Disable IGMP snooping on the FCoE VLAN.
- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

This example does not show how to configure the MC-LAG itself. This example does include a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Topology

QFX3500 switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in Figure 197 on page 5123:

Figure 213: Supported Topology for an MC-LAG on an FCoE Transit Switch

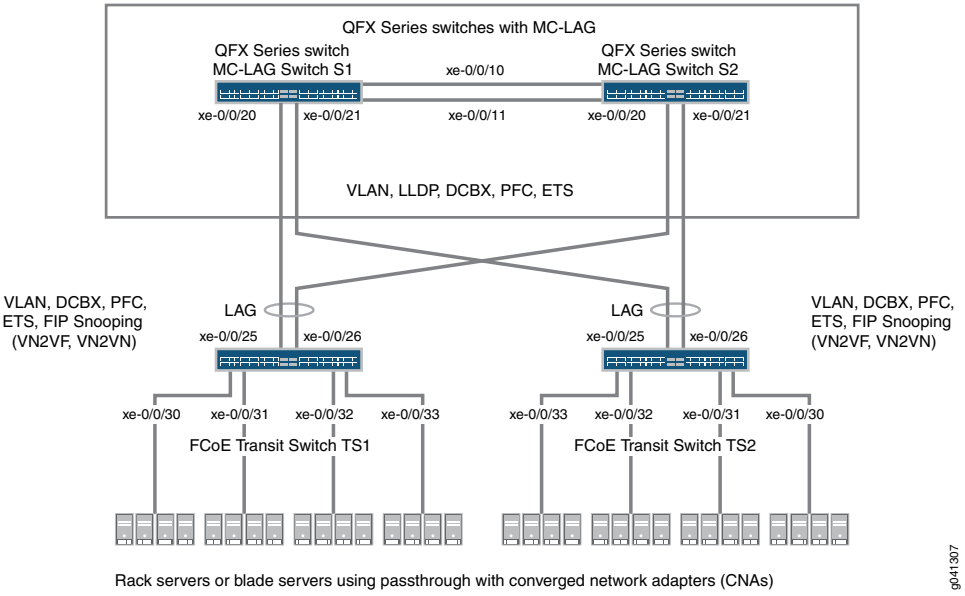

Table 406 on page 5123 shows the configuration components for this example.

Table 527: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology

Component	Settings
Hardware	Four QFX3500 switches (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access)
Forwarding class (all switches)	Default **fcoe** forwarding class.
Classifier (forwarding class mapping of incoming traffic to IEEE priority)	Default IEEE 802.1p trusted classifier on all FCoE interfaces.
LAGs and MC-LAG	S1—Ports xe-0/0/10 and x-0/0/11 are members of LAG **ae0**, which connects Switch S1 to Switch S2. Ports xe-0/0/20 and xe-0/0/21 are members of MC-LAG **ae1**. All ports are configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. S2—Ports xe-0/0/10 and x-0/0/11 are members of LAG **ae0**, which connects Switch S2 to Switch S1. Ports xe-0/0/20 and xe-0/0/21 are members of MC-LAG **ae1**. All ports are configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. NOTE: Ports xe-0/0/20 and xe-0/0/21 on Switches S1 and S2 are the members of the MC-LAG. TS1—Ports xe-0/0/25 and x-0/0/26 are members of LAG **ae1**, configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. Ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are configured in **tagged-access** port mode, with an MTU of **2180**. TS2—Ports xe-0/0/25 and x-0/0/26 are members of LAG **ae1**, configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. Ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are configured in **tagged-access** port mode, with an MTU of **2180**.
FCoE queue scheduler (all switches)	**fcoe-sched**: Minimum bandwidth **3g** Maximum bandwidth **100**% Priority **low**
Forwarding class-to-scheduler mapping (all switches)	Scheduler map **fcoe-map**: Forwarding class **fcoe** Scheduler **fcoe-sched**

Table 527: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology *(continued)*

Component	Settings
Forwarding class set (FCoE priority group, all switches)	**fcoe-pg**: Forwarding class **fcoe** Egress interfaces: • S1—LAG **ae0** and MC-LAG **ae1** • S2—LAG **ae0** and MC-LAG **ae1** • TS1—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** • TS2—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**
Traffic control profile (all switches)	**fcoe-tcp**: Scheduler map **fcoe-map** Minimum bandwidth **3g** Maximum bandwidth **100**%
PFC congestion notification profile (all switches)	**fcoe-cnp**: Code point **011** Ingress interfaces: • S1—LAG **ae0** and MC-LAG **ae1** • S2—LAG **ae0** and MC-LAG **ae1** • TS1—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** • TS2—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**
FCoE VLAN name and tag ID	Name—**fcoe_vlan** ID—**100** Include the FCoE VLAN on the interfaces that carry FCoE traffic on all four switches. Disable IGMP snooping on the FCoE VLAN on all four switches.
FIP snooping	Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping. This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration.

NOTE: This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode and tagged access mode ports if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is queue **3**.

  NOTE: In Junos OS Release 12.2, traffic mapped to explicitly configured forwarding classes, even lossless forwarding classes such as **fcoe**, is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. To receive lossless treatment in release 12.2, traffic must use one of the default lossless forwarding classes (**fcoe** or **no-loss**).

  In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.

- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk and tagged-access port modes. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (011) to the FCoE forwarding class. You can configure the BA classifier if you wish, but you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.
- Configure a congestion notification profile that enables PFC on the FCoE code point (code point 011 in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers and how to disable IGMP

snooping on the FCoE VLAN. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ("Example: Configuring Multichassis Link Aggregation" on page 2462 describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ("Configuring Link Aggregation" on page 2537 describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

Configuration

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

- Configuring MC-LAG Switches S1 and S2 on page 5643
- Configuring FCoE Transit Switches TS1 and TS2 on page 5644
- Results on page 5646

CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the [edit] hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g
set class-of-service schedulers fcoe-sched shaping-rate percent 100
set class-of-service scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set class-of-service forwarding-class-sets fcoe-pg class fcoe
set class-of-service traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate
3g
set class-of-service traffic-control-profiles fcoe-tcp shaping-rate percent 100
set class-of-service interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile

Configuring MC-LAG Switches S1 and S2

Step-by-Step Procedure

To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
```

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

7. Apply the PFC configuration to the LAG and MC-LAG interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```

8. Configure the VLAN for FCoE traffic (**fcoe_vlan**):

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

9. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG between the two MC-LAG switches:

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```

11. Add the member interfaces to the MC-LAG:

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```

12. Configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe_vlan**) for the LAG (**ae0**) and for the MC-LAG (**ae1**):

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and MC-LAG interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```

14. Set the LAG and MC-LAG interfaces as FCoE trusted ports (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

Configuring FCoE Transit Switches TS1 and TS2

Step-by-Step Procedure

The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:

```
[edit class-of-service]
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/30 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/31 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/32 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/33 congestion-notification-profile
fcoe-cnp
```

8. Configure the VLAN for FCoE traffic (**fcoe_vlan**):

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

9. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG:

```
[edit interfaces]
user@switch# set xe-0/0/25 ether-options 802.3ad ae1
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```

11. On the LAG (**ae1**), configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

12. On the FCoE access interfaces (**xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**), configure the port mode as **tagged-access** and membership in the FCoE VLAN (**fcoe_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and FCoE access interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

14. Set the LAG interface as an FCoE trusted port (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

15. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN_Port FIP snooping; the example is equally valid if you use VN2VF_Port FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port vlan fcoe_vlan
examine-fip examine-vn2v2 beacon-period 90000
```

Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
    fcoe-tcp {
        scheduler-map fcoe-map;
        shaping-rate percent 100;
        guaranteed-rate 3000000000;
    }
}
forwarding-class-sets {
    fcoe-pg {
        class fcoe;
    }
```

```
}
congestion-notification-profile {
    fcoe-cnp {
        input {
            ieee-802.1 {
                code-point 011 {
                    pfc;
                }
            }
        }
    }
}
interfaces {
    ae0 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
    ae1 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {
        transmit-rate 3000000000;
        shaping-rate percent 100;
        priority low;
    }
}
```

NOTE: The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

For MC-LAG verification commands, see "Example: Configuring Multichassis Link Aggregation" on page 2462.

Display the results of the CoS configuration on FCoE Transit Switch TS1 and on FCoE Transit Switch TS2 (the results on both transit switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
   fcoe-tcp {
      scheduler-map fcoe-map;
      shaping-rate percent 100;
      guaranteed-rate 3000000000;
   }
}
forwarding-class-sets {
   fcoe-pg {
      class fcoe;
   }
}
congestion-notification-profile {
   fcoe-cnp {
      input {
         ieee-802.1 {
            code-point 011 {
               pfc;
            }
         }
      }
   }
}
interfaces {
   xe-0/0/30 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
   }
   xe-0/0/31 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
   }
   xe-0/0/32 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
   }
   xe-0/0/33 {
      forwarding-class-set {
         fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
         }
      }
      congestion-notification-profile fcoe-cnp;
```

```
    }
    ae1 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
  }
  scheduler-maps {
    fcoe-map {
      forwarding-class fcoe scheduler fcoe-sched;
    }
  }
  schedulers {
    fcoe-sched {
      transmit-rate 3000000000;
      shaping-rate percent 100;
      priority low;
    }
  }
```

NOTE: The forwarding class and classifier configurations are not shown because the **show** command does not display default portions of the configuration.

Verification

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

- Verifying That the Output Queue Schedulers Have Been Created on page 5650
- Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created on page 5650
- Verifying That the Forwarding Class Set (Priority Group) Has Been Created on page 5651
- Verifying That Priority-Based Flow Control Has Been Enabled on page 5651
- Verifying That the Interface Class of Service Configuration Has Been Created on page 5652
- Verifying That the Interfaces Are Correctly Configured on page 5654
- Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces on page 5656
- Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2 on page 5657
- Verifying That IGMP Snooping Is Disabled on the FCoE VLAN on page 5657

Verifying That the Output Queue Schedulers Have Been Created

Purpose Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

Action List the scheduler map using the operational mode command **show class-of-service scheduler-map fcoe-map**:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023

  Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any             1    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>
```

Meaning The **show class-of-service scheduler-map fcoe-map** command lists the properties of the scheduler map **fcoe-map**. The command output includes:

- The name of the scheduler map (**fcoe-map**)
- The name of the scheduler (**fcoe-sched**)
- The forwarding classes mapped to the scheduler (**fcoe**)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)
- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created

Purpose Verify that the traffic control profile **fcoe-tcp** has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

Action List the FCoE traffic control profile properties using the operational mode command **show class-of-service traffic-control-profile fcoe-tcp**:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
  Shaping rate: 100 percent
```

```
  Scheduler map: fcoe-map
  Guaranteed rate: 3000000000
```

Meaning The **show class-of-service traffic-control-profile fcoe-tcp** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**fcoe-tcp**)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (**fcoe-map**)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

Verifying That the Forwarding Class Set (Priority Group) Has Been Created

Purpose Verify that the FCoE priority group has been created and that the **fcoe** priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

Action List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class                        Index
  fcoe                                      1
```

Meaning The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

Action List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2500
  100          Disabled
  101          Disabled
```

```
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
               6
  111
               7
```

Meaning The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point **011** (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying That the Interface Class of Service Configuration Has Been Created

Purpose Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

Action List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}

ae1 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/30 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/31 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/32 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/33 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
ae1 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
```

Meaning The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

NOTE: Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33, which are not members of a LAG.

Verifying That the Interfaces Are Correctly Configured

Purpose Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

Action List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
ae0 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
```

```
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/25 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/26 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/30 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/31 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/32 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/33 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
```

```
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}

ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

Meaning The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The port mode (**trunk** mode for interfaces that connect two switches, **tagged-access** mode for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe_vlan**)

Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces

Purpose Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

Action List the port security configuration on FCoE transit switches TS1 and TS2 using the operational mode command **show configuration ethernet-switching-options secure-access-port**:

```
user@switch> show configuration ethernet-switching-options secure-access-port
interface ae1.0 {
    fcoe-trusted;
}
vlan fcoe_vlan {
```

```
    examine-fip;
}
```

Meaning The **show configuration ethernet-switching-options secure-access-port** command lists port security information, including whether a port is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- FIP snooping is enabled (**examine-fip**) on the FCoE VLAN (**fcoe_vlan**). On Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**,**xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2

Purpose Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

Action List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
VLAN: fcoe_vlan,    Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
…
```

NOTE: The output has been truncated to show only the relevant information.

Meaning The **show fip snooping brief** command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe_vlan**
- The FIP snooping mode is VN2VN_Port FIP snooping (**VN2VN Snooping**)

Verifying That IGMP Snooping Is Disabled on the FCoE VLAN

Purpose Verify that IGMP snooping is disabled on the FCoE VLAN on all four switches.

Action List the IGMP snooping protocol information on each of the four switches using the **show configuration protocols igmp-snooping** command:

```
user@switch> show configuration protocols igmp-snooping
vlan fcoe_vlan {
    disable;
}
```

Meaning The **show configuration protocols igmp-snooping** command lists the IGMP snooping configuration for the VLANs configured on the switch. The command output shows that IGMP snooping is disabled on the FCoE VLAN (**fcoe_vlan**).

Example: Configuring Unicast Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. You apply classifiers to ingress interfaces.

- Requirements on page 5658
- Overview on page 5658
- Configuring Unicast Classifiers on page 5659
- Verification on page 5660

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP or DSCP IPv6) value or IEEE 802.1p value.

- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

NOTE: You must assign unicast traffic and multidestination (multicast, broadcast, and destination lookup fail) traffic to different classifiers. One classifier cannot include both unicast and multidestination forwarding classes. A unicast classifier can include only forwarding classes for unicast traffic.

This example describes how to configure a BA classifier called **ba-ucast-classifier** as the default IEEE 802.1 map and apply it to ingress interface **xe-0/0/10**. The BA classifier assigns loss priorities, as shown in Table 528 on page 5659, to incoming packets in the four forwarding classes.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

Table 528: ba-ucast-classifier Loss Priority Assignments

Unicast Forwarding Class	For CoS Traffic Type	ba-ucast-classifier Loss Priority to IEEE 802.1p Code Point Mapping	Packet Drop Attribute
be	Best-effort traffic	Low loss priority code point: **000**	drop
fcoe	Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic	Low loss priority code point: **011**	no-loss
no-loss	Guaranteed delivery for TCP traffic	Low loss priority code point: **100**	no-loss
nc	Network-control traffic	Low loss priority code point: **110**	drop

Configuring Unicast Classifiers

To configure a unicast IEEE 802.1 BA classifier named **ba-ucast-classifier** as the default IEEE 802.1 map:

1. Associate code point **000** with forwarding class **be** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 ba-ucast-classifier import default forwarding-class be loss-priority low code-points 000
   ```

2. Associate code point **011** with forwarding class **fcoe** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   ```

```
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class fcoe loss-priority low
code-points 011
```

3. Associate code point **100** with forwarding class **no-loss** and loss priority **low**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class no-loss loss-priority low
code-points 100
```

4. Associate code point **110** with forwarding class **nc** and loss priority **low**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class nc loss-priority low
code-points 110
```

5. Apply the unicast classifier to ingress interface **xe-0/0/10**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/10 unit 0 classifiers ieee-802.1 ba-ucast-classifier
```

Verification

To verify the unicast classifier configuration, perform these tasks:

- Verifying the Unicast Classifier Configuration on page 5660
- Verifying the Ingress Interface Configuration on page 5660

Verifying the Unicast Classifier Configuration

Purpose Verify that you configured the unicast classifier with the correct forwarding classes, loss priorities, and code points.

Action List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier
    forwarding-class be {
        loss-priority low code-points 000;
    }
    forwarding-class fcoe {
        loss-priority low code-points 011;
    }
    forwarding-class no-loss {
        loss-priority low code-points 100;
    }
    forwarding-class nc
        loss-priority low code-points 110;
    }
```

Verifying the Ingress Interface Configuration

Purpose Verify that the unicast classifier **ba-ucast-classifier** is attached to ingress interface **xe-0/0/10**.

Action List the ingress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/10**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/10
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
```

```
            ieee-802.1 ba-ucast-classifier;
        }
    }
```

Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class.

- Requirements on page 5661
- Overview on page 5661
- Configuring Multidestination Classifiers on page 5662
- Verification on page 5662

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.

  

  NOTE: **DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.**

- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.

- Multifield traffic classifiers—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

NOTE: **You must assign unicast traffic and multicast traffic to different classifiers. One classifier cannot include both unicast and multicast forwarding classes. A multidestination classifier can include only forwarding classes for multicast traffic.**

The following example describes how to configure a BA classifier called **ba-mcast-classifier**, which is applied to all of the switch interfaces. The BA classifier assigns loss priorities, as shown in Table 529 on page 5662, to incoming packets in the multidestination forwarding class.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

Table 529: BA-mcast-classifier Loss Priority Assignments

Multicast Forwarding Class	For CoS Traffic Type	ba-mcast-classifier Assignment
mcast	Best-effort multicast traffic	Low loss priority code point: **000**

Configuring Multidestination Classifiers

To configure a multicast IEEE 802.1 BA classifier named **ba-mcast-classifier**:

1. Associate code point **000** with forwarding class **mcast** and loss priority **low**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-mcast-classifier forwarding-class mcast-be loss-priority low code-points 000
```

2. Configure the classifier as a multidestination classifier:

```
[edit class-of-service]
user@switch# set multi-destination classifiers ieee-802.1 ba-mcast-classifier
```

Verification

To verify the multidestination classifier configuration, perform these tasks:

- Verifying the IEEE 802.1 Multidestination Classifier on page 5663
- Verifying the Multidestination Classifier Configuration on page 5663

Verifying the IEEE 802.1 Multidestination Classifier

Purpose Verify that the classifier **ba-mcast-classifier** is configured as the IEEE 802.1 multidestination classifier:

Action Verify the results of the classifier configuration using the operational mode command **show configuration class-of-service multi-destination classifiers ieee-802.1**:

```
user@switch> show configuration class-of-service multi-destination classifiers ieee-802.1
ba-mcast-classifier;
```

Verifying the Multidestination Classifier Configuration

Purpose Verify that you configured the multidestination classifier with the correct forwarding classes, loss priorities, and code points.

Action List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier
    forwarding-class mcast {
        loss-priority low code-points 000;
    }
```

Example: Configuring Tail-Drop Profiles

You can configure an interpolated weighted random early detection (WRED) tail-drop profile to control packet drop characteristics for different traffic loss priorities.

NOTE: You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

- Requirements on page 5664
- Overview on page 5664
- Configuring a Drop Profile on page 5666
- Verification on page 5666

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

You associate a tail-drop profile with a loss priority in a scheduler. When you attach the scheduler to a forwarding class (queue), you apply the interpolated drop profile to traffic of the specified loss priority in that queue. *Interpolated* means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point:

- Drop start point—Percentage of average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop.
- Drop end point—Average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.)
- Maximum drop rate—Drop probability when the average queue fill level reaches the drop end point.

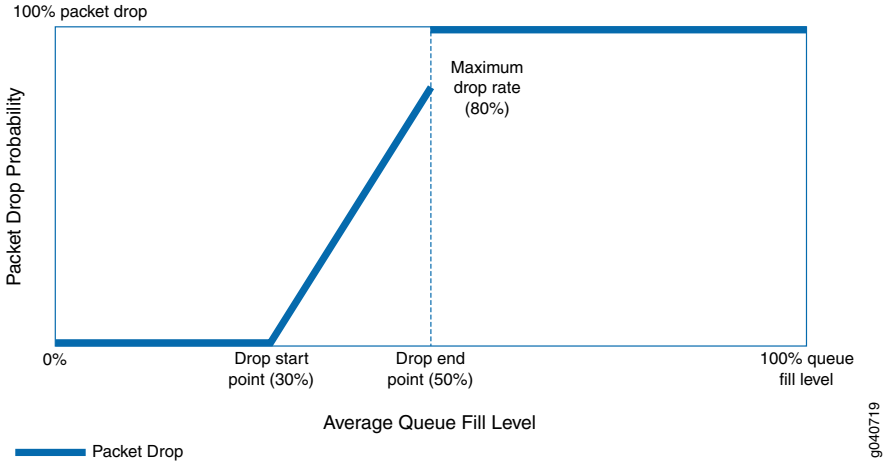
You set the drop start point and the drop end point by specifying two queue fill level percentage values. The first value is the drop start point and the second value is the drop end point.

You set the maximum drop rate by specifying two drop probability percentage values. The first value is always zero (0), which is the minimum drop rate, the probability of dropping a packet at the drop start point. The second value is the maximum drop rate at the drop end point.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

Figure 214 on page 5665 shows the graph for a drop profile with a drop start point of 30 percent, a drop end point of 50 percent, and a maximum drop rate of 80 percent.

Figure 214: Tail-Drop Profile Packet Drop Example



The graph shows that when the queue fill level is less than 30 percent, the packet drop rate is zero. When the queue fill level reaches 30 percent, packets begin to drop. As the queue fills, a higher percentage of packets drop. When the queue fill level reaches 50 percent, the packet drop rate has climbed to 80 percent. When the queue fill level exceeds 50 percent, all packets drop.

This example describes how to configure the drop profile shown in Figure 214 on page 5665. The drop profile will have:

- The name **be-dp1**
- 30 percent for the drop start point (first **fill-level** setting)
- 50 percent for the drop end point (second **fill-level** setting)
- 0 percent for the minimum drop rate (first **drop-probability** setting)
- 80 percent for the maximum drop rate (second **drop-probability** setting)

You apply a drop profile by configuring a drop profile map that maps the drop profile to a packet loss priority and associates the drop profile and packet loss priority with a scheduler. When you associate the scheduler with a forwarding class (queue), the switch applies the drop profile to the packets in the forwarding class that have a matching packet loss priority.

Configuring a Drop Profile

1. Set the drop start point at **30** percent, the drop end point at **50** percent, the minimum drop rate at **0** percent, and the maximum drop rate at **80** percent for the drop profile **be-dp1**:

```
[edit class-of-service]
user@switch# set drop-profile be-dp1 interpolate fill-level 30 fill-level 50 drop-probability
0 drop-probability 80
```

Verification

Verifying the Drop Profile Configuration

Purpose Verify that you configured the drop profile **be-dp1** with the correct drop start and end points and with the correct drop rates.

Action Verify the results of the drop profile configuration using the operational mode command **show configuration class-of-service drop-profiles be-dp1**:

```
user@switch> show configuration class-of-service drop-profiles be-dp1
interpolate {
    fill-level [ 30 50 ];
    drop-probability [ 0 80 ];
}
```

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606
- Example: Configuring Queue Schedulers on page 5674
- Example: Configuring Drop Profile Maps on page 5666
- Configuring CoS Tail-Drop Profiles on page 5786
- Understanding CoS Tail-Drop Profiles on page 5545

Example: Configuring Drop Profile Maps

A drop-profile map associates a tail-drop profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified tail-drop profile to traffic in the forwarding class that matches the specified loss priority.

- Requirements on page 5666
- Overview on page 5667
- Configuring a Drop Profile Map on page 5667
- Verification on page 5667

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

The following example describes how to configure a drop profile map for a scheduler named **mylan** that includes:

- A drop profile called **lp-profile** for low-priority traffic
- A drop profile called **mh-profile** for medium-high priority traffic
- A drop profile called **h-profile** for high-priority traffic

You apply the drop profiles in the drop profile map to a forwarding class by associating the scheduler **mylan** with a forwarding class in a scheduler map.

Configuring a Drop Profile Map

1. Configure the drop profile for low-priority traffic:

   ```
   [edit class-of-service]
   user@switch# set schedulers mylan drop-profile-map loss-priority low protocol any
   drop-profile lp-profile
   ```
2. Configure the drop profile for medium-high priority traffic:

   ```
   [edit class-of-service]
   user@switch# set schedulers mylan drop-profile-map loss-priority medium-high protocol
   any drop-profile mh-profile
   ```
3. Configure the drop profile for high-priority traffic:

   ```
   [edit class-of-service]
   user@switch# set schedulers mylan drop-profile-map loss-priority high protocol any
   drop-profile h-profile
   ```

Verification

Verifying the Drop Profile Map Configuration

Purpose Verify that you configured the drop profile map for the scheduler **mylan** with the correct loss priorities and drop profiles.

Action Verify the results of the drop profile map configuration using the operational mode command **show configuration class-of-service schedulers mylan**:

```
user@switch> show configuration class-of-service schedulers mylan
transmit-rate 3g;
shaping-rate percent 100;
priority low;
drop-profile-map loss-priority low protocol any drop-profile lp-profile;
drop-profile-map loss-priority medium-high protocol any drop-profile mh-profile;
drop-profile-map loss-priority high protocol any drop-profile h-profile;
```

NOTE: This example does not include configuring scheduler bandwidth and priority. This information (transmit rate, shaping rate, and priority) is shown for completeness.

Example: Configuring Forwarding Classes

Forwarding classes allow you to group packets for transmission. You assign packets to unicast or multidestination (multicast, broadcast, and destination lookup fail) output queues based on forwarding classes.

- Requirements on page 5668
- Overview on page 5668
- Configuring Forwarding Classes on page 5670
- Verification on page 5670

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The switch supports a total of 12 forwarding classes. In order to forward traffic, you must map (assign) the forwarding classes to unicast or multidestination output queues. The switch has 12 queues. Queues 0 through 7 are for unicast traffic, and queues 8 through 11 are for multidestination traffic. The switch supports up to two lossless forwarding classes.

By default, four categories of unicast forwarding classes and one multidestination forwarding class are defined. You can define the remaining seven forwarding classes and configure them as unicast or multidestination by mapping them to unicast or multidestination queues. The type of queue, unicast or multidestination, determines the type of forwarding class.

The four default unicast forwarding classes are:

- **be**—Best-effort traffic
- **fcoe**—Guaranteed delivery for Fibre Channel over Ethernet traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **nc**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue. The statement format is:

```
[edit class-of-service forwarding-classes]
user@switch# class class-name queue-num queue-number ;
```

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

NOTE: Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

```
[edit class-of-service forwarding-classes]
user@switch# queue queue-number class-name
```

The **queue** statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the **queue** statement to map forwarding classes to queues, edit the configuration to replace the **queue** statement with the **class** statement.

NOTE: The QFX Series uses hierarchical scheduling to control output queue forwarding. When you define a forwarding class that will carry traffic on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

Table 530 on page 5670 shows the configuration forwarding-class-to-queue mapping for this example:

Table 530: Forwarding-Class-to-Queue Example Configuration

Forwarding Class	Queue
best-effort	0
nc	7
mcast	8

Configuring Forwarding Classes

To configure CoS forwarding classes, map the forwarding classes to queues:

1. Map the **best-effort** forwarding class to queue **0**:

```
[edit class-of-service forwarding-classes]
user@switch# set class best-effort queue-num 0
```

2. Map the **nc** forwarding class to queue **7**:

```
[edit class-of-service forwarding-classes]
user@switch# set class nc queue-num 7
```

3. Map the **mcast-be** forwarding class to queue **8**:

```
[edit class-of-service forwarding-classes]
user@switch# set class mcast-be queue-num 8
```

Verification

Verifying the Forwarding-Class-to-Queue Mapping

Purpose Verify the forwarding-class-to-queue mapping. (The system shows only the explicitly configured forwarding classes; it does not show default forwarding classes such as **fcoe** and **no-loss**.)

Action Verify the results of the forwarding class configuration using the operational mode command **show configuration class-of-service forwarding-classes**:

```
user@switch> show configuration class-of-service forwarding-classes
class best-effort queue-num 0;
class network-control queue-num 7;
class mcast queue-num 8;
```

Related Documentation

- Overview of CoS Changes Introduced in Junos OS Release 12.2 on page 5428
- Understanding CoS Forwarding Classes on page 5469

Example: Configuring Forwarding Class Sets

A forwarding class set (fc-set) is a priority group for enhanced transmission selection (ETS) traffic control. Each fc-set consists of one or more forwarding classes (output queues).

ETS enables you to configure link resources (bandwidth and bandwidth sharing characteristics) for a priority group, and then allocate the priority group's resources among the forwarding classes that belong to the priority group. This is called two-tier, or hierarchical, scheduling. Traffic control profiles control the scheduling for the priority group, and schedulers control the scheduling for individual forwarding classes.

- Requirements on page 5671
- Overview on page 5671
- Configuring Forwarding Class Sets on page 5672
- Verification on page 5673

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

You can configure up to three unicast fc-sets and one multicast fc-set. A common way to configure unicast priority groups is to configure separate fc-sets for local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and then assign the appropriate forwarding classes to each fc-set.

NOTE: If you configure **strict-high** priority queues, you must create an fc-set that is dedicated only to **strict-high** priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

To apply ETS, you map one or more fc-sets to a physical egress port. You can map up to three forwarding class sets to each port. When you map an fc-set to a port, the port uses hierarchical scheduling to allocate port resources to the priority group (fc-set) and to allocate the priority group resources to the queues (forwarding classes) that belong to the priority group.

This example describes how to:

- Configure three fc-sets called **lan-pg**, **san-pg**, and **hpc-pg**.
- Assign forwarding classes to each of the fc-sets.
- Apply the fc-sets and their output traffic control profiles to an egress interface.

This example does not describe how to configure the forwarding classes assigned to the fc-sets or how to configure traffic control profiles. Table 531 on page 5672 shows the configuration components for this example:

Table 531: Components of the Forwarding Class Sets Configuration Example

Component	Settings
Hardware	QFX3500 switch
LAN traffic priority group	Forwarding class set: **lan-pg** Forwarding classes: **best-effort-1**, **best-effort-2**
SAN traffic priority group	Forwarding class set: **san-pg** Forwarding classes: **fcoe**, **fcoe-2**
HPC traffic priority group	Forwarding class set: **hpc-pg** Forwarding classes: **nc**, **high-perf**
Egress interface	**xe-0/0/7**

Configuring Forwarding Class Sets

1. Define the **lan-pg** priority group (fc-set) and assign to it the forwarding classes **best-effort-1** and **best-effort-2**:

```
[edit class-of-service]
user@switch# set forwarding-class-sets lan-pg class best-effort-1
user@switch# set forwarding-class-sets lan-pg class best-effort-2
```

2. Define the **san-pg** priority group and assign to it the forwarding classes **fcoe** and **fcoe-2**:

```
[edit class-of-service]
```

```
user@switch# set forwarding-class-sets san-pg class fcoe
user@switch# set forwarding-class-sets san-pg class fcoe-2
```

3. Define the **hpc-pg** priority group and assign to it the forwarding classes **nc** and **high-perf**:

```
[edit class-of-service]
user@switch# set forwarding-class-sets hpc-pg class nc
user@switch# set forwarding-class-sets hpc-pg class high-perf
```

4. Map the three forwarding class sets to an interface (the output traffic control profiles associated with the forwarding class sets determine the class of service scheduling for the priority groups):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile lan-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set san-pg
output-traffic-control-profile san-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

Verification

To verify the priority group configuration, perform these tasks:

- Verifying Forwarding Class Set Membership on page 5673
- Verifying the Egress Interface Configuration on page 5673

Verifying Forwarding Class Set Membership

Purpose Verify that you configured the **lan-pg**, **san-pg**, and **hpc-pg** priority groups with the correct forwarding classes.

Action List the forwarding class set member configuration using the operational mode command **show configuration class-of-service forwarding-class-sets**:

```
user@switch> show configuration class-of-service forwarding-class-sets
lan-pg {
    class best-effort-1;
    class best-effort-2;
}
san-pg {
    class fcoe;
    class fcoe-2;
}
hpc-pg {
    class high-perf;
    class nc;
}
```

Verifying the Egress Interface Configuration

Purpose Verify that egress interface **xe-0/0/7** is associated with the **lan-pg**, **san-pg**, and **hpc-pg** priority groups and with the correct output traffic control profiles.

Action Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    lan-pg {
        output-traffic-control-profile lan-tcp;
    }
    san-pg {
        output-traffic-control-profile san-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
```

Example: Configuring Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, and the tail-drop profiles associated with the queue.

- Requirements on page 5674
- Overview on page 5674
- Configuring a CoS Scheduler on page 5677
- Verification on page 5678

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Scheduler parameters define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each queue mapped to the scheduler receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue. You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

  

  NOTE: The transmit-rate setting works only if you also configure the guaranteed-rate in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed-rate, the transmit-rate does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate. If you configure transmit rates whose sum exceeds the forwarding class set guaranteed rate, the commit check fails, and the system rejects the configuration.

  

  NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each queue receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

  

  NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:
  - **low**—The scheduler has low priority.
  - **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **drop-profile-map**—Mapping of a drop profile to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.

NOTE: Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

NOTE: Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

Scheduler maps associate schedulers with forwarding classes (queues). After defining schedulers and mapping them to queues in a scheduler map, to configure hardware queue scheduling (port scheduling) you:

1. Associate a scheduler map with a traffic control profile (a traffic control profile schedules resources for a group of forwarding classes, called a *forwarding class set* or *priority group*).
2. Attach a forwarding class and a traffic control profile to an interface.

You can associate up to four user-defined scheduler maps with forwarding class sets.

This process configures the hardware queues, packet schedulers, and WRED characteristics that operate according to the scheduler mapping. The traffic control profile uses the scheduler CoS properties to determine the resources that should be allocated to the individual output queues from the total resources available to the priority group.

Table 532 on page 5676 shows the configuration components for this example.

Table 532: Components of the Queue Scheduler Configuration Example

Component	Settings
Hardware	QFX3500 switch

Table 532: Components of the Queue Scheduler Configuration Example *(continued)*

Component	Settings
Scheduler	Name: **be-sched** Transmit rate: **20%** Shaping rate: **40%** Buffer size: **20%** Priority: **low** Drop profile: **be-dp**
Scheduler map	Name: **be-map** Forwarding class to associate with the **be-sched** scheduler: **best-effort**
Traffic control profile	Name: **be-tcp** NOTE: This topic does not describe how to define a traffic control profile.
Forwarding class set	Name: **lan-pg**

Configuring a CoS Scheduler

To configure a CoS scheduler using the CLI:

1. Create a scheduler (**be-sched**) with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, low priority, and map it to the drop profile **be-dp**:

```
[edit class-of-service schedulers]
user@switch# set be-sched transmit-rate percent 20
user@switch# set be-sched shaping-rate percent 40
user@switch# set be-sched buffer-size percent 20
user@switch# set be-sched priority low
user@switch# set be-sched drop-profile-map loss-priority low protocol any drop-profile
be-dp
```

2. Configure a scheduler map (**be-map**) that associates the scheduler (**be-sched**) with the forwarding class (**best-effort**):

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

3. Associate the scheduler map **be-map** with a traffic control profile (**be-tcp**):

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

4. Associate the traffic control profile **be-tcp** with a forwarding class set (**lan-pg**) and a 10-Gigabit Ethernet interface (**xe-0/0/7**):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile be-tcp
```

5. Alternatively, you can assign the scheduler map (**be-map**) to all the 10-Gigabit Ethernet interfaces using wildcards (**xe-***):

```
[edit class-of-service interfaces]
user@switch# set xe-* forwarding-class-set lan-pg output-traffic-control-profile be-tcp
```

Verification

To verify that the queue scheduler has been created and is mapped to the correct interfaces, perform these tasks:

- Verifying the Scheduler Configuration on page 5678
- Verifying the Scheduler Map Configuration on page 5678
- Verifying That the Scheduler Is Associated with the Interface on page 5679

Verifying the Scheduler Configuration

Purpose Verify that the queue scheduler **be-sched** has been created with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, the priority set to **low**, and the drop profile **be-dp**.

Action Display the scheduler using the operational mode command **show configuration class-of-service schedulers be-sched**:

```
user@switch> show configuration class-of-service schedulers be-sched
transmit-rate percent 20;
shaping-rate percent 40;
buffer-size percent 20
priority low;
drop-profile-map loss-priority low protocol any drop-profile be-dp;
```

Verifying the Scheduler Map Configuration

Purpose Verify that the scheduler map **be-map** has been created and associates the forwarding class **best-effort** with the scheduler **be-sched**, and also that the scheduler map is attached to the traffic control profile **be-tcp**.

Action Display the scheduler map using the operational mode command **show configuration class-of-service scheduler-maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Display the traffic control profile to verify that the scheduler map **be-map** is attached using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

NOTE: This topic does not describe how to configure a traffic control profile or its allocation of port bandwidth. Using a traffic control profile to configure the port resource allocation to the priority group is necessary to implement hierarchical scheduling.

Verifying That the Scheduler Is Associated with the Interface

Purpose Verify that the forwarding class set (**lan-pg**) and the traffic control profile (**be-tcp**) that are associated with the queue scheduler are attached to the interface **xe-0/0/7**.

Action List the interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    lan-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

Example: Configuring Queue Scheduling Priority

You can configure the bandwidth scheduling priority of individual queues by specifying the priority in a scheduler, and then using a scheduler map to associate the scheduler with a queue.

- Requirements on page 5680
- Overview on page 5680
- Configuring Queue Scheduling Priority on page 5681
- Verification on page 5681

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Queues can have one of two bandwidth priorities:

- **strict-high**—You can configure only one queue as a strict-high or high-priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

  NOTE: If you configure strict-high priority queues, you must create an fc-set that is dedicated only to strict-high priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.

Table 533 on page 5680 shows the configuration components for this example.

This example describes how to set the queue priority for two forwarding classes (queues) named **fcoe** and **no-loss**. Both queues have a priority of **low**. The scheduler for the **fcoe** queue is named **fcoe-sched** and the scheduler for the **no-loss** queue is named **nl-sched**. One scheduler map, **schedmap1**, associates the schedulers to the queues.

Table 533: Components of the Queue Scheduler Priority Configuration Example

Component	Settings
Hardware	QFX3500 switch
Schedulers	**fcoe-sched** for FCoE traffic **nl-sched** for no-loss traffic
Priority	**low** for FCoE traffic **low** for no-loss traffic
Scheduler map	**schedmap1**: FCoE mapping: scheduler **fcoe-sched** to forwarding class **fcoe** No-loss mapping: scheduler **nl-sched** to forwarding class **no-loss**

Configuring Queue Scheduling Priority

To configure queue priority using the CLI:

1. Create the FCoE scheduler with **low** priority:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low
```

2. Create the no-loss scheduler with **low** priority:

```
[edit class-of-service]
user@switch# set schedulers nl-sched priority low
```

3. Associate the schedulers with the desired queues in the scheduler map:

```
[edit class-of-service]
user@switch# set scheduler-maps schedmap1 forwarding-class fcoe scheduler fcoe-sched
user@switch# set scheduler-maps schedmap1 forwarding-class no-loss scheduler nl-sched
```

Verification

To verify that you configured the queue scheduling priority for bandwidth and mapped the schedulers to the correct forwarding classes, perform these tasks:

- Verifying the Queue Scheduling Priority on page 5681
- Verifying the Scheduler-to-Forwarding-Class Mapping on page 5681

Verifying the Queue Scheduling Priority

Purpose Verify that you configured the queue schedulers **fcoe-sched** and **nl-sched** with **low** queue scheduling priority.

Action Display the **fcoe-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers fcoe-sched priority**:

```
user@switch> show configuration class-of-service schedulers fcoe-sched priority
priority low;
```

Display the **nl-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers nl-sched priority**:

```
user@switch> show configuration class-of-service schedulers nl-sched priority
priority low;
```

Verifying the Scheduler-to-Forwarding-Class Mapping

Purpose Verify that you configured the scheduler map **schedmap1** to map scheduler **fcoe-sched** to forwarding class **fcoe** and schedule **nl-sched** to forwarding class **no-loss**.

Action Display the scheduler map **schedmap1** using the operational mode command **show configuration class-of-service scheduler-maps schedmap1**:

```
user@switch> show configuration class-of-service scheduler-maps schedmap1
forwarding-class fcoe scheduler fcoe-sched;
forwarding-class no-loss scheduler nl-sched;
```

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606
- Example: Configuring Queue Schedulers on page 5674
- Defining CoS Queue Scheduling Priority on page 5792
- Monitoring CoS Scheduler Maps on page 5919
- Understanding CoS Output Queue Schedulers on page 5486

Example: Configuring Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

- Requirements on page 5682
- Overview on page 5682
- Configuring a Traffic Control Profile on page 5684
- Verification on page 5684

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each priority group receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

NOTE: In order for the **transmit-rate** option (minimum bandwidth for a queue that you set using scheduler configuration) to work properly, you must configure the **guaranteed-rate** for the priority group. If a priority group does not have a guaranteed minimum bandwidth, the queues (forwarding classes) that belong to the priority group cannot have a guaranteed minimum bandwidth.

NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each priority group receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

  NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

  NOTE: Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

  For example, if you map three priority groups to a 10-Gigabit Ethernet port, the queues associated with all three of the priority groups share the 10-Gbps bandwidth as defined by the traffic control profiles. Therefore, the total combined **guaranteed-rate** value of the three priority groups should not exceed 10 Gbps. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

  The sum of the queue (forwarding class) transmit rates cannot exceed the total **guaranteed-rate** of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

  If you configure the **guaranteed-rate** of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

Configuring a Traffic Control Profile

This example describes how to configure a traffic control profile named **san-tcp** with a scheduler map named **san-map1**and allocate to it a minimum bandwidth of 4 Gbps and a maximum bandwidth of 8 Gbps:

1. Create the traffic control profile and set the **guaranteed-rate** (minimum guaranteed bandwidth) to **4g**:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles san-tcp guaranteed-rate 4g
   ```

2. Set the **shaping-rate** (maximum guaranteed bandwidth) to **8g**:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles san-tcp shaping-rate 8g
   ```

3. Associate the scheduler map **san-map1** with the traffic control profile:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles san-tcp scheduler-map san-map1
   ```

Verification

Verifying the Traffic Control Profile Configuration

Purpose Verify that the traffic control profile **san-tcp** has been created with a minimum guaranteed bandwidth of 4 Gbps, a maximum bandwidth of 8 Gbps, and the scheduler map **san-map1**.

Action List the traffic control profile using the operational mode command **show configuration class-of-service traffic-control-profiles san-tcp**:

```
user@switch> show configuration class-of-service traffic-control-profiles san-tcp
scheduler-map san-map1;
shaping-rate percent 8g;
guaranteed-rate 4g;
```

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The priority group minimum guaranteed bandwidth defines the minimum total amount of bandwidth available for all of the queues in the priority group to meet their minimum bandwidth requirements.

The **transmit-rate** setting in the scheduler configuration determines the minimum guaranteed bandwidth for an individual queue. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

The **guaranteed-rate** setting in the traffic control profile configuration determines the minimum guaranteed bandwidth for a priority group. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

NOTE: You must configure both the **transmit-rate** value for the queue and the **guaranteed-rate** value for the priority group in order to set a valid minimum bandwidth guarantee for a queue. (If the priority group does not have a guaranteed minimum bandwidth, there is no guaranteed bandwidth pool from which the queue can take its guaranteed minimum bandwidth.)

The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

NOTE: When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

NOTE: You cannot configure minimum guaranteed bandwidth on strict-high priority queues or on a priority group that contains strict-high priority queues.

This example describes how to:

- Configure a transmit rate (minimum guaranteed queue bandwidth) of 2 Gbps for queues in a scheduler named **be-sched**.
- Configure a guaranteed rate (minimum guaranteed priority group bandwidth) of 4 Gbps for a priority group in a traffic control profile named **be-tcp**.
- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the minimum guaranteed bandwidth scheduling to the egress interface **xe-0/0/7**.

Table 534 on page 5686 shows the configuration components for this example:

Table 534: Components of the Minimum Guaranteed Output Bandwidth Configuration Example

Component	Settings
Hardware	QFX3500 switch
Minimum guaranteed queue bandwidth	Transmit rate: **2g**
Minimum guaranteed priority group bandwidth	Guaranteed rate: **4g**
Scheduler	**be-sched**
Scheduler map	**be-map**
Traffic control profile	**be-tcp**
Forwarding class set (priority group)	**be-pg**
Queue (forwarding class)	**best-effort**

Table 534: Components of the Minimum Guaranteed Output Bandwidth Configuration Example *(continued)*

Component	Settings
Egress interface	xe-0/0/7

Configuring Guaranteed Minimum Bandwidth

To configure the minimum guaranteed bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the minimum guaranteed queue bandwidth of 2 Gbps for scheduler **be-sched**:

   ```
   [edit class-of-service schedulers]
   user@switch# set be-sched transmit-rate 2g
   ```

2. Configure the minimum guaranteed priority group bandwidth of 4 Gbps for traffic control profile **be-tcp**:

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set be-tcp guaranteed-rate 4g
   ```

3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set be-map forwarding-class best-effort scheduler be-sched
   ```

4. Associate the scheduler map with the traffic control profile:

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set be-tcp scheduler-map be-map
   ```

5. Assign the **best-effort** queue to the priority group **be-pg**:

   ```
   [edit class-of-service forwarding-class-sets]
   user@switch# set be-pg class best-effort
   ```

6. Apply the configuration to interface **xe-0/0/7**:

   ```
   [edit class-of-service interfaces]
   user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
   ```

Verification

To verify the minimum guaranteed output bandwidth configuration, perform these tasks:

- Verifying the Minimum Guaranteed Queue Bandwidth on page 5688
- Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association on page 5688
- Verifying the Scheduler Map Configuration on page 5688
- Verifying Queue (Forwarding Class) Membership in the Priority Group on page 5688
- Verifying the Egress Interface Configuration on page 5689

Verifying the Minimum Guaranteed Queue Bandwidth

Purpose Verify that you configured the minimum guaranteed queue bandwidth as **2g** in the scheduler **be-sched**.

Action Display the minimum guaranteed bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched transmit-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched transmit-rate
2g;
```

Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association

Purpose Verify that the minimum guaranteed priority group bandwidth is **4g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

Action Display the minimum guaranteed bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate
4g;
```

Display the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

Verifying the Scheduler Map Configuration

Purpose Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

Action Display the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service schedulers maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Verifying Queue (Forwarding Class) Membership in the Priority Group

Purpose Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.

Action Display the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:

```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

Verifying the Egress Interface Configuration

Purpose Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.

Action Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

Example: Configuring Maximum Output Bandwidth

Scheduling the maximum output bandwidth for a queue (forwarding class) requires configuring both tiers of the hierarchical scheduler. One tier is scheduling the resources for the individual queue. The other tier is scheduling the resources for the priority group (forwarding class set) to which the queue belongs.

- Requirements on page 5689
- Overview on page 5689
- Configuring Maximum Bandwidth on page 5691
- Verification on page 5691

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The priority group maximum bandwidth defines the maximum total amount of bandwidth available for all of the queues in the priority group.

The **shaping-rate** setting in the scheduler configuration determines the maximum bandwidth for an individual queue.

The **shaping-rate** setting in the traffic control profile configuration determines the maximum bandwidth for a priority group.

NOTE: When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

NOTE: When you set the maximum bandwidth (**shaping-rate**) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate** value.

This example describes how to:

- Configure a maximum rate of 4 Gbps for queues in a scheduler named **be-sched**.
- Configure a maximum rate of 6 Gbps for a priority group in a traffic control profile named **be-tcp**.
- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the bandwidth scheduling to the interface **xe-0/0/7**.

Table 535 on page 5690 shows the configuration components for this example:

Table 535: Components of the Maximum Output Bandwidth Configuration Example

Component	Settings
Hardware	QFX3500 switch
Maximum queue bandwidth	Shaping rate: **4g**
Maximum priority group bandwidth	Shaping rate: **6g**
Scheduler	**be-sched**
Scheduler map	**be-map**
Traffic control profile	**be-tcp**

Table 535: Components of the Maximum Output Bandwidth Configuration Example *(continued)*

Component	Settings
Forwarding class set (priority group)	**be-pg**
Queue (forwarding class)	**best-effort**
Egress interface	**xe-0/0/7**

Configuring Maximum Bandwidth

To configure the maximum bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the maximum queue bandwidth of 4 Gbps for scheduler **be-sched**:

   ```
   [edit class-of-service schedulers]
   user@switch# set be-sched shaping-rate 4g
   ```

2. Configure the maximum priority group bandwidth of 6 Gbps for traffic control profile **be-tcp**:

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set be-tcp shaping-rate 6g
   ```

3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set be-map forwarding-class best-effort scheduler be-sched
   ```

4. Associate the scheduler map with the traffic control profile:

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set be-tcp scheduler-map be-map
   ```

5. Assign the **best-effort** queue to the priority group **be-pg**:

   ```
   [edit class-of-service forwarding-class-sets]
   user@switch# set be-pg class best-effort
   ```

6. Apply the configuration to interface **xe-0/0/7**:

   ```
   [edit class-of-service interfaces]
   user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
   ```

Verification

To verify the maximum output bandwidth configuration, perform these tasks:

- Verifying the Maximum Queue Bandwidth on page 5692
- Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association on page 5692
- Verifying the Scheduler Map Configuration on page 5692
- Verifying Queue (Forwarding Class) Membership in the Priority Group on page 5692
- Verifying the Egress Interface Configuration on page 5692

Verifying the Maximum Queue Bandwidth

Purpose Verify that you configured the maximum queue bandwidth as **4g** in the scheduler **be-sched**.

Action List the maximum bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched shaping-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched shaping-rate
4g;
```

Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association

Purpose Verify that the maximum priority group bandwidth is **6g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

Action List the maximum bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp shaping-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp shaping-rate
4g;
```

List the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

Verifying the Scheduler Map Configuration

Purpose Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

Action List the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service schedulers maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Verifying Queue (Forwarding Class) Membership in the Priority Group

Purpose Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.

Action List the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:

```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

Verifying the Egress Interface Configuration

Purpose Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.

Action List the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

Related Documentation

Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your network uses a different priority than 3 for FCoE traffic, you need to configure lossless FCoE transport on that priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic instead of using priority 3.

- Requirements on page 5693
- Overview on page 5693
- Configuration on page 5696
- Verification on page 5697

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

Overview

Although FCoE traffic typically uses IEEE 802.1p priority 3 on converged Ethernet networks, some networks use a different priority for FCoE traffic. Regardless of the priority used, FCoE traffic must receive lossless treatment. Supporting lossless behavior for FCoE traffic when your network does not use priority 3 requires configuring:

- A lossless forwarding class for FCoE traffic.
- A behavior aggregate (BA) classifier to map the FCoE forwarding class to the appropriate IEEE 802.1p priority.
- A congestion notification profile (CNP) to enable PFC on the FCoE code point at the interface ingress and to configure flow control on the interface egress. Flow control on the interface egress enables the interface to respond to PFC messages received from the connected peer and pause the correct IEEE 802.1p priority on the correct output queue.

NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- A DCBX application and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priority. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure one lossless FCoE traffic class, map it to a priority other than priority 3, and configure flow control to ensure lossless behavior on the interfaces. This example uses two Ethernet interfaces, xe-0/0/25 and xe-0/0/26. The interfaces connect to a converged Ethernet network that uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic.

The configuration on the two interfaces is the same. Both interfaces use the same explicitly configured lossless FCoE forwarding class and the same ingress classifier. Both interfaces enable PFC on priority 5 and enable flow control on the same output queue (which is mapped to the lossless FCoE forwarding class).

Table 536 on page 5694 shows the configuration components for this example.

Table 536: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3

Component	Settings
Hardware	QFX3500 switch

Table 536: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3 *(continued)*

Component	Settings
Forwarding class	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.
BA classifier	Name—**fcoe_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**.
PFC configuration (CNPs)	CNP name—**fcoe_p5_cnp** Input CNP code point—**101** MRU—**2240** bytes Cable length—**100** meters Output CNP code point—**101** Output CNP flow control queue—**5** NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.
DCBX application mapping	Application name—**fcoe_p5_app** Application EtherType—**0x8906** Application map name—**fcoe_p5_app_map** Application map code points—**101** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure a lossless FCoE forwarding class that uses a different priority than IEEE 802.1p priority 3 for FCoE traffic on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101
pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
set class-of-service interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
set applications application fcoe_p5_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map
```

Configuring A Lossless FCoE Forwarding Class On IEEE 802.1p Priority 5

Step-by-Step Procedure

To configure a lossless forwarding class for FCoE traffic on IEEE 802.1p priority 5 (code point 101), classify FCoE traffic into the lossless forwarding class, configure a congestion notification profile to enable PFC on the FCoE priority and output queue, and configure DCBX application protocol TLV exchange for traffic on the FCoE priority:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue **5**) for FCoE traffic on IEEE 802.1p priority 5:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

2. Configure the ingress classifier (**fcoe_p5**). The classifier maps the FCoE priority (code point **101**) to the lossless FCoE forwarding class **fcoe1**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
   101
   ```

3. Apply the classifier to interfaces **xe-0/0/25** and **xe-0/026**:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
   user@switch# set interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
   ```

4. Configure the CNP. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

   ```
   [edit class-of-service]
   ```

```
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

5. Apply the CNP to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
```

6. Configure the DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priority 5 instead of on the default priority 3:

```
[edit]
user@switch# set applications application fcoe_p5_app ether-type 0x8906
```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set policy-options application-maps fcoe_p5_app_map application
fcoe_p5_app code-points 101
```

8. Apply the application map to the Ethernet interfaces so that DCBX exchanges FCoE application TLVs on the correct code point:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
user@switch# set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map
```

Verification

To verify the configuration and proper operation of the lossless forwarding class and IEEE 802.1p priority, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5697
- Verifying the Behavior Aggregate Classifier Configuration on page 5698
- Verifying the PFC Flow Control Configuration (CNP) on page 5698
- Verifying the Interface Configuration on page 5699
- Verifying the DCBX Application Configuration on page 5700
- Verifying the DCBX Application Map Configuration on page 5700
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5700

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                          ID      Queue  Policing priority  No-Loss

  best-effort                             0         0         normal        Disabled

  fcoe                                    1         3          normal        Enabled

  no-loss                                 2         4          normal        Enabled

  network-control                         3         7         normal        Disabled

  fcoe1                                   4         5          normal        Enabled

  mcast                                   8         8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifier configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065
  Code point         Forwarding class                   Loss priority
  101                fcoe1                              low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**, and all other priorities to the **best-effort** forwarding class with a packet loss priority of **high**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priority and that flow control is configured on the correct output queue in the CNP.

Action Display the congestion notification profile using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p5_cnp, Index: 12137
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the configured CNPs.

The **fcoe_p5_cnp** CNP input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

Verifying the Interface Configuration

Purpose Verify that the correct classifier and congestion notification profile are configured on the interfaces.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/25** and **show configuration class-of-service interfaces xe-0/0/26**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/25
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/26
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}
```

Meaning Both the **show configuration class-of-service interfaces xe-0/0/25** command and the **show configuration class-of-service interfaces xe-0/0/26** command show that the

congestion notification profile **fcoe_p5_cnp** is configured on each interface, and that the IEEE 802.1p classifier associated with each interface is **fcoe_p5**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX application for FCoE is configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_p5_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe_p5_app** is configured with an EtherType of **0x8906**.

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map is configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe_p5_app_map** consists of the application named **fcoe_p5_app**, which is mapped to IEEE 802.1p code point **101**.

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application map is applied to the correct interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/25.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/26.0 {
    application-map fcoe_p5_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/25.0** and **xe-0/0/26.0** use application map **fcoe_p5_app_map**.

- Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 5064

Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your converged Ethernet network uses more than one priority for FCoE traffic, you need to configure lossless transport for each FCoE priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses both priority 3 (IEEE 802.1p code point 011) and priority 5 (IEEE 802.1p code point 101) for FCoE traffic.

- Requirements on page 5701
- Overview on page 5701
- Configuration on page 5704
- Verification on page 5706

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, a converged Ethernet network might include two separate FCoE networks that use different priorities to identify traffic. Interfaces that carry traffic for both FCoE networks need to support lossless FCoE transport on both priorities.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class).
- A behavior aggregate (BA) classifier to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities).
- A congestion notification profile (CNP) to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer.

NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifier, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure two lossless FCoE traffic classes on an interface, map them to two different priorities, and configure flow control to ensure lossless behavior. This example uses two Ethernet interfaces, xe-0/0/20 and xe-0/0/21, that are connected to the converged Ethernet network. Both interfaces transport FCoE traffic on priorities 3 (011) and 5 (101), and must support lossless transport of that traffic.

Table 537 on page 5702 shows the configuration components for this example.

Table 537: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology

Component	Settings
Hardware	QFX3500 switch

Table 537: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology *(continued)*

Component	Settings
Forwarding classes	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. Name—**fcoe** This is the default lossless FCoE forwarding class, so no configuration required. The **fcoe** forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of **no-loss**.
BA classifier	Name—**fcoe_classifier** FCoE priority mapping for forwarding class **fcoe**—mapped to code point **011** (IEEE 802.1p priority 3) and a packet loss priority of **low**. FCoE priority mapping for forwarding class **fcoe1**—mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**.
PFC configuration (CNP)	CNP name—**fcoe_cnp** Input CNP code points—**011** and **101** MRU—2240 bytes Cable length—100 meters Output CNP code points—**011** and **101** Output CNP flow control queues—**3** and **5** NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for PFC pause unless they are included in the explicitly configured output CNP. In this example, because the explicit output CNP overwrites the default output CNP, we must explicitly configure flow control on queue 3.

Table 537: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology *(continued)*

Component	Settings
DCBX application mapping	Application name—**fcoe_app** Application EtherType—**0x8906** Application map name—**fcoe_app_map** Application map code points—**011** and **101** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.
Interfaces	Interfaces **xe-0/0/20** and **xe-0/0/21** use the same configuration: • Classifier—**fcoe_classifier** • CNP—**fcoe_cnp** • DCBX application map—**fcoe_app_map**

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch interface, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_classifier forwarding-class fcoe loss-priority low code-points 011
set class-of-service classifiers ieee-802.1 fcoe_classifier forwarding-class fcoe1 loss-priority low code-points 101set class-of-service interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
set class-of-service interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
set class-of-service congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 011 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 101 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
set class-of-service congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
set class-of-service interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
set applications application fcoe_app ether-type 0x8906
set policy-options application-maps fcoe_app_map application fcoe_app code-points [011 101]
set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on the same interface, classify FCoE traffic into the forwarding classes, configure CNPs to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

```
[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
```

NOTE: This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier. The classifier maps the FCoE priorities (IEEE 802.1p code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1 fcoe_classifier forwarding-class fcoe1 loss-priority low
code-points 101
```

3. Apply the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
```

4. Configure the CNP. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point
011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

5. Apply the CNP to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
```

6. Configure a DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on both of the IEEE 802.1p priorities used for FCoE transport:

```
[edit]
```

```
user@switch# set applications application fcoe_app ether-type 0x8906
```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priorities:

```
[edit]
user@switch# set policy-options application-maps fcoe_app_map application fcoe_app
code-points [011 101]
```

8. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5706
- Verifying the Behavior Aggregate Classifier Configuration on page 5707
- Verifying the PFC Flow Control Configuration (CNP) on page 5707
- Verifying the Interface Configuration on page 5708
- Verifying the DCBX Application Configuration on page 5708
- Verifying the DCBX Application Map Configuration on page 5709
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5709

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                          ID      Queue  Policing priority  No-Loss

  best-effort                             0         0         normal        Disabled

  fcoe                                    1         3          normal        Enabled

  no-loss                                 2         4          normal        Enabled

  network-control                         3         7         normal        Disabled

  fcoe1                                   4         5          normal        Enabled

  mcast                                   8         8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifiers using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_classifier, Code point type: ieee-802.1, Index: 10964
  Code point         Forwarding class                  Loss priority
  011                fcoe                              low
  101                fcoe1                             low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe_classifier** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities.

Action List the CNPs using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_cnp, Index: 46504
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2240
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  011
               3
  101
               5
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the CNP.

The CNP **fcoe_cnp** input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the interface cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

Verifying the Interface Configuration

Purpose Verify that the classifier and congestion notification profile are configured on the interfaces. Both interfaces should show the same configuration.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
ccongestion-notification-profile fcoe_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_classifier;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/21
congestion-notification-profile fcoe_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_classifier**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_classifier**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX application for FCoE is configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe_app** is configured with an EtherType of **0x8906**.

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map is configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_app_map {
    application fcoe_app code-points [011 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe_app_map** consists of the application named **fcoe_app**, which is mapped to IEEE 802.1p code points **011** and **101** (priorities 3 and 5, respectively).

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application map is applied to the interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/20.0 {
    application-map fcoe_app_map;
}
interface xe-0/0/21.0 {
    application-map fcoe_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/20.0** and **xe-0/0/21.0** use application map **fcoe_app_map**.

Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic if it uses different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and map them to two different priorities on an FCoE transit switch.

- Requirements on page 5710
- Overview on page 5710
- Configuration on page 5714
- Verification on page 5717

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, when the QFX3500 switch acts as a transit switch, it could be connected to two QFX3500 switches in FCoE-FC gateway mode. Each of the gateway switches could connect a set of FCoE clients to a different SAN, and each set of FCoE clients could use a different priority for FCoE traffic to avoid fate sharing and maintain separation of the two FCoE networks. In this case, you need to configure two forwarding classes for FCoE traffic, each mapped to a different output queue and a different priority.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- Behavior aggregate (BA) classifiers to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure two lossless FCoE traffic classes, map them to two different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses three Ethernet interfaces, xe-0/0/20, xe-0/0/21, and xe-0/0/22:

- Interface xe-0/0/20 connects to an FCoE-FC gateway that connects to Fibre Channel (FC) SAN 1. FCoE traffic to and from FC SAN 1 uses the default **fcoe** forwarding class and the default mapping to priority 3 (IEEE 802.1p code point 011) and output queue 3.
- Interface xe-0/0/21 connects to another FCoE-FC gateway that connects to Fibre Channel (FC) SAN 2. FCoE traffic to and from FC SAN-2 uses an explicitly configured FCoE forwarding class that is mapped to priority 5 (code point 101) and output queue 5.
- Interface xe-0/0/22 connects to FCoE devices on the converged Ethernet network and handles traffic destined for FC SAN 1 and FC SAN 2. Interface xe-0/0/22 must properly handle lossless FCoE traffic of both priorities (both FCoE forwarding classes), including pausing the traffic on ingress or egress as required.

Figure 215 on page 5712 shows the topology for this example, and Table 538 on page 5712 shows the configuration components for this example.

Figure 215: Topology of the Two Lossless FCoE Priorities Example

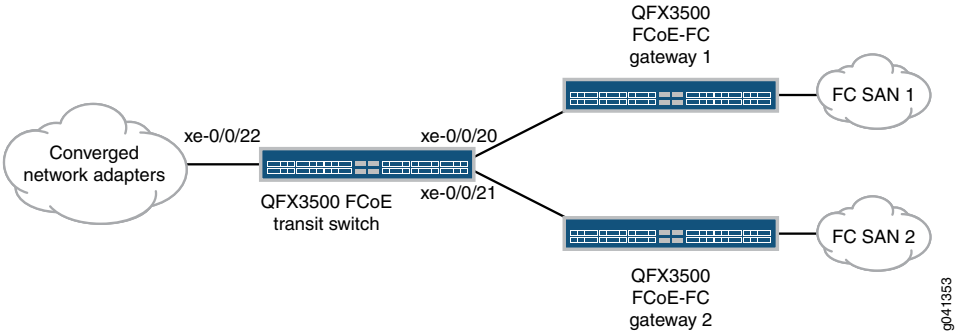

Table 538: Components of the Two Lossless FCoE Priorities Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Forwarding classes	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. Name—**fcoe** This is the default lossless FCoE forwarding class, so no configuration required. The **fcoe** forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of **no-loss**
BA classifiers	Each interface requires a different classifier because each interface handles a different subset of FCoE traffic. • Interface xe-0/0/20 classifier: Name—**fcoe_p3** FCoE priority mapping—Forwarding class **fcoe** mapped to code point **011** (IEEE 802.1p priority 3) and a packet loss priority of **low**. • Interface xe-0/0/21 classifier: Name—**fcoe_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**. • Interface xe-0/0/22 classifier: Name—**fcoe_p3_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** and a packet loss priority of **low**, and forwarding class **fcoe** mapped to code point **011** and a packet loss priority of **low**.

Table 538: Components of the Two Lossless FCoE Priorities Configuration Topology *(continued)*

Component	Settings
PFC configuration (CNPs)	Each interface requires a different CNP because each interface handles a different subset of FCoE traffic and must pause that traffic on different priorities. • Interface xe-0/0/20 CNP: CNP name—**fcoe_p3_cnp** Input CNP code point—**011** MRU—2240 bytes Cable length—100 meters NOTE: Because interface xe-0/0/20 uses the default FCoE configuration, output queue 3 is paused by default and you do not need to configure the output stanza of the CNP. • Interface xe-0/0/21 CNP: CNP name—**fcoe_p5_cnp** Input CNP code point—**101** MRU—**2240** bytes Cable length—**150** meters Output CNP code point—**101** Output CNP flow control queue—**5** • Interface xe-0/0/22 CNP: CNP name—**fcoe_p3_p5_cnp** Input CNP code points—**011** and **101** MRU—**2240** bytes (both priorities) Cable length—**100** meters Output CNP code points—**011** (for queue **3**) and **101** (for queue **5**) Output CNP flow control queues—**3** for priority 3 (code point 011) and **5** for priority 5 (code point 101) NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.

Table 538: Components of the Two Lossless FCoE Priorities Configuration Topology *(continued)*

Component	Settings
DCBX application mapping	Interface xe-0/0/20 does not need an application map because DCBX exchanges application protocol TLVs only on the default FCoE priority (priority 3). Interface xe-0/0/21 requires an application map that enables DCBX application protocol TLV exchange on priority 5 (code point 101) for FCoE traffic. Interface xe-0/0/22 requires an application map that enables DCBX application protocol TLV exchange both on priority 3 (code point 011) and on priority 5 (code point 101) for FCoE traffic. • Interface xe-0/0/21 DCBX application mapping: Application name—**fcoe_p5_app** Application ether-type—**0x8906** Application map name—**fcoe_p5_app_map** Application map code points—**101** • Interface xe-0/0/22 DCBX application mapping: Application name—**fcoe_all_app** Application ether-type—**0x8906** Application map name—**fcoe_all_app_map** Application map code points—**011** and **101** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
set class-of-service interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
set class-of-service congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 011
pfc mru 2240
```

```
set class-of-service congestion-notification-profile fcoe_p3_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101
pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 150
set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point
011 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point
011 pfc flow-control-queue 3
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp
set class-of-service interfaces xe-0/0/21 congestion-notification-profile fcoe_p5_cnp
set class-of-service interfaces xe-0/0/22 congestion-notification-profile fcoe_p3_p5_cnp
set applications application fcoe_p5_app ether-type 0x8906
set applications application fcoe_all_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set policy-options application-maps fcoe_all_app_map application fcoe_all_app code-points [011
101]
set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map
```

Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on different interfaces, classify FCoE traffic into the forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

   

   NOTE: This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier (**fcoe_p3**) for interface **xe-0/0/20**. The classifier maps the FCoE priority (IEEE 802.1p code point **011**) to lossless FCoE forwarding class **fcoe**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low code-points
   011
   ```

3. Configure the ingress classifier (**fcoe_p5**) for interface **xe-0/0/21**. The classifier maps the FCoE priority (IEEE 802.1p code point **101**) to lossless FCoE forwarding class **fcoe1**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
   101
   ```

4. Configure the ingress classifier (**fcoe_p3_p5**) for interface **xe-0/0/22**. The classifier maps the two FCoE priorities (IEEE 802.1p code points **011** and **101**) to the two lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points
011
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points
101
```

5. Apply each classifier to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
user@switch# set interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
```

6. Configure the CNP input stanza for interface xe-0/0/20 to enable PFC on the FCoE priority (IEEE 802.1p code point 011), set the MRU value (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queue 3 is paused by default on priority 3, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100
```

7. Configure the CNP for interface xe-0/0/21. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point 101), sets the MRU value (2240 bytes), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

8. Configure the CNP for interface xe-0/0/22. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 101 pfc flow-control-queue 5
```

9. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp
```

```
user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/22 congestion-notification-profile fcoe_p3_p5_cnp
```

10. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/21. Interface xe-0/0/21 uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on priority 5 on interface xe-0/0/21. Configure an application named **fcoe_p5_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe_p5_app_map** to map the application to code point 101:

    ```
    [edit]
    user@switch# set applications application fcoe_p5_app ether-type 0x8906
    user@switch# set policy-options application-maps fcoe_p5_app_map application
    fcoe_p5_app code-points 101
    ```

    NOTE: Interface xe-0/0/20 uses the default FCoE configuration (priority 3). DCBX exchanges protocol TLVs for the FCoE application by default, so you do not need to configure DCBX explicitly on interface xe-0/0/20.

11. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/22. Interface xe-0/0/22 uses both priority 3 (IEEE 802.1p code point 011) and priority 5 for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on both priority 3 and priority 5. Configure an application named **fcoe_all_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe_all_app_map** to map the application to code points 011 and 101:

    ```
    [edit]
    user@switch# set applications application fcoe_all_app ether-type 0x8906
    user@switch# set policy-options application-maps fcoe_all_app_map application
    fcoe_all_app code-points [011 101]
    ```

12. Apply the application maps to the interfaces xe-0/0/21 and xe-0/0/22 so that DCBX exchanges FCoE application TLVs on the correct code points on each interface:

    ```
    [edit]
    user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
    user@switch# set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map
    ```

Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5718
- Verifying the Behavior Aggregate Classifier Configuration on page 5718
- Verifying the PFC Flow Control Configuration (CNP) on page 5719
- Verifying the Interface Configuration on page 5721
- Verifying the DCBX Application Configuration on page 5721
- Verifying the DCBX Application Map Configuration on page 5722
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5722

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                        ID      Queue  Policing priority  No-Loss

  best-effort                           0         0         normal        Disabled

  fcoe                                   1         3         normal         Enabled

  no-loss                                2         4         normal         Enabled

  network-control                       3         7         normal        Disabled

  fcoe1                                  4         5         normal         Enabled

  mcast                                 8         8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p3, Code point type: ieee-802.1, Index: 13913
  Code point         Forwarding class                   Loss priority
  011                fcoe                               low

Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065
  Code point         Forwarding class                   Loss priority
  101                fcoe1                              low

Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 10964
  Code point         Forwarding class                   Loss priority
  011                fcoe                               low
  101                fcoe1                              low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are three classifiers, **fcoe_p3**, **fcoe_p5**, and **fcoe_p3_p5**.

Classifier **fcoe_p3** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**.

Classifier **fcoe_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe_p3_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p3_cnp, Index: 12037
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled

  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the three CNPs. For CNP **fcoe_p3_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows the default mapping of priorities to output queues.

NOTE: By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queue 3 responds to pause messages from the connected peer on interfaces that use CNP **fcoe_p3_cnp**, because the input stanza enables PFC priority 3 only.

For CNP **fcoe_p3_p5_cnp**, the input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

For CNP **fcoe_p5_cnp**, the input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **150** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

Verifying the Interface Configuration

Purpose Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20**, **show configuration class-of-service interfaces xe-0/0/21**, and **show configuration class-of-service interfaces xe-0/0/22**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
ccongestion-notification-profile fcoe_p3_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/21
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/22
congestion-notification-profile fcoe_p3_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_p5;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe_p3_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p5**.

The **show configuration class-of-service interfaces xe-0/0/22** command shows that the congestion notification profile **fcoe_p3_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3_p5**.

Verifying the DCBX Application Configuration

Purpose Verify that the two DCBX applications for FCoE are configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_all_app {
    ether-type 0x8906;
```

```
application fcoe_p5_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe_all_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic) and that the application **fcoe_p5_app** is also configured with an EtherType of **0x8906**.

Verifying the DCBX Application Map Configuration

Purpose Verify that the application maps are configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_all_app_map {
    application fcoe_all_app code-points [011 101];
}
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there are two application maps.

Application map **fcoe_all_app_map** consists of the application named **fcoe_all_app** mapped to IEEE 802.1p code points **011** (priority 3) and **101** (priority 5).

Application map **fcoe_p5_app_map** consists of the application named **fcoe_p5_app** mapped to IEEE 802.1p code point **101** (priority 5).

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps are applied to the correct interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/21.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/22.0 {
    application-map fcoe_all_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/21.0** uses application map **fcoe_p5_app_map** and interface **xe-0/0/22.0** uses application map **fcoe_all_app_map**.

NOTE: Because interface xe-0/0/20 uses the default lossless FCoE configuration, you do not configure application mapping to interface xe-0/0/20. The default configuration automatically exchanges application protocol TLVs for the default FCoE configuration on priority 3 (IEEE 802.1p code point 011).

Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic on different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, and map the forwarding classes to three different priorities. (The converged Ethernet network includes two FCoE networks, each of which uses a different priority to identify FCoE traffic, and an iSCSI network.)

- Requirements on page 5723
- Overview on page 5724
- Configuration on page 5728
- Verification on page 5732

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode

- Junos OS Release 12.3 or later for the QFX Series

Overview

Some converged Ethernet networks support FCoE on more than one IEEE 802.1p priority and also require supporting other lossless traffic classes. Interfaces that carry multiple lossless forwarding classes need to support lossless behavior for the priorities mapped to those forwarding classes. To support the two FCoE forwarding classes and the iSCSI forwarding class used in this example, you need to configure:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- A lossless forwarding class for iSCSI traffic
- Behavior aggregate (BA) classifiers to map the lossless forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE and iSCSI code points at the interface ingress, and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer

NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- DCBX applications and an application map to support DCBX application TLV exchange for the FCoE and iSCSI traffic on the configured lossless priorities. By default, DCBX is enabled on all Ethernet interfaces for FCoE, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure two lossless FCoE traffic classes and one lossless iSCSI traffic class, map them to three different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses four Ethernet interfaces, xe-0/0/31, xe-0/0/32, xe-0/0/33, and xe-0/0/34:

- Interface xe-0/0/31 handles FCoE traffic on priority 3 (IEEE 802.1p code point 011) and iSCSI traffic on priority 4 (code point 100).
- Interface xe-0/0/32 handles FCoE traffic on priority 5 (code point 101) and iSCSI traffic on priority 4.
- Interface xe-0/0/33 handles FCoE traffic on priority 3 and priority 5.
- Interface xe-0/0/34 handles iSCSI traffic on priority 4.

Figure 216 on page 5725 shows the topology for this example, and Table 539 on page 5725 shows the configuration components for this example.

Figure 216: Topology of the Lossless FCoE and iSCSI Priorities Example

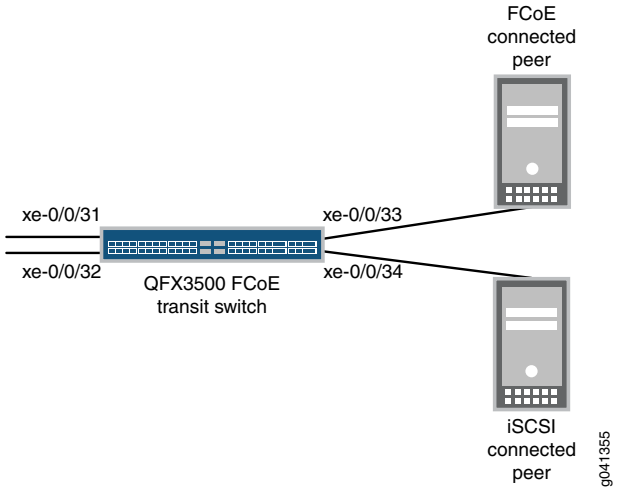

Table 539: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology

Component	Settings
Hardware	QFX3500 switch

Table 539: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology *(continued)*

Component	Settings
Forwarding classes	This example uses one explicitly configured lossless FCoE forwarding class, the default lossless FCoE forwarding class, and one explicitly configured iSCSI forwarding class. • iSCSI forwarding class: Name—**iscsi** Queue mapping—queue **4** Packet drop attribute—**no-loss** • FCoE forwarding class (explicitly configured): Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. • FCoE forwarding class (default) Name—**fcoe** The default **fcoe** forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of **no-loss**.
BA classifiers	Each interface requires a different classifier because each interface handles a different subset of FCoE traffic. • Interface xe-0/0/31 classifier: Name—**fcoe_p3_iscsi** FCoE priority mapping—Forwarding class **fcoe** mapped to code point **011** (IEEE 802.1p priority 3) and a packet loss priority of **low**. iSCSI priority mapping—Forwarding class **iscsi** mapped to code point **100** (priority 4) and a packet loss priority of **low**. • Interface xe-0/0/32 classifier: Name—**fcoe_p5_iscsi** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**. iSCSI priority mapping—Forwarding class **iscsi** mapped to code point **100** (priority 4) and a packet loss priority of **low**. • Interface xe-0/0/33 classifier: Name—**fcoe_p3_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (priority 5) and a packet loss priority of **low**, and forwarding class **fcoe** mapped to code point **011** and a packet loss priority of **low**. • Interface xe-0/0/34 classifier: Name—**iscsi_classifier** iSCSI priority mapping—Forwarding class **iscsi** mapped to code point **100** (priority 4) and a packet loss priority of **low**.

Table 539: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology *(continued)*

Component	Settings
PFC configuration (CNPs)	Each interface requires a different CNP because each interface handles a different subset of FCoE and iSCSI traffic, and must pause that traffic on different priorities. • Interface xe-0/0/31 CNP: CNP name—**fcoe_p3_cnp** Input CNP code points—**011** and **100** MRU—2240 bytes for code point **011**, default value (2500 bytes) for code point **100** Cable length—100 meters NOTE: On interface xe-0/0/31, the FCoE forwarding class is mapped to queue 3 and priority 3 (code point 011), and the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Therefore, interface xe-0/0/31 does not require an output CNP configuration because queue 3 and queue 4 are enabled for PFC flow control by default on code points 011 and 100, respectively. • Interface xe-0/0/32 CNP: CNP name—**fcoe_p5_cnp** Input CNP code points—**100** and **101** MRU—Default value (2500 bytes) for code point **100**, **2240** bytes for code point **101** Cable length—**150** meters Output CNP code points—**100** and **101** Output CNP flow control queues—**4** and **5** • Interface xe-0/0/33 CNP: CNP name—**fcoe_p3_p5_cnp** Input CNP code points—**011** and **101** MRU—**2240** bytes (both priorities) Cable length—**100** meters Output CNP code points—**011** and **101** Output CNP flow control queues—**3** and **5** • Interface xe-0/0/34 CNP: CNP name—**iscsi_cnp** Input CNP code point—**100** MRU—**2500** bytes (default value) Cable length—**100** meters NOTE: On interface xe-0/0/34, the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Interface xe-0/0/34 does not require an output CNP configuration because queue 4 is enabled for PFC flow control by default on code point 100. NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.

Table 539: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology *(continued)*

Component	Settings
DCBX application mapping	This example requires configuring applications for FCoE and iSCSI, including them in the same application map, and applying the application map to all four interfaces. Application map name—**dcbx_iscsi_fcoe_app_map** • FCoE application name—**fcoe_app** Application ether-type—**0x8906** Application map code points—**011** and **101** • iSCSI application name—**iscsi_app** Application protocol type—**tcp** Application destination port—**3260** Application map code point—**100** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes and one lossless iSCSI forwarding class and map them to different priorities, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class iscsi queue-num 4 no-loss
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low
code-points 100
set class-of-service classifiers ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low
code-points 100
set class-of-service classifiers ieee-802.1 fcoe_p5_iscsi forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low

```

Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, classify the traffic into the three forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding classes **iscsi** for iSCSI traffic and **fcoe1** for FCoE traffic (this example uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class) and map them to output queues:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class iscsi queue-num 4 no-loss
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

2. Configure the ingress classifier (**fcoe_p3_iscsi**) for interface **xe-0/0/31**. The classifier maps the FCoE priority (code point **011**) to lossless FCoE forwarding class **fcoe** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

   ```
   [edit class-of-service classifiers]
   ```

```
user@switch# set ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low
code-points 100
```

3. Configure the ingress classifier (**fcoe_p5_iscsi**) for interface **xe-0/0/32**. The classifier maps the FCoE priority (code point **101**) to lossless FCoE forwarding class **fcoe1** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low
code-points 100
user@switch# set ieee-802.1 fcoe_p5_iscsi forwarding-class fcoe1 loss-priority low
code-points 101
```

4. Configure the ingress classifier (**fcoe_p3_p5**) for interface **xe-0/0/33**. The classifier maps the two FCoE priorities (code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points
011
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points
101
```

5. Configure the ingress classifier (**iscsi_classifier**) for interface **xe-0/0/34**. The classifier maps the iSCSI priority (code point **101**) to lossless iSCSI forwarding class **iscsi**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi_classifier forwarding-class iscsi loss-priority low
code-points 100
```

6. Apply each classifier to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe_p3_iscsi
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe_p5_iscsi
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe_p3_p5
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 iscsi_classifier
```

7. Configure the CNP input stanza for interface xe-0/0/31 to enable PFC on the FCoE and iSCSI priorities that the interface handles (code points 011 and 100), set the MRU value for the FCoE traffic (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queues 3 and 4 are paused by default on priorities 3 and 4, respectively, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100
```

8. Configure the CNP for interface xe-0/0/32. The input stanza enables PFC on the FCoE priority (code point 101), sets the MRU value for FCoE traffic (2240 bytes), enables PFC on the iSCSI priority (code point 100), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority and on output queue 4 on the iSCSI priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
100 pfc flow-control-queue 4
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

9. Configure the CNP for interface xe-0/0/33. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 101 pfc flow-control-queue 5
```

10. Configure the CNP input stanza for interface xe-0/0/34 to enable PFC on the iSCSI priority (code point 100) and set the cable length value (100 meters). No output stanza is needed because queue 4 is paused by default on priority 4, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile iscsi_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile iscsi_cnp input cable-length 100
```

11. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe_p3_cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe_p3_p5_cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile iscsi_cnp
```

12. Configure the DCBX applications for FCoE and iSCSI to map to the interfaces so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priorities used for FCoE and iSCSI traffic:

```
[edit]
user@switch# set applications application fcoe_app ether-type 0x8906
user@switch# set applications application iscsi_app protocol tcp destination-port 3260
```

13. Configure a DCBX application map to map the FCoE and iSCSI applications to the correct priorities:

```
[edit]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application
fcoe_app code-points [011 101]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application
iscsi_app code-points 100
```

14. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/31 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/32 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/33 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/34 application-map
dcbx_iscsi_fcoe_app_map
```

Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5732
- Verifying the Behavior Aggregate Classifier Configuration on page 5733
- Verifying the PFC Flow Control Configuration (CNP) on page 5733
- Verifying the Interface Configuration on page 5736
- Verifying the DCBX Application Configuration on page 5737
- Verifying the DCBX Application Map Configuration on page 5737
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5738

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding classes **iscsi** and **fcoe1** have been created and that the default lossless forwarding class **fcoe** is still enabled for lossless transport.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch> show class-of-service forwarding-class
Forwarding class                          ID      Queue  Policing priority  No-Loss

  best-effort                             0         0         normal        Disabled

  fcoe                                    1         3          normal        Enabled

  iscsi                                   2         4          normal        Enabled

  network-control                         3         7         normal        Disabled

  fcoe1                                   4         5          normal        Enabled

  mcast                                   8         8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **iscsi** and **fcoe1** forwarding classes are configured on output queues **4** and **5**, respectively, with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default **fcoe** forwarding class, it remains in its default state (lossless configuration).

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the four classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p3_iscsi, Code point type: ieee-802.1, Index: 13915
  Code point         Forwarding class                  Loss priority
  011                fcoe                              low
  100                iscsi                             low

Classifier: fcoe_p5_iscsi, Code point type: ieee-802.1, Index: 62035
  Code point         Forwarding class                  Loss priority
  100                iscsi                             low
  101                fcoe1                             low

Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 17774
  Code point         Forwarding class                  Loss priority
  011                fcoe                              low
  101                fcoe1                             low

Classifier: iscsi_classifier, Code point type: ieee-802.1, Index: 31635
  Code point         Forwarding class                  Loss priority
  100                iscsi                             low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are four classifiers, **fcoe_p3_iscsi**, **fcoe_p5_iscsi**, **fcoe_p3_p5**, and **iscsi_classifier**.

Classifier **fcoe_p3_iscsi** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and code point **100** (priority 4) to explicitly configured lossless forwarding class **iscsi**.

Classifier **fcoe_p5_iscsi** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**, and code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe_p3_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **iscsi_classifier** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p3_cnp, Index: 12037
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2240
  100          Enabled      9216
  101          Disabled
  110          Disabled
  111          Disabled

  111
               7
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the four CNPs.

For CNP **fcoe_p3_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3) with an MRU of **2240** bytes, and cable length of **100** meters. The input stanza also shows that PFC is enabled on code point **100** (priority 4) with the default MRU value of **9216** bytes. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

NOTE: By default, only queues 3 and 4 are enabled respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queues 3 and 4 respond to pause messages from the connected peer on interfaces that use CNP **fcoe_p3_cnp** because the input stanza enables PFC only on priorities 3 and 4.

For CNP **fcoe_p3_p5_cnp**, the input stanza shows that PFC is enabled on code points **011** and **101** (priority 5), the MRU is **2240** bytes on both priorities, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

For CNP **fcoe_p5_cnp**, the input stanza shows that PFC is enabled on code points **100** and **101**. The MRU for code point **101** (FCoE traffic) is **2240** bytes and the MRU for code point **100** is **9216**. The interface cable length is **150** meters. The CNP output stanza shows that output flow control is configured on queue **4** for code point **100** and on queue **5** for code point **101**.

For CNP **iscsi_cnp**, the input stanza shows that PFC is enabled on code point **100**, the MRU value is **9216** bytes, and the interface cable length is **100** meters. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

Verifying the Interface Configuration

Purpose Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/31**, **show configuration class-of-service interfaces xe-0/0/32**, **show configuration class-of-service interfaces xe-0/0/33**, and **show configuration class-of-service interfaces xe-0/0/34**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe_p3_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_iscsi;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5_iscsi;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe_p3_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_p5;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile iscsi_cnp;
unit 0 {
    classifiers {
        ieee-802.1 iscsi_classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/31** command shows that the congestion notification profile **fcoe_p3_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/32** command shows that the congestion notification profile **fcoe_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p5_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/33** command shows that the congestion notification profile **fcoe_p3_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3_p5**.

The **show configuration class-of-service interfaces xe-0/0/34** command shows that the congestion notification profile **iscsi_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **iscsi_classifier**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX applications for FCoE and iSCSI are configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application iscsi_app {
    protocol tcp;
    destination-port 3260;
}
application fcoe_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **iscsi_app** is configured with a protocol value of **tcp** and a destination port value of **3260**, and that the application **fcoe_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map is configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iscsi_app code-points 100;
    application fcoe_app code-points [011 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there is one application map named **dcbx-iscsi-fcoe_app_map**. It consists of the application **iscsi_app** mapped to code point **100** and the application **fcoe_app** mapped to code points **011** and **101**.

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps are applied to the correct interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/31.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/32.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/33.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/34.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that all four interfaces use the application map **dcbx-iscsi-fcoe-app-map**.

Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway

FCoE traffic typically uses IEEE 802.1p priority 3 (code point 011). However, if your FCoE network uses a different IEEE 802.1p priority than priority 3 for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that priority. You specify the lossless forwarding class used for the FCoE traffic by configuring a fixed classifier and applying it to the native FC (NP_Port) interface. All traffic received from the FC SAN on that NP_Port interface is classified into the forwarding class specified in the fixed classifier.

When native FC interfaces on the FCoE-FC gateway encapsulate incoming FC traffic in Ethernet to create FCoE frames, by default they assign IEEE 802.1p code point 011 to the FCoE traffic, forward the traffic internally to the gateway Ethernet interfaces, and then forward the traffic to the FCoE network. Setting a rewrite value for the IEEE 802.1p code point configures the gateway native FC interface to assign the rewrite value priority to the FCoE frames when the native FC interface forwards the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

You can configure one rewrite value per native FC interface. Each native FC interface can use a different rewrite value.

This example shows how to configure FCoE priority remapping for a converged Ethernet network that uses priority 5 (IEEE code point 101) for FCoE traffic. If your network uses priority 3 for FCoE traffic, then you do not need to remap the FCoE priority, because the default configuration supports lossless FCoE transport on priority 3.

- Requirements on page 5739
- Overview on page 5739
- Configuration on page 5743
- Verification on page 5744

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

Native FC interfaces on an FCoE-FC gateway receive native FC traffic from the FC SAN and encapsulate it in Ethernet to create FCoE frames. Priority remapping enables you to map the encapsulated FC traffic (the FCoE traffic) to any IEEE 802.1p priority.

To support lossless FCoE traffic flows, you must configure the remapped priority correctly on the native FC interfaces and also on the Ethernet interfaces that connect to the FCoE

network. Achieving lossless behavior for FCoE traffic when you remap the FCoE priority requires configuring:

- A lossless forwarding class for FCoE traffic (or using the default **fcoe** forwarding class)
- A behavior aggregate (BA) classifier on the FCoE Ethernet interfaces to map the FCoE forwarding class to the IEEE 802.1p code points (priority) used for FCoE traffic on the FCoE network (the ingress classifier priority for the forwarding class must be the same as the rewrite value priority)
- A fixed classifier on the FCoE-FC gateway FC interface that maps all traffic from the FC network into the lossless FCoE forwarding class (the forwarding class must be lossless)
- A priority rewrite value that remaps the IEEE 802.1p code point on the FCoE-FC gateway FC interface to the priority used for FCoE traffic on the FCoE network
- An input congestion notification profile (CNP) to enable priority-based flow control (PFC) on the FCoE code point (the code point used as the rewrite value) at the Ethernet interface ingress and an output CNP to configure flow control to pause the correct output queue at the Ethernet interface egress

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- A DCBX application and application map on the Ethernet interface to support DCBX application TLV exchange for the lossless FCoE traffic on the FCoE priority

The priority specified in the BA classifier, CNP, and DCBX application map on the Ethernet ingress interfaces must match the priority specified in the fixed classifier and rewrite value configurations on the FC interfaces. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure priority remapping of FCoE traffic on one native FC interface (fc-0/0/2) connected to the FC SAN and on one Ethernet interface (xe-0/0/27) connected to the converged Ethernet (FCoE) network. Both the native FC interface and the Ethernet interface belong to the same local FC fabric on the FCoE-FC gateway.

The converged Ethernet network uses priority 5 (IEEE 80.21p code point 101) for FCoE traffic. The native FC interface on the FCoE-FC gateway receives FC traffic from the FC SAN. The native FC interface encapsulates the FC traffic in Ethernet to create FCoE frames, tags the frames with the IEEE 802.1p priority value 101, and then forwards the FCoE frames to the FCoE-FC gateway Ethernet interface. Because traffic marked with IEEE 802.1p priority 5 is mapped to a lossless FCoE forwarding class, the traffic receives

lossless treatment. The Ethernet interface forwards the FCoE traffic on to the Ethernet network.

FCoE traffic (tagged with priority 5) arriving at the FCoE-FC gateway from the Ethernet network receives lossless treatment and is forwarded to the native FC interface. The native FC interface removes the Ethernet encapsulation from the FCoE frames and forwards the resulting native FC traffic to the FC SAN.

Figure 217 on page 5741 shows the topology for this example, and Table 540 on page 5741 shows the configuration components for this example.

Figure 217: Topology of the IEEE 802.1p Priority Remapping Example

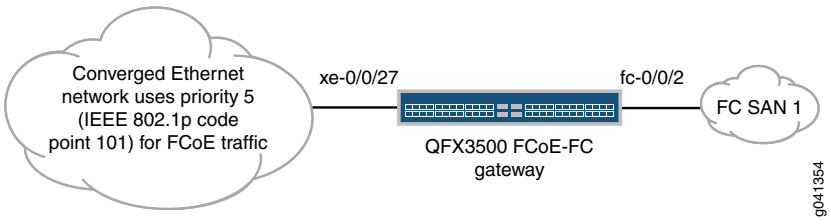

Table 540: Components of the IEEE 802.1p Priority Remapping Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Forwarding class configuration	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: The lossless forwarding class can be mapped to any output queue. However, because FCoE uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.
BA classifier (Ethernet interface)	Name—**fcoe_gw_classifier** Maps code point **101** (IEEE 802.1p priority 5) to the **fcoe1** forwarding class and assigns traffic a packet loss priority of **low**. The classifier is applied to Ethernet interface **xe-0/0/27**.
Fixed classifier (native FC interface)	Forwarding class—**fcoe1** The classifier is applied to native FC interface **fc-0/0/2**
Rewrite value	IEEE 802.1p code point—**101** The rewrite value is applied to native FC interface **fc-0/0/2**

Table 540: Components of the IEEE 802.1p Priority Remapping Configuration Topology *(continued)*

Component	Settings
PFC configuration (CNP on Ethernet interface)	Name—**fcoe1_p5_rewrite_cnp** Input CNP code point—**101** Output CNP code point—**101** Output CNP flow control queue—**5** Interface—**xe-0/0/27**
DCBX application mapping	Application name—**myfcoe5** Application ether-type—**0x8906** Application map name—**myfcoe5_map** Application map code points—**101** Interface—**xe-0/0/27** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

The priority used to identify FCoE traffic (5, IEEE 802.1p code point 101) is configured for lossless transport across the QFX device on interfaces xe-0/0/27 and fc-0/0/2, which belong to the same local FC fabric on the FCoE-FC gateway.

On the Ethernet interface, the classifier maps priority 5 to a lossless forwarding class (fcoe1), the input CNP enables PFC on incoming priority 5 traffic, and the output CNP enables output queue 5 to respond to pause messages received from the peer on traffic tagged with priority 5. On the native FC interface, FC traffic is remapped from priority 3 (the default mapping) to priority 5 and assigned to the same lossless forwarding class, fcoe1, because of the fixed classifier configuration. In this way, traffic tagged with priority 5 on interfaces xe-0/0/27 and fc-0/0/2 receives lossless treatment.

NOTE: To avoid fate sharing, ensure that the remapped priority is classified only to the forwarding class used in the fixed classifier on all other interfaces. For example, if you configure a fixed classifier on an FC interface that classifies all of the traffic into lossless forwarding class fcoe1 and remaps the priority to priority 5 (IEEE 802.1p code point 101), then in all other classifier configurations on all other interfaces, priority 5 should always be classified to forwarding class fcoe1. If you classify priority 6 on another interface to forwarding class fcoe1, then congestion on priority 6 traffic affects priority 5 traffic unfairly.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the local FC fabric configuration. This examples focuses only on priority remapping.

Configuration

CLI Quick Configuration

To quickly configure IEEE 802.1p priority remapping on an FCoE-FC gateway, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_gw_classifier forwarding-class fcoe1 loss-priority low code-points 101
set class-of-service interfaces xe-0/0/27 unit 0 classifiers ieee-802.1 fcoe_gw_classifier
set class-of-service interfaces fc-0/0/2 forwarding-class fcoe1
set class-of-service interfaces fc-0/0/2 rewrite-value input ieee-802.1p code-point 101
set class-of-service congestion-notification-profile fcoe1_p5_rewrite_cnp input ieee-802.1 code-point 101 pfc
set class-of-service congestion-notification-profile fcoe1_p5_rewrite_cnp output ieee-802.1 code-point 101 flow-control-queue 5
set class-of-service interfaces xe-0/0/27 congestion-notification-profile fcoe1_p5_rewrite_cnp
set applications application myfcoe5 ether-type 0x8906
set policy-options application-maps myfcoe5_app_map application myfcoe5 code-points 101
set protocols dcbx interface xe-0/0/27 application-map myfcoe5_app_map
```

Step-by-Step Procedure

To configure a lossless forwarding class for FCoE traffic, classify FCoE traffic into that forwarding class, configure a rewrite value on the native FC interface for the FCoE traffic, and enable PFC on the Ethernet interface, and configure DCBX application protocol TLV exchange for FCoE traffic:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue **5**) for FCoE traffic that uses IEEE 802.1p priority 5:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

2. Configure an ingress classifier named **fcoe_gw_classifier** to map the FCoE priority (IEEE 802.1p code point **101**) to the lossless FCoE forwarding class (**fcoe1**):

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_gw_classifier forwarding-class fcoe1 loss-priority low code-points 101
   ```

3. Apply the classifier named **fcoe_gw_classifier** to Ethernet interface **xe-0/0/27**:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/27 unit 0 classifiers ieee-802.1 fcoe_gw_classifier
   ```

4. Configure the fixed classifier on the native FC interface, using the lossless FCoE forwarding class **fcoe1** (all traffic from the FC SAN is classified into the specified forwarding class). The traffic classified into this forwarding class is tagged with the priority value configured in the next step.

   ```
   [edit class-of-service]
   user@switch# set interfaces fc-0/0/2 forwarding-class fcoe1
   ```

5. Configure the rewrite value (IEEE 802.1p code point **101**) applied to all incoming traffic from the FC SAN on the native FC interface. The rewrite value is the IEEE 802.1p priority that the encapsulated FCoE traffic classified into the **fcoe1** forwarding class uses on the converged Ethernet network.

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 rewrite-value input ieee-802.1p code-point 101
```

6. Configure the input stanza of the CNP (named **fcoe1_p5_rewrite_cnp**) to enable PFC on the FCoE priority on the Ethernet interface:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe1_p5_rewrite_cnp input ieee-802.1
code-point 101 pfc
```

7. Configure the output stanza of the CNP to enable output queue 5 to respond to pause messages received from the peer on traffic tagged with priority 5:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe1_p5_rewrite_cnp output ieee-802.1
code-point 101 flow-control-queue 5
```

8. Apply the CNP named **fcoe1_p5_rewrite_cnp** to Ethernet interface **xe-0/0/27**:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/27 congestion-notification-profile fcoe1_p5_rewrite_cnp
```

9. Configure a DCBX application for FCoE to map to the Ethernet interface, so that DCBX can exchange application protocol TLVs on the correct (remapped) IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set applications application myfcoe5 ether-type 0x8906
```

10. Configure a DCBX application map to map the FCoE application to the correct (remapped) IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set policy-options application-maps myfcoe5_app_map application myfcoe5
code-points 101
```

11. Apply the application map to the Ethernet interface so that DCBX exchanges FCoE application TLVs on the correct code point:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/27 application-map myfcoe5_app_map
```

Verification

To verify the configuration and proper operation of IEEE 802.1p priority remapping on an FCoE-FC gateway, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5745
- Verifying the Behavior Aggregate Classifier Configuration on page 5745
- Verifying the FC Interface Configuration (Fixed Classifier, Rewrite Value) on page 5746
- Verifying the Ethernet Interface PFC Configuration (CNP) on page 5746
- Verifying the Ethernet Interface Configuration on page 5747

- Verifying the DCBX Application Configuration on page 5747
- Verifying the DCBX Application Map Configuration on page 5747
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5748

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                          ID      Queue  Policing priority  No-Loss

  best-effort                            0        0         normal         Disabled

  fcoe                                    1        3         normal          Enabled

  no-loss                                 2        4         normal          Enabled

  network-control                        3        7         normal         Disabled

  fcoe1                                   4        5         normal          Enabled

  mcast                                  8        8         normal         Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifier configured for priority remapping using the operational mode command **show class-of-service classifier name fcoe_gw_classifier**:

```
user@switch> show class-of-service classifier name fcoe_gw_classifier
Classifier: fcoe_gw_classifier, Code point type: ieee-802.1, Index: 13100
  Code point         Forwarding class                   Loss priority
  101                fcoe1                              low
```

Meaning The **show class-of-service classifier name fcoe_gw_classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in the classifier. The command output shows that the classifier maps forwarding class **fcoe1** to IEEE 802.1p code point **101** (priority 5) with a packet loss priority of **low**.

Verifying the FC Interface Configuration (Fixed Classifier, Rewrite Value)

Purpose Verify that the native FC interface (NP_Port) classifies incoming traffic into forwarding class **fcoe1** and that the interface rewrite value is priority 5 (IEEE code point 101).

Action Display the FC interface configuration using the operational mode command **show configuration class-of-service interfaces fc-0/0/2**:

```
user@switch> show configuration class-of-service interfaces fc-0/0/2
rewrite-value {
    input {
        ieee-802.1 {
            code-point {
                101;
            }
        }
    }
}
forwarding-class fcoe1;
```

Meaning The **show configuration class-of-service interfaces fc-0/0/2** command shows that the rewrite value for incoming (input) traffic is IEEE 802.1p code point **101** (priority 5), and that the interface uses forwarding class **fcoe1** as the fixed classifier for all incoming traffic.

Verifying the Ethernet Interface PFC Configuration (CNP)

Purpose Verify that PFC is enabled on the correct priority (IEEE 802.1p code point **101**) for lossless transport and that flow control is enabled on the correct output queue (queue **5**) on the Ethernet interface.

Action List the congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe1_p5_rewrite_cnp**:

```
user@switch> show class-of-service congestion-notification fcoe1_p5_rewrite_cnp
Name: fcoe1_p5_rewrite_cnp, Index: 7061
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2500
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

Meaning The **show class-of-service congestion-notification fcoe1_p5_rewrite_cnp** command shows the input and output stanzas of the CNP. The input stanza shows that PFC is enabled on IEEE 802.1p code point 101 (priority 5). The input stanza also shows that the CNP uses

the default values of 100 meters for the cable length value and 2500 bytes for the maximum receive unit (MRU) value.

The output stanza shows that flow control is enabled on output queue **5** for IEEE 802.1p priority code point **101** (priority 5).

Verifying the Ethernet Interface Configuration

Purpose Verify that the classifier **fcoe_gw_classifier** and the congestion notification profile **fcoe1_p5_rewrite_cnp** are configured on Ethernet interface **xe-0/0/27**.

Action List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces xe-0/0/27**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/27
congestion-notification-profile fcoe1_p5_rewrite_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_gw_classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/27** command shows that the congestion notification profile **fcoe1_p5_rewrite_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_gw_classifier**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX application named **myfcoe5** for FCoE is configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application myfcoe5 {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **myfcoe5** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map **myfcoe5_app_map** is configured.

Action List the application map by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
myfcoe5_app_map {
    application myfcoe5 code-points 101;
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map.

The output shows that there is one application map, **myfcoe5_app_map**, which consists of the application named **myfcoe5** mapped to IEEE 802.1p code point **101** (priority 5).

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application map is applied to the correct interface (**xe-0/0/27**).

Action List the application maps using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/27.0 {
    application-map myfcoe5_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/27** uses application map **myfcoe5_app_map**.

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) unicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

- Requirements on page 5749
- Overview on page 5749
- Configuration on page 5750
- Verification on page 5752

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort unicast traffic, more buffer space needs to be allocated to lossy buffers, and less buffer space should be allocated to lossless buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly unicast traffic.

Topology

Table 541 on page 5750 shows the configuration components for this example.

Table 541: Components of the Recommended Shared Buffer Configuration for Best-Effort Unicast Network Topologies

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text

file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly best-effort unicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent 100
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress buffer-partition lossless percent 5
   user@switch# set ingress buffer-partition lossless-headroom percent 0
   user@switch# set ingress buffer-partition lossy percent 95
   ```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set egress percent 100
   ```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set egress buffer-partition lossless percent 5
   user@switch# set egress buffer-partition lossy percent 75
   user@switch# set egress buffer-partition multicast percent 20
   ```

Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
```

```
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless          :  360.10 KB
    Lossless Headroom :  0.00 KB
    Lossy             :  6841.90 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                 Free
  0                   0.00 KB        0.00 KB              0.00 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  332.80 KB
    Multicast         :  1331.20 KB
    Lossy             :  4992.00 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved,

ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 1331.20 KB to multicast traffic
  - 4992 KB to lossy unicast traffic

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) traffic on links with Ethernet PAUSE (IEEE 802.3X) enabled. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

- Requirements on page 5754
- Overview on page 5754
- Configuration on page 5756
- Verification on page 5757

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic.

From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort traffic on links enabled for Ethernet PAUSE, more buffer space needs to be allocated to ingress dedicated port buffers, and less buffer space should be allocated to ingress shared buffers. Also, more buffer space needs to be allocated to lossless-headroom buffers, and less space to ingress lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly best-effort traffic on links enabled for Ethernet PAUSE.

Topology

Table 542 on page 5756 shows the configuration components for this example.

Table 542: Components of the Recommended Shared Buffer Configuration for Best-Effort Network Topologies with Links Enabled for Ethernet PAUSE

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 70% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 80% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 15%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 70
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 15
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links Enabled for Ethernet PAUSE

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent 70
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 80
user@switch# set ingress buffer-partition lossy percent 15
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 75
user@switch# set egress buffer-partition multicast percent 20
```

Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 70;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 15;
    }
    buffer-partition lossless-headroom {
        percent 80;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
```

```
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  4318.60 KB
  Shared Buffer    :  5041.40 KB
    Lossless          :  252.07 KB
    Lossless Headroom :  4033.12 KB
    Lossy             :  756.21 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  332.80 KB
    Multicast         :  1331.20 KB
    Lossy             :  4992.00 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 4318.6 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 70 percent of the available (user-configurable) buffer space.
- With the ingress shared buffer pool configured as 70 percent of the available buffers, the total size of the ingress shared buffer pool is 5041.4 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 252.07 KB to lossless traffic
  - 4033.12 KB to lossless headroom traffic
  - 756.21 KB to lossy unicast traffic

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:

- 332.80 KB to lossless traffic
- 1331.20 KB to multicast traffic
- 4992 KB to lossy unicast traffic

- Overview on page 5760
- Configuration on page 5761
- Verification on page 5763

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.

- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly multicast traffic, more buffer space needs to be allocated to lossy buffers, less buffer space should be allocated to lossless buffers, and more space needs to be allocated to egress multicast buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly multicast traffic.

Topology

Table 543 on page 5761 shows the configuration components for this example.

Table 543: Components of the Recommended Shared Buffer Configuration for Multicast Network Topologies

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 20% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 75%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly multicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
```

```
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 20
set egress buffer-partition multicast percent 75
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Multicast Traffic

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly multicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 0
user@switch# set ingress buffer-partition lossy percent 95
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 20
user@switch# set egress buffer-partition multicast percent 75
```

Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 20;
    }
    buffer-partition multicast {
```

```
        percent 75;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless          :  360.10 KB
    Lossless Headroom :  0.00 KB
    Lossy             :  6841.90 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                 Free
  0                   0.00 KB        0.00 KB              0.00 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  332.80 KB
    Multicast         :  4992.00 KB
    Lossy             :  1331.20 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic

  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 4992 KB to multicast traffic
  - 1331.20 KB to lossy unicast traffic

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly lossless traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

NOTE: When we discuss lossless buffers, we mean buffers that handle traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x).

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

- Requirements on page 5765
- Overview on page 5765
- Configuration on page 5767
- Verification on page 5768

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly lossless traffic, more buffer space needs to be allocated to lossless buffers, and less buffer space should be allocated to lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly lossless traffic.

Topology

Table 544 on page 5767 shows the configuration components for this example.

Table 544: Components of the Recommended Shared Buffer Configuration for Lossless Network Topologies

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 15% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless headroom buffer partition): 80% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 5%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 90% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 5% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 5%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly lossless traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 15
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 5
set egress percent 100
set egress buffer-partition lossless percent 90
set egress buffer-partition lossy percent 5
set egress buffer-partition multicast percent 5
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Lossless Traffic

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly lossless traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent 100
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress buffer-partition lossless percent 15
   user@switch# set ingress buffer-partition lossless-headroom percent 80
   user@switch# set ingress buffer-partition lossy percent 5
   ```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 90
user@switch# set egress buffer-partition lossy percent 5
user@switch# set egress buffer-partition multicast percent 5
```

Results

Display the results of the configuration:

```
rroot@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 15;
    }
    buffer-partition lossy {
        percent 5;
    }
    buffer-partition lossless-headroom {
        percent 80;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 90;
    }
    buffer-partition lossy {
        percent 5;
    }
    buffer-partition multicast {
        percent 5;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
```

```
  Shared Buffer    :  7202.00 KB
    Lossless       :  1080.30 KB
    Lossless Headroom :  5761.60 KB
    Lossy          :  360.10 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                 Free
  0                   5761.60 KB     0.00 KB              5761.60 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless       :  5990.40 KB
    Multicast      :  332.80 KB
    Lossy          :  332.80 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 1080 KB to lossless traffic
  - 5761.60 KB to lossless headroom traffic
  - 360.10 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Of the total available lossless headroom buffer space of 5761.60 KB, currently no buffer space is being used, so all 5761.60 KB of buffer space is free.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 5990.40 KB to lossless traffic
  - 332.80 KB to multicast traffic
  - 332.80 KB to lossy unicast traffic

Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The QFX Series handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the QFX Series exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE priority (the FCoE IEEE 802.1p code point). The default priority mapping for the

FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).

- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

- Configuration on page 5775
- Verification on page 5776

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX Series device
- Junos OS Release 12.1 or later for the QFX Series

Overview

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

NOTE: DCBX also advertises PFC and enhanced transmission selection (ETS) information. See "Configuring DCBX Autonegotiation" on page 5204 for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.

- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. Table 407 on page 5146 shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode. Table 408 on page 5146 shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

Table 545: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Table 546: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low
010	best-effort	low
011	best-effort	low
100	best-effort	low

Table 546: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier) *(continued)*

Code Point	Forwarding Class	Loss Priority
101	best-effort	low
110	best-effort	low
111	best-effort	low

Topology

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

NOTE: You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 409 on page 5147 shows the configuration components for this example.

Table 547: Components of DCBX Application Protocol Exchange Configuration Topology

Component	Settings
Hardware	QFX Series device
LLDP	Enabled by default on Ethernet interfaces
DCBX	Enabled by default on Ethernet interfaces
iSCSI application (Layer 4)	Application name—**iscsi** protocol—**TCP** destination-port—**3260** code-points—**111**
PTP application (Layer 2)	Application name—**ptp** ether-type—**0x88F7** code-points—**001**, **101**

Table 547: Components of DCBX Application Protocol Exchange Configuration Topology *(continued)*

Component	Settings
FCoE application (Layer 2)	Application name—**fcoe** ether-type—**0x8906** code-points—**011** NOTE: You explicitly configure the FCoE application because you are applying an application map to the interface. When you apply an application map to an interface, all applications must be explicitly configured and included in the application map.
Application maps	**dcbx-iscsi-fcoe-app-map**—Maps the iSCSI and FCoE applications to IEEE 802.1p code points **dcbx-iscsi-ptp-app-map**—Maps iSCSI and PTP applications to IEEE 802.1p code points
Interfaces	**xe-0/0/10**—Configured to exchange FCoE and iSCSI application TLVs (uses application map **dcbx-iscsi-fcoe-app-map**, carries FCoE traffic, and has PFC enabled on the FCoE priority) **xe-0/0/11**—Configured to exchange iSCSI and PTP application TLVs (uses application map **dcbx-iscsi-ptp-app-map**)
PFC congestion notification profile for FCoE application exchange	**fcoe-cnp**: • Code point—**011** • Interface—**xe-0/0/10**
Behavior aggregate classifiers (map forwarding classes to incoming packets by the packet's IEEE 802.1 code point)	**fcoe-iscsi-cl1**: • Maps the **fcoe** forwarding class to the IEEE 802.1p code point used for the FCoE application (**011**) and a loss priority of **high** • Maps the **network-control** forwarding class to the IEEE 802.1p code point used for the iSCSI application (**111**) and a loss priority of **high** • Applied to interface **xe-0/0/10** **iscsi-ptp-cl2**: • Maps the **network-control** forwarding class to the IEEE 802.1p code point used for the iSCSI application (**111**) and a loss priority of **low** • Maps the **best-effort** forwarding class to the IEEE 802.1p code points used for the PTP application (**001** and **101**) and a loss priority of **low** • Applied to interface **xe-0/0/11**

NOTE: This example does not include scheduling (bandwidth allocation) configuration or lossless configuration for the iSCSI forwarding class.

Configuration

CLI Quick Configuration

To quickly configure DCBX application protocol exchange, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set applications application iSCSI protocol tcp destination-port 3260
set applications application FCoE ether-type 0x8906
set applications application PTP ether-type 0x88F7
set policy-options application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
set policy-options application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001
101]
set protocols dcbx interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
set protocols dcbx interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map

set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
set class-of-service interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

Configuring DCBX Application Protocol TLV Exchange

Step-by-Step Procedure

To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.

   ```
   [edit applications]
   user@switch# set application iSCSI protocol tcp destination-port 3260
   user@switch# set application FCoE ether-type 0x8906
   user@switch# set application PTP ether-type 0x88F7
   ```

2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.

   ```
   [edit policy-options]
   user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points
   111
   user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points
   011
   ```

3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.

   ```
   [edit policy-options]
   user@switch# set application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points
   111
   user@switch# set application-maps dcbx-iscsi-ptp-app-map application PTP code-points
   [001 101]
   ```

4. Apply the iSCSI and FCoE application map to interface **xe-0/0/10**, and apply the iSCSI and PTP application map to interface **xe-0/0/11**.

```
[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
```

5. Create the congestion notification profile to enable PFC on the FCoE code point (**011**), and apply the congestion notification profile to interface **xe-0/0/10**.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
```

6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority
high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control
loss-priority high code-points 111
```

7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control
loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- Verifying the Application Configuration on page 5776
- Verifying the Application Map Configuration on page 5777
- Verifying DCBX Application Protocol Exchange Interface Configuration on page 5777
- Verifying the PFC Configuration on page 5778
- Verifying the Classifier Configuration on page 5779

Verifying the Application Configuration

Purpose Verify that DCBX applications have been configured.

Action List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
```

```
application iSCSI {
   protocol tcp;
   destination-port 3260;
}

application fcoe {
   ether-type 0x8906;
}

application ptp {
   ether-type 0x88F7;
}
```

Meaning The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

Verifying the Application Map Configuration

Purpose Verify that the application maps have been configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
   application iSCSI code-points 111;
   application FCoE code-points 011;
}

dcbx-iscsi-ptp-app-map {
   application iSCSI code-points 111;
   application PTP code-points [001 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ptp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the FCoE application, which is mapped to IEEE 802.1p code point **011**.

The application map **dcbx-iscsi-ptp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the PTP application, which is mapped to IEEE 802.1p code points **001** and **101**.

Verifying DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps have been applied to the correct interfaces.

Action List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
   application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
   application-map dcbx-iscsi-ptp-app-map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

Verifying the PFC Configuration

Purpose Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

Action Display the PFC configuration to verify that PFC is enabled on the FCoE code point (**011**) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
        }
    }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
}
```

NOTE: The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

Meaning The **show class-of-service congestion-notification-profile** configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile **fcoe-cnp** has been configured and has enabled PFC on the IEEE 802.1p code point **011** (the default FCoE code point).

The **show class-of-service interfaces** configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile **fcoe-cnp**, which enables PFC on the FCoE code point, is applied to interface **xe-0/0/10**.

Verifying the Classifier Configuration

Purpose Verify that the classifiers have been configured and applied to the correct interfaces.

Action Display the classifier configuration by using the configuration mode command **show class-of-service**:

```
user@switch# show class-of-service
classifiers {
    ieee-802.1 fcoe-iscsi-cl1 {
        import default;
        forwarding-class network-control {
            loss-priority high code-points 111;
        }
        forwarding-class fcoe {
            loss-priority high code-points 011;
        }
    }
    ieee-802.1 iscsi-ptp-cl2 {
        import default;
        forwarding-class network-control {
            loss-priority low code-points 111;
        }
        forwarding-class best-effort {
            loss-priority low code-points [ 001 101 ];
        }
    }
}
interfaces {
    xe-0/0/10 {
        congestion-notification-profile fcoe-cnp;
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-iscsi-cl1;
            }
        }
    }
    xe-0/0/11 {
        unit 0 {
            classifiers {
                ieee-802.1 iscsi-ptp-cl2;
            }
        }
    }
}
```

NOTE: The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

Meaning The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ptp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

Configuring CoS

The class-of-service topics describe how to configure the Junos CoS components for the QFX Series. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue. After defining the CoS components, you assign classifiers to the required physical and logical interfaces.

You can configure various CoS components individually or in combination to define CoS services.

NOTE: When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.

The following topics describe how to configure CoS components :

Defining CoS Code-Point Aliases

You can use code-point aliases to streamline the process of configuring CoS features on your switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- DSCP or DSCP IPv6—Handles incoming IPv4 or IPv6 packets.
- IEEE 802.1p—Handles Layer 2 CoS.

To configure a code-point alias:

1. Specify a CoS marker type (IEEE 802.1 or DSCP).
2. Assign an alias.
3. Specify the code point that corresponds to the alias.

```
[edit class-of-service code-point-aliases]
user@switch# set (dscp | dscp-ipv6 | ieee-802.1) alias-name code-point-bits
```

For example, to configure a code-point alias for an IEEE 802.1 CoS marker type that has the alias name fcoe1 and maps to the code-point bits 011:

```
[edit class-of-service code-point-aliases]
user@switch# set ieee-802.1 fcoe1 011
```

Defining CoS Unicast BA Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP or DSCP IPv6) value or IEEE 802.1p CoS value in the packet header to determine the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

Unicast traffic must use different classifiers than multidestination (mulitcast, broadcast, and destination lookup fail) traffic.

To configure a unicast BA classifier using the CLI:

1. Create a unicast BA classifier:
   - To create a unicast BA classifier based on the default classifier, import the default DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

     ```
     [edit class-of-service classifiers]
     user@switch# set (dscp | ieee-802.1) classifier-name import default forwarding-class
     forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
     ```

   - To create a unicast BA classifier that is not based on the default classifier, create a DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

     ```
     [edit class-of-service classifiers]
     user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class
     forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
     ```

2. Apply the unicast classifier to a specific 10-Gigabit Ethernet interface or to all 10-Gigabit Ethernet interfaces or to all Fibre Channel interfaces on the switch.
   - To apply the classifier to a specific interface:

     ```
     [edit class-of-service interfaces]
     user@switch# set interface-name unit unit classifiers (dscp | ieee-802.1) classifier-name
     ```

   - To apply the classifier to all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

     ```
     [edit class-of-service interfaces]
     user@switch# set xe-* unit * classifiers (dscp | ieee-802.1) classifier-name
     ```

Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP) value or IEEE 802.1p CoS value in the packet header to determine the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

NOTE: DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

Unicast and multidestination traffic must use different classifiers.

To configure a multidestination BA classifier using the CLI:

1. Create a DSCP or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

   ```
   [edit class-of-service classifiers]
   user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class forwarding-class-name
   loss-priority level code-points [aliases] [bit-patterns]
   ```

2. Configure the classifier as a multidestination classifier:

   ```
   [edit class-of-service]
   user@switch# set multi-destination classifiers (dscp | ieee-802.1) classifier-name
   ```

Configuring CoS Tail-Drop Profiles

You can configure an interpolated weighted random early detection (WRED) tail-drop profile to control packet drop characteristics for different traffic loss priorities.

NOTE: You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

Interpolated means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point.

The drop start point is the average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop. Specify the drop start point using the first of two **fill-level** statements.

The drop end point is the average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.) Specify the drop end point using the second of two **fill-level** statements.

The minimum drop rate is always **0**. Specify the minimum drop rate using the first of two **drop-probability** statements. The maximum drop rate is the drop probability when the average queue fill level reaches the drop end point. Specify the maximum drop rate using the second of two **drop-probability** statements.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

Configuring CoS Drop Profile Maps

A drop-profile map associates a tail-drop profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified tail-drop profile to traffic in the forwarding class that matches the specified loss priority.

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

To configure a drop-profile map using the CLI:

- For the desired scheduler, configure the traffic loss priority and specify the drop profile you want to use to control the drop characteristics for traffic of that loss priority:

  ```
  [edit class-of-service]
  user@switch# set schedulers scheduler-name drop-profile-map loss-priority level protocol
  any drop-profile drop-profile-name
  ```

Defining CoS Forwarding Classes

Forwarding classes allow you to group packets for transmission. The switch supports a total of 12 forwarding classes. In order to forward traffic, you map (assign) the forwarding classes to unicast or multidestination (multicast, broadcast, and destination lookup fail) output queues.

The switch has 12 output queues. Queues 0 through 7 are for unicast traffic and queues 8 through 11 are for multicast traffic. Forwarding classes mapped to unicast queues must carry unicast traffic, and forwarding classes mapped to multidestination queues must carry multidestination traffic. There are four default unicast forwarding classes and one default multidestination forwarding class.

The default unicast forwarding classes are:

- **best-effort**—Best-effort traffic
- **fcoe**—Guaranteed delivery for FCoE traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **network-control**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. In addition, all forwarding classes mapped to a particular queue must be either lossless or lossy. You cannot mix lossless and lossy forwarding classes (traffic) on the same queue. Also, you cannot mix unicast and multicast forwarding classes on the same queue.

```
[edit class-of-service forwarding-classes]
user@switch# class class-name queue-num queue-number <no-loss>
```

NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment unless you include the optional no-loss packet drop attribute introduced in Junos OS Release 12.3 in the forwarding class configuration..

NOTE: Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

```
[edit class-of-service forwarding-classes]
user@switch# queue queue-number class-name
```

The queue statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the queue statement to map forwarding classes to queues, edit the configuration to replace the queue statement with the class statement.

Defining CoS Forwarding Class Sets

A forwarding class set is a priority group for enhanced transmission selection (ETS) traffic control. Each forwarding class set consists of one or more forwarding classes (priorities, which can also be considered as output queues).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set.

To configure a forwarding class set using the CLI:

1. Assign one or more forwarding classes to the forwarding class set:

   ```
   [edit class-of-service]
   user@switch# set forwarding-class-sets forwarding-class-set-name class
   forwarding-class-name
   ```

2. Map the forwarding class set to an interface:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name forwarding-class-set forwarding-class-set-name
   ```

Related Documentation

Defining CoS Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, the tail-drop profiles associated with the queue, and the queue buffer size.

The parameters you configure in a scheduler define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR), set as a percentage rate or as an absolute value in bits per second. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

  NOTE: Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.

  NOTE: You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR), set as a percentage rate or as an absolute value in bits per second.

  NOTE: Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:
  - **low**—The scheduler has low priority.
  - **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **drop-profile-map**—Drop profile mapping to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.

NOTE: Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

NOTE: Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

To apply scheduling properties to traffic, map schedulers to forwarding classes using a scheduler map, and then associate the scheduler map with the interfaces. This applies the configured scheduling to the traffic in the specified forwarding class on the associated interface. Using different scheduler maps, you can map different schedulers to the same traffic (the same forwarding class) to apply different scheduling to that traffic on different interfaces.

To configure a scheduler using the CLI:

1. Name the scheduler and define the minimum guaranteed bandwidth for the queue:

   ```
   [edit class-of-service]
   user@switch# set schedulers scheduler-name transmit-rate (rate | percent percentage)
   ```

2. Define the maximum bandwidth for the queue:

   ```
   [edit class-of-service schedulers scheduler-name]
   user@switch# set shaping-rate (rate | percent percentage)
   ```

3. Define the queue priority:

   ```
   [edit class-of-service schedulers scheduler-name]
   user@switch# set priority level
   ```

4. Define the drop profile using a drop profile map:

   ```
   [edit class-of-service schedulers scheduler-name]
   user@switch# set drop-profile-map loss-priority (low | medium-high | high) protocol protocol
   drop-profile drop-profile-name
   ```

5. Configure the size of the port dedicated buffer space for the queue:

   ```
   [edit class-of-service schedulers scheduler-name]
   ```

```
user@switch# set buffer-size percent 20
```

6. Configure a scheduler map to map the scheduler to a forwarding class, which applies the scheduler's properties to the traffic in that forwarding class:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

7. Assign the scheduler map to one or more interfaces to apply the scheduling to the traffic that belongs to the specified forwarding class on those interfaces:

```
[edit class-of-service]
user@switch# set interfaces interface-name scheduler-map scheduler-map-name
```

Defining CoS Queue Scheduling Priority

You can configure the scheduling priority of individual queues by specifying the priority in a scheduler, and then associating the scheduler with a queue by using a scheduler map. Queues can have one of two bandwidth priorities:

- **strict-high** —The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.
- To configure queue priority using the CLI:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name priority level
```

Related Documentation

Changing the Host Outbound Traffic Default Queue Mapping

If you do not want to use the default mapping of host Routing Engine and CPU outbound traffic to queues, you can change the default output queue. You can also change the default DSCP bits used in the type of service (ToS) field of packets generated by the Routing Engine.

Configuring a queue for host outbound traffic maps all traffic that the host generates to one forwarding class (queue). The configuration is global and applies to all host-generated traffic on the switch. Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

NOTE: Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the **fcoe** queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (**fcoe**) across the Interconnect device (fabric) and the egress Node device.

To change the host outbound traffic egress queue by including the **host-outbound-traffic** statement at the **[edit class-of-service]** hierarchy level:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class class-name;
  dscp-code-point code-point;
}
```

For example, to map host outbound traffic to queue 7 (the network control forwarding class) and set the DSCP code point value to 101010:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class network-control;

Defining CoS Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) contained in a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

  NOTE: You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR).
- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

  NOTE: Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

To configure a traffic control profile using the CLI:

1. Name the traffic control profile and define the minimum guaranteed bandwidth for the priority group:

   ```
   [edit class-of-service ]
   user@switch# set traffic-control-profiles traffic-control-profile-name guaranteed-rate (rate | percent percentage)
   ```

2. Define the maximum bandwidth for the priority group:

   ```
   [edit class-of-service traffic-control-profiles traffic-control-profile-name]
   user@switch# set shaping-rate (rate | percent percentage)
   ```

3. Attach a scheduler map to the traffic control profile:

   ```
   [edit class-of-service traffic-control-profiles traffic-control-profile-name]
   user@switch# set scheduler-map scheduler-map-name
   ```

Configuring CoS PFC (Congestion Notification Profiles)

A congestion notification profile (CNP) enables priority-based flow control (PFC) on specified IEEE 802.1p priorities (code points). A CNP has two components:

- Input CNP:
  - Enable PFC on a specified priority.
  - Configure the maximum receive unit (MRU) on an interface for traffic that matches the PFC priority (optional).
  - Specify the length of the attached cable on the ingress interface (optional)
- Output CNP (optional): Configure flow control to enable PFC pause on specific output queues for specified priorities.

NOTE: By default, output queues 3 and 4 (which are mapped to default lossless forwarding classes fcoe and no-loss, respectively) are configured to respond to PFC pause messages received from the connected peer on priorities 3 and 4 (code points 011 and 100, respectively). If you explicitly configure flow control on any output queue, you must configure flow control on every output queue that you want to respond to pause messages. (The explicit configuration overrides the default configuration.)

To achieve lossless behavior, the output queue priorities on which you enable PFC flow control must match the PFC priorities on which you enable PFC on the input interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101) in the output component of the CNP, then you must also enable pause on priorities 3 and 5 on the input component of the CNP. (In addition, the forwarding classes mapped to the paused output queues must be lossless forwarding classes.)

Associating a CNP with an interface enables PFC on the ingress traffic that matches the priority specified in the input CNP, and programs the queues listed in the output CNP to pause when the interface receives a PFC pause message from the connected peer. Configure PFC on a priority end to end along the entire data path to create a lossless lane of traffic on the network.

NOTE: You must enable PFC on the priority used by FCoE traffic on ingress interfaces (input CNP). Enable PFC on the FCoE priority on every interface that carries FCoE traffic. By convention, FCoE traffic uses priority 3 (code point 011), which maps to queue 3. If your network uses priority 3 for FCoE traffic, the default forwarding class and classifier configuration support lossless transport, but you must still configure a CNP and apply it to the correct ingress interfaces to enable PFC and achieve lossless transport.

If your network does not use priority 3 for FCoE traffic, you need to configure a classifier that classifies FCoE traffic into a lossless forwarding class, based on the priority your network uses for FCoE traffic. If you are not using the default lossless forwarding class configuration, then you also need to ensure that the output queue mapped to the lossless FCoE forwarding class is programmed to pause.

You can attach only one CNP to an interface. There is no limit to the total number of CNPs you can create.

Configuring a CNP consists of:

- Naming the CNP.
- Specifying the IEEE 802.1 code point (priority) on which you want to enable PFC on ingress interfaces (input CNP).
- Optionally, specifying the MRU and the length of the attached cable on ingress interfaces (input CNP).
- Optionally, configuring flow control (PFC pause) on specified output queues if you want queues other than queues 3 and 4 to respond to pause messages received from the connected peer (output CNP).
- Mapping the CNP to an interface.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

1. Enable PFC on the desired priority in the input CNP and optionally configure the interface MRU for traffic on that priority:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile cnp-name input ieee-802.1 code-point code-point bits pfc mru mru-value
   ```

   For example, to configure a CNP named **fcoe-cnp** that enables PFC on IEEE 802.1 code point **011** and configures an MRU value of **2240**:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc mru 2240
   ```

2. Configure the length of the cable attached to the ingress interface (optional):

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile cnp-name input cable-length cable-length-value
   ```

   For example, to configure a CNP named **fcoe-cnp** that sets the length of the ingress interface cable to **100** meters:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe-cnp input cable-length 100
   ```

3. (Optional) Configure flow control on output queues:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point code-point-bits flow-control-queue [queue | list-of-queues]
   ```

   For example, to configure a CNP named **fcoe-cnp** that enables PFC pause flow control on output queues 3 and 5 for FCoE traffic that uses priority 3 (code point **011**) and on output queue 4 for traffic that uses priority 4 (code point **100**):

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point 011 flow-control-queue [3 5]
   user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point 100 flow-control-queue 4
   ```

4. Map the CNP to an interface:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface congestion-notification-profile cnp-name
   ```

   For example, to map the CNP **fcoe-cnp** to the interface **xe-0/0/7**:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/7 congestion-notification-profile fcoe-cnp
   ```

Enabling and Disabling CoS Symmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to Ethernet link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Symmetric flow control means that an interface has the same PAUSE configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled, or they are both disabled.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. If you attempt to configure both features, the switch returns a commit error. Ethernet PAUSE and PFC are also mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

By default, all flow control features are disabled. You enable symmetric flow control on the interfaces on which you want to PAUSE all of the traffic on a link.

- To enable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
user@switch# set flow-control
```

- To disable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
user@switch# set no-flow-control
```

Configuring CoS Asymmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction.

Symmetric flow control means that the interface has the same configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled or they are both disabled. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

Asymmetric flow control provides the ability to configure the receive buffer and transmit buffer Ethernet PAUSE actions independently on an interface. The buffers perform the following actions:

- The receive buffers generate and send PAUSE messages to the connected peer to ask the peer to stop sending traffic for a time period specified in the PAUSE frame. The peer interface's buffers may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.
- The transmit buffers respond to PAUSE messages received from the connected peer to stop sending traffic to the peer. The transmit buffer may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to PAUSE messages:

- Receive buffers on—Enable PAUSE transmission (generate and send PAUSE frames)
- Transmit buffers on—Enable PAUSE reception (respond to received PAUSE frames)

You must explicitly set both the receive buffer and the transmit buffer to configure asymmetric flow control.

- To configure asymmetric flow control on an interface:

  ```
  [edit interfaces interface-name ether-options]
  ```

```
user@switch# set configured-flow-control rx-buffers (on | off) tx-buffers (on | off)
```

For example, to configure interface **xe-0/0/24** to generate and send PAUSE messages but not to respond to received PAUSE messages:

```
set interfaces xe-0/0/24 ether-options configured-flow-control rx-buffers on tx-buffers off
```

For example, to configure interface **xe-0/0/30** to respond to received PAUSE messages but not to generate and send PAUSE messages:

```
set interfaces xe-0/0/30 ether-options configured-flow-control rx-buffers off tx-buffers on
```

NOTE: If you configure both buffers to be on, that is equivalent to symmetric flow control. If you configure both buffers to be off, there is no flow control (flow control is disabled).

Configuring CoS Fixed Classifier Rewrite Values for Native FC Interfaces (NP_Ports)

Fibre Channel over Ethernet (FCoE) traffic typically uses IEEE 802.1p priority 3 (code point 011). When Fibre Channel (FC) traffic arrives on a native FC interface (NP_Port) on an FCoE-FC gateway, the interface encapsulates the FC traffic in Ethernet to create FCoE frames. By default, the native FC interface assigns priority 3 to the FCoE traffic. The traffic is then forwarded internally to the gateway Ethernet interfaces, and then forwarded to the FCoE network.

If your FCoE network uses priority 3 for FCoE traffic, you do not need to use a rewrite value to remap the FCoE priority on native FC interfaces, because the default configuration maps priority 3 to the FCoE forwarding class.

However, if the FCoE network uses a different priority than priority 3 for FCoE traffic, then you can configure a rewrite value to remap incoming traffic from the FC SAN to that priority after the interface encapsulates the FC packets in Ethernet. Setting a rewrite value for the IEEE 802.1p code point (priority) configures the gateway native FC interface to assign the rewrite value to the encapsulated FCoE frames before forwarding the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

Traffic coming from the FC SAN is classified into a lossless forwarding class, and that lossless forwarding class is mapped to the rewrite value (the priority used for FCoE traffic on the converged Ethernet network). You specify the lossless forwarding class used for FCoE traffic on a native FC interface by configuring a fixed classifier and applying it to the native FC interface. (The same forwarding class must also be mapped to the rewrite value priority in the ingress classifier applied to the FCoE Ethernet interfaces.) All traffic received from the FC SAN on that FC interface is encapsulated in Ethernet, classified into the forwarding class specified in the fixed classifier, and assigned the rewrite value priority.

Configuring a rewrite value consists of:

- Configuring a fixed classifier on the native FC interface. The fixed classifier assigns all the traffic that arrives at the interface from the connected peer in the FC SAN to one fixed forwarding class. The forwarding class must be a lossless forwarding class and must be classified to the rewrite value priority in the ingress classifier configuration on the FCoE Ethernet interfaces.
- Specifying an IEEE 802.1p rewrite value for the native FC interface. The traffic mapped to the forwarding class in the fixed classifier is marked with the priority you specify in the rewrite value when the traffic is encapsulated in Ethernet. The rewrite value must be the IEEE 802.1p priority used for FCoE traffic in your converged Ethernet network.

You can configure one rewrite value per native FC interface. Each native FC interface can use a different rewrite value.

1. Configure a fixed classifier on the native FC interface:

```
[edit class-of-service]
user@switch# set interfaces fc-interface-name forwarding-class
lossless-forwarding-class-name
```

For example, to configure a fixed classifier on native FC interface **fc-0/0/2** that specifies the lossless forwarding class **fcoe1**:

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 forwarding-class fcoe1
```

2. Configure a rewrite value for the traffic classified into the fixed classifier (this must be the IEEE 802.1p priority used for the traffic on your converged Ethernet network):

   ```
   [edit class-of-service]
   user@switch# set interfaces fc-interface-name rewrite-value input ieee-802.1 code-point code-point-bits
   ```

   For example, to configure a rewrite value on native FC interface **fc-0/0/2** that specifies an IEEE 802.1p priority of **101** (the lossless forwarding class specified in the fixed classifier must be classified to this priority in the ingress classifier configuration on the FCoE Ethernet interfaces):

   ```
   [edit class-of-service]
   user@switch# set interfaces fc-0/0/2 rewrite-value input ieee-802.1 code-point 101
   ```

In the example, all traffic from the FC SAN that arrives at FCoE-FC gateway interface fc-0/0/2 is encapsulated in Ethernet, classified into the lossless fcoe1 forwarding class, and tagged with the IEEE 802.1p priority 5 (code point 101). In this example, we assume that the converged Ethernet network uses priority 5 for FCoE traffic, and that the fcoe1 forwarding class is mapped to priority 5 in the ingress classifier configuration on the Ethernet interfaces. To achieve lossless transport, you must also enable PFC on priority 5 on the Ethernet interfaces that connect the FCoE traffic to the Ethernet network.

Configuring Global Ingress and Egress Shared Buffers

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of ingress and egress buffers to better support different mixes of network traffic.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Use the default shared buffer settings (for a network with a balanced mix of lossless, best-effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from one of the recommended configurations, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more

than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffer allocation and partitioning using the CLI:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent percent
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress buffer-partition lossless percent percent
   user@switch# set ingress buffer-partition lossless-headroom percent percent
   user@switch# set ingress buffer-partition lossy percent percent
   ```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set egress percent percent
   ```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set egress buffer-partition lossless percent percent
   user@switch# set egress buffer-partition lossy percent percent
   user@switch# set egress buffer-partition multicast percent percent
   ```

Defining CoS Rewrite Rules

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on an interface. You can also apply an existing rewrite rule on an interface.

NOTE: On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

NOTE: To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the rewrite rule and then apply the new rule.

NOTE: For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

To create rewrite rules and enable them on interfaces:

- To create an 802.1p rewrite rule named **customup-rw** in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point
000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high code-point
001
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point
010
user@switch# set ieee-802.1 customup-rw forwarding-class fcoe loss-priority low code-point
011
```

```
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority low
code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority high
code-point 101
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority low code-point
110
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority high code-point
111
```

- To enable an 802.1p rewrite rule named **customup-rw** on a Layer 2 interface:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/7 unit 0 rewrite-rules ieee-802.1
customup-rw
```

NOTE: All forwarding classes assigned to port xe-0/0/7 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

- To enable an 802.1p rewrite rule named **customup-rw** on all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical interface (unit) number:

```
[edit]
user@switch# set class-of-service interfaces xe-* unit * rewrite-rules customup-rw
```

NOTE: In this case, *all* forwarding classes assigned to *all* 10-Gigabit Ethernet ports must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

Assigning CoS Components to Interfaces

After you define the following CoS components, you assign them to physical or logical interfaces. Components that you assign to physical interfaces are valid for all of the logical interfaces configured on the physical interface. Components that you assign to a logical interface are valid only for that logical interface.

- Classifiers—Assign only to logical interfaces.
- Congestion notification profiles—Assign only to physical interfaces.
- Forwarding classes—Assign to interfaces by mapping to forwarding class sets.
- Forwarding class sets—Assign only to physical interfaces.
- Output traffic control profiles—Assign only to physical interfaces (with a forwarding class set).
- Rewrite rules—Assign only to logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wildcards. You can also assign a congestion notification profile or a forwarding class set globally to all interfaces.

To assign CoS components to interfaces:

Assign CoS components to a single interface by associating a CoS component (for example a forwarding class set named **san-priority-group**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set san-priority-group
```

Assign a CoS component to multiple interfaces by associating a CoS component (for example, a rewrite rule named **customup-rw**) to all 10-Gigabit Ethernet interfaces on the switch, use wildcard characters for the interface name and logical interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set xe-* unit * rewrite-rules ieee-802.1 customup-rw
```

Assign a congestion notification profile or a forwarding class set globally to all interfaces using the **set class-of-service interfaces all** statement. For example, to assign a forwarding class set named **be_fcset** to all interfaces:

```
[edit class-of-service interfaces]
user@switch# set all forwarding-class-set be_fcset
```

NOTE: If there is an existing CoS configuration of any type on an interface, the global configuration is not applied to that particular interface. The global configuration is applied to all interfaces that do not have an existing CoS configuration.

For example, if you configure a rewrite rule, assign it to interfaces xe-0/0/20.0 and xe-0/0/22.0, and then configure a congestion notification profile and apply it to all interfaces, the congestion notification profile is applied to every interface except xe-0/0/20 and xe-0/0/22.

- Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5460

Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. QFX Systems support three DCBX modes:

- Autonegotiation—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- IEEE DCBX—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- DCBX Version 1.01—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric Node devices come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

NOTE: QFX Systems do not support pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00. If a QFX Series interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

```
[edit protocols dcbx]
user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |
dcbx-version-1.01)
```

For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

```
user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
```

To configure IEEE DCBX on all interfaces:

```
user@switch# set protocols dcbx interface all mode ieee-dcbx
```

Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to

the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is "willing" to learn its PFC configuration from the switch, DCBX pushes the switch's PFC configuration to the peer and does not check the peer's administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as "willing").

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

NOTE: **If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as "FCoE down" and disables FCoE on the interface.**

When DCBX marks an interface as "FCoE down," the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as "FCoE down."

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

   ```
   [edit]
   user@switch# set protocols dcbx interface interface-name priority-flow-control
   no-auto-negotiation
   ```

2. Turn off autonegotiation for applications.

   ```
   [edit]
   user@switch# set protocols dcbx interface interface-name applications no-auto-negotiation
   ```

3. Turn off autonegotiation for ETS.

   ```
   [edit]
   user@switch# set protocols dcbx interface interface-name enhanced-transmission-selection
   no-auto-negotiation
   ```

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- ```
  [edit protocols dcbx interface interface-name]
  user@switch# set enhanced-transmission-selection no-recommendation-tlv
  ```

  ```

Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

NOTE: **Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.**

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is "willing," the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- `[edit protocols dcbx interface` *`interface-name`*`]`
  `user@switch#` **set enhanced-transmission-selection no-recommendation-tlv**

Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

  ```
  [edit applications]
  user@switch# set application application-name ether-type ether-type
  ```

  For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

  ```
  user@switch# set applications application ptp ether-type 0x88F7
  ```

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

  ```
  [edit]
  user@switch# set applications application application-name protocol (tcp | udp)
  destination-port port-value
  ```

  For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

  ```
  user@switch# set applications application iscsi protocol tcp destination-port 3260
  ```

Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

  ```
  [edit policy-options]
  user@switch# set application-maps application-map-name application application-name
  code-points [ aliases ] [ bit-patterns ]
  ```

  For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

  ```
  user@switch# set policy-options application-maps ptp-app-map application ptp code points
  [ 001 101 ]
  ```

Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange

After you define applications and map them to IEEE 802.1p code points in an application map, apply the application map to the interfaces on which you want DCBX to exchange the application protocol information with connected peers. (See *Related Documentation* for how to define applications and configure application maps to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

- To apply an application map to a DCBX interface, specify the DCBX interface and the application map name:

  ```
  [edit protocols]
  user@switch# set dcbx interface interface-name application-map application-map-name
  ```

  For example, to apply an application map named **ptp-app-map** on interface **xe-0/0/11**:

  ```
  user@switch# set protocols dcbx interface xe-0/0/11 application-map ptp-app-map
  ```

buffer-partition (Egress)

Syntax

```
buffer-partition (lossless | lossy | multicast) {
    percent percent;
}
```

Hierarchy Level [edit class-of-service shared-buffer egress]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description The egress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best-effort, lossless, and multicast traffic (multicast also includes broadcast and destination lookup fail traffic). To better support the mix of traffic on your network, you can optimize the allocation of egress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three egress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ports. All ports on the switch receive the same allocation of egress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Default The default egress buffer partition shown in Table 548 on page 5824 supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

Table 548: Default Egress Shared Buffer Partitioning

Lossless Partition	Lossy Partition	Multicast Partition
50%	31%	19%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages must always total 100 percent.

Options **lossless**—Shared buffer space reserved for all lossless egress traffic.

lossy—Shared buffer space for best-effort unicast egress traffic.

multicast—Shared buffer space reserved for all multicast (including broadcast and destination lookup fail) egress traffic.

percent *percent*—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossy, or multicast buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

buffer-partition (Ingress)

Syntax

```
buffer-partition (lossless | lossless-headroom | lossy) {
    percent percentage;
}
```

Hierarchy Level [edit class-of-service shared-buffer ingress]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description The ingress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best effort (best-effort unicast and multicast) and lossless traffic. To better support the mix of traffic on your network, you can optimize the allocation of ingress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three ingress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ingress traffic. All ports on the switch receive the same allocation of ingress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Default The default ingress buffer partition shown in Table 549 on page 5826 supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

Table 549: Default Ingress Shared Buffer Partitioning

Lossless Partition	Lossless-Headroom Partition	Lossy Partition
9%	45%	46%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages always must total 100 percent.

Options **lossless**—Shared buffer space reserved for all lossless ingress traffic.

lossless-headroom—Shared buffer space reserved to store packets received while either an 802.3x Ethernet PAUSE or a priority-based flow control (PFC) pause is asserted. (When an ingress interface pauses traffic, it must have the buffer space to store all of the packets currently in the buffer, and also all of the packets received before the connected peer stops sending traffic and the wire is cleared of packets.)

lossy—Shared buffer space for best-effort ingress traffic.

percent *percent*—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossless-headroom, or lossy buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

buffer-size

Syntax buffer-size (percent *percent* | remainder);

Hierarchy Level [edit class-of-service schedulers *scheduler-name*]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Set the dedicated buffer size of the egress queue that you bind the scheduler to in the scheduler map configuration. The switch allocates space from the global dedicated buffer pool to ports and queues in a hierarchical manner. The switch allocates an equal number of dedicated buffers to each egress port, so each egress port receives the same amount of dedicated buffer space. The amount of dedicated buffer space per port is not configurable.

However, the **buffer-size** statement allows you to control the way each port allocates its share of dedicated buffers to its queues. For example, if a port only uses two queues to forward traffic, you can configure the port to allocate all of its dedicated buffer space to those two ports and avoid wasting buffer space on queues that are not in use. We recommend that the buffer size should be the same size as the minimum guaranteed transmission rate (the **transmit-rate**).

You configure the proportion of port dedicated buffers allocated to a particular output queue using the following process:

1. Configure a scheduler and set the **buffer-size** option to match the scheduler **transmit-rate** value.
2. Use a scheduler map to map the scheduler to the forwarding class that is mapped to the queue to which you want to apply the buffer size.

   For example, suppose that you want to change the dedicated buffer allocation for FCoE traffic. FCoE traffic is mapped to the fcoe forwarding class, and the fcoe forwarding class is mapped to queue 3 (this is the default configuration). To use default FCoE traffic mapping, in the scheduler map configuration, map the scheduler to the **fcoe** forwarding class.
3. Associate the scheduler map with the traffic control profile you want to use on the egress ports that carry FCoE traffic.
4. Associate the traffic control profile that includes the scheduler map with the desired egress ports. For this example, you associate the traffic control profile with the ports that carry FCoE traffic.

   Queue 3, which is mapped to the fcoe forwarding class and therefore to the FCoE traffic, receives the dedicated buffer allocation specified in the **buffer-size** statement.

NOTE: The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

Default The port allocates dedicated buffers to queues that have an explicitly configured scheduler buffer size. If you do not explicitly configure a scheduler buffer size for a queue, the port serves the explicitly configured queues first. Then the port divides the remaining dedicated buffers equally among the queues that have an explicitly attached scheduler *without* an explicitly configured buffer size configuration. (If you configure a scheduler, but you do not configure the buffer size parameter, the default is equivalent to configuring the buffer size with the **remainder** option.)

If you use the default scheduler and scheduler map on a port (no explicit scheduler configuration), then the port allocates its dedicated buffer pool to queues based on the default scheduling, as shown in Table 550 on page 5829. The default buffer size is the same as the default transmit rate for each default queue:

Table 550: Default Output Queue Buffer Sizes

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
0	best-effort	5%	5%
3	fcoe	35%	35%
4	no-loss	35%	35%
7	network-control	5%	5%
8	mcast	20%	20%

Because the default scheduler includes only five forwarding classes, only the queues mapped to those forwarding classes receive dedicated buffers from the port buffer pool. (Buffers are not wasted on queues that do not carry traffic.)

Options **percent** *percent*—Percentage of the port dedicated buffer pool allocated to the queue (or queues) mapped to the scheduler.

remainder—Remaining dedicated buffer pool after the port satisfies the needs of the explicitly configured buffers. The port divides the remaining buffers equally among the queues that are explicitly attached to a scheduler but that do not have an explicit buffer size configuration (or are configured with **remainder** as the buffer size).

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

cable-length (Congestion Notification)

Syntax cable-length *cable-length-value*;

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* input]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Specify the length of the cable between the interface and its peer interface in meters. The system uses the cable length and the maximum receive unit (MRU) to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The the shorter the cable length and lower the MRU, the less headroom buffer space is required for PFC.

NOTE: You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the **mtu** statement at the **[edit interfaces *interface-name*]** hierarchy level.

Default The default cable length value is 100 meters (approximately 328 feet).

Options ***cable-length-value***—Length of the cable in meters. (Generally from 1 to 300 meters, but there is no configuration restriction.)

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

class (Forwarding Classes)

Syntax

```
class {
  class-name {
    queue-num queue-number <no-loss>;
  }
}
```

Hierarchy Level [edit class-of-service forwarding-classes]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

Description Map one or more forwarding classes to a single queue. You can map unicast forwarding classes to a unicast queue (0 through 7) and multidestination forwarding classes to a multicast queue (8 through 11). The queue to which you map a forwarding class determines if the forwarding class is a unicast or multicast forwarding class.

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the fcoe forwarding class and you do not include the no-loss option, the fcoe forwarding class is lossy, not lossless.

Options *class-name* —Name of the forwarding class.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

code-point (Fibre Channel Interfaces)

Syntax code-point *code-point-bits*;

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name* rewrite-value input ieee-802.1]

Description Configure the IEEE 802.1p code point value assigned to all traffic received from the Fibre Channel (FC) network on the specified FC interface (NP_Port). When native FC traffic from the FC SAN arrives at the NP_Port interface, the NP_Port interface encapsulates it in Ethernet to create FCoE packets before forwarding the traffic onto the FCoE network. Instead of using the default value of priority 3 (code point 011) for the FCoE traffic, the interface rewrites the IEEE 802.1p code point to the value specified in the rewrite value code points.

After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE traffic typically uses priority 3 (IEEE code point 011). The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

Options ***code-point-bits***—Value of the code-point bits, in decimal form.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

code-point (Output Congestion Notification)

Syntax

```
code-point [ code-point-bits ] {
  flow-control-queue [ queue | list-of-queues ];
}
```

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* output ieee-802.1]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Specify the IEEE 802.1p code point bits that identify the traffic you want to enable for priority-based flow control (PFC) pause.

Default By default, IEEE 802.1p priorities 3 and 4 (code points 011 and 100, respectively) are enabled for PFC pause on all Ethernet interfaces. If you explicitly configure priorities to pause and the output queues on which to enable pause, the explicit configuration overrides the default configuration. When you apply an explicit output congestion notification profile to an interface, only the priorities and queues specified in the output congestion notification profile are enabled for pause on that interface.

For example, if you configure an output congestion notification profile that specifies priority 2 (code point 010), then traffic with IEEE 802.1p priority 2 is paused on the configured output queue during periods of congestion. However, traffic with priority 3 and priority 4 is not programmed to pause, because the explicit configuration overwrites the default configuration, and the explicit configuration does not pause priority 3 and priority 4. If you configure an explicit output congestion notification profile, all of the priorities you want to enable for PFC and all of the output queues you want to pause must be explicitly configured.

Options ***code-point-bits***—3-bit value in decimal form.

The remaining statements are described separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

configured-flow-control

Syntax

```
configured-flow-control {
  rx-buffers (on | off);
  tx-buffers (on | off);
}
```

Hierarchy Level [edit interfaces *interface-name* ether-options]

Description Configure Ethernet PAUSE asymmetric flow control on an interface. You can set an interface to generate and send PAUSE messages, and you can set an interface to respond to PAUSE messages sent by the connected peer. You must set both the **rx-buffers** and the **tx-buffers** values when you configure asymmetric flow control.

Use the **flow-control** and **no-flow-control** statements to enable and disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual "lanes" of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC) by applying a congestion notification profile to the interface.

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Interface Congestion Notification Profile Association

```
congestion-notification-profile profile-name {
```

Hierarchy Level

[edit class-of-service],
[edit class-of-service interfaces *interface-name*]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure a congestion notification profile to enable priority-based flow control (PFC) on traffic specified by an IEEE 802.1 code point, and apply the profile to an interface.

NOTE: You must configure PFC for FCoE traffic. Each interface that carries FCoE traffic should be configured for PFC on the FCoE code point (usually 011).

You can attach a maximum of one congestion notification profile to an interface. There is no limit to the total number of congestion notification profiles you can create.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

Options

profile-name—Name of the congestion notification profile.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

dcbx-version

Syntax dcbx-version (auto-negotiate | ieee-dcbx | dcbx-version-1.01);

Hierarchy Level [edit protocols dcbx interface (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Set the DCBX version for the specified interface or interfaces.

QFX3500 switches come up in IEEE DCBX mode and then autonegotiate with the connected peer to set the DCBX version.

QFabric system Node devices come up using DCBX version 1.01, and then autonegotiate with the connected peer to set the DCBX mode.

Default The default DCBX mode is autonegotation.

Options **auto-negotiate**—Automatically negotiate the DCBX version with the connected peer.

ieee-dcbx—Force the interface to use IEEE DCBX mode, regardless of the peer configuration.

dcbx-version-1.01—Force the interface to use version 1.01 DCBX mode, regardless of the peer configuration.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

destination-port (Applications)

Syntax destination-port *port-value*;

Hierarchy Level [edit applications application *application-name*]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) destination port number, which combines with **protocol** to identify an application type. The Internet Assigned Numbers Authority (IANA) assigns port numbers. See the IANA *Service Name and Transport Protocol Port Number Registry* at http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml for a list of assigned port numbers.

NOTE: To create an application for iSCSI, use the protocol **tcp** with the destination port number **3260**.

Options *port-value*—Identifier for the port.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

disable (DCBX)

Syntax disable

Hierarchy Level [edit protocols dcbx]

[edit protocols dcbx interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.

Description Disable Data Center Bridging Capability Exchange protocol (DCBX) on one or more 10-Gigabit Ethernet interfaces.

Default DCBX is enabled by default on all 10-Gigabit or higher Ethernet interfaces.

DCBX is enabled by default on all 10-Gigabit Ethernet interfaces on EX4500 CEE-enabled switches.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

drop-probability

Syntax drop-probability 0 drop-probability *high-value*;

Hierarchy Level [edit class-of-service drop-profiles *profile-name* interpolate]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description When configuring WRED, map the packet **drop-probability** to the fullness of a queue (fill-level). You configure the **fill-level** and **drop-probability** statements in related pairs by specifying a low **fill-level** value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high **fill-level** value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability.

Options 0—Probability that packets will drop at the lowest **fill-level** value. This is always zero, because until the queue reaches the specified low **fill-level** value, no packets are scheduled to drop.

high-value—The maximum probability that packets will drop before queue fullness exceeds the high value of the queue **fill-level**, expressed as a percentage. If the queue fills beyond the high **fill-level** value, all packets drop.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Tail-Drop Profiles on page 5663

Release Information

Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description

Define the Differentiated Services code point (DSCP) IPv6 mapping that is applied to the packets.

NOTE: There is no DSCP IPv6 classifier for multidestination (multicast, broadcast, and destination lookup fail) traffic. Multidestination IPv6 traffic uses the multidestination DSCP classifier.

Options

The statements are explained separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

egress (Buffer Configuration)

Syntax

```
egress {
  percent percent;
  buffer-partition (lossless | lossy | multicast) {
    percent percent;
  }
}
```

Hierarchy Level [edit class-of-service shared-buffer]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global shared buffer pool allocation for egress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for other buffers such as dedicated buffers (buffers allocated permanently to ports).

The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports. However, on a port, you can configure the portion of dedicated port buffer space allocated to each queue in the scheduler configuration using the **buffer-size** option.)

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

You can also partition the shared buffer pool to adjust the egress buffer allocations for different mixes of network traffic using the **buffer-partition** statement.

Default The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)

Options

percent *percent*—Percentage of available egress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

enhanced-transmission-selection

Syntax

```
enhanced-transmission-selection {
  no-auto-negotiation;
  no-recommendation-tlv;
  recommendation-tlv {
    no-auto-negotiation;
  }
}
```

Hierarchy Level [edit protocols dcbx interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Disable advertising the enhanced transmission selection (ETS) state of the interface to the peer. To disable ETS on the interface, do not enable ETS on the interface in the class-of-service (CoS) configuration.

Disabling ETS autonegotiation stops the QFX Series from advertising the ETS Configuration TLV and the ETS Recommendation TLV.

Disabling the ETS recommendation TLV stops the QFX Series from advertising the ETS Recommendation TLV, but the ETS Configuration TLV is still advertised.

Options

no-auto-negotiation—Disable automatic negotiation of ETS (Configuration TLV and Recommendation TLV)

no-recommendation-tlv—Disable automatic negotiation of the ETS Recommendation TLV

recommendation-tlv—Enable automatic negotiation of ETS Recommendation TLV

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

fill-level

Syntax fill-level *low-value* fill-level *high-value*;

Hierarchy Level [edit class-of-service drop-profiles *profile-name* interpolate]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description When configuring random early detection (RED), map the fullness of a queue to a packet drop-probability value. You configure the **fill-level** and **drop-probability** statements in related pairs by specifying a low **fill-level** value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high **fill-level** value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability.

Options ***low-value***—Fullness of the queue before packets begin to drop, expressed as a percentage. The low value must be less than the high value.

Range: 0 through 100

high-value—Fullness of the queue before it reaches the maximum drop probability. If the queue fills beyond the fill level high value, all packets drop. The high value must be greater than the low value.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Tail-Drop Profiles on page 5663
- Understanding CoS Tail-Drop Profiles on page 5545

flow-control

Syntax (flow-control | no-flow-control);

Hierarchy Level [edit interfaces *interface-name* ether-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.

You can configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces *interface-name* ether-options** hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual "lanes" of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

- **flow-control**—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.
- **no-flow-control**—Disable flow control.

Default Flow control is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

flow-control-queue (Output Congestion Notification)

Syntax flow-control-queue [*queue* | *list-of-queues*];

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* output ieee-802.1 code-point *code-point-bits*]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Specify one or more output queues to pause, to support priority-based flow control (PFC). The specified queues pause when the interface receives a PFC frame with a matching IEEE 802.1p code point.

Default Queue 3 (mapped to the fcoe forwarding class) and queue 4 (mapped to the no-loss forwarding class) are programmed as flow control queues to pause. No other output queues are programmed to pause by default.

If you configure flow control queues explicitly, only the queues that you specify are programmed to pause. The explicit flow control queue to pause configuration overrides the default setting, so the queues paused in the default configuration are no longer paused by default.

For example, if you configure queue 2 as a flow control queue, then queue 2 pauses when congestion occurs, but queues 3 and 4 do not pause because they were not explicitly specified. To enable pause on output queues 2, 3, and 4, you must explicitly configure all three of the queues as flow control queues.

The same behavior applies to the IEEE 802.1p code points (priorities) on which PFC is enabled. By default, priorities 3 (011) and 4 (100) are enabled for PFC pause. If you explicitly configure flow control queues to pause, you must also explicitly configure pause for each priority (code point) that you want to pause, because the explicit configuration overrides the default configuration.

Options [***queue*** | ***list-of-queues***]—The output queue or a list of output queues to pause.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

forwarding-class (Fibre Channel Interfaces)

Syntax forwarding-class *lossless-forwarding-class-name*;

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name*]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure a Layer 3 fixed classifier on a Fibre Channel (FC) interface. The fixed classifier places all traffic received from the FC network into the specified forwarding class. The forwarding class must be lossless. (That is, the forwarding class must be either the default **fcoe** or **no-loss** forwarding class, or the forwarding class must be configured with the **no-loss** drop attribute.) If you attempt to specify a lossy forwarding class, the system returns a commit error.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. If the IEEE 802.1p code point value that the Ethernet network uses for FCoE traffic is different than code point 3, you can rewrite the code point to the value used in your Ethernet (FCoE) network. The lossless forwarding class specified in the fixed classifier uses the **rewrite-value** statement as the IEEE 802.1p code point (priority) for FCoE traffic on the FCoE network.

To rewrite the code point value, include the **rewrite-value input ieee code-point** ***code-point-bits*** statement at the [**edit class-of-service interfaces** ***fc-interface-name***] hierarchy level.

NOTE: If you are not using the default configuration (priority 3 for FCoE traffic), the lossless forwarding class specified in the FC interface fixed classifier must be mapped to the IEEE 802.1p code point specified in the rewrite value statement.

In order to avoid fate sharing (separate flows that affect each other's throughput), the code point (priority) used for the lossless forwarding class (the code point specified in the rewrite value statement) should be the only code point classified to that forwarding class (at the [edit class-of-service classifiers] hierarchy level). For example, if the rewrite value uses code point 101 for lossless FCoE forwarding class fcoe_fc1, then in the classifier configuration attached to ingress Ethernet interfaces, code point 101 is the only code point that should be classified to the fcoe_fc1 forwarding class. Now if you also attach a classifier to an interface that maps code point 110 to forwarding class fcoe_fc1, then congestion on priority 110 unfairly (and unintentionally) affects the FCoE traffic that uses priority 101. Both priorities 101 and 110 are classified into forwarding class fcoe_fc1, so the traffic from both priorities shares the same fate.

Options ***lossless-forwarding-class-name***—Name of the lossless forwarding class.

Required Privilege Level
interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

forwarding-class (Host Outbound Traffic)

Syntax
forwarding-class *class-name*;

Hierarchy Level
[edit class-of-service host-outbound-traffic]

Release Information
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Define forwarding class name for outbound host traffic (traffic generated by the Routing Engine).

Options
class-name—Name of the forwarding class.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

forwarding-class-set (Node Device)

Syntax

```
forwarding-class-set forwarding-class-set-name {
    output-traffic-control-profile profile-name;
}
```

Hierarchy Level [edit class-of-service interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Apply a previously defined forwarding class set to an output traffic control profile.

Options ***fowarding-class-set-name***—Name of the forwarding class set.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

forwarding-class-sets

Syntax

```
forwarding-class-sets forwarding-class-set-name {
    class class-name;
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Assign forwarding classes to forwarding class sets (priority groups).

Options ***fowarding-class-set-name***—Name of the forwarding class set.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606
- Example: Configuring Forwarding Class Sets on page 5671
- Understanding CoS Forwarding Class Sets (Priority Groups) on page 5474

forwarding-classes

Syntax

```
forwarding-classes {
  class {
    class-name {
      queue-num queue-number <no-loss>;
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

Description Map one or more forwarding classes to a single queue. You can configure up to 12 forwarding classes (8 unicast forwarding classes on queues 0 through 7 and 4 multidestination forwarding classes on queues 8 through 11) and map them to queues. You can map multiple forwarding classes to a single queue using the **class** statement. All forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if

you explicitly configure the **fcoe** forwarding class and you do not include the **no-loss** option, the **fcoe** forwarding class is lossy, not lossless.

Options The statements are explained separately.

Required Privilege Level
interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

guaranteed-rate

Syntax guaranteed-rate (*rate*| percent *percentage*);

Hierarchy Level [edit class-of-service traffic-control-profiles *traffic-control-profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a guaranteed minimum rate of transmission for a traffic control profile. The sum of the guaranteed rates of all of the forwarding class sets (priority groups) on a port should not exceed the total port bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group (forwarding class set) can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

NOTE: You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.

Default If you do not specify a guaranteed rate, the guaranteed rate is zero (0) and there is no minimum guaranteed bandwidth.

NOTE: If you do not configure a guaranteed rate for a traffic control profile, the queues that belong to any forwarding class set (priority group) that uses that traffic control profile cannot have a configured transmit rate. The result is that there is no minimum guaranteed bandwidth for those queues and that those queues can be starved during periods of congestion.

Options **percent** ***percentage***—Minimum percentage of transmission capacity allocated to the forwarding class set or logical interface.

Range: 1 through 100 percent

rate—Minimum transmission rate allocated to the forwarding class set or logical interface, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Range: 1000 through 10,000,000,000 bps

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

host-outbound-traffic

Syntax

```
host-outbound-traffic {
  forwarding-class class-name;
  dscp-code-point code-point;
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Allow queue selection for traffic generated by the Routing Engine (host). The selected queue must be configured properly. You can also configure specific DSCP code point bits for the type of service (ToS) field of the generated packets. This configuration does not affect transit packets or incoming packets. This is a global configuration that only affects packets originating on the Routing Engine. If you do not configure an output queue for host outbound traffic, the switch uses the default queue mapping.

Options The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

ieee-802.1 (Fibre Channel Interfaces)

Syntax

```
ieee-802.1 {
  code-point code-point-bits;
}
```

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name* rewrite-value input]

Description Configure the IEEE 802.1p code point value to which all traffic received from the Fibre Channel (FC) network on the specified FC interface is rewritten. After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

The statement is described separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

ingress (Buffer Configuration)

Syntax

```
ingress {
  buffer-partition (lossless | lossless-headroom | lossy) {
    percent percent;
  }
  percent percent;
}
```

Hierarchy Level [edit class-of-service shared-buffer]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global shared buffer pool allocation for ingress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for buffers such as dedicated buffers (buffers allocated permanently to ports) and headroom buffers (buffers that help prevent packet loss on lossless flows).

The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared ingress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

You can also partition the shared buffer pool to adjust the ingress buffer allocations for different mixes of network traffic using the **buffer-partition** statement.

Default The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)

Options

percent *percent*—Percentage of available ingress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

input (Fibre Channel Interfaces)

Syntax

```
input {
  ieee-802.1{
    code-point code-point-bits;
  }
}
```

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name* rewrite-value]

Description Configure the IEEE 802.1p code point value to which all traffic received from the Fibre Channel (FC) network on the specified FC interface is rewritten. After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

The statements are described separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

loss-priority (Rewrite Rules)

Syntax

```
loss-priority level {
  code-point (alias | bit-pattern);
}
```

Hierarchy Level

[edit class-of-service rewrite-rules (dscp | dscp-ipv6 | ieee-802.1) *rewrite-name* forwarding-class *class-name*]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Specify a loss priority to which to apply a rewrite rule. The rewrite rule sets the code-point aliases and bit patterns for a specific forwarding class and loss priority. Packets that match the forwarding class and loss priority are rewritten with the rewrite code-point alias or bit pattern.

Options

level—Can be one of the following:

- **low**—Packet has low loss priority.
- **medium-high**—Packet has medium-high loss priority.
- **high**—Packet has high loss priority.

The remaining statement is explained separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multi-destination

Syntax

```
multi-destination {
  classifiers {
    (dscp | ieee-802.1) classifier-name;
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a multicast CoS behavior aggregate (BA) classifier.

Options The statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

mru

Syntax mru *mru-value*;

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* input ieee-802.1 code-point *code-point-bits* pfc]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the maximum receive unit (MRU) of the interface in bytes (incoming packet sizes must be less than or equal to the MRU, or the packets are dropped). The system uses the MRU and the cable length to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The lower the MRU and the shorter the cable length, the less headroom buffer space is required for PFC.

NOTE: You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the **mtu** statement at the **[edit interfaces *interface-name*]** hierarchy level.

Default For priority 3 traffic, the default MRU value is 2500 bytes.

For priority 4 traffic, the default MRU value is 9612 bytes.

Options ***mru-value***—Value of the maximum packet receive unit size in bytes (generally from 1500 to 9216 bytes, but there is no configuration restriction).

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

policy-options

Syntax

```
policy-options
  application-maps application-map-name {
    application application-name {
      code-points [ aliases ] [ bit-patterns ];
    }
  }
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list prefix-list-name;
        prefix-list-filter prefix-list-name match-type <actions>;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then actions;
    }
  }
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.
Statement introduced in Junos OS Release 12.1 for the EX Series.

Description Configure options such as application maps for DCBX application protocol exchange and policy statements.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

priority (Schedulers)

Syntax priority *priority*;

Hierarchy Level [edit class-of-service schedulers *scheduler-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the packet-scheduling drop priority value.

Options *priority*—It can be one of the following:

- **low**—Scheduler has low priority.
- **strict-high**—Scheduler has strict high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606
- Example: Configuring Queue Schedulers on page 5674

priority-flow-control

Syntax

```
priority-flow-control {
  no-auto-negotiation;
}
```

Hierarchy Level [edit protocols dcbx interface (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.

Description Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.

Options **no-auto-negotiation**—Disable automatic negotiation of PFC.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

protocol (Applications)

Syntax protocol (tcp | udp);

Hierarchy Level [edit applications application *application-name*]

Release Information Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Networking protocol type, which combines with **destination-port** to identify an application type.

NOTE: To create an application for iSCSI, use the protocol **tcp** with the destination port number **3260**.

Options **tcp**—Transmission Control Protocol

udp—User Datagram Protocol

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

protocol (Drop Profile Map)

Syntax protocol *protocol* drop-profile *profile-name*;

Hierarchy Level [edit class-of-service schedulers *scheduler-name* drop-profile-map loss-priority (low | medium-high | high)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the protocol type for the specified drop profile.

Options ***protocol***—Type of protocol. The protocol can be:

- **any**—Accept any protocol type.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

queue-num

Syntax queue-num *queue-number* <no-loss>;

Hierarchy Level [edit class-of-service forwarding-classes class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

Description Map a forwarding class to an output queue number. Optionally, configure the forwarding class as a lossless forwarding class.

You can map some or all of the eight unicast forwarding classes to a unicast queue (0 through 7) or some or all of the four multidestination (multicast, broadcast, destination lookup fail) forwarding classes to the same multidestination queue (8 through 11), providing that you do not map one forwarding class to more than one queue. The queue to which you map a forwarding class determines if the forwarding class is a unicast or multidestination forwarding class.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the fcoe forwarding class and you do not include the no-loss option, the fcoe forwarding class is lossy, not lossless.

Options

queue-number—Number of the CoS unicast queue (0 through 7) or the CoS multidestination queue (8 through 11).

no-loss—Optional packet drop attribute keyword to configure the forwarding class as lossless.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

recommendation-tlv

Syntax

```
recommendation-tlv {
  no-auto-negotiation;
}
```

Hierarchy Level

[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]

Release Information

Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description

Disable or enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.)

Default

DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.

Options

no-auto-negotiation—Disable sending of the ETS recommendation TLV.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- show dcbx neighbors on page 5300

rewrite-rules

Syntax

```
rewrite-rules {
  (dscp | dscp-ipv6 | ieee-802.1) rewrite-name {
    import (rewrite-name | default);
    forwarding-class class-name {
      loss-priority priority code-point (alias | bits);
    }
  }
}
```

Interface Association

```
rewrite-rules {
  (dscp | dscp-ipv6 | ieee-802.1) rewrite-name;
}
```

Hierarchy Level

[edit class-of-service],
[edit class-of-service interfaces *interface-name* unit *logical-unit-number*]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure rewrite rules that map traffic to code points when traffic exits the system, and apply the rewrite rules to a specific interface.

Options

The statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Defining CoS Rewrite Rules on page 5805
- Understanding CoS Rewrite Rules on page 5549

rewrite-value (Fibre Channel Interfaces)

Syntax

```
rewrite-value {
  input {
    ieee-802.1{
      code-point code-point-bits;
    }
  }
}
```

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name*]

Description Configure the IEEE 802.1p code point value (priority) for all traffic received from the Fibre Channel (FC) network on the specified FC interface. Instead of using the default priority 3 (011) for FCoE traffic, the priority is rewritten to the specified priority before being forwarded. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE traffic typically uses priority 3 (IEEE code point 011). The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011) for FCoE traffic.

The system supports only one IEEE 802.1p code point value per FC interface, so you cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

NOTE: In order to avoid fate sharing (separate flows that affect each others' throughput), the code point used for the rewrite value should be the only code point used for the lossless FCoE forwarding class (the forwarding class used for the fixed classifier on the Fibre Channel interface). When you configure classifiers for ingress Ethernet interfaces, map only the rewrite value code point to the forwarding class.

For example, if the rewrite value uses code point 101 for lossless FCoE forwarding class fcoe_fc1, then in the classifier configuration attached to ingress Ethernet interfaces, code point 101 is the only code point that should be classified to the fcoe_fc1 forwarding class. Now if you also attach a classifier to an interface that maps code point 110 to forwarding class fcoe_fc1, then congestion on priority 110 unfairly (and unintentionally) affects the FCoE traffic that uses priority 101. Both priorities 101 and 110 are classified into

forwarding class fcoe_fc1, so the traffic from both priorities shares the same fate.

The remaining statements are described separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

rx-buffers

Syntax rx-buffers (on | off);

Hierarchy Level [edit interfaces *interface-name* ether-options configured-flow-control]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.

Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the **rx-buffers** statement with the **tx-buffers** statement to configure asymmetric Ethernet PAUSE on an interface. (Use the **flow-control** statement to enable symmetric PAUSE and the **no-flow-control** statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options **on | off**—Enable or disable an interface to generate and send Ethernet PAUSE messages.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

schedulers

Syntax

```
schedulers {
  scheduler-name  {
    buffer-size (percent percentage | remainder);
    drop-profile-map loss-priority (low | medium-high | high) protocol protocol drop-profile
      drop-profile-name;
    priority priority;
    shaping-rate (rate | percent percentage);
    transmit-rate (percent percentage);
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify scheduler name and parameter values such minimum bandwidth (**transmit-rate**), maximum bandwidth (**shaping-rate**), and priority (**priority**).

Options *scheduler-name* —Name of the scheduler.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606
- Example: Configuring Queue Schedulers on page 5674

- Understanding CoS Output Queue Schedulers on page 5486

shaping-rate

Syntax shaping-rate (*rate* | percent *percentage*);

Hierarchy Level [edit class-of-service schedulers *scheduler-name*],
[edit class-of-service traffic-control-profiles *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the shaping rate. The shaping rate throttles the rate of packet transmission by setting a maximum bandwidth (rate in bits per second) or a maximum percentage of bandwidth for a queue or a forwarding class set. You specify the maximum bandwidth for a queue by using a scheduler map to associate a forwarding class (queue) with a scheduler that has a configured shaping rate. You specify the maximum bandwidth for a forwarding class set by setting the shaping rate for a traffic control profile, and then applying the traffic control profile and a forwarding class set to an interface.

We recommend that you configure the shaping rate as an absolute maximum usage and not as additional usage beyond the configured transmit rate (the minimum guaranteed bandwidth for a queue) or the configured guaranteed rate (the minimum guaranteed bandwidth for a forwarding class set).

NOTE: When you set the maximum bandwidth (**shaping-rate** value) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate** value.

Default If you do not configure a shaping rate, the default shaping rate is 100 percent (all of the available bandwidth), which is the equivalent of no rate shaping.

Options **percent *percentage***—Shaping rate as a percentage of the available interface bandwidth.

Range: 1 through 100 percent

rate—Peak (maximum) rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Range: 1000 through 10,000,000,000 bps

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5606
- Example: Configuring Queue Schedulers on page 5674
- Example: Configuring Traffic Control Profiles (Priority Group Scheduling) on page 5682

- Understanding CoS Traffic Control Profiles on page 5496

shared-buffer

Syntax

```
shared-buffer {
  egress {
    buffer-partition (lossless | lossy | multicast) {
      percent percent
    }
    percent percent;
  }
  ingress {
    percent percent;
    buffer-partition (lossless | lossless-headroom | lossy) {
      percent percent
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global shared buffer pool allocation to ports. Shared buffers are a pool of buffer space that the system can allocate dynamically across all of its ports as memory space is needed. Some buffer space is reserved for dedicated buffers (buffers allocated permanently to ports), headroom buffers (buffers that help prevent packet loss on lossless flows), and other buffers.

Configure the way the system uses the available (user-configurable) buffer space by setting the **shared-buffer** percentage for the ingress buffer pool and for the egress buffer pool.

The percentage you specify is the percentage of available buffer space allocated to the global shared ingress buffer pool or to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until the buffer reprogramming is complete.**

You can also partition the ingress shared buffer pool and the egress shared buffer pool to adjust the buffer allocations for different mixes of network traffic (best-effort, lossless, multicast) using the **buffer-partition** statement.

Options The statements are explained separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traceoptions (Class of Service)

Syntax

```
traceoptions {
  file filename <size size> <files number>
  <world-readable | no-world-readable>;
  flag flag <flag-modifier>;
  no-remote-trace
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set class-of-service (CoS) tracing options.

NOTE: The traceoptions statement is not supported on the QFabric system.

Default Traceoptions is disabled.

Options **file** ***filename***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **asynch**—Trace asynchronous configuration processing.
- **chassis-scheduler**—Trace chassis stream scheduler processing.
- **cos-adjustment**—Trace CoS rate adjustments.
- **dynamic**—Trace dynamic CoS functions.
- **hardware-database**—Trace the chassis hardware database related processing.
- **init**—Trace initialization events.

- **performance-monitor**—Trace performance monitor countors.
- **process**—Trace configuration processing.
- **restart**—Trace restart processing.
- **route-socket**—Trace route-socket events.
- **show**—Trace show command servicing.
- **snmp**—Trace SNMP-related processing.
- **util**—Trace utilities.

The following are the global tracing options:

- **all**—Perform all tracing operations
- **parse**—Trace parser processing.

no-remote-trace—(Optional) Disable remote tracing.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0.** Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traffic-control-profiles

Syntax

```
traffic-control-profiles profile-name {
  guaranteed-rate (rate| percent percentage);
  scheduler-map map-name;
  shaping-rate (rate| percent percentage);
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure traffic shaping and scheduling profiles for forwarding class sets (priority groups) to implement enhanced transmission selection (ETS) or for logical interfaces.

Options *profile-name*—Name of the traffic-control profile. This name is also used to specify an output traffic control profile.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

transmit-rate

Syntax transmit-rate (*rate* | percent *percentage*);

Hierarchy Level [edit class-of-service schedulers *scheduler-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the minimum transmission rate or percentage for a queue (forwarding class) scheduler. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

NOTE: The transmit-rate setting works only if you also configure the guaranteed-rate in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed rate, the minimum guaranteed rate for individual queues that you set using the transmit-rate statement does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate.

NOTE: You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

NOTE: For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

Default If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 11 are:

Queue Number	Default Minimum Guaranteed Bandwidth
0 (best-effort)	5 %
1	0
2	0
3 (fcoe)	35 %
4 (no-loss)	35 %
5	0
6	0
7 (network control)	5 %
8 (mcast)	20 %
9	0
10	0
11	0

Configure schedulers if you want to change the minimum guaranteed bandwidth and other queue characteristics.

Options

rate—Minimum transmission rate for the queue, in bps. You can specify a value in bits-per-second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), m (1,000,000), or **g** (1,000,000,000).

Range: 1000 through 10,000,000,000 bps

percent *percentage*—Minimum percentage of transmission capacity allocated to the queue. A percentage of zero means that there is no minimum bandwidth guarantee for the queue.

Range: 0 through 100 percent

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

tx-buffers

Syntax tx-buffers (on | off);

Hierarchy Level [edit interfaces *interface-name* ether-options configured-flow-control]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.

Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the **tx-buffers** statement with the **rx-buffers** statement to configure asymmetric Ethernet PAUSE on an interface. (Use the **flow-control** statement to enable symmetric PAUSE and the **no-flow-control** statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual "lanes" of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options **on | off**—Enable or disable an interface to respond to an Ethernet PAUSE message.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

unit

Syntax

```
unit logical-unit-number {
  classifiers {
    (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);
  }
  forwarding-class class-name;
  rewrite-rules {
    (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);
  }
}
```

Hierarchy Level [edit class-of-service interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a logical interface on the physical device. You must configure a logical interface to use the physical device.

Options *logical-unit-number*—Number of the logical unit.

Range: 0 through 16,385

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Monitoring CoS Classifiers

Purpose Display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

Action To monitor CoS classifiers in the CLI, enter the CLI command:

user@switch> **show class-of-service classifier**

To monitor a particular classifier in the CLI, enter the CLI command:

user@switch> **show class-of-service classifier name *classifier-name***

To monitor a particular type of classifier in the CLI, enter the CLI command:

user@switch> **show class-of-service classifier type *classifier-type***

Meaning Table 551 on page 5915 summarizes key output fields for CoS classifiers.

Table 551: Summary of Key CoS Classifier Output Fields

Field	Values
Classifier	Name of a classifier.

Table 551: Summary of Key CoS Classifier Output Fields *(continued)*

Field	Values
Code point type	Type of classifier: • **dscp**—All classifiers of the DSCP type. • **ieee-802.1**—All classifiers of the IEEE 802.1 type. • **ieee-mcast**—All classifiers of the IEEE 802.1 multicast type.
Index	Internal index of the classifier.
Code point	DSCP or IEEE 802.1 code point value of the incoming packets, in bits. These values are used for classification.
Forwarding Class	Name of the forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.
Loss Priority	Loss priority value that the classifier assigns to the incoming packet based on its code point value.

Monitoring CoS Forwarding Classes

Purpose Use the monitoring functionality to view the current assignment of CoS forwarding classes to queue numbers on the system.

Action To monitor CoS forwarding classes in the CLI, enter the following CLI command:

user@switch> **show class-of-service forwarding-class**

Meaning Table 552 on page 5917 summarizes key output fields for CoS forwarding classes.

Table 552: Summary of Key CoS Forwarding Class Output Fields

Field	Values
Forwarding Class	Names of forwarding classes assigned to queue numbers. By default, the following unicast forwarding classes are assigned to queues 0, 3, 4, and 7, respectively: • **best-effort**—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value. • **fcoe**—Provides guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic. • **no-loss**—Provides guaranteed delivery for TCP lossless traffic • **network-control**—Packets can be delayed but not dropped. By default, the following multidestination forwarding class is assigned to queue 8: • **mcast**—Provides no special CoS handling of packets.
Queue	Queue number corresponding to the forwarding class name. By default, four queues (0, 3, 4, and 7) are assigned to unicast forwarding classes and one queue (8) is assigned to a multidestination forwarding class.
No-Loss	Packet drop attribute associated with each forwarding class: • Disabled—The forwarding class is configured for lossy transport (packets might drop during periods of congestion) • Enabled—The forwarding class is configured for lossless transport NOTE: To achieve lossless transport, you must ensure that priority-based flow control (PFC) and DCBX are properly configured on the lossless priority (IEEE 802.1p code point), and that sufficient port bandwidth is reserved for the lossless traffic flows.

Monitoring Interfaces That Have CoS Components

Purpose Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

Action To monitor interfaces that have CoS components in the CLI, enter the command:

user@switch> **show class-of-service interface**

To monitor a specific interface in the CLI, enter the command:

user@switch> **show class-of-service interface *interface-name***

Meaning Table 553 on page 5918 summarizes key output fields for CoS interfaces.

Table 553: Summary of Key CoS Interfaces Output Fields

Field	Values
Physical interface	Name of a physical interface to which CoS components are assigned.
Index	Index of this interface or the internal index of a specific object.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Scheduler map	Name of the scheduler map associated with this interface.
Congestion-notification	Status of congestion notification (enabled or disabled).
Rewrite Input IEEE Code-point	(Fibre Channel NP_Port interfaces only) IEEE 802.1p code point (priority) the interface assigns to incoming Fibre Channel (FC) traffic when the interface encapsulates the FC traffic in Ethernet before forwarding it onto the FCoE network.
Logical Interface	Name of a logical interface on the physical interface to which CoS components are assigned.
Object	Category of an object—for example, **classifier**, **scheduler-map**, or **rewrite**.
Name	Name of the object—for example, **ba-classifier**.
Type	Type of the object—for example, **ieee8021p** for a classifier.

Related Documentation

- Assigning CoS Components to Interfaces on page 5807

Monitoring CoS Rewrite Rules

Purpose Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

Action To monitor CoS rewrite rules in the CLI, enter the CLI command:

user@switch> **show class-of-service rewrite-rule**

To monitor a particular rewrite rule in the CLI, enter the CLI command:

user@switch> **show class-of-service rewrite-rule name *rewrite-rule-name***

To monitor a particular type of rewrite rule (for example, DSCP, DSCP IPv6, or IEEE-802.1) in the CLI, enter the CLI command:

user@switch> **show class-of-service rewrite-rule type *rewrite-rule-type***

Meaning Table 554 on page 5919 summarizes key output fields for CoS rewrite rules.

Table 554: Summary of Key CoS Rewrite Rule Output Fields

Field	Values
Rewrite rule	Name of the rewrite rule.
Code point type	Rewrite rule type: • **dscp**—For IPv4 DiffServ traffic. • **dscp-ipv6**—For IPv6 Diffserv traffic. • **ieee-802.1**—For Layer 2 traffic.
Index	Internal index for the rewrite rule.
Forwarding class	Name of the forwarding class that is used to determine CoS values for rewriting in combination with loss priority. Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.
Loss priority	Level of loss priority that is used to determine CoS values for rewriting in combination with forwarding class.
Code point	Rewrite code point value.

Related Documentation
- Defining CoS Rewrite Rules on page 5805

Monitoring CoS Scheduler Maps

Purpose Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

Action To monitor CoS scheduler maps in the CLI, enter the CLI command:

user@switch> **show class-of-service scheduler-map**

To monitor a specific scheduler map in the CLI, enter the CLI command:

user@switch> **show class-of-service scheduler-map *scheduler-map-name***

Meaning Table 555 on page 5919 summarizes key output fields for CoS scheduler maps.

Table 555: Summary of Key CoS Scheduler Maps Output Fields

Field	Values
Scheduler map	Name of the scheduler map.
Index	Index of a specific object—scheduler maps, schedulers, or drop profiles.

Table 555: Summary of Key CoS Scheduler Maps Output Fields *(continued)*

Field	Values
Scheduler	Name of the scheduler.
Forwarding class	Names of the forwarding classes to which the scheduler is assigned.
Transmit rate	Configured transmit rate of the scheduler as a percentage of the total interface bandwidth.
Priority	Scheduling priority of a queue: • **strict-high** or **high**—Packets in this queue are transmitted first. Only one queue can be configured as **strict-high** or **high**. • **low**—Packets in this queue are transmitted after packets in the **strict-high** queue.
Drop Profiles	Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.
Loss Priority	Drop profile associated with each packet loss priority. You can configure different drop profiles for **low**, **medium-high**, and **high** loss priority traffic.
Protocol	Transport protocol of the drop profile for the particular priority.
Name	Name of the drop profile.

Related Documentation
- Defining CoS Queue Schedulers on page 5789

Monitoring CoS Value Aliases

Purpose Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP and IEEE 802.1p code point bits.

Action To monitor CoS value aliases in the CLI, enter the CLI command:

user@switch> **show class-of-service code-point-aliases**

To monitor a specific type of code-point alias (for example, DSCP or IEEE 802.1) in the CLI, enter the CLI command:

user@switch> **show class-of-service code-point-aliases ieee-802.1**

Meaning Table 556 on page 5921 summarizes key output fields for CoS value aliases.

Table 556: Summary of Key CoS Value Alias Output Fields

Field	Values
Code point type	Type of the CoS value: • **dscp**—Examines Layer 3 packet headers for IP packet classification. • **ieee-802.1**—Examines Layer 2 packet headers for packet classification.
Alias	Name given to a set of bits—for example, **af11** is a name for bits **001010**.
Bit pattern	Set of bits associated with the alias.

List of Sample Output show class-of- service on page 5924

Output Fields Table 557 on page 5923 lists the output fields for the **show class-of-service** command. Output fields are listed in the approximate order in which they appear.

Table 557: show class-of-service Output Fields

Field Name	Field Description	Level of Output
Forwarding class	The forwarding class configuration: • **Forwarding class**—Name of the forwarding class. • **ID**—Forwarding class ID. • **Queue**—Queue number.	All levels
Code point type	The type of code-point alias: • **dscp**—Aliases for DiffServ code point (DSCP) values. • **ieee–802.1**—Aliases for IEEE 802.1p values.	All levels
Alias	Names given to CoS values.	All levels
Bit pattern	Set of bits associated with an alias.	All levels
Classifier	Name of the classifier.	All levels
Code point	Code-point values.	All levels
Loss priority	Loss priority assigned to specific CoS values and aliases of the classifier.	All levels
Rewrite rule	Name of the rewrite rule if one has been configured.	All levels

Table 557: show class-of-service Output Fields *(continued)*

Field Name	Field Description	Level of Output
Drop profile	Name of the drop profile.	All levels
Type	Type of drop profile. QFX Series supports only the **discrete** type of drop-profile.	All levels
Fill level	Percentage of queue buffer fullness in a drop profile at which packets begin to drop during periods of congestion.	All levels
Scheduler map	Name of the scheduler map.	All levels
Scheduler	Name of the scheduler.	All levels
Transmit rate	Transmission rate of the scheduler.	All levels
Buffer size	Delay buffer size in the queue.	All levels
Drop profiles	Drop profiles configured for the specified scheduler.	All levels
Protocol	Transport protocol corresponding to the drop profile.	All levels
Name	Name of the drop profile.	All levels
Queues supported	Number of queues that can be configured on the interface.	All levels
Queues in use	Number of queues currently configured.	All levels
Physical interface	Name of the physical interface.	All levels
Scheduler map	Name of the scheduler map.	All levels
Congestion-notification	Enabled if a congestion notification profile is applied to the interface; disabled if no congestion notification profile is applied to the interface.	All levels
Forwarding class set	Name of the forwarding class set (priority group).	
Index	Internal index of an object.	All levels

Sample Output

show class-of-service classifier

Syntax

show class-of-service classifier
<name *name*>
<type dscp | type dscp-ipv6 | type exp | type ieee-802.1 | type inet-precedence>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

For each class-of-service (CoS) classifier, display the mapping of code point value to forwarding class and loss priority.

Options

none—Display all classifiers.

name *name*—(Optional) Display named classifier.

type dscp—(Optional) Display all classifiers of the Differentiated Services code point (DSCP) type.

type dscp-ipv6—(Optional) Display all classifiers of the DSCP for IPv6 type.

type exp—(Optional) Display all classifiers of the MPLS experimental (EXP) type.

type ieee-802.1—(Optional) Display all classifiers of the ieee-802.1 type.

type inet-precedence—(Optional) Display all classifiers of the inet-precedence type.

Required Privilege Level

view

List of Sample Output

show class-of-service classifier type ieee-802.1 on page 5928
show class-of-service classifier type ieee-802.1 (QFX Series) on page 5928

Output Fields

Table 558 on page 5927 describes the output fields for the **show class-of-service classifier** command. Output fields are listed in the approximate order in which they appear.

Table 558: show class-of-service classifier Output Fields

Field Name	Field Description
Classifier	Name of the classifier.
Code point type	Type of the classifier: **exp** (not on EX Series switch), **dscp**, **dscp-ipv6** (not on EX Series switch), **ieee-802.1**, or **inet-precedence**.
Index	Internal index of the classifier.
Code point	Code point value used for classification
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.

Table 558: show class-of-service classifier Output Fields *(continued)*

Field Name	Field Description
Loss priority	Loss priority value used for classification. For most platforms, the value is **high** or **low**. For some platforms, the value is **high**, **medium-high**, **medium-low**, or **low**.

Sample Output

show class-of-service classifier type ieee-802.1

```
user@host>  show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point         Forwarding Class                  Loss priority
  000              best-effort                         low
  001              best-effort                         high
  010              expedited-forwarding                low
  011              expedited-forwarding                high
  100              assured-forwarding                  low
  101              assured-forwarding                  medium-high
  110              network-control                     low
  111              network-control                     high

Classifier: users-ieee802.1, Code point type: ieee-802.1
  Code point         Forwarding class                    Loss priority
  100                expedited-forwarding                low
```

show class-of-service classifier type ieee-802.1 (QFX Series)

```
user@switch>  show class-of-service classifier type ieee-802.1
Classifier: ieee8021p-default, Code point type: ieee-802.1, Index: 11
  Code point         Forwarding class                    Loss priority
  000                best-effort                         low
  001                best-effort                         low
  010                best-effort                         low
  011                fcoe                                low
  100                no-loss                             low
  101                best-effort                         low
  110                network-control                     low
  111                network-control                     low

Classifier: ieee-mcast, Code point type: ieee-802.1, Index: 46
  Code point         Forwarding class                    Loss priority
  000                mcast                               low
  001                mcast                               low
  010                mcast                               low
  011                mcast                               low
  100                mcast                               low
  101                mcast                               low
  110                mcast                               low
  111                mcast                               low
```

show class-of-service code-point-aliases

Syntax

show class-of-service code-point-aliases
<dscp | dscp-ipv6 | exp | ieee-802.1 | inet-precedence>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns.

Options

none—Display code point aliases of all code point types.

dscp—(Optional) Display Differentiated Services code point (DSCP) aliases.

dscp-ipv6—(Optional) Display IPv6 DSCP aliases.

exp—(Optional) Display MPLS EXP code point aliases.

ieee-802.1—(Optional) Display IEEE-802.1 code point aliases.

inet-precedence—(Optional) Display IPv4 precedence code point aliases.

Required Privilege Level

view

List of Sample Output

show class-of-service code-point-aliases exp on page 5930

Output Fields

Table 559 on page 5929 describes the output fields for the **show class-of-service code-point-aliases** command. Output fields are listed in the approximate order in which they appear.

Table 559: show class-of-service code-point-aliases Output Fields

Field Name	Field Description
Code point type	Type of the code points displayed: **dscp**, **dscp-ipv6** (not on EX Series switch), **exp** (not on EX Series switch or the QFX Series), **ieee-802.1**, or **inet-precedence** (not on the QFX Series).
Alias	Alias for a bit pattern.
Bit pattern	Bit pattern for which the alias is displayed.

Sample Output

show class-of-service code-point-aliases exp

```
user@host> show class-of-service code-point-aliases exp
Code point type: exp
  Alias              Bit pattern
  af11               100
  af12               101
  be                 000
  be1                001

  ef                 010
  ef1                011
  nc1                110
  nc2                111
```

show class-of-service congestion-notification

Syntax show class-of-service congestion-notification

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display whether priority-based flow control (PFC) is enabled for each IEEE 802.1p code point.

Options **none**—Display the PFC state for all IEEE 802.1p code points.

Required Privilege Level view

Output Fields Table 560 on page 5931 describes the output fields for the **show class-of-service congestion-notification** command. Output fields are listed in the approximate order in which they appear.

Table 560: show class-of-service congestion-notification Output Fields

Field Name	Field Description
Type	Type of interfaces on which congestion notification is applied. Congestion notification is applied on input interfaces.
Index	Index of this congestion notification profile.
Name	Name of the congestion notification profile.
Cable Length	Length of the attached physical cable in meters. The default value is 100 meters.
Priority	IEEE 802.1p code point.
PFC	State of PFC for the corresponding code point, either **enabled** or **disabled**.
MRU	Maximum receive unit of the interface in bytes. (Incoming traffic that exceeds the MRU size of an interface is dropped.) The default values are: • 2500 bytes for priority 3 traffic • 9216 bytes for priority 4 traffic NOTE: If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.
Flow-Control-Queues	Output queue mapping to IEEE 802.1p code points (priorities). Explicit output queue to priority mapping overwrites the default configuration, and only explicitly mapped queues are displayed in the output. Flow control is only enabled on a queue when you enable PFC on the corresponding priority in the input stanza of the congestion notification profile.

Sample Output

show class-of-service congestion-notification

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p3_cnp, Index: 12037
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU

show class-of-service drop-profile

Syntax show class-of-service drop-profile
<profile-name *profile-name*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display data points for each class-of-service (CoS) random early detection (RED) drop profile.

Options **none**—Display all drop profiles.

profile-name *profile-name*—(Optional) Display the specified profile only.

Required Privilege Level view

List of Sample Output
show class-of-service drop-profile on page 5934
show class-of-service drop-profile (EX4200 Switch) on page 5934
show class-of-service drop-profile (EX8200 Switch) on page 5934

Output Fields Table 561 on page 5933 describes the output fields for the **show class-of-service drop-profile** command. Output fields are listed in the approximate order in which they appear.

Table 561: show class-of-service drop-profile Output Fields

Field Name	Field Description
Drop profile	Name of a drop profile.
Type	Type of drop profile: • **discrete** (default) • **interpolated** (EX8200 switches only)
Index	Internal index of this drop profile.
Fill Level	Percentage fullness of a queue.
Drop probability	Drop probability at this fill level.

Sample Output

show class-of-service drop-profile

```
user@host> show class-of-service drop-profile
Drop profile: <default-drop-profile>, Type: discrete, Index: 1
  Fill level    Drop probability
         100                 100
Drop profile: user-drop-profile, Type: interpolated, Index: 2989

show class-of-service forwarding-class

Syntax show class-of-service forwarding-class

Release Information Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about forwarding classes, including the mapping of forwarding classes to queue numbers.

Required Privilege Level view

show class-of-service forwarding-class (EX8200 Switch) on page 5937
show class-of-service forwarding-class (QFX Series) on page 5937

Output Fields Table 562 on page 5936 describes the output fields for the **show class-of-service forwarding-class** command. Output fields are listed in the approximate order in which they appear.

Table 562: show class-of-service forwarding-class Output Fields

Field Name	Field Description
Forwarding class	Name of the forwarding class.
ID	Forwarding class identifier.
Queue	CoS queue mapped to the forwarding class.
Policing priority	Not supported on EX Series switches or the QFX Series and can be ignored.
Fabric priority	(EX8200 switches only) Fabric priority for the forwarding class, either **high** or **low**. Determines the priority of packets entering the switch fabric.

Table 562: show class-of-service forwarding-class Output Fields *(continued)*

Field Name	Field Description
No-Loss	(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes: • Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is **drop**). • Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is **no-loss**).

Sample Output

show class-of-service forwarding-class

```
user@switch> show class-of-service forwarding-class
Forwarding class                ID                      Queue  Policing priority
  best-effort                   0                           0           normal
  expedited-forwarding          1                           5           normal
  assured-forwarding            2                           1           normal
  network-control               3                           7           normal
```

Sample Output

show class-of-service forwarding-class (EX8200 Switch)

```
user@switch> show class-of-service forwarding-class
Forwarding class                 ID      Queue  Fabric priority
  best-effort                    0       0      low
  expedited-forwarding           1       5      low
  assured-forwarding             2       1      low
  network-control                3       7      low
  mcast-be                       4       2      low
  mcast-ef                       5       4      low
  mcast-af                       6       6      low
```

Sample Output

show class-of-service forwarding-class (QFX Series)

```
user@switch> show class-of-service forwarding-class
Forwarding class                 ID      Queue  Policing priority  No-Loss

  best-effort                    0       0         normal          Disabled

  fcoe                           1       3         normal          Enabled

  no-loss                        2       4         normal          Enabled

  network-control                3       7         normal          Disabled

  mcast                          8       8         normal          Disabled
```

show class-of-service forwarding-class-set

Syntax show class-of-service forwarding-class-set
<*forwarding-class-set-name*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the forwarding classes associated with each forwarding class set.

Options **none**—Display all forwarding class sets.

forwarding-class-set-name—(Optional) Display the forwarding classes associated with the specified forwarding class set.

Required Privilege Level view

Output Fields Table 563 on page 5938 describes the output fields for the **show class-of-service forwarding-class-set** command. Output fields are listed in the approximate order in which they appear.

Table 563: show class-of-service forwarding-class-set Output Fields

Field Name	Field Description
Forwarding class set	Name of the forwarding class set.
Type	Internal Junos OS type.
Forwarding class set index	Index of this forwarding class set.
Forwarding class	Name of a forwarding class.
Index	Index of this forwarding class.

Sample Output

show class-of-service forwarding-class-set

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: san_fcset, Type: normal-type, Forwarding class set index:
37839
  Forwarding class                      Index
  fcoe                                    1

Forwarding class set: lan_fcset, Type: normal-type, Forwarding class set index:
37840
  Forwarding class                      Index
  best-effort                             0

Forwarding class set: multicast_fcset, Type: normal-type, Forwarding class set
index: 37841
```

```
Forwarding class                        Index
mcast                                     8
```

Syntax
show class-of-service forwarding-table

Syntax (TX Matrix and TX Matrix Plus Router)
show class-of-service forwarding-table
<lcc *number*> | <sfc *number*>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display the entire class-of-service (CoS) configuration as it exists in the forwarding table. Executing this command is equivalent to executing all **show class-of-service forwarding-table** commands in succession.

Options
lcc *number*—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the forwarding table configuration for a specific T640 router (or line-card chassis) configured in a routing matrix. On a TX Matrix Plus router, display the forwarding table configuration for a specific router (or line-card chassis) configured in the routing matrix.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display the forwarding table configuration for the TX Matrix Plus router. Replace ***number*** with **0**.

Required Privilege Level

show class-of-service forwarding-table classifier

Syntax show class-of-service forwarding-table classifier

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the mapping of code point value to queue number and loss priority for each classifier as it exists in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table classifier on page 5944

Output Fields Table 564 on page 5944 describes the output fields for the **show class-of-service forwarding-table classifier** command. Output fields are listed in the approximate order in which they appear.

Table 564: show class-of-service forwarding-table classifier Output Fields

Field Name	Field Description
Classifier table index	Index of the classifier table.
entries	Total number of entries.
Table type	Type of code points in the table: **DSCP**, **EXP** (not on the QFX Series), **IEEE 802.1**, **IPv4 precedence** (not on the QFX Series), or **IPv6 DSCP**.
Entry #	Entry number.
Code point	Code point value used for classification.
Forwarding-class #	Forwarding class to which the code point is assigned.
PLP	Packet loss priority value set by classification. For most platforms, the value can be **0** or **1**. For some platforms, the value is **0**, **1**, **2**, or **3**. The value **0** represents low PLP. The value **1** represents **high** PLP. The value **2** represents medium-low PLP. The value **3** represents medium-high PLP.

Sample Output

show class-of-service forwarding-table classifier

```

show class-of-service forwarding-table classifier mapping

Syntax show class-of-service forwarding-table classifier mapping

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table classifier mapping on page 5946

Output Fields Table 565 on page 5946 describes the output fields for the**show class-of-service forwarding-table classifier mapping** command. Output fields are listed in the approximate order in which they appear.

Table 565: show class-of-service forwarding-table classifier mapping Output Fields

Field Name	Field Description
Table index/ Q num	If the table type is **Fixed**, the number of the queue to which the interface is mapped. For all other types, this value is the classifier index number.
Interface	Name of the logical interface. This field can also show the physical interface (QFX Series).
Index	Logical interface index.
Table type	Type of code points in the table: **DSCP**, **EXP** (not on the QFX Series), **Fixed**, **IEEE 802.1**, **IPv4 precedence** (not on the QFX Series),or **IPv6 DSCP**.

Sample Output

show class-of-service forwarding-table classifier mapping

```
user@host> show class-of-service forwarding-table classifier mapping
                          Table index/
Interface       Index       Q num       Table type
so-5/0/0.0         10       62436       DSCP
so-0/1/0.0         11       62436       DSCP
so-0/2/0.0         12           1       Fixed
so-0/2/1.0         13       62436       DSCP
so-0/2/1.0         13       62437       IEEE 802.1
so-0/2/2.0         14       62436       DSCP
so-0/2/2.0         14       62438       IPv4 precedence
```

show class-of-service forwarding-table drop-profile

Syntax show class-of-service forwarding-table drop-profile

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the data points of all random early detection (RED) drop profiles as they exist in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table drop-profile on page 5948

Output Fields Table 566 on page 5948 describes the output fields for the **show class-of-service forwarding-table drop-profile** command. Output fields are listed in the approximate order in which they appear.

Table 566: show class-of-service forwarding-table drop-profile Output Fields

Field Name	Field Description
RED drop profile index	Index of this drop profile.
# entries	Number of entries in a particular RED drop profile index.
Entry	Drop profile entry number.
Fullness(%)	Percentage fullness of a queue.
Drop probability(%)	Drop probability at this fill level.

Sample Output

show class-of-service forwarding-table drop-profile

```
user@host> show class-of-service forwarding-table drop-profile
RED drop profile index: 4, # entries: 1
                              Drop
Entry      Fullness(%)    Probability(%)
    0              100              100

RED drop profile index: 8742, # entries: 3
                              Drop
Entry      Fullness(%)    Probability(%)
    0               10               10
    1               20               20
    2               30               30
```

```
RED drop profile index: 24627, # entries: 64
                                Drop
Entry      Fullness(%)   Probability(%)
    0                0                0

    3                4                4
 ...
   61               98               98
   62               99               99
   63              100              100
```

show class-of-service forwarding-table rewrite-rule

Syntax show class-of-service forwarding-table rewrite-rule

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display mapping of queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table rewrite-rule on page 5950

Output Fields Table 567 on page 5950 describes the output fields for the **show class-of-service forwarding-table rewrite-rule** command. Output fields are listed in the approximate order in which they appear.

Table 567: show class-of-service forwarding-table rewrite-rule Output Fields

Field Name	Field Description
Rewrite table index	Index for this rewrite rule.
# entries	Number of entries in this rewrite rule.
Table type	Type of table: **DSCP**, **EXP** (not on the QFX Series), **EXP-PUSH-3** (not on the QFX Series), **EXP-SWAP-PUSH-2**,(J Series routers only), **IEEE 802.1**,**IPv4 precedence** (not on the QFX Series), **IPv6 DSCP**, or **Fixed**.
Q#	Queue number to which this entry is assigned.
Low bits	Code point value for low-priority loss profile.
State	State of this code point: **enabled**, **rewritten**, or **disabled**.
High bits	Code point value for high-priority loss profile.

Sample Output

show class-of-service forwarding-table rewrite-rule

```
user@host> show class-of-service forwarding-table rewrite-rule
Rewrite table index: 3753, # entries: 4, Table type: DSCP
Q#     Low bits  State      High bits  State
 0      000111  Enabled      001010   Enabled
 2      000000  Disabled     001100   Enabled
```

```
1       101110  Enabled       110111   Enabled
3       110000  Enabled       111000   Enabled
```

show class-of-service forwarding-table rewrite-rule mapping

Syntax show class-of-service forwarding-table rewrite-rule mapping

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each logical interface, display the table identifier of the rewrite rule map for each code point type.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table rewrite-rule mapping on page 5952

Output Fields Table 568 on page 5952 describes the output fields for the **show class-of-service forwarding-table rewrite-rule mapping** command. Output fields are listed in the approximate order in which they appear.

Table 568: show class-of-service forwarding-table rewrite-rule mapping Output Fields

Field Name	Field Description
Interface	Name of the logical interface. This field can also show the physical interface (QFX Series).
Index	Logical interface index.
Table index	Rewrite table index.
Type	Type of classifier: **DSCP**, **EXP** (not on the QFX Series), **EXP-PUSH-3** (not on the QFX Series), **EXP-SWAP-PUSH-2** (not on the QFX Series),**Frame-Relay DE** (J Series routers only), **IEEE 802.1**, **IPv4 precedence** (not on the QFX Series), **IPv6 DSCP**, or **Fixed**.

Sample Output

show class-of-service forwarding-table rewrite-rule mapping

```
user@host> show class-of-service forwarding-table rewrite-rule mapping
Interface       Index   Table index  Type
so-5/0/0.0         10          3753  DSCP
so-0/1/0.0         11          3753  DSCP
so-0/2/0.0         12          3753  DSCP
so-0/2/1.0         13          3753  DSCP
so-0/2/2.0         14          3753  DSCP
so-0/2/3.0         15          3753  DSCP
```

show class-of-service forwarding-table scheduler-map

Syntax show class-of-service forwarding-table scheduler-map

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each physical interface, display the scheduler map information as it exists in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table scheduler-map on page 5954

Output Fields Table 569 on page 5953 describes the output fields for the **show class-of-service forwarding-table scheduler-map** command. Output fields are listed in the approximate order in which they appear.

Table 569: show class-of-service forwarding-table scheduler-map Output Fields

Field Name	Field Description
Interface	Name of the physical interface.
Index	Physical interface index.
Map index	Scheduler map index.
Num of queues	Number of queues defined in this scheduler map.
Entry	Number of this entry in the scheduler map.
Scheduler index	Scheduler policy index.
Forwarding-class #	Forwarding class number to which this entry is applied.
Tx rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword **remainder**, which indicates that the scheduler receives the remaining bandwidth of the interface.
Max buffer delay	Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword **remainder**, which indicates that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	• **high**—Queue priority is high. • **low**—Queue priority is low.
PLP high	Drop profile index for a high packet loss priority profile.

Table 569: show class-of-service forwarding-table scheduler-map Output Fields *(continued)*

Field Name	Field Description
PLP low	Drop profile index for a low packet loss priority profile.
PLP medium-high	Drop profile index for a medium-high packet loss priority profile.
PLP medium-low	Drop profile index for a medium-low packet loss priority profile.
TCP PLP high	Drop profile index for a high TCP packet loss priority profile.
TCP PLP low	Drop profile index for a low TCP packet loss priority profile.
Policy is exact	If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled.

Sample Output

show class-of-service forwarding-table scheduler-map

```
user@host> show class-of-service forwarding-table scheduler-map
Interface: so-5/0/0 (Index: 9, Map index: 17638, Num of queues: 2):
  Entry 0 (Scheduler index: 6090, Forwarding-class #: 0):
    Tx rate: 0 Kb (30%), Max buffer delay: 39 bytes (0%)
    Priority low
    PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low:8742
    Policy is exact
  Entry 1 (Scheduler index: 38372, Forwarding-class #: 1):
    Traffic chunk: Max = 0 bytes, Min = 0 bytes
    Tx rate: 0 Kb (40%), Max buffer delay: 68 bytes (0%)
    Priority high
    PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low: 8742

Interface: at-6/1/0 (Index: 10, Map index: 17638, Num of queues: 2):
  Entry 0 (Scheduler index: 6090, Forwarding-class #: 0):
    Traffic chunk: Max = 0 bytes, Min = 0 bytes
    Tx rate: 0 Kb (30%), Max buffer delay: 39 bytes (0%)
    Priority high
    PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low: 8742
  Entry 1 (Scheduler index: 38372, Forwarding-class #: 1):
    Traffic chunk: Max = 0 bytes, Min = 0 bytes
    Tx rate: 0 Kb (40%), Max buffer delay: 68 bytes (0%)
    Priority low
    PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low: 8742
```

show class-of-service interface

Syntax

show class-of-service interface
<**detail | comprehensive**> <*interface-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Forwarding class map information added in Junos OS Release 9.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.
Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.
Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.

Description

Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

Options

comprehensive—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

detail—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface
- Information about filters or policers for the logical interface
- CoS information about the logical interface

interface-name—(Optional) Display class-of-service (CoS) associations for the specified interface.

none—Display CoS associations for all physical and logical interfaces.

Required Privilege Level

view

List of Sample Output

show class-of-service interface (Physical) on page 5966

show class-of-service interface (Logical) on page 5967
show class-of-service interface (Gigabit Ethernet) on page 5967
show class-of-service interface (PPPoE Interface) on page 5967

show class-of-service interface detail on page 5968
show class-of-service interface comprehensive on page 5968
show class-of-service interface (ACX Series Routers) on page 5978

Output Fields Table 570 on page 5956 describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

Table 570: show class-of-service interface Output Fields

Field Name	Field Description
Physical interface	Name of a physical interface.
Index	Index of this interface or the internal index of this object.
Dedicated Queues	Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Total non-default queues created	Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.
Rewrite Input IEEE Code-point	(QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.
Shaping rate	Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the **Shaping rate** field is displayed for either the physical interface or the logical interface.
Scheduler map	Name of the output scheduler map associated with this interface.
Scheduler map forwarding class sets	(QFX Series only) Name of the fabric forwarding class set scheduler map associated with a QFabric system Interconnect device interface.
Input shaping rate	For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.
Input scheduler map	For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.
Chassis scheduler map	Name of the scheduler map associated with the packet forwarding component queues.
Rewrite	Name and type of the rewrite rules associated with this interface.
Classifier	Name and type of classifiers associated with this interface.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Forwarding-class-map	Name of the forwarding map associated with this interface.
Congestion-notification	(QFX Series only) Congestion notification state, **enabled** or **disabled**.
Logical interface	Name of a logical interface.
Object	Category of an object: **Classifier**, **Fragmentation-map** (for LSQ interfaces only), **Scheduler-map**, **Rewrite**, or **Translation Table** (for IQE PICs only).
Name	Name of an object.
Type	Type of an object: **dscp**, **dscp-ipv6**, **exp**, **ieee-802.1**, **ip**, or **inet-precedence**.
Link-level type	Encapsulation on the physical interface.
MTU	MTU size on the physical interface.
Speed	Speed at which the interface is running.
Loopback	Whether loopback is enabled and the type of loopback.
Source filtering	Whether source filtering is enabled or disabled.
Flow control	Whether flow control is enabled or disabled.
Auto-negotiation	(Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status. • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Device flags	The **Device flags** field provides information about the physical device and displays one or more of the following values: • **Down**—Device has been administratively disabled. • **Hear-Own-Xmit**—Device receives its own transmissions. • **Link-Layer-Down**—The link-layer protocol has failed to connect with the remote endpoint. • **Loopback**—Device is in physical loopback. • **Loop-Detected**—The link layer has received frames that it sent, thereby detecting a physical loopback. • **No-Carrier**—On media that support carrier recognition, no carrier is currently detected. • **No-Multicast**—Device does not support multicast traffic. • **Present**—Device is physically present and recognized. • **Promiscuous**—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media. • **Quench**—Transmission on the device is quenched because the output buffer is overflowing. • **Recv-All-Multicasts**—Device is in multicast promiscuous mode and therefore provides no multicast filtering. • **Running**—Device is active and enabled.

Interface flags	The **Interface flags** field provides information about the physical interface and displays one or more of the following values:
	• **Admin-Test**—Interface is in test mode and some sanity checking, such as loop detection, is disabled.
	• **Disabled**—Interface is administratively disabled.
	• **Down**—A hardware failure has occurred.
	• **Hardware-Down**—Interface is nonfunctional or incorrectly connected.
	• **Link-Layer-Down**—Interface keepalives have indicated that the link is incomplete.
	• **No-Multicast**—Interface does not support multicast traffic.
	• **No-receive No-transmit**—Passive monitor mode is configured on the interface.
	• **Point-To-Point**—Interface is point-to-point.
	• **Pop all MPLS labels from packets of depth**—MPLS labels are removed as packets arrive on an interface that has the **pop-all-labels** statement configured. The depth value can be one of the following:
	  ◦ **1**—Takes effect for incoming packets with one label only.
	  ◦ **2**—Takes effect for incoming packets with two labels only.
	  ◦ **[1 2]**—Takes effect for incoming packets with either one or two labels.
	• **Promiscuous**—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.
	• **Recv-All-Multicasts**—Interface is in multicast promiscuous mode and provides no multicast filtering.
	• **SNMP-Traps**—SNMP trap notifications are enabled.
	• **Up**—Interface is enabled and operational.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Flags	The **Logical interface flags** field provides information about the logical interface and displays one or more of the following values: • **ACFC Encapsulation**—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer). • **Device-down**—Device has been administratively disabled. • **Disabled**—Interface is administratively disabled. • **Down**—A hardware failure has occurred. • **Clear-DF-Bit**—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit. • **Hardware-Down**—Interface protocol initialization failed to complete successfully. • **PFC**—Protocol field compression is enabled for the PPP session. • **Point-To-Point**—Interface is point-to-point. • **SNMP-Traps**—SNMP trap notifications are enabled. • **Up**—Interface is enabled and operational.
Encapsulation	Encapsulation on the logical interface.
Admin	Administrative state of the interface (**Up** or **Down**)
Link	Status of physical link (**Up** or **Down**).
Proto	Protocol configured on the interface.
Input Filter	Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.
Output Filter	Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.
Link flags	Provides information about the physical link and displays one or more of the following values: • **ACFC**—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option. • **Give-Up**—Link protocol does not continue connection attempts after repeated failures. • **Loose-LCP**—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational. • **Loose-LMI**—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational. • **Loose-NCP**—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational. • **Keepalives**—Link protocol keepalives are enabled. • **No-Keepalives**—Link protocol keepalives are disabled. • **PFC**—Protocol field compression is configured. The PPP session negotiates the PFC option.
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.
CoS queues	Number of CoS queues configured.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped: *year-month-day hour:minute:second:timezone* (*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**
Statistics last cleared	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.
Input errors	Input errors on the interface. The labels are explained in the following list: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Bucket Drops**—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **HS link FIFO overflows**—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Output errors	Output errors on the interface. The labels are explained in the following list: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **HS link FIFO underflows**—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeds the MTU of the interface.
Egress queues	Total number of egress queues supported on the specified interface.
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.
SONET alarms **SONET defects**	(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: **SONET PHY**, **SONET section**, **SONET line**, and **SONET path**.
SONET PHY	Counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET PHY** field has the following subfields: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
SONET section	Counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET section** field has the following subfields: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOS**—Loss of signal • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)
SONET line	Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET line** field has the following subfields: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
SONET path	Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET path** field has the following subfields: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload (signal) label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **ES-PFE**—Errored seconds (far-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)
Received SONET overhead **Transmitted SONET overhead**	Values of the received and transmitted SONET overhead: • **C2**—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • **F1**—Section user channel byte. This byte is set aside for the purposes of users. • **K1** and **K2**—These bytes are allocated for APS signaling for the protection of the multiplex section. • **J0**—Section trace. This byte is defined for STS-1 number 1 of an STS-*N* signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • **S1**—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-*N* signal. • **Z3** and **Z4**—Allocated for future use.
Received path trace **Transmitted path trace**	SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.
Forwarding classes	Total number of forwarding classes supported on the specified interface.
Egress queues	Total number of egress queues supported on the specified interface.
Queue	Queue number.
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets queued to this queue.
Queued Bytes	Number of bytes queued to this queue. The byte counts vary by PIC type.
Transmitted Packets	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.
Transmitted Bytes	Number of bytes transmitted by this queue. The byte counts vary by PIC type.
Tail-dropped packets	Number of packets dropped because of tail drop.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description

RED-dropped packets	Number of packets dropped because of random early detection (RED).
	• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories:
	  • **Low, non-TCP**—Number of low-loss priority non-TCP packets dropped because of RED.
	  • **Low, TCP**—Number of low-loss priority TCP packets dropped because of RED.
	  • **High, non-TCP**—Number of high-loss priority non-TCP packets dropped because of RED.
	  • **High, TCP**—Number of high-loss priority TCP packets dropped because of RED.
	• (MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories:
	  • **Low**—Number of low-loss priority packets dropped because of RED.
	  • **Medium-low**—Number of medium-low loss priority packets dropped because of RED.
	  • **Medium-high**—Number of medium-high loss priority packets dropped because of RED.
	  • **High**—Number of high-loss priority packets dropped because of RED.

RED-dropped bytes	Number of bytes dropped because of RED. The byte counts vary by PIC type.
	• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories:
	  • **Low, non-TCP**—Number of low-loss priority non-TCP bytes dropped because of RED.
	  • **Low, TCP**—Number of low-loss priority TCP bytes dropped because of RED.
	  • **High, non-TCP**—Number of high-loss priority non-TCP bytes dropped because of RED.
	  • **High, TCP**—Number of high-loss priority TCP bytes dropped because of RED.

Transmit rate	Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.
Rate Limit	Rate limiting configuration of the queue. Possible values are : • **None**—No rate limit. • **exact**—Queue transmits at the configured rate.
Buffer size	Delay buffer size in the queue.
Priority	Scheduling priority configured as **low** or **high**.
Excess Priority	Priority of the excess bandwidth traffic on a scheduler: **low**, **medium-low**, **medium-high**, **high**, or **none**.

Table 570: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Drop profiles	Display the assignment of drop profiles. • **Loss priority**—Packet loss priority for drop profile assignment. • **Protocol**—Transport protocol for drop profile assignment. • **Index**—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles. • **Name**—Name of the drop profile. • **Type**—Type of the drop profile: **discrete** or **interpolated**. • **Fill Level**—Percentage fullness of a queue. • **Drop probability**—Drop probability at this fill level.
Excess Priority	Priority of the excess bandwidth traffic on a scheduler.
Drop profiles	Display the assignment of drop profiles. • **Loss priority**—Packet loss priority for drop profile assignment. • **Protocol**—Transport protocol for drop profile assignment. • **Index**—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles. • **Name**—Name of the drop profile. • **Type**—Type of the drop profile: **discrete** or **interpolated**. • **Fill Level**—Percentage fullness of a queue. • **Drop probability**—Drop probability at this fill level.
Adjustment information	Display the assignment of shaping-rate adjustments on a scheduler node or queue. • **Adjusting application**—Application that is performing the shaping-rate adjustment. ◦ The adjusting application can appear as **ancp LS-0**, which is the Junos OS Access Node Control Profile process (**ancpd**) that performs shaping-rate adjustments on schedule nodes. ◦ The adjusting application can also appear as **pppoe**, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode). • **Adjustment type**—Type of adjustment: **absolute** or **delta**. • **Configured shaping rate**—Shaping rate configured for the scheduler node or queue. • **Adjustment value**—Value of adjusted shaping rate. • **Adjustment target**—Level of shaping-rate adjustment performed: **node** or **queue**. • **Adjustment overhead-accounting mode**—Configured shaping mode: **frame** or **cell**.

```

show class-of-service multi-destination

Syntax show class-of-service multi-destination

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each class-of-service (CoS) multidestination classifier, display the classifier type.

Options **none**—Display all multidestination classifiers.

Required Privilege Level view

Output Fields Table 571 on page 5981 describes the output fields for the **show class-of-service multi-destination** command. Output fields are listed in the approximate order in which they appear.

Table 571: show class-of-service multi-destination Output Fields

Field Name	Field Description
Family ethernet	Family to which the classifier belongs.
Classifier Name	Name of the classifier.
Classifier Type	Type of the classifier: **dscp** or **ieee-802.1**.
Classifier Index	Internal index of the classifier.

Sample Output

show class-of-service multi-destination

```
user@switch>  show class-of-service multi-destination

Family ethernet:
Classifier Name                Classifier Type                Classifier Index
  ba-mcast-classifier            ieee-802.1                     62376
```

show class-of-service rewrite-rule

Syntax

show class-of-service rewrite-rule
<name *name*>
<type *type*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the mapping of forwarding classes and loss priority to code point values.

Options

none—Display all rewrite rules.

name *name*—(Optional) Display the specified rewrite rule.

type *type*—(Optional) Display the rewrite rule of the specified type. The rewrite rule type can be one of the following:

- **dscp**—For IPv4 traffic.
- **dscp-ipv6**—For IPv6 traffic.
- **exp**—For MPLS traffic.
- **frame-relay-de**—(J Series routers only) For Frame Relay traffic.
- **ieee-802.1**—For Layer 2 traffic.
- **inet-precedence**—For IPv4 traffic.

Required Privilege Level

view

List of Sample Output

show class-of-service rewrite-rule type dscp on page 5983
show class-of-service rewrite-rule type dscp (QFX Series) on page 5983

Output Fields

Table 572 on page 5982 describes the output fields for the **show class-of-service rewrite-rule** command. Output fields are listed in the approximate order in which they appear.

Table 572: show class-of-service rewrite-rule Output Fields

Field Name	Field Description
Rewrite rule	Name of the rewrite rule.
Code point type	Type of rewrite rule: **dscp**, **dscp-ipv6**, **exp**, **frame-relay-de**, or **inet-precedence**.
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router or switch.
Index	Internal index for this particular rewrite rule.
Loss priority	Loss priority for rewriting.

Table 572: show class-of-service rewrite-rule Output Fields *(continued)*

Field Name	Field Description
Code point	Code point value to rewrite.

Sample Output

show class-of-service rewrite-rule type dscp

```
user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp
  Forwarding class                  Loss priority       Code point
  gold                              high                000000
  silver                            low                 110000
  silver                            high                111000
  bronze                            low                 001010
  bronze                            high                001100
  lead                              high                101110

Rewrite rule: abc-dscp-rewrite, Code point type: dscp, Index: 3245
Forwarding class                  Loss priority       Code point
  gold                              low                 000111
  gold                              high                001010

  lead                              low                 101110
  lead                              high                110111
```

Sample Output

show class-of-service rewrite-rule type dscp (QFX Series)

```
user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp, Index: 31
  Forwarding class                  Loss priority       Code point
  best-effort                       low                 000000
  best-effort                       high                000000
  fcoe                              low                 101110
  fcoe                              high                101110
  no-loss                           low                 001010
  no-loss                           high                001100
  network-control                   low                 110000
  network-control                   high                111000
```

show class-of-service scheduler-map

Syntax show class-of-service scheduler-map
<*name*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the mapping of schedulers to forwarding classes and a summary of scheduler parameters for each entry.

Options **none**—Display all scheduler maps.

name—(Optional) Display a summary of scheduler parameters for each forwarding class to which the named scheduler is assigned.

Required Privilege Level view

List of Sample Output show class-of-service scheduler-map on page 5985

Output Fields Table 573 on page 5984 describes the output fields for the **show class-of-service scheduler-map** command. Output fields are listed in the approximate order in which they appear.

Table 573: show class-of-service scheduler-map Output Fields

Field Name	Field Description
Scheduler map	Name of the scheduler map.
Index	Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.
Scheduler	Name of the scheduler.
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
Transmit rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword **remainder**, which indicates that the scheduler receives the remaining bandwidth of the interface.
Rate Limit	Rate limiting configuration of the queue. Possible values are **none**, meaning no rate limiting, and **exact**, meaning the queue only transmits at the configured rate.
Maximum buffer delay	Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword **remainder** to indicate that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	Scheduling priority: **low** or **high**.

Table 573: show class-of-service scheduler-map Output Fields *(continued)*

Field Name	Field Description
Excess priority	Priority of excess bandwidth: **low**, **medium-low**, **medium-high**, **high**, or **none**.
Adjust minimum	Minimum shaping rate for an adjusted queue, in bps.
Adjust percent	Bandwidth adjustment applied to a queue, in percent.
Drop profiles	Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.
Loss priority	Packet loss priority for drop profile assignment.
Protocol	Transport protocol for drop profile assignment.
Name	Name of the drop profile.

Sample Output

show class-of-service scheduler-map

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84

  Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
   Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
   Priority: high
   Drop profiles:
    Loss priority   Protocol    Index    Name
     Low            non-TCP     8724     aa-drop-profile
     Low            TCP         9874     bb-drop-profile
     High           non-TCP     8833     cc-drop-profile
     High           TCP         8484     dd-drop-profile

  Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
   Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
   Priority: high
   Drop profiles:
    Loss priority   Protocol    Index    Name
     Low            non-TCP     8724     aa-drop-profile
     Low            TCP         9874     bb-drop-profile
     High           non-TCP     8833     cc-drop-profile
     High           TCP         8484     dd-drop-profile
```

show class-of-service shared-buffer

Syntax

show class-of-service shared-buffer
<egress | ingress>

Release Information

Command introduced in Junos OS Release 12.3 for the QFX Series.

Description

Display the shared buffer allocation and partitioning configuration.

Options

none—Display ingress and egress shared buffer settings.

egress—(Optional) Display the egress shared buffer settings.

ingress—(Optional) Display the ingress shared buffer settings.

Required Privilege Level

view

List of Sample Output

show class-of-service shared-buffer on page 5987

Output Fields

Table 574 on page 5986 describes the output fields for the **show class-of-service shared-buffer** command. Output fields are listed in the approximate order in which they appear.

Table 574: show class-of-service shared-buffer Output Fields

Field Name	Field Description
Ingress	Ingress shared buffer configuration.
Total Buffer	Total buffer space available to the ports in KB. This is the combined dedicated buffer pool and shared buffer pool.
Dedicated Buffer	Buffer space allocated to the dedicated buffer pool in KB.
Shared Buffer	Buffer space allocated to the shared buffer pool in KB.
Lossless	Buffer space allocated to the lossless traffic buffer pool in KB.

Table 574: show class-of-service shared-buffer Output Fields *(continued)*

Field Name	Field Description
Lossless Headroom	Buffer space allocated to the lossless headroom traffic buffer pool to support priority-based flow control (PFC) and Ethernet PAUSE in KB. (Ingress ports only.)
Lossy	Buffer space allocated to the lossy (best-effort) traffic buffer pool in KB.
Lossless Headroom Utilization	Utilization of the ingress lossless headroom buffer pool. (These fields can help you to determine how much headroom buffer space you need to reserve to support PFC and Ethernet PAUSE for lossless flows.)
Node Device	Index number that identifies the switch. On a QFX3500 switch, this field always has a value of zero (0).
Total	Size of the lossless headroom ingress buffer pool in KB.
Used	Amount in KB of lossless headroom ingress buffer used.
Free	Amount in KB of lossless headroom ingress buffer free (unused).
Egress	Egress shared buffer configuration.
Multicast	Buffer space allocated to the multicast traffic buffer pool in KB. (Egress ports only.)

Sample Output

show class-of-service shared-buffer

```
user@switch> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless          :  648.18 KB
    Lossless Headroom :  3240.90 KB
    Lossy             :  3312.92 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                 Free
  0                   3240.90 KB     0.00 KB              3240.90 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  3328.00 KB
    Multicast         :  1264.64 KB
    Lossy             :  2063.36 KB
```

show class-of-service traffic-control-profile

Syntax show class-of-service traffic-control-profile
<profile-name>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Routers.

Description For Gigabit Ethernet IQ PICs, Channelized IQ PICs, EQ DPCs, and Trio MPC/MIC interfaces only, display traffic shaping and scheduling profiles.

(ACX Series routers) For ATM IMA pseudowire interfaces, display traffic shaping and scheduling profiles.

Options **none**—Display all profiles.

profile-name—(Optional) Display information about a single profile.

Required Privilege Level view

List of Sample Output
show class-of-service traffic-control-profile on page 5990
show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC) on page 5990
show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces) on page 5990

Output Fields Table 575 on page 5988 describes the output fields for the **show class-of-service traffic-control-profile** command. Output fields are listed in the approximate order in which they appear.

Table 575: show class-of-service traffic-control-profile Output Fields

Field Name	Field Description
Traffic control profile	Name of the traffic control profile.
Index	Index number of the traffic control profile.
ATM Service	(MX Series routers with ATM Multi-Rate CE MIC) Configured category of ATM service. Possible values: • cbr—Constant bit rate. • rtvbr—Real time variable bit rate. • nrtvbr—Non real time variable bit rate. • ubr—Unspecified bit rate.
Maximum Burst Size	Configured maximum burst size, in cells.
Peak rate	Configured peak rate, in cps.

Table 575: show class-of-service traffic-control-profile Output Fields *(continued)*

Field Name	Field Description
Sustained rate	Configured sustained rate, in cps.
Shaping rate	Configured shaping rate, in bps. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) Configured peak rate, in cps.
Shaping rate burst	Configured burst size for the shaping rate, in bytes. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.
Shaping rate priority high	Configured shaping rate for high-priority traffic, in bps.
Shaping rate priority medium	Configured shaping rate for medium-priority traffic, in bps.
Shaping rate priority low	Configured shaping rate for low-priority traffic, in bps.
Shaping rate excess high	Configured shaping rate for high-priority excess traffic, in bps.
Shaping rate excess low	Configured shaping rate for low-priority excess traffic, in bps.
Scheduler map	Name of the associated scheduler map.
Delay Buffer rate	Configured delay buffer rate, in bps.
Excess rate	Configured excess rate, in percent or proportion.
Excess rate high	Configured excess rate for high priority traffic, in percent or proportion.
Excess rate low	Configured excess rate for low priority traffic, in percent or proportion.
Guaranteed rate	Configured guaranteed rate, in bps or cps. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: • **cbr**—Guaranteed rate is equal to the configured peak rate in cps. • **rtvbr**—Guaranteed rate is equal to the configured sustained rate in cps. • **nrtvbr**—Guaranteed rate is equal to the configured sustained rate in cps.
Guaranteed rate burst	Configured burst size for the guaranteed rate, in bytes.
adjust-minimum	Configured minimum shaping rate for an adjusted queue, in bps.

Table 575: show class-of-service traffic-control-profile Output Fields *(continued)*

Field Name	Field Description
overhead accounting mode	Configured shaping mode: **Frame Mode** or **Cell Mode**.
Overhead bytes	Configured byte adjustment value.

Sample Output

show class-of-service traffic-control-profile

```
user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3
  Delay Buffer rate: 800000
  Guaranteed rate: 3000000
 .Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
  Scheduler map: m4
  Delay Buffer rate: 750000
  Guaranteed rate: 4000000
..adjust-minimum 20000000
```

show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```
user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
  ATM Service: RTVBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
  Shaping rate: 1000 cps
  Shaping rate burst: 500 cells
  Delay Buffer rate: 2000 cps
  Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
  ATM Service: UBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
```

show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces)

```
user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
  ATM Service: RTVBR
  Shaping rate: 2000 cps
```

```
Shaping rate burst: 200 cells
Scheduler map: <default>
Delay Buffer rate: 1000 cps
Guaranteed rate: 1700 cps
```

show dcbx

Syntax show dcbx

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description List DCBX status (enabled or disabled) and the interfaces on which DCBX is enabled.

Required Privilege Level view

Related Documentation
- show dcbx neighbors on page 5300
- Configuring DCBX Autonegotiation on page 5204

Output Fields Table 416 on page 5299 lists the output fields for the **show dcbx** command. Output fields are listed in the approximate order in which they appear.

Table 576: show dcbx output fields

Field Name	Field Description
DCBX	Status of DCBX on the switch or for the specified interface: • Enabled—DCBX is enabled on the switch or on the specified interface • Disabled—DCBX is disabled on the switch or on the specified interface
Interface	Name of the interface

Sample Output

show dcbx

```
user@switch> show dcbx
DCBX                    : Enabled
Interface       DCBX
xe-0/0/9.0      enabled
xe-0/0/32.0     enabled
xe-0/0/36.0     enabled
```

show dcbx neighbors

Syntax

show dcbx neighbors
<**interface** *interface-name*>
<**terse**>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 11.3 for EX Series switches.

Description

Display information about Data Center Bridging Capability Exchange protocol (DCBX) neighbor interfaces.

Options

none—Display information about all DCBX neighbor interfaces.

interface-name—(Optional) Display information for the specified interface.

terse—Display the specified level of output.

Required Privilege Level

Output Fields

Table 417 on page 5300 lists the output fields for the **show dcbx neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 577: show dcbx neighbors Output Fields

Field Name	Field Description
Interface	Name of the interface.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Parent Interface	Name of the link aggregation group (LAG) interface to which the DCBX interface belongs.
Active-application-map	Name of the application map applied to the interface.
Protocol-Mode	(QFX Series) DCBX protocol mode the interface uses: • IEEE DCBX Version—The interface uses IEEE DCBX mode. • DCBX Version 1.01—The interface uses DCBX version 1.01. NOTE: On interfaces that use the IEEE DCBX mode, the **show dcbx neighbors interface *interface-name*** operational command does not include application, PFC, or ETS operational state in the output.
Protocol-State	(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.
Local-Advertisement	(DCBX Version 1.01 only) Status of advertisements that the local interface sends to the peer.
Operational version	Version of the DCBX standard used.
sequence-number	Number of state change messages sent to the peer. If the interface **Protocol-State** value is **in-sync**, this number should match the **acknowledge-id** number in the **Peer-Advertisement** section. If the interface **Protocol-State** value is **ack-pending**, this number does not match the **acknowledge-id** number in the **Peer-Advertisement** section.
acknowledge-id	Number of acknowledge messages received from the peer. If the **Protocol-State** value is **in-sync**, this number should match the **sequence-number** value in the **Peer-Advertisement** section. If the **Protocol-State** value is **ack-pending**, this number does not match the **sequence-number** value in the **Peer-Advertisement** section.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
Peer-Advertisement		(DCBX Version 1.01 only) Status of advertisements that the peer sends to the local interface.
	Operational version	Version of the DCBX standard used.
	sequence-number	Number of state change messages the peer sent to the local interface. If this number matches the **acknowledge-id** number in the **Local-Advertisement** field, this indicates that the local interface has acknowledged all of the peer's state change messages and is synchronized. If this number does not match the **acknowledge-id** number in the **Local-Advertisement** field, this indicates that the peer has not yet received an acknowledgment for a state change message from the local interface.
	acknowledge-id	Number of acknowledge messages the peer has received from the local interface. If this number matches the **sequence-number** value in the **Local-Advertisement** field, this indicates that the peer has acknowledged all of the local interface's state change messages and is in synchronization. If this number does not match the **sequence-number** value in the **Local-Advertisement** field, this indicates that the peer has not yet sent an acknowledgment for a state change message from the local interface.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Feature: PFC	Priority-based flow control (PFC) feature DCBX state information.
Protocol-State	(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface. • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface. • **not-applicable**—PFC autonegotiation is disabled.
Operational State	(DCBX Version 1.01 only) Operational state of the feature: **enabled** or **disabled**.
Local-Advertisement	Status of advertisements that the local interface sends to the peer.
Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
Willing	Willingness of the local interface to learn the PFC configuration from the peer using DCBX: • **Yes**—The local interface is willing to learn the PFC configuration from the peer. • **No**—The local interface is not willing to learn the PFC configuration from the peer.
Mac auth Bypass Capability	(IEEE DCBX only) (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. This is not supported, so the only value seen in the local advertisement field is **no**.
Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Operational State	PFC operational state on the interface: • Enabled—PFC is enabled on the interface • Disabled—PFC is disabled on the interface
	Maximum Traffic Classes capable to support PFC	Largest number of traffic classes the local interface supports for PFC: • **6** (EX Series switches) • **8** (QFX Series)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Admin Mode	PFC administrative state for each code point on the local interface: • **Enabled**—PFC is enabled for the code point. • **Disabled**—PFC is disabled for the code point.
	Operational Mode	(QFX Series) PFC operational mode for each code point: • Enable—PFC is enabled on the code point. • Disable—PFC is disabled on the code point.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
	Willing	Willingness of the peer to learn the PFC configuration from the local interface using DCBX: • **Yes**—The peer is willing to learn the PFC configuration from the local interface. • **No**—The peer is not willing to learn the PFC configuration from the local interface.
	Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Operational State	PFC operational state on the interface: • Enabled—PFC is enabled on the interface • Disabled—PFC is disabled on the interface
	Mac auth Bypass Capability	(IEEE DCBX only) (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. Although the QFX Series does not support this feature, the connected peer might support it. This field reports the peer state: • **Yes**—The connected peer supports MAC authentication bypass. • **No**—The connected peer does not support MAC authentication bypass.
	Maximum Traffic Classes capable to support PFC	Largest number of traffic classes the peer supports for PFC: • **6** (EX Series switches) • **8** (QFX Series)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Admin Mode	PFC administrative state for each code point on the peer: • **Enabled**—PFC is enabled for the code point. • **Disabled**—PFC is disabled for the code point.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: Application			State information for the DCBX application.
	Protocol-State		(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface. • **not-applicable**—The local interface is set to **no-auto-negotiation** (autonegotiation is disabled). If the interface is associated with an FCoE forwarding class, the interface advertises FCoE capability even if the connected peer does not advertise FCoE capability.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer. If the local interface is set to **no-auto-negotiation** (autonegotiation is disabled), the local advertisement portion of the output is not shown.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		Willing	(DCBX Version 1.01 only) Willingness of the local interface to learn the FCoE interface state from the peer using DCBX: • **Yes**—The local interface is willing to learn the FCoE interface state from the peer. • **No**—The local interface is not willing to learn the FCoE interface state from the peer.
		Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. The local and peer configuration are compatible. • **Yes**—Error detected. The local and peer configuration are not compatible.
		Appl-Name	Name of the application:

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Ethernet-Type	(DCBX Version 1.01 only) Ethernet type (EtherType) of the application. For example, **0x8906** indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Socket-Number	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Priority-Field or **Priority-Map**	Priority assigned to the application. For EX Series switches, the priority of the FCoE application is determined by the PFC congestion notification profile that has been configured and associated with the FCoE interface. For other applications, the priority is based on the application map.
	Status	(DCBX Version 1.01 only) Local status when autonegotiation is enabled: • **Enabled**—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.) • **Disabled**—The local configuration and the peer configuration do not match. NOTE: If there is a configuration mismatch in one application between the switch and the peer, all the other applications including FCoE are disabled.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
	Willing	(DCBX Version 1.01 only) Willingness of the peer to learn the FCoE interface state from the local interface using DCBX: • **Yes**—The peer is willing to learn the FCoE interface state from the local interface. • **No**—The peer is not willing to learn the FCoE interface state from the local interface.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.
	Appl-Name	Name of the application: • **FCoE**—Fibre Channel over Ethernet
	Ethernet-Type	Ethernet type (EtherType) of the application. For example, **0x8906** indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket-Number (for Layer 4 applications) of the application is displayed in the output.
	Socket-Number	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Priority-Field or **Priority-Map**	Priority assigned to the application.
	Status	(DCBX Version 1.01 only) Peer interface status: • **Enabled**—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.) • **Disabled**—The local configuration and the peer configuration do not match.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Feature: ETS	Enhanced Transmission Selection (ETS) DCBX state information.
Protocol-State	(DCBX Version 1.01 only) ETS protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.
Operational State	(DCBX Version 1.01 only) Operational state of the feature, **enabled** or **disabled**.
Local-Advertisement	Status of advertisements that the local interface sends to the peer.
Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
TLV Type	(IEEE DCBX only) Type of ETS TLV: • Configuration—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration. • Recommendation—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is "willing," configures the peer interface to match the local ETS configuration. • Recommendation-or-Configuration—Advertises both TLVs.
Willing	Willingness of the local interface to learn the ETS state from the peer using DCBX (EX Series switches always advertise **No** for this field): • **Yes**—Local interface is willing to learn the ETS state from the peer. • **No**—Local interface is not willing to learn the ETS state from the peer.
Credit Based Shaper	

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
		(IEEE DCBX only) Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always **No**.
	Error	(DCBX Version 1.01 only) Configuration error status: • **No**—No error. This should always be the switch ETS error state. • **Yes**—Error detected.
	Maximum Traffic Classes capable to support PFC	(DCBX Version 1.01 only) Largest number of traffic classes the local interface supports for PFC.
	Maximum Traffic Classes supported	(IEEE DCBX only) Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Priority-Group	Class-of-service (CoS) priority group (forwarding class set) identification number.
	Percentage B/W	Configured minimum percentage of link bandwidth allocated to the priority group. Only explicitly configured values appear in this output column. If the link bandwidth is the default percentage, it is not shown. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
	Transmission Selection Algorithm	(IEEE DCBX only) The transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is **ETS**.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
TLV Type	(IEEE DCBX only) Type of ETS TLV: • Configuration—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration. • Recommendation—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is "willing," configures the peer interface to match the local ETS configuration. • Configuration/Recommendation—Advertises both TLVs.
Willing	Willingness of the peer to learn the ETS state from the local interface using DCBX: • **Yes**—Peer is willing to learn the ETS state from the local interface. • **No**—Peer is not willing to learn the ETS state from the local interface.
Credit Based Shaper	(IEEE DCBX only) Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always **No**.
Error	(DCBX Version 1.01 only) Configuration error status of the peer: • **No**—No error in peer ETS TLV. • **Yes**—Error in peer ETS TLV.
Maximum Traffic Classes capable to support PFC	(DCBX Version 1.01 only) Largest number of traffic classes the local interface supports for PFC.
Maximum Traffic Classes supported	(IEEE DCBX only) Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
Code Point	

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
		PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Priority-Group	CoS priority group (forwarding class set) identification number.
	Percentage B/W	Configured minimum percentage of link bandwidth allocated to the priority group. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
	Transmission Selection Algorithm	(IEEE DCBX only) Transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is **ETS**.
PFC		(QFX Series, **terse** option only) DCBX TLV advertisement state for PFC: • Disabled—PFC configuration matches the configuration on the connected peer and PFC is disabled • Enabled—PFC configuration matches the configuration on the connected peer and PFC is enabled • Not Advt—Interface does not advertise PFC to the connected peer
ETS		(**terse** option only) Local DCBX TLV advertisement state for ETS: • Advt—Interface advertises ETS TLVs • Disabled—ETS is disabled on the interface (interface does not advertise ETS)
ETS Rec		(**terse** option only) DCBX TLV peer advertisement state for ETS (state received from the connected DCBX peer): • Advt—Peer interface advertises ETS TLVs • Not Advt—Peer interface does not advertise ETS NOTE: When the DCBX mode is DCBX version 1.01, no peer information is displayed.

Table 577: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Version	(**terse** option only) The DCBX version used on the interface and whether the DCBX version was autonegotiated or explicitly configured: • **IEEE**—The interface uses IEEE DCBX. • **1.01**—The interface uses DCBX version 1.01. When the DCBX version used is the result of autonegotiation, the term **(Auto)** appears next to the version. For example, **IEEE (Auto)** indicates that the interface autonegotiated with the connected peer to use IEEE DCBX. Autonegotiation is enabled by default.

Sample Output

show dcbx neighbors interface (QFX Series, DCBX Version 1.01 Mode)

```
user@switch> show dcbx neighbors interface xe-0/0/0
Interface : xe-0/0/0.0 - Parent Interface: ae0.0

show interfaces queue

Syntax

show interfaces queue
<aggregate | remaining-traffic>
<both-ingress-egress>
<egress>
<forwarding-class *forwarding-class*>
<ingress>
<interface-name *interface-name*>
<l2-statistics>
<remaining-traffic>

Release Information

Command introduced before Junos OS Release 7.4.
both-ingress-egress, **egress**, and **ingress** options introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
l2-statistics option introduced in Junos OS Release 12.1.

Description

Display class-of-service (CoS) queue information for physical interfaces.

Options

none—Show detailed CoS queue statistics for all physical interfaces.

aggregate—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

both-ingress-egress—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

egress—(Optional) Display egress queue statistics.

forwarding-class *forwarding-class*—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

ingress—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

interface-name *interface-name*—(Optional) Show detailed CoS queue statistics for the specified interface.

l2-statistics—(optional) Display layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in Table 252 on page 2708. Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the layer 3 level. In the case of link fragmentation and interleaving (LFI) for which not fragmentation is applied, corresponding layer 2 overheads are added, as shown in Table 252 on page 2708.

Table 578: Layer 2 Overhead, Transmitted Packets/Bytes

Protocol	Fragmentation		LFI
	First fragmentation	Second to n fragmentations	
	Bytes	Bytes	
MLPPP (Long)	13	12	8
MLPPP (short)	11	10	8
MLFR (FRF15)	12	10	8
MFR (FRF16)	10	8	-
MCMLPPP(Long)	13	12	-
MCMLPPP(Short)	11	10	-

Layer 2 Statistics - Fragmentation Overhead Calculation

```
MLPPP/MC-MLPPP Overhead details:
   ==============================
   Fragment 1:

    Outer PPP header                          : 4 bytes
    Long or short sequence MLPPP header       : 4 bytes or 2 bytes
    Inner PPP header                          : 1 byte
    HDLC flag and FCS bytes                   : 4 bytes

   Fragments 2 .. n :

    Outer PPP header                          : 4 bytes
    Long or short sequence MLPPP header       : 4 bytes or 2 bytes
    HDLC flag and FCS bytes                   : 4 bytes

   MLFR (FRF15) Overhead details:
   ============================
   Fragment 1:
       Framerelay header     :  2 bytes
       Control,NLPID         :  2 bytes
       Fragmentaion header   :  2 bytes
       Inner proto           :  2 bytes
       HDLC flag and  FCS    :  4 bytes

   Fragments 2 ...n :

       Framerelay header     :  2 bytes
       Control,NLPID         :  2 bytes
       Fragmentaion header   :  2 bytes
       HDLC flag and  FCS    :  4 bytes

   MFR (FRF16) Overhead details:
   ============================
```

```
   Fragment 1:
      Fragmentaion header   :  2 bytes
      Framerelay header     :  2 bytes
      Inner proto           :  2 bytes
      HDLC flag and  FCS    :  4 bytes

   Fragments 2 ...n :
      Fragmentaion header   :  2 bytes
      Framerelay header     :  2 bytes
      HDLC flag and  FCS    :  4 bytes
```

Overhead with LFI

```
MLPPP(Long & short sequence):
   ============================
       Outer PPP header      :  4 bytes
       HDLC flag and  FCS    :  4 bytes

  MLFR (FRF15):
  =============
       Framerelay header     :  2 bytes
       Control,NLPID         :  2 bytes
       HDLC flag and  FCS    :  4 bytes
```

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the layer 2 level, bytes transmitted is 1008 in 1 packet.

remaining-traffic—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

Additional Information

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular

physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos® OS Network Interfaces*. For related CoS operational mode commands, see the CLI Explorer.

Output Fields Table 253 on page 2710 lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

Table 579: show interfaces queue Output Fields

Field Name	Field Description
Physical interface	Name of the physical interface.
Enabled	State of the interface. Possible values are described in the "Enabled Field" section under *Common Output Fields Description*.
Interface index	Physical interface's index number, which reflects its initialization sequence.
SNMP ifIndex	SNMP index number for the interface.
Forwarding classes supported	Total number of forwarding classes supported on the specified interface.

Table 579: show interfaces queue Output Fields *(continued)*

Field Name	Field Description
Forwarding classes in use	Total number of forwarding classes in use on the specified interface.
Ingress queues supported	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface.
Ingress queues in use	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.
Output queues supported	Total number of output queues supported on the specified interface.
Output queues in use	Total number of output queues in use on the specified interface.
Egress queues supported	Total number of egress queues supported on the specified interface.
Egress queues in use	Total number of egress queues in use on the specified interface.
Queue	Queue number.
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.
Burst size	(Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets queued to this queue. NOTE: For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.
Queued Bytes	Number of bytes queued to this queue. The byte counts vary by PIC type. For more information, see Table 254 on page 2713.
Transmitted Packets	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values. NOTE: For layer 2 statistics, see "Overhead for Layer 2 Statistics" on page 2707

Table 579: show interfaces queue Output Fields *(continued)*

Field Name	Field Description
Transmitted Bytes	Number of bytes transmitted by this queue. The byte counts vary by PIC type. For more information, see Table 254 on page 2713. NOTE: On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation. NOTE: For layer 2 statistics, see "Overhead for Layer 2 Statistics" on page 2707
Tail-dropped packets	Number of packets dropped because of tail drop.

RED-dropped packets	Number of packets dropped because of random early detection (RED).
	
	• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories:
	  ◦ **Low, non-TCP**—Number of low-loss priority non-TCP packets dropped because of RED.
	  ◦ **Low, TCP**—Number of low-loss priority TCP packets dropped because of RED.
	  ◦ **High, non-TCP**—Number of high-loss priority non-TCP packets dropped because of RED.
	  ◦ **High, TCP**—Number of high-loss priority TCP packets dropped because of RED.
	
	• (J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories:
	  ◦ **Low**—Number of low-loss priority packets dropped because of RED.
	  ◦ **Medium-low**—Number of medium-low loss priority packets dropped because of RED.
	  ◦ **Medium-high**—Number of medium-high loss priority packets dropped because of RED.
	  ◦ **High**—Number of high-loss priority packets dropped because of RED.

RED-dropped bytes	Number of bytes dropped because of RED. The byte counts vary by PIC type. For more information, see Table 254 on page 2713.
	
	• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories:
	  ◦ **Low, non-TCP**—Number of low-loss priority non-TCP bytes dropped because of RED.
	  ◦ **Low, TCP**—Number of low-loss priority TCP bytes dropped because of RED.
	  ◦ **High, non-TCP**—Number of high-loss priority non-TCP bytes dropped because of RED.
	  ◦ **High, TCP**—Number of high-loss priority TCP bytes dropped because of RED.
	
	• (J Series routers only) The output classifies dropped bytes into the following categories:
	  ◦ **Low**—Number of low-loss priority bytes dropped because of RED.
	  ◦ **Medium-low**—Number of medium-low loss priority bytes dropped because of RED.
	  ◦ **Medium-high**—Number of medium-high loss priority bytes dropped because of RED.
	  ◦ **High**—Number of high-loss priority bytes dropped because of RED.

	Byte counts vary by PIC type. Table 254 on page 2713 shows how the byte counts on the outbound interfaces vary depending on the PIC type. Table 254 on page 2713 is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 580: Byte Count by PIC Type

PIC Type	Output Level	Byte Count Includes	Comments
Gigabit Ethernet IQ and IQE PICs	Interface	Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes	The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type. For RED dropped, 6 bytes are added for the source MAC address.
	Packet forwarding component	Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet	–
Non-IQ PIC	Interface	T Series, TX Series, T1600, and MX Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet. T4000 routers with Type 5 FPCs : • Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Inter frame Gap. • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Interframe Gap. M Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead. PTX Series Packet Transport Switches: • Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes FCS + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). • RED dropped: 478 bytes of Layer 3 packet + 22 bytes special header. To the TQ, this packet has 4 bytes more than queued or transmitted.	The Layer 2 overhead is 14 bytes for non-VLAN traffic and 18 bytes for VLAN traffic.

Table 580: Byte Count by PIC Type *(continued)*

PIC Type	Output Level	Byte Count Includes	Comments
IQ and IQE PICs with a SONET/SDH interface	Interface	Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes	The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.
	Packet forwarding component	Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes	For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.
Non-IQ PIC with a SONET/SDH interface	Interface	T Series, TX Series, T1600, and MX Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet. M Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes • RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet	For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP).
Interfaces configured with Frame Relay Encapsulation	Interface	The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.	
1-port 10-Gigabit Ethernet IQ2 and IQ2–E PICs	Interface	Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC. Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.	The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.
4-port 1G IQ2 and IQ2-E PICs 8-port 1G IQ2 and IQ2-E PICs	Packet forwarding component	Queued: 478 bytes of Layer 3 packet. Transmitted: 478 bytes of Layer 3 packet.	–

Sample Output

show interfaces queue (Aggregated Ethernet on a T320 Router)

The following example shows that the aggregated Ethernet interface, **ae1**, has traffic on queues **af1** and **af12**:

```
user@host> show interfaces queue ae1
Physical interface: ae1, Enabled, Physical link is Up
Interface index: 158, SNMP ifIndex: 33 Forwarding classes: 8 supported, 8 in use
Output queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: be
  Queued:
    Packets              :                     5                     0 pps
    Bytes                :                   242                     0 bps
  Transmitted:
    Packets              :                     5                     0 pps
    Bytes                :                   242                     0 bps
    Tail-dropped packets :                     0                     0 pps
    RED-dropped packets  :                     0                     0 pps

Syntax
show pfe next-hop
<interface *interface-name*>

Syntax (TX Matrix and TX Matrix Plus Routers)
show pfe next-hop
<fpc *slot*>
<interface *interface-name*>
<lcc *number*>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description
Display Packet Forwarding Engine next-hop information.

Options
none—Display all Packet Forwarding Engine next-hop information.

fpc *slot*—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**.
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe next-hop fpc 1 lcc 1
user@host> show pfe next-hop fpc 9
```

interface *interface-name*—(Optional) Display the Packet Forwarding Engine next-hop interface.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine next-hop interface for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine next-hop interface for the router (or line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Required Privilege Level admin

<<inet6 | ip | iso> <prefix *prefix*> | <table <*table-name*> <index *index*> <prefix *prefix*>>>
<lcc *number*>
<mpls>
<summary>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.

NOTE: The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the **show route forwarding table** command. For more information, see the CLI Explorer.

Options

none—Display all Packet Forwarding Engine forwarding table information.

fpc *slot*—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**

- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

index ***index***—(Optional) Display table index.

inet6—(Optional) Display Packet Forwarding Engine IPv6 routes.

ip—(Optional) Display Packet Forwarding Engine IPv4 routes.

iso —(Optional) Display ISO version routing tables.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

mpls—(Optional) Display Packet Forwarding Engine MPLS information.

prefix ***prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

summary—(Optional) Display summary of Packet Forwarding Engine information.

table <***table-name***>—(Optional) Display table information.

Required Privilege Level

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Packet Forwarding Engine status information.

Options

none—Display brief information about the Packet Forwarding Engine.

all-members—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for all members in the Virtual Chassis configuration.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine information for a T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine information for the router (or line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display Packet Forwarding Engine information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display Packet Forwarding Engine information for the TX Matrix Plus router (or switch-fabric chassis).

Troubleshooting Dropped FCoE Traffic

Problem **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

Cause There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

Solution The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

   If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

   If you explicitly configured a forwarding class for FCoE traffic, ensure that:

   - You specified the **no-loss** packet drop attribute in the forwarding class configuration
   - The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
   - The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

   For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2500
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces** *interface-name*.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers** ***scheduler-name*** operational command (specify the scheduler for FCoE traffic as the ***scheduler-name***) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

   Use the **show configuration class-of-service traffic-control-profiles** ***traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the ***traffic-control-profile***) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.

7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class** ***fcoe-forwarding-class-name*** **queue-num** ***queue-number*** **no-loss**).

See "Example: Configuring CoS PFC for FCoE Traffic" on page 5113 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

Problem **Description:** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

Solution When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

Problem **Description:** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

NOTE: The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

Solution When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

Troubleshooting Egress Queue Bandwidth Impacted by Congestion

Problem **Description:** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

Cause Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

Solution The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

Troubleshooting an Unexpected Rewrite Value

Problem **Description:** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

NOTE: For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

Cause If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

Solution If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

TIP: If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

NOTE: There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

   ```
   [edit class-of-service rewrite-rules]
   ```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point 011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp | ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1 custom-rw
```

Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

Problem **Description:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

Cause Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

Solution If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

   ```
   [edit class-of-service]
   user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
   ```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps scheduler-map-name forwarding-class
   forwarding-class-name scheduler scheduler-name
   ```

3. Associate the scheduler map with a traffic control profile:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
   scheduler-map-name
   ```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name forwarding-class-set fc-set-name
   output-traffic-control-profile traffic-control-profile-name
   ```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues. Table 581 on page 6073 shows the topology for this example:

Table 581: Components of the Rate Shaping Troubleshooting Example

Component	Settings
Affected interface	**shpnode:xe-0/0/10**
Scheduler (strict-high priority scheduler)	Name: **shp-sched** Shaping rate: **7g** Priority: **strict-high** NOTE: This example assumes that the scheduler already exists and has been configured as **strict-high** priority, but that rate shaping to prevent the strict-high priority traffic from using all of the port bandwidth has not been applied.
Scheduler map	Name: **shp-map** Forwarding class to associate with the **shp-sched** scheduler: **strict-high** NOTE: This example assumes that a strict-high priority forwarding class has been configured and assigned the name **strict-high**.
Traffic control profile	Name: **shp-tcp** NOTE: This example does not describe how to define a complete traffic control profile.

Table 581: Components of the Rate Shaping Troubleshooting Example *(continued)*

Component	Settings
Forwarding class set	Name: **shp-pg**

To configure the scheduler, map it to the strict-high priority forwarding class, and apply it to interface **shpnode:xe-0/0/10** using the CLI:

1. Specify the scheduler for the strict-high priority queue (**shp-sched**) with a maximum bandwidth of 7 Gbps:

   ```
   [edit class-of-service schedulers]
   user@switch# set shp-sched shaping-rate 7g
   ```

2. Configure a scheduler map (**shp-map**) that associates the scheduler (**shp-sched**) with the forwarding class (**strict-high**):

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set shp-map forwarding-class strict-high scheduler shp-sched
   ```

3. Associate the scheduler map **shp-map** with a traffic control profile (**shp-tcp**):

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set shp-tcp scheduler-map shp-map
   ```

4. Associate the traffic control profile **shp-tcp** with a forwarding class set (**shp-pg**) and the affected interface (**shpnode:xe-0/0/10**):

   ```
   [edit class-of-service]
   user@switch# set interfaces shpnode:xe-0/0/10 forwarding-class-set shp-pg
   output-traffic-control-profile shp-tcp
   ```

Understanding Device and Network Management Features

After you install a QFX Series product in your network, you need to manage the device. The QFX Series products support features that you use to manage the device within the network, including the management of configuration, system performance, fault monitoring, and remote access.

Table 582 on page 6077 lists the device and network management features on the QFX Series.

Table 582: Device and Network Management Features on the QFX Series

Feature	Typical Uses	Documentation
AI-Scripts and Advanced Insight Manager (AIM)—Automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems, and submit problem reports to Juniper Support Systems.	Fault management	*Advanced Insight Scripts (AI-Scripts) Release Notes*

Table 582: Device and Network Management Features on the QFX Series *(continued)*

Feature	Typical Uses	Documentation
Alarms and LEDs on the switch—Show status of hardware components and indicate warning or error conditions.	Fault management	"Chassis Alarm Messages on a QFX3500 Device" on page 6488
Firewall filters—Control the packets that are sent to and from the network, balance network traffic, and optimize performance.	Performance management	• *Routing Policy Configuration Guide* • Overview of Firewall Filters on page 4635
In-band management—Enables connection to the switch using the same interfaces through which customer traffic flows. Communication between the switch and a remote console is typically enabled using SSH and Telnet services. SSH provides secure encrypted communications, whereas Telnet provides unencrypted, and therefore less secure, access to the switch.	Remote access management	• Configuring SSH Service for Remote Access to the Router or Switch on page 1709 • *Configuring Telnet Service for Remote Access to a Router or Switch*
Juniper Networks Junos OS automation scripts—Configuration and operations automation tools provided by Junos OS. These tools include commit scripts, operation scripts, event scripts, and event policies. Commit scripts enforce custom configuration rules, whereas operation scripts, event policies, and event scripts automate network troubleshooting and management.	• Configuration management • Performance management • Fault management	*Junos OS Configuration and Operations Automation Guide*
Junos OS command-line interface (CLI)—CLI configuration statements that enable you to configure the switch based on your networking requirements, such as security, service, and performance.	• Configuration management • Performance management • User access management • Remote access management	*CLI User Guide*
Junos Space software—Multipurpose GUI-based network management system that includes a base platform, the Network Application Platform, and other optional applications such as Ethernet Design, Service Now, Service Insight, and Virtual Control.	• Configuration management • Performance management • Fault management	• Understanding Junos Space Support on page 6101 • *Junos Space Network Application Platform User Guide*
Junos XML API—XML representation of Junos OS configuration statements and operational mode commands. Junos XML configuration tag elements are the content to which the Junos XML protocol operations apply. Junos XML operational tag elements are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device. The Junos XML API also includes tag elements that are the counterpart to Junos CLI configuration statements.	• Configuration management • Performance management • Fault management	• *Junos XML API Configuration Developer Reference* • *Junos XML API Operational Developer Reference*

Table 582: Device and Network Management Features on the QFX Series *(continued)*

Feature	Typical Uses	Documentation
NETCONF XML management protocol—XML-based management protocol that client applications use to request and change configuration information on routing, switching, and security platforms running Junos OS. The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as **show**, **set**, and **commit** to perform those operations.	• Configuration management • Performance management • Fault management	*NETCONF XML Management Protocol Guide*
Operational mode commands—May be used to do the following: • Monitor switch performance. For example, the **show chassis routing-engine** command shows the CPU utilization of the Routing Engine. High CPU utilization of the Routing Engine can affect performance of the switch. • View current activity and status of the device or network. For example, you can use the **ping** command to monitor and diagnose connectivity problems, and the **traceroute** command to locate points of failure on the network.	• Performance management • Fault management	CLI Explorer
Out-of-band management—Enables connection to the switch through a management interface. Out-of-band management is supported on two dedicated management Ethernet interfaces as well as on the console and auxiliary ports. The management Ethernet interfaces connect directly to the Routing Engine. No transit traffic is allowed through the interfaces, separating customer and management traffic and ensuring that congestion or failures in the transit network do not affect the management of the switch.	Remote access management	• *Connecting a QFX3500 Device to a Network for Out-of-Band Management* • *Connecting a QFX Series Device to a Management Console* • Configuring Console and Auxiliary Port Properties on page 6177
SNMP Configuration Management MIB—Provides notification for configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable.	Configuration management	*SNMP MIBs and Traps Reference*

Table 582: Device and Network Management Features on the QFX Series *(continued)*

Feature	Typical Uses	Documentation
SNMP MIBs and traps—Enable the monitoring of network devices from a central location. Use SNMP requests such as **get** and **walk** to monitor and view system activity. The QFX3500 switch supports SNMP Version 1 (v1), v2, and v3, and both standard and Juniper Networks enterprise-specific MIBs and traps.	Fault management	• *SNMP MIBs and Traps Reference* • Understanding the Implementation of SNMP on page 6107
System log messages—Log details of system and user events, including errors. You can specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	• Fault management • User access management	• *Junos OS System Log Messages Reference* • Overview of Junos OS System Log Messages on page 6154 • Overview of Single-Chassis System Logging Configuration on page 6155

Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log *filename*** operational mode command to view messages.
- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.
- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

NOTE: Do not install Junos Space and AIS on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

Understanding Telnet on the QFabric System

This topic describes the support for the Telnet protocol on QFabric systems.

Telnet service is available for devices running Junos OS, including QFX Series devices. However, on QFabric systems, Telnet support is limited and the following conditions apply:

- You can telnet from a QFabric system to external devices that are connected to the QFabric system by way of the network Node group. To connect to these external devices, issue the **telnet** command from the QFabric default partition CLI.
- You cannot use the Telnet protocol to connect from the QFabric system default partition CLI to individual components. To access system components, you must issue the **request component login** command instead.

Related Documentation

- request component login on page 1444
- *telnet*

Understanding Tracing and Logging Operations

Tracing and logging operations enable you to track events that occur in the switch—both normal operations and error conditions—and to track the packets that are generated by or passed through the switch. The results of tracing and logging operations are placed in files in the **/var/log** directory on the switch.

The Junos OS supports remote tracing for the following processes:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

You configure remote tracing by using the **tracing** statement at the **[edit system]** hierarchy level.

NOTE: **The tracing statement is not supported on the QFX3000 QFabric system.**

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit *process-name* traceoptions]** hierarchy level. This feature does not alter local tracing functionality in any way, and logging files are stored on the switch.

Logging operations use a system logging mechanism similar to the UNIX **syslogd** utility to record systemwide, high-level operations, such as interfaces going up or down and users logging in to or out of the switch. You configure these operations by using the **syslog** statement at the **[edit system]** hierarchy level and by using the **options** statement at the **[edit ethernet-switching-options]** hierarchy level.

Tracing operations record more detailed information about the operations of the switch, including packet forwarding and routing information. To configure tracing operations, use the **traceoptions** statement.

NOTE: The traceoptions statement is not supported on the QFX3000 QFabric system.

You can define tracing operations in different portions of the switch configuration:

- SNMP agent activity tracing operations—Define tracing of the activities of SNMP agents on the switch. You configure SNMP agent activity tracing operations at the **[edit snmp]** hierarchy level.
- Global switching tracing operations—Define tracing for all switching operations. You configure global switching tracing operations at the **[edit ethernet-switching-options]** hierarchy level of the configuration.
- Protocol-specific tracing operations—Define tracing for a specific routing protocol. You configure protocol-specific tracing operations in the **[edit protocols]** hierarchy when configuring the individual routing protocol. Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.
- Tracing operations within individual routing protocol entities—Some protocols allow you to define more granular tracing operations. For example, in Border Gateway Protocol (BGP), you can configure peer-specific tracing operations. These operations override any equivalent BGP-wide operations or, if there are no equivalents, supplement them. If you do not specify any peer-specific tracing operations, the peers inherit, first, all the BGP-wide tracing operations and, second, the global tracing operations.
- Interface tracing operations—Define tracing for individual interfaces and for the interface process itself. You define interface tracing operations at the **[edit interfaces]** hierarchy level of the configuration.
- Remote tracing—To enable system-wide remote tracing, configure the **destination-override syslog host** statement at the **[edit system tracing]** hierarchy level. This specifies the remote host running the system log process (syslogd), which collects

the traces. Traces are written to files on the remote host in accordance with the syslogd configuration in **/etc/syslog.conf**. By default, remote tracing is not configured.

To override the system-wide remote tracing configuration for a particular process, include the **no-remote-trace** statement at the **[edit *process-name* traceoptions]** hierarchy. When **no-remote-trace** is enabled, the process does local tracing.

To collect traces, use the **local0** facility as the selector in the **/etc/syslog.conf** file on the remote host. To separate traces from various processes into different files, include the process name or trace-file name (if it is specified at the [edit ***process-name*** **traceoptions file**] hierarchy level) in the Program field in the **/etc/syslog.conf** file. If your system log server supports parsing hostname and program name, then you can separate traces from the various processes.

NOTE: During a commit check, warnings about the traceoptions configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

- Required Boilerplate for Op Scripts on page 6097

Understanding Automation Scripts Support

This document describes the support for the Junos OS automation scripts on the QFabric system Director devices.

Junos OS automation consists of a suite of tools used to automate operational and configuration tasks on network devices running Junos OS. The automation tools, which leverage the native XML capabilities of the Junos OS, include commit scripts, operation (op) scripts, event policies and event scripts, and macros.

NOTE: Event policies and event scripts are not supported on the QFabric system at this time.

The QFabric system supports Junos OS automation scripts that are written in Stylesheet Language Alternative Syntax (SLAX) version 1.0.

Commit scripts automate the commit process and enforce custom configuration rules. You can use commit scripts to generate specific errors and warnings, and customize configurations and configuration templates. When a candidate configuration is committed, it is inspected by each active commit script. If a configuration violates your custom rules and the scripts generate an error, the commit fails. If the commit is successful, any configuration changes (both transient and permanent) are incorporated into the active configuration before it is passed to the Director software, which distributes the configuration to all applicable QFabric system components, including Node devices and Node servers.

Op scripts automate operational and troubleshooting tasks. Op scripts can be executed manually from the Junos OS CLI or NETCONF XML management protocol, or they can be called from another script.

The QFabric system supports the following automation script features:

- Commit scripts and op scripts are supported.
- Scripts written in SLAX version 1 are supported.
- Scripts are configured and deployed from the Director group. Since there is more than one Director device in a Director group, scripts must be deployed by each Director device or deployed in the shared media space.
- Scripts are stored in the shared media at this location: **/pbdata/mgd_shared/*partition-ip*/var/db/scripts**. Under this directory, commit scripts are stored in the **commit** subdirectory, and op scripts are stored in the **op** subdirectory.
- Scripts are not stored in flash memory.

How Commit Scripts Work

You enable commit scripts by listing the names of one or more commit script files at the **[edit system scripts commit]** hierarchy level. These scripts contain instructions that enforce custom configuration rules. Commit scripts are invoked during the commit process before the standard Junos OS validity checks are performed.

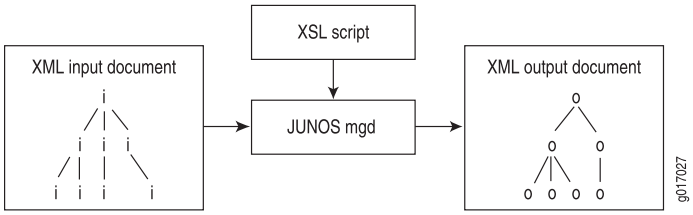
When you perform a commit operation, Junos OS executes each script in turn, passing the information in the candidate configuration to the scripts. The script inspects the configuration, performs the necessary tests and validations, and generates a set of instructions for performing certain actions. These actions include generating error, warning,

and system log messages. If errors are generated, the commit operation fails and the candidate configuration remains unchanged. This is the same behavior that occurs with standard commit errors.

Commit scripts can also generate changes to the system configuration. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 218 on page 6085 shows the flow of commit script input and output.

Figure 218: Commit Script Input and Output



Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

The following sections discuss several important concepts related to the commit script input and output:

- Commit Script Input on page 6085
- Commit Script Output on page 6086
- Commit Scripts and the Junos OS Commit Model on page 6087

Commit Script Input

The input for a commit script is the postinheritance candidate configuration in Junos XML API format. The term *postinheritance* means that all configuration group values have been inherited by their targets in the candidate configuration and the inactive portions of the configuration have been removed. For more information about configuration groups, see the *CLI User Guide*.

When you issue the **commit** command, Junos OS automatically generates the candidate configuration in XML format and reads it into the management (mgd) process, at which time the input is evaluated by any commit scripts.

To display the XML format of the postinheritance configuration, issue the **show | display commit-scripts view** command:

```
[edit]
user@host# show | display commit-scripts view
```

To display all configuration groups data, including script-generated changes to the groups, issue the **show groups | display commit-scripts** command:

```
[edit]
user@host# show groups | display commit-scripts
```

To save the commit script input to a file, add the **save** command to the command line:

```
[edit]
user@host# show | display commit-scripts view | save filename.xml
```

By default, the file is placed in your home directory on the switch, router, or security device.

Commit Script Output

To specify the desired commit script output—including warning, error, and system log messages, persistent changes, and transient changes—the script can contain tags that appear in any order, in any number. The tags for specifying output are as follows:

- **<xnm:warning>**—Generates a warning message
- **<xnm:error>**—Generates an error message.
- **<syslog><message>**—Generates a system log message.
- **<change>**—Generates a persistent change to the configuration.
- **<transient-change>**—Generates a transient change to the configuration.
- **<xsl:call-template name="jcs:emit-change">**
  <xsl:with-param name="content">—Generates a persistent change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
  <xsl:with-param name="tag" select="'transient-change'"/>
  <xsl:with-param name="content">—Generates a transient change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
  <xsl:with-param name="message">
  <xsl:text>—Generates a warning message in conjunction with a configuration change. You can use this set of tags to generate a notification that the configuration has been changed.

Junos OS processes this output and performs the appropriate actions. Errors and warnings are passed back to the Junos OS CLI or to a Junos XML protocol client application. The presence of an error automatically causes the commit operation to fail. Persistent and transient changes are loaded into the appropriate configuration database.

To test the output of error, warning, and system log messages from commit scripts, issue the **commit check | display xml** command:

```
[edit]
user@host# commit check | display xml
```

To display a detailed trace of commit script processing, issue the **commit check | display detail** command:

```
[edit]
user@host# commit check | display detail
```

NOTE: System log messages do not appear in the trace output, so you cannot use the commit check operation to test script-generated system log messages. Furthermore, system log messages are written to the system log during a commit operation, but not during a commit check operation.

Commit Scripts and the Junos OS Commit Model

Junos OS uses a commit model to update the device's configuration. This model allows you to make a series of changes to a candidate configuration without affecting the operation of the device. When the changes are complete, you can commit the configuration. The commit operation saves the candidate configuration changes into the current configuration.

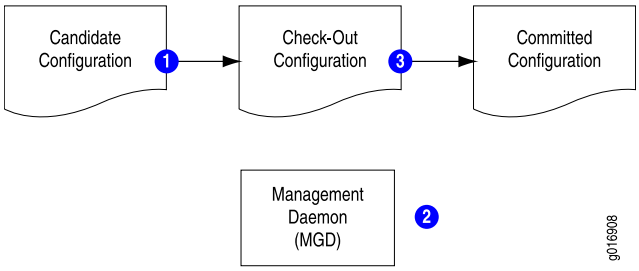
When you commit a set of changes in the candidate configuration, two methods are used to forward these changes to the current configuration:

- Standard commit model—Used when no commit scripts are active on the device.
- Commit script model—Incorporates commit scripts into the commit model.

Standard Commit Model

In the standard commit model, the management (mgd) process validates the candidate configuration based on standard Junos validation rules. If the configuration file is valid, it becomes the current active configuration. Figure 219 on page 6087 and the accompanying discussion explain how the standard commit model works:

Figure 219: Standard Commit Model



In the standard commit model, the software performs the following steps:

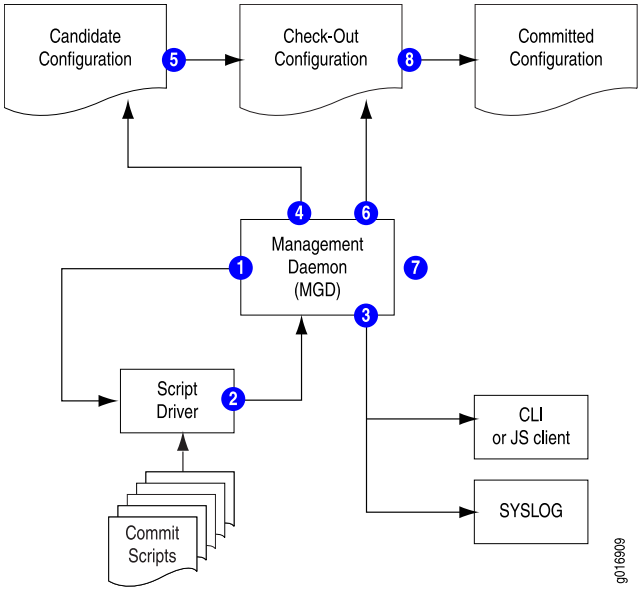
1. When the candidate configuration is committed, it is copied to become the checkout configuration.

2. The mgd process validates the checkout configuration.
3. If no error occurs, the checkout configuration is copied as the current active configuration.

Commit Model with Commit Scripts

When commit scripts are added to the standard commit model, the process becomes more complex. The mgd process first passes an XML-formatted checkout configuration to a script driver, which handles the verification of the checkout configuration by the commit scripts. When verification is complete, the script driver returns an XML *action file* to the mgd process. The mgd process follows the instructions in the action file to update the candidate and checkout configurations, issue messages to the CLI, and write information to the system log as required. After processing the action file, the mgd process performs the standard Junos OS validation. Figure 220 on page 6088 and the accompanying discussion explain this process.

Figure 220: Commit Model with Commit Scripts Added



In the commit script model, Junos OS performs the following steps:

1. When the candidate configuration is committed, the mgd process sends the XML-formatted candidate configuration to the script driver.
2. Each enabled commit script is invoked against the candidate configuration, and each script can generate a set of actions for the mgd process to perform. The actions are collected in an XML action file.
3. The mgd process performs the following actions in response to **<error>**, **<warning>**, and **<syslog>** tag elements in the action file:
   - **<error>**—The mgd process halts the commit process (that is, the commit operation fails), returns an error message to the CLI or Junos XML protocol client, and takes no further action.

- **<warning>**—The mgd process forwards the message to the CLI or the Junos XML protocol client.
- **<syslog>**—The mgd process forwards the message to the system log process.

4. If the action file includes any **<change>** tag elements, the mgd process loads the requested changes into the candidate configuration.
5. The candidate configuration is copied to become the checkout configuration.
6. If the action file includes any **<transient-change>** tag elements, the mgd process loads the requested changes into the checkout configuration.
7. The mgd process validates the checkout configuration.
8. If there are no validation errors, the checkout configuration is copied to become the current active configuration.

NOTE: **Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.**

Changes that are made to the candidate configuration during the commit operation are not evaluated by the custom rules during that commit operation. However, persistent changes are maintained in the candidate configuration and are evaluated by the custom rules during subsequent commit operations. For more information about how commit scripts change the candidate configuration, see "Avoiding Potential Conflicts When Using Multiple Commit Scripts" on page 6089.

Transient changes are never evaluated by the custom rules in commit scripts, because they are made to the checkout configuration only after the commit scripts have evaluated the candidate configuration and the candidate is copied to become the checkout configuration. To remove a transient change from the configuration, remove, disable, or deactivate the commit script (as discussed in *Controlling Execution of Commit Scripts During Commit Operations*), or comment out the code that generates the transient change.

For more information about differences between persistent and transient changes, see "Overview of Generating Persistent or Transient Configuration Changes" on page 6090.

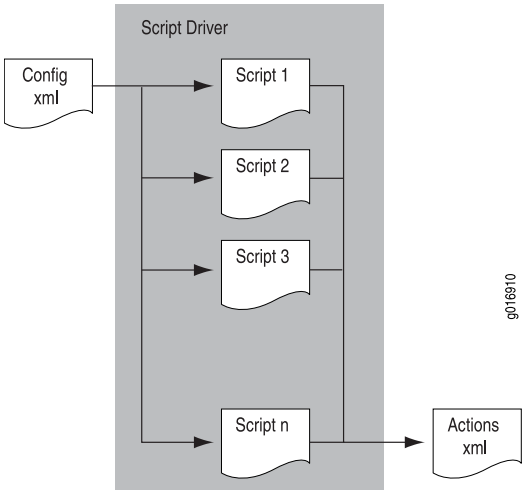
Related Documentation

- Avoiding Potential Conflicts When Using Multiple Commit Scripts on page 6089

Avoiding Potential Conflicts When Using Multiple Commit Scripts

When you use multiple commit scripts, each script evaluates the original candidate configuration file. Changes made by one script are not evaluated by the other scripts. This means that conflicts between scripts might not be resolved when the scripts are first applied to the configuration. The commit scripts are executed in the order they are listed at the **[edit system scripts commit]** hierarchy level, as illustrated in Figure 221 on page 6090.

Figure 221: Configuration Evaluation by Multiple Commit Scripts



As an example of a conflict between commit scripts, suppose that commit script **A.xsl** is created to ensure that the device uses the domain name server with IP address 192.168.0.255. Later, the DNS server's address is changed to 192.168.255.255 and a second script, **B.xsl**, is added to check that the device uses the DNS server with that address. However, script **A.xsl** is not removed or disabled.

Because each commit script evaluates the original candidate configuration, the final result of executing both scripts **A.xsl** and **B.xsl** depends on which DNS server address is configured in the original candidate configuration. If the now outdated address of 192.168.0.255 is configured, script **B.xsl** changes it to 192.168.255.255. However, if the correct address of 192.168.255.255 is configured, script **A.xsl** changes it to the incorrect value 192.168.0.255.

As another example of a potential conflict between commit scripts, suppose that a commit script protects a hierarchy using the **protect** attribute. If a second commit script attempts to modify or delete the hierarchy or the statements within the hierarchy, Junos OS issues a warning during the commit process and prevents the configuration change.

Exercise care to ensure that you do not introduce conflicts between scripts like those described in the examples. As a method of checking for conflicts with persistent changes, you can issue two separate **commit** commands.

Related Documentation

- How Commit Scripts Work on page 6084

Overview of Generating Persistent or Transient Configuration Changes

Junos OS commit scripts enforce custom configuration rules. When a candidate configuration includes statements that you have decided must not be included in your configuration, or when the candidate configuration omits statements that you have

decided are required, commit scripts can automatically change the configuration and thereby correct the problem.

- Differences Between Persistent and Transient Changes on page 6091
- Interaction of Configuration Changes and Configuration Groups on page 6094
- Tag Elements and Templates for Generating Changes on page 6094

Differences Between Persistent and Transient Changes

Configuration changes made by commit scripts can be *persistent* or *transient*.

A persistent change remains in the candidate configuration and affects routing operations until you explicitly delete it, even if you subsequently remove or disable the commit script that generated the change and reissue the **commit** command. In other words, removing the commit script does not cause a persistent change to be removed from the configuration.

A transient change, in contrast, is made in the *checkout configuration* but not in the candidate configuration. The checkout configuration is the configuration database that is inspected for standard Junos OS syntax just before it is copied to become the active configuration on the device. If you subsequently remove or disable the commit script that made the change and reissue the **commit** command, the change is no longer made to the checkout configuration and so does not affect the active configuration. In other words, removing the commit script effectively removes a transient change from the configuration.

A common use for transient changes is to eliminate the need to repeatedly configure and display well-known policies, thus allowing these policies to be enforced implicitly. For example, if MPLS must be enabled on every interface with an International Organization for Standardization (ISO) protocol enabled, the change can be transient, so that the repetitive or redundant configuration data need not be carried or displayed in the candidate configuration. Furthermore, transient changes allow you to write script instructions that apply the change only if a set of conditions is met.

Persistent and transient changes are loaded into the configuration in the same manner that the **load replace** configuration mode command loads an incoming configuration. When generating a persistent or transient change, adding the **replace="replace"** attribute to a configuration element produces the same behavior as a **replace:** tag in a **load replace** operation.

By default, Junos OS merges the incoming configuration and the candidate configuration. New statements and hierarchies are added, and conflicting statements are overridden. When generating a persistent or transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing configuration element with the incoming configuration element. If the **replace="replace"** attribute is added to a configuration element, but there is no existing element of the same name in the current configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.

Persistent and transient changes are loaded before the standard Junos validation checks are performed. This means any configuration changes introduced by a commit script are

validated for correct syntax. If the syntax is correct, the new configuration becomes the active, operational device configuration.

Protected elements in the configuration hierarchy cannot be modified or deleted by either a persistent or a transient change. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made, and proceeds with the commit.

Persistent and transient changes have several important differences, as described in Table 583 on page 6092.

Table 583: Differences Between Persistent and Transient Changes

Persistent Changes	Transient Changes
A persistent change is represented in a commit script by the **<change>** tag. Another way to represent a persistent change is with the **content** parameter inside a call to the **jcs:emit-change** template. The **jcs:emit-change** template is a helper template contained in the **junos.xsl** import file.	A transient change is represented in a commit script by the **<transient-change>** tag. Another way to represent a transient change is to use the **content** parameter and the **tag transient** parameter inside a call to the **jcs:emit-change** template.
You can use persistent changes to perform any Junos XML protocol operation, such as activate, deactivate, delete, insert (reorder), comment (annotate), and replace sections of the configuration.	Like persistent changes, you can use transient changes to perform any Junos XML protocol operation. However, some Junos XML protocol operations do not make sense to use with transient changes, such as generating comments and inactive settings.
Persistent changes are always loaded during the commit process if no errors are generated by any commit scripts or by the standard Junos OS validity check.	For transient changes to be loaded, you must include the **allow-transients** statement at the **[edit system scripts commit]** hierarchy level. If you enable a commit script that generates transient changes and you do not include the **allow-transients** statement in the configuration, the CLI generates an error message and the commit operation fails. Like persistent changes, transient changes must pass the standard Junos OS validity check. You cannot use a commit script to generate the **allow-transients** statement at the **[edit system scripts commit]** hierarchy level. Rather, you must include this statement directly by using the CLI.

Table 583: Differences Between Persistent and Transient Changes *(continued)*

Persistent Changes	Transient Changes
Persistent changes work like the **load replace** configuration mode command, and the change is added to the candidate configuration. When generating a persistent change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing element in the candidate configuration with the incoming configuration element. If there is no existing element of the same name in the candidate configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.	Transient changes work like the **load replace** configuration mode command, and the change is added to the checkout configuration. When generating a transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing element in the checkout configuration with the incoming configuration element. If there is no existing element of the same name in the checkout configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration. Transient changes are not copied to the candidate configuration. For this reason, transient changes are not saved in the configuration if the associated commit script is deleted or deactivated.
After a persistent change is committed, the software treats it like a change you make by directly editing and committing the candidate configuration. After the persistent changes are copied to the candidate configuration, they are copied to the checkout configuration. If the changes pass the standard Junos OS validity checks, the changes are propagated to the switch, router, or security device components.	Each time a transient change is committed, the software updates the checkout configuration database. After the transient changes pass the standard Junos OS validity checks, the changes are propagated to the device components.
After committing a script that causes a persistent change to be generated, you can view the persistent change by issuing the **show** configuration mode command: **user@host# show** This command displays persistent changes only, not transient changes.	After committing a script that causes a transient change to be generated, you can view the transient change by issuing the **show | display commit-scripts** configuration mode command: **user@host# show | display commit-scripts** This command displays both persistent and transient changes.
Persistent changes must conform to your custom configuration design rules as dictated by commit scripts. This does not become apparent until after a second commit operation because persistent changes are not evaluated by commit script rules on the current commit operation. The subsequent commit operation fails if the persistent changes do not conform to the rules imposed by the commit scripts configured during the first commit operation.	Transient changes are never tested by and do not need to conform to your custom rules. This is caused by the order of operations in the Junos OS commit model, which is explained in detail in "Commit Scripts and the Junos OS Commit Model" on page 6087.
A persistent change remains in the configuration even if you delete, disable, or deactivate the commit script instructions that generated the change.	If you delete, disable, or deactivate the commit script instructions that generate a transient change, the change is removed from the configuration after the next commit operation. In short, if the associated instructions or the entire commit script is removed, the transient change is also removed.

Table 583: Differences Between Persistent and Transient Changes *(continued)*

Persistent Changes	Transient Changes
As with direct CLI configuration, you can remove a persistent change by rolling back to a previous configuration that did not include the change and issuing the **commit** command. However, if you do not disable or deactivate the associated commit script, and the problem that originally caused the change to be generated still exists, the change is automatically regenerated when you issue another **commit** command.	You cannot remove a transient change by rolling back to a previous configuration.
You can alter persistent changes directly by editing the configuration using the CLI.	You cannot directly alter or delete a transient change by using the Junos OS CLI, because the change is not in the candidate configuration. To alter the contents of a transient change, you must alter the statements in the commit script that generates the transient change.

Interaction of Configuration Changes and Configuration Groups

Any configuration change you can make by directly editing the configuration using the Junos OS command-line interface (CLI) can also be generated by a commit script as a persistent or transient change. This includes values specified at a specific hierarchy level or in configuration groups. As with direct CLI configuration, values specified in the *target* override values inherited from a configuration group. The target is the statement to which you apply a configuration group by including the **apply-groups** statement.

If you define persistent or transient changes as belonging to a configuration group, the configuration groups are applied in the order you specify in the **apply-groups** statements, which you can include at any hierarchy level except the top level. You can also disable inheritance of a configuration group by including the **apply-groups-except** statement at any hierarchy level except the top level.

CAUTION: Each commit script inspects the postinheritance view of the configuration. If a candidate configuration contains a configuration group, be careful when using a commit script to change the related target configuration, because doing so might alter the intended inheritance from the configuration group.

Also be careful when using a commit script to change a configuration group, because the configuration group might be generated by an application that performs a load replace operation on the group during each commit operation.

For more information about configuration groups, see the *CLI User Guide*.

Tag Elements and Templates for Generating Changes

To generate changes, you can use the **jcs:emit-change** template, which implicitly includes **<change>** and **<transient-change>** XML elements; or you can explicitly include **<change>**

and **<transient-change>** XML elements. Using the **jcs:emit-change** template allows you to set the hierarchical context of the change once rather than multiple times.

The **<change>** and **<transient-change>** elements are similar to the **<load-configuration>** operation defined by the Junos XML management protocol. The possible contents of the **<change>** and **<transient-change>** elements are the same as the contents of the **<configuration>** tag element used in the Junos XML protocol operation **<load-configuration>**. For complete details about the **<load-configuration>** element, see the *Junos XML Management Protocol Developer Guide*.

Required Boilerplate for Commit Scripts

When you write commit scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all commit scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make commit scripts easier to read and write, which you import from a file called **junos.xsl**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Commit scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all commit scripts that you create. The XSLT boilerplate follows:

XSLT Boilerplate for Commit Scripts

```
1  <?xml version="1.0" standalone="yes"?>
2  <xsl:stylesheet version="1.0"
3     xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4     xmlns:junos="http://xml.juniper.net/junos/*/junos"
5     xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6     xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7     <xsl:import href="../import/junos.xsl"/>

8     <xsl:template match="configuration">
        <!-- ... Insert your code here ... -->
9     </xsl:template>
10 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI). This PI specifies that the code is written in XML using version 1.0. The XML PI, if present, must be the first noncomment token in the script file.

```
1  <?xml version="1.0"?>
```

Lines 2 through 6 set the style sheet element and the associated namespaces. Line 2 sets the style sheet version as 1.0. Lines 3 through 6 list all the namespace mappings commonly used in commit scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
2  <xsl:stylesheet version="1.0"
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as **../import/junos.xsl**, which ships as part of the Junos OS. The **junos.xsl** file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7    <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the **<configuration>** element, which is the node selected by the **<xsl:template match="/">** template, contained in the **junos.xsl** import file. The **<xsl:template match="configuration">** element allows you to exclude the **/configuration/** root element from all XML Path Language (XPath) expressions in the script and begin XPath expressions with the top Junos OS hierarchy level. For more information, see *XPath Overview*.

```
8    <xsl:template match="configuration">
```

Add your code between Lines 8 and 9.

Line 9 closes the template.

```
9    </xsl:template>
```

Line 10 closes the style sheet and the commit script.

```
10  </xsl:stylesheet>
```

SLAX Boilerplate for Commit Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;
ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match configuration {
  /*
  * Insert your code here
  */
}
```

How Op Scripts Work

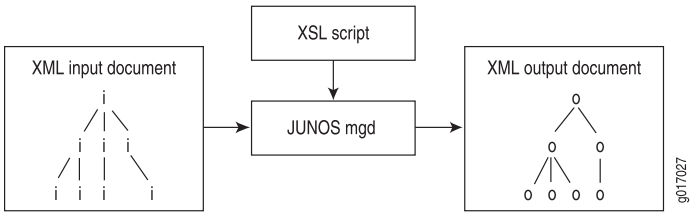
Op scripts execute Junos OS operational commands and inspect the resulting output. After inspection, op scripts can automatically correct errors within the device running Junos OS based on this output.

You add op scripts to device operations by listing the filenames of one or more op script files within the **[edit system scripts op]** hierarchy level. These files must be added to the appropriate op script file directory. For more information about op script file directories, see *Storing Scripts in Flash Memory*. Once added to the device, op scripts are invoked from the command line, using the **op *filename*** command.

You can use op scripts to generate changes to the device configuration by including the **<load-configuration>** tag element. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 222 on page 6097 shows a high-level view of the flow of op script input and output.

Figure 222: Op Script Input and Output



Required Boilerplate for Op Scripts

When you write operation (op) scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all op scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make scripts easier to read and write, which you import from a file called **junos.xsl**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Op scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all op scripts that you create. The XSLT boilerplate follows:

XSLT Boilerplate for Op Scripts

```
1  <?xml version="1.0" standalone="yes"?>
2  <xsl:stylesheet version="1.0"
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7    <xsl:import href="../import/junos.xsl"/>

8    <xsl:template match="/">
```

```
 9       <op-script-results>
         <!-- ... insert your code here ... -->
10       </op-script-results>
11    </xsl:template>
    <!-- ... insert additional template definitions here ... -->
12  </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI), which marks this file as XML and specifies the version of XML as 1.0. The XML PI, if present, must be the first non-comment token in the script file.

```
1  <?xml version="1.0"?>
```

Line 2 opens the style sheet and specifies the XSLT version as 1.0.

```
2  <xsl:stylesheet version="1.0"
```

Lines 3 through 6 list all the namespace mappings commonly used in operation scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as **../import/junos.xsl**, which ships as part of Junos OS (in the file **/usr/libdata/cscript/import/junos.xsl**). The **junos.xsl** file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7    <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the **</>** element. The **<xsl:template match="/">** element is the root element and represents the top level of the XML hierarchy. All XML Path Language (XPath) expressions in the script must start at the top level. This allows the script to access all possible Junos XML and Junos XML protocol remote procedure calls (RPCs). For more information, see *XPath Overview*.

```
8    <xsl:template match="/">
```

After the **<xsl:template match="/">** tag element, the **<op-script-results>** and **</op-script-results>** container tags must be the top-level child tags, as shown in Lines 9 and 10.

```
9       <op-script-results>
        <!-- ... insert your code here ... -->
10      </op-script-results>
```

Line 11 closes the template.

```
11   </xsl:template>
```

Between Line 11 and Line 12, you can define additional XSLT templates that are called from within the **<xsl:template match="/">** template.

Line 12 closes the style sheet and the op script.

```
12  </xsl:stylesheet>
```

SLAX Boilerplate for Op Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match / {
  <op-script-results> {
    /*
      * Insert your code here
    */
  }
}
```

Fabric OAM

- Overview of Internal Fabric Monitoring on page 6099

Overview of Internal Fabric Monitoring

Internal fabric monitoring is a feature of the Operation, Administration, and Maintenance (OAM) of the QFabric system. This feature enables you to validate the flow path of protocol data units (PDUs) across a given VLAN on the QFabric system using the unicast ping, multicast ping, and traceroute operations.

Internal fabric monitoring is useful for fault detection on the QFabric system. For example, if a PDU reaches a destination that is not part of the VLAN configuration, the operation (unicast ping, multicast ping, or traceroute) displays the exception on the console at runtime.

The unicast and multicast ping operations send PDUs from a source interface (called the source fabric maintenance endpoint [FMEP]) to a destination FMEP. The destination FMEP sends a response to the source FMEP when the PDUs are received.

The traceroute operation, also called a flow linktrace, traces the path taken by a specific, learned unicast flow from a source FMEP to a destination FMEP in a VLAN. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices. The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the PDU travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

The following internal fabric monitoring commands are supported:

- **show oam fabric flow specification**
- **show oam fabric interfaces**
- **ping fabric unicast-flow**
- **ping fabric multicast-flow**
- **traceroute fabric unicast-flow**

The following are the main components of the internal fabric monitoring feature:

- FMEP—Represents the source or destination point (endpoint) in the monitoring operations. An FMEP is an interface through which PDUs are sent (source FMEP) or received (destination FMEP). Upon receipt of the PDUs, the destination FMEP sends a response to the source FMEP to validate the monitoring flow. FMEPs are associated with a VLAN in the fabric maintenance association (FMA) configuration, and the source and destination FMEP addresses are configured in the flow specification.
- FMA—Associates a set of FMEPs with a VLAN. The FMA defines the VLAN and FMEP parameters, including the VLAN name, FMEP identifiers, FMEP names, and the interface names of the FMEPs. The FMEPs defined in the FMA are the source and destination FMEPs used in the monitoring commands.

NOTE: **A default FMA is automatically created for each Node group in the QFabric system. The default FMA is used to send error response PDUs (for example, in the case of a VLAN leak) and responses to PDUs that are not mapped to a specific interface in the QFabric system.**

- Flow specification—Configures the flow type and FMEP addressing parameters. Unicast flow types include an Ethernet type (other than IPv4) and Ethernet IPv4. Multicast flow types include the Ethernet IPv4 and VLAN flood type. The flow specification also defines parameters within each flow type, such as MAC or IPv4 addresses of the source and destination FMEPs. The names and identifiers of these FMEPs are configured in the FMA parameters.

To enable internal fabric monitoring, configure the **fabric-maintenance-associations** and **flow-specs** statements at the **[edit protocols oam fabric]** hierarchy level.

The **ping fabric unicast-flow**, **ping fabric multicast-flow**, and **traceroute fabric unicast-flow** commands require that you specify the flow specification and FMA names, as well as the source and destination FMEP names.

- Preparing the Device for Junos Space Management on page 6104

Understanding Junos Space Support

The Juniper Networks Junos Space application, running on a JA1500 appliance or a Junos Space Virtual Appliance, is a comprehensive platform for building and deploying applications for collaboration, productivity, and network infrastructure and operations management. Junos Space provides a runtime environment implemented as a fabric of virtual and physical appliances.

The Junos Space software comprises various applications for network management and configuration. Starting with Junos Space Release 11.1, the following Junos Space applications provide support for the QFX Series devices:

- Network Application Platform (Platform) automates network management operations, including device discovery and management, device templates for configuration, scripts management, image management, and SSH secure console.
- Ethernet Design provides tools to simultaneously configure and manage multiple Junos OS devices within a network. You can manage and customize port profiles, and apply port profiles to your devices.
- Service Now enables you to display and manage information about problem events. When problems are detected on the device by Advanced Insight Scripts (AI-Scripts) that are installed on the device, the data is collected and sent to Service Now for your review and action. This application is available only if you have a Juniper Networks service contract.

NOTE: Do not install Junos Space and AIS on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

- Service Insight provides proactive support in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their end of life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. This application is available only if you have a Juniper Networks service contract.
- Virtual Control is a web-based solution that enables you to manage virtual networks deployed in virtualized environments in data centers. It provides a single management interface for you to monitor and control the virtual and physical elements of the virtual environment.
- IBM Systems Director and Junos Space Launch in Context (LiC) integrate the IBM Systems Director and Junos Space software to manage Juniper Networks devices.

For more information about Junos Space, go to:

http://www.juniper.net/techpubs/en_US/release-independent/junos-space/

NOTE: Before you can perform the tasks listed in Table 584 on page 6102, you must first ensure the configuration on the device meets the requirements for device discovery in Junos Space. For more information, see "Preparing the Device for Junos Space Management" on page 6104.

Table 584 on page 6102 lists some device and network management tasks you can perform in Junos Space.

Table 584: Device and Network Management Tasks in Junos Space

Task	Application Workspace Task	Documentation
Set up and manage user access	**Platform > Administration > Users > Create User**	*Junos Space Network Application Platform User Guide*
Bring the device under Junos Space management (device discovery) NOTE: Before the device can be discovered in Junos Space, the following requirements must be met: • The device configuration has a static management IP address that is reachable from the Junos Space server. • There is a user with full administrative privileges for Junos Space administration. • If you plan on using SNMP to probe devices as part of device discovery, SNMP is enabled with appropriate read-only v1/v2c/v3 credentials.	**Platform > Devices > Discover Devices**	• Preparing the Device for Junos Space Management on page 6104 • *Junos Space Network Application Platform User Guide*
View the hardware inventory or status of physical interfaces on the device	**Platform > Devices > Manage Devices**	*Junos Space Network Application Platform User Guide*
Upload Junos OS software image, deploy the image on the device, and manage device images	**Platform > Device Images > Manage Images**	
Edit the configuration of a managed device	**Platform > Devices > Manage Devices > Edit Device Configuration**	*Junos Space Network Application Platform User Guide*

- Preparing the Device for Junos Space Management on page 6104

Preparing the Device for Junos Space Management

Before you can use the Juniper Networks Junos Space application to manage the QFX Series device, you must ensure that the configuration on the device meets the following requirements for device discovery in Junos Space:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

NOTE: **Do not install Junos Space and AI-Scripts (AIS) on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system**

To prepare the device before using Junos Space:

1. Perform the initial configuration of the device through the console port using the Junos OS CLI. This task includes the configuration of a static management IP address and a user with root administrative privileges.

   For the QFX3500 switch, see "Configuring a QFX3500 Device as a Standalone Switch" on page 163.

   For the QFabric system, see "QFabric System Initial and Default Configuration Information" on page 1255 and "Performing the QFabric System Initial Setup on a QFX3100 Director Group" on page 1335.

2. (Optional) Configure SNMP if you plan on using SNMP to probe devices during device discovery.

   See "Configuring SNMP" on page 1703.

3. (Optional) Enable SSH if you wish to use the Secure Console feature in Junos Space.

   See "Configuring SSH Service for Remote Access to the Router or Switch" on page 1709.

4. In Junos Space, set up a default DMI schema by navigating to **Network Application Platform > Administration > Manage DMI Schemas**.

   For more information, see "Managing DMI Schemas" in the *Junos Space Network Application Platform User Guide* at:

   http://www.juniper.net/techpubs/en_US/release-independent/junos-space/ .

sFlow Techology

- Overview of sFlow Technology on page 6105

Overview of sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

sFlow technology implements the following two sampling mechanisms:

- Packet-based sampling—Samples one packet out of a specified number of packets from an interface enabled for sFlow technology. Only the first 128 bytes of each packet are sent to the collector. Data collected include the Ethernet, IP, and TCP headers, along with other application-level headers (if present). Although this type of sampling might not capture infrequent packet flows, the majority of flows are reported over time, allowing the collector to generate a reasonably accurate representation of network activity. You configure packet-based sampling when you specify a sample rate.
- Time-based sampling—Samples interface statistics (counters) at a specified interval from an interface enabled for sFlow technology. Statistics such as Ethernet interface errors are captured. You configure time-based sampling when you specify a polling interval.

An sFlow monitoring system consists of an sFlow agent embedded in the device and up to four external collectors. On a QFX3500 or QFX3600 standalone switch, the sFlow agent performs packet sampling and gathers interface statistics, and then combines the information into UDP datagrams that are sent to the sFlow collectors.

On a QFabric system, the sFlow technology architecture is distributed. The global sFlow technology configuration defined on the QFabric system Director device is distributed to Node groups that have sFlow sampling configured on their interfaces. The sFlow agent has a separate sampling entity, known as a *subagent*, running on each Node device. Each subagent has its own independent state and forwards its own sample information (datagrams) directly to the sFlow collectors.

On the QFabric system, an sFlow collector must be reachable through the data network. Because each Node device has all routes stored in the default routing instance, the collector IP address should be included in the default routing instance to ensure the collector's reachability from the Node device.

Regardless of the rate of traffic or the configured sampling interval, a datagram is sent whenever its size reaches the maximum Ethernet transmission unit (MTU) of 1500 bytes, or whenever a 250-ms timer expires, whichever occurs first. The timer ensures that a collector receives regularly sampled data.

To ensure sampling accuracy and efficiency, QFX Series devices use adaptive sFlow sampling. Adaptive sampling monitors the overall incoming traffic rate on the device and

provides feedback to the interfaces to dynamically adapt their sampling rate to traffic conditions. The sFlow agent reads the statistics on the interfaces every 5 seconds and identifies five interfaces with the highest number of samples. On a standalone switch, when the CPU processing limit is reached, a binary backoff algorithm is implemented to reduce the sampling load of the top five interfaces by half. The adapted sampling rate is then applied to other interfaces.

On a QFabric system, sFlow technology monitors the interfaces on each Node device as a group, and implements the binary backoff algorithm based on the traffic on that group of interfaces.

Using adaptive sampling prevents overloading of the CPU and keeps the device operating at its optimum level even when there is a change in traffic patterns on the interfaces. The reduced sampling rate is used until the device is rebooted or when a new sampling rate is configured.

The sFlow collector uses the IP address of the sFlow agent to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID for the sFlow agent remains constant. If you do not assign an IP address to the agent, an IP address will be assigned to the agent using the IP address of a configured interface.

On the QFX3500 and QFX3600 standalone switches, the following priority is used to determine which interface will be used:

1. Management Ethernet interface me0 IP address
2. Any Layer 3 interface if the me0 IP address is not available

If a particular interface is not configured, the IP address of the next interface in the priority list is used as the IP address for the agent. Once an IP address is assigned to the agent, the agent ID is not modified until the sFlow service is restarted. At least one interface has to be configured for an IP address to be assigned to the agent.

In addition, you can explicitly configure the IP address for the source data (sFlow datagrams). On the QFX3500 and QFX3600 standalone switches, if you do not configure that address, the following priority is used:

- Any Layer 3 interface IP address
- The me0 IP address if no Layer 3 interface IP address is available

On the QFabric system, the following default values are used if the optional parameters are not configured:

- Agent ID is the management IP address of the default partition.
- Source IP is the management IP address of the default partition.

In addition, the QFabric system subagent ID (which is included in the sFlow datagrams) is the ID of the Node group from which the datagram is sent to the collector.

On the QFX Series, limitations of sFlow traffic sampling include:

- sFlow sampling on ingress interfaces does not capture CPU-bound traffic.
- sFlow sampling on egress interfaces does not support broadcast and multicast packets.
- Egress samples do not contain modifications made to the packet in the egress pipeline.
- If a packet is discarded because of a firewall filter, the reason code for discarding the packet is not sent to the collector.
- The **out-priority** field for a VLAN is always set to 0 (zero) on ingress and egress samples.
- You cannot configure sFlow monitoring on a link aggregation group (LAG), but you can configure it individually on a LAG member interface.

Understanding the Implementation of SNMP

The QFX Series products support the Simple Network Management Protocol (SNMP) that is implemented in the Junos OS software.

NOTE: By default, SNMP is not enabled on devices running Junos OS. For information on enabling SNMP on a device running Junos OS, see "Configuring SNMP" on page 1703.

A typical SNMP implementation includes the following components:

- Network management system (NMS)—The NMS is a combination of hardware and software that is used to monitor and administer a network. Software running on the

NMS includes the SNMP manager, which collects information about network connectivity, activity, and events by polling the managed devices.

- Managed device—A managed device (also called a network element) is any device managed by the NMS. Routers and switches are common examples of managed devices. The SNMP agent is the SNMP process that resides on the managed device and communicates with the NMS.
- SNMP agent—The SNMP agent exchanges network management information with SNMP manager software running on an NMS, or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

SNMP data is stored in a highly structured, hierarchical format known as a management information base (MIB). The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The "leaf" in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device. The SNMP implementation in Junos OS uses both standard (developed by IETF and documented in RFCs) and Juniper Networks enterprise-specific MIBs.

Communication between the agent and the manager occurs in one of the following forms:

- **Get**, **GetBulk**, and **GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

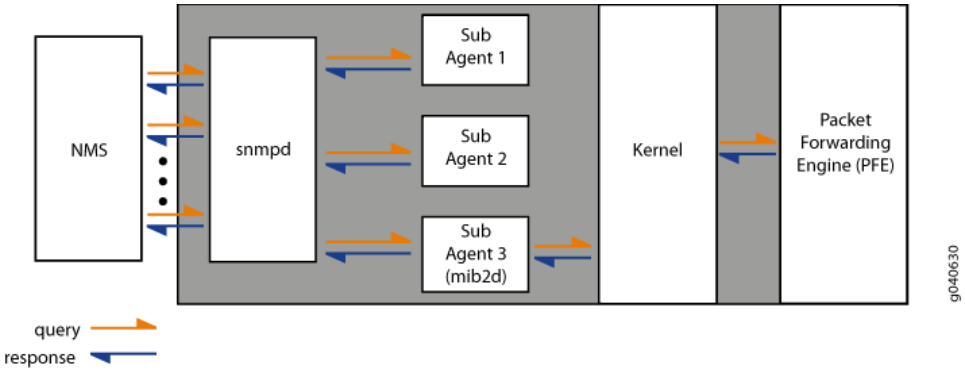
The processes maintaining the SNMP management data include:

- A master SNMP agent (known as SNMP process, or snmpd) that resides on the managed device and is managed by the NMS or host.
- Various subagents that reside on different modules of Junos OS, such as the Routing Engine, and are managed by the master SNMP agent.
- Junos OS processes that share data with the subagents when polled for SNMP data (for example, interface-related MIBs).

When an NMS polls the master agent for data, the master agent immediately shares the data with the NMS if the requested data is available from the master agent or one of the subagents. However, if the requested data is not maintained by the master agent or subagents, the subagent polls the Junos OS kernel or the process that maintains that data. The Junos OS kernel may need to get the data from the Packet Forwarding Engine. On receiving the required data, the subagent passes the response back on to the master agent, which in turn passes it on to the NMS.

Figure 223 on page 6109 shows the communication flow among the NMS, SNMP master agent (snmpd), SNMP subagents, Junos OS kernel, and Packet Forwarding Engine.

Figure 223: SNMP Communication Flow



When a significant event, most often an error or a failure, occurs on a network device, the SNMP agent sends notifications to the SNMP manager. SNMP notifications can be sent as traps (unconfirmed notifications) or inform requests (confirmed notifications).

Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and control the trap traffic. On QFX Series products, the maximum size of trap queues (throttle queue plus destination queue) is 40,960 traps. The maximum size of any one queue is 20,480 traps.

Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and it adds the subsequent traps to the same destination to the queue. Junos OS checks for availability of routes every 30 seconds, and sends the traps from the destination queue in a round-robin fashion.

If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is ten. After ten unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

Junos OS also has a throttle mechanism to control the number of traps (throttle threshold) sent during a particular time period (throttle interval). The throttle mechanism ensures consistency in trap traffic, especially when large numbers of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The default throttle threshold is 500 traps, and the throttle interval default is 5 seconds.

NOTE: You cannot configure trap queueing in Junos OS. You cannot view information about trap queues except for what is provided in the system logs.

Understanding the Implementation of SNMP on the QFabric System

SNMP monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

NOTE: In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device does. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your **mibwalk** command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

  

  NOTE: Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)
  - RFC 1215, *A Convention for Defining Traps for use with the SNMP*
  - RFC 1901, *Introduction to Community-based SNMPv2*

Fabric Chassis MIB

The Juniper Networks enterprise-specific SNMP Fabric Chassis MIB (mib-jnx-fabric-chassis) provides hardware information about the QFabric system and its component devices in a single MIB. The Fabric Chassis MIB is based on the Juniper Networks enterprise-specific Chassis MIB that provides information for individual devices. Unlike the Chassis MIB, the Fabric Chassis MIB represents the QFabric system component devices as part of the QFabric system. Only the information from the Fabric Chassis MIB (and not from individual Chassis MIBs) is available to SNMP management clients of the QFabric system.

The Fabric Chassis MIB uses the basic information structure of the Chassis MIB, but adds another level of indexing that provides detailed information about QFabric system devices. Each physical device in a QFabric system (such as a Node device or an Interconnect device) is represented with its hardware components, including the power supply, fans, and front and rear cards.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent (snmpd) resides in the QFabric system Director software and is responsible for receiving and distributing all traps as well as responding to all queries from the SNMP manager. In addition, there is an SNMP subagent running in the Routing Engine of each Node group and Interconnect device. The SNMP subagent manages the information about the component device, and that information is communicated to the SNMP agent in the Director software as needed. Traps that are generated by a Node device are sent to the

SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

Table 585 on page 6113 describes the tables and objects in the Fabric Chassis MIB.

Table 585: Fabric Chassis MIB Tables and Objects

Table or Object Name	Root OID	Description
Tables with Counterparts in the Chassis MIB		
jnxFabricContainersTable	1.3.6.1.4.1.2636.3.42.2.2.2	Provides information about different types of containers in QFabric system devices. • Containers for Interconnect devices include fan trays, power supply units, control boards, and so on. • Containers for Node devices include fan trays, power supply units, Flexible PIC Concentrator (FPC), PICs, and so on. • Containers for the Director devices include CPU, memory, fan trays, power supply units, and hard disks. The containers have a non-hierarchical or flat structure, and components in them are organized as siblings to each other.
jnxFabricContentsTable	1.3.6.1.4.1.2636.3.42.2.2.3	Contains contents that are present across all devices represented in the jnxFabricDeviceTable object. This table includes all field replaceable units (FRUs) and non-FRUs for QFabric system devices. • Contents in the Interconnect devices include fan trays and control boards. • Contents in the Node devices include fan trays and power supply units. • Contents in the Director devices include CPUs, memory, fan trays, power supply units, and hard disks, but do not include network interface cards (NICs).
jnxFabricFilledTable	1.3.6.1.4.1.2636.3.42.2.2.4	Shows the status of containers in QFabric devices. The jnxFabricFilledState object represents the state of the component: (1) unknown, (2) empty, or (3) filled. NOTE: The jnxFabricFilledTable object does not contain information about the Director group.
jnxFabricOperatingTable	1.3.6.1.4.1.2636.3.42.2.2.5	Represents different operating parameters for the contents that are populated in the jnxFabricContentsTable object. • Contents in each Node device and Interconnect device include fan trays, power supply units, FPC, PIC, and Routing Engine. • Contents in the Director device include CPUs, memory, fan trays, power supply units, and hard disks, but do not include network interface cards (NICs). The jnxFabricOperatingState object provides the state of the device: (1) unknown, (2) running, (3) ready, (4) reset, (5) runningAtFullSpeed (for fans only), (6) down, (6) off (for power supply units), or (7) standby.

Table 585: Fabric Chassis MIB Tables and Objects *(continued)*

Table or Object Name	Root OID	Description
jnxFabricRedundancyTable	1.3.6.1.4.1.2636.3.42.2.2.6	Represents the redundancy information that is available at different subsystem levels across the QFabric system. Information about the Routing Engines in Node devices is included, but there are no corresponding entries for Interconnect devices in this table. The jnxFabricRedundancyState object indicates the state of the subsystem: (1) unknown, (2) master, (3) backup, or (4) disabled. NOTE: Information about redundant Director devices, virtual machines (VMs) within Director groups, and Virtual Chassis devices is not available at this time.
jnxFabricFruTable	1.3.6.1.4.1.2636.3.42.2.2.7	Contains all FRUs for the QFabric system in the jnxFabricDeviceTable table. The FRUs are listed regardless of whether or not they are installed or online. The jnxFabricFruState object represents the state of the FRU, including online, offline, or empty, and so on. This table also contains information about each FRU, such as name, type, temperature, time last powered on, and time last powered off. NOTE: The jnxFabricFruTable table does not include network interface cards (NICs) on Director devices.
Table Specific to the Fabric Chassis MIB		
jnxFabricDeviceTable	1.3.6.1.4.1.2636.3.42.2.2.1	Contains information about all devices in the QFabric system. This table organizes scalar variables represented in the Chassis MIB into a table format for the QFabric system component devices. Columns in this table include device information such as model, device alias, and serial number. The jnxFabricDeviceIndex identifies each QFabric system device (Node device, Interconnect device, and Director device). NOTE: At this time, information about the Virtual Chassis is not available. NOTE: The following objects are not supported: • jnxFabricDeviceEntryRevision • jnxFabricDeviceEntryFirmwareRevision • jnxFabricDeviceEntryKernelMemoryUsedPercent
Scalar Variables		

Table 585: Fabric Chassis MIB Tables and Objects *(continued)*

Table or Object Name	Root OID	Description
The following scalar variables are supported: • jnxFabricClass • jnxFabricDescr • jnxFabricSerialNo • jnxFabricRevision • jnxFabricLastInstalled • jnxFabricContentsLastChange • jnxFabricFilledLastChange	1.3.6.1.4.1.2636.3.42.2.1	Describe the QFabric system as a whole. NOTE: The jnxFabricFirmwareRevision scalar variable is not supported at this time.

Table 586 on page 6115 describes the SNMPv2 traps that are defined in the Fabric Chassis MIB.

NOTE: Only SNMPv2 traps are supported on the QFabric system.

Table 586: Fabric Chassis MIB SNMPv2 Traps

Trap Group and Name	Root OID	Description
jnxFabricChassisTraps group—Includes the following traps: • jnxFabricPowerSupplyFailure • jnxFabricFanFailure • jnxFabricOverTemperature • jnxFabricRedundancySwitchover • jnxFabricFruRemoval • jnxFabricFruInsertion • jnxFabricFruPowerOff • jnxFabricFruPowerOn • jnxFabricFruFailed • jnxFabricFruOffline • jnxFabricFruOnline • jnxFabricFruCheck • jnxFabricFEBSwitchover • jnxFabricHardDiskFailed • jnxFabricHardDiskMissing • jnxFabricBootFromBackup	1.3.6.1.4.1.2636.4.19	Indicates an alarm condition. NOTE: Hardware events on the Director group are detected by scanning. As a result, a trap may not be generated until up to 30 seconds after the event has occurred. NOTE: The software does not distinguish between the fan removal and fan failure events on the Director group. In each case, both the jnxFabricFanFailure and jnxFabricFruFailed traps are generated. NOTE: The software does not distinguish between the fan insertion and fan OK events on the Director group. In each case, both the jnxFabricFanOK and jnxFabricFruOK traps are generated.

Table 586: Fabric Chassis MIB SNMPv2 Traps *(continued)*

Trap Group and Name	Root OID	Description
jnxFabricChassisOKTraps group—Includes the following traps: • jnxFabricPowerSupplyOK • jnxFabricFanOK • jnxFabricTemperatureOK • jnxFabricFruOK	1.3.6.1.4.1.2636.4.20	Indicates an alarm cleared condition.

Utility MIB

The Juniper Networks enterprise-specific Utility MIB, whose object ID is {jnxUtilMibRoot 1}, defines objects for counters, integers, and strings. The Utility MIB contains one table for each of the following five data types:

- 32-bit counters
- 64-bit counters
- Signed integers
- Unsigned integers
- Octet strings

Each data type has an arbitrary ASCII name, which is defined when the data is populated, and a timestamp that shows the last time when the data instance was modified. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/ reference/mibs/mib-jnx-util.txt .

SNMPv3 Overview

The QFX3500 switch supports SNMP version 3 (SNMPv3). SNMPv3 enhances the functionality of SNMPv1 and SNMPv2c by supporting user authentication and data encryption. SNMPv3 uses the user-based security model (USM) to provide security for SNMP messages, and the view-based access control model (VACM) for user access control.

SNMPv3 features include:

- With USM, the SNMP messages between the SNMP manager and the agent can have the message source authenticated and the data integrity checked. USM reduces messaging delays and message replays by enforcing timeout limits and by checking for duplicate message request IDs.
- VACM complements USM by providing user access control for SNMP queries to the agent. You define access privileges that you wish to extend to a group of one or more users. Access privileges are determined by the security model parameters (**usm**, **v1**, or **v2**) and security level parameters (**authentication**, **privacy**, or **none**). For each security level, you must associate one MIB view for the group. Associating a MIB view with a group grants the read, write, or notify permission to a set of MIB objects for the group.
- You configure security parameters for each user, including the username, authentication type and authentication password, and privacy type and privacy password. The username given to each user is in a format that is dependent on the security model configured for that user.
- To ensure messaging security, another type of username, called the security name, is included in the messaging data that is sent between the local SNMP server and the destination SNMP server. Each user name is mapped to a security name, but the security name is in a format that is independent of the security model.
- Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag that defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines the address of an SNMP management application and other attributes used in sending notifications. Target parameters define the message processing and security parameters used in sending notifications to a particular target.

Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the **[edit snmp v3]** and **[edit snmp]** hierarchy levels:

NOTE: You must configure at least one view (notify, read, or write) at the **[edit snmp view-name]** hierarchy level.

```
[edit snmp]
view view-name {
   oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
   tag tag-name;
}
notify-filter profile-name {
   oid object-identifier (include | exclude);
}
snmp-community community-index {
   security-name security-name;
}
target-address target-address-name {
   address address;
   target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
   notify-filter profile-name;
   parameters {
      message-processing-model (v1 | v2c | v3);
      security-level (authentication | none | privacy);
      security-model (usm | v1 | v2c);
      security-name security-name;
   }
}
usm {
   local-engine {
      user username {
      }
   }
}
vacm {
   access {
      group group-name {
         (default-context-prefix | context-prefix context-prefix){
            security-model (any | usm | v1 | v2c) {
               security-level (authentication | none | privacy) {
                  notify-view view-name;
                  read-view view-name;
                  write-view view-name;
               }
            }
         }
```

```
        }
      }
      security-to-group {
        security-model (usm | v1 | v2c) {
          security-name security-name {
            group group-name;
          }
        }
      }
    }
```

Understanding RMON

- RMON Overview on page 6119
- Alarm Thresholds and Events on page 6120

RMON Overview

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

An operational support system (OSS) or a fault-monitoring system can be used to automatically monitor events that track many different metrics, including performance, availability, faults, and environmental data. For example, an administrator might want to know when the internal temperature of a chassis has risen above a configured threshold, which might indicate that a chassis fan tray is faulty, the chassis air flow is impeded, or the facility cooling system in the vicinity of the chassis is not operating normally.

The RMON MIB also defines tables that store various statistics for Ethernet interfaces, including the **etherStatsTable** and the **etherHistoryTable**. The **etherStatsTable** contains cumulative real-time statistics for Ethernet interfaces, such as the number of unicast, multicast, and broadcast packets received on an interface. The **etherHistoryTable** maintains a historical sample of statistics for Ethernet interfaces. The control of the **etherHistoryTable**, including the interfaces to track and the sampling interval, is defined by the RMON **historyControlTable**.

To enable RMON alarms, you perform the following steps:

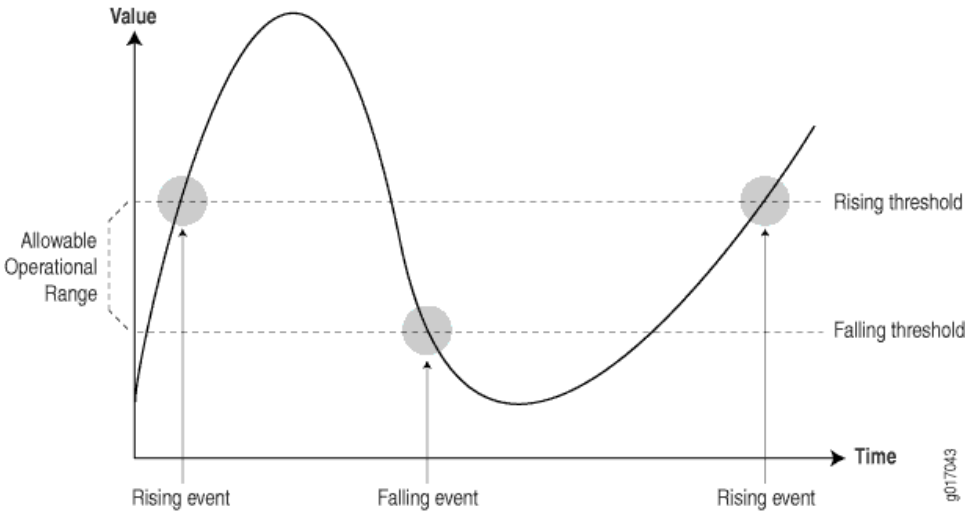
1. Configure SNMP, including trap groups. You configure SNMP at the [**edit snmp**] hierarchy level.
2. Configure rising and falling events in the **eventTable**, including the event types and trap groups. You can also configure events using the CLI at the [**edit snmp rmon event**] hierarchy level.
3. Configure alarms in the **alarmTable**, including the variables to monitor, rising and falling thresholds, the sampling types and intervals, and the corresponding events to generate when alarms occur. You can also configure alarms using the CLI at the [**edit snmp rmon alarm**] hierarchy level.

   Extensions to the **alarmTable** are defined in the Juniper Networks enterprise-specific MIB **jnxRmon** (mib-jnx-rmon.txt).

Alarm Thresholds and Events

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range (see Figure 224 on page 6120).

Figure 224: Setting Thresholds



Events are only generated when the alarm threshold is first crossed in any one direction rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs. This considerably reduces the quantity of events that are produced by the system, making it easier for operations staff to react when events do occur.

Before you configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least

3 months is not unusual when you first identify the operational ranges and define thresholds, but baseline monitoring should continue over the life span of each monitored variable.

RMON MIB Event, Alarm, Log, and History Control Tables

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

Table 587 on page 6121 provides each field in the RMON **eventTable**, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [**edit snmp rmon**] hierarchy level.

Table 587: RMON Event Table

Field	Description	Statement [edit snmp rmon]
eventDescription	Text description of this event.	**description**
eventType	Type of event (for example, **log**, **trap**, or **log and trap**).	**type**
eventCommunity	Trap group to which to send this event, as defined in the Junos OS configuration. (This is not the same as the SNMP community.)	**community**
eventOwner	Entity (for example, **manager**) that created this event.	—
eventStatus	Status of this row (for example, **valid**, **invalid**, or **createRequest**).	—

Table 588 on page 6121 provides each field in the RMON **alarmTable**, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [**edit snmp rmon**] hierarchy level.

Table 588: RMON Alarm Table

Field	Description	Statement [edit snmp rmon]
alarmStatus	Status of this row (for example, **valid**, **invalid**, or **createRequest**)	—
alarmInterval	Sampling period (in seconds) of the monitored variable	**interval**
alarmVariable	Object identifier (OID) and instance of the variable to be monitored	—

Table 588: RMON Alarm Table *(continued)*

Field	Description	Statement [edit snmp rmon]
alarmValue	Actual value of the sampled variable	—
alarmSampleType	Sample type (**absolute** or **delta** changes)	**sample-type**
alarmStartupAlarm	Initial alarm (**rising**, **falling**, or **either**)	**startup-alarm**
alarmRisingThreshold	Rising threshold against which to compare the value	**rising-threshold**
alarmFallingThreshold	Falling threshold against which to compare the value	**falling-threshold**
alarmRisingEventIndex	Index (row) of the rising event in the event table	**rising-event-index**
alarmFallingEventIndex	Index (row) of the falling event in the event table	**falling-event-index**

Table 589 on page 6122 provides each field in the **jnxRmon jnxRmonAlarmTable**, which is an extension to the RMON **alarmTable**. You can troubleshoot the RMON agent, **rmopd**, that runs on a switch by inspecting the contents of the **jnxRmonAlarmTable** object.

Table 589: jnxRmon Alarm Table

Field	Description
jnxRmonAlarmGetFailCnt	Number of times the internal **Get** request for the variable failed
jnxRmonAlarmGetFailTime	Value of the **sysUpTime** object when the last failure occurred
jnxRmonAlarmGetFailReason	Reason why the **Get** request failed
jnxRmonAlarmGetOkTime	Value of the **sysUpTime** object when the variable moved out of failure state
jnxRmonAlarmState	Status of this alarm entry

Table 590 on page 6122 provides each field in the RMON **historyControlTable**, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [**edit snmp rmon history**] hierarchy level. The **historyControlTable** controls the RMON **etherHistoryTable**.

Table 590: RMON History Control Table

Field	Description	Statement [edit snmp rmon history]
historyControlDataSource	Identifies the source of the data for which historical data was collected.	**interface**

Table 590: RMON History Control Table *(continued)*

Field	Description	Statement [edit snmp rmon history]
historyControlBucketsRequested	Requested number of discrete time intervals over which data is to be saved.	bucket-size
historyControlBucketsGranted	Number of discrete sampling intervals over which data is to be saved.	—
historyControlInterval	Interval, in seconds, over which the data is sampled for each bucket.	interval
historyControlOwner	Entity that configured this entry.	owner
historyControlStatus	Status of this entry.	—

Understanding Health Monitoring

Health monitoring is an SNMP feature that extends the RMON alarm infrastructure to provide monitoring for a predefined set of objects (such as file system usage, CPU usage, and memory usage), and for Junos OS processes.

You enable the health monitor feature using the **health-monitor** statement at the **[edit snmp]** hierarchy level. You can also configure health monitor parameters such as a falling threshold, rising threshold, and interval. If the value of a monitored object exceeds the rising or falling threshold, an alarm is triggered and an event may be logged.

The falling threshold is the lower threshold for the monitored object instance. The rising threshold is the upper threshold for the monitored object instance. Each threshold is expressed as a percentage of the maximum possible value. The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

Events are only generated when a threshold is first crossed in any one direction, rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs.

System log entries for health monitor events have a corresponding **HEALTHMONITOR** tag and not a generic **SNMPD_RMON_EVENTLOG** tag. However, the health monitor sends generic RMON **risingThreshold** and **fallingThreshold** traps. You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

When you configure the health monitor, monitoring information for certain object instances is available, as shown in Table 591 on page 6124.

Table 591: Monitored Object Instances

Object	Description
jnxHrStoragePercentUsed.1	Monitors the **/dev/ad0s1a:** file system on the switch. This is the root file system mounted on /.
jnxHrStoragePercentUsed.2	Monitors the **/dev/ad0s1e:** file system on the switch. This is the configuration file system mounted on **/config**.
jnxOperatingCPU (RE0)	Monitors CPU usage by the Routing Engine (**RE0**).
jnxOperatingBuffer (RE0)	Monitors the amount of memory available on the Routing Engine (**RE0**).
sysApplElmtRunCPU	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
sysApplElmtRunMemory	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

RFC 1212, *Concise MIB Definitions*	—

RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II*	The following areas are supported:
	• MIB II and its SNMP version 2 derivatives, including:
	  ◦ Statistics counters
	  ◦ IP, except for ipRouteTable, which has been replaced by ipCidrRouteTable (RFC 2096, *IP Forwarding Table MIB*)
	  ◦ ipAddrTable
	  ◦ SNMP management
	  ◦ Interface management
	• SNMPv1 **Get**, **GetNext** requests, and SNMPv2 **GetBulk** request
	• Junos OS-specific secured access list
	• Master configuration keywords
	• Reconfigurations upon SIGHUP

RFC 1215, *A Convention for Defining Traps for use with the SNMP*	Support is limited to MIB II SNMP version 1 traps and version 2 notifications.

RFC 2287, *Definitions of System-Level Managed Objects for Applications*	The following objects are supported: • sysApplInstallPkgTable • sysApplInstallElmtTable • sysApplElmtRunTable • sysApplMapTable
RFC 2570, *Introduction to Version 3 of the Internet-standard Network Management Framework*	—

Table 592: Standard MIBs Supported on QFX3500 and QFX3600 Switches *(continued)*

RFC	Additional Information
RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access)	NOTE: RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.
RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access)	NOTE: RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.
RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	NOTE: RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.
RFC 2578, *Structure of Management Information Version 2 (SMIv2)*	—
RFC 2579, *Textual Conventions for SMIv2*	—
RFC 2580, *Conformance Statements for SMIv2*	—
RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*	—
RFC 2787, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol*	Support does not include row creation, the Set operation, and the vrrpStatsPacketLengthErrors object.
RFC 2790, *Host Resources MIB*	Support is limited to the following objects: • Only hrStorageTable. The file systems **/**, **/config**, **/var**, and **/tmp** always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change. • Only the objects of the hrSystem and hrSWInstalled groups.
RFC 2819, *Remote Network Monitoring Management Information Base*	The following objects are supported: • etherStatsTable (for Ethernet interfaces only), alarmTable, eventTable, and logTable. • historyControlTable and etherHistoryTable (except the etherHistoryUtilization object).
RFC 2863, *The Interfaces Group MIB*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.
RFC 2932, *IPv4 Multicast Routing MIB*	—
RFC 2933, *Internet Group Management Protocol (IGMP) MIB*	—
RFC 2934, *Protocol Independent Multicast MIB for IPv4*	In Junos OS, RFC 2934 is implemented based on a draft version, *pimmib.mib*, of the now standard RFC.

Table 593: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches

MIB	Description
Alarm MIB (mib-jnx-chassis-alarm)	Provides support for alarms from the switch. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-chassis-alarm.txt . For more information, see *Alarm MIB*.
Analyzer MIB (mib-jnx-analyzer)	Contains analyzer and remote analyzer data related to port mirroring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-analyzer.txt . For more information, see *Analyzer MIB*.
Chassis MIB (mib-jnx-chassis)	Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-chassis.txt . For more information, see *Chassis MIBs*.
Chassis Definitions for Router Model MIB (mib-jnx-chas-defines)	Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify routing and switching platforms and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-chas-defines.txt . For more information, see *Chassis MIBs*.
Class-of-Service MIB (mib-jnx-cos)	Provides support for monitoring interface output queue statistics per interface and per forwarding class. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-cos.txt . For more information, see *Class-of-Service MIB*.

Table 593: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches *(continued)*

MIB	Description
Configuration Management MIB (mib-jnx-cfgmgmt)	Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-cfgmgmt.txt . For more information, see *Configuration Management MIB*.
Ethernet MAC MIB (mib-jnx-mac)	Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, inoctets, inframes, outoctets, and outframes on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-mac.txt . For more information, see *Ethernet MAC MIB*.
Event MIB (mib-jnx-event)	Defines a generic trap that can be generated using an operations script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-event.txt . For more information, see *Event MIB*.
Firewall MIB (mib-jnx-firewall)	Provides support for monitoring firewall filter counters. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-firewall.txt . For more information, see *Firewall MIB*.
Host Resources MIB (mib-jnx-hostresources)	Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-hostresources.txt . For more information, see *Host Resources MIB*.

Table 593: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches *(continued)*

MIB	Description
Interface MIB (Extensions) (mib-jnx-if-extensions)	Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-if-extensions.txt . For more information, see *Interface MIB*.
Ping MIB (mib-jnx-ping)	Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-ping.txt . For more information, see *PING MIB*.
RMON Events and Alarms MIB (mib-jnx-rmon)	Supports Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments the alarmTable object with additional information about each alarm. Two additional traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-rmon.txt . For more information, see *RMON Events and Alarms MIB*.
Structure of Management Information MIB (mib-jnx-smi)	Explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-smi.txt . For more information, see *Structure of Management Information MIB*.
System Log MIB (mib-jnx-syslog)	Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-syslog.txt . For more information, see *System Log MIB*.

Table 593: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches *(continued)*

MIB	Description
Utility MIB (mib-jnx-util)	Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-util.txt . For more information, see "Utility MIB" on page 6116 and "Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage" on page 6396.
VLAN MIB (mib-jnx-vlan)	Contains information about prestandard IEEE 802.10 VLANs and their association with LAN emulation clients. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-vlan.txt . For more information, see *VLAN MIB*.

MIBs Supported on QFabric Systems

The QFabric systems support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- Table 594 on page 6133 for standard MIBs
- Table 595 on page 6137 for Juniper Networks enterprise-specific MIBs

RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*	—
RFC 2233, *The Interfaces Group MIB Using SMIv2*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863. NOTE: The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.

Table 594: Standard MIBs Supported on QFabric Systems *(continued)*

RFC	Additional Information
RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access)	NOTE: RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.
RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access)	NOTE: RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.
RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	NOTE: RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.
RFC 2578, *Structure of Management Information Version 2 (SMIv2)*	—
RFC 2579, *Textual Conventions for SMIv2*	—
RFC 2580, *Conformance Statements for SMIv2*	—
RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*	The QFabric system supports the following tables only: • dot3StatsTable—There is one row with statistics for each Ethernet-like interface in the QFabric system. The dot3StatsIndex is an interface index that is unique across the system. • dot3ControlTable—There is one row in this table for each Ethernet-like interface in the QFabric system that implements the MAC control sublayer. OIDs supported are dot3ControlFunctionsSupported and dot3ControlInUnknownOpcode. • dot3PauseTable—There is one row in this table for each Ethernet-like interface in the QFabric system that supports the MAC control PAUSE function. OIDs supported are dot3PauseAdminMode, dot3PauseOperMode, dot3InPauseFrames, and dot3OutPauseFrames. NOTE: Scalar variables are not supported on the QFabric system.
RFC 2863, *The Interfaces Group MIB*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863. NOTE: The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.
RFC 2933, *Internet Group Management Protocol (IGMP) MIB*	—
RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*	—

Table 594: Standard MIBs Supported on QFabric Systems *(continued)*

RFC	Additional Information
RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*	NOTE: RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.
RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.
RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.
RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*	—
RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.
RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	—
RFC 4188, *Definitions of Managed Objects for Bridges*	The QFabric system support is limited to the following objects: • Under the dot1dBase OID, the dot1dBasePortTable table supports only the first two columns in the table: dot1dBasePort and dot1dBasePortIfIndex. • The system does not implement the optional traps supporting dot1dNotifications (dot1dBridge 0). • Under the dot1dStp OID, supports only the dot1dStpPortTable table. Does not support the scalar variables under dot1dStp. • The system does not support scalar variables under dot1dTp, but under that, the dot1dTpFdbTable table is supported (dot1dBridge 4). • For OIDS with tables support only, scalar values that are returned by the SNMP agent may not be meaningful and are therefore not recommended for use.
RFC 4293, *Management Information Base for the Internet Protocol (IP)*	Supports the ipAddrTable table only. On the QFabric system, supported objects in the ipAddrTable table include ipAdEntAddr, ipAdEntIfIndex, ipAdEntNetMask, ipAdEntBcastAddr, and ipAdEntReasmMaxSize. NOTE: On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.

Table 594: Standard MIBs Supported on QFabric Systems *(continued)*

RFC	Additional Information
RFC 4363b, *Q-Bridge VLAN MIB*	The QFabric system supports the following tables only: • dot1qTpFdbTable • dot1qVlanStaticTable • dot1qPortVlanTable • dot1qFdbTable

Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems

MIB	Description
Analyzer MIB (mib-jnx-analyzer)	Contains analyzer and remote analyzer data related to port mirroring. The QFabric system supports: • Analyzer table—jnxAnalyzerName, jnxMirroringRatio, jnxLossPriority. • Analyzer input table—jnxAnalyzerInputValue, jnxAnalyzerInputOption, jnxAnalyzerInputType. • Analyzer output table—jnx AnalyzerOutputValue, jnxAnalyzerOutputType. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-analyzer.txt . For more information, see *Analyzer MIB*.
Chassis MIB (mib-jnx-chassis)	NOTE: The Chassis MIB has been deprecated for the QFabric system. We recommend that you use the Fabric Chassis MIB (mib-jnx-fabric-chassis) for information about the QFabric system.
Class-of-Service MIB (mib-jnx-cos)	Provides support for monitoring interface output queue statistics per interface and per forwarding class. The QFabric system supports the following tables and objects: • Jnxcosifstatflagtable—jnxCosIfstatFlags and jnxCosIfIndex. • Jnxcosqstattable—jnxCosQstatTxedPkts, jnxCosQstatTxedPktRate, jnxCosQstatTxedBytes, and jnxCosQstatTxedByteRate. • Jnxcosfcidtable—jnxCosFcIdToFcName. • Jnxcosfctable—jnxCosFcQueueNr. The QFabric system does not support any traps for this MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-cos.txt . For more information, see *Class-of-Service MIB*.

Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems *(continued)*

MIB	Description
Configuration Management MIB (mib-jnx-cfgmgmt)	Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable. NOTE: On the QFabric system, these conditions apply: • All scalar variables under the jnxCmCfgChg table are supported. • Supported scalar OIDs are jnxCmCfgChgLatestIndex, jnxCmCfgChgLatestTime, jnxCmCfgChgLatestDate, jnxCmCfgChgLatestSource, jnxCmCfgChgLatestUser, and jnxCmCfgChgMaxEventEntries. • Scalar variables under the jnxCmRescueChg table are not supported. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-cfgmgmt.txt . For more information, see *Configuration Management MIB*.
Fabric Chassis MIB (mib-jnx-fabric-chassis)	Provides hardware information about the QFabric system and its component devices. This MIB is based on the Juniper Networks enterprise-specific Chassis MIB but adds another level of indexing that provides information for QFabric system component devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-fabric-chassis.txt . For more information, see "Fabric Chassis MIB" on page 6112.
Host Resources MIB (mib-jnx-hostresources)	Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-hostresources.txt . For more information, see *Host Resources MIB*.
Interface MIB (Extensions) (mib-jnx-if-extensions)	Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables. NOTE: On the QFabric system, scalar variables are not supported. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-if-extensions.txt . For more information, see *Interface MIB*.

Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems *(continued)*

MIB	Description
Power Supply Unit MIB (mib-jnx-power-supply-unit)	Provides support for environmental monitoring of the power supply unit for the Interconnect device of the QFabric system. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-power-supply-unit.txt . For more information, see *Power Supply Unit MIB*. NOTE: On the QFabric system, scalar variables for the jnxPsuObjects 1 object ID in the jnxPsuScalars table are not supported.
QFabric MIB (jnx-qf-smi)	Explains how the Juniper Networks enterprise-specific QFabric MIBs are structured. Defines the MIB objects that are reported by the QFabric system and the contents of the traps that can be issued by the QFabric system. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-qf-smi.txt .
Utility MIB (mib-jnx-util)	Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.1/topics/reference/mibs/mib-jnx-util.txt . For more information, see "Utility MIB" on page 6116 and "Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage" on page 6396.

SNMP Traps Support

The QFX3500 and QFX3600 switches and QFabric systems support standard SNMP traps and Juniper Networks enterprise-specific traps.

For more information, see:

- SNMP Traps Supported on QFX3500 and QFX3600 Switches on page 6140
- SNMP Traps Supported on QFabric Systems on page 6148

SNMP Traps Supported on QFX3500 and QFX3600 Switches

The QFX3500 and QFX3600 standalone switches support SNMPv1 and v2 traps. For more information, see:

- SNMPv1 Traps on page 6140
- SNMPv2 Traps on page 6144

SNMPv1 Traps

QFX3500 and QFX3600 switches support both standard SNMPv1 traps and Juniper Networks enterprise-specific SNMPv1 traps. See:

- Table 596 on page 6140 for standard SNMPv1 traps.
- Table 597 on page 6142 for enterprise-specific SNMPv1 traps.

The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

SNMP Traps Supported on QFabric Systems

QFabric systems support standard SNMPv2 traps and Juniper Networks enterprise-specific SNMPv2 traps.

NOTE: QFabric systems do not support SNMPv1 traps.

For more information, see:

- Table 600 on page 6149 for standard SNMPv2 traps
- Table 601 on page 6150 for Juniper Networks enterprise-specific SNMPv2 traps

Table 600: Standard SNMPv2 Traps Supported on QFabric Systems

Defined in	Trap Name	SNMP Trap OID	System Logging Severity Level	Syslog Tag
Link Notifications				
RFC 2863, *The Interfaces Group MIB*	linkDown	1.3.6.1.6.3.1.1.5.3	Warning	SNMP_TRAP_ LINK_DOWN
	linkUp	1.3.6.1.6.3.1.1.5.4	Info	SNMP_TRAP_ LINK_UP
Startup Notifications				
RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*	coldStart	1.3.6.1.6.3.1.1.5.1	Critical	SNMPD_TRAP_ COLD_START
	warmStart	1.3.6.1.6.3.1.1.5.2	Error	SNMPD_TRAP_ WARM_START
	authenticationFailure	1.3.6.1.6.3.1.1.5.5	Notice	SNMPD_TRAP_ GEN_FAILURE

Overview of Junos OS System Log Messages

The Junos OS, running on the QFX Series, generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Messages Reference*.

Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 6222.

You direct messages to one or more destinations by including the appropriate statement at the **[edit system syslog]** hierarchy level:

- To a named file in a local file system, by including the **file** statement. See "Directing System Log Messages to a Log File" on page 6209.
- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the **user** statement. See "Directing System Log Messages to a User Terminal" on page 6211.
- To the switch console, by including the **console** statement. See "Directing System Log Messages to the Console" on page 6211.
- To a remote machine that is running the **syslogd** utility, by including the **host** statement. See "Directing System Log Messages to a Remote Machine" on page 6210.

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see "Logging Messages in Structured-Data Format" on page 6215.
- A message's facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the **explicit-priority** statement. For more information, see "Including Priority Information in System Log Messages" on page 6213.
- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see "Including the Year or Millisecond in Timestamps" on page 6215.

- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see "Directing System Log Messages to a Remote Machine" on page 6210.
- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see "Using Regular Expressions to Refine the Set of Logged Messages" on page 6227.

NOTE: During a commit check, warnings about the traceoptions configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log (syslog) messages as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log *filename*** operational mode command to view the messages.

NOTE: On the QFabric system, a syslog file named messages with a size of 100 MB is configured by default. If you do not configure a filename, you can use the default filename messages with the show log *filename* command.

All messages with a severity level of notice or higher are logged. Messages with a facility level of interactive-commands on Node devices are not logged.

The QFabric system supports the following system log message features:

- The **file** *filename* and **host** *hostname* statements at the **[edit system syslog]** hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the **show log** *filename* command by configuring the **file** *filename* **archive** *maximum-file-size* statement.
- You can specify that one or more system log message servers receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.
- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- The unit of time is is measured and displayed in seconds, and not milliseconds. If you attempt to configure the **time-format** option in milliseconds, the log output displays **000**.

Starting in Junos OS Release 13.1, the QFabric system supports these additional syslog features:

- You can filter the output of the **show log** *filename* operational mode command by device type and device ID or device alias when you specify the ***device-type*** **(*device-id* | *device-alias*)** optional parameters. Device types include **director-device**, **infrastructure-device**, **interconnect-device**, and **node-device**.
- You can specify the syslog structured data output format when you configure the **structured-data** statement at the **[edit system syslog file** *filename***]** and **[edit system syslog host** *hostname***]** hierarchy levels.

NOTE: Information displayed in the structured data output for system logs originating from the Director software may not be complete.

- You can filter the types of logs that the Director group collects from a component device when you configure the **filter all** *facility severity* or **filter all match "***regular-expression***"** statements at the **[edit system syslog]** hierarchy level.

Unsupported syslog features include:

- File access to syslog messages
- Monitoring of syslog messages

Examples: Configuring System Logging

The system log provides an excellent way of tracking all management activity on the switch by recording events such as user authentication, access authorization, and command execution. Logged command executions include commands entered by users at the CLI prompt or by client applications such as the Junos XML protocol or NETCONF XML client. Because system log files contain information about commands executed on the switch and the user who executed the commands, checking system log files for failed authentication events can help identify attempts to hack in to the switch. You can also

analyze network activity by correlating executed commands with events and changes that occurred on the network at a particular time.

System log files are stored locally on the switch in the default **/var/log** directory.

The following example shows how to configure system log messages to record all commands entered by users and all authentication or authorization attempts. Logged commands include those entered by users at the CLI prompt and by client applications. Authentication and authorization attempts include events that are saved in the file named **cli-commands** and those that are sent to the terminal of a user who is logged in.

```
[edit system]
syslog {
   file cli-commands {
      interactive-commands info;
      authorization info;
   }
   user * {
      interactive-commands info;
      authorization info;
   }
}
```

The following example shows how to log all alarms state changes to the file **/var/log/alarms**:

```
[edit system]
syslog {
   file alarms {
      kernel warning;
   }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user **alex**, to a remote machine, and to the console:

```
[edit system]
syslog {
   /* write all security-related messages to file /var/log/security */
   file security {
      authorization info;
      interactive-commands info;
   }
   /* write messages about potential problems to file /var/log/messages: */
   /* messages from &ldquo;authorization&rdquo; facility at level &ldquo;notice&rdquo;
      and above, */
   /* messages from all other facilities at level &ldquo;warning&rdquo; and above */
   file messages {
      authorization notice;
      any warning;
   }
   /* write all messages at level &ldquo;critical&rdquo; and above to terminal of user
      &ldquo;alex&rdquo; if */
   /* that user is logged in */
   user alex {
```

```
    any critical;
  }
  /* write all messages from the &ldquo;daemon&rdquo; facility at level &ldquo;info&rdquo;
    and above, and */
  /* messages from all other facilities at level &ldquo;warning&rdquo; and above, to the
    */
  /* machine monitor.mycompany.com */
  host monitor.mycompany.com {
    daemon info;
    any warning;
  }
  /* write all messages at level &ldquo;error&rdquo; and above to the system console */
  console {
    any error;
  }
}
```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the **interactive-commands** facility at the **info**, **notice**, and **warning** severity levels:

```
[edit system]
file user-actions {
  interactive-commands info;
  }
  user philip {
    interactive-commands notice;
  }
  console {
    interactive-commands warning;
  }
}
```

The following list describes the security levels used in the example:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file **/var/log/user-actions**.
- **notice**—Logs a message when users issue the configuration mode commands **rollback** and **commit**. The example writes the messages to the terminal of user **philip**.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

Examples: Assigning an Alternative Facility

This topic contains examples of configuring system log messages to use an alternative facility for logging.

The following example shows how to log all messages generated on the switch at the **error** level or higher to the **local0** facility on the remote host called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
   any error;
   facility-override local0;
}
```

The following example contains two sets of statements that show how to configure switches located in California and in New York to send messages to a single remote host called **central-logger.mycompany.com.** The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- The following statements configure the California switch to aggregate messages in the **local0** facility:

  ```
  [edit system syslog]
  host central-logger.mycompany.com {
     change-log info;
     facility-override local0;
  }
  ```

- The following statements configure the New York switch to aggregate messages in the **local2** facility:

  ```
  [edit system syslog]
  host central-logger.mycompany.com {
     change-log info;
     facility-override local2;
  }
  ```

On the remote host named **central-logger** you can subsequently configure the system logging utility to write messages from the **local0** facility to one file (for example, **california-config**) and the messages from the **local2** facility to another file (for example, **new-york-config**).

Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- Requirements on page 6163
- Overview on page 6163
- Configuration on page 6163

Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.1
- QFabric system
- External servers that can be configured as system log message hosts

Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

NOTE: You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

NOTE: On the QFabric system, a syslog file named messages is configured implicitly with facility and severity levels of any any and a file size of 100 MBs.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

Results From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
    archive {
      size 1g;
    }
    structured-data {
      brief;
    }
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Example: Monitoring Network Traffic Using sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow monitoring on a QFX3500 switch in standalone mode.

- Requirements on page 6165
- Overview on page 6165
- Configuration on page 6166
- Verification on page 6167

Requirements

This example uses the following hardware and software components:

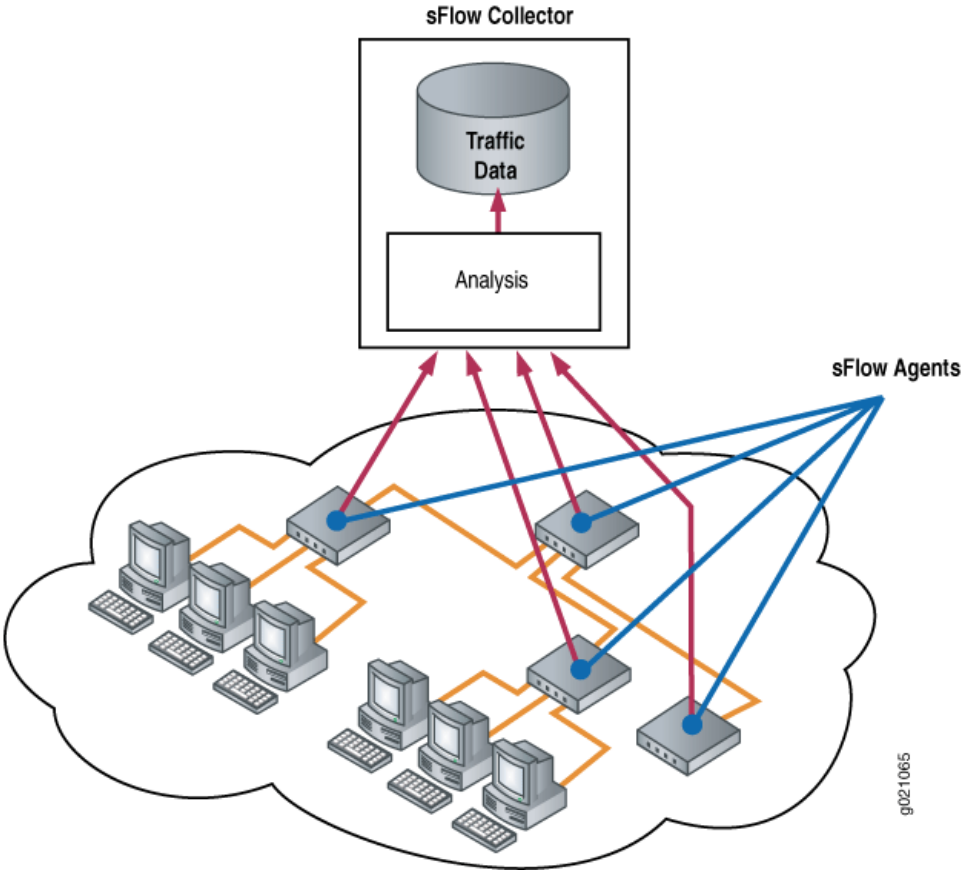
- Junos OS Release 11.3 or later
- One QFX3500 switch

Overview

An sFlow monitoring system consists of an sFlow agent embedded in the device and a centralized collector on the network. The two main activities of the sFlow agent are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them to the IP address and UDP destination port of the sFlow collector in UDP datagrams.

Figure 225 on page 6166 depicts the basic elements of an sFlow system.

Figure 225: sFlow Technology Monitoring System



Configuration

CLI Quick Configuration

To quickly configure sFlow technology, copy the following commands and paste them into the terminal window of the switch:

```
[edit protocols sflow]
set collector 10.204.32.46 udp-port 5600
set interfaces xe-0/0/1.0
set polling-interval 20
set sample-rate 1000
```

Step-by-Step Procedure

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

   ```
   [edit protocols sflow]
   user@switch# set collector 10.204.32.46 udp-port 5600
   ```

   The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@switch# set interfaces xe-0/0/1.0
   ```

NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example, ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled at the global level. The following example sets a sample rate of 1 in 1000 packets:

```
[edit protocols sflow]
user@switch# set sample-rate 1000
```

Results Check the results of the configuration:

```
[edit]
user@switch# show protocols
sflow {
  collector 10.204.32.46 {
    udp-port 5600;
  }
  interfaces xe-0/0/1.0 {
    polling-interval 20;
    sample-rate 1000;
  }
}
```

Verification

To confirm that the configuration is correct, perform these tasks:

- Verifying That sFlow Technology Has Been Configured Properly on page 6167
- Verifying That sFlow Technology Is Enabled on an Interface on page 6168
- Verifying the sFlow Collector Configuration on page 6168

Verifying That sFlow Technology Has Been Configured Properly

Purpose Verify that sFlow technology has been configured properly.

Action Enter the **show sflow** operational mode command:

```
user@switch> show sflow
```

```
sFlow            : Enabled
Sample limit     : 300 packets/second
Polling interval : 20 second
Sample rate      : 1:1000
Agent ID         : 10.1.1.2
```

NOTE: The sample limit cannot be configured and is set to 300 packets per second.

Meaning The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and sampling rate.

Verifying That sFlow Technology Is Enabled on an Interface

Purpose Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

Action Enter the **show sflow interface** operational mode command:

```
user@switch> show sflow interface
Interface       Status     Sample     Polling
                            rate       interval
xe-0/0/1.0   Enabled      1000         20
```

Meaning The output indicates that sFlow technology is enabled on the **Node1:xe-0/0/1.0** interface on the Node device with a sampling rate of 1000 and a polling interval of 20 seconds.

Verifying the sFlow Collector Configuration

Purpose Verify the sFlow collector configuration.

Action Enter the **show sflow collector** operational mode command:

```
user@switch> show sflow collector
Collector        Udp-port    No. of samples
 address
10.204.32.46         5600           7516
```

Meaning The output displays the IP address of the collector, the UDP port, and the number of samples collected.

Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- Requirements on page 6169
- Overview on page 6169
- Configuration on page 6169

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name “snmp qfabric” description “qfabric0 switch”
set snmp location “Lab 4 Row 11” contact “qfabric-admin@qfabric0”
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group “qf-traps” destination-port 155 targets 192.168.0.100
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

NOTE: If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

   ```
   [edit snmp]
   user@switch# set name “snmp qfabric”
   ```

2. Specify a description.

   ```
   [edit snmp]
   user@switch# set description “qfabric0 system”
   ```

   This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

   ```
   [edit snmp]
   user@switch# set location “Lab 4 Row 11”
   ```

   This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

   ```
   [edit snmp]
   user@switch# set contact “qfabric-admin@qfabric0”
   ```

   This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

   

   NOTE: The read-write option is not supported on the QFabric system.

   ```
   [edit snmp]
   user@switch# set community public authorization read-only
   ```

6. Create a client list with a set of IP addresses that can use the SNMP community.

   ```
   [edit snmp]
   user@switch# set client-list list0 192.168.0.0/24
   user@switch# set community public client-list-name list0
   ```

7. Specify IP addresses of clients that are restricted from using the community.

   ```
   [edit snmp]
   user@switch# set community public clients 192.170.0.0/24 restrict
   ```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group “qf-traps” destination-port 155 targets 192.168.0.100
```

NOTE: You do not need to include the destination-port statement if you use the default port 162.

The trap group qf-traps is configured to send traps to 192.168.0.100.

Results From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
  snmp {
    name "snmp qfabric";
    description "qfabric0 system";
    location "Lab 4 Row 11";
    contact "qfabric-admin@qfabric0";
    client-list list0 {
      192.168.0.0/24;
    }
    community public {
      authorization read-only;
      clients {
        197.170.0.0/24 restrict;
      }
    }
    trap-group qf-traps {
      destination-port 155;
      targets {
        192.168.0.100;
      }
    }
  }
```

If you are done configuring the device, enter **commit** from configuration mode.

- snmp on page 1810

Example: Configuring Internal Fabric OAM Monitoring

This example shows how to configure the internal fabric Operation, Administration, Maintenance (OAM) monitoring feature on the QFabric system, including the fabric maintenance association (FMA) and flow specifications for unicast Ethernet traffic.

Internal fabric monitoring enables you to validate the flow path of protocol data units (PDUs) across a given VLAN on the QFabric system using the ping operation.

Internal fabric monitoring is useful for fault detection on the QFabric system. For example, if a PDU reaches a destination that is not part of the VLAN configuration, the ping operation displays the exception on the console at runtime.

- Requirements on page 6172
- Overview on page 6172
- Configuration on page 6174
- Verification on page 6176

Requirements

This example uses the following hardware and software components:

- One QFabric system with the following components:
  - A Director group (two Director devices)
  - Two QFabric system Interconnect devices
  - Node devices, including:
    - One Node device (Node-81) configured in a default network Node group (NNW-NG-0)
    - One Node device (Node-80) in an autogenerated server Node group (SNG-80)
    - Two Node devices (Node-83 and Node-84) configured in a redundant server Node group (RSNG-8384)
- Junos OS Release 12.2 or later

Before you configure the FMA, first configure a VLAN in which the internal fabric OAM monitoring occurs. You can usually configure a VLAN by specifying a VLAN ID or VLAN name. However, in the case of the VLAN used for internal fabric OAM monitoring, you must specify a VLAN name (not a VLAN ID). The FMA configuration requires a VLAN name and not a VLAN ID.

If you have already configured a VLAN ID for the VLAN, you must delete the VLAN ID from the associated interfaces and then add a VLAN name.

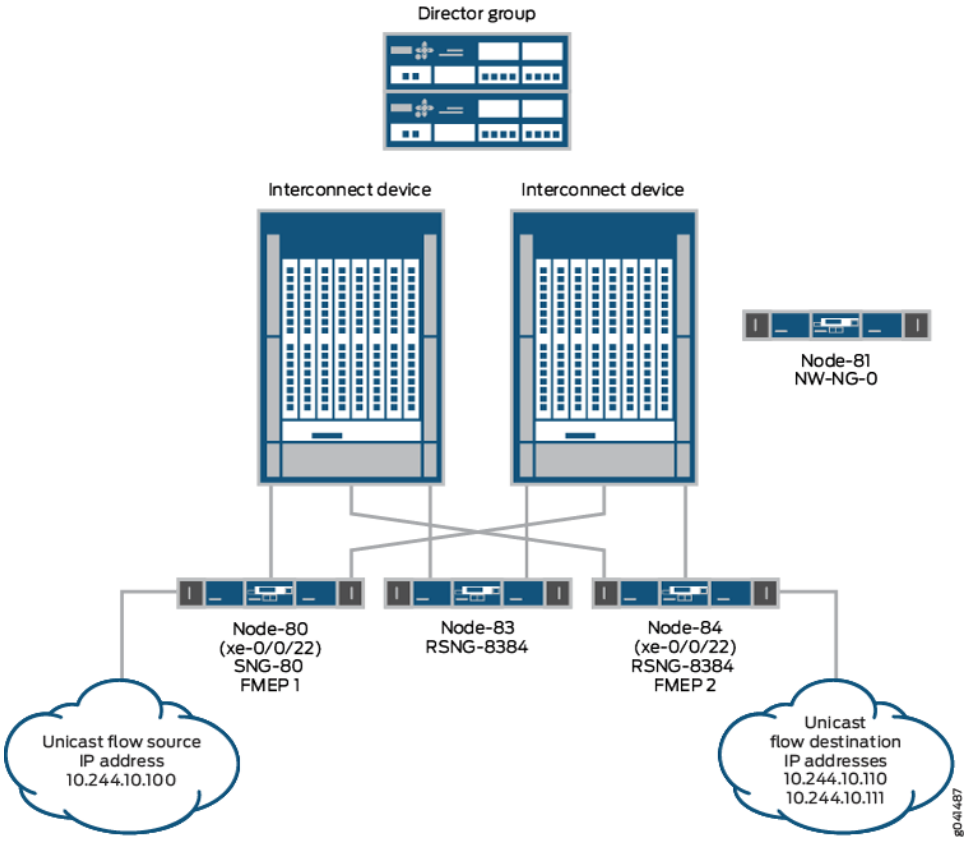
Overview

On a QFabric system, enabling internal fabric OAM monitoring requires that you configure an FMA and a flow specification.

- The *FMA* associates a particular VLAN with a set of source and destination interfaces called fabric maintenance endpoints (FMEPs) that are used for tracing the data path between the endpoints. Configuration of the VLAN name is mandatory when you configure an FMA.
- A *flow specification* is used to determine the contents of a packet that is used for a particular operation. For example, an Ethernet type flow specification describes the contents of a pure Layer 2 packet, whereas an Ethernet IPv4 type flow specification describes an Ethernet IPv4 packet.

Topology

This example uses the following topology:



- The QFabric system Node devices are connected to the Interconnect devices.
- Node device Node-80 is configured in the server Node group SNG-80.
- Node devices Node-83 and Node-84 are configured in a redundant server Node group RSNG-8384.
- The device with the unicast flow source IP address is connected to Node-80.
- The device with the unicast flow destination IP addresses is connected to Node-84.

Table 602 on page 6173 maps the association of the fabric OAM elements configured in this example.

Table 602: Fabric OAM Configuration Elements

Interface	FMA	VLAN Name	FMEP ID	Flow Specifications
Node-80:xe-0/0/22	fma1	v10	1	• flowspec1 • flowspec2
Node-84:xe-0/0/22	fma1	v10	2	• flowspec1 • flowspec2

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set vlans v10 vlan-id 10
set interfaces Node-80:xe-0/0/22 unit 0 family ethernet-switching vlan members v10
set interfaces Node-84:xe-0/0/22 unit 0 family ethernet-switching vlan members v10
set protocols oam fabric fabric-maintenance-associations fma1 vlan-name v10
set protocols oam fabric fabric-maintenance-associations fma1
  fabric-maintenance-end-points 1 fmep-interface Node-80:xe-0/0/22.0
set protocols oam fabric fabric-maintenance-associations fma1
  fabric-maintenance-end-points 2 fmep-interface Node-84:xe-0/0/22.0
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 source-ip
  10.244.10.100
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 destination-ip
  10.244.10.110
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 destination-mac
  00:00:80:8d:2d:15
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 source-l4-port 60
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 destination-l4-port
  80
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 source-ip
  10.244.10.100
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 destination-ip
  10.244.10.111
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 destination-mac
  00:00:80:8d:2d:17
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 source-l4-port 60
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 destination-l4-port
  80
```

Step-by-Step Procedure

To configure internal fabric OAM monitoring:

1. Configure a name and ID for the VLAN.

   ```
   [edit]
   set vlans v10 vlan-id 10
   ```

2. Assign a set of interfaces to the VLAN.

   ```
   [edit]
   set interfaces Node-80:xe-0/0/22 unit 0 family ethernet-switching vlan members
     v10
   set interfaces Node-84:xe-0/0/22 unit 0 family ethernet-switching vlan members
     v10
   ```

3. Define the FMA and associate it with a VLAN name.

   ```
   [edit protocols oam fabric]
   set fabric-maintenance-associations fma1 vlan-name v10
   ```

4. Configure FMEPs for the FMA.

   ```
   [edit protocols oam fabric]
   ```

```
set fabric-maintenance-associations fma1 fabric-maintenance-end-points 1
  fmep-interface Node-80:xe-0/0/22.0
set fabric-maintenance-associations fma1 fabric-maintenance-end-points 2
  fmep-interface Node-84:xe-0/0/22.0
```

5. Configure two IPv4 flow specifications for unicast traffic from FMEP 1 to FMEP 2.

```
[edit protocols oam fabric]
set flow-specs flowspec1 unicast-ethernet-ipv4 source-ip 10.244.10.100
set flow-specs flowspec1 unicast-ethernet-ipv4 destination-ip 10.244.10.110
set flow-specs flowspec1 unicast-ethernet-ipv4 destination-mac 00:00:80:8d:2d:15
set flow-specs flowspec1 unicast-ethernet-ipv4 source-l4-port 60
set flow-specs flowspec1 unicast-ethernet-ipv4 destination-l4-port 80
set flow-specs flowspec2 unicast-ethernet-ipv4 source-ip 10.244.10.100
set flow-specs flowspec2 unicast-ethernet-ipv4 destination-ip 10.244.10.111
set flow-specs flowspec2 unicast-ethernet-ipv4 destination-mac 00:00:80:8d:2d:17
set flow-specs flowspec2 unicast-ethernet-ipv4 source-l4-port 60
set flow-specs flowspec2 unicast-ethernet-ipv4 destination-l4-port 80
```

Results Display the results of the configuration.

```
root@qfabric> show protocols oam fabric

            destination-mac 0:0:80:8d:2d:15;
            source-l4-port 60;
            destination-l4-port 80;
        }
    }
    flowspec2 {
        unicast-ethernet-ipv4 {
            source-ip 10.244.10.100;
            destination-ip 10.244.10.111;
            destination-mac 0:0:80:8d:2d:17;
            source-l4-port 60;
            destination-l4-port 80;
        }
    }
}
```

Verification

Confirm that the configuration is working properly.

- Verifying Configuration of Fabric OAM Interfaces on page 6176
- Verifying Configuration of the Fabric OAM Flow Specification on page 6176
- Verifying Operation of the Unicast ping Command on page 6177

Verifying Configuration of Fabric OAM Interfaces

Purpose Verify that the interfaces are associated with the FMA.

Action Display the fabric OAM interfaces.

```
root@qfabric> show oam fabric interfaces

Interface-name       Fabric-Maintenance    VLAN    Interface      MEP        MEP
                      Association                    state     Identifier    Name
NW-NG-0:NULL          fma-default           *         up          32790      fmep-default-BBAK8793
NW-NG-0:NULL          fma-default           *         up          32791      fmep-default-BBAK8798
RSNG-8384:NULL        fma-default           *         up          32794      fmep-default-BBAK8748
RSNG-8384:NULL        fma-default           *         up          32795      fmep-default-BBAK0465
Node-84:xe-0/0/22.0   fma1                  V10       up          2
SNG-60:NULL           fma-default           *         up          32793      fmep-default-BBAK9603
SNG-80:NULL           fma-default           *         up          32792      fmep-default-BBAK8728
Node-80:xe-0/0/22.0   fma1                  V10       up          1
```

Meaning Interfaces Node-84:xe-0/0/22.0 and Node-80:xe-0/0/22.0 are associated with the FMA, FMEP, and VLAN as configured.

Interfaces that are not configured for fabric OAM monitoring (NW-NG-0:NULL, RSNG-8384:NULL, SNG-60:NULL, and SNG-80:NULL) display an asterisk (*) in the VLAN column, and the default FMA and FMEP names in the Fabric-Maintenance Association and MEP Name columns.

Verifying Configuration of the Fabric OAM Flow Specification

Purpose Verify the configuration of the flow specifications.

Action Display the fabric OAM flow specification configuration.

```
root@qfabric> show oam fabric flow-specification
Flow specification name  : flowspec1 Type : Ethernet Unicast IPV4
     Ethernet frame size  : Unspecified
     Source-IP  : 10.244.10.100
     Source-IP Mask : Unspecified
     Destination-IP  : 10.244.10.110
     Destination-IP Mask : Unspecified
     Destination-mac : 0:0:80:8d:2d:15
     IP-protocol : Unspecified
     Source-L4-port : 60
     Destination-L4-port : 80
 Flow specification name  : flowspec2 Type : Ethernet Unicast IPV4
     Ethernet frame size  : Unspecified
     Source-IP  : 10.244.10.100
     Source-IP Mask : Unspecified
```

```
Destination-IP  : 10.244.10.111
Destination-IP Mask : Unspecified
Destination-mac : 0:0:80:8d:2d:17
IP-protocol : Unspecified
Source-L4-port : 60
Destination-L4-port : 80
```

Meaning The output shows that flow specifications were configured as the user intended.

Verifying Operation of the Unicast ping Command

Purpose Verify that the fabric OAM unicast **ping** command works.

Action Issue the **ping fabric unicast-flow** command.

```
root@qfabric> ping fabric unicast-flow source-fmep-id 1 dest-fmep-id 2 flow-spec-name
flowspec1 fma-name fma1 count 3
Fabric flow ping between source Node-80 destination Node-84
received response from fmep-id 2...
received response from fmep-id 2...
received response from fmep-id 2...
sent 3 requests, received 3 responses

root@qfabric> ping fabric unicast-flow source-fmep-id 1 dest-fmep-id 2 fma-name
fma1 flow-spec-name flowspec2
Fabric flow ping between source Node-80 destination Node-84
received response from fmep-id 2...
sent 1 requests, received 1 responses
```

Meaning The fabric OAM unicast ping request from the source Node device (Node-80) to the destination Node device (Node-84) has been successful.

Configuration Tasks for Network Management

- Configuring Console and Auxiliary Port Properties on page 6177
- Configuring SSH Service for Remote Access to the Router or Switch on page 6178
- Configuring Telnet Service for Remote Access to a Switch on page 6180

Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data

terminal may be connected to the switch. The console port is enabled by default, and its speed is 9600 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

   ```
   [edit system ports]
   user@switch# set console log-out-on-disconnect
   ```

2. To specify the auxiliary port terminal type:

   ```
   [edit system ports]
   user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
   ```

   For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

   ```
   [edit system ports]
   user@switch# set auxiliary type xterm
   ```

3. To check the configuration:

   ```
   [edit system ports]
   user@switch# show
   console log-out-on-disconnect;
   auxiliary type xterm;
   ```

Related Documentation

Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-tcp-forwarding;
  protocol-version [v1 v2] ;
```

```
    rate-limit limit;
    root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit** *limit*—Maximum number of simultaneous connections per protocol (IPV4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection** *number*—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit** *limit*—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

For information about other configuration settings, see the following topics:

- Configuring the Root Login Through SSH on page 6179
- Configuring the SSH Protocol Version on page 6179
- Configuring the Client Alive Mechanism on page 6180

Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit systems services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

allow—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

deny—Disables users from logging in to the router or switch as root through SSH.

deny-password—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
```

```
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

Configuring Telnet Service for Remote Access to a Switch

Telnet provides unencrypted access to network devices. Configuring Telnet service for a switch enables in-band remote access to the switch.

By default, the switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute. Optionally, you can change the default Telnet settings by configuring the connection limit and rate limit at the **[edit system services telnet]** hierarchy level.

The connection limit is the maximum number of simultaneous connections per protocol (IPv4). The range is from **1** through **250**. The default is **75**.

The rate limit is the maximum number of connection attempts accepted per minute per protocol. The range is from **1** through **250**. The default is **150**.

To configure Telnet service:

1. To specify the connection limit:

   ```
   [edit system services]
   user@switch# set telnet connection-limit connection-limit
   ```

2. To specify the rate limit:

```
[edit system services]
user@switch# set telnet rate-limit rate-limit
```

3. Check that the Telnet connection limit and rate limit show the values you specified:

```
[edit system services]
user@switch# show
  telnet {
    connection-limit 50;
    rate-limit 100;
  }
```

Configuration Tasks for Automation Scripts

- Controlling the Execution of Commit Scripts on page 6181

Controlling the Execution of Commit Scripts

This document describes the tasks that affect the way commit scripts are executed. In the QFabric system, commit scripts are stored in the in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit** directory that is shared among Director devices in a Director group.

To determine which commit scripts are currently enabled on the QFabric system, use the **show** command to display the files included at the **[edit system scripts commit]** hierarchy level. To ensure that the enabled files are on the device, list the contents of the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit** directory using the **file list** operational mode command.

See the following tasks:

- Enabling Commit Scripts to Execute on page 6181
- Removing Commit Scripts from the Configuration on page 6182
- Deactivating Commit Scripts on page 6183
- Activating Inactive Commit Scripts on page 6183

Enabling Commit Scripts to Execute

The commit operation requires that all scripts be included in configuration at the **[edit system scripts commit file]** hierarchy level for all QFabric Director devices.

If you need to temporarily remove a script from a commit operation but do not want to remove it from the configuration permanently, you may configure the **optional** statement at the **[edit system scripts commit file *filename*]** hierarchy level to enable the commit operation to succeed even if a script is missing from the commit script directory.

CAUTION: When you include the optional statement at the [edit system scripts commit file *filename*] hierarchy level, no error message is generated during

the commit operation if the file does not exist. As a result, you might not be aware that a script has not been executed as expected.

The filename of a commit script written in SLAX must include the **.slax** extension for the script to be executed.

To enable a commit script to execute during a commit operation:

1. Ensure that the commit script is located in the correct directory: **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit** directory on the Director device.
2. Configure the commit script.

   ```
   [edit system scripts commit]
   user@switch# set file filename <optional>
   ```

3. Commit the configuration.

   ```
   [edit system scripts commit]
   user@switch# top
   [edit]
   user@switch# commit
   ```

Removing Commit Scripts from the Configuration

You can prevent commit scripts from executing during a commit operation by removing the scripts from the commit directory in the configuration.

NOTE: You can also deactivate a script using the deactivate statement instead of removing it from the configuration. Deactivated scripts may be reactivated later.

To prevent a commit script from executing during a commit operation:

1. Delete the commit script file from the commit directory in the configuration.

   ```
   [edit system scripts commit]
   user@switch# delete file filename
   ```

2. Commit the configuration.

   ```
   [edit system scripts commit]
   user@switch# top
   [edit]
   user@switch# commit
   ```

3. Remove the commit script from the **/pbdata/mgd_shared/** directory on the Director device.

BEST PRACTICE: Although removing the commit script is not necessary, we recommend deleting unused files from the system.

Deactivating Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration. The script is not executed during the commit operation, but you can reactivate the script by using the **activate** statement.

To deactivate the commit script:

1. Deactivate the script.

   ```
   [edit]
   user@switch deactivate system scripts commit file filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit
   ```

3. Verify that the commit script is deactivated.

   ```
   [edit]
   user@switch# show system scripts commit
   inactive: file mycommit.slax
   ```

Activating Inactive Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration and is therefore not executed during the commit operation.

To activate an inactive commit script:

1. Activate the script.

   ```
   [edit]
   user@switch# activate system scripts commit file filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit
   ```

Configuration Tasks for Fabric OAM

- Configuring a Fabric Maintenance Association on page 6184
- Configuring Flow Specifications on page 6185

Configuring a Fabric Maintenance Association

On a QFabric system, enabling internal fabric monitoring using the ping and traceroute operations requires that a fabric maintenance association (FMA) be configured in addition to a flow specification. The FMA associates a particular VLAN with a set of source and destination interfaces called fabric maintenance endpoints (FMEPs) that are used for tracing the flow path between the endpoints. Configuration of the VLAN name is mandatory.

Before configuring the FMA, configure a VLAN name (and not a VLAN ID) for the VLAN in which the internal fabric monitoring occurs. If you already configured a VLAN ID instead of a VLAN name, you must first delete the VLAN ID and then specify and VLAN name before you configure the FMA.

NOTE: **Because each FMA and VLAN have a one-to-one correspondence, an FMA in each QFabric system must be given a unique name.**

To configure an FMA:

1. Configure an FMA name that is unique within the QFabric system:

   [edit protocols oam fabric]
   user@host# set fabric-maintenance-associations *fma-name*

2. (Optional) Configure the FMA description:

   [edit protocols oam fabric]
   user@host# set fabric-maintenance-associations *fma-name* description *string*

3. Configure the VLAN name:

   [edit protocols oam fabric]
   user@host# set fabric-maintenance-associations *fma-name* vlan-name *vlan-name*

4. Configure an FMEP, including the identifier, name, description, and associated interface:

   [edit protocols oam fabric]
   user@host# set fabric-maintenance-associations *fma-name*
   fabric-maintenance-end-points *fmep-id* fmep-name *name* description *string*
   fmep-interface *interface-name*

5. Repeat Step 4 to configure additional FMEPs.

Related Documentation

- Configuring Flow Specifications on page 6185
- fabric (OAM) on page 6256
- ping fabric multicast-flow on page 6419
- ping fabric unicast-flow on page 6421
- traceroute fabric unicast-flow on page 6467

Configuring Flow Specifications

On a QFabric system, enabling internal fabric monitoring using the ping and traceroute operations requires that a flow specification be configured in addition to a fabric maintenance association (FMA). A flow specification is used to determine the contents of the packet that is used for a particular operation. For example, an Ethernet type flow specification describes the contents of a pure Layer 2 packet, whereas an Ethernet IPv4 type flow specification describes an Ethernet IPv4 packet.

NOTE: In the flow specification configuration, some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets:

- Unicast Ethernet—Source MAC address, destination MAC address, Ethertype
- Unicast IPv4—Source IP address, destination IP address, source L4 port, destination L4 port, destination MAC address

The configuration for each flow specification type includes parameters specific to that particular type. Use one of the following procedures to configure the flow specification for your flow type:

- Configuring a Unicast Ethernet Flow Specification on page 6185
- Configuring a Unicast Ethernet IPv4 Flow Specification on page 6186
- Configuring a Multicast IPv4 Flow Specification on page 6187
- Configuring a Multicast VLAN Flood Flow Specification on page 6188

Configuring a Unicast Ethernet Flow Specification

This procedure describes how to configure a flow specification for a unicast Ethernet flow type. This configuration is applicable for the unicast ping and traceroute operations.

NOTE: Some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets: source MAC address, destination MAC address, and Ethertype.

To configure a unicast Ethernet flow specification:

1. Configure a flow specification name:

[edit protocols oam fabric]
user@host# set flow-specs *flow-specification-name*

2. (Optional) Set the Ethernet frame size:

   [edit protocols oam fabric]
   user@host# set ethernet-frame-size *ethernet-frame-size*

3. Set the flow specification type as unicast Ethernet and specify the EtherType:

   [edit protocols oam fabric flow-specs *flow-specification-name*]
   user@host# set unicast-ethernet ethertype *ethertype*

4. (Optional) Set the MAC address and the MAC address range of the source FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet]
   user@host# set source-mac *source-mac-address* source-mac-mask *source-mac-mask*

   NOTE: Configuration of the source-mac and source-mac-mask parameters is optional, but the source-mac-mask parameter can be specified only if the source-mac parameter is also configured.

5. (Optional) Set the MAC address or address range mask for the destination FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet]
   user@host# set destination-mac *destination-mac-address* destination-mac-mask *destination-mac-mask*

   NOTE: Configuration of the destination-mac and destinastion-mac-mask parameters is optional, but the destination-mac-mask parameter can be specified only if the destination-mac parameter is also configured.

Configuring a Unicast Ethernet IPv4 Flow Specification

This procedure describes how to configure a flow specification for a unicast Ethernet IPv4 flow type. This configuration is applicable for the unicast ping and traceroute operations.

NOTE: All parameters except the flow specification name are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets: source IP address, destination IP address, source L4 port, destination L4 port, destination MAC address.

To configure a unicast Ethernet IPv4 flow specification:

1. Configure a flow specification name:

[edit protocols oam fabric]
user@host# **set flow-specs** ***flow-specification-name***

2. (Optional) Set the Ethernet frame size:

   [edit protocols oam fabric flow-specs *flow-specification-name*]
   user@host# **set ethernet-frame-size** ***size***

3. Set the flow specification type as unicast Ethernet IPv4:

   [edit protocols oam fabric flow-specs *flow-specification-name*]
   user@host# **set unicast-ethernet-ipv4**

4. (Optional) Set the IPv4 address or the address range of the source FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **set source-ip** ***source-ip-address***

   or

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **set source-ip-mask** ***source-ip-mask***

5. (Optional) Set the IPv4 address or the address range of the destination FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **set destination-ip** ***destination-ip-address***

   or

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **set destination-ip-mask** ***destination-ip-mask***

6. (Optional) Set the IPv4 protocol type:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **ip-proto** ***protocol***

7. (Optional) Set the L4 port (TCP or UDP port number) of the source FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **source-l4-port** ***source-l4-port-number***

8. (Optional) Set the L4 port of the destination FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* unicast-ethernet-ipv4]
   user@host# **destination-l4-port** ***destination-l4-port-number***

Configuring a Multicast IPv4 Flow Specification

This procedure describes how to configure a flow specification for a multicast IPv4 flow type.

NOTE: Some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

To configure a multicast IPv4 flow specification:

1. Configure a flow specification name:

[edit protocols oam fabric]
user@host# set flow-specs *flow-specification-name*

2. Set the flow specification type as multicast IPv4:

   [edit protocols oam fabric flow-specs *flow-specification-name*]
   user@host# set multicast-ipv4

3. (Optional) Set the IPv4 address of the source FMEP:

   [edit protocols oam fabric flow-specs *flow-specification-name* multicast-ipv4]
   user@host# set source-ip *ipv4-address*

4. Set the IPv4 multicast group address:

   [edit protocols oam fabric flow-specs *flow-specification-name* multicast-ipv4]
   user@host# set dest-ip-multicast-group *ipv4-mcast-address*

Configuring a Multicast VLAN Flood Flow Specification

This procedure describes how to configure a flow specification for a multicast VLAN flood flow type.

To configure a multicast VLAN flood flow specification:

1. Configure a flow specification name:

   [edit protocols oam fabric]
   user@host# set flow-specs *flow-specification-name*

2. Set the flow specification type as multicast VLAN flood:

   [edit protocols oam fabric flow-specs *flow-specification-name*]
   user@host# set multicast-vlan-flood

Configuration Tasks for sFlow Technology

- Configuring sFlow Technology on page 6189

Configuring sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

On the QFabric system, the sFlow monitoring global configuration that is defined on the Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

   ```
   [edit protocols sflow]
   user@host# set collector ip-address udp-port port-number
   ```

   The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@host# set interfaces interface-name
   ```

   NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

   You cannot enable sFlow technology on a LAG interface (for example ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

   ```
   [edit protocols sflow]
   user@host# set polling-interval seconds
   ```

   NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets are sampled at the global level. For example, configuring a ***number*** of 1000 sets a sample rate of 1 in 1000 packets.

   ```
   [edit protocols sflow]
   user@host# set sample-rate number
   ```

5. (Optional) You can also configure the polling interval and sample rate at the interface level:

   ```
   [edit protocols sflow]
   ```

```
user@host# set interfaces interface-name polling-interval seconds sample-rate number
```

NOTE: The interface-level configuration overrides the global configuration for the specified interface.

Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
```

```
community community-name {
  authorization authorization;
  client-list-name client-list-name;
  clients {
    address restrict;
  }
  logical-system logical-system-name {
    routing-instance routing-instance-name {
      clients {
      addresses;
      }
    }
  }
  routing-instance routing-instance-name {
    clients {
    addresses;
    }
  }
  view view-name;
}
contact contact;
description description;
filter-duplicates;
filter-interfaces;
health-monitor {
  falling-threshold integer;
  interval seconds;
  rising-threshold integer;
}
interface [ interface-names ];
location location;
name name;
nonvolatile {
  commit-delay seconds;
}
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type type;
  }
  history history-index {
```

```
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}
traceoptions {

Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see "Configuring MIB Views" on page 6197.

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are

allowed. For ***address***, you must specify an IPv4 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local switch.

NOTE: **Community names must be unique within each SNMP system.**

Related Documentation

- Configuring SNMP on page 1703

Configuring SNMP Trap Groups

Before any SNMP traps can be sent, you must configure a trap group, the categories of traps the group can receive, and the targets (systems) that will receive the traps. To create and name an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 address of each recipient and not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement.

A trap group can receive the following categories of traps:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications such as up-down transitions
- **remote-operations**—Remote operation notifications
- **startup**—System warm and cold starts

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see version.

Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name *name*** statement at the **[edit snmp community *community-name*]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
   client-list client-list-name {
   ip-addresses;
}
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list** statement, see the *Routing Policy Configuration Guide*.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]
client-list-name client-list-name;
```

NOTE: The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
   client-list clentlist1 {
      10.1.1.1/32;
      10.2.2.2/32;
   }
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]
```

```
snmp {
  community community1 {
    authorization read-only;
    client-list-name clientlist1;
  }
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
  prefix-list prefixlist {
  10.3.3.3/32;
  10.5.5.5/32;
  }
}
snmp {
  community community2 {
  client-list-name prefixlist;
  }
}
```

Related Documentation

Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

Related Documentation

- *Configuration Statements at the [edit snmp] Hierarchy Level*
- *Example: Configuring Secured Access List Checking*
- Configuring SNMP on page 1703

Configuring MIB Views

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
view view-name {
   oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as interfaces). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

NOTE: To remove an OID completely, use the **delete view all oid** *oid-number* command but omit the **include** parameter.

To associate MIB views with a community, include the **view** statement at the **[edit snmp community** *community-name***]** hierarchy level:

```
[edit snmp community community-name]
view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the *PING MIB* topic in the *SNMP MIBs and Traps Reference*.

- *oid*

Configuring RMON Alarms and Events

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

To configure RMON alarms and events using the CLI, perform these tasks:

1. Configuring SNMP on page 6199
2. Configuring an Event on page 6199
3. Configuring an Alarm on page 6200

Configuring SNMP

To configure SNMP:

1. Grant read-only access to all SNMP clients:

   ```
   [edit snmp]
   user@switch# set community community-name authorization authorization
   ```

   For example:

   ```
   [edit snmp]
   user@switch# set community public authorization read-only
   ```

2. Grant read-write access to the **RMON** and **jnx-rmon** MIBs:

   ```
   [edit snmp]
   user@switch# set view view-name oid object-identifier include
   user@switch# set view view-name oid object-identifier include
   user@switch# set community community-name authorization authorization view view-name
   ```

   For example:

   ```
   [edit snmp]
   user@switch# set view rmon-mib-view oid .1.3.6.1.2.1.16 include
   user@switch# set view rmon-mib-view oid .1.3.6.1.4.1.2636.13 include
   user@switch# set community private authorization read-write view rmon-mib-view
   ```

   OIDs 1.3.6.1.2.1.16 and 1.3.6.1.4.1.2636.13 correspond to the **RMON** and **jnxRmon** MIBs.

3. Configure an SNMP trap group:

   ```
   [edit snmp]
   user@switch# set trap-group group-name categories category
   user@switch# set trap-group group-name targets address
   ```

   For example:

   ```
   [edit snmp]
   user@switch# set trap-group rmon-trap-group categories rmon-alarm
   user@switch# set trap-group rmon-trap-group targets 192.168.5.5
   ```

   The trap group **rmon-trap-group** is configured to send RMON traps to 192.168.5.5.

Configuring an Event

To configure an event:

1. Configure an event index, community name, and type:

   ```
   [edit snmp rmon]
   user@switch# set event index community community-name  typetype
   ```

   For example:

   ```
   [edit snmp rmon]
   user@switch# set event 1 community rmon-trap-group type log-and-trap
   ```

   The event community corresponds to the SNMP trap group and is not the same as an SNMP community. This event generates an SNMP trap and adds an entry to the **logTable** in the RMON MIB.

2. Configure a description for the event:

   ```
   [edit snmp rmon]
   user@switch# set event index description description
   ```

For example:

```
[edit snmp rmon]
user@switch# set event 1 description “rmon event”
```

Configuring an Alarm

To configure an alarm:

1. Configure an alarm index, the variable to monitor, the rising and falling thresholds, and the corresponding rising and falling events:

   ```
   [edit snmp rmon]
   user@switch# set alarm index variable oid-variable falling-threshold integer rising-threshold integer rising-event-index index falling-event-index index
   ```

   For example:

   ```
   [edit snmp rmon]
   user@switch# set alarm 5 variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 falling-threshold 75 rising-threshold 90 rising-event-index 1 falling-event-index 1
   ```

   The variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 corresponds to the **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The falling and rising threshold integers are 75 and 90. The rising and falling events both generate the same event (event index 1).

2. Configure the sample interval and type and the alarm type:

   ```
   [edit snmp rmon]
   user@switch# set alarm index interval seconds sample-type (absolute-value | delta-value) startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm)
   ```

   For example:

   ```
   [edit snmp rmon]
   user@switch# set alarm 5 interval 30 sample-type absolute-value startup-alarm rising-or-falling-alarm
   ```

   The absolute value of the monitored variable is sampled every 30 seconds. The initial alarm can occur because of rising above the rising threshold or falling below the falling threshold.

Configuring Health Monitoring

This topic describes how to configure the health monitor feature for QFX Series devices.

The health monitor feature extends the SNMP RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (such as file system usage, CPU usage, and memory usage) and dynamic object instances (such as Junos OS processes).

To configure health monitoring:

1. Configure the health monitor:

   ```
   [edit snmp]
   user@switch# set health-monitor
   ```

2. Configure the falling threshold:

   ```
   [edit snmp]
   user@switch# set health-monitor falling-threshold percentage
   ```

   For example:

   ```
   user@switch# set health-monitor falling-threshold 85
   ```

3. Configure the rising threshold:

   ```
   [edit snmp]
   user@switch# set health-monitor rising-threshold percentage
   ```

   For example:

   ```
   user@switch# set health-monitor rising-threshold 75
   ```

4. Configure the interval:

   ```
   [edit snmp]
   user@switch# set health-monitor interval seconds
   ```

   For example:

   ```
   user@switch# set health-monitor interval 600
   ```

Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

NOTE: You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

username is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
  privacy-password privacy-password;
}
privacy-3des {
  privacy-password privacy-password;
}
privacy-none;
```

Configuring Access Privileges for a Group

In SNMPv3, you can configure a group that sets the same access privileges for one or more users. Configuring a group includes defining the security model and security level, and associating one or more MIB view permissions for the group.

NOTE: You must associate at least one MIB view with the group. You can associate multiple MIB views (read, notify, write) to authorize different permissions based on the view. The view name cannot exceed 32 characters.

To configure access privileges for a group:

1. To configure the group:

   ```
   [edit snmp v3 vacm access]
   user@switch# edit group group-name
   ```

2. To configure the context prefix of the SNMP instance for the group:

   ```
   [edit snmp v3 vacm access group group-name]
   user@switch# edit (default-context-prefix | context-prefix context-prefix)
   ```

   For example, to configure the default context prefix:

   ```
   [edit snmp v3 vacm access group group-name]
   ```

```
user@switch# edit default-context-prefix
```

3. To configure the security model:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix)]
user@switch# edit security-model (any | usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix)]
user@switch# edit security-model usm
```

4. To configure the security level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level (authentication | none | privacy)
```

For example, to configure a security level requiring user authentication and encryption:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level privacy
```

NOTE: Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or v2c security model, use **none** as your security level. If you are configuring the SNMPv3 security model (USM), use the **authentication**, **none**, or **privacy** security level.

5. (Optional) To associate a read-only MIB view with an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
  none | privacy)]
user@switch# edit read-view view-name
```

6. (Optional) To associate a MIB view with an SNMP notification permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
  none | privacy)]
user@switch# edit notify-view view-name
```

7. (Optional) To associate a MIB view with write permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
  context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
  none | privacy)]
user@switch# edit write-view view-name
```

Assigning a Security Name to a Group

In SNMPv3, each username is associated with a security name. The security name, together with the SNMP engine ID, is included in SNMP messages to ensure messaging security.

Before you assign a security name to a group, first create the security name. For an SNMPv3 client, the security name is the username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 or v2c clients, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Assigning a security name to a group includes configuring a security model for the group, assigning the security name to the group, and configuring the group.

To assign an SNMP security name to a group:

1. To configure a security model for the group:

   ```
   [edit snmp v3 vacm security-to-group]
   user@switch# edit security-model (usm | v1 | v2c)
   ```

   For example, to configure the SNMPv3 user-based security model (USM):

   ```
   [edit snmp v3 vacm security-to-group]
   user@switch# edit security-model usm
   ```

2. To associate the security name with a group:

   ```
   [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
   user@switch# edit security-name security-name
   ```

3. To configure a group of SNMPv3 security names with the same security policy:

   ```
   [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
     security-name]
   user@switch# edit group group-name
   ```

Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see "Configuring SNMP Informs" on page 6206.

The target address defines a management application's address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the **[edit snmp v3 vacm access]** and **[edit snmp v3 vacm security-to-group]** hierarchy levels.

To configure SNMP traps, include the following statements at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
notify name {
    tag tag-name;
    type trap;
}
notify-filter name {
    oid object-identifier (include | exclude);
}
target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system (SNMP) logical-system;
    port port-number;
    routing-instance instance;
    tag-list tag-list;
    target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
        message-processing-model (v1 | v2c | v3);
        security-level (authentication | none | privacy);
        security-model (usm | v1 | v2c);
        security-name security-name;
    }
}
```

Configuring SNMP Informs

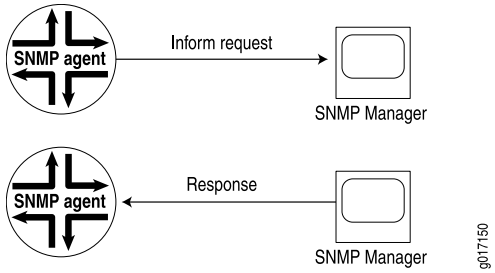
Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see Figure 226 on page 6206). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

Figure 226: Inform Request and Response



For information about configuring SNMP traps, see "Configuring SNMPv3 Traps on a Device Running Junos OS" on page 6204.

Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in Table 603 on page 6207. For more information about the configuration statements, see *Single-Chassis System Logging Configuration Overview*.

Table 603: Minimum Configuration Statements for System Logging

Destination	Minimum Configuration Statements

File	[edit system syslog]
	file *filename* {
	  facility severity;
	}

Terminal session of one, several, or all users	[edit system syslog]
	user (*username* | *) {
	  facility severity;
	}

Table 603: Minimum Configuration Statements for System Logging *(continued)*

Destination	Minimum Configuration Statements

Router or switch console	[edit system syslog]
	console {
	  facility severity;
	}

Remote machine or the other Routing Engine on the router or switch	[edit system syslog]
	host (*hostname* | other-routing-engine) {
	  facility severity;
	}

Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the **syslog** statement at the **[edit system]** hierarchy level:

```
[edit system]
syslog {
  archive <files number> <size size> <world-readable | no-world-readable>;
  console {
    facility severity;
  }
  file filename {
    facility severity;
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
      <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
      no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
      brief;
    }
  }
  host hostname {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string
    match "regular-expression";
  }
  source-address source-address;
  time-format (year | millisecond | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
```

```
    }
}
```

Related Documentation

- Overview of Junos OS System Log Messages on page 6154

Adding a Text String to System Log Messages

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign (=) and the colon (:). It also cannot include the space character; do not enclose the string in quotation marks (“ ”) in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```
[edit system syslog]
host hardware-logger.mycompany.com {
    any info;
    log-prefix M120;
}
```

When these configuration statements are included on an M120 router called origin1, a message in the system log on hardware-logger.mycompany.com looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user ‘root’, command ‘run
    show version’
```

Related Documentation

Directing System Log Messages to a Log File

To direct system log messages to a file in the **/var/log** directory of the local Routing Engine, include the **file** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
file filename {
    facility severity;
```

```
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
      <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
      no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
      brief;
    }
  }
```

For the list of facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the **archive** statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see "Specifying Log File Size, Number, and Archiving Properties" on page 6220.

For information about the following statements, see the indicated sections:

- **explicit-priority**—See "Including Priority Information in System Log Messages" on page 6213
- **match**—See "Using Regular Expressions to Refine the Set of Logged Messages" on page 6227
- **structured-data**—See *Logging Messages in Structured-Data Format*

Related Documentation

- *Examples: Configuring System Logging*
- Examples: Configuring System Logging on page 6159

Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the **host** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the **host** *hostname* statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard **syslogd** utility. We do not recommend

directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the **host** statement, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 6222.

To record facility and severity level information in each message, include the **explicit-priority** statement. For more information, see "Including Priority Information in System Log Messages" on page 6213.

For information about the **match** statement, see "Using Regular Expressions to Refine the Set of Logged Messages" on page 6227.

When directing messages to remote machines, you can include the **source-address** statement to specify the IP address of the switch that is reported in the messages as their source. In each **host** statement, you can also include the **facility-override** statement to assign an alternative facility and the **log-prefix** statement to add a string to each message.

Related Documentation

- Overview of Single-Chassis System Logging Configuration on page 6155

Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*. For information about the **match** statement, see "Using Regular Expressions to Refine the Set of Logged Messages" on page 6227.

Related Documentation

Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

Related Documentation

Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the ***facility*** **none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the **any** ***severity*** statement and then a ***facility*** **none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
console {
    any error;
    daemon none;
    kernel none;
}
file internals {
    daemon info;
    kernel info;
}
```

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
```

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2

- Interpreting Messages Generated in Structured-Data Format on page 6216

Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]
facility severity;
explicit-priority;
```

NOTE: Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the **[edit system syslog host (*hostname* | other-routing-engine)]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
explicit-priority;
```

NOTE: The **other-routing-engine** option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see "Changing the Alternative Facility Name for Remote System Log Messages" on page 6225.

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

FACILITY-*severity*[-*TAG*]

(The tag is a unique identifier assigned to some Junos OS system log messages; for more information, see the *Junos OS System Log Messages Reference*.)

In the following example, the **CHASSISD_PARSE_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info** (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
  Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
  configuration
```

For more information about message formatting, see the *Junos OS System Log Messages Reference*.

- Overview of Single-Chassis System Logging Configuration on page 6155
- *Examples: Configuring System Logging*

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 15:36:30
```

To include the year, the millisecond, or both, in the timestamp, include the **time-format** statement at the [**edit system syslog**] hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the [**edit system syslog**] hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Aug 21 15:36:30.401 2010
```

NOTE: By default, messages logged in structured-data format include the year and millisecond. If you include the **structured-data** statement at the [**edit system syslog file** *filename*] hierarchy level along with the **time-format** statement, the **time-format** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see "Logging Messages in Structured-Data Format" on page 6215. For information about interpreting messages in a structured-data format, see "Interpreting Messages Generated in Structured-Data Format" on page 6216.

Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft draft-ietf-syslog-protocol-21.txt. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the [**edit system syslog file** *filename*] hierarchy level:

```
[edit system syslog file filename]
facility severity;
structured-data {
 brief;
}
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data–format message, see "Interpreting Messages Generated in Structured-Data Format" on page 6216.

The structured format is used for all messages logged to the file that are generated by a Junos OS process or software library.

NOTE: If you include either or both of the **explicit-priority** and **time-format** statements along with the **structured-data** statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

Interpreting Messages Generated in Structured-Data Format

By default, Junos OS processes and software libraries write messages to the system log file in structured-data format. For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*.

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

<priority code>version timestamp hostname process processID TAG [junos@2636.platform variable-value-pairs] message-text

Table 604 on page 6217 describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen (-) appears instead.

Table 604: Fields in Structured-Data Messages

Field	Description	Examples
<priority code>	Number that indicates the facility and severity of a message. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see *Specifying the Facility and Severity of Messages to Include in the Log*.	<165> for a message from the pfe facility (facility=20) with severity notice (severity=5).
version	Version of the Internet Engineering Task Force (IETF) system logging protocol specification.	1 for the initial version
timestamp	Time when the message was generated, in one of two representations: • *YYYY-MM-DDTHH:MM:SS.MSZ* is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC) • *YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM* is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC	2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007. 2007-02-15T01:17:15.719 -08:00 is the same timestamp expressed as Pacific Standard Time in the United States.
hostname	Name of the host that originally generated the message.	switch1
process	Name of the Junos OS process that generated the message.	mgd
processID	UNIX process ID (PID) of the Junos process that generated the message.	3046
TAG	Junos OS system log message tag, which uniquely identifies the message.	UI_DBASE_LOGOUT_EVENT
junos@2636.*platform*	An identifier for the type of hardware platform that generated the message. The junos@2636 prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type.	junos@2636.1.1.1.2.18
variable-value-pairs	A variable-value pair for each element in the *message-text* string that varies depending on the circumstances that triggered the message. Each pair appears in the format ***variable = "value"***.	username="regress"

Table 604: Fields in Structured-Data Messages *(continued)*

Field	Description	Examples
message-text	English-language description of the event or error (omitted if the brief statement is included at the [**edit system syslog file *filename* structured-data**] hierarchy level).	User 'regress' exiting configuration mode

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
  [junos@2636.1.1.1.2.18 username="regress"] User 'regress' exiting configuration mode
```

When the brief statement is included at the [**edit system syslog file *filename* structured-data**] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
  [junos@2636.1.1.1.2.18 username="regress"]
```

Table 605 on page 6218 maps the codes that appear in the ***priority-code*** field to facility and severity level.

NOTE: Not all of the facilities and severities listed in Table 605 on page 6218 can be included in statements at the [edit system syslog] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 6222.

Table 605: Facility and Severity Codes in the priority-code Field

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug
kernel (0)	1	1	2	3	4	5	6	7
user (1)	8	9	10	11	12	13	14	15

Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the **explicit-priority** statement is included at the [**edit system syslog file *filename***] or [**edit system syslog host *hostname***] hierarchy level, a system log message has the following syntax:

  ```
  timestamp  message-source: %facility-severity-TAG: message-text
  ```

- When directed to the console or to users, or when the **explicit-priority** statement is not included for files or remote hosts, a system log message has the following syntax:

  ```
  timestamp  message-source: TAG: message-text
  ```

Table 606 on page 6220 describes the message fields.

Table 606: Fields in Standard-Format Messages

Field	Description
timestamp	Time at which the message was logged.
message-source	Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format: *hostname process[process-ID]*
facility	Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: **Facility Codes Reported in Priority Information** in "Including Priority Information in System Log Messages" on page 6213.
severity	Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: **Numerical Codes for Severity Levels Reported in Priority Information** in "Including Priority Information in System Log Messages" on page 6213.
TAG	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix. Not all processes on a routing platform use tags, so this field does not always appear.
message-text	Text of the message.

Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches and J Series routers
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called ***logfile*** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file ***logfile*.0.gz**. The logging utility then opens and writes to a new active file called ***logfile***. This process is also known as file rotation. When the new ***logfile*** reaches the configured maximum size, ***logfile*.0.gz** is renamed ***logfile*.1.gz**, and the new ***logfile*** is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches

the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the **root** user and users who have the Junos OS **maintenance** permission.

Junos OS provides a configuration statement **log-rotate-frequency** that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the **log-rotate-frequency** statement at the **[edit system syslog]** hierarchy level.

You can include the **archive** statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the **archive** statement at the **[edit system syslog]** hierarchy level:

```
archive <files number> <size size> <world-readable | no-world-readable>;
```

To configure values that apply to a specific log file, include the **archive** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
archive <archive-sites (ftp-url <password password>)> <files number> <size size>
  <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
  no-world-readable> ;
```

archive-sites *site-name* specifies a list of archive sites that you want to use for storing files. The ***site-name*** value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see "Format for Specifying Filenames and URLs in Junos OS CLI Commands" on page 73.

binary-data Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the **no-binary-data** statement.

files *number* specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

size *size* specifies the maximum size of each file. The value can be from 64 KB (64k) through 1 gigabyte (1g); to represent megabytes, use the letter **m** after the integer. There is no space between the digits and the **k**, **m**, or **g** units letter.

start-time "*YYYY-MM-DD.hh:mm*" defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval *interval* defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before

it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

world-readable enables all users to read log files. To restore the default permissions, include the **no-world-readable** statement.

Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level or higher are logged to the destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
   facility severity;
}
```

Junos OS System Logging Facilities and Message Severity Levels

Table 607 on page 6222 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

Table 607: Junos OS System Logging Facilities

Facility	Type of Event or Error
any	All (messages from all facilities)
authorization	Authentication and authorization attempts
change-log	Changes to the Junos OS configuration
conflict-log	Specified configuration is invalid on the router type

Table 607: Junos OS System Logging Facilities *(continued)*

Facility	Type of Event or Error
daemon	Actions performed or errors encountered by system processes
dfc	Events related to dynamic flow capture
firewall	Packet filtering actions performed by a firewall filter
ftp	Actions performed or errors encountered by the FTP process
interactive-commands	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
kernel	Actions performed or errors encountered by the Junos OS kernel
pfe	Actions performed or errors encountered by the Packet Forwarding Engine
user	Actions performed or errors encountered by user-space processes

Table 608 on page 6223 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see "Disabling the System Logging of a Facility" on page 6212.

Table 608: System Log Message Severity Levels

Severity Level	Description
any	Includes all severity levels
none	Disables logging of the associated facility to a destination
emergency	System panic or other condition that causes the router to stop functioning
alert	Conditions that require immediate correction, such as a corrupted system database
critical	Critical conditions, such as hard errors
error	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
warning	Conditions that warrant monitoring
notice	Conditions that are not errors but might warrant special handling

Table 608: System Log Message Severity Levels *(continued)*

Severity Level	Description
info	Events or nonerror conditions of interest

- Overview of Single-Chassis System Logging Configuration on page 6155

Junos OS System Log Alternate Facilities for Remote Logging

Table 610 on page 6224 lists the facilities that you can specify in the **facility-override** statement.

Table 610: Facilities for the facility-override Statement

Facility	Description
authorization	Authentication and authorization attempts
daemon	Actions performed or errors encountered by system processes

Table 610: Facilities for the facility-override Statement *(continued)*

Facility	Description
ftp	Actions performed or errors encountered by the FTP process
kernel	Actions performed or errors encountered by the Junos OS kernel
local0	Local facility number 0
local1	Local facility number 1
local2	Local facility number 2
local3	Local facility number 3
local4	Local facility number 4
local5	Local facility number 5
local6	Local facility number 6
local7	Local facility number 7
user	Actions performed or errors encountered by user-space processes

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

Related Documentation

- *Examples: Assigning an Alternative Facility*
- *Single-Chassis System Logging Configuration Overview*
- Overview of Single-Chassis System Logging Configuration on page 6155

Changing the Alternative Facility Name for Remote System Log Messages

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see Table 607 on page 6222). In the recommended configuration, a remote machine designated at the **[edit system syslog host *hostname*]** hierarchy level is not a Juniper Networks router or switch, so its syslogd utility cannot interpret the Junos OS-specific names. To enable the standard syslogd utility to handle messages from these facilities when messages are directed to a remote machine, a standard **local*X*** facility name is used instead of the Junos OS-specific facility name.

Table 609 on page 6224 lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The syslogd utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called **local-router** direct messages from the **authorization** facility to the remote machine *monitor.mycompany.com*:

```
[edit system syslog]
host monitor.mycompany.com {
   authorization info;
}
```

The default alternative facility for the local **authorization** facility is also **authorization**. If the syslogd utility on **monitor** is configured to write messages belonging to the **authorization** facility to the file **/var/log/auth-attempts**, then the file contains the messages generated when users log in to **local-router** and the messages generated when users log in to **monitor**. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the **auth-attempts** file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on **local-router** when they are directed to **monitor**. You can then configure the syslogd utility on **monitor** to write messages with the alternative facility to a different file from messages generated on **monitor** itself.

To change the facility used for all messages directed to a remote machine, include the **facility-override** statement at the **[edit system syslog host *hostname*]** hierarchy level:

```
[edit system syslog host hostname]
facility severity;
facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the **local*X*** facilities. On the remote machine, you must also configure the syslogd utility to handle the messages in the desired manner.

Table 610 on page 6224 lists the facilities that you can specify in the **facility-override** statement.

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the error level or higher to the local0 facility on the remote machine called monitor.mycompany.com:

```
[edit system syslog]
host monitor.mycompany.com {
   any error;
   facility-override local0;
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called central-logger.mycompany.com. The messages from California are assigned to alternative facility local0 and the messages from New York are assigned to alternative facility local2.

- Configure California routers to aggregate messages in the local0 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
   change-log info;
   facility-override local0;
}
```

- Configure New York routers to aggregate messages in the local2 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
   change-log info;
   facility-override local2;
}
```

On central-logger, you can then configure the system logging utility to write messages from the local0 facility to the file **change-log** and the messages from the local2 facility to the file **new-york-config**.

Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

match "*regular-expression*";

You can include this statement at the following hierarchy levels:

- **[edit system syslog file *filename*]** (for a file)
- **[edit system syslog user (*username* | *)]** (for a specific user session or for all user sessions on a terminal)
- **[edit system syslog host (*hostname* | other-routing-engine)]** (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax

is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, http://www.ieee.org).

Table 611 on page 6228 specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term term refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

NOTE: The match statement is not case-sensitive.

Table 611: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
| (pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets. One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
$ (dollar sign)	End of a line.
[ ] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
( ) (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

Using Regular Expressions

Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
 interactive-commands any;
 match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
  'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
 daemon error;
 match "!(.*snmpd.*)";
}
file snmpd-errors {
 daemon error;
 match ".*snmpd.*";
}
```

connection-limit

Syntax connection-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).

Options ***limit***—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).

Range: 1 through 250

Default: 75

NOTE: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured connection-limit value if the system resources are limited.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

destination-override

Syntax

```
destination-override {
  syslog host ip-address;
}
```

Hierarchy Level [edit system tracing]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Override the system-wide configuration of the switch at the **[edit system tracing]** hierarchy level. This statement has no effect if system tracing is not configured.

Options **syslog**—System process log files to send to the remote tracing host.

- **syslog**—System process log files to send to the remote tracing host.
- **host *ip-address***—IP address to which to send tracing information.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

- tracing on page 312

no-remote-trace

Syntax no-remote-trace

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch to disable remote tracing after remote tracing has been enabled.

Default Remote tracing is disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- tracing on page 312

protocol-version

Syntax protocol-version *version*;

Hierarchy Level [edit system services ssh]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the secure shell (SSH) protocol version.

Default **v2**—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.

Options ***version***—SSH protocol version: **v1**, **v2**, or both.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the SSH Protocol Version on page 1710

rate-limit

Syntax rate-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.

Default 150 connections

Options **rate-limit *limit***—(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6).

Range: 1 through 250

Default: 150

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

ssh

Syntax

```
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...];
  client-alive-count-max seconds;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm|no-algorithm>;
  key-exchange <algorithm>;
  macs <algorithm>;
  max-sessions-per-connection <number>;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login (allow | deny | deny-password);
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
client-alive-interval and **client-alive-max-count** statements introduced in Junos OS Release 12.2.

Description Allow SSH requests from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

telnet

Syntax

```
telnet {
  connection-limit limit;
  rate-limit limit;
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Provide Telnet connections from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Configuring Telnet Service for Remote Access to a Router or Switch*

tracing

Syntax

```
tracing {
  destination-override syslog host ip-address;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch to enable remote tracing to a specified host IP address.

NOTE: **The tracing statement is not supported on the QFX3000 QFabric system.**

The following processes are supported:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit system *process-name* traceoptions]** hierarchy level.

Default Remote tracing is disabled by default.

Options **destination-override syslog host *ip-address***—Overrides the global configuration for system tracing and has no effect if the **tracing** statement is not configured.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

allow-transients

Syntax allow-transients;

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, enable transient configuration changes to be committed.

Default Transient changes are disabled by default. If you do not include the **allow-transients** statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Generating a Persistent or Transient Change*
- *Creating a Macro to Read the Custom Syntax and Generate Related Configuration Statements*

apply-macro

Syntax

```
apply-macro apply-macro-name {
    parameter-name parameter-value;
}
```

Hierarchy Level All hierarchy levels

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description With commit script macros, use custom syntax in your configuration.

Macros work by locating **apply-macro** statements that you include in the candidate configuration and using the values specified in the **apply-macro** statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.

In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or *hooks*) that are used by commit script macros.

You can include the **apply-macro** statement at any level of the configuration hierarchy. You can include multiple **apply-macro** statements at each level of the configuration hierarchy; however, each must have a unique name.

Options ***apply-macro-name***—Name of the **apply-macro** statement.

parameter-name—One or more parameters. Parameters can be any text you want to include in your configuration.

parameter-value—A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.

Required Privilege Level configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.

Related Documentation

- *Overview of Creating Custom Configuration Syntax with Macros*

checksum

Syntax checksum (md5 | sha-256 | sha1) *hash*;

Hierarchy Level [edit event-options event-script file *filename*],
[edit system scripts commit file *filename*],
[edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event, commit, or op script, Junos OS verifies the authenticity of the script by using the configured checksum hash.

Options

md5 *hash*—MD5 checksum of this script.

sha-256 *hash*—SHA-256 checksum of this script.

sha1 *hash*—SHA-1 checksum of this script.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

command

Syntax command *filename-alias*;

Hierarchy Level [edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, configure a filename alias for the script file. This allows you to run the script by referencing either the script filename or the filename alias.

Options ***filename-alias***—Alias for the script file.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

commit

Syntax

```
commit {
  allow-transients;
  direct-access;
  file filename {
    checksum (md5 | sha-256 | sha1) hash;
    optional;
    refresh;
    refresh-from url;
    source url;
  }
  max-datasize
  refresh;
  refresh-from url;
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit system scripts]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, configure the commit-time scripting mechanism.

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Storing and Enabling Scripts*

description

Syntax description *descriptive-text*;

Hierarchy Level [edit system scripts op file *filename*]
[edit system scripts op file *filename* arguments *argument-name*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, provide a help-text string that appears in the command-line interface (CLI).

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

direct-access

Syntax direct-access;

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify that commit scripts read input configurations directly from the database when inspecting these scripts for errors.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Executing Large Commit Scripts*

file (Commit Scripts)

Syntax

```
file filename {
  checksum (md5 | sha-256 | sha1) hash;
  optional;
  refresh;
  refresh-from url;
  source url;
}
```

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, enable a commit script that is located in the **/var/db/scripts/commit** directory.

Options ***filename***—Name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing a commit script.

The remaining statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

file (Op Scripts)

Syntax

```
file filename {
  arguments {
    argument-name {
      description descriptive-text;
    }
  }
  checksum (md5 | sha-256 | sha1) hash;
  command filename-alias;
  description descriptive-text;
  refresh;
  refresh-from url;
  source url;
}
```

Hierarchy Level [edit system scripts op]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, enable an op script that is located in the **/var/db/scripts/op** directory.

Options ***filename***—The name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing an op script.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Enabling an Op Script and Defining a Script Alias*

no-allow-url

Syntax no-allow-url;

Hierarchy Level [edit system scripts op]

Release Information Statement introduced in Junos OS Release 10.0.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, prohibit the remote execution of scripts. When you include this configuration statement, the **op url** operational mode command generates an error and does not permit you to execute the op script from a remote site.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- file (Op Scripts) on page 6244
- *Executing an Op Script from a Remote Site*

op

Syntax

```
op {
  file filename {
    arguments {
      argument-name {
        description descriptive-text;
      }
    }
    checksum (md5 | sha-256 | sha1) hash;
    command filename-alias;
    description descriptive-text;
    max-datasize
    refresh;
    refresh-from url;
    source url;
  }
  no-allow-url
  refresh;
  refresh-from url;
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit system scripts]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, configure an operation scripting mechanism.

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Storing and Enabling Scripts*

optional

Syntax optional;

Hierarchy Level [edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the **file** statement is missing from the **/var/db/scripts/commit** directory on the device.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Controlling Execution of Commit Scripts During Commit Operations*

refresh (Commit Scripts)

Syntax refresh;

Hierarchy Level [edit system scripts commit],
[edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the **/var/db/scripts/commit** directory with the copy located at the source URL, as specified in the **source** statement at the same hierarchy level.

The update operation occurs as soon as you issue the **set refresh** configuration mode command. Issuing the **set refresh** command does not add the **refresh** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

refresh (Op Scripts)

Syntax refresh;

Hierarchy Level [edit system scripts op],
[edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 on the QFX Series.

Description For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the **/var/db/scripts/op** directory with the copy located at the source URL, specified in the **source** statement at the same hierarchy level.

The update operation occurs as soon as you issue the **set refresh** configuration mode command. Issuing the **set refresh** command does not add the **refresh** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: On the QFabric system, op scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/op/** directory on the Director device.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

refresh-from (Commit Scripts)

Syntax refresh-from *url*;

Hierarchy Level [edit system scripts commit],
[edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the **/var/db/scripts/commit** directory with the copy located at a URL other than the URL specified in the **source** statement.

The update operation occurs as soon as you issue the **set refresh-from *url*** configuration mode command. Issuing the **set refresh-from** command does not add the **refresh-from** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: This statement is not supported on the QFabric system.

Options *url*—The source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Using an Alternate Source Location for a Script*
- refresh (Commit Scripts) on page 6248
- source (Commit Scripts) on page 6253

refresh-from (Op Scripts)

Syntax refresh-from *url*;

Hierarchy Level [edit system scripts op],
[edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 on the QFX Series.

Description For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the **/var/db/scripts/op** directory with the copy located at a URL other than the URL specified in the **source** statement.

The update operation occurs as soon as you issue the **set refresh-from *url*** configuration mode command. Issuing the **set refresh-from** command does not add the **refresh-from** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: This statement is not supported on the QFabric system.

Options *url*—Source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

fabric-maintenance-associations

Syntax

```
fabric-maintenance-associations {
  fma-name {
    description string;
    fabric-maintenance-end-points {
      fmep-id {
        description string;
        fmep-interface interface-name;
        fmep-name name;
      }
    }
    vlan-name vlan-name;
  }
}
```

Hierarchy Level [edit protocols oam fabric]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure the fabric maintenance association (FMA) parameters for internal fabric monitoring. The FMA defines a set of QFabric system interfaces (fabric maintenance endpoints [FMEPs]) that are members of a given VLAN which are used in internal fabric monitoring operations. The FMA associates the set of FMEPs with a VLAN. Configuration of the VLAN is mandatory.

The remaining statements under this hierarchy level are explained separately.

Options **description *string***—Description of the FMA.

Syntax: 1 to 128 alphanumeric characters

fma-name—Name of the FMA.

Syntax: 1 to 20 alphanumeric characters

vlan-name *vlan-name*—Name of the VLAN for which the FMA is defined.

NOTE: **Configuring the VLAN option is mandatory.**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

fabric-maintenance-end-points

Syntax

```
fabric-maintenance-end-points {
  fmep-id {
    description string;
    fmep-interface interface-name;
    fmep-name name;
  }
}
```

Hierarchy Level [edit protocols oam fabric fabric-maintenance-associations *fma-name*]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure the fabric maintenance association endpoint (FMEP) parameters within a fabric maintenance association (FMA). The FMA associates the FMEP with a VLAN for purposes of internal fabric monitoring.

Options

description *string*—Description of the FMEP.

Syntax: 1 to 128 alphanumeric characters

fmep-id—32-bit integer that is used to identify an FMEP.

Range: 1 to 64,000

fmep-name *name*—Name of the fabric maintenance association endpoint.

Syntax: 1 to 20 alphanumeric characters

fmep-interface *interface-name*—Interface on a QFabric system Node device.

Syntax: *node-device-name*:*interface-type-fpc/pic/slot*.*unit*

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

flow-specs

Syntax

```
flow-specs {
  flow-specification-name {
    ethernet-frame-size ethernet-frame-size;
    multicast-ipv4 {
      dest-ip-multicast-group ipv4-mcast-address;
      source-ip ipv4-address;
    }
    multicast-vlan-flood;
    unicast-ethernet {
      destination-mac destination-mac-address destination-mac-mask
        destination-mac-mask;
      ethertype ethertype;
      source-mac mac-address source-mac-mask source-mac-mask;
    }
    unicast-ethernet-ipv4 {
      destination-ip destination-ip-address destination-ip-mask destination-ip-mask;
      destination-l4-port destination-l4-port-number;
      destination-mac destination-mac-address;
      ip-proto protocol;
      source-ip source-ip-address source-ip-mask source-ip-mask;
      source-l4-port source-l4-port-number;
    }
  }
}
```

Hierarchy Level [edit protocols oam fabric]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure the fabric flow specification parameters for internal fabric monitoring. The following conditions apply:

- You must specify a protocol type for each flow specification: **unicast-ethernet**, **unicast-ethernet-ipv4**, **multicast-ipv4**, or **multicast-vlan-flood**.
- You can specify only one type for each flow specification.
- All other parameters are optional.

The remaining statements under this hierarchy level are explained separately.

Options ***flow-specification-name***—Name of the flow specification.

Syntax: 1 to 20 alphanumeric characters

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

unicast-ethernet-ipv4

Syntax

```
unicast-ethernet-ipv4 {
  source-ip source-ip-address source-ip-mask source-ip-mask;
  destination-ip destination-ip-address destination-ip-mask destination-ip-mask;
  ip-proto protocol;
  source-l4-port source-l4-port-number;
  destination-l4-port destination-l4-port-number;
}
```

Hierarchy Level [edit protocols oam fabric flow-specs *flow-specification-name*]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure unicast parameters for the Ethernet IPv4 protocol type in the internal fabric monitoring flow specifications.

Options

destination-ip ***destination-ip-address***—Unicast IPv4 address of the destination fabric maintenance endpoint (FMEP) that is configured in the fabric maintenance association (FMA).

Syntax: Dotted decimal notation without the prefix

destination-l4-port ***destination-l4-port-number***—L4 TCP or UDP port for the destination fabric maintenance endpoint (FMEP).

Values: 2-byte decimal or hexadecimal notation

ip-proto ***protocol***—IPv4 protocol type.

Values: 1-byte value in decimal or hexadecimal notation

destination-ip-mask ***destination-ip-mask***—IPv4 address range mask for the destination FMEP that is configured in the flow specification.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination IPv4 address parameter. The mask must be contiguous.

Syntax: Dotted decimal notation without the prefix

Values: Maximum of 6 contiguous masked bits, or a mask range of 64

source-ip ***source-ip-address***—Unicast IPv4 address of the source fabric maintenance endpoint (FMEP) that is configured in the fabric maintenance association (FMA).

Syntax: Dotted decimal notation without the prefix

source-l4-port ***source-l4-port-number***—TCP or UDP port for the source fabric maintenance endpoint (FMEP).

Values: 2-byte decimal or hexadecimal notation

source-ip-mask ***source-ip-mask***—IPv4 address range mask for the source FMEP that is configured in the flow specification.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination IPv4 address parameter. The mask must be contiguous.

Syntax: Dotted decimal notation without the prefix

Values: Maximum of 6 contiguous masked bits, or a mask range of 64

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multicast-ipv4

Syntax

```
multicast-ipv4 {
  source-ip source-ip-address;
  dest-ip-multicast-group ipv4-mcast-address;
}
```

Hierarchy Level [edit protocols oam fabric flow-specs *flow-specification-name*]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure multicast parameters for the IPv4 Ethernet protocol type in the internal fabric monitoring flow specifications.

Options

dest-ip-multicast-group *ipv4-mcast-address*—IPv4 multicast group address of the destination fabric maintenance endpoint (FMEP) that is configured in the flow specification. Configuration of this parameter is mandatory.

Syntax: Dotted decimal notation without the prefix

source-ip *source-ip-address*—(Optional) IPv4 multicast address of the source fabric maintenance endpoint (FMEP) that is configured in the flow specification.

Syntax: Dotted decimal notation without the prefix

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multicast-vlan-flood

Syntax multicast-vlan-flood

Hierarchy Level [edit protocols oam fabric flow-specs *flow-specification-name*]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure parameters of the multicast VLAN flood protocol type in the internal fabric monitoring flow specification.

Options There are no configuration options.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

unicast-ethernet

Syntax

```
unicast-ethernet {
  destination-mac destination-mac-address destination-mac-mask destination-mac-mask;
  ethertype ethertype;
  source-mac source-mac-address source-mac-mask source-mac-mask;
}
```

Hierarchy Level [edit protocols oam fabric flow-specs *flow-specification-name*]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure unicast Ethernet parameters for a flow specification used in internal fabric monitoring.

Options

destination-mac ***destination-mac-address***—(Optional) MAC address of the destination fabric maintenance endpoint (FMEP) that is configured in the flow specification.

destination-mac-mask ***destination-mac-mask***—(Optional) MAC address range mask for the destination FMEP that is configured in the flow specification. You cannot configure the **destination-mac-mask** parameter unless you also configure the **destination-mac** parameter.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination MAC address parameter. The mask must be contiguous.

Values: Maximum of 6 contiguous masked bits, or a mask range of 64

ethertype ***ethertype***—Valid Ethernet type other than the IPv4 Ethertype.

Values: 2 bytes in decimal or hexadecimal notation

source-mac ***source-mac-address***—(Optional) MAC address of the source FMEP or interface that is configured in the flow specification.

source-mac-mask ***source-mac-mask***—(Optional) MAC address range mask for the source FMEP that is configured in the flow specification. You cannot configure the **source-mac-mask** parameter unless you also configure the **source-mac** parameter.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination MAC address parameter. The mask must be contiguous.

Values: Maximum of 6 contiguous masked bits, or a mask range of 64

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Configuration Statements for sFlow Technology

- agent-id on page 6267
- collector on page 6268
- interfaces (sFlow) on page 6268
- polling-interval on page 6269
- sample-rate on page 6270
- sflow on page 6271
- source-ip on page 6272
- traceoptions (sFlow Technology) on page 6273
- udp-port on page 6274

agent-id

Syntax agent-id *ip-address*;

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the IP address of the sFlow agent. If you do not configure the sFlow agent ID, the IP address for the agent is dynamically created using the IP address of an interface configured on the QFX Series device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring sFlow Technology on page 6189
- sflow on page 6271

collector

Syntax

```
collector ip-address {
  udp-port port-number;
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the configured collector for analysis. You can configure up to four collectors on the device. You specify the IP address for each collector you configure.

The remaining statement is explained separately.

Options *ip-address*—IP address of the collector.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6189
- Example: Monitoring Network Traffic Using sFlow Technology on page 6165

interfaces (sFlow)

Syntax

```
interfaces interface-name {
  polling-interval seconds;
  sample-rate number;
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure sFlow network traffic monitoring on the specified interface on the device. You can configure sFlow parameters (polling interval, sample rate) with different values on different interfaces.

The remaining statements are explained separately.

Options *interface-name*—Name of the interface on which to configure sFlow parameters.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6189
- Example: Monitoring Network Traffic Using sFlow Technology on page 6165

polling-interval

Syntax polling-interval *seconds*;

Hierarchy Level [edit protocols sflow],
[edit protocols sflow interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the rate (in seconds) at which successive samples of interface statistics (counters) are taken.

Default If no polling interval is configured for a particular interface, the device uses the global polling interval configured at the **[edit protocols sflow]** hierarchy level. If no global interval is configured, the device uses the default polling interval of 20 seconds.

Options *seconds*—Number of seconds between successive samples of interface statistics. Specifying a value of **0** (zero) disables the polling.

Range: 0 through 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6189
- Example: Monitoring Network Traffic Using sFlow Technology on page 6165

sample-rate

Syntax sample-rate *number*;

Hierarchy Level [edit protocols sflow],
[edit protocols sflow interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Specify the denominator (***number***) of the ratio that is the sample rate in sFlow traffic monitoring. For example, to configure a sample rate of 1 in 1000 packets, you specify a ***number*** of 1000.

Default If no sample rate is configured for a particular interface, the device uses the global sample rate configured at the **[edit protocols sflow]** hierarchy level. If no global rate is configured, the device uses the default sample rate of 1 in 2000 packets.

Options *number*—Denominator of the ratio representing the sample rate (one packet out of *number*).

Range: 1 through 16,777,215

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Monitoring Network Traffic Using sFlow Technology on page 6165

sflow

Syntax

```
sflow {
    agent-id ip-address;
    collector ip-address {
        udp-port port-number;
    }
    interfaces interface-name {
        polling-interval number;
        sample-rate {
            egress number;
            ingress number;
        }
    }
    polling-interval number;
    sample-rate {
        egress number;
        ingress number;
    }
    source-ip ip-address;
    traceoptions {
        file filename <files number> <no-stamp> <replace> <size size> <world-readable |
            no-world-readable>;
        flag flag;
    }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure sFlow technology to monitor traffic continuously on specified interfaces simultaneously. sFlow data can be used to characterize network activity.

The remaining statements are explained separately.

Default The sFlow protocol is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6189
- Example: Monitoring Network Traffic Using sFlow Technology on page 6165

source-ip

Syntax source-ip *ip-address*;

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the source IP address to be used for sFlow datagrams. If you do not configure a source IP address, it is dynamically created based on the IP address of an Ethernet interface configured on the QFX Series device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6189
- sflow on page 6271

traceoptions (sFlow Technology)

Syntax

```
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable |
    no-world-readable>;
  flag flag;
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Define tracing operations for sFlow technology.

Default The **traceoptions** feature is disabled.

Options

file *filename*—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the **/var/log/** directory.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify the maximum number of files, you must also specify the maximum file size using the **size** option.

Range: 2 through 1000 files

Default: 1 trace file

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

- all—Trace all sFlow monitoring events.
- client-server—Trace sFlow monitoring client-server events.
- configuration—Trace sFlow monitoring configuration events.
- interface—Trace sFlow monitoring interface events.
- rtsock—Trace routing socket code events.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

no-world-readable—(Optional) Prevent any user from reading the trace file.

replace—(Optional) Replace an existing trace file if there is one.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it

is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size of 4 GB

Default: 128 KB

world-readable—(Optional) Allow any user to read the trace file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation
- Overview of sFlow Technology on page 6105

udp-port

Syntax
udp-port *port-number*;

Hierarchy Level
[edit protocols sflow collector]

Release Information
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure the UDP port for a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the collector for analysis.

Default
Port 6343

Options
port-number—UDP port number for this collector.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

          read-view view-name;
          write-view view-name;
        }
      }
    }
  }
}
```

Hierarchy Level [edit snmp v3 vacm]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set SNMP access limits.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

address (SNMP)

Syntax address *address*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the SNMP target address for receiving traps or informs.

Options ***address***—IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

address-mask

Syntax address-mask *address-mask*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 on the QFX Series.

Description Define and verify the source addresses for a group of target addresses for SNMP traps and informs.

Options ***address-mask***—Define a range of addresses.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Address Mask*

agent-address

Syntax agent-address outgoing-interface;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is **outgoing-interface**, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Options **outgoing-interface**—Value of the agent address of all SNMPv1 traps generated by this router or switch. The **outgoing-interface** option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Default: Disabled (the agent address is not specified in SNMPv1 traps).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Agent Address for SNMP Traps*

alarm (SNMP RMON)

Syntax

```
alarm index {
  description description;
  falling-event-index index;
  falling-threshold integer;
  falling-threshold-interval seconds;
  interval seconds;
  request-type (get-next-request | get-request | walk-request);
  rising-event-index index;
  rising-threshold integer;
  sample-type (absolute-value | delta-value);
  startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
  syslog-subtag syslog-subtag;
  variable oid-variable;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure RMON alarm entries.

Options ***index***—Identifies this alarm entry as an integer.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

authentication-md5

Syntax

```
authentication-md5 {
    authentication-password authentication-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user username]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure MD5 as the authentication type for the SNMPv3 user.

NOTE: You can only configure one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring MD5 Authentication*

authentication-none

Syntax authentication-none;

Hierarchy Level [edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure that there should be no authentication for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring No Authentication*

authentication-password

Syntax authentication-password *authentication-password*;

Hierarchy Level [edit snmp v3 usm local-engine user *username* authentication-md5],
[edit snmp v3 usm local-engine user *username* authentication-sha],
[edit snmp v3 usm remote-engine *engine-id* user *username* authentication-md5],
[edit snmp v3 usm remote-engine *engine-id* user *username* authentication-sha]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the password for user authentication.

Options ***authentication-password***—Password that a user enters. The password is then converted into a key that is used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

authentication-sha

Syntax

```
authentication-sha {
    authentication-password authentication-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring SHA Authentication*

authorization

Syntax authorization *authorization*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the access authorization for SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests.

Options ***authorization***—Access authorization level:

- **read-only**—Enable **Get**, **GetNext**, and **GetBulk** requests.
- **read-write**—Enable all requests, including **Set** requests. You must configure a view to enable **Set** requests.

NOTE: **The read-write option is not supported on the QFX3000 QFabric system.**

Default: read-only

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String on page 6194

bucket-size

Syntax bucket-size *number*;

Hierarchy Level [edit snmp rmon history *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the sampling of Ethernet statistics for network fault diagnosis, planning, and performance tuning.

Default 50

Options ***number***—Number of discrete samples of Ethernet statistics requested.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

categories

Syntax

```
categories {
  category;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the types of traps that are sent to the targets of the named trap group.

Default If you omit the **categories** statement, all trap types are included in trap notifications.

Options ***category***—Name of a trap type: **authentication**, **chassis**, **configuration**, **link**, **remote-operations**, **rmon-alarm**, or **startup**.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6195

client-list

Syntax

```
client-list client-list-name {
    ip-addresses;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a list of SNMP clients.

Options ***client-list-name***—Name of the client list.

ip-addresses—IP addresses of the SNMP clients to be added to the client list,

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Adding a Group of Clients to an SNMP Community on page 6196

client-list-name

Syntax client-list-name *client-list-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Add a client list or prefix list to an SNMP community.

Options ***client-list-name***—Name of the client list or prefix list.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Adding a Group of Clients to an SNMP Community on page 6196

clients

Syntax

```
clients {
  address <restrict>;
}
```

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.

Default If you omit the **clients** statement, all SNMP clients using this community string are authorized to access the switch.

Options ***address***—Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple ***address*** options.

restrict—(Optional) Do not allow the specified SNMP client to access the switch.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the SNMP Community String*

commit-delay

Syntax commit-delay *seconds*;

Hierarchy Level [edit snmp nonvolatile]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the timer for the SNMP **Set** reply and start of the commit.

Options ***seconds***—Delay between an affirmative SNMP **Set** reply and start of the commit operation.

Default: 5 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Commit Delay Timer*

community (SNMP)

Syntax

```
community community-name {
  authorization authorization;
  client-list-name client-list-name;
  clients {
    address restrict;
  }
  view view-name;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

NOTE: The **authorization read-write** option is not supported on the QFX3000 QFabric system.

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

Default If you omit the **community** statement, all SNMP requests are denied.

Options ***community-name***—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String on page 6194

community (RMON)

Syntax community *community-name*;

Hierarchy Level [edit snmp rmon event *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the SNMP trap group that is used when generating a trap (if the **eventType** object is configured to send traps). If that trap group has the **rmon-alarm** trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of **eventCommunity**). If nothing is configured, traps are sent to each group that has the **rmon-alarm** category configured.

The event community is not the same as an SNMP community.

Options ***community-name***—Name of the trap group that is used when generating a trap if the event is configured to send traps.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

community-name (SNMP)

Syntax community-name *community-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11. for the QFX Series.

Description Define an SNMP community to authorize SNMPv1 or SNMPv2c clients in an SNMPv3 system. When you configure a community in SNMPv3, you can also specify a security name. The access privileges associated with the security name determine which MIB objects are available and which operations (read, write, or notify) are allowed on those objects.

Options ***community-name***—Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose the name in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community *community-index*]** hierarchy levels.

The community name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level is encrypted and not displayed in the command-line interface (CLI).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the SNMPv3 Community*

contact

Syntax contact *contact*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysContact** object, which is the contact person for the managed system.

Options ***contact***—Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Contact on a Device Running Junos OS*

description (SNMP)

Syntax description *description*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysDescription** object, which is the description of the system being managed.

Options ***description***—System description. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Description on a Device Running Junos OS*

description (RMON)

Syntax description *description*;

Hierarchy Level [edit snmp rmon alarm *index*],
[edit snmp rmon event *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Text description of alarm or event.

Options ***description***—Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

destination-port (SNMP)

Syntax destination-port *port-number*;

Hierarchy Level [edit snmp trap-group]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Assign a trap port number other than the default.

Default If you omit this statement, the default port is 162.

Options ***port-number***—SNMP trap port number.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6195

engine-id

Syntax

```
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks* and cannot be configured. The suffix is configured here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.

By default, the engine ID suffix is configured with the MAC address of the management interface (the use-mac-address option) on the QFX Series. You can override this configuration by using the local ***engine-id-suffix*** or use-default-ip-address option.

Default use-mac-address

Options

local ***engine-id-suffix***—The engine ID suffix is set based on the data entered.

use-default-ip-address—The engine ID suffix is generated from the default IP address.

use-mac-address—The engine ID suffix is generated from the MAC address of the management interface on the switch.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

event

Syntax

```
event index {
  community community-name;
  description description;
  type (RMON Notification) type;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure RMON event entries.

Options *index*—Identifier for a specific event entry.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

falling-event-index (RMON)

Syntax falling-event-index *index*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the index number of the event entry that is used when a falling threshold is crossed. You specify the falling-event index when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.

Options ***index***—Index of the event entry that is used when a falling threshold is crossed.

Range: 0 through 65,535

Default: 0

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

falling-threshold (Health Monitor)

Syntax falling-threshold *percentage*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options ***percentage***—Lower threshold for the alarm entry.

Range: 1 through 100

Default: 70 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- rising-threshold on page 1807
- Configuring Health Monitoring on page 6200

falling-threshold (RMON)

Syntax falling-threshold *integer*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the lower threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options ***integer***—Lower threshold for the alarm entry.

Range: –2,147,483,648 through 2,147,483,647

Default: 20 percent less than the **rising-threshold** value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

falling-threshold-interval

Syntax falling-threshold-interval *seconds*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the interval between samples after the rising threshold is exceeded and the value of the sample starts to drop. If the value of the sample drops and exceeds the falling threshold, the regular sampling interval is used.

Options ***interval***—Time between samples, in seconds.
Range: 1 through 2,147,483,647 seconds
Default: 60 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

filter-duplicates

Syntax filter-duplicates;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Filter duplicate **Get**, **GetNext**, or **GetBulk** SNMP requests.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

filter-interfaces

Syntax

```
filter-interfaces {
    all-internal-interfaces;
    interfaces interface
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Filter out information related to specific interfaces from the output of SNMP **Get** and **GetNext** requests performed on interface-related MIBs.

Options

all-internal-interfaces—Filter out information from SNMP **Get** and **GetNext** requests for all internal interfaces.

interfaces—Filter out information from SNMP **Get** and **GetNext** requests for the specified interface.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Filtering Interface Information Out of SNMP Get and GetNext Output*

group (Associating a Security Name)

Syntax

```
group group-name;
```

Hierarchy Level

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)
  security-name security-name]
```

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate a security name with a group composed of users with the same access privileges. The security name is used during authentication of SNMP messages, and is mapped to a username.

Options

group-name—Collection of SNMP security names that share the same SNMPv3 access privileges.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Group*

group (Configuring Access Privileges)

Syntax

```
group group-name {
  (default-context-prefix | context-prefix context-prefiix){
    security-model (any | usm | v1 | v2c) {
      security-level (authentication | none | privacy) {
        notify-view view-name;
        read-view view-name;
        write-view view-name;
      }
    }
  }
}
```

Hierarchy Level [edit snmp v3 vacm access]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix *context-prefix*** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

Options ***group-name***—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Group*

health-monitor

Syntax

```
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure health monitoring.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6200

history

Syntax

```
history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent on the network to monitor all the traffic flowing among devices on all connected LAN segments. The RMON history feature collects statistics in accordance with user-configurable parameters.

The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. If you use the **history** statement, you must also configure the interface ***interface-name*** statement.

Options ***history-index***—Provide a number for this history entry.

Range: 1 through 655535

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

interface (SNMP)

Syntax interface [*interface-names*];

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interfaces on which SNMP requests can be accepted.

Default If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.

Options ***interface-names***—Names of one or more logical interfaces.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 6197

interface (RMON)

Syntax interface *interface-name*;

Hierarchy Level [edit snmp rmon history *history-index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the interface to be monitored in the specified RMON history entry.

Only one interface can be specified for a particular RMON history index. There is a one-to-one relationship between the interface and the history index. The interface must be specified in order for the RMON history to be created.

Options ***interface-name***—Specify the interface to be monitored within the specified entry of the RMON history of Ethernet statistics.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

interval (Health Monitor)

Syntax interval *seconds*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interval between sampling of the object being monitored by the health monitor.

Options ***seconds***—Time between samples, in seconds.

Range: 1 through 2147483647 seconds

Default: 300 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6200

interval (RMON)

Syntax interval *seconds*;

Hierarchy Level [edit snmp rmon alarm *index*],
[edit snmp rmon history *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interval over which data is to be sampled for the specified alarm or interface.

Default **60 sec** for alarm sampling.

1800 sec for history sampling.

Options ***seconds***—Interval at which data is to be sampled for the specified alarm or interface.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

local-engine

Syntax

```
local-engine {
  user username {
    authentication-md5 {
      authentication-password authentication-password;
    }
    authentication-none;
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-aes128 {
      privacy-password privacy-password;
    }
    privacy-des {
      privacy-password privacy-password;
    }
    privacy-3des {
      privacy-password privacy-password;
    }
    privacy-none {
      privacy-password privacy-password;
    }
  }
}
```

Hierarchy Level [edit snmp v3 usm]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure local engine information for the user-based security model (USM).

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Creating SNMPv3 Users on page 6201

location

Syntax location *location*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysLocation** object, which is the physical location of the managed system.

Options ***location***—Location of the local system. You must enclose the name within quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the System Location for a Device Running Junos OS*

logical-system (SNMP)

Syntax

```
logical-system logical-system-name {
  routing-instance routing-instance-name;
}
```

Hierarchy Level

[edit snmp community *community-name*],
[edit snmp trap-group],
[edit snmp trap-options]
[edit snmp v3target-address *target-address-name*]

Release Information

Statement introduced in Junos OS Release 9.3
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

NOTE: **The logical-system statement replaces the logical-router statement, and is backward-compatible with Junos OS Release 8.3 and later.**

Description

Specify a logical system name for SNMP v1 and v2c clients.

Include at the **[edit snmp trap-options]** hierarchy level to specify a logical-system address as the source address of an SNMP trap.

Include at the **[edit snmp v3 target-address]** hierarchy level to specify a logical-system name as the destination address for an SNMPv3 trap or inform.

Options

logical-system-name—Name of the logical system.

routing-instance *routing-instance-name*—Statement to specify a routing instance associated with the logical system.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Specifying a Routing Instance in an SNMPv1 or SNMPv2c Community*
- *Configuring the Trap Target Address*

message-processing-model

Syntax message-processing-model (v1 | v2c | v3);

Hierarchy Level [edit snmp v3 target-parameters *target-parameter-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the message processing model to be used when generating SNMP notifications.

Options **v1**—SNMPv1 message process model.

v2c—SNMPv2c message process model.

v3—SNMPv3 message process model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Message Processing Model*

name

Syntax name *name*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the system name from the command-line interface.

Options ***name***—System name override.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Name*

nonvolatile

Syntax

```
nonvolatile {
  commit-delay seconds;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure options for SNMP **Set** requests.

The statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Commit Delay Timer*
- *commit-delay*

notify

Syntax

```
notify name {
  tag tag-name;
  type (trap | inform);
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
type inform option added in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.

Options ***name***—Name assigned to the notification.

tag-name—Notifications are sent to all targets configured with this tag.

type—Notification type is **trap** or **inform**. Traps are unconfirmed notifications. Informs are confirmed notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Inform Notification Type and Target Address*
- *Configuring the SNMPv3 Trap Notification*

notify-filter (Applying to the Management Target)

Syntax notify-filter *profile-name*;

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the notify filter applied to a specific set of SNMPv3 target parameters. Target parameters are the message processing and security parameters for notifications sent to a target SNMP manager.

Options ***profile-name***—Name of the notify filter to apply to notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Applying the Trap Notification Filter*

notify-filter (Configuring the Profile Name)

Syntax
```
notify-filter profile-name {
  oid oid (include | exclude);
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.

Options ***profile-name***—Name assigned to the notify filter.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Trap Notification Filter*
- *oid (SNMP)*

notify-view

Syntax notify-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options ***view-name***—Name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring MIB Views on page 6197
- *Configuring the Notify View*

oid

Syntax oid *object-identifier* (exclude| include);

Hierarchy Level [edit snmp view *view-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects.

Options **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

object-identifier—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring MIB Views on page 6197

oid (SNMPv3)

Syntax oid *oid* (include | exclude);

Hierarchy Level [edit snmp v3 notify-filter *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects. This OID is a prefix that the represented MIB objects have in common.

Options

exclude—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

oid—Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

owner

Syntax owner *owner-name*;

Hierarchy Level [edit snmp rmon history *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the user or group responsible for this RMON history configuration.

Options

owner-name—User or group responsible for this configuration.

Range: 0 through 32 alphanumeric characters

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

parameters

Syntax

```
parameters {
  message-processing-model (v1 | v2c | v3);
  security-level (none | authentication | privacy);
  security-model (usm | v1 | v2c);
  security-name security-name;
}
```

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a set of target parameters for message processing and security.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Defining and Configuring the Trap Target Parameters*

port (SNMP)

Syntax port *port-number*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a UDP port number for an SNMP target.

Default If you omit this statement, the default port is 162.

Options ***port-number***—Port number for the SNMP target.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Port*

privacy-3des

Syntax

```
privacy-3des {
    privacy-password privacy-password;
}
```

Hierarchy Level [edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the triple Data Encryption Standard (3DES) as the privacy type for the SNMPv3 user.

Options **privacy-password *privacy-password***—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Encryption Type*

privacy-aes128

Syntax

```
privacy-aes128 {
    privacy-password privacy-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the Advanced Encryption Standard encryption algorithm (CFB128-AES-128 Privacy Protocol) for the SNMPv3 user.

Options

privacy-password *privacy-password*—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Encryption Type*

privacy-des

Syntax

```
privacy-des {
    privacy-password privacy-password;
}
```

Hierarchy Level [edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the Data Encryption Standard (DES) as the privacy type for the SNMPv3 user.

Options **privacy-password *privacy-password***—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Encryption Type*

privacy-none

Syntax

```
privacy-none;
```

Hierarchy Level [edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure that no encryption be used for the SNMPv3 user.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Encryption Type*

privacy-password

Syntax privacy-password *privacy-password*;

Hierarchy Level [edit snmp v3 usm local-engine user *username* privacy-3des],
[edit snmp v3 usm local-engine user *username* privacy-aes128],
[edit snmp v3 usm local-engine user *username* privacy-des],
[edit snmp v3 usm remote-engine *engine-id* user *username* privacy-3des],
[edit snmp v3 usm remote-engine *engine-id* user *username* privacy-aes128],
[edit snmp v3 usm remote-engine *engine-id* user *username* privacy-des]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a privacy password for the SNMPv3 user.

Options ***privacy-password***—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Encryption Type*

read-view

Syntax read-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate the read-only view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options ***view-name***—The name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Read View*
- Configuring MIB Views on page 6197

remote-engine

Syntax

```
remote-engine engine-id {
  user username {
    authentication-md5 {
      authentication-password authentication-password;
    }
    authentication-none;
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-aes128 {
      privacy-password privacy-password;
    }
    privacy-des {
      privacy-password privacy-password;
    }
    privacy-3des {
      privacy-password privacy-password;
    }
    privacy-none {
      privacy-password privacy-password;
    }
  }
}
```

Hierarchy Level [edit snmp v3 usm]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.

Options ***engine-id***—Engine identifier. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Remote Engine and Remote User*

request-type

Syntax request-type (get-next-request | get-request | walk-request);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Extend monitoring to a specific SNMP object instance (**get-request**), to all object instances belonging to a MIB branch (**walk-request**), or to the next object instance after the instance specified in the configuration (**get-next-request**).

Default **walk-request**

Options **get-next-request**—Perform an SNMP get next request.

get-request—Perform an SNMP get request.

walk-request—Perform an SNMP walk request.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

retry-count (SNMPv3)

Syntax retry-count *number*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the retry count for SNMP informs.

Options ***number***—Maximum number of times the inform is transmitted if no acknowledgment is received. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.

Default: 3 times

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Informs on page 6206
- *timeout*

rising-event-index

Syntax rising-event-index *index*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the index of the event entry that is used when a rising alarm threshold is exceeded. The rising-event index is specified when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.

Options ***index***—Index of the event entry that is used when a rising threshold is exceeded.

Range: 0 through 65,535

Default: 0

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

rising-threshold (Health Monitor)

Syntax rising-threshold *percentage*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options *percentage*—Upper threshold for the alarm entry.

Range: 1 through 100

Default: 80 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6200
- falling-threshold on page 1772

rising-threshold (RMON)

Syntax rising-threshold *integer*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the upper threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options ***integer***—Upper threshold for the alarm entry.
Range: –2,147,483,648 through 2,147,483,647

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

rmon

Syntax

```
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type (RMON Notification) type;
  }
  history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Provide comprehensive network fault diagnosis, planning, and performance tuning information. RMON delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports the RMON statistics, history, alarm, and event groups.

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

routing-instance (SNMP)

Syntax routing-instance *routing-instance-name*;

Hierarchy Level [edit snmp community *community-name*],
[edit snmp community *community-name* logical-system *logical-system-name*],
[edit snmp trap-group *group*]

Release Information Statement introduced in Junos OS Release 8.3.
Added to the **[edit snmp community *community-name*]** hierarchy level in Junos OS Release 8.4.
Added to the **[edit snmp community *community-name* logical-system *logical-system-name*]** hierarchy level in Junos OS Release 9.1.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a routing instance for SNMPv1 and SNMPv2 trap targets. All targets configured in the trap group use this routing instance.

If the routing instance is defined within a logical system, include the **logical-system *logical-system-name*** statement at the **[edit snmp community *community-name*]** hierarchy level and specify the **routing-instance** statement under the **[edit snmp community *community-name* logical-system *logical system-name*]** hierarchy level.

Options ***routing-instance-name***—Name of the routing instance.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring SNMP Trap Groups*
- *Configuring the Source Address for SNMP Traps*

sample-type

Syntax sample-type (absolute-value | delta-value);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the method of sampling the selected variable (monitored object). When you configure an SNMP RMON alarm, you can specify the sample type.

Options

absolute-value—Actual value of the selected variable is used when comparing against the thresholds.

delta-value—Difference between samples of the selected variable is used when comparing against the thresholds.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

security-level (Defining Access Privileges)

Syntax

```
security-level (authentication | none | privacy) {
  notify-view view-name;
  read-view view-name;
  write-view view-name;
}
```

Hierarchy Level

[edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c)]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Define the security level used for access privileges.

Default

none

Options

authentication—Provide authentication but no encryption.

none—No authentication and no encryption.

privacy—Provide authentication and encryption.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Level*

security-level (Generating SNMP Notifications)

Syntax security-level (authentication | none | privacy);

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security level to use when generating SNMP notifications.

Default none

Options **authentication**—Provide authentication but no encryption.

none—No authentication and no encryption.

privacy—Provide authentication and encryption.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Level*

security-model (Access Privileges)

Syntax security-model (usm | v1 | v2c);

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.

Options

usm—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Model*

security-model (Group)

Syntax

```
security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}
```

Hierarchy Level [edit snmp v3 vacm security-to-group]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a security model for an SNMPv3 group and associate the security name of a user with the group. All users in the group have the same access privileges.

Options

usm—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Model*

security-model (SNMP Notifications)

Syntax security-model (usm | v1 | v2c);

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.

Options

usm—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Model*

security-name (Community String)

Syntax security-name *security-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate a community string with the security name of a user. The community string, which is used for SNMPv1 and SNMPv2c clients in an SNMPv3 system, is configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Options ***security-name***—Name that is used for messaging security and user access control.

NOTE: The security name must match the configured security name at the **[edit snmp v3 target-parameters *target-parameters-name* parameters]** hierarchy level when you configure traps or informs.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Names*

security-name (Security Group)

Syntax

```
security-name security-name {
    group group-name;
}
```

Hierarchy Level [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate the security name of a user (for SNMPv3 clients) or a community string (for SNMPv1 and SNMPv2c clients) with a configured security group.

Options

security-name—SNMPv3 secure username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level that is used for messaging security. For SNMPv1 and SNMPv2c, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

security-name (SNMP Notifications)

Syntax security-name *security-name*;

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security name used when generating SNMP notifications.

Options ***security-name***—If the SNMPv3 USM security model is used, identify the user when generating the SNMP notification. If the v1 or v2c security models are used, identify the SNMP community used when generating the notification.

NOTE: The access privileges for the group associated with this security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the **[edit snmp v3 vacm security-to-group]** hierarchy level must match the security name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Name*

security-to-group

Syntax

```
security-to-group {
  security-model (usm | v1 | v2c) {
    group group-name;
    security-name security-name;
  }
}
```

Hierarchy Level [edit snmp v3 vacm]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the group to which a specific SNMPv3 security name belongs. The security name is used for messaging security.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure SNMP.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

snmp-community

Syntax

```
snmp-community community-index {
  community-name community-name;
  security-name security-name;
  tag tag-name;
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the SNMP community which authorizes SNMPv1 or SNMPv2c clients in an SNMPv3 system.

Options ***community-index***—(Optional) String that identifies an SNMP community.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the SNMPv3 Community*

source-address (SNMP)

Syntax source-address *address*;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.

Options ***address***—Source address of SNMP traps. You can configure the source address of trap packets two ways: **lo0** or a valid IPv4 address configured on one of the interfaces. The value **lo0** indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface **lo0**.

Default: Disabled. (The source address is the address of the outgoing interface.)

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Source Address for SNMP Traps*

startup-alarm

Syntax startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set an initial alarm that is sent after the configured SNMP RMON alarm becomes active.

Default **rising-or-falling-alarm**

Options

falling-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the falling threshold.

rising-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the rising threshold.

rising-or-falling-alarm—Generated if the first sample after the alarm entry becomes active is equal to or greater than either the rising threshold or the falling threshold.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Understanding RMON on page 6119
- *Junos OS Network Management Configuration Guide*

syslog-subtag

Syntax syslog-subtag *syslog-subtag*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Add the **syslog-subtag** tag to the system log message. The tag should not exceed 80 uppercase characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

tag (Configuring Notification Targets)

Syntax tag *tag-name*;

Hierarchy Level [edit snmp v3 notify *name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).

Options ***tag-name***—Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The ***tag-name*** is not included in the notification.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

tag (Configuring the SNMP Community)

Syntax tag *tag-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a set of SNMP managers that are authorized to use a community string.

Options ***tag-name***—Identify the set of addresses for the SNMP managers authorized to use the community string.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

tag-list

Syntax tag-list *tag-list*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure an SNMP tag list used to select target addresses.

Options ***tag-list***—Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Trap Target Address*

target-address

Syntax

```
target-address target-address-name {
  address address;
  address-mask address-mask;
  port port-number;
  retry-count number;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the address of an SNMP management application and the parameters to be used in sending notifications.

Options ***target-address-name***—String that identifies the target address.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

target-parameters

Syntax

At the **[edit snmp v3]** hierarchy level:

```
target-parameters target-parameters-name {
  profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

At the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
target-parameters target-parameters-name;
```

Hierarchy Level

[edit snmp v3]
[edit snmp v3 target-address *target-address-name*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the **[edit snmp v3]** hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the **[edit snmp v3 target-parameters *target-parameters-name*]** hierarchy level to the target address configuration at the **[edit snmp v3]** hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Defining and Configuring the Trap Target Parameters*
- *Applying Target Parameters*

targets

Syntax
```
targets {
  address;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure one or more systems to receive SNMP traps.

Options ***address***—IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- Configuring SNMP Trap Groups on page 6195

timeout

Syntax timeout *seconds*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the timeout period (in seconds) for SNMP informs.

Default **15** seconds

Options ***seconds***—Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

traceoptions (SNMP)

Syntax

```
traceoptions {
  file filename <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Track the activities of SNMP agents on the switch and record the information in log files.

NOTE: The **traceoptions** statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options

file *filename*—By default, the name of the log file that records trace output is the name of the process being traced (for example, **mib2d** or **snmpd**). Use this option to specify another name.

files *number*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, **snmpd**) reaches its maximum size, it is archived by being renamed to **snmpd.0**. The previous **snmpd.1** is renamed to **snmpd.2**, and so on. The oldest archived file is deleted.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match ***regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

size ***size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

Range: 10 KB through 1 GB

Default: 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

trap-group

Syntax

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for QFX Series switches.

Description Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

Options *group-name*—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

trap-options

Syntax

```
trap-options {
  agent-address outgoing-interface;
  source-address address;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

The remaining statements are explained separately.

Default Disabled

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring SNMP Trap Options*

type (RMON Notification)

Syntax type *type*;

Hierarchy Level [edit snmp rmon event *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the type of notification generated when a rising or falling threshold is crossed.

Default **log-and-trap**

Options ***type***—Type of notification. It can be one of the following:

- **log**—Add an entry to the **logTable** object.
- **log-and-trap**—Send an SNMP trap and add a log entry.
- **none**—No notifications are sent.
- **snmptrap**—Send an SNMP trap.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

type (SNMPv3)

Syntax type (inform | trap);

Hierarchy Level [edit snmp v3 notify *name*]

Release Information Statement introduced before Junos OS Release 7.4.
inform option added in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the type of SNMP notification.

Options **inform**—Defines the type of notification as an inform. SNMP informs are confirmed notifications.

trap—Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

user

Syntax user *username*;

Hierarchy Level [edit snmp v3 usm local-engine],
[edit snmp v3 usm remote-engine *engine-id*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a user associated with an SNMPv3 group on a local or remote SNMP engine.

Options ***username***—SNMPv3 user-based security model (USM) username.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

usm

Syntax

```
usm {
  local-engine {
    user username {
      authentication-md5 {
        authentication-password authentication-password;
      }
      authentication-none;
      authentication-sha {
        authentication-password authentication-password;
      }
      privacy-aes128 {
        privacy-password privacy-password;
      }
      privacy-des {
        privacy-password privacy-password;
      }
      privacy-3des {
        privacy-password privacy-password;
      }
      privacy-none {
        privacy-password privacy-password;
      }
    }
    remote-engine engine-id {
      user username {
        authentication-md5 {
          authentication-password authentication-password;
        }
        authentication-none;
        authentication-sha {
          authentication-password authentication-password;
        }
        privacy-aes128 {
          privacy-password privacy-password;
        }
        privacy-des {
          privacy-password privacy-password;
        }
        privacy-3des {
          privacy-password privacy-password;
        }
        privacy-none {
          privacy-password privacy-password;
        }
      }
    }
  }
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure user-based security model (USM) information.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.

vacm

Syntax

```
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
  security-to-group {
    security-model (usm | v1 | v2c);
    security-name security-name {
      group group-name;
    }
  }
}
```

Hierarchy Level
[edit snmp v3]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure view-based access control model (VACM) information, including access privileges such as security model and security level for a group of users.

The remaining statements are explained separately.

Required Privilege Level
snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Defining Access Privileges for an SNMP Group*

variable

Syntax variable *oid-variable*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the object identifier (OID) of the MIB object (also called variable) to be monitored when you configure an SNMP RMON alarm. If the value of the monitored variable exceeds the configured rising threshold or falling threshold, an alarm is triggered and a corresponding event may be generated.

Options ***oid-variable***—OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, **1.3.6.1.2.1.2.1.2.2.1.10.1**) or the name of the MIB object—for example, **ifInOctets.1**.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

- *Junos OS Network Management Configuration Guide*

version

Syntax version (all | v1 | v2);

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the version number of SNMP traps.

Default **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

Options **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

v1—Send SNMPv1 traps only.

v2—Send SNMPv2 traps only.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6195

view (Configuring a MIB View)

Syntax

```
view view-name {
  oid object-identifier (include | exclude);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The **view** statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the **view** statement at the **[edit snmp community *community-name*]** hierarchy level.

NOTE: To remove an OID completely, use the **delete view all oid oid-number** command but omit the **include** parameter.

Options ***view-name***—Name of the view.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- community on page 1766

view (Associating MIB View with a Community)

Syntax view *view-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate a view with a community. A view represents a group of MIB objects.

Options ***view-name***—Name of the view. You must use a view name already configured in the **view** statement at the **[edit snmp]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the SNMP Community String*

write-view

Syntax write-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series switches.

Description Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options ***view-name***—Name of the view for which the SNMP user group has write permission.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

archive (All System Log Files)

Syntax

```
archive <files number> <size size> <start-time time> <transfer-interval interval>
  <binary-data | no-binary-data>;
  <world-readable | no-world-readable> ;
```

Hierarchy Level [edit system syslog]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure archiving properties for all system log files.

Options

files ***number***—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it ***logfile*.0.gz** (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Range: 1 through 1000

Default: 10 files

size ***size***—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

Syntax: ***x*** **k** to specify the number of kilobytes, ***x*** **m** for the number of megabytes, or ***x*** **g** for the number of gigabytes

Range: 64 KB through 1 GB

Default:

- 128 KB for EX Series switches and J Series routers
- 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch
- 10 MB for TX Matrix and TX Matrix Plus routers

binary-data | no-binary-data—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..

Default: no-binary-data

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default: no-world-readable

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Specifying Log File Size, Number, and Archiving Properties on page 6220

archive (Individual System Log File)

Syntax archive <archive-sites (*ftp-url* <password *password*>)> <files *number*> <size *size*> <start-time "*YYYY-MM-DD.hh*:*mm*"> <transfer-interval *minutes*> <world-readable | no-world-readable>;

Hierarchy Level [edit system syslog file *filename*]

Release Information Statement introduced before Junos OS Release 7.4.
start-time and **transfer-interval** statements introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure archiving properties for a specific system log file.

Options

archive-sites *site-name*—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see "Format for Specifying Filenames and URLs in Junos OS CLI Commands" on page 73). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the **[edit system syslog]** hierarchy level.

files *number*—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it ***logfile*.0.gz** (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Range: 1 through 1000

Default: 10 files

password *password*—Password for authenticating with the site specified by the **archive-sites** statement.

size *size*—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

Syntax: ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes

Range: 64 KB through 1 GB

Default: 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers

start-time "*YYYY-MM-DD.hh:mm*"—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval *interval*—Interval at which to transfer the log file to an archive site.

Range: 5 through 2880 minutes

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default: **no-world-readable**

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Specifying Log File Size, Number, and Archiving Properties on page 6220

archive (QFabric System)

Syntax

```
archive {
  size size;
}
```

Hierarchy Level
[edit system syslog file *filename*]

Release Information
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description
Configure the archiving properties for the system message log file.

Options
size *size*—Maximum amount of system log message data that the QFabric system stores in the log file.

Syntax: *x*k to specify the number of kilobytes, *x*m for the number of megabytes, or *x*g for the number of gigabytes

Range: 65 KB through 1 GB

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- syslog on page 1403

console (System Logging)

Syntax

```
console {
  facility severity;
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the logging of system messages to the system console.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 607 on page 6222.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Table 608 on page 6223.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Directing System Log Messages to the Console on page 6211
- *Junos OS System Log Messages Reference*

explicit-priority

Syntax explicit-priority;

Hierarchy Level [edit logical-systems *logical-system-name* system syslog file *filename*],
[edit logical-systems *logical-system-name* system syslog host],
[edit system syslog file *filename*],
[edit system syslog host]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.

When the **structured-data** statement is also included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Including Priority Information in System Log Messages on page 6213
- *Junos OS System Log Messages Reference*
- structured-data on page 6379

facility-override

Syntax facility-override *facility*;

Hierarchy Level [edit system syslog host]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.

Options ***facility***—Alternate facility to substitute for the default facilities. For a list of the possible facilities, see Table 610 on page 6224.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Changing the Alternative Facility Name for Remote System Log Messages on page 6225
- *Junos OS System Log Messages Reference*

file (QFabric System)

Syntax

```
file filename {
  archive {
    size maximum-file-size;
  }
  explicit-priority;
  facility severity;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the logging of system messages to a file.

NOTE: On the QFabric system, a syslog file named messages is configured implicitly with facility and severity levels of any any and a size of 100 MBs.

Options

facility—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements.

filename—Filename that you specify with the **show log** command.

Default: Filename **messages**

severity—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities at the specified level and higher are logged.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

file (System Logging)

Syntax

```
file filename {
  facility severity;
  archive {
    files number;
    size size;
    (no-world-readable | world-readable);
  }
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the logging of system messages to a file.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 607 on page 6222.

file *filename*—File in the **severity** directory in which to log messages from the specified facility. To log messages to more than one file, include more than one **file** statement.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Table 608 on page 6223.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

files

Syntax files *number*;

Hierarchy Level [edit system syslog archive],
[edit system syslog file *filename* archive]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it to ***logfile*.0.gz** (for information about the maximum file size, see size). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Options ***number***—Maximum number of archived files.

Range: 1 through 1000

Default: 10 files

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

host (System)

Syntax

```
host (hostname | other-routing-engine) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
  source-address source-address;
  structured-data {
    brief;
  }
}
```

QFX Series

```
host (hostname {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
  port;
  source-address source-address;
}
```

TX Matrix Router and EX Series Switches

```
host (hostname | other-routing-engine | scc-master) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
  port;
  source-address source-address;
}
```

TX Matrix Plus Router

```
host (hostname | other-routing-engine | sfc0-master) {
  facility severity;
  allow-duplicates;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
  port;
  source-address source-address;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* system syslog],
[edit system syslog]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the logging of system messages to a remote destination.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 607 on page 6222.

hostname—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

other-routing-engine—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

NOTE: **The other-routing-engine option is not applicable to the QFX Series.**

port—Port number of the remote syslog server that can be modified.

scc-master—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Table 608 on page 6223.

sfc0-master—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

log-prefix (System)

Syntax log-prefix *string*;

Hierarchy Level [edit system syslog host]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Include a text string in each message directed to a remote destination.

Options ***string***—Text string to include in each message.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Adding a Text String to System Log Messages on page 6209

match

Syntax match "*regular-expression*";

Hierarchy Level [edit logical-systems *logical-system-name* system syslog file *filename*],
[edit logical-systems *logical-system-name* system syslog user (*username* | *)],
[edit system syslog file *filename*],
[edit system syslog host *hostname* | other-routing-engine| scc-master)],
[edit system syslog user (*username* | *)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Using Regular Expressions to Refine the Set of Logged Messages on page 6227

size (System)

Syntax size *size*;

Hierarchy Level [edit system syslog archive],
[edit system syslog file *filename* archive]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***. For information about the number of archive files that the utility creates in this way, see files.

Options ***size***—Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

Syntax: ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes

Range: 64 KB through 1 GB

Default: 1 MB for MX Series routers and the QFX Series

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

structured-data

Syntax

```
structured-data {
  brief;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* system syslog file *filename*],
[edit system syslog file *filename*]

Release Information Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol* (http://tools.ietf.org/html/draft-ietf-syslog-protocol-23).

NOTE: When this statement is included, other statements that specify the format for messages written to the file are ignored (the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level and the **time-format** statement at the **[edit system syslog]** hierarchy level).

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

  source-address source-address;
  time-format(millisecond | year | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* system],
[edit system]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Support at the **[edit logical-systems *logical-system-name* system]** hierarchy level introduced in Junos OS Release 11.4.

Description

Configure the types of system log messages to send to files, to a remote destination, to user terminals, or to the system console.

The remaining statements are explained separately.

Options

archive—Define parameters for archiving log messages.

console—Send log messages of a specified class and severity to the console.

file—Send log messages to a named file.

host —Remote location to be notified of specific log messages.

log-rotate-frequency—Configure the interval for checking logfile size and archiving messages.

server—Name of the system log server in the inet.0 routing instance.

source-address—Include a specified address as the source address for log messages.

time-format—Additional information to include in the system log time stamp.

user—Notify a specific user of the log event.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

syslog (QFabric System)

Syntax

```
syslog {
  file filename {
    archive {
      size maximum-file-size;
    }
    explicit-priority;
    facility severity;
    match "regular-expression";
    structured-data;
  }
  filter all {
    facility severity;
    match "regular-expression";
  }
  host hostname {
    explicit-priority;
    facility severity;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
    structured-data;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure system log messages for the QFabric system.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding the Implementation of System Log Messages on the QFabric System on page 1227

time-format

Syntax time-format (year | millisecond | year millisecond);

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a **host** statement.

By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, **Aug 21 12:36:30**. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

NOTE: When the **structured-data** statement is included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Options **millisecond**—Include the millisecond in the timestamp.

year—Include the year in the timestamp.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including the Year or Millisecond in Timestamps on page 167

user (System Logging)

Syntax

```
user (username | *) {
  facility severity;
  match "regular-expression";
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the logging of system messages to user terminals.

Options

***** (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 607 on page 6222.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see Table 608 on page 6223.

username—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one **user** statement.

The remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

user@switch> **show log** *log-filename*
user@switch> **file show** *log-file-pathname*

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K

Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6386
2. Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6387

Displaying Real-Time Statistics About All Interfaces on the Router or Switch

Purpose Display real-time statistics about traffic passing through all interfaces on the router or switch.

Action To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

Sample Output

```
user@host> monitor interface traffic
host name                  Seconds: 15                 Time: 12:31:09
Interface    Link  Input packets        (pps)     Output packets        (pps)
 so-1/0/0    Down              0          (0)                  0          (0)
 so-1/1/0    Down              0          (0)                  0          (0)
 so-1/1/1    Down              0          (0)                  0          (0)
 so-1/1/2    Down              0          (0)                  0          (0)
 so-1/1/3    Down              0          (0)                  0          (0)
 t3-1/2/0    Down              0          (0)                  0          (0)
 t3-1/2/1    Down              0          (0)                  0          (0)
 t3-1/2/2    Down              0          (0)                  0          (0)
 t3-1/2/3    Down              0          (0)                  0          (0)
 so-2/0/0      Up         211035          (1)              36778          (0)
 so-2/0/1      Up         192753          (1)              36782          (0)
 so-2/0/2      Up         211020          (1)              36779          (0)
 so-2/0/3      Up         211029          (1)              36776          (0)
 so-2/1/0      Up         189378          (1)              36349          (0)
 so-2/1/1    Down              0          (0)              18747          (0)
 so-2/1/2    Down              0          (0)              16078          (0)
 so-2/1/3      Up              0          (0)              80338          (0)
 at-2/3/0      Up              0          (0)                  0          (0)
 at-2/3/1    Down              0          (0)                  0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

Meaning The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

Displaying Real-Time Statistics About an Interface on the Router or Switch

Purpose Display real-time statistics about traffic passing through an interface on the router or switch.

Action To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

user@host> **monitor interface** ***interface-name***

Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'

SONET error counts/seconds:
  LOS count                              1
  LOF count                              1
  SEF count                              1
  ES-S                                  77
  SES-S                                 77
SONET statistics:
  BIP-B1                                 0
  BIP-B2                                 0
  REI-L                                  0
  BIP-B3                                 0
  REI-P                                  0
Received SONET overhead:  F1        : 0x00  J0        : 0xZ
```

Meaning The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in Table 612 on page 6388.

Table 612: Output Control Keys for the monitor interface Command

Action	Key
Display information about the next interface. The **monitor interface** command scrolls through the physical or logical interfaces in the same order that they are displayed by the **show interfaces terse** command.	**N**
Display information about a different interface. The command prompts you for the name of a specific interface.	**I**
Freeze the display, halting the display of updated statistics.	**F**
Thaw the display, resuming the display of updated statistics.	**T**
Clear (zero) the current delta counters since **monitor interface** was started. It does not clear the accumulative counter.	**C**
Stop the **monitor interface** command.	**Q**

See the CLI Explorer for details on using match conditions with the **monitor traffic** command.

Monitoring RMON MIB Tables

Purpose Monitor remote monitoring (RMON) alarm, event, and log tables.

Action To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                          Value State

     5 monitor
       jnxOperatingCPU.9.1.0.0                          5 falling threshold

Event
Index  Type                        Last Event
    1  log and trap                2010-07-10 11:34:17 PDT
Event Index: 1
    Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
    Time: 2010-07-10 11:34:07 PDT
    Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
    Time: 2010-07-10 11:34:17 PDT
```

Meaning The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

Related Documentation

- clear snmp history on page 6402

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.

- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                          Value State

 32768 Health Monitor: root file system utilization
       jnxHrStoragePercentUsed.1                       58 active

 32769 Health Monitor: /config file system utilization
       jnxHrStoragePercentUsed.2                        0 active

 32770 Health Monitor: RE 0 CPU utilization
       jnxOperatingCPU.9.1.0.0                          0 active

 32773 Health Monitor: RE 0 Memory utilization
       jnxOperatingBuffer.9.1.0.0                      35 active

 32775 Health Monitor: jkernel daemon CPU utilization
       Init daemon                                      0 active
       Chassis daemon                                  50 active
       Firewall daemon                                  0 active
       Interface daemon                                 5 active
       SNMP daemon                                     11 active
       MIB2 daemon                                     42 active
       ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system

sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx

- show snmp statistics on page 1859

Monitoring System Log Messages

Purpose Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

Action To view system log messages:

```
user@switch1> show log messages
```

Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

Meaning The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user **jsmith**.

Pinging Hosts

Purpose Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

Action To use the **ping** command to send four requests (ping count) to **host3**:

ping *host* count *number*

Sample Output

ping host3 count 4

```
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

Meaning

- The **ping** results show the following information:
  - Size of the ping response packet (in bytes).
  - IP address of the host from which the response was sent.
  - Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
  - Time-to-live (ttl) hop-count value of the ping response packet.
  - Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
  - Number of ping requests (probes) sent to the host.
  - Number of ping responses received from the host.

- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named ***filename*** reaches its maximum size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
   file <files number> <match regular-expression> <size size> <world-readable |
      no-world-readable>;
   flag flag;
   no-remote-trace;
}
```

These statements are described in the following sections:

- Configuring the Number and Size of SNMP Log Files on page 6394
- Configuring Access to the Log File on page 6394

- Configuring a Regular Expression for Lines to Be Logged on page 6394
- Configuring the Trace Operations on page 6395

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until there are three trace files. Then the oldest trace file (***filename*.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (***filename***) reaches 2 MB, ***filename*** is renamed ***filename*.0**, and a new file called ***filename*** is created. When the new ***filename*** reaches 2 MB, ***filename*.0** is renamed ***filename*.1** and ***filename*** is renamed ***filename*.0**. This process repeats until there are 20 trace files. Then the oldest file (***filename*.19**) is overwritten by the newest file (***filename*.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
   all;
   configuration;
   database;
   events;
   general;
   interface-stats;
   nonvolatile-sets;
   pdu;
   policy;
   protocol-timeouts;
   routing-socket;
   server;
   subagent;
   timer;
   varbind-error;
}
```

Table 613 on page 6395 describes the meaning of the SNMP tracing flags.

Table 613: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the **[edit snmp]** hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off

Table 613: SNMP Tracing Flags *(continued)*

Flag	Description	Default Setting
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log *agent*d | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where ***agent*** is the name of an SNMP agent.

Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though the Junos OS has built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, the Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**. You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- **request snmp utility-mib set instance *name* object-type <counter | counter 64 | integer | string | unsigned integer> object-value *value***
- **request snmp utility-mib clear instance *name* object-type <counter | counter 64 | integer | string | unsigned integer>**

The **instance *name*** option of the **request snmp utility-mib <set | clear>** command specifies the name of the data instance and is the main identifier of the data. The **object-type**

<counter | counter 64 | integer | string | unsigned integer> option enables you specify the object type, and the **object-value *value*** option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

Event Policy Configuration

To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the [**edit**] hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 600;
  }
  policy MBUFS {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

check-mbufs.slax Script

The following example shows the **check-mbufs.slax** script that is stored under **/var/db/scripts/event/**:

```
------ script START ------
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
    <op-script-results>{
 var $cmd = <command> "show system buffers";
        var $out = jcs:invoke($cmd);

     var $lines = jcs:break_lines($out);
     for-each ($lines) {
         if (contains(., "current/peak/max")) {
             var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
             var $split = jcs:regex($pattern, .);
             var $result = $split[2];

             var $rpc = <request-snmp-utility-mib-set> {
                 <object-type> "integer";
                 <instance> "current-mbufs";
                 <object-value> $result;
             }
             var $res = jcs:invoke($rpc);
                }
```

```
        }
    }
}
------ script END ------
```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```
user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
regress@caramels>
```

NOTE: The **show snmp mib walk** command is not available on the QFabric system, but you can use external SNMP client applications to perform this operation.

Displaying Commit Script Output

Table 614 on page 6398 summarizes the Junos OS command-line interface (CLI) commands you can use to monitor and troubleshoot commit scripts. For more information about the **cscript.log** file, see *Tracing Commit Script Processing*.

NOTE: Tracing commit script processing, including the **cscript.log** file, is not supported on the QFX3000-G QFabric system.

Table 614: Commit Script Configuration and Operational Mode Commands

Task	Command
Configuration Mode Commands	
Display errors and warnings generated by commit scripts.	**commit** or **commit check**
Display detailed information.	**commit | display detail**
Display the underlying Extensible Markup Language (XML) data.	**commit | display xml**

Table 614: Commit Script Configuration and Operational Mode Commands *(continued)*

Task	Command
Display the postinheritance contents of the configuration database. This view includes transient changes, but does not include changes made in configuration groups.	**show | display commit-scripts**
Display the postinheritance contents of the configuration database. This view excludes transient changes.	**show | display commit-scripts no-transients**
Display the postinheritance configuration in XML format. Viewing the configuration in XML format can be helpful when you are writing XML Path Language (XPath) expressions and configuration element tags.	**show | display commit-scripts view**
Display the postinheritance configuration in XML format, but exclude transient changes.	**show |** **display commit-scripts view |** **display commit-scripts no-transients**
Display all configuration groups data, including script-generated changes to the groups.	**show groups | display commit-scripts**
Display a particular configuration group, including script-generated changes to the group.	**show groups *group-name* | display commit-scripts**
Operational Mode Commands	
Display logging data associated with all commit script processing.	**show log cscript.log**
Display processing for only the most recent commit operation.	**show log cscript.log | last**
Display processing for script errors.	**show log cscript.log | match error**
Display processing for a particular script.	**show log cscript.log | match *filename***

Sample Output

clear sflow collector statistics

The following example shows two output examples for the **show sflow collector** command, one before and one after the **clear sflow collector statistics** command was issued.

```
user@host> show sflow collector
Collector        Udp-port    No. of samples
   address
   10.1.1.1           6343        3174
   10.1.2.1           6343        3562

user@host> clear sflow collector statistics

user@host> show sflow collector
Collector        Udp-port    No. of samples
   address
   10.1.1.1           6343        0
   10.1.2.1           6343        0
```

clear snmp history

Syntax clear snmp history (*index* | all)

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Delete the samples of Ethernet statistics collected for a history group.

Options **all**—Clear all the entries in the history index.

index—Clear the contents of the specified entry in the history index.

Required Privilege Level clear

Output Fields See show snmp statistics for an explanation of output fields.

Sample Output

clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,

monitor traffic

Syntax

monitor traffic
<brief | detail | extensive>
<absolute-sequence>
<count *count*>
<interface *interface-name*>
<layer2-headers>
<matching *matching*>
<no-domain-names>
<no-promiscuous>
<no-resolve>
<no-timestamp>
<print-ascii>
<print-hex>
<resolve-timeout>
<size *size*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

NOTE: This command is not supported on the QFabric system.

Options

none—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

brief | detail | extensive—(Optional) Display the specified level of output.

absolute-sequence—(Optional) Display absolute TCP sequence numbers.

count *count*—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.

interface ***interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

layer2-headers—(Optional) Display the link-level header on each line.

matching ***matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

no-domain-names—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

no-promiscuous—(Optional) Do not put the interface into promiscuous mode.

no-resolve—(Optional) Suppress reverse lookup of the IP addresses.

no-timestamp—(Optional) Suppress timestamps on displayed packets.

print-ascii—(Optional) Display each packet in ASCII format.

print-hex—(Optional) Display each packet, except the link-level header, in hexadecimal format.

resolve-timeout ***timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

size ***size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

Additional Information

In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace ***expression*** with one or more of the match conditions listed in Table 615 on page 6407.

Table 615: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	**host [***address* **|** *hostname***]**	Matches packets that contain the specified address or hostname. The protocol match conditions **arp**, **ip**, or **rarp**, or any of the directional match conditions can be prepended to the **host** match condition.
	net *address*	Matches packets with source or destination addresses containing the specified network address.
	net *address* **mask** *mask*	Matches packets containing the specified network address and subnet mask.
	port (*port-number* **|** *port-name***)**	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as **bgp** (179), **dhcp** (67), or **domain** (53) (the port numbers are also listed).
Directional	**dst**	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	src	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	src and **dst**	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	src or **dst**	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	**less** *value*	Matches packets shorter than or equal to the specified value, in bytes.
	greater *value*	Matches packets longer than or equal to the specified value, in bytes.

Table 615: Match Conditions for the monitor traffic Command *(continued)*

Match Type	Condition	Description
Protocol	**amt**	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	arp	Matches all ARP packets.
	ether	Matches all Ethernet packets.
	ether (broadcast | multicast)	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with**src** and **dst**.
	ether *protocol* **(***address* **| (arp | ip | rarp))**	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The **ether protocol** arguments **arp**, **ip**, and **rarp** are also independent match conditions, so they must be preceded by a backslash (\) when used in the **ether protocol** match condition.
	icmp	Matches all ICMP packets.
	ip	Matches all IP packets.
	ip (broadcast | multicast)	Matches broadcast or multicast IP packets.
	ip protocol (*address* **| (icmp | igrp | tcp | udp))**	Matches packets with the specified address or protocol type. The **ip protocol** arguments **icmp**, **tcp**, and **udp** are also independent match conditions, so they must be preceded by a backslash (\) when used in the **ip protocol** match condition.
	isis	Matches all IS-IS routing messages.
	rarp	Matches all RARP packets.
	tcp	Matches all TCP datagrams.
	udp	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in Table 616 on page 6408.

Table 616: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.

Table 616: Logical Operators for the monitor traffic Command *(continued)*

Logical Operator (Highest to Lowest Precedence)	Description
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
||	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
( )	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"'"arithmetic_expression relational_operator
  arithmetic_expression"
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are **1, 2,** or **4** bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in Table 617 on page 6410.

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the **match** pipe option (**| match**) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see Table 615 on page 6407.
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[*x*]** command for aggregated Ethernet interfaces (such as **ae0**) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 617: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
|	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

```

<wait *seconds*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options ***host***—IP address or hostname of the remote system to ping.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

count *requests*—(Optional) Number of ping requests to send. The range of values is **1** through **2,000,000,000**. The default value is an unlimited number of requests.

detail—(Optional) Include in the output the interface on which the ping reply was received.

do-not-fragment—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

NOTE: In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.

interface *source-interface*—(Optional) Interface to use to send the ping requests.

interval *seconds*—(Optional) How often to send ping requests. The range of values, in seconds, is **1** through infinity. The default value is **1**.

logical-system *logical-system-name*—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system *logical-system-name*** command and then run the **ping** command. To return to the main router, enter the **clear cli logical-system** command.

loose-source ***value***—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address ***mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern ***string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance ***routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

size ***bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source ***source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

strict—(Optional) Use the strict source route option (IPv4).

strict-source ***value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos ***type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

ttl ***value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

verbose—(Optional) Display detailed output.

vpls ***instance-name***—(Optional) Ping the instance to which this VPLS belongs.

wait ***seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

Required Privilege Level

List of Sample Output

ping hostname on page 6418
ping hostname rapid on page 6418
ping hostname size count on page 6418

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

Sample Output

ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes

ping fabric multicast-flow

Syntax ping fabric multicast-flow source-fmep-id *source-fmep-id* fma-name *fma-name*
flow-spec-name *flow-specification-name*
<verbose>

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Send a fabric multicast ping command to the multicast group destination fabric maintenance endpoints (FMEPs) configured in the flow specification. Send a single PDU with a timeout after 1 second.

Options

flow-spec-name *flow-specification-name*—Name of the flow specification that defines the protocol parameters (unicast or multicast) for the fabric ping operation.

fma-name *fma-name*—Name of the FMA.

source-fmep-id *source-fmep-id*—FMEP ID that is the source of the fabric ping operation.

verbose—(Optional) Detailed version of the output display.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Output Fields Table 618 on page 6419 lists the output fields for the **ping fabric-multicast-flow** command. Output fields are listed in the approximate order in which they appear.

Table 618: ping fabric multicast-flow Output Fields

Field Name	Field Description
Using fabric flow-specification	Name of the flow specification.
Ethernet frame-size	Ethernet frame size in bytes.
Source-IP	MAC address of the source FMEP interface.
Destination-IP	MAC address of the destination FMEP interface.

Table 618: ping fabric multicast-flow Output Fields *(continued)*

Field Name	Field Description
Protocol	IP protocol.
received response from fmep-id	FMEP ID from which responses are received.

Sample Output

ping fabric multicast-flow

```
user@host> ping fabric multicast-flow source-fmep-id 3 fma-name fma1 flow-spec-name fspec2
verbose

Using fabric flow-specification: fspec2
 Ethernet frame-size: 256
 Source-IP: 87.238.205.21
 Destination-IP: 225.0.0.1 IP
 Protocol: 17
 received response from fmep-id 32775...
 received response from fmep-id 32794...
 received response from fmep-id 32795...
 sent 1 requests, received 3 responses
```

ping fabric unicast-flow

Syntax

ping fabric unicast-flow fma-name *fma-name* source-fmep-id *source-fmep-id* dest-fmep-id *dest-fmep-id* flow-spec-name *flow-specification-name*
<count *count*>
<forced-fte-interface *fte-interface*>
<verbose>

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Send a unicast fabric ping command to the destination fabric maintenance endpoints (FMEPs) specified.

Options

count *count*—(Optional) Number of fabric ping PDUs to send.
The maximum PDU count is 5. The default PDU count is 1.

dest-fmep-id *destination-fmep-id*—ID of the destination FMEP of the fabric ping operation.

flow-spec-name *flow-specification-name*—Name of the flow specification that defines the protocol parameters (unicast or multicast) for the fabric ping operation.

fma-name *fma-name*—Name of the FMA.

forced-fte-interface *fte-interface*—(Optional) Forces the fabric ping operation to use the specified FTE interface to inject the PDU into the fabric instead of using the internal forwarding path lookup table to determine the FTE interface.

source-fmep-id *source-fmep-id*—ID of the FMEP that is the source of the fabric ping operation.

verbose—(Optional) Detailed version of the output display.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

```

request snmp spoof-trap

Syntax **request snmp spoof-trap**
<*trap*> variable-bindings <*object*> <*instance*> <*value*>

Release Information Command introduced in Junos OS Release 8.2.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.

Options **<*trap*>**—Name of the trap to spoof.

variable-bindings <*object*> <*instance*> <*value*>—(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, **ifIndex[14] = 14**). Enclose the list of variable bindings in quotation marks (“ “) and use a comma to separate each object name, instance, and value definition (for example, **variable-bindings “ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2”**). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.

<*dummy name*>—A dummy trap name to display the list of available traps.

Question mark (?)—Question mark**?** to display possible completions.

Required Privilege Level request

List of Sample Output
request snmp spoof-trap (with Variable Bindings) on page 6424
request snmp spoof-trap (Illegal Trap Name) on page 6424
request snmp spoof-trap (Question Mark ?) on page 6428

Sample Output

request snmp spoof-trap (with Variable Bindings)

```
user@host> request snmp spoof-trap linkUp variable-bindings “ifIndex[14] = 14, ifAdminStatus[14]
= 1, ifOperStatus[14] = 2”
Spoof trap request result: trap sent successfully
```

request snmp spoof-trap (Illegal Trap Name)

```
user@host> request snmp spoof-trap xx
Spoof trap request result: trap not found

request snmp utility-mib clear instance

Syntax request snmp utility-mib clear instance *name*
object-type *type*

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Clear the data stored in the specified container object in the SNMP Utility MIB.

Options *name*—Name of the SNMP instance that is used to identify the data stored in the container object.

object-type *type*—Type of container object in which the data is stored. The following container object types are supported:

- **counter**—Stores a 32-bit counter value.
- **counter64**—Stores a 64-bit counter value.
- **integer**—Stores a 32-bit signed integer value.
- **unsigned-integer**—Stores a 32-bit unsigned integer value.

Required Privilege Level clear

request snmp utility-mib set instance

Syntax

request snmp utility-mib set instance *name*
object-type *type*
object-value *value*

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Store data in the specified container object in the SNMP Utility MIB. The data may be retrieved by SNMP operations.

Options

name—Name of the SNMP instance that is used to identify the data stored in the container object.

object-type *type*—Type of container object in which to store data. The following container object types are supported:

- **counter**—Stores a 32-bit counter value.
- **counter64**—Stores a 64-bit counter value.
- **integer**—Stores a 32-bit signed integer value.
- **unsigned-integer**—Stores a 32-bit unsigned integer value.
- **string**—Stores an octet string value.

object-value *value*—Data that is stored in the container object.

Required Privilege Level

show oam fabric flow-specification

Syntax show oam fabric flow-specification
<flow-specification-name>

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Display the fabric flow specifications that are configured in a QFabric system Node group.

Options ***flow-specification-name***—(Optional) Name of a flow specification.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

show oam fabric flow-specification (Flow Specification Specified) on page 6434

Output Fields Table 620 on page 6432 lists the output fields for the **show oam fabric flow-specification** command. Output fields are listed in the approximate order in which they appear.

Table 620: show oam fabric flow-specification Output Fields

Field Name	Field Description
Flow specification name	Name of the flow specification.
Type	Flow specification type: • **Ethernet** • **Ethernet Unicast IPV4** • **Multicast IPV4** • **Multicast VLAN flood**
Ethernet frame size	Ethernet frame size in bytes.
Ether type	EtherType protocol.
Source-MAC	MAC address of the source FMEP interface.

Table 620: show oam fabric flow-specification Output Fields *(continued)*

Field Name	Field Description
Source-MAC Mask	MAC address mask of the source FMEP interface.
Destination-MAC	MAC address of the destination FMEP interface.
Destination-MAC Mask	MAC address mask of the destination FMEP interface.
Source-IP	IP address of the source FMEP interface.
Source-IP Mask	IP address mask of the source FMEP interface.
Destination-IP	IP address of the destination FMEP interface.
Destination-IP mask	IP address mask of the destination FMEP interface.
IP-Protocol	IPv4 protocol configured.
Source-L4-Port	Source TCP or UDP port.
Destination-L4-Port	Destination TCP or UDP port.
Destination multicast group IP	IP address of the destination multicast group.

Sample Output

show oam fabric flow-specification (All)

```
user@host> show oam fabric flow-specification

 Flow specification name  : fspec1 Type  : Ethernet
     Ethernet frame size  : Unspecified
     Ether type  : Unspecified
     Source-MAC  : Unspecified
     Source-MAC Mask : Unspecified
     Destination-MAC  : Unspecified
     Destination-MAC Mask : Unspecified

    Source-L4-port : 270
    Destination-L4-port : Unspecified
```

show oam fabric interfaces

Syntax

show oam fabric interfaces
<*interface-name*>
<fabric-maintenance-association *fma-name*>
<brief>

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Display the fabric maintenance associations (FMAs) and fabric maintenance endpoints (FMEPs) that are configured in a QFabric system Node group.

If you do not specify an interface, display information for an FMA (if one is specified) or all FMAs configured in the Node group.

Options

brief—(Optional) Summarized version of the output.

fabric-maintenance-association *fma-name*—(Optional) Name of a specific FMA.

interface-name—(Optional) Name of a specific interface.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

show log

List of Syntax

Syntax on page 6437
Syntax (QFabric System) on page 6437
Syntax (TX Matrix Routers) on page 6437

Syntax

show log
<*filename* | user <*username*>>

Syntax (QFabric System)

show log *filename*
<*device-type (device-id* | *device-alias*)>

Syntax (TX Matrix Routers)

show log
<all-lcc | lcc *number* | scc>
<*filename* | user <*username*>>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option *device-type (device-id* | *device-alias*) is introduced in Junos OS Release 13.1 for the QFX Series.

Description

List log files, display log file contents, or display information about users who have logged in to the router or switch.

Options

none—List all log files.

<all-lcc | lcc *number* | scc>—(TX Matrix routers only)(Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace ***number*** with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the device-type optional parameter, you must also specify either the device-id or device-alias optional parameter.

(*device-id* | *device-alias*)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

user <*username*>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include ***username***, display logging information about the specified user.

show sflow

Syntax

show sflow
<collector>
<interface>

Release Information

Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display sFlow configuration information.

Options

none—Display all sFlow configuration information.

collector—(Optional) Display a list of configured sFlow collectors and their properties.

interface—(Optional) Display the interfaces on which sFlow technology is enabled and the sampling parameters.

Required Privilege Level

view

Output Fields

Table 622 on page 6440 lists the output fields for the **show sflow** command. Output fields are listed in the approximate order in which they appear.

Table 622: show sflow Output Fields

Field Name	Field Description	Level of Output
sFlow	Status of the feature: **Enabled** or **Disabled**.	All levels
Sample limit	Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second.	All levels
Polling interval	Interval at which the sFlow agent polls the interface.	All levels
Sample rate egress	Rate at which egress packets are sampled.	All levels
Sample rate ingress	Rate at which ingress packets are sampled.	All levels
Agent ID	IP address assigned to the sFlow agent.	All levels
Source IP address	Source IP address for the sFlow packets.	All levels

Sample Output

show sflow

```
user@host> show sflow

sFlow                    : Enabled
Sample limit             : 300 packets/second
Polling interval         : 20 second
Sample rate egress       : 1:2048: Disabled
Sample rate ingress      : 1:1000: Enabled
Agent ID                 : 10.93.54.7
Source IP address        : 10.93.54.7
```

show sflow collector

Syntax show sflow collector

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Display a list of configured sFlow collectors and their properties.

Required Privilege Level view

```

show snmp health-monitor

Syntax show snmp health-monitor
<alarms (brief | detail) | logs>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.

Options **none**—Display information about all health monitor alarms and logs.

alarms (brief | detail)—(Optional) Display information about health monitor alarms. Optionally, specify brief or detailed information about the alarms.

logs—(Optional) Display information about health monitor logs.

Required Privilege Level view

List of Sample Output show snmp health-monitor on page 6447
show snmp health-monitor alarms detail on page 6447

Output Fields Table 625 on page 6445 describes the output fields for the **show snmp health-monitor** command. Output fields are listed in the approximate order in which they appear.

Table 625: show snmp health-monitor Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 625: show snmp health-monitor Output Fields *(continued)*

Field Name	Field Description	Level of Output

State	State of the alarm or event entry:
	• Alarms:
	  • **active**—Entry is fully configured and activated.
	  • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit.
	  • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit.
	  • **under creation**—Entry is being configured and is not yet activated.
	  • **startup**—Alarm is waiting for the first sample of the monitored variable.
	  • **object not available**—Monitored variable of that type is not available to the health monitor agent.
	  • **instance not available**—Monitored variable's instance is not available to the health monitor agent.
	  • **object type invalid**—Monitored variable is not a numeric value.
	  • **object processing errored**—An error occurred when the monitored variable was processed.
	  • **unknown**—State is not one of the above.
		All levels

Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value **absolute value** or **delta value**.	**detail**

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  • Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  • Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  • Value of the alarm is between the thresholds.

show snmp inform-statistics

Syntax show snmp inform-statistics

Release Information Command introduced in Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about Simple Network Management Protocol (SNMP) inform requests.

Options This command has no options.

Required Privilege Level view

List of Sample Output show snmp inform-statistics on page 6450

Output Fields Table 626 on page 6450 describes the output fields for the **show snmp inform-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 626: show snmp inform-statistics Output Fields

Field Name	Field Description
Target Name	Name of the device configured to receive and respond to SNMP informs.
Address	IP address of the target device.
Sent	Number of informs sent to the target device and acknowledged by the target device.
Pending	Number of informs held in memory pending a response from the target device.
Discarded	Number of informs discarded after the specified number of retransmissions to the target device were attempted.
Timeouts	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
Probe Failures	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

Sample Output

show snmp inform-statistics

```
user@host> show snmp inform-statistics
Inform Request Statistics:
 Target Name: TA1_v3_md5_none Address: 172.17.20.184
  Sent: 176, Pending: 0
  Discarded: 0, Timeouts: 0, Probe Failures: 0
 Target Name: TA2_v3_sha_none Address: 192.168.110.59
```

```
 Sent: 0, Pending: 4
 Discarded: 84, Timeouts: 0, Probe Failures: 258
Target Name: TA5_v2_none Address: 172.17.20.184
 Sent: 0, Pending: 0
 Discarded: 2, Timeouts: 10, Probe Failures: 0
```

show snmp mib

Syntax show snmp mib (get | get-next | walk) (ascii | decimal) *object-id*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
ascii and **decimal** options introduced in Junos OS Release 9.6.
ascii and **decimal** options introduced in Junos OS Release 9.6 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.

Options

get—Retrieve and display one or more SNMP object values.

get-next—Retrieve and display the next SNMP object values.

walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.

ascii—Display the SNMP object's string indices as an ASCII-key representation.

decimal—Display the SNMP object values in the decimal (default) format. The **decimal** option is the default option for this command. Therefore, issuing the **show snmp mib (get | get-next | walk) decimal object-id** and the **show snmp mib (get | get-next | walk) object-id** commands display the same output.

object-id—The object can be represented by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). When entering multiple objects, enclose the objects in quotation marks.

Required Privilege Level snmp—To view this statement in the configuration.

List of Sample Output

show snmp mib get on page 6453
show snmp mib get (Multiple Objects) on page 6453
show snmp mib get (Layer 2 Policer) on page 6453
show snmp mib get-next on page 6453
show snmp mib get-next (Specify an OID) on page 6453
show snmp mib walk on page 6453
show snmp mib walk (QFX Series) on page 6453
show snmp mib walk decimal on page 6454
show snmp mib walk (ASCII) on page 6454
show snmp mib walk (Multiple Indices) on page 6454
show snmp mib walk decimal (Multiple Indices) on page 6454

Output Fields Table 627 on page 6453 describes the output fields for the **show snmp mib** command. Output fields are listed in the approximate order in which they appear.

Table 627: show snmp mib Output Fields

Field Name	Field Description
name	Object name and numeric instance value.
object value	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output

show snmp mib get

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

show snmp mib get (Multiple Objects)

```
user@host> show snmp mib get ?sysObjectID.0 sysUpTime.0?
sysObjectID.0 = jnxProductNameM20
sysUpTime.0 = 1640992
```

show snmp mib get (Layer 2 Policer)

```

```

show snmp rmon

Syntax

show snmp rmon
<alarms (brief | detail)>
<events (brief | detail)>
<logs>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display information about Simple Network Management Protocol (SNMP) Remote Monitoring (RMON) alarms, events, and logs.

Options

none—Display information about all RMON alarms and events.

brief | detail—(Optional) Display brief or detailed information about RMON alarms or events.

alarms—(Optional) Display information about RMON alarms.

events—(Optional) Display information about RMON events.

logs—(Optional) Display information about RMON monitoring logs.

Output Fields

Table 628 on page 6455 describes the output fields for the **show snmp rmon** command. Output fields are listed in the approximate order in which they appear.

Table 628: show snmp rmon Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels

Table 628: show snmp rmon Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	State of the alarm or event entry: Alarms: • **active**—Entry is fully configured and activated. • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit. • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit. • **under creation**—Entry is being configured and is not yet activated. • **startup**—Alarm is waiting for the first sample of the monitored variable. • **object not available**—Monitored variable of that type is not available to the SNMP agent. • **instance not available**—Monitored variable's instance is not available to the SNMP agent. • **object type invalid**—Monitored variable is not a numeric value. • **object processing errored**—An error occurred when the monitored variable was processed. • **unknown**—State is not one of the above. Events: • **active**—Entry has been fully configured and activated. • **under creation**—Entry is being configured and is not yet activated. • **unknown**—State is not one of the above.	All levels
Variable name	Name of the SNMP object instance being monitored.	All levels
Event Index	Event identifier.	All levels
Type	Type of notification made when an event is triggered. It can be one of the following: • **log**—A system log message is generated and an entry is made to the log table. • **snmptrap**—An SNMP trap is sent to the configured destination. • **log and trap**—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination. • **none**—Neither log nor trap will be sent.	**detail**
Last Event	Date and time of the last event. It has the format *yyyy-mm-dd hh:mm:ss timezone*.	**brief**
Community	Trap group used for sending the SNMP trap.	**detail**
Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of **absolute value** or **delta value**.	**detail**

Table 628: show snmp rmon Output Fields *(continued)*

Field Name	Field Description	Level of Output

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  ◦ Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  ◦ Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  ◦ Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  ◦ Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  ◦ Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	**detail**
Creator	Mechanism by which the entry was configured (**CLI** or **SNMP**).	**detail**
Sample interval	Time period between samples (in seconds).	**detail**
Rising threshold	Upper limit threshold value configured by the user.	**detail**
Falling threshold	Lower limit threshold value configured by the user.	**detail**
Rising event index	Event triggered when the rising threshold is crossed.	**detail**
Falling event index	Event triggered when the falling threshold is crossed.	**detail**
Current value	Current value of the monitored variable in the most recent sample interval.	**detail**

show snmp statistics

Syntax show snmp statistics

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.

Options This command has no options.

Required Privilege Level view

Related Documentation
- clear snmp statistics on page 6403

List of Sample Output show snmp statistics on page 6463

Output Fields Table 178 on page 1859 describes the output fields for the **show snmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 629: show snmp statistics Output Fields

Field Name	Field Description
Input	Information about received packets: • **Packets(snmpInPkts)**—Total number of messages delivered to the SNMP entity from the transport service. • **Bad versions—(snmpInBadVersions**) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • **Bad community names—(snmpInBadCommunityNames)** Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • **Bad community uses—(snmpInBadCommunityUses)** Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • **ASN parse errors—(snmpInASNParseErrs)** Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • **Too bigs—(snmpInTooBigs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpInNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpInBadValues)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **badValue**. • **Read onlys—(snmpInReadOnlys)** Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of **readOnly**. Only incorrect implementations of SNMP generate this error.

Table 629: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
Input (continued)	• **General errors—(snmpInGenErrs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **genErr**. • **Total requests varbinds—(snmpInTotalReqVars)** Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP **GetRequest** and **GetNext** PDUs. • **Total set varbinds—(snmpInSetVars)** Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP **SetRequest** PDUs. • **Get requests—(snmpInGetRequests)** Total number of SNMP **GetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get nexts—(snmpInGetNexts)** Total number of SNMP **GetNext** PDUs that have been accepted and processed by the SNMP entity. • **Set requests—(snmpInSetRequests)** Total number of SNMP **SetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get responses—(snmpInGetResponses)** Total number of SNMP **GetResponse** PDUs that have been accepted and processed by the SNMP entity. • **Traps—(snmpInTraps)** Total number of SNMP traps generated by the SNMP entity. • **Silent drops—(snmpSilentDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • **Proxy drops—(snmpProxyDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned. • **Commit pending drops**—Number of SNMP packets for **Set** requests dropped because of a previous pending SNMP **Set** request on the committed configuration. • **Throttle drops**—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 629: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
V3 Input	Information about SNMP version 3 packets: • **Unknown security models—(snmpUnknownSecurityModels)** Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • **Invalid messages—(snmpInvalidMsgs)** Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • **Unknown pdu handlers—(snmpUnknownPDUHandlers)** Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • **Unavailable contexts—(snmpUnavailableContexts)** Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • **Unknown contexts—(snmpUnknownContexts)** Total number of requests received for a context that is unknown to the SNMP engine. • **Unsupported security levels—(usmStatsUnsupportedSecLevels)** Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • **Not in time windows—(usmStatsNotInTimeWindows)** Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • **Unknown user names—(usmStatsUnknownUserNames)** Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • **Unknown engine ids—(usmStatsUnknownEngineIDs)** Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine. • **Wrong digests—(usmStatsWrongDigests)** Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • **Decryption errors—(usmStatsDecryptionErrors)** Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.

Table 629: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
Output	Information about transmitted packets: • **Packets—(snmpOutPkts)** Total number of messages passed from the SNMP entity to the transport service. • **Too bigs—(snmpOutTooBigs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpOutNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpOutBadValues)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **badValue**. • **General errors—(snmpOutGenErrs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **genErr**. • **Get requests—(snmpOutGetRequests)** Total number of SNMP **GetRequest** PDUs generated by the SNMP entity. • **Get nexts—(snmpOutGetNexts)** Total number of SNMP **GetNext** PDUs generated by the SNMP entity. • **Set requests—(snmpOutSetRequests)** Total number of SNMP **SetRequest** PDUs generated by the SNMP entity. • **Get responses—(snmpOutGetResponses)** Total number of SNMP **GetResponse** PDUs generated by the SNMP entity. • **Traps—(snmpOutTraps)** Total number of SNMP traps generated by the SNMP entity.

Sample Output

show snmp statistics

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 246213, Bad versions: 12, Bad community names: 12,
    Bad community uses: 0, ASN parse errors: 96,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 227084, Total set varbinds: 67,
    Get requests: 44942, Get nexts: 190371, Set requests: 10712,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
    Throttle drops: 0,
  V3 Input:
    Unknown security models: 0, Invalid messages: 0
    Unknown pdu handlers: 0, Unavailable contexts: 0
    Unknown contexts: 0, Unsupported security levels: 1
    Not in time windows: 0, Unknown user names: 0
    Unknown engine ids: 44, Wrong digests: 23, Decryption errors: 0
  Output:
    Packets: 246093, Too bigs: 0, No such names: 31561,

```

show snmp v3

Syntax

show snmp v3
<access <brief | detail> | community | general | groups | notify <filter> | target <address | parameters> | users>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.

Options

none—Display all of the SNMPv3 operating configuration.

access—(Optional) Display SNMPv3 access information.

brief | detail—(Optional) Display brief or detailed information about SNMPv3 access information.

community—(Optional) Display SNMPv3 community information.

general—(Optional) Display SNMPv3 general information.

groups—(Optional) Display SNMPv3 security-to-group information.

notify <filter>—(Optional) Display SNMPv3 notify information and, optionally, notify filter information.

target <address | parameters>—(Optional) Display SNMPv3 target information and, optionally, either target address or target parameter information.

users—(Optional) Display SNMPv3 user information.

Additional Information

To edit the default display of the **show snmp v3** command, specify options in the **show** statement at the **[edit snmp v3]** hierarchy level.

Required Privilege Level

List of Sample Output

show snmp v3 on page 6465

Output Fields

Table 630 on page 6465 describes the output fields for the **show snmp v3** command. Output fields are listed in the approximate order in which they appear.

Table 630: show snmp v3 Output Fields

Field Name	Field Description
Local engine	Information about the local SNMP engine configuration: • **Local engine ID**—Unique Identifier of the local SNMPv3 engine. • **Engine boots**—Number of times the local SNMPv3 engine has rebooted or reinitialized since this engine ID was configured. • **Engine time**—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • **Max msg size**—Maximum message size the sender can accommodate.
Engine ID (local engine)	Information about the local SNMP engine ID and the associated users: • **User**—SNMPv3 username. • **Auth/Priv**—Authentication and encryption algorithm that is configured for the user. • **Storage**—Indicates whether a username is saved to the configuration file (nonvolatile) or not saved (volatile). Applies only to users with active status. • **Status**—Status of the user as listed in the SNMPv3 user table. Only rows with an active status in the table are used by the SNMPv3 engine.
Engine ID (remote engine)	Information about a remote SNMP engine, associated users, user groups, and user access policies: • **User**—SNMPv3 username. • **Auth/Priv**—Authentication and encryption algorithm that is configured for the user. • **Storage**—Indicates whether a username is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status. • **Status**—Status of a new user that has been activated. Only users with an active status can use SNMPv3. • **Group name**—Name of a group of users for which the configured access privileges apply. • **Security model**—Security model (such as **usm**, **v1**, **v2c**, or **any**) that is configured for the group. The security model is used with the security name to ensure messaging security. • **Security name**—Security name that is associated with a user, and which is used with the security model to ensure messaging security. • **Storage type**—Indicates whether a username is saved to the configuration file (nonvolatile) or not saved (volatile). Applies only to users with active status. • **Status**—Status of a user in a group. Only users with an active status can use SNMPv3.
Access control	Information about access control: • **Group name**—Name of a group of users for which the configured access privileges apply. • **Context prefix**—SNMPv3 context for which the configured access privileges apply. • **Security model/level**—Security model and security level combination that is configured for user access privileges. • **Read view**—Identifies the MIB view used for SNMPv3 read operations. • **Write view**—Identifies the MIB view used for SNMPv3 write operations. • **Notify view**—Identifies the MIB view used for outbound SNMP notifications.

Sample Output

show snmp v3

```
user@host> show snmp v3
```

```
Local engine ID: 80 00 0a 4c e04 31 32 33 34
Engine boots:          38
Engine time:        64583 seconds
Max msg size:        2048 bytes

Engine ID: local
    User                            Auth/Priv   Storage      Status
    user1                            md5/des    nonvolatile  active
    user2                            sha/none   nonvolatile  active
    user3                           none/none   nonvolatile  active

traceroute fabric unicast-flow

Syntax

traceroute fabric unicast-flow flow-spec-name *flow-specification-name* fma *fma-name*
<source-fmep *fmep-name*>
<dest-fmep *fmep-name*>
<forced-fte-interface *fte-interface*>
<count *count*>
<verbose>

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Trace the path taken by a specific unicast flow (ping) operation across a VLAN on the QFabric system from a source maintenance endpoint (FMEP) to a destination FMEP. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices.

The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the protocol data unit (PDU) travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

NOTE: **This command is not supported on the QFX3000-M QFabric system.**

Options

dest-fmep-id ***source-fmep-id***—(Optional) ID of the destination FMEP of the traceroute operation.

flow-spec-name ***flow-specification-name***—Name of the flow specification that defines the parameters of the traceroute operation.

fma-name ***fma-name***—Name of the FMA that associates a VLAN with the FMEPs.

forced-fte-interface ***fte-interface***—(Optional) Option to force the fabric ping operation to use the specified FTE interface to inject the PDU into the fabric instead of using the internal forwarding path lookup table to determine the FTE interface.

source-fmep-id ***source-fmep-id***—(Optional) ID of the FMEP that is the source of the traceroute operation.

verbose—(Optional) Detailed version of the output display.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- ping fabric unicast-flow on page 6421

List of Sample Output

traceroute fabric unicast-flow on page 6468
traceroute fabric unicast-flow (Verbose) on page 6468

Output Fields

Table 631 on page 6468 lists the output fields for the **traceroute fabric-unicast-flow** command. Output fields are listed in the approximate order in which they appear.

Table 631: traceroute fabric unicast-flow Output Fields

Field Name	Field Description
Fabric flow traceroute between source *source-fmep-name* **destination** *destination-fmep-name*	Source and destination FMEP names.
Using fabric flow-specification	Name of the flow specification.
Ethernet frame-size	Ethernet frame size.
Source-MAC	MAC address of the source FMEP interface.
Destination-MAC	MAC address of the destination FMEP interface.
Ethertype	EtherType protocol.
Received response from fmip-id, interface	FMIP identifier and interface name of the FMIP that received the PDU and responded to the source FMEP.
Received total *number* **responses**	Number of responses that are received after the traceroute operation has finished.

Sample Output

traceroute fabric unicast-flow

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8
Received response from fmep-id 2
Received total 3 responses
```

Sample Output

traceroute fabric unicast-flow (Verbose)

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1 verbose
```

```
Fabric flow traceroute between source ED1494 destination ED1497
Using fabric flow-specification: fspec1
Ethernet frame-size: 256
Source-MAC: 0:EF:7:99:85:10
Destination-MAC: 0:D3:A6:11:39:21
Ethertype: 11564
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8
Received response from fmep-id 2
Received total 3 responses
```

- Troubleshooting Procedures on page 6475

Troubleshooting Overview

- Understanding Troubleshooting Resources on page 6471
- Troubleshooting Overview on page 6473

Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 632 on page 6471 provides a list of some of the troubleshooting resources.

Table 632: Troubleshooting Resources on the QFX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	"Chassis Alarm Messages on a QFX3500 Device" on page 6488
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	*Chassis Status LEDs on a QFX3500 Device*
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	"Interface Alarm Messages" on page 6491
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	"Understanding Alarms" on page 6487

Table 632: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	• Overview of Single-Chassis System Logging Configuration on page 6155 • Junos OS System Log Configuration Statements on page 6208
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the **traceroute monitor** command to locate points of failure in a network.	• Monitoring System Process Information on page 315 • Monitoring System Properties on page 316 • **traceroute monitor**
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	*Junos OS Configuration and Operations Automation Guide*
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	*Junos XML API Operational Developer Reference*
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as **show**, **set**, and **commit** to perform those operations.	*NETCONF XML Management Protocol Guide*
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	• SNMP MIBs Support on page 6124 • SNMP Traps Support on page 6139 • *Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS*
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	*Advanced Insight Scripts (AI-Scripts) Release Notes*
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	*Service Automation*

Table 632: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	*Service Automation*
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	http://kb.juniper.net

Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

Table 633 on page 6473 provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 633: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See "Chassis Alarm Messages on a QFX3500 Device" on page 6488.
	Fan tray LED is blinking amber.	See *Fan Tray LED on a QFX3500 Device*.
	Chassis status LED for the power is blinking amber.	See *Chassis Status LEDs on a QFX3500 Device*.
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See *Chassis Status LEDs on a QFX3500 Device*.

Table 633: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	Check whether the port is a valid Gigabit Ethernet port (6 through 41). See "QFX3500 Device Overview" on page 3.
	Cannot configure a port as a Fibre Channel port.	Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47). See "QFX3500 Device Overview" on page 3.
	Cannot configure a port as a 10-Gigabit Ethernet port.	If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports. If the port is a 40-Gbps QSFP+ interface. make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See "QFX3500 Device Overview" on page 3.
	Cannot configure a 40-Gbps QSFP+ interface.	The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See "QFX3500 Device Overview" on page 3.
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them. NOTE: The management ports are on the front panel of the QFX3500 switch. They are labeled **C0** and **C1** on the front panel. In the CLI they are referred to as **me0** and **me1**. See "Configuring a QFX3500 Device as a Standalone Switch" on page 163.

Table 633: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See "Recovering from a Failed Software Installation" on page 119.
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: • Loading a Previous Configuration File on page 1600 • Reverting to the Default Factory Configuration on page 173 • Reverting to the Rescue Configuration on page 175 • Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device on page 111
	Root password is lost or forgotten.	Recover the root password. See "Recovering the Root Password" on page 1159.
Network interfaces	An aggregated Ethernet interface is down.	See "Troubleshooting an Aggregated Ethernet Interface" on page 1161.
	Interface on built-in network port is down.	See "Troubleshooting Network Interfaces" on page 1160.
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See "Troubleshooting Ethernet Switching" on page 2261.
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See "Troubleshooting Firewall Filter Configuration" on page 4873.

Troubleshooting Procedures

- Recovering from a Failed Software Installation on page 6475
- Loading a Previous Configuration File on page 6476
- Reverting to the Default Factory Configuration on page 6477
- Reverting to the Rescue Configuration on page 6478
- Recovering the Root Password on page 6478

Recovering from a Failed Software Installation

Problem **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

   Hit [Enter] to boot immediately, or space bar for command prompt.

   Press the Spacebar to enter the manual loader. The **loader>** prompt appears.
3. Enter the following command:

   `loader>` **install [– –format] [– –external]** ***source***
   where:

   - **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
   - **external**—Installs the installation package onto external media (a USB stick, for example).
   - ***source***—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
     - Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
     - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**).

   The installation now proceeds normally and ends with a login prompt.

Loading a Previous Configuration File

You can use the **rollback** <***number*** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <***number***>

Options

- **none**— Return to the most recently saved configuration.
- ***number***—Configuration to return to.

- **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
- **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

   ```
   [edit]
   user@switch# rollback 1
   load complete
   ```

2. Activate the configuration you have loaded:

   ```
   [edit]
   user@switch# commit
   ```

Related Documentation

- Configuration File Terms on page 48

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. ```
   [edit]
   user@switch# load factory-default
   [edit]
   user@switch# delete system commit factory-settings
   [edit]
   user@switch# commit
   ```

Related Documentation

- Understanding Configuration Files on page 1590
- Loading a Previous Configuration File on page 1600
- Reverting to the Rescue Configuration on page 175
   ```

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   ```
   [edit]
   user@switch# load override filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit filename
   ```

Related Documentation

- Reverting to the Default Factory Configuration on page 173
- Configuration File Terms on page 48

Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45–to–DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45–to–DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.

7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

   The terminal emulation screen on your management device displays the switch's boot sequence.
10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

    ```
    Hit [Enter] to boot immediately, or space bar for command prompt.
    Booting [kernel] in 9 seconds...
    ```
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

    ```
    ok boot -s
    ```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

    ```
    Enter full pathname of shell or 'recovery' for root password recovery or RETURN
    for /bin/sh: recovery
    ```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

    ```
    user@switch# set system root-authentication plain-text-password
    ```
15. At the following prompt, enter the new root password. For example:

    ```
    New password: juniper1
    Retype new password:
    ```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

    ```
    root@host# commit
    commit complete
    ```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.

    ```
    Reboot the system? [y/n] y
    ```

Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 632 on page 6471 provides a list of some of the troubleshooting resources.

Table 634: Troubleshooting Resources on the QFX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	"Chassis Alarm Messages on a QFX3500 Device" on page 6488
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	*Chassis Status LEDs on a QFX3500 Device*
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	"Interface Alarm Messages" on page 6491
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	"Understanding Alarms" on page 6487

Table 634: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	• Overview of Single-Chassis System Logging Configuration on page 6155 • Junos OS System Log Configuration Statements on page 6208
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the **traceroute monitor** command to locate points of failure in a network.	• Monitoring System Process Information on page 315 • Monitoring System Properties on page 316 • **traceroute monitor**
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	*Junos OS Configuration and Operations Automation Guide*
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	*Junos XML API Operational Developer Reference*
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as **show**, **set**, and **commit** to perform those operations.	*NETCONF XML Management Protocol Guide*
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	• SNMP MIBs Support on page 6124 • SNMP Traps Support on page 6139 • *Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS*
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	*Advanced Insight Scripts (AI-Scripts) Release Notes*
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	*Service Automation*

Table 634: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	*Service Automation*
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	http://kb.juniper.net

Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

Table 633 on page 6473 provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 635: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See "Chassis Alarm Messages on a QFX3500 Device" on page 6488.
	Fan tray LED is blinking amber.	See *Fan Tray LED on a QFX3500 Device*.
	Chassis status LED for the power is blinking amber.	See *Chassis Status LEDs on a QFX3500 Device*.
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See *Chassis Status LEDs on a QFX3500 Device*.

Table 635: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	Check whether the port is a valid Gigabit Ethernet port (6 through 41). See "QFX3500 Device Overview" on page 3.
	Cannot configure a port as a Fibre Channel port.	Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47). See "QFX3500 Device Overview" on page 3.
	Cannot configure a port as a 10-Gigabit Ethernet port.	If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports. If the port is a 40-Gbps QSFP+ interface. make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See "QFX3500 Device Overview" on page 3.
	Cannot configure a 40-Gbps QSFP+ interface.	The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See "QFX3500 Device Overview" on page 3.
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them. NOTE: The management ports are on the front panel of the QFX3500 switch. They are labeled **C0** and **C1** on the front panel. In the CLI they are referred to as **me0** and **me1**. See "Configuring a QFX3500 Device as a Standalone Switch" on page 163.

Table 635: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See "Recovering from a Failed Software Installation" on page 119.
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: • Loading a Previous Configuration File on page 1600 • Reverting to the Default Factory Configuration on page 173 • Reverting to the Rescue Configuration on page 175 • Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device on page 111
	Root password is lost or forgotten.	Recover the root password. See "Recovering the Root Password" on page 1159.
Network interfaces	An aggregated Ethernet interface is down.	See "Troubleshooting an Aggregated Ethernet Interface" on page 1161.
	Interface on built-in network port is down.	See "Troubleshooting Network Interfaces" on page 1160.
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See "Troubleshooting Ethernet Switching" on page 2261.
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See "Troubleshooting Firewall Filter Configuration" on page 4873.

Alarms

- Understanding Alarms on page 6487
- Chassis Alarm Messages on a QFX3500 Device on page 6488
- Interface Alarm Messages on page 6491

Understanding Alarms

The QFX Series support different alarm types and severity levels. Table 636 on page 6488 provides a list of alarm terms and definitions that may help you in monitoring the device.

Table 636: Alarm Terms and Definitions

Term	Definition
Alarm	Signal alerting you to conditions that might prevent normal operation. On the device, alarm indicators include the LCD panel and LEDs on the front. The LCD panel displays the chassis alarm message count. Blinking amber LEDs indicate yellow alarm conditions for chassis components.
Alarm condition	Failure event that triggers an alarm.

Alarm severity levels	Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).
	• Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action.
	  • One or more hardware components have failed.
	  • One or more hardware components have exceeded temperature thresholds.
	  • An alarm condition configured on an interface has triggered a critical warning.
	• Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance. For example, a missing rescue configuration generates a yellow system alarm.

Alarm types	Alarms include the following types: • Chassis alarm—Predefined alarm triggered by a physical condition on the device such as a power supply failure or excessive component temperature. • Interface alarm—Alarm you configure to alert you when an interface link is down. Applies to **ethernet**, **fibre-channel**, and **management-ethernet** interfaces. You can configure a red (major) or yellow (minor) alarm for the link-down condition, or have the condition ignored. • System alarm—Predefined alarm triggered by a missing rescue configuration or failure to install a license for a licensed software feature.

- Chassis Alarm Messages on a QFX3500 Device on page 6488
- Interface Alarm Messages on page 6491

Chassis Alarm Messages on a QFX3500 Device

Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.

The chassis alarm message count is displayed on the LCD panel on the front of the device. To view the chassis alarm message text remotely, use the **show chassis lcd** CLI command.

Chassis alarms on QFX3500 devices have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the conditions described in Table 637 on page 6489. A red alarm condition requires immediate action.

- Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

Table 637 on page 6489 describes the chassis alarm messages on QFX3500 devices.

Table 637: QFX3500 Chassis Alarm Messages

Component	Alarm Type	CLI Message	Recommended Action
Fans	Major (red)	**Fan/Blower Absent**	The fan is missing. Install a fan.
		Fan Failure	Replace the fan and report the failure to customer support.
		Fan I2C Failure	Check the system log for one of the following messages and report the error message to customer support: • **CM ENV Monitor: Get fan speed failed**. • ***Fan-number* is NOT spinning @ correct speed**, where ***fan-number*** may be 1, 2, or 3.
		Fan *fan-number* Not Spinning	Remove and check the fan for obstructions, and then reinsert the fan. If the problem persists, replace the fan.

Table 637: QFX3500 Chassis Alarm Messages *(continued)*

Component	Alarm Type	CLI Message	Recommended Action
Power supplies	Major (red)	**PEM *pem-number* Airflow not matching Chassis Airflow**	The power supply airflow direction is the opposite of the chassis airflow direction. Replace the power supply with a power supply that supports the same airflow direction as the chassis.
		PEM *pem-number* I2C Failure	Check the system log for one of the following messages and report the error message to customer support: • **I2C Read failed for device *number***, where ***number*** may be from 123 to 125. • **PS *number*: Transitioning from online to offline**, where power supply (PS) ***number*** may be 1 or 2.
		PEM *pem-number* is not powered	For information only. Check the power cord connection and reconnect it if necessary.
		PEM *pem-number* is not supported	Indicates a power supply problem, or the power supply is not supported on the device. Report the problem to customer support.
		PEM *pem-number* Not OK	Indicates a problem with the incoming AC or outgoing DC power. Replace the power supply.
	Minor (yellow)	**PEM *pem-number* Absent**	For information only. Indicates the device was powered on with two power supplies installed, but now one is missing. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.
		PEM *pem-number* Power Supply Type Mismatch	For information only. Indicates that an AC power supply and DC power supply have been installed in the same chassis. If you wish to remove this alarm message, reboot the device with two AC power supplies or two DC power supplies.
		PEM *pem-number* Removed	For information only. Indicates the device was powered on with two power supplies installed, but one has been removed. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.

Table 637: QFX3500 Chassis Alarm Messages *(continued)*

Component	Alarm Type	CLI Message	Recommended Action
Temperature sensors	Major (red)	***sensor-location*** **Temp Sensor Fail**	Check the system log for the following message and report it to customer support: **Temp sensor *sensor-number* failed**, where *sensor-number* may range from 1 through 10.
		sensor-location **Temp Sensor Too Hot**	Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor. If the condition persists, the device may shut down.
	Minor (yellow)	***sensor-location*** **Temp Sensor Too Warm**	For information only. Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor.

Related Documentation

- *Front Panel of a QFX3500 Device*
- Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types on page 147
- alarm on page 2554

Interface Alarm Messages

Interface alarms are alarms that you configure to alert you when an interface is down.

To configure an interface link-down condition to trigger a red or yellow alarm, or to configure the link-down condition to be ignored, use the alarm statement at the [**edit chassis**] hierarchy level. You can specify the **ethernet**, **fibre-channel**, or **management-ethernet** interface type.

NOTE: **Fibre Channel alarms are only valid on QFX3500 devices.**

By default, major alarms are configured for interface link-down conditions on the control plane and management network interfaces in a QFabric system. The link-down alarms indicate that connectivity to the control plane network is down. You can configure these alarms to be ignored using the alarm statement at the [**edit chassis**] hierarchy level.

NOTE: If you configure a yellow alarm on the QFX3008-I Interconnect device, it will be handled as a red alarm.

- Pinging Hosts on page 6503

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                          Value State

 32768 Health Monitor: root file system utilization
       jnxHrStoragePercentUsed.1                        58 active

 32769 Health Monitor: /config file system utilization
       jnxHrStoragePercentUsed.2                         0 active
```

```
 32770 Health Monitor: RE 0 CPU utilization
       jnxOperatingCPU.9.1.0.0                          0 active

 32773 Health Monitor: RE 0 Memory utilization
       jnxOperatingBuffer.9.1.0.0                      35 active

 32775 Health Monitor: jkernel daemon CPU utilization
       Init daemon                                      0 active
       Chassis daemon                                  50 active
       Firewall daemon                                  0 active
       Interface daemon                                 5 active
       SNMP daemon                                     11 active
       MIB2 daemon                                     42 active
       ...
```

The following example provides sample output from the **show snmp mib** command:

user@switch> show snmp mib walk system

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx

Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

user@switch> show snmp statistics

```
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 0, Total set varbinds: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
    Throttle drops: 0, Duplicate request drops: 0
    Output:
    Packets: 0, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0
```

- show snmp statistics on page 1859

Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named ***filename*** reaches its maximum size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
    file <files number> <match regular-expression> <size size> <world-readable |
        no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

These statements are described in the following sections:

- Configuring the Number and Size of SNMP Log Files on page 6496
- Configuring Access to the Log File on page 6496
- Configuring a Regular Expression for Lines to Be Logged on page 6496
- Configuring the Trace Operations on page 6496

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until there are three trace files. Then the oldest trace file (***filename*.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (***filename***) reaches 2 MB, ***filename*** is renamed ***filename*.0**, and a new file called ***filename*** is created. When the new ***filename*** reaches 2 MB, ***filename*.0** is renamed ***filename*.1** and ***filename*** is renamed ***filename*.0**. This process repeats until there are 20 trace files. Then the oldest file (***filename*.19**) is overwritten by the newest file (***filename*.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
   all;
```

```
    configuration;
    database;
    events;
    general;
    interface-stats;
    nonvolatile-sets;
    pdu;
    policy;
    protocol-timeouts;
    routing-socket;
    server;
    subagent;
    timer;
    varbind-error;
}
```

Table 613 on page 6395 describes the meaning of the SNMP tracing flags.

Table 638: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the **[edit snmp]** hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off

Table 638: SNMP Tracing Flags *(continued)*

Flag	Description	Default Setting
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log *agent*d | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where ***agent*** is the name of an SNMP agent.

Monitoring RMON MIB Tables

Purpose Monitor remote monitoring (RMON) alarm, event, and log tables.

Action To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                          Value State

     5 monitor
       jnxOperatingCPU.9.1.0.0                           5 falling threshold

Event
Index  Type                        Last Event
    1  log and trap                2010-07-10 11:34:17 PDT
Event Index: 1
    Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
    Time: 2010-07-10 11:34:07 PDT
    Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
    Time: 2010-07-10 11:34:17 PDT
```

Meaning The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

user@switch> **show log** *log-filename*
user@switch> **file show** *log-file-pathname*

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30  switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
 10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30  switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
 AS 100): Can't assign requested address
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
```

```
SNMP trap: cold start
...
```

Monitoring System Log Messages

Purpose Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

Action To view system log messages:

```
user@switch1> show log messages
```

Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

Meaning The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user **jsmith**.

Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6501
2. Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6501

Displaying Real-Time Statistics About All Interfaces on the Router or Switch

Purpose Display real-time statistics about traffic passing through all interfaces on the router or switch.

Action To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

Sample Output

```
user@host> monitor interface traffic
host name                  Seconds: 15                 Time: 12:31:09
Interface    Link  Input packets        (pps)     Output packets        (pps)
 so-1/0/0    Down              0          (0)                  0          (0)
 so-1/1/0    Down              0          (0)                  0          (0)
 so-1/1/1    Down              0          (0)                  0          (0)
 so-1/1/2    Down              0          (0)                  0          (0)
 so-1/1/3    Down              0          (0)                  0          (0)
 t3-1/2/0    Down              0          (0)                  0          (0)
 t3-1/2/1    Down              0          (0)                  0          (0)
 t3-1/2/2    Down              0          (0)                  0          (0)
 t3-1/2/3    Down              0          (0)                  0          (0)
 so-2/0/0      Up         211035          (1)              36778          (0)
 so-2/0/1      Up         192753          (1)              36782          (0)
 so-2/0/2      Up         211020          (1)              36779          (0)
 so-2/0/3      Up         211029          (1)              36776          (0)
 so-2/1/0      Up         189378          (1)              36349          (0)
 so-2/1/1    Down              0          (0)              18747          (0)
 so-2/1/2    Down              0          (0)              16078          (0)
 so-2/1/3      Up              0          (0)              80338          (0)
 at-2/3/0      Up              0          (0)                  0          (0)
 at-2/3/1    Down              0          (0)                  0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

Meaning The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

Displaying Real-Time Statistics About an Interface on the Router or Switch

Purpose Display real-time statistics about traffic passing through an interface on the router or switch.

Action To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

user@host> **monitor interface** ***interface-name***

Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:                  5856541 (88 bps)
  Output bytes:                 6271468 (96 bps)
  Input packets:                 157629 (0 pps)
  Output packets:                157024 (0 pps)
Encapsulation statistics:
  Input keepalives:               42353
  Output keepalives:              42320
  LCP state: Opened
Error statistics:
  Input errors:                       0
  Input drops:                        0
  Input framing errors:               0
  Input runts:                        0
  Input giants:                       0
  Policed discards:                   0
  L3 incompletes:                     0
  L2 channel errors:                  0
  L2 mismatch timeouts:               0
  Carrier transitions:                1
  Output errors:                      0
  Output drops:                       0
  Aged packets:                       0
Active alarms : None
Active defects: None
SONET error counts/seconds:
  LOS count                           1
  LOF count                           1
  SEF count                           1
  ES-S                               77
  SES-S                              77
SONET statistics:
  BIP-B1                              0
  BIP-B2                              0
  REI-L                               0
  BIP-B3                              0
  REI-P                               0
Received SONET overhead:  F1        : 0x00  J0        : 0xZ
```

Meaning The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in Table 612 on page 6388.

Table 639: Output Control Keys for the monitor interface Command

Action	Key
Display information about the next interface. The **monitor interface** command scrolls through the physical or logical interfaces in the same order that they are displayed by the **show interfaces terse** command.	**N**
Display information about a different interface. The command prompts you for the name of a specific interface.	**I**
Freeze the display, halting the display of updated statistics.	**F**
Thaw the display, resuming the display of updated statistics.	**T**
Clear (zero) the current delta counters since **monitor interface** was started. It does not clear the accumulative counter.	**C**
Stop the **monitor interface** command.	**Q**

See the CLI Explorer for details on using match conditions with the **monitor traffic** command.

Pinging Hosts

Purpose Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

Action To use the **ping** command to send four requests (ping count) to **host3**:

ping *host* count *number*

Sample Output

ping host3 count 4

```
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

Meaning

- The **ping** results show the following information:
  - Size of the ping response packet (in bytes).
  - IP address of the host from which the response was sent.

- Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
- Time-to-live (ttl) hop-count value of the ping response packet.
- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

CHAPTER 73

- High Availability on page 6515
- Interfaces on page 6516
- Junos OS Basics on page 6522
- Layer 3 Protocols on page 6536
- Security on page 6537
- Services on page 6547
- Storage on page 6550
- Traffic Management on page 6555

Configuration and File Management

- Loading a Previous Configuration File on page 6505
- Reverting to the Default Factory Configuration on page 6506
- Reverting to the Rescue Configuration on page 6507
- Cleaning Up the System File Storage Space on page 6507

Loading a Previous Configuration File

You can use the **rollback** <***number*** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <*number*>

Options

- **none**— Return to the most recently saved configuration.
- ***number***—Configuration to return to.

- **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
- **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

   ```
   [edit]
   user@switch# rollback 1
   load complete
   ```

2. Activate the configuration you have loaded:

   ```
   [edit]
   user@switch# commit
   ```

Related Documentation

- Configuration File Terms on page 48

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. ```
   [edit]
   user@switch# load factory-default
   [edit]
   user@switch# delete system commit factory-settings
   [edit]
   user@switch# commit
   ```

Related Documentation

- Understanding Configuration Files on page 1590
- Loading a Previous Configuration File on page 1600
- Reverting to the Rescue Configuration on page 175
   ```

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   ```
   [edit]
   user@switch# load override filename
   ```

2. Commit your changes.

   ```
   [edit]
   user@switch# commit filename
   ```

Cleaning Up the System File Storage Space

Problem **Description:** The system file storage space on the switch is full. Rebooting the switch does not solve the problem.

The following error message is displayed during a typical operation on the switch after the file storage space is full.

```
user@switch% cli
user@switch> configure
/var: write failed, filesystem is full
```

Solution Clean up the file storage on the switch by deleting system files.

1. Request to delete system files on the switch.

   ```
   user@switch> request system storage cleanup
   ```

   The list of files to be deleted is displayed.

   ```
   List of files to delete:

            Size Date         Name
      11B Jul 26 20:55 /var/jail/tmp/alarmd.ts
     124B Aug  4 18:05 /var/log/default-log-messages.0.gz
    1301B Jul 26 20:42 /var/log/install.0.gz
     387B Jun  3 14:37 /var/log/install.1.gz
    4920B Aug  4 18:05 /var/log/messages.0.gz
    20.0K Jul 26 21:00 /var/log/messages.1.gz
    16.3K Jun 25 13:45 /var/log/messages.2.gz
     804B Aug  4 18:05 /var/log/security.0.gz
    16.8K Aug  3 11:15 /var/log/security.1.gz
   ```

```
   487B Aug  4 18:04 /var/log/wtmp.0.gz
   855B Jul 29 22:54 /var/log/wtmp.1.gz
   920B Jun 30 16:32 /var/log/wtmp.2.gz
    94B Jun  3 14:36 /var/log/wtmp.3.gz
 353.2K Jun  3 14:37 /var/sw/pkg/jloader-qfx-11.2I20110303_1117_dc-builder.tgz

 124.0K Jun  3 14:30 /var/tmp/gres-tp/env.dat
     0B Apr 14 16:20 /var/tmp/gres-tp/lock
     0B Apr 14 17:37 /var/tmp/if-rtsdb/env.lck
  12.0K Jul 26 20:55 /var/tmp/if-rtsdb/env.mem
2688.0K Jul 26 20:55 /var/tmp/if-rtsdb/shm_usr1.mem
 132.0K Jul 26 20:55 /var/tmp/if-rtsdb/shm_usr2.mem
2048.0K Jul 26 20:55 /var/tmp/if-rtsdb/trace.mem
   155B Jul 26 20:55 /var/tmp/krt_gencfg_filter.txt
     0B Jul 26 20:55 /var/tmp/rtsdb/if-rtsdb
1400.6K Aug  3 10:13 /var/tmp/sfid.core.0.gz
1398.9K Aug  3 17:01 /var/tmp/sfid.core.1.gz
Delete these files ? [yes,no] (no)
```

2. Enter **yes** to delete the files.
3. Reboot the switch.

BEST PRACTICE: We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch.

Troubleshooting Ethernet Switching

Problem

Description: Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by

issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

Solution Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

   ```
   [edit system arp]
   user@switch# set aging-timer 3
   ```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

   ```
   [edit vlans]
   user@switch# set vlans sales mac-table-aging-time 180
   ```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

Troubleshooting Layer 2 Protocol Tunneling

- Drop Threshold Statistics Might Be Incorrect on page 6509
- Egress Filtering of L2PT Traffic Not Supported on page 6509

Drop Threshold Statistics Might Be Incorrect

Problem **Description:** L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets will not be reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit are not reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

Solution This is expected behavior.

Egress Filtering of L2PT Traffic Not Supported

Problem **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a

firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

Solution This is expected behavior.

Troubleshooting Private VLANs

Use the following information to troubleshoot a private VLAN configuration.

- Limitations of Private VLANs on page 6510
- Forwarding with Private VLANs on page 6510
- Egress Firewall Filters with Private VLANs on page 6511
- Egress Port Mirroring with Private VLANs on page 6512

Limitations of Private VLANs

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

Forwarding with Private VLANs

Problem **Description:**

- When isolated VLAN or community VLAN tagged traffic is received on a PVLAN trunk port, MAC addresses are learned from the primary VLAN. This means that output from the **show ethernet-switching table** command shows that MAC addresses are learned from the primary VLAN and replicated to secondary VLANs. This behavior has no effect on forwarding decisions.
- If a packet with a secondary VLAN tag is received on a promiscuous port, it is accepted and forwarded.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
  - The packet has a community VLAN tag.
  - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on an isolated VLAN.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.

- The packet has an isolated VLAN tag.
- The packet is destined to a unicast MAC address or multicast group MAC address that was learned on a community VLAN.

- If a packet with a primary VLAN tag is received by a secondary (isolated or community) VLAN port, the secondary port forwards the packet.
- If you configure a community VLAN on one device and configure another community VLAN on a second device and both community VLANs use the same VLAN ID, traffic for one of the VLANs can be forwarded to the other VLAN. For example, assume the following configuration:
  - Community VLAN comm1 on switch 1 has VLAN ID 50 and is a member of primary VLAN pvlan100.
  - Community VLAN comm2 on switch 2 also has VLAN ID 50 and is a member of primary VLAN pvlan200.
  - Primary VLAN pvlan100 exists on both switches.

  If traffic for comm1 is sent from switch 1 to switch 2, it will be sent to the ports participating in comm2. (The traffic will also be forwarded to the ports in comm1, as you would expect.)

Solution These are expected behaviors.

Egress Firewall Filters with Private VLANs

Problem **Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port

- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

Solution These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

Egress Port Mirroring with Private VLANs

Problem **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

Solution This is expected behavior.

Troubleshooting Q-in-Q and VLAN Translation Configuration

- Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 6513
- Egress Port Mirroring with VLAN Translation on page 6513

Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

Problem

Description: If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

Solution

This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statemen at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same Ethertype.

Egress Port Mirroring with VLAN Translation

Problem

Description: If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

Solution

This is expected behavior.

Hardware

- Troubleshooting QFX3100 Director Device Isolation on page 6514

Troubleshooting QFX3100 Director Device Isolation

Problem **Description:** Both connections between the QFX3100 Director devices are broken so that one of the Director devices in a Director group becomes isolated from the group.

The redundant patch cables interconnecting the Director devices are critical links required for the operation of the Director group. The two inter-Director device links must remain connected when the Director devices are online. After the Director devices are installed and the Director group is active, if a single inter-Director device link loses and regains its connection, the operation of the Director group remains intact. However, the loss of both inter-Director device links causes one Director device to isolate itself from the Director group.

WARNING: **Do not reconnect the inter-Director patch cables before properly restarting the isolated Director device. Restarting the active Director device instead of the isolated Director device can result in both Director devices rebooting, with a subsequent data loss.**

Environment: This problem occurs between the two QFX3100 Director devices found in QFabric systems.

Symptoms: Symptoms of this problem include an unscheduled rebooting of one of the Director devices.

Resolution ***Determine Which Director Device Is Isolated***

Before restoring the inter-Director device links, determine which one of the Director devices is in isolation.

To locate an isolated Director device, use one of the following methods:

- Review logs or management tools for standard SNMP traps issued from the Director group before the Director device became isolated.
  - If eth-2/6 links are down, the Director group cannot communicate. Normally, one of the devices reboots.
  - If both eth-2/6 and eth-7/8/9 links are down, the Director device is isolated from the control plane and is not providing fabric services.
    - Issue **show fabric session-host**.
- Use the CLI to determine the serial numbers of the active Director device.
  - Issue the **show fabric session-host** command.

```
root@qfabric>show fabric session-host
Identifier: 0281042010000013
```

- Issue the **show fabric administration inventory director-group status | grep “dg0|dg1”** command.

  root@qfabrid> **show fabric administration inventory director-group status | grep “dg0|dg1”**

  ```
  dg0 online master  10.94.214.80   0%   13597976k  4  4 days, 22:36 hrs
  dg1 online master  10.94.214.81   0%   18677380k  3  4 days, 22:25 hrs
  dg0  0281042010000013  online  master
  dg1  0281042010000018  online  backup
  ```

  When the Director devices cannot communicate, the **show fabric administration inventory director-group** command only displays the Director device that is online.

Power Off the Isolated Director Device and Restore the Inter-Director Device Links

CAUTION: Be sure you know which Director device is active and which is isolated. If you power off the active Director device, both Director devices reboot and cause potential data loss on the system.

To restore communication within the Director group:

1. Power off the isolated Director device.
2. Restore the inter-Director device links (port **3** to port **3**) by firmly inserting the redundant patch cables.
3. Power on the previously isolated Director device. The Director device reboots.

- *Connecting QFX3100 Director Devices in a Director Group*

High Availability

- Troubleshooting VRRP on page 6515

Troubleshooting VRRP

Problem **Description:** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

Solution Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

Related Documentation

- Troubleshooting Network Interfaces on page 6516
- Troubleshooting Multichassis Link Aggregation on page 6517

Troubleshooting an Aggregated Ethernet Interface

Problem **Description:** The **show interfaces terse** command shows that the LAG is down.

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

Troubleshooting Network Interfaces

The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

Problem **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

Symptoms: When you check the status with the CLI command **show interfaces** ***interface-name*** , the disabled port is not listed.

Cause By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

Solution Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

- AE Interfaces Go Down on page 6522
- Flooding of Upstream Traffic on page 6522

MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

Problem **Description:** When both of the mulitchassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table.

For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
  VLAN             MAC address       Type         Age Interfaces
  v10               *                 Flood          - All-members
  v10               00:10:94:00:00:01 Learn(L)     3:55 ae0.0 (MCAE)
```

```
  v10              00:10:94:00:00:02 Learn(R)        0 xe-0/0/9.0
  v20              *                 Flood          - All-members
  v30              *                 Flood          - All-members
  v30              84:18:88:de:b1:2e Static         - Router

user@switchB> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
  VLAN             MAC address       Type         Age Interfaces
  v10              *                 Flood          - All-members
  v10              00:10:94:00:00:01 Learn(R)       0 ae0.0 (MCAE)
  v10              00:10:94:00:00:02 Learn         40 xe-0/0/10.0
  v20              *                 Flood          - All-members
  v30              *                 Flood          - All-members
  v30              84:18:88:df:83:0a Static         - Router
```

Solution This is expected behavior.

MC-LAG Peer Does Not Go into Standby Mode

Problem **Description:** A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

Solution To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

Problem **Description:** When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

Solution This is expected behavior.

Redirect Filters Take Priority over User-Defined Filters

Problem **Description:** Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

Solution This is expected behavior.

Operational Command Output Is Wrong

Problem **Description:** After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
  Redundancy Group IDs Joined: None

Client Application: lacpd
  Redundancy Group IDs Joined: 1

Client Application: eswd
  Redundancy Group IDs Joined: 1
```

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

Solution This is expected behavior.

ICCP Connection Might Take Up to 60 Seconds to Become Active

Problem **Description:** When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

Solution This is expected behavior.

MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

Problem **Description:** When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
  VLAN              MAC address       Type         Age Interfaces
  v100              *                 Flood          - All-members
  v100              00:10:00:00:00:01 Learn(L)     0 ae0.0 (MCAE)
  v100              00:10:00:00:00:02 Learn(L)     0 ae0.0 (MCAE)
```

Solution This is expected behavior.

MAC Address Is Not Learned Remotely in a Default VLAN

Problem **Description:** If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

Solution This is expected behavior.

Snooping Entries Learned on MC-AE Interfaces Are Not Removed

Problem **Description:** When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down. This is done to speed up convergence time when the interfaces come up, or come up and go down.

Solution This is expected behavior.

ICCP Does Not Come Up After You Add or Delete an Authentication Key

Problem **Description:** The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

Solution Delete the ICCP configuration , and then add the ICCP configuration.

Local Status Is Standby When It Should Be Active

Problem **Description:** If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

Solution This is expected behavior.

Packets Loop on the Server When ICCP Fails

Problem **Description:** When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

Solution This is expected behavior.

Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

Problem **Description:** After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

Solution This is expected behavior.

No Commit Checks Are Done for ICL-PL Interfaces

Problem **Description:** There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

Solution This is expected behavior.

Double Failover Scenario

Problem **Description:** If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

Solution This is expected behavior.

Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

Problem **Description:** When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag Ip4McastFloodMode for the VLAN is changed to MCAST_FLOOD_ALL. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

Solution This is expected behavior.

Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

Problem **Description:** When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

Solution This is expected behavior.

AE Interfaces Go Down

Problem **Description:** When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

Solution Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

Flooding of Upstream Traffic

Problem **Description:** When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

Solution Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
  <[Enter]>            Execute this command
  at                   Time at which to perform the operation
  in                   Number of minutes to delay before operation
  media                Boot media for next boot
  message              Message to display to all users
  |                    Pipe through a command
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
  <[Enter]>            Execute this command
  at                   Time at which to perform the operation
  in                   Number of minutes to delay before operation
  media                Boot media for next boot
  message              Message to display to all users
  |                    Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says "Hardware-based members will halt, Virtual Junos Routing Engines will reboot." If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Recovering from a Failed Software Installation

Problem **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

   Hit [Enter] to boot immediately, or space bar for command prompt.

   Press the Spacebar to enter the manual loader. The **loader>** prompt appears.
3. Enter the following command:

   `loader>` **install [– –format] [– –external]** ***source***
   where:

   - **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
   - **external**—Installs the installation package onto external media (a USB stick, for example).
   - ***source***—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
     - Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
     - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**).

   The installation now proceeds normally and ends with a login prompt.

Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: **The root password cannot be recovered on a QFabric system.**

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45–to–DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45–to–DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

   The terminal emulation screen on your management device displays the switch's boot sequence.
10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

    ```
    Hit [Enter] to boot immediately, or space bar for command prompt.
    Booting [kernel] in 9 seconds...
    ```
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

    ```
    ok boot -s
    ```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

    ```
    Enter full pathname of shell or 'recovery' for root password recovery or RETURN
    for /bin/sh: recovery
    ```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from http://www.juniper.net/customers/support/ .

NOTE: In the following procedure, we assume that you are creating the emergency boot device on a QFX3500 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX3500 device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the QFX3500 device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

NOTE: The password is the root password for the QFX3500 device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command:

   ```
   root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
   ```

   The device writes the installation media image to the USB device:

   ```
   root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
   11006+1 records in
   11006+1 records out
   180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
   ```

6. Log out of the shell:

   ```
   root@device% exit
   % exit
   user@device>
   ```

Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See "Creating an Emergency Boot Device for a QFX Series Device" on page 165 for information on how to create an emergency boot device.
2. Copy the existing configuration in the file **/config/juniper.conf.gz** from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named **/config/juniper.conf.*n***, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

   

   WARNING: **The recovery installation process completely overwrites the entire contents of the internal flash storage.**
3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

   

   NOTE: **Do not power off the device if it is already on.**

   ```
   [edit system]
   user@device> request system reboot
   ```

   If you do not have access to the CLI, power cycle the QFX Series device.

   The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.
3. The software prompts you with the following options:

   ```
   External USB install media detected.
   You can load Junos from this media onto an internal drive.
   Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
   Do you wish to continue ([y]/f/n)? f
   ```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

   If you do no want to format the internal flash storage, type **y**.

   The following messages are displayed:

   ```
   Installing packages from external USB drive da1
   Packages will be installed to da0, media size: 8G

   Processing format options
   Fri September  4 01:18:44 UTC 2012

   -- IMPORTANT INFORMATION --
   Installer has detected settings to format system boot media.
   This operation will erase all data from your system.

   Formatting installation disk .. this will take a while, please wait
   Disabling platform watchdog - threshold 12 mins

   Determining installation slice
   Fri September  4 01:27:07 UTC 2012
   ```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

   When the device is finished copying the software, you are presented with the following prompt:

   ```
   *** Fri September  4 01:19:00 UTC 2012***
   Installation successful..
   Please select one of the following options:
   Reboot to installed Junos after removing install media (default) ... 1
   Reboot to installed Junos by disabling install media ............... 2
   Exit to installer debug shell ..................................... 3
   Install Junos to alternate slice .................................. 4
   Your choice: 4
   NOTE: System installer will now install Junos to alternate slice
   Do not power off or remove the external installer media or
   interrupt the installation mechanism.
   ```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.

7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.

8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

   You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

   Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

   ```
   user@switch> request system software configuration-backup path
   ```

NOTE: To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 6530
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 6532

(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.

5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install media you want to download in the **QFabric System Install Media** section.

   A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.

    ftp ftp://*hostname/pathname install-media-qfabric-<version>*.img.tgz
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.

    binary
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

    get *install-media-qfabric-<version>*.img.tgz
14. Close the FTP session:

    bye
15. Untar the *install-media-qfabric-<version>* .img.tgz file on your UNIX workstation.

    ```
    tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
    ```
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

    dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
    ```
    250880+0 records in
    250880+0 records out
    4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
    ```
18. Perform the steps in "Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software" on page 115 to continue with the recovery installation.

Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

NOTE: Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
   - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
   - If you do not have access to the default partition, power cycle the Director device.

   The following menu appears on the Director device console when the Director device boots up:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```

3. Type **install** and then press **Enter** to install the software on the Director device.

   Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```

4. Press **Enter**.

   The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

   The following menu appears on the Director device console:

   ```
   Before you can access the QFabric system, you must complete the initial setup
    of the Director group by using the steps that follow.
   If the initial setup procedure does not complete successfully, log out of the
    Director device and then log back in to restart
    this setup menu.

   Continue?[y/n]
   ```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the **mount** directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root       4096 Sep  7 05:16 .
drwxr-xr-x 3 root root       4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root       4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

    The following menu appears:

```
Before you can access the QFabric system, you must complete the initial setup
 of the Director group by using the steps that follow.
If the initial setup procedure does not complete successfully, log out of the
 Director device and then log back in to restart
 this setup menu.

Continue?[y/n] y
Initial Configuration

You may enter the configuration manually or restore from a backup.

Specify a backup file? [y/n] : y
Please specify the full path of the configuration backup file. :
/mnt/myusb/mybackup-20110907
```

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

    The following messages appear:

```
Saving temporary configuration...

Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

Direct Routes Not Leaked Between Routing Instances

Problem

Description: Direct routes are not exported (leaked) between virtual routing instances For example, consider the following scenario:

- QFX switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the QFX switch connects to the upstream device over a direct route and these routes are not leaked between instances.

NOTE: You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the QFX switch over indirect routes.

Solution

This is expected behavior.

Firewall Filter Configuration Returns a No Space Available in TCAM Message

Problem **Description:** When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

Solution When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN , or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

   Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

NOTE: The original filter is not deleted and is still available in the configuration.

Filter Counts Previously Dropped Packet

Problem **Description:** If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:

- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
- You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

Solution This is expected behavior.

Matching Packets Not Counted

Problem **Description:** If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet.

For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **admin**VLAN, and interface xe-0/0/1 is a member of that VLAN.

- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

Solution This is expected behavior.

Counter Reset When Editing Filter

Problem **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

Solution This is expected behavior.

Cannot Include loss-priority and policer Actions in Same Term

Problem **Description:** You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: “cannot support policer action if loss-priority is configured.”

Solution This is expected behavior.

Cannot Egress Filter Certain Traffic Originating on QFX Switch

Problem **Description:** On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

Solution This is expected behavior.

Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

Problem **Description:** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

Solution This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statemen at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same Ethertype.

Egress Firewall Filters with Private VLANs

Problem **Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).

- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

Solution These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

Egress Filtering of L2PT Traffic Not Supported

Problem **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

Solution This is expected behavior.

Cannot Drop BGP Packets in Certain Circumstances

Problem **Description:** BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

Solution This is expected behavior.

Invalid Statistics for Policer

Problem **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

Solution This is expected behavior.

Policers can Limit Egress Filters

Problem **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional

egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters. Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

Solution You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

- Policers Can Limit Egress Filters on page 6546

Incomplete Count of Packet Drops

Problem **Description:** Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

Solution This is expected behavior.

Counter Reset When Editing Filter

Problem **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

Solution This is expected behavior.

Invalid Statistics for Policer

Problem **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

Solution This is expected behavior.

Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

Problem **Description:** If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate

might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/2 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

Solution This is expected behavior.

Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

Problem **Description:** You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and

reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

Solution To prevent this unexpected behavior, use the information about TCAM slices presented in "Planning the Number of Firewall Filters to Create" on page 4658 to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

Policers Can Limit Egress Filters

Problem **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

Solution You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.

- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

- Egress Port Mirroring with Private VLANs on page 6549

Port Mirroring Constraints and Limitations

- Local and Remote Port Mirroring on page 6547
- Remote Port Mirroring Only on page 6549

Local and Remote Port Mirroring

The following constraints and limitations apply to local and remote port mirroring with the QFX Series:

- You can create a total of four port-mirroring configurations on a QFX Series standalone switch.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

NOTE: On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer** *name* **output** statement:
  - **interface**
  - **ip-address**
  - **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a QFX3500 device or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

Remote Port Mirroring Only

The following constraints and limitations apply to remote port mirroring with the QFX Series:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

Egress Port Mirroring with VLAN Translation

Problem **Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

Solution This is expected behavior.

Egress Port Mirroring with Private VLANs

Problem **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

Solution This is expected behavior.

Troubleshooting Dropped FCoE Traffic

Problem **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

Cause There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.
5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.

6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

Solution The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

   If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

   If you explicitly configured a forwarding class for FCoE traffic, ensure that:

   - You specified the **no-loss** packet drop attribute in the forwarding class configuration
   - The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
   - The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

   For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2500
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces** *interface-name*.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the ***scheduler-name***) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

   Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the ***traffic-control-profile***) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.

7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See "Example: Configuring CoS PFC for FCoE Traffic" on page 5113 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

Troubleshooting Fibre Channel Interface Deletion

Problem **Description:** You deleted a Fibre Channel (FC) interface at the **[edit interfaces]** hierarchy level, but the commit check fails so the interface is not deleted.

Cause You must first delete the FC interface from the FC fabric on the QFX Series before you can delete the FC interface at the **[edit interfaces]** hierarchy level. You must perform both operations to delete a FC interface.

Solution First delete the interface from the FC fabric and then delete the interface from the QFX Series:

1. Delete the FC interface from the FC fabric to which it belongs:

   ```
   [edit]
   user@switch# delete fc-fabrics fabric-name interface interface-name
   ```

   For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

   ```
   [edit]
   user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
   ```

2. Delete the FC interface at the **[edit interfaces]** hierarchy level:

   ```
   [edit]
   user@switch: delete interfaces interface-name
   ```

   For example, to delete the interface **fc-0/0/3.0** from the switch:

   ```
   [edit]
   user@switch: delete interfaces fc-0/0/3.0
   ```

Troubleshooting Dropped FIP Traffic

Problem **Description:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) traffic such as FIP VLAN discovery and notification frames is dropped on the QFX Series.

Cause The interface on which the FIP traffic is dropped does not have a native VLAN configured. FIP VLAN discovery and notification messages are exchanged as untagged packets on the native VLAN. (After the FCoE session with the Fibre Channel switch is established, FCoE traffic uses the FCoE VLAN.)

Solution Check to ensure that every 10-Gigabit Ethernet interface that connects to an FCoE device includes a native VLAN. Configure a native VLAN on all 10-Gigabit Ethernet interfaces that connect to FCoE devices.

NOTE: Make sure that the native VLAN you are using on the QFX Series is the same native VLAN that the FCoE devices use for Ethernet traffic.

To configure a native VLAN on an interface:

1. Set the interface port mode to **tagged-access** if you have not already done so:

   ```
   [edit]
   ```

```
user@switch# set interfaces interface unit unit family ethernet-switching port-mode
tagged-access
```

For example, to set the port mode to **tagged-access** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure a native VLAN on the interface:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching native-vlan-id
vlan-id
```

For example, to set the native VLAN ID to **1** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
```

3. Configure the native VLAN if it does not already exist:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

For example, to name the native VLAN **native** and use the VLAN ID **1**:

```
[edit]
user@switch# set vlans native vlan-id 1
```

Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

Problem **Description:** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

Solution When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

Problem **Description:** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

NOTE: The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

Solution When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

Troubleshooting Egress Queue Bandwidth Impacted by Congestion

Problem **Description:** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

Cause Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

Solution The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

Troubleshooting an Unexpected Rewrite Value

Problem **Description:** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

NOTE: For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

Cause If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

Solution If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

TIP: If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

NOTE: There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

   ```
   [edit class-of-service rewrite-rules]
   ```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

Problem **Description:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

Cause Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

Solution If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

   ```
   [edit class-of-service]
   user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
   ```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps scheduler-map-name forwarding-class
   forwarding-class-name scheduler scheduler-name
   ```

3. Associate the scheduler map with a traffic control profile:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
   scheduler-map-name
   ```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name forwarding-class-set fc-set-name
   output-traffic-control-profile traffic-control-profile-name
   ```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues. Table 581 on page 6073 shows the topology for this example:

Table 640: Components of the Rate Shaping Troubleshooting Example

Component	Settings
Affected interface	**shpnode:xe-0/0/10**
Scheduler (strict-high priority scheduler)	Name: **shp-sched** Shaping rate: **7g** Priority: **strict-high** NOTE: This example assumes that the scheduler already exists and has been configured as **strict-high** priority, but that rate shaping to prevent the strict-high priority traffic from using all of the port bandwidth has not been applied.
Scheduler map	Name: **shp-map** Forwarding class to associate with the **shp-sched** scheduler: **strict-high** NOTE: This example assumes that a strict-high priority forwarding class has been configured and assigned the name **strict-high**.
Traffic control profile	Name: **shp-tcp** NOTE: This example does not describe how to define a complete traffic control profile.

Table 640: Components of the Rate Shaping Troubleshooting Example *(continued)*

Component	Settings
Forwarding class set	Name: **shp-pg**

To configure the scheduler, map it to the strict-high priority forwarding class, and apply it to interface **shpnode:xe-0/0/10** using the CLI:

1. Specify the scheduler for the strict-high priority queue (**shp-sched**) with a maximum bandwidth of 7 Gbps:

   ```
   [edit class-of-service schedulers]
   user@switch# set shp-sched shaping-rate 7g
   ```

2. Configure a scheduler map (**shp-map**) that associates the scheduler (**shp-sched**) with the forwarding class (**strict-high**):

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set shp-map forwarding-class strict-high scheduler shp-sched
   ```

3. Associate the scheduler map **shp-map** with a traffic control profile (**shp-tcp**):

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set shp-tcp scheduler-map shp-map
   ```

4. Associate the traffic control profile **shp-tcp** with a forwarding class set (**shp-pg**) and the affected interface (**shpnode:xe-0/0/10**):

   ```
   [edit class-of-service]
   user@switch# set interfaces shpnode:xe-0/0/10 forwarding-class-set shp-pg
   output-traffic-control-profile shp-tcp
   ```
