  3. The unicast classifier that maps traffic with code point **011** to the **fcoe** forwarding class is mapped to interface **xe-0/0/1**:

     `user@switch#` **set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast_cl**

  4. The multidestination classifier that maps traffic with code point **011** to the **mcast** forwarding class is mapped to all interfaces (multidestination traffic maps to all interfaces and cannot be mapped to individual interfaces):

     `user@switch#` **set class-of-service multi-destination classifiers ieee-802.1 mcast-cl**

Because the same code point (**011**) maps unicast traffic to a lossless traffic flow and also maps multidestination traffic to a multidestination traffic flow, the multidestination traffic flow might experience ingress port congestion during periods of congestion.

To avoid ingress port congestion, do not map the code point used by the multidestination traffic to lossless unicast traffic. For example:

1. Instead of classifying code point **011** into the **fcoe** forwarding class, classify code point **011** into the **best-effort** forwarding class:

   `user@switch#` **set class-of-service classifiers ieee-802.1 ucast_cl forwarding-class best-effort loss-priority low code-points 011**

2. `user@switch#` **set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast loss-priority low code-points 011**
3. `user@switch#` **set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast_cl**
4. `user@switch#` **set class-of-service multi-destination classifiers ieee-802.1 mcast-cl**

   Because the code point **011** does not map unicast traffic to a lossless traffic flow, the multidestination traffic flow does not experience ingress port congestion during periods of congestion.

The best practice is to classify unicast traffic with IEEE 802.1p code points that are also used for multidestination traffic into best-effort forwarding classes.

Understanding CoS Buffer Configuration

Each QFX3500 and QFX3600 switch has 9 MB of Packet Forwarding Engine (PFE) wide common packet buffer memory that is used to store packets on interface queues. Each QFX5100 switch has 12 MB of PFE wide common packet buffer memory. The buffer memory has separate ingress and egress accounting to make accept, drop, or pause decisions. Because the switch has a single pool of memory with separate ingress and egress accounting, the full amount of buffer memory is available from both the ingress and the egress perspective. Packets are accounted for as they enter and leave the switch, but there is no concept of a packet arriving at an ingress buffer and then being moved to an egress buffer.

The buffers are divided into two pools from both an ingress and an egress perspective:

1. *Shared buffers* are a global memory pool that the switch allocates dynamically to ports as needed, so the buffers are shared among the switch ports.
2. *Dedicated buffers* are a memory pool divided equally among the switch ports. Each port receives a minimum guaranteed amount of buffer space, dedicated to each port, not shared among ports.

NOTE: **Lossless traffic is traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link enabled for Ethernet PAUSE (IEEE 802.3x).**

The switch reserves nonconfigurable buffer space to ensure that ports and queues receive a minimum memory allocation. You can configure how the system uses the rest of the buffer space to optimize the allocation for your mix of network traffic. You can configure the percentage of available buffer space used as shared buffer space versus dedicated buffer space. You can also configure how shared buffer space is allocated to different types of traffic. You can optimize the buffer settings for the traffic on your network.

The default buffer configuration is designed for networks that have a balance of best-effort and lossless traffic.

The default class-of-service configuration provides two lossless forwarding classes (**fcoe** and **no-loss**), a best-effort unicast forwarding class, a network control traffic forwarding class, and one multidestination (multicast, broadcast, and destination lookup fail) forwarding class. Each default forwarding class maps to a different default output queue. The default configuration allocates the buffers in a manner that supports a moderate amount of lossless traffic while still providing the ability to absorb bursts in best-effort traffic transmission.

Changing the buffer settings changes the abilities of the buffers to absorb traffic bursts and handle lossless traffic. For example, networks with mostly best-effort traffic require allocating most of the shared buffer space to best-effort buffers. This provides deep, flexible buffers that can absorb traffic bursts with minimal packet loss, at the expense of buffer availability for lossless traffic.

Conversely, networks with mostly lossless traffic require allocating most of the shared buffer space to lossless headroom buffers. This prevents packet loss on lossless flows at the expense of absorbing bursty best-effort traffic efficiently.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

This topic describes the buffer architecture and settings:

Buffer Pools

From both an ingress and an egress perspective, the PFE buffer is split into two main pools, a shared buffer pool and a dedicated buffer pool that ensures a minimum allocation to each port. You can configure the amount of buffer space allocated to each of the two pools. A portion of the buffer space is reserved so that there is always a minimum amount of shared and dedicated buffer space available to each port.

- Shared buffer pool—A global memory space that all of the ports on the switch share dynamically as they need buffers. The shared buffer pool is further partitioned into buffers for best-effort unicast, best-effort multidestination (broadcast, multicast, and destination lookup fail), and PFC (lossless) traffic types. You can allocate global shared memory space to buffer partitions to better support different mixes of network traffic. The larger the shared buffer pool, the better the switch can absorb traffic bursts because more shared memory is available for the traffic.
- Dedicated buffer pool—A reserved global memory space allocated equally to each port. The switch reserves a minimum dedicated buffer pool that is not user-configurable. You can divide the dedicated buffer allocation for a port among the port queues on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic.)

  A larger dedicated buffer pool means a larger amount of dedicated buffer space for each port, so congestion on one port is less likely to affect traffic on another port because the traffic does not need to use as much shared buffer space. However, the larger the dedicated buffer pool, the less bursty traffic the switch can handle because there is less dynamic shared buffer memory.

You can configure the way the available unreserved portion of the buffer space is allocated to the global shared buffer pool and to the dedicated shared buffer pool by configuring the ingress and egress shared buffer percentages.

By default, 100 percent of the available unreserved buffer space is allocated to the shared buffer pool. If you change the percentage of space allocated to the shared buffer, the available buffer space that is not allocated to the shared buffer is allocated to the dedicated buffer. For example, if you configure the ingress shared buffer pool as 80 percent, the remaining 20 percent of the available buffer space is allocated to the dedicated buffer pool and divided equally across the ports.

NOTE: When 100 percent of the available (user-configurable) buffers are allocated to the shared buffer pool, the switch still reserves a minimum dedicated buffer pool.

You can separately configure ingress and egress shared buffer pool allocations. You can also partition the ingress and egress shared buffer pool to allocate percentages of the shared buffer pool to specific types of traffic. If you do not use the default configuration or one of the recommended configurations, pay particular attention to the ingress configuration of the lossless and lossless headroom buffers (these buffers handle PFC pause during periods of congestion) and to the egress configuration of the best-effort buffers to handle incast congestion (multiple synchronized sources sending data to the same receiver in parallel).

In addition to the shared buffer pool and the dedicated buffer pool, there is also a small ingress global headroom buffer pool that is reserved and is not configurable.

When contention for buffer space occurs, the switch uses an internal algorithm to ensure that the buffer pools are distributed fairly among competing flows. When traffic for a given flow exceeds the amount of dedicated port buffer reserved for that flow, the flow begins to consume memory from the dynamic shared buffer pool. Competing flows compete for shared buffer memory with other flows that also have exhausted their dedicated buffers. When there is no congestion, there are no competing flows.

Buffer Handling of Lossless Flows (PFC) Versus Ethernet PAUSE

When we discuss lossless buffers in the following sections, we mean buffers that handle traffic on which you enable PFC to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x). The lossless ingress and egress shared buffers, and the ingress lossless headroom shared buffer, are used only for traffic on which you enable PFC.

NOTE: To support lossless flows, you must configure the appropriate data center bridging capabilities (PFC, DCBX, or ETS) and scheduling properties.

Shared Buffer Pool and Partitions

The shared buffer pool is a global memory space that all of the ports on the switch share dynamically as they need buffers. The switch uses the shared buffer pool to absorb traffic bursts after the dedicated buffer pool for a port is exhausted.

You can divide both the ingress shared buffer pool and the egress shared buffer pool into three partitions to allocate percentages of each buffer pool to different types of traffic. When you partition the ingress or egress shared buffer pool:

- If you explicitly configure one ingress shared buffer partition, you must explicitly configure all three ingress shared buffer partitions. (You either explicitly configure all three ingress partitions or you use the default setting for all three ingress partitions.)

  If you explicitly configure one egress shared buffer partition, you must explicitly configure all three egress shared buffer partitions. (You either explicitly configure all three egress partitions or you use the default setting for all three egress partitions.)

  The switch returns a commit error if you do not explicitly configure all three partitions when configuring the ingress or egress shared buffer partitions.
- The combined percentages of the three ingress shared buffer partitions must total exactly 100 percent.

  The combined percentages of the three egress shared buffer partitions must total exactly 100 percent.

  When you explicitly configure ingress or egress shared buffer partitions, the switch returns a commit error if the total percentage of the three partitions does not equal 100 percent.
- If you explicitly partition one set of shared buffers, you do not have to explicitly partition the other set of shared buffers. For example, you can explicitly configure the ingress shared buffer partitions and use the default egress shared buffer partitions. However, if you change the buffer partitions for the ingress buffer pool to match the expected types of traffic flows, you would probably also want to change the buffer partitions for the egress buffer pool to match those traffic flows.

You can configure the percentage of available unreserved buffer space allocated to the shared buffer pool. Space that you do not allocate to the shared buffer pool is added to the dedicated buffer pool and divided equally among the ports. The default configuration allocates 100 percent of the unreserved ingress and egress buffer space to the shared buffers.

Configuring the ingress and egress shared buffer pool partitions enables you to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic.

Ingress Shared Buffer Pool Partitions

You can configure three ingress buffer pool partitions:

- Lossless buffers—Shared buffer pool for all lossless ingress traffic. The recommended minimum value for lossless buffers is 5 percent.

- Lossless headroom buffers—Shared buffer pool for packets received while a pause is asserted. If PFC is enabled on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers for which the recommended value can be less than 5 percent.)
- Lossy buffers—Shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The recommended minimum value for best-effort buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and best-effort buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. If you explicitly configure an ingress shared buffer partition, you must explicitly configure all three ingress buffer partitions, even if the lossless headroom buffer partition has a value of 0 (zero) percent.

Egress Shared Buffer Pool Partitions

You can configure three egress buffer pool partitions:

- Lossless buffers—Shared buffer pool for all lossless egress queues. The recommended minimum value for lossless buffers is 5 percent.
- Lossy buffers—Shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The recommended minimum value for best-effort buffers is 5 percent.
- Multicast buffers—Shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The recommended minimum value for multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and should have a value of at least 5 percent. If you explicitly configure an egress shared buffer partition, you must explicitly configure all three egress buffer partitions, and each partition should have a value of at least 5 percent.

Dedicated Port Buffer Pool and Buffer Allocation to Queues

The global dedicated buffer pool is memory that is allocated equally to each port, so each port receives a guaranteed minimum amount of buffer space. Dedicated buffers are not shared among ports. Each port receives an equal proportion of the dedicated buffer pool.

The amount of dedicated buffer space is not user-configurable and depends on the percentage of available nonreserved buffers allocated to the shared buffers. (The dedicated buffer space is equal to the minimum reserved port buffers plus the remainder of the available nonreserved buffers that are not allocated to the shared buffer pool.)

When traffic enters and exits the switch, the switch ports use their dedicated buffers to store packets. If the dedicated buffers are not sufficient to handle the traffic, the switch uses shared buffers. The only way to increase the dedicated buffer pool is to decrease the shared buffer pool from its default value of 100 percent of available unreserved buffers.

NOTE: **If 100 percent of the available unreserved buffers are allocated to the shared buffer pool, the switch still reserves a minimum dedicated buffer pool.**

The larger the shared buffer pool, the better the burst absorption across the ports. The larger the dedicated buffer pool, the larger the amount of dedicated buffer space for each port. The greater the dedicated buffer space, the less likely that congestion on one port can affect traffic on another port, because the traffic does not need to use as much shared buffer space.

Allocating Dedicated Port Buffers to Queues

You can divide the dedicated buffer allocation for an egress port among the port queues by including the **buffer-size** statement in the scheduler configuration. This enables you to control the egress port dedicated buffer allocation on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic, or to stop the port from reserving buffers for queues that do not carry traffic.) Egress dedicated port buffer allocation is a hierarchical structure that allocates a global dedicated buffer pool evenly among ports, and then divides the allocation for each port among the port queues.

By default, ports divide their allocation of dedicated buffers among their egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (the **transmit-rate** option) for traffic. Only the queues included in the default scheduler receive bandwidth and dedicated buffers, in the proportions shown in Table 466 on page 5396:

Table 466: Default Dedicated Buffer Allocation to Egress Queues (Based on Default Scheduler)

Forwarding Class	Queue	Minimum Guaranteed Bandwidth (transmit-rate)	Proportion of Reserved Dedicated Port Buffers
best-effort	0	5%	5%
fcoe	3	35%	35%
no-loss	4	35%	35%
network-control	7	5%	5%
mcast	8	20%	20%

In the default configuration, no egress queues other than the ones shown in Table 466 on page 5396 receive an allocation of dedicated port buffers.

NOTE: The switch uses hierarchical scheduling to control port and queue bandwidth allocation, as described in "Understanding CoS Hierarchical Port Scheduling (ETS)" on page 5366 and shown in "Example: Configuring CoS Hierarchical Port Scheduling (ETS)" on page 5474. For egress queue buffer size configuration, when you attach a traffic control profile (includes the queue scheduler information) to a port, the dedicated egress buffers on the port are divided among the queues as configured in the scheduler.

If you do not want to use the default allocation of dedicated port buffers to queues, use the **buffer-size** option in the scheduler that is attached to the port to configure the queue allocation. You can configure the dedicated buffer allocation to queues in two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is attached to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining dedicated port buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit scheduler for a queue means no dedicated buffer allocation for that queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

NOTE: The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

Configuring Dedicated Port Buffer Allocation to Queues

In a port configuration that includes multiple forwarding class sets, with multiple forwarding classes mapped to multiple schedulers, the allocation of port dedicated buffers to queues depends on the mix of queues with buffer sizes configured as explicit percentages and queues configured with (or defaulted to) the **remainder** option.

The best way to demonstrate how using the percentage and remainder options affects dedicated port buffer allocation to queues is by showing an example of queue buffer allocation, and then showing how the queue buffer allocation changes when you add another forwarding class (queue) to the port.

Table 467 on page 5398 shows an initial configuration that includes four forwarding class sets, the five default forwarding classes (mapped to the five default queues for those forwarding classes), the **buffer-size** option configuration, and the resulting buffer allocation for each queue. Table 468 on page 5398 shows the same configuration after we add another forwarding class (best-effort-2, mapped to queue 1) to the best-effort forwarding class set. Comparing the buffer allocations in each table shows you how adding another queue affects buffer allocation when you use remainders and explicit percentages to configure the buffer allocation for different queues.

Table 467: Egress Queue Dedicated Buffer Allocation (Example 1)

Forwarding Class Set (Priority Group)	Forwarding Class	Queue	Scheduler Buffer Size Configuration	Buffer Allocation per Queue (Percentage)
fc-set-be	best-effort	0	10%	10%
fc-set-lossless	fcoe	3	20%	20%
	no-loss	4	40%	40%
fc-set-strict-high	network-control	7	remainder	15%
fc-set-mcast	mcast	8	remainder	15%

In this first example, 70 percent of the egress port dedicated buffer pool is explicitly allocated to the best-effort, fcoe, and no-loss queues. The remaining 30 percent of the port dedicated buffer pool is split between the two queues that use the **remainder** option (network-control and mcast), so each queue receives 15 percent of the dedicated buffer pool.

Now we add another forwarding class (queue) to the best-effort priority group (fc-set-be) and configure it with a buffer size of *remainder* instead of configuring a specific percentage. Because a third queue now shares the remaining dedicated buffers, the queues that share the remainder receive fewer dedicated buffers, as shown in Table 468 on page 5398. The queues with explicitly configured percentages receive the configured percentage of dedicated buffers.

Table 468: Egress Queue Dedicated Buffer Allocation with Another Remainder Queue (Example 2)

Priority Group (fc-set)	Forwarding Class	Queue	Scheduler Buffer Size Configuration	Buffer Allocation per Queue (Percentage)
fc-set-be	best-effort	0	10%	10%
	best-effort-2	1	remainder	10%
fc-set-lossless	fcoe	3	20%	20%
	no-loss	4	40%	40%
fc-set-strict-high	network-control	7	remainder	10%
fc-set-mcast	mcast	8	remainder	10%

The two tables show how the port divides the dedicated buffer space that remains after servicing the queues that have an explicitly configured percentage of dedicated buffer space.

Trade-off Between Shared Buffer Space and Dedicated Buffer Space

The trade-off between shared buffer space and dedicated buffer space is:

- Shared buffers provide better absorption of traffic bursts because there is a larger pool of dynamic buffers that ports can use as needed to handle the bursts. However, all flows that exhaust their dedicated buffer space compete for the shared buffer pool. A larger shared buffer pool means a smaller dedicated buffer pool, and therefore more competition for the shared buffer pool because more flows exhaust their dedicated buffer allocation. Too much shared buffer space results in no single flow receiving very much shared buffer space, to maintain fairness when many flows contend for that space.
- Dedicated buffers provide guaranteed buffer space to each port. The larger the dedicated buffer pool, the less likely that congestion on one port affects traffic on another port, because the traffic does not need to use as much shared buffer space. However, less shared buffer space means less ability to dynamically absorb traffic bursts.

For optimal burst absorption, the switch needs enough dedicated buffer space to avoid persistent competition for the shared buffer space. When fewer flows compete for the shared buffers, the flows that need shared buffer space to absorb bursts receive more of the shared buffer because fewer flows exhaust their dedicated buffer space.

The default configuration and all of the recommended configurations allocate 100 percent of the user-configurable memory space to the global shared buffer pool because the amount of space reserved for dedicated buffers provides enough space to avoid persistent competition for dynamic shared buffers. This results in fewer flows competing for the shared buffers, so the competing flows receive more of the buffer space.

Order of Buffer Consumption

The total buffer pool is divided into ingress and egress shared buffer pools and dedicated buffer pools. When traffic flows through the switch, the buffer space is used in a particular order that depends on the type of traffic.

On ingress, the order of buffer consumption is:

- Best-effort unicast traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)
- Lossless unicast traffic:
  1. Dedicated buffers
  2. Shared buffers

3. Lossless headroom buffers
4. Global headroom buffers (very small)

- Multidestination traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)

On egress, the order of buffer consumption is the same for unicast best-effort, lossless unicast, and multidestination traffic:

- Dedicated buffers
- Shared buffers

In all cases on all ports, the switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for the port or queue is exhausted. This reserves the maximum amount of dynamic shared buffer space to absorb traffic bursts.

Default Buffer Pool Values

You can view the default or configured ingress and egress buffer pool values in KB units using the **show class-of-service shared-buffer** operational command. You can view the configured shared buffer pool values in percent units using the **show configuration class-of-service shared-buffer** operational command.

This section provides the default total buffer, shared buffer, and dedicated buffer values for QFX Series switches.

Total Buffer Pool Size

The total buffer pool is common memory that has separate ingress and egress accounting, so the full buffer pool is available from both the ingress and egress perspective. The total buffer pool consists of the dedicated buffer space and the shared buffer space. The size of the total buffer pool is not user-configurable, but the allocation of buffer space to the dedicated and shared buffer pools is user-configurable.

On QFX3500 and QFX3600 switches, the combined total size of the ingress and egress buffer pools is approximately 9 MB (exactly 9360 KB).

On QFX5100 switches, the combined total size of the ingress and egress buffer pools is approximately 12 MB (exactly 12480 KB).

Shared Buffer Pool Default Values

The QFX5100 switch has a larger shared buffer pool (12 MB) than QFX3500 and QFX3600 switches (9 MB). However, the allocation of shared buffer space to the individual ingress and egress buffer pools is the same on a percentage basis, even though the absolute values are different. For example, the default ingress lossless buffer is 9 percent of the total shared ingress buffer space on QFX5100, QFX3500, and QFX3600 switches, even though the default absolute value of the ingress lossless buffer is 861.05KB on QFX5100 switches and 648.18KB on QFX3500 and QFX3600 switches.

This section describes the default values in percent and in KB for the shared ingress and shared egress buffers.

- Shared Ingress Buffer Default Values on page 5401
- Shared Egress Buffer Default Values on page 5401

Shared Ingress Buffer Default Values

The QFX5100 switch has a larger shared ingress buffer than the QFX3500 and QFX3600 switches. Table 469 on page 5401 shows the default ingress shared buffer allocation values in KB units for QFX5100 switches.

Table 469: QFX5100 Switch Default Shared Ingress Buffer Values (KB)

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
9567.19 KB	861.05 KB	4305.23 KB	4400.91 KB

Table 470 on page 5401 shows the default ingress shared buffer allocation values in KB units for QFX3500 and QFX3600 switches.

Table 470: QFX3500 and QFX3600 Switch Default Shared Ingress Buffer Values (KB)

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
7202 KB	648.18 KB	3240.9 KB	3312.92 KB

Table 471 on page 5401 shows the default ingress shared buffer allocation values as percentages for QFX5100, QFX3500, and QFX3600 switches. (If you change the default shared buffer allocation, you configure the change as a percentage.)

Table 471: Default Shared Ingress Buffer Values (Percentage)

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	9%	45%	46%

Shared Egress Buffer Default Values

The QFX5100 switch has a larger shared egress buffer than the QFX3500 and QFX3600 switches. Table 472 on page 5402 shows the default egress shared buffer allocation values in KB units for QFX5100 switches.

Table 472: QFX5100 Switch Default Shared Egress Buffer Values (KB)

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
8736 KB	4368 KB	2708.16 KB	1659.84 KB

Table 473 on page 5402 shows the default egress shared buffer allocation values in KB units.

Table 473: QFX3500 and QFX3600 Switch Default Shared Egress Buffer Values (KB)

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
6656 KB	3328 KB	2063.36 KB	1264.64 KB

Table 474 on page 5402 shows the default egress shared buffer allocation values as percentages.

Table 474: Default Shared Egress Buffer Values (Percentage)

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	50%	31%	19%

Dedicated Buffer Pool Default Values

The system reserves ingress and egress dedicated buffer pools that are divided equally among the switch ports. By default, the system allocates 100 percent of the available unreserved buffer space to the shared buffer pool. If you reduce the percentage of available unreserved buffer space allocated to the shared buffer pool, the remaining unreserved buffer space is added to the dedicated buffer pool allocation. You configure the amount of dedicated buffer pool space by reducing (or increasing) the percentage of buffer space allocated to the shared buffer pool. You do not directly configure the dedicated buffer pool allocation.

The default dedicated buffer pool values for QFX3500 and QFX3600 switches in KB units are:

- Ingress dedicated buffer—2158 KB
- Egress dedicated buffer—2704.0 KB

The default dedicated buffer pool values for QFX5100 switches in KB units are:

- Ingress dedicated buffer—2912.81 KB
- Egress dedicated buffer—3744 KB

Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios

The way you configure the shared buffer pool depends on the mix of traffic on your network. This section provides shared buffer configuration recommendations for five basic network traffic scenarios:

- Balanced traffic—The network carries a balanced mix of unicast best-effort, lossless, and multicast traffic. (This is the default configuration.)
- Best-effort unicast traffic—The network carries mostly unicast best-effort traffic.
- Best-effort traffic with Ethernet PAUSE (IEEE 802.3X) enabled—The network carries mostly best-effort traffic with Ethernet PAUSE enabled on the links.
- Best-effort multicast traffic—The network carries mostly multicast best-effort traffic.
- Lossless traffic—The network carries mostly lossless traffic (traffic on which PFC is enabled).

NOTE: Lossless traffic is defined as traffic on which you enable PFC to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link on which you enable Ethernet PAUSE. Start with the recommended profiles for each network traffic scenario, and adjust them if necessary for your network traffic conditions.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete. This includes changing the default configuration to one of the recommended configurations.

Because you configure buffer allocations in percentages, the recommended allocations for each network traffic scenario are valid for all QFX Series switches. Use one of the following recommended shared buffer configurations for your network traffic conditions. Start with a recommended configuration, then make small adjustments to the buffer allocations to fine-tune the buffers if necessary as described in "Optimizing Buffer Configuration" on page 5406.

Balanced Traffic (Default Configuration)

The default shared buffer configuration is optimized for networks that carry a balanced mix of best-effort unicast, lossless, and multidestination (multicast, broadcast, and destination lookup fail) traffic. The default class-of-service (CoS) configuration is also optimized for networks that carry a balanced mix of traffic.

We recommend that you use the default shared buffer configuration for networks that carry a balanced mix of traffic, especially if you are using the default CoS settings. Table 475 on page 5404 shows the default ingress shared buffer allocations:

Table 475: Default Ingress Shared Buffer Configuration

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	9%	45%	46%

Table 476 on page 5404 shows the default egress shared buffer allocations:

Table 476: Default Egress Shared Buffer Configuration

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	50%	31%	19%

Best-Effort Unicast Traffic

If your network carries mostly best-effort (lossy) unicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see Table 477 on page 5404) and egress shared buffer settings (see Table 478 on page 5404):

Table 477: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	5%	0%	95%

Table 478: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	75%	20%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic" on page 5530 for an example that shows you how to configure the recommended buffer settings shown in Table 477 on page 5404 and Table 478 on page 5404.

Ethernet PAUSE Traffic

If your network carries mostly best-effort (lossy) traffic *and* enables Ethernet PAUSE on links, then the default shared buffer configuration allocates too much buffer space to the shared ingress buffer (Ethernet PAUSE traffic uses the dedicated buffers instead of shared buffers) and not enough space to the lossless-headroom buffers. We recommend that you use the following ingress shared buffer settings (see Table 479 on page 5405) and egress shared buffer settings (see Table 480 on page 5405):

Table 479: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Traffic and Ethernet PAUSE Enabled

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
70%	5%	80%	15%

Table 480: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Traffic and Ethernet PAUSE Enabled

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	75%	20%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled" on page 5535 for an example that shows you how to configure the recommended buffer settings shown in Table 477 on page 5404 and Table 478 on page 5404.

Best-Effort Multicast (Multidestination) Traffic

If your network carries mostly best-effort (lossy) multicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see Table 481 on page 5405) and egress shared buffer settings (see Table 482 on page 5406):

Table 481: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best -Effort Multicast Traffic

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	5%	0%	95%

Table 482: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Multicast Traffic

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	20%	75%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic" on page 5541 for an example that shows you how to configure the recommended buffer settings shown in Table 481 on page 5405 and Table 482 on page 5406.

Lossless Traffic

If your network carries mostly lossless traffic, then the default shared buffer configuration allocates too much buffer space to support best-effort traffic. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see Table 483 on page 5406) and egress shared buffer settings (see Table 484 on page 5406):

Table 483: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Lossless Traffic

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	15%	80%	5%

Table 484: Recommended Egress Shared Buffer Configuration for Networks with Mostly Lossless Traffic

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	90%	5%	5%

See "Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic" on page 5547 for an example that shows you how to configure the recommended buffer settings shown in Table 483 on page 5406 and Table 484 on page 5406.

Optimizing Buffer Configuration

Starting from the default configuration or from a recommended buffer configuration, you can further optimize the buffer allocation to best support the mix of traffic on your network. Adjust the settings gradually to fine-tune the shared buffer allocation. Use caution when adjusting the shared buffer configuration, not just when you fine-tune the ingress and egress buffer partitions, but also when you fine-tune the total ingress and egress shared buffer percentage. (Remember that if you allocate less than 100 percent of the available buffers to the shared buffers, the remaining buffers are added to the dedicated buffers). Tuning the buffers incorrectly can cause problems such as ingress port congestion.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

The relationship between the sizes of the ingress buffer pool and the egress buffer pool affects when and where packets are dropped. The buffer pool sizes include the shared buffers and the dedicated buffers. In general, if there are more ingress buffers than egress buffers, the switch can experience ingress port congestion because egress queues fill before ingress queues can empty.

Use the show class-of-service shared-buffer operational command to see the sizes in kilobytes (KB) of the dedicated and shared buffers and of the shared buffer partitions.

For best-effort traffic (unicast and multidestination), the combined ingress lossy shared buffer partition and ingress dedicated buffers must be *less than* the combined egress lossy and multicast shared buffer partitions plus the egress dedicated buffers. This prevents ingress port congestion by ensuring that egress best-effort buffers are deeper than ingress best-effort buffers, and ensures that if packets are dropped, they are dropped at the egress queues. (Packets dropping at the ingress prevents the egress schedulers from working properly.)

For lossless traffic (traffic on which you enable PFC), the combined ingress lossless shared buffer partition and a reasonable portion of the ingress headroom buffer partition, plus the dedicated buffers, must be *less than* the total egress lossless shared buffer partition and dedicated buffers. (A reasonable portion of the ingress headroom buffer is approximately 20 to 25 percent of the buffer space, but this varies depending on how much buffer headroom is required to support the lossless traffic.) When these conditions are met, if there is ingress port congestion, the ingress port congestion triggers PFC on the ingress port to prevent packet loss. If the total lossless ingress buffers exceed the total lossless egress buffers, packets could be dropped at the egress instead of PFC being applied at the ingress to prevent packet loss.

NOTE: If you commit a buffer configuration for which the switch does not have sufficient resources, the switch might log an error instead of returning a commit error. After you commit a buffer configuration, check the syslog messages to ensure that the new buffer configuration did not fail to commit.

If the buffer configuration commits but you receive a syslog message that indicates the configuration cannot be implemented, you can:

- Reconfigure the buffers or reconfigure other parameters (for example, the PFC configuration, which affects the need for lossless headroom buffers and lossless buffers—the more priorities you pause, the more lossless and lossless headroom buffer space you need), then attempt the commit operation again.
- Roll back the switch to the last successful configuration.

If you receive a syslog message that says the buffer configuration cannot be implemented, you must take corrective action. If you do not fix the configuration or roll back to a previous successful configuration, the system behavior is unpredictable.

General Buffer Configuration Rules and Considerations

Keep the following rules and considerations in mind when you configure the buffers:

- Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.
- If you configure the ingress or egress shared buffer percentages as less than 100 percent, the remaining percentage of buffer space is added to the dedicated buffer pool.
- The sum of all of the ingress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent except the lossless headroom buffer, which can have a value of 0 percent.
- The sum of all of the egress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent.
- Lossless and lossless headroom shared buffers serve traffic on which you enable PFC, and do not serve traffic subject to Ethernet PAUSE.
- The switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for a port or queue is exhausted.
- Too little dedicated buffer space results in too much competition for shared buffer space.
- Too much dedicated buffer space results in poorer burst absorption because there is less available shared buffer space.
- Always check the syslog messages after you commit a new buffer configuration.
- The optimal buffer configuration for your network depends on the types of traffic on the network. If your network carries less traffic of a certain type (for example, lossless

traffic), then you can reduce the size of the buffers allocated to that type of traffic (for example, you can reduce the sizes of the lossless and lossless headroom buffers).

Understanding CoS Tail-Drop Profiles

When the number of packets queued is greater than the ability of the switch to empty an output queue, the queue requires a method for determining which packets to drop to relieve the congestion. Weighted random early detection (WRED) drop profiles define the drop probability of packets as the output queue fills. During periods of congestion, as the output queue fills, the switch drops incoming packets as determined by a drop profile until the output queue becomes less congested.

Depending on the drop probabilities, a drop profile can drop many packets long before the buffer becomes full, or it can drop only a few packets even if the buffer is almost full.

You configure drop profiles in the drop profile section of the class-of-service (CoS) configuration hierarchy. You apply drop profiles using a drop profile map in each scheduler configuration. For each scheduler, you can configure separate drop profiles for each combination of loss priority (low, medium-high, and high) and protocol.

Drop profiles define the meaning of each of the loss priorities by setting the values for when to drop packets and the probability that packets will drop.

You can configure a maximum of 32 drop profiles.

NOTE: You cannot apply drop profiles to multidestination (multicast) queues.

Do not apply drop profiles to lossless flows such as FCoE traffic, because the corresponding queues require lossless behavior. Use priority-based flow control (PFC) to prevent packet drop.

- Drop Profile Parameters on page 5410
- Default Drop Profile on page 5411
- Packet Drop Method on page 5411

Drop Profile Parameters

Drop profiles specify two values:

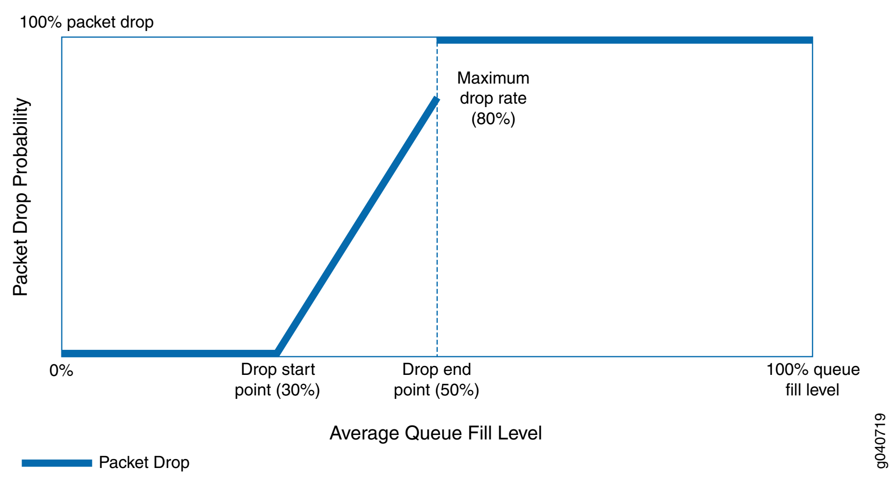
- Fill level—The queue fullness value, which represents a percentage of the memory used to store packets in relation to the total amount of memory allocated to the queue.
- Drop probability—The percentage value that corresponds to the likelihood that an individual packet is dropped.

You set two queue fill levels and two drop probabilities in each drop profile. The two fill levels and the two drop probabilities create two pairs of values. The first fill level and the first drop probability create one value pair and the second fill level and the second drop probability create the second value pair.

The first fill level value specifies the percentage of queue fullness at which packets begin to drop, known as the drop start point. Until the queue reaches this level of fullness, no packets are dropped. The second fill level value specifies the percentage of queue fullness at which all packets are dropped, known as the drop end point.

The first drop probability value is always **0** (zero). This pairs with the drop start point and specifies that until the queue fullness level reaches the first fill level, no packets drop. When the queue fullness exceeds the drop start point, packets begin to drop until the queue exceeds the second fill level, when all packets drop. The second drop probability value, known as the maximum drop rate, specifies the likelihood of dropping packets when the queue fullness reaches the drop end point. As the queue fills from the drop start point to the drop end point, packets drop in a smooth, linear pattern (called an interpolated graph) as shown in Figure 197 on page 5410. After the drop end point, all packets drop.

Figure 197: Tail-Drop Profile Packet Drop



The thick line in Figure 197 on page 5410 shows the packet drop characteristics for a sample tail-drop profile. At the drop start point, the queue reaches a fill level of 30 percent. At the drop end point, the queue fill level reaches 50 percent, and the maximum drop rate is 80 percent.

No packets drop until the queue fill level reaches the drop start point of 30 percent. When the queue reaches the 30 percent fill level, packets begin to drop. As the queue fills, the percentage of packets dropped increases in a linear fashion. When the queue fills to the drop end point of 50 percent, the rate of packet drop has increased to the maximum drop rate of 80 percent. When the queue fill level exceeds the drop end point of 50 percent, all of the packets drop until the queue fill level drops below 50 percent.

Default Drop Profile

If you do not configure default profiles and apply them to queue schedulers, the switch uses the default drop profile for lossy traffic classes. In the default drop profile, when the fill level is 0 percent, the drop probability is 0 percent. When the fill level is 100 percent, the drop probability is 100 percent. As soon as packets arrive on a queue, the default profile might begin to drop packets.

Packet Drop Method

When a packet reaches the head of the queue, the switch generates a random number between 0 and 100. The switch plots the random number against the drop profile using the current fullness of the queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped.

To create the linear drop pattern from the drop start point to the drop end point, the drop probabilities are derived using a linear approximation with eight sections, or steps, from the minimum queue fill level to the maximum queue fill level. The fill levels are divided into the eight sections equally, starting at the minimum fill level and ending at the maximum fill level. As the queue fills, the percentage of dropped packets increases. The percentage of packets dropped is based on the maximum drop rate.

For example, the default drop profile (which specifies a maximum drop rate of 100 percent) has the following drop probabilities at each section, or step, in the eight-section linear drop pattern:

- First section—The minimum drop probability is 6.25 percent of the maximum drop rate. The maximum drop probability is 12.5 percent of the maximum drop rate.
- Second section—The minimum drop probability is 18.75 percent of the maximum drop rate. The maximum drop probability is 25 percent of the maximum drop rate.
- Third section—The minimum drop probability is 30.25 percent of the maximum drop rate. The maximum drop probability is 37.5 percent of the maximum drop rate.
- Fourth section—The minimum drop probability is 43.75 percent of the maximum drop rate. The maximum drop probability is 50 percent of the maximum drop rate.
- Fifth section—The minimum drop probability is 56.25 percent of the maximum drop rate. The maximum drop probability is 62 percent of the maximum drop rate.
- Sixth section—The minimum drop probability is 68.75 percent of the maximum drop rate. The maximum drop probability is 75.5 percent of the maximum drop rate.

- Seventh section—The minimum drop probability is 81.25 percent of the maximum drop rate. The maximum drop probability is 87.5 percent of the maximum drop rate.
- Eighth section—The minimum drop probability is 92.75 percent of the maximum drop rate. The maximum drop probability is 100 percent of the maximum drop rate.

Packets drop even when there is no congestion, because packet drops begin at the drop start point regardless of whether congestion exists on the port. The default drop profile example represents the worst-case scenario, because the drop start point fill level is 0 percent, so packet drop begins when the queue starts to receive packets.

You can specify when packets begin to drop by configuring a drop start point at a fill level greater than 0 percent. For example, if you configure a drop profile that has a drop start point of 30 percent, packets do not drop until the queue is 30 percent full.

The smaller the gap between the minimum drop rate (which is always 0) and the maximum drop rate, the smaller the gap between the minimum drop probability and the maximum drop probability at each section (step) of the linear drop pattern. The default drop profile, which has the maximum gap between the minimum drop rate (0 percent) and the maximum drop rate (100 percent), has the highest gap between the minimum drop probability and the maximum drop probability at each step. Configuring a lower maximum drop rate for a drop profile reduces the gap between the minimum drop probability and the maximum drop probability.

Drop Profile Maps

Drop profile maps are part of scheduler configuration. A drop profile map maps a drop profile to a loss priority and a protocol. Specifying the drop profile map in a scheduler associates the drop profile with the queues (forwarding classes) that you map to the scheduler in a scheduler map.

You configure loss priority for a queue in the classifier section of the CoS configuration hierarchy, and the loss priority is applied to the queue at the ingress interface.

Each scheduler can have multiple drop profile maps, one for each combination of loss priority and protocol.

Congestion Prevention

Configuring drop profiles on output queues prevents them from impacting other queues on the egress ports. If you do not configure drop profiles and map them to output queues, output queues without drop profiles can impact output queues on other egress ports, even if those queues are not experiencing congestion.

For example, if an ingress port forwards traffic to more than one egress port, and at least one of the egress ports experiences congestion, that can cause ingress port congestion. Ingress port congestion (ingress buffer exceeds its resource allocation) can cause frames to drop at the ingress port instead of at the egress port. Ingress port frame drop affects all of the egress ports to which the congested ingress port forwards traffic, not just the congested egress port.

NOTE: Do not configure drop profiles for the **fcoe** and **no-loss** forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. Rewrite rules set the value of the CoS bits within the header of the outgoing packet. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header, replacing the old CoS value. Rewrite rules must be assigned to an interface for rewrites to be activated.

You can apply (bind) one DSCP or DSCP IPv6 rewrite rule and one IEEE 802.1p rewrite rule to each interface as described in "Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces" on page 5344. You can also bind EXP rewrite rules to logical interfaces to rewrite the CoS bits of MPLS traffic.

You cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface. Each interface supports only one DSCP rewrite rule. Both IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6. You can apply an EXP rewrite rule on an interface that has DSCP or IEEE rewrite rules. Only MPLS traffic uses the EXP rewrite rule.

NOTE: There are no default rewrite rules.

You can look at behavior aggregate (BA) classifiers and rewrite rules as two sides of the same coin. A BA classifier reads the CoS bits of incoming packets and classifies the packets into forwarding classes, then the system applies the CoS configured for the forwarding class to those packets. Rewrite rules change (rewrite) the CoS bits just before the packets leave the system so that the next switch or router can apply the appropriate level of CoS to the packets. When you apply a rewrite rule to an interface, the rewrite rule is the last CoS action performed on the packet before it is forwarded.

Rewrite rules alter CoS values in outgoing packets on the outbound interfaces of an edge switch to accommodate the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

NOTE: On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

QFX Series does not have default rewrite rules. If you want to apply a rewrite rule to outgoing packets, you must explicitly configure the rewrite rule.

NOTE: Rewrite rules are applied *before* the egress filter is matched to traffic. Because the code point rewrite occurs before the egress filter is matched to traffic, the egress filter match is based on the rewrite value, not on the original code point value in the packet.

For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

MPLS EXP rewrite rules apply only to logical interfaces. You cannot apply to an EXP rewrite rule to a physical interface. You can configure as many EXP rewrite rules as you want, but you can only use 16 EXP rewrite rules at any time on the switch. On a given logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

NOTE: If the switch is performing penultimate hop popping (PHP), EXP rewrite rules do not take effect. If both an EXP classifier and an EXP rewrite rule are configured on the switch, then the EXP value from the last popped label is copied into the inner label. If either an EXP classifier or an EXP rewrite rule (but not both) is configured on the switch, then the inner label EXP value is sent unchanged.

Understanding CoS Flow Control (Ethernet PAUSE and PFC)

Flow control supports lossless transmission by regulating traffic flows to avoid dropping frames during periods of congestion. Flow control stops and resumes the transmission of network traffic between two connected peer nodes on a full-duplex Ethernet physical link. Controlling the flow by pausing and restarting it prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

The QFX Series supports two methods of flow control:

- IEEE 802.3X Ethernet PAUSE
- IEEE 802.1Qbb priority-based flow control (PFC)

Ethernet PAUSE and PFC are link-level flow control mechanisms.

Ethernet PAUSE pauses transmission of all traffic on a physical Ethernet link.

PFC decouples the pause function from the physical Ethernet link and enables you to divide traffic on one link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that are mapped to forwarding classes and output queues. Each priority is mapped to a 3-bit IEEE 802.1p CoS code point flag in the VLAN header. You can enable PFC on one or more priorities (IEEE 802.1p code points) on a link. When PFC-enabled traffic is paused on a link, traffic that is not PFC-enabled continues to flow (or is dropped if congestion is severe enough).

Use Ethernet PAUSE when you want to prevent packet loss on all of the traffic on a link. Use PFC to prevent traffic loss only on specified types of traffic (for example, Fibre Channel over Ethernet traffic).

NOTE: **Depending on the amount of traffic on a link or assigned to a priority, pausing traffic can cause ingress port congestion and spread congestion through the network.**

Attempting to configure both Ethernet PAUSE and PFC on a link causes a commit error. Ethernet PAUSE and PFC are mutually exclusive configurations on an interface.

By default, all forms of flow control are disabled. You must explicitly enable flow control on interfaces to pause traffic.

- Ethernet PAUSE on page 5416
- PFC on page 5420
- Lossless Transport Support Summary on page 5424

Ethernet PAUSE

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends Ethernet PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to Ethernet PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends an Ethernet PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the Ethernet PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives an Ethernet PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the Ethernet PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

  In this scenario, if Node B sends an Ethernet PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

Symmetric flow control means an interface has the same Ethernet PAUSE configuration in both directions. The Ethernet PAUSE generation and Ethernet PAUSE response functions are both configured as enabled, or they are both disabled. You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

Asymmetric flow control allows you to configure the Ethernet PAUSE functionality in each direction independently on an interface. The configuration for generating Ethernet PAUSE messages and for responding to Ethernet PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. You configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. Asymmetric flow control overrides and disables symmetric flow control. (If PFC is configured on an interface, the PFC configuration overrides Ethernet PAUSE flow control.) The QFX Series supports both symmetric and asymmetric flow control.

- Symmetric Flow Control on page 5417
- Asymmetric Flow Control on page 5418

Symmetric Flow Control

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send Ethernet PAUSE messages and respond to them (flow control is enabled), or the interface cannot send Ethernet PAUSE messages or respond to them (flow control is disabled).

When you enable symmetric flow control on an interface, the Ethernet PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the interface can perform any Ethernet PAUSE functions that the connected peer can perform. (When symmetric flow control is disabled, the interface does not send or respond to Ethernet PAUSE messages.)

Asymmetric Flow Control

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends Ethernet PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to Ethernet PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits Ethernet PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to Ethernet PAUSE messages:

- Receive buffers on—Enable Ethernet PAUSE transmission (generate and send Ethernet PAUSE frames)
- Transmit buffers on—Enable Ethernet PAUSE reception (respond to received Ethernet PAUSE frames)

You must explicitly set the flow control for both the receive buffer and the transmit buffer (**on** or **off**) to configure asymmetric Ethernet PAUSE. Table 373 on page 4887 describes the configured flow control state when you set the receive (Rx) and transmit (Tx) buffers on an interface:

Table 485: Asymmetric Ethernet PAUSE Flow Control Configuration

Receive (Rx) Buffer	Transmit (Tx) Buffer	Configured Flow Control State
On	Off	Interface generates and sends Ethernet PAUSE messages. Interface does not respond to Ethernet PAUSE messages (interface continues to transmit even if peer requests that the interface stop sending traffic).
Off	On	Interface responds to Ethernet PAUSE messages received from the connected peer, but does not generate or send Ethernet PAUSE messages. (The interface does not request that the connected peer stop sending traffic.)
On	On	Same functionality as symmetric Ethernet PAUSE. Interface generates and sends Ethernet PAUSE messages and responds to received Ethernet PAUSE messages.
Off	Off	Ethernet PAUSE flow control is disabled.

The configured flow control is the Ethernet PAUSE state configured on the interface.

On 1-Gigabit Ethernet interfaces, the QFX Series supports autonegotiation of Ethernet PAUSE with the connected peer. (The QFX Series does not support autonegotiation on 10-Gigabit Ethernet interfaces.) Autonegotiation enables the interface to exchange state advertisements with the connected peer so that the two devices can agree on the Ethernet PAUSE configuration. Each interface advertises its flow control state to the connected peer using a combination of the Ethernet PAUSE and ASM_DIR bits, as described in Table 374 on page 4888:

Table 486: Flow Control State Advertised to the Connected Peer (Autonegotiation)

Rx Buffer State	Tx Buffer State	PAUSE Bit	ASM_DIR Bit	Description
Off	Off	0	0	The interface advertises no Ethernet PAUSE capability. This is equivalent to disabling flow control on an interface.
On	On	1	0	The interface advertises symmetric flow control (both the transmission of Ethernet PAUSE messages and the ability to receive and respond to Ethernet PAUSE messages).
On	Off	0	1	The interface advertises asymmetric flow control (the transmission of Ethernet PAUSE messages, but not the ability to receive and respond to Ethernet PAUSE messages).
Off	On	1	1	The interface advertises both symmetric and asymmetric flow control. Although the interface does not generate and send Ethernet PAUSE requests to the peer, the interface supports both symmetric and asymmetric Ethernet PAUSE configuration on the peer because the peer is not affected if the peer does not receive Ethernet PAUSE requests. (If the interface responds to the peer's Ethernet PAUSE requests, that is sufficient to support either symmetric or asymmetric flow control on the peer.)

The flow control configuration on each switch interface interacts with the flow control configuration of the connected peer. Each peer advertises its state to the other peer. The interaction of the flow control configuration of the peers determines the flow control behavior (resolution) between them, as shown in Table 375 on page 4889. The first four columns show the Ethernet PAUSE configuration on the local QFX Series and on the connected peer (also known as the link partner). The last two columns show the Ethernet PAUSE resolution that results from the local and peer configurations on each interface. This illustrates how the Ethernet PAUSE configuration of each interface affects the Ethernet PAUSE behavior on the other interface.

NOTE: In the Resolution columns of the table, disabling Ethernet PAUSE transmit means that the interface receive buffers do not generate and send Ethernet PAUSE messages to the peer. Disabling Ethernet PAUSE receive means that the interface transmit buffers do not respond to Ethernet PAUSE messages received from the peer.

Table 487: Asymmetric Ethernet PAUSE Behavior on Local and Peer Interfaces

Local Interface (QFX Series)		Peer Interface			
PAUSE Bit	ASM_DIR Bit	PAUSE Bit	ASM_DIR Bit	Local Resolution	Peer Resolution
0	0	Don't care	Don't care	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
0	1	0	Don't care	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
0	1	1	0	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
0	1	1	1	Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive	Disable Ethernet PAUSE transmit and enable Ethernet PAUSE receive
1	0	0	Don't care	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
1	0	1	Don't care	Enable Ethernet PAUSE transmit and receive	Enable Ethernet PAUSE transmit and receive
1	1	0	0	Disable Ethernet PAUSE transmit and receive	Disable Ethernet PAUSE transmit and receive
1	1	0	1	Enable Ethernet PAUSE receive and disable Ethernet PAUSE transmit	Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive
1	1	Don't care	Don't care	Enable Ethernet PAUSE transmit and receive	Enable Ethernet PAUSE transmit and receive

NOTE: For your convenience, Table 375 on page 4889 replicates Table 28B-3 of Section 2 of the IEEE 802.X specification.

PFC

PFC is a lossless transport and congestion relief feature that works by providing granular link-level flow control for each IEEE 802.1p code point (priority) on a full-duplex Ethernet link. When the receive buffer on a switch interface fills to a threshold, the switch transmits a pause frame to the sender (the connected peer) to temporarily stop the sender from transmitting more frames. The buffer threshold must be low enough so that the sender has time to stop transmitting frames and the receiver can accept the frames already on the wire before the buffer overflows. The switch automatically sets queue buffer thresholds to prevent frame loss.

When congestion forces one priority on a link to pause, all of the other priorities on the link continue to send frames. Only frames of the paused priority are not transmitted. When the receive buffer empties below another threshold, the switch sends a message that starts the flow again.

You configure PFC using a congestion notification profile (CNP). A CNP has two parts:

- Input—Specify the code point (or code points) on which to enable PFC, and optionally specify the maximum receive unit (MRU) and the cable length between the interface and the connected peer interface.
- Output—Specify the output queue or output queues that respond to pause messages from the connected peer.

You apply a PFC configuration by configuring a CNP on one or more interfaces. Each interface that uses a particular CNP is enabled to pause traffic with the priorities (code points) specified in that CNP. You can configure one CNP on an interface, and you can configure different CNPs on different interfaces. When you configure a CNP on an interface, ingress traffic that is mapped to a priority that the CNP enables for PFC is paused whenever the queue buffer fills to the pause threshold. (The pause threshold is not user-configurable.)

Configure PFC for a priority end to end along the entire data path to create a lossless lane of traffic on the network. You can selectively pause the traffic in any queue without pausing the traffic for other queues on the same link. You can create lossless lanes for traffic such as Fibre Channel over Ethernet (FCoE), LAN backup, or management, while using standard frame-drop congestion management for IP traffic on the same link.

Potential consequences of link-level flow control are:

- Ingress port congestion (configuring too many lossless flows can cause ingress port congestion)
- A paused priority that causes upstream devices to pause the same priority, thus spreading congestion back through the network

By definition, PFC supports symmetric pause only (as opposed to Ethernet PAUSE, which supports symmetric and asymmetric pause). With symmetric pause, a device can:

- Transmit pause frames to pause incoming traffic. (You configure this using the input stanza of a congestion notification profile.)
- Receive pause frames and stop sending traffic to a device whose buffer is too full to accept more frames. (You configure this using the output stanza of a congestion notification profile.)

Receiving a PFC frame from a connected peer pauses traffic on egress queues based on the IEEE 802.1p priorities that the PFC pause frame identifies. The priorities are 0 through 7. By default, the priorities map to queue numbers 0 through 7, respectively, and to specific forwarding classes, as shown in Table 376 on page 4891:

Table 488: Default PFC Priority to Queue and Forwarding Class Mapping

IEEE 802.1p Priority (Code Point)	Queue	Forwarding Class
0 (000)	0	best-effort
1 (001)	1	best-effort
2 (010)	2	best-effort
3 (011)	3	fcoe
4 (100)	4	no-loss
5 (101)	5	best-effort
6 (110)	6	network-control
7 (111)	7	network-control

For example, a received PFC pause frame that pauses priority 3 pauses output queue 3. If you do not want to use the default configuration, you can configure customized mapping of priorities to queues and forwarding classes.

NOTE: By convention, deployments with converged server access typically use IEEE 802.1p priority 3 for FCoE traffic. The default forwarding class configuration sets the **fcoe** forwarding class as a lossless forwarding class that is mapped to queue 3. The default classifier maps incoming priority 3 traffic to the **fcoe** forwarding class. *However, you must apply PFC to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE traffic requires.*

If your network uses priority 3 for FCoE traffic, we recommend that you use the default configuration. If your network uses a priority other than 3 for FCoE traffic, you can configure lossless FCoE transport on any IEEE 80.21p priority as described in “Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 5427 and “Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 5446.

You enable PFC on a priority by:

1. Specifying the IEEE 802.1p code point to pause in the input stanza of a CNP
2. Applying the CNP to the ingress interfaces on which you want to pause the traffic

CAUTION: Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.
  3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.
- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

When you associate the CNP with an interface, the interface uses PFC to send pause requests when the output queue buffer for the lossless traffic fills to the pause threshold.

Although unicast traffic and multidestination (multicast, broadcast, and destination lookup fail) traffic must use different classifiers, you can map a unicast queue (queue 0 through 7) and a multidestination queue (queue 8, 9, 10, or 11) to the same PFC priority so that both unicast and multicast traffic use that priority. Do not map multidestination traffic to lossless priorities. Starting with Junos OS Release 12.3, you can map one priority to multiple output queues.

NOTE: You can attach a maximum of one CNP to an interface, but you can create an unlimited number of CNPs that explicitly configure only the input stanza and use the default output stanza.

The output stanza of the CNP maps to a profile that interfaces use to respond to pause messages received from the connected peer. On standalone QFX3500 switches and QFX3600 switches, you can create two CNPs with an explicitly configured output stanza.

When a QFX3500 switch or a QFX3600 switch is a Node device in a QFabric system, you can create one CNP with an explicitly configured output stanza. (One fewer profile is available on QFabric systems because the system needs a default profile for fabric interfaces, which are not used as fabric interfaces when the switches are not part of a QFabric system. "Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows" on page 5427 describes configuring output flow control.

Lossless Transport Support Summary

The QFX Series supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p priorities (code points) mapped to lossless forwarding classes.

CAUTION: Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

The following limitation applies to support lossless transport on QFabric systems only:

- The internal fiber cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.

The default CoS configuration provides two lossless forwarding classes, *fcoe* and *no-loss*. If you explicitly configure lossless forwarding classes, you must include the **no-loss** packet drop attribute to enable lossless behavior, or the traffic is not lossless. For both default and explicit lossless forwarding class configuration, you must configure CNP input stanzas to enable PFC on the priority of the lossless traffic and apply the CNPs to ingress interfaces.

NOTE: Junos OS Release 12.2 introduced changes to the way the QFX Series handles lossless forwarding classes (including the default **fcoe** and **no-loss** forwarding classes).

In Junos OS Release 12.1, either explicitly configuring the **fcoe** and **no-loss** forwarding classes or using the default configuration for these forwarding classes resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the **fcoe** or the **no-loss** forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the **fcoe** or the **no-loss** forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the the explicit **fcoe** and **no-loss** forwarding class configuration before you upgrade to Junos OS Release 12.2.

See "Overview of CoS Changes Introduced in Junos OS Release 12.2" on page 5304 for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the **fcoe** and **no-loss** forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new **no-loss** packet drop attribute or the forwarding class is lossy.

"Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows" on page 5427 provides detailed information about the explicit configuration of lossless priorities and about the default configuration of lossless priorities, including the input and output stanzas of the CNP.

NOTE: PFC and Ethernet PAUSE are used only on Ethernet interfaces. Fabric (fte) ports on QFabric systems (Node device fabric ports and Interconnect device fabric ports) use link-layer flow control (LLFC) to ensure the appropriate treatment of lossless traffic.

QFX Series Standalone Switches, QFabric Systems Only

Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows

Junos OS Release 12.3 increased support for lossless priorities from two lossless forwarding classes to up to six lossless forwarding classes on QFX3500 and QFX3600 switches. Each forwarding class is mapped to an IEEE 802.1p code point (priority).

NOTE: Junos OS Release 13.1 introduced support for up to six lossless forwarding classes on QFabric systems. Throughout this document, features introduced on standalone switches in Junos OS Release 12.3 are introduced on QFabric systems in Junos OS Release 13.1 unless otherwise noted.

Junos OS Release 13.2 is the first QFX5100 switch release. The QFX5100 also supports up to six lossless forwarding classes. However, because the QFX5100 switch has no native Fibre Channel (FC) interfaces, the QFX5100 switch does not support native FC traffic and does not support configuration as an FCoE-FC gateway. Throughout this document, features that pertain to native FC traffic and to FCoE-FC gateway configuration do not apply to QFX5100 switches.

Earlier Junos OS software releases supported two lossless forwarding classes, the default *fcoe* and *no-loss* forwarding classes, which are mapped by default to IEEE 802.1p priorities 3 (code point 011) and 4 (code point 100), respectively. Junos OS Release 12.3 also introduced a new output stanza in the congestion notification profile (CNP) to configure priority-based flow control (PFC) on output queues.

The default configuration is the same as the default configuration in Junos OS Release 12.2 and is backward-compatible. If you need only two (or fewer) lossless forwarding classes, use the default configuration. If you need more than two lossless forwarding classes, you can use the two default forwarding classes and configure additional lossless forwarding classes. If you do not want to use the default lossless forwarding classes, you can change them or use only the lossless forwarding classes that you explicitly configure.

- Configuration Rules and Recommendations on page 5444

Lossless Transport Features Introduced in Junos OS Release 12.3

Support for lossless transport introduced in Junos OS Release 12.3 includes:

- Configuring up to six lossless forwarding classes.
- Configuring PFC pause on output queues to program the output queues that can respond to PFC pause messages received from the connected peer. The priorities you pause on output queues must match the priorities on which you enable PFC on the corresponding ingress interfaces. For example, if you program output queues to pause

priorities 3 (011) and 5 (101), then you must also enable pause on priorities 3 and 5 on the corresponding ingress interfaces. Configuring flow control on the output queues and enabling PFC on the corresponding input queues allows you to pause up to six priorities (forwarding classes).

- Controlling the headroom buffer on Ethernet interfaces by configuring the maximum receive unit (MRU) size for the traffic mapped to an IEEE 802.1p priority (configured per priority) and the length of the attached cable (configured per interface). The MRU size can range up to full jumbo packet size (9216 bytes).
- Remapping (rewriting) IEEE 802.1p priorities on native Fibre Channel (FC) interfaces when the system is acting as an FCoE-FC gateway. If the Ethernet (FCoE) network uses a different IEEE 802.1p priority than priority 3 (011) for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that different priority (see "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5446).

Lossless transport still requires configuring previously existing features, including enabling PFC on the lossless priorities on ingress interfaces, and configuring classifiers to classify incoming traffic into lossless forwarding classes based on the IEEE 802.1p priority tag of the packet.

NOTE: If you expect a large amount of lossless traffic on your network and configure multiple lossless traffic classes, ensure that you reserve enough scheduling resources (bandwidth) and lossless headroom buffer space to support the lossless flows. ("Understanding CoS Buffer Configuration" on page 5391 describes how to configure buffers and provides a recommended buffer configuration for networks with larger amounts of lossless traffic.)

Default Lossless Priority Configuration

If you do not explicitly configure forwarding classes, the system uses the default forwarding class configuration, which provides two default lossless forwarding classes (*fcoe* and *no-loss*). (If you change the forwarding class configuration on a QFX Series switch or on a QFabric Node device, the changes apply to all traffic on that device because forwarding classes are global to a particular device.)

If you do not explicitly configure classifiers, and you do not explicitly configure flow control to pause output queues (configured in the output stanza of the CNP), the default classifier and the default output queue pause configuration are applied to all Ethernet interfaces on QFX Series switches and Node devices. You can override the default classifier and the default output queue pause configuration on a per-interface basis by applying an explicit configuration to an Ethernet interface. The default configuration is used on all Ethernet interfaces that do not have an explicit configuration.

NOTE: If you do not configure flow control on output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause in the output stanza of the CNP.

In the default configuration, only queue 3 and queue 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza of the CNP. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza of the CNP.

The default configuration is the same as the default configuration in software releases earlier than Junos OS Release 12.3, and provides the same lossless behavior:

- There are two default lossless forwarding classes (the no-loss packet drop attribute is applied automatically):
  fcoe—Mapped to output queue 3
  no-loss—Mapped to output queue 4
- The default classifier maps the fcoe forwarding class to IEEE 802.1p priority 3 (011) and the no-loss forwarding class to IEEE 802.1p priority 4 (100)
- Priority-based flow control (PFC) is enabled on Ethernet interface output queues 3 and 4 when those queues carry lossless traffic (traffic that is mapped to the fcoe and no-loss forwarding classes, respectively). In Junos OS software releases earlier than Release 12.3, output queue flow control was not user-configurable.

  On native FC interfaces (NP_Ports), default flow control is enabled on output queue 3 (IEEE 802.1p priority 3) for FCoE/FC traffic.
- PFC must be enabled explicitly on the lossless IEEE 802.1p priorities (code points) on ingress Ethernet interfaces; no default PFC configuration is applied at ingress interfaces. If you do not enable PFC on lossless priorities, those priorities might experience packet loss during periods of congestion. For example, if you want lossless FCoE traffic and you are using the default fcoe forwarding class, you use a CNP to enable PFC on priority 3 (code point 011), and apply that CNP to all ingress interfaces that carry FCoE traffic.
- On Ethernet ports, PFC buffer calculations use the following default values to determine the headroom buffer size:
  Cable length—100 meters (approximately 328 feet)
  MRU for priority 3 traffic—2500 bytes
  MRU for priority 4 traffic—9216 bytes
  Maximum transmission unit (MTU)—1522 (or the configured MTU value for the interface)

NOTE: If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.

- DCBX is enabled on all interfaces in autonegotiation mode, and automatically exchanges FCoE application protocol type, length, and values (TLVs) on interfaces that carry FCoE traffic. However, if you explicitly configure DCBX protocol TLV exchange for any application, then you must explicitly configure protocol TLV exchange for every application for which you want DCBX to exchange TLVs, including FCoE.

The default CoS configuration is backward-compatible with the *default* CoS configuration of software releases before Junos OS Release 12.3. If you explicitly configure lossless transport, ensure that the input and output queues corresponding to the lossless forwarding classes are explicitly configured for PFC pause.

NOTE: If you *explicitly* configured the lossless fcoe or no-loss forwarding classes before upgrading from a release earlier than Junos OS Release 12.3, those forwarding classes are *not* lossless after the upgrade to Junos OS Release 12.3 or later. To regain lossless behavior, you can delete the explicit configuration and use the default lossless forwarding classes, or you can use the no-loss packet drop attribute introduced in Junos OS Release 12.3 to configure the forwarding classes for lossless behavior.

Table 489 on page 5430 summarizes the default unicast forwarding classes and their mapping to output queues, IEEE 802.1p priorities, and drop attributes.

Table 489: Mapping of Default Unicast Forwarding Class to Queue, IEEE 802.1p Priority, and Drop Attribute

Forwarding Class Name	Output Queue	Priority	Drop Attribute
best-effort	0	0	drop
fcoe	3	3	no-loss
no-loss	4	4	no-loss
network-control	7	7	drop

There is one default multidestination forwarding class named *mcast* for multicast, broadcast, and destination lookup fail (DLF) traffic that is mapped to output queue 8 with a drop attribute of drop. (Incoming multidestination traffic on all IEEE 802.1p priorities is mapped to the mcast forwarding class by default.)

Configuring Lossless Priorities

Configuring more than two lossless priorities (forwarding classes), or changing the default mapping of lossless forwarding classes to priorities and paused output queues, requires explicit configuration. Configuring lossless priorities includes:

- Configuring forwarding classes with the no-loss packet drop attribute
- Using a CNP to configure PFC on ingress interfaces and flow control (PFC) on egress interfaces
- Configuring a classifier to map IEEE 802.1p priorities (code points) to the correct forwarding classes (the forwarding classes for which you want lossless transport)

In addition, on Ethernet interfaces, DCBX must exchange the appropriate application protocol TLVs for the lossless traffic, and when the switch acts as an FCoE-FC gateway, you need to remap the FCoE priority on native FC interfaces if your network uses a priority other than 3 (IEEE code point 011) for FCoE traffic. This section describes:

Configuring Lossless Forwarding Classes (Packet Drop Attribute)

Junos OS Release 12.3 introduced the *no-loss* parameter for forwarding class configuration. (Although it uses the same name, this is not the no-loss default forwarding class. It is a packet drop attribute you can specify to configure any unicast forwarding class as a lossless forwarding class.)

You can configure up to six forwarding classes (depending on system architecture and the availability of system resources) as lossless forwarding classes by including the **no-loss** drop attribute at the **[edit class-of-service forwarding-classes class *forwarding-class-name* queue-num *queue-number*]** hierarchy level.

If you use the default fcoe or no-loss forwarding classes, they include the no-loss drop attribute by default. If you explicitly configure the fcoe or no-loss forwarding classes and you want to retain their lossless behavior, you *must* include the no-loss drop attribute in the configuration.

NOTE: All forwarding classes mapped to the same output queue must have the same packet drop attribute. (All forwarding classes mapped to the same output queue must be either lossy or lossless. You cannot map both a lossy and a lossless forwarding class to the same queue.)

To avoid fate sharing (different flows receiving the same CoS treatment), use a one-to-one mapping of lossless forwarding classes to IEEE 802.1p code points (priorities) and queues. (Each forwarding class should be mapped to a different queue and classified into a different priority.) The classifier attached to the interface determines the forwarding class to priority mapping.

The fcoe and no-loss forwarding classes are special cases, because in the default configuration, they are configured for lossless behavior (providing that you also enable PFC on the priorities mapped to the fcoe and no-loss forwarding classes in the CNP input stanza).

Table 490 on page 5432 summarizes the possible configurations of the fcoe and no-loss forwarding classes in Junos OS Release 12.3 and later, and the result of those configurations in terms of lossless traffic behavior. It is assumed that PFC, DCBX, and classifiers are properly configured.

Table 490: FCoE and No-Loss Forwarding Class Configuration in Junos OS Release 12.3

Explicit (User-Configured) or Default Forwarding Class Configuration	Packet Drop Attribute	Result and Notes
Default	Default	The fcoe and no-loss forwarding classes are lossless. NOTE: Even if you explicitly configure other forwarding classes (lossy or lossless forwarding classes), the fcoe and no-loss forwarding classes remain lossless because they are not explicitly configured.
Explicit	Not specified in the explicit forwarding class configuration	The fcoe and no-loss forwarding classes are lossy because they do not include the no-loss drop attribute.
Explicit	No-loss	The fcoe and no-loss forwarding classes are lossless.
Explicit, configured in Junos OS Release 12.2 or earlier	Not specified (packet drop attribute was not available before Junos OS Release 12.3)	The fcoe and no-loss forwarding classes are lossy in Junos OS Release 12.3 and later because they do not include the no-loss drop attribute. NOTE: To retain lossless behavior, before you upgrade to Junos OS Release 12.3, delete the explicit configuration so that the system uses the default configuration. Alternatively, you can reconfigure the forwarding classes with the no-loss packet drop attribute after upgrading to Junos OS Release 12.3 or later.

For all other forwarding classes, you must explicitly configure lossless transport by specifying the no-loss packet drop attribute, because the default configuration for all other forwarding classes is lossy.

Congestion Notification Profiles (PFC Configuration)

Use CNPs to configure lossless PFC characteristics on input and output interfaces.

The input stanza of a CNP enables PFC on specified IEEE 802.1p priorities (code points) and fine-tunes headroom buffer settings by configuring the maximum receive unit (MRU) value and cable length on ingress interfaces.

The output stanza of a CNP enables PFC (flow control) on output queues for specified IEEE 802.1p priorities so that the queues can respond to PFC pause messages from the connected peer on the priority of your choice. (By default, output queues 3 and 4 respond to received PFC messages when those queues carry lossless traffic in the fcoe and no-loss forwarding classes, respectively.)

To achieve lossless transport, the priority paused at the ingress interfaces must match the priority paused at the egress interfaces for a given traffic flow. For example, if you configure ingress interfaces to pause traffic tagged with IEEE 802.1p priority 5 (code point 101) and priority 5 traffic is mapped to output queue 5, then you must also configure the corresponding output interfaces to pause priority 5 on queue 5. In addition, the forwarding class mapped to queue 5 must be configured as a lossless forwarding class (using the no-loss drop attribute).

CAUTION: Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.

3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.

- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

Configuring Input Interface Flow Control (PFC and Headroom Buffer Calculation)

On Ethernet interfaces, the input stanza of the CNP enables PFC on specified priorities so that the ingress interface can send a pause message to the connected peer during periods of congestion. Input CNPs also fine-tune the headroom buffers used for PFC support by allowing you to configure the MRU value and cable length (if you do not want to use the default configuration).

Headroom buffers support lossless transport by storing the traffic that arrives at an interface after the interface sends a PFC flow control message to pause incoming traffic. Until the connected peer receives the flow control message and pauses traffic, the interface continues to receive traffic and must buffer it (and the traffic that is still on the wire after the peer pauses) to prevent packet loss.

The system uses the MRU and the length of the attached physical cable to calculate buffer headroom allocation. The default configuration values are:

- MRU for priority 3 traffic—2500 bytes
- MRU for priority 4 traffic—9216 bytes
- Cable length—100 meters (approximately 328 feet)

NOTE: If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not explicitly configure an MRU value, the default MRU value is 2500 bytes.

You can fine-tune the MRU and the cable length to adjust the size of the headroom buffer on an interface. The QFX Series has a shared global buffer pool and dynamically allocates headroom buffer space to lossless queues as needed.

A lower MRU or a shorter cable length reduces the amount of headroom buffer required on an interface and leaves more headroom buffer space for other interfaces. A higher MRU or a longer cable length increases the amount of headroom buffer space required on an interface and leaves less headroom buffer space for other interfaces.

In many cases, you can better utilize the headroom buffers by reducing the MRU value (for example, an MRU of 2180 is sufficient for most FCoE networks) and by reducing the cable length value if the physical cable is less than 100 meters long.

NOTE: When you configure the headroom buffers by changing the MRU or the cable length, and commit the configuration, the system performs a commit check and rejects the configuration if sufficient headroom buffer space is not available.

However, the system does not perform a commit check but instead returns a syslog error if:

- The buffers are configured on a LAG interface.
- The default classifier is used on the interface (instead of a user-configured classifier).
- The interface has not been created yet.

Configuring Output Interface Flow Control (PFC)

On Ethernet interfaces, you can use the output stanza of the CNP to configure flow control on unicast output queues and enable PFC pause response on specified IEEE 802.1p priorities. By default, output queues 3 and 4 are enabled for PFC pause on priorities 3 (IEEE 802.1p code point 011) and 4 (IEEE 802.1p code point 100). The default PFC pause response supports the default lossless forwarding class configuration, which maps the fcoe forwarding class to queue 3 and priority 3, and maps the no-loss forwarding class to queue 4 and priority 4.

Configuring PFC on output queues enables you to pause any priority on any unicast output queue on any Ethernet interface. Output flow control enables you to use more than two output queues to support lossless traffic flows (you can configure up to six lossless forwarding classes and map them to different output queues that are enabled for PFC pause). Output queue flow control also enables you to support multiple lossless forwarding classes (each mapped to a different priority and output queue) for one class of traffic.

NOTE: Output flow control only works when PFC is enabled in the CNP input stanza on the corresponding priorities on the interface.

For example, if the converged Ethernet network uses two different priorities for FCoE traffic (for example, priority 3 and priority 5), then you can classify those priorities into different lossless forwarding classes that are mapped to different output queues by:

1. Configuring two lossless forwarding classes for FCoE traffic, with each forwarding class mapped to a different output queue. For example, you could use the default fcoe forwarding class, which is mapped to queue 3, and you could configure a second lossless forwarding class called fcoe1 and map it to queue 5. The fcoe forwarding class is for priority 3 FCoE traffic (code point 011), and the fcoe1 forwarding class is for priority 5 (code point 101) FCoE traffic.
2. Configuring a classifier that maps each forwarding class to the desired IEEE 802.1p code point (priority). If FCoE traffic on both priorities uses one interface, the classifier

must classify both forwarding classes to the correct priorities. If FCoE traffic of different priorities uses different interfaces, the classifier configuration on each interface must map the correct priority to the corresponding lossless forwarding class.

3. Applying the classifier to the interfaces that carry FCoE traffic. The classifier determines the mapping of forwarding classes to priorities on each interface.

To configure lossless transport for these forwarding classes, you also need to:

- Enable PFC on the two priorities (3 and 5 in this example) at the ingress interfaces in the CNP input stanza.
- Configure PFC on the output queues and priorities for the forwarding classes in the CNP output stanza so that the interface can respond to pause messages received from the connected peer.

  NOTE: When you configure the CNP on an interface, all ingress and egress traffic is blocked until the configuration is implemented, then the interface is unblocked and traffic resumes. During the time the interface is blocked, all queues on the interface experience packet loss.

- Configure DCBX to exchange application protocol TLVs on both FCoE priorities.

NOTE: If you do not configure flow control to pause output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer, and you must explicitly enable PFC on the corresponding priorities in the CNP input stanza to achieve lossless behavior.

If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause. For example, if you explicitly configure flow control on output queue 5, the default configuration is no longer valid, and only output queue 5 is enabled for PFC pause. Output queues 3 and 4 are no longer enabled for PFC pause, so traffic using those queues no longer responds to PFC pause messages even if the corresponding forwarding class is configured with the no-loss drop attribute. To retain the pause configuration on output queues 3 and 4 and configure flow control on queue 5, you need to explicitly configure flow control on queues 3, 4, and 5.

You cannot configure flow control to pause a multidestination output queue. You can configure flow control to pause only unicast output queues.

Output Interface Flow Control Profiles

Configuring the CNP output stanza creates an output flow control profile that tells egress ports the queues on which the Ethernet interface should respond to PFC pause messages. Although you can create an unlimited number of CNPs that contain input stanzas only, the number of CNPs that you can configure with output stanzas is limited:

- For QFX3500 and QFX3600 standalone switches that are not part of a QFabric system, you can configure up to two output interface flow control profiles. (You can configure up to two CNPs with output stanzas.)
- For QFabric systems, you can configure one output interface flow control profile per Node device. (You can configure one CNP with an output stanza per Node device.)

There are a total of four output flow control profiles.

The system has a default output flow control profile that is applied to all Ethernet interfaces when the CNP attached to the interface has only an input stanza and does not include an output stanza. The default profile responds to PFC pause messages received on queue 3 (for priority 3, for the default fcoe forwarding class) and on queue 4 (for priority 4, for the default no-loss forwarding class), and is effective only if PFC is configured on those priorities in the CNP input stanza.

Additionally, the system has two internal output flow control profiles that it applies automatically to fabric (FTE) ports and to native FC interfaces (NP_Ports). When the QFX3500 switch or the QFX3600 switch is not part of a QFabric system, the profile normally used for FTE ports is available for user configuration and provides a second user-configurable profile. (That is why standalone QFX3500 and QFX3600 switches have two user-configurable output flow control profiles, but QFX3500 and QFX3600 switches that are part of a QFabric have only one user-configurable output flow control profile.)

Because one output CNP can configure PFC pause response on multiple output queues (priorities), one user-configurable output CNP is usually flexible enough to specify the desired PFC response on all programmed interfaces.

NOTE: **Each port can use one output flow control profile. You cannot apply more than one profile to one port.**

Output flow control profiles can be expressed in table format. For example, Table 491 on page 5437 shows the default output flow control profile that pauses priorities 3 and 4 on queues 3 and 4 (remember that PFC must also be enabled on code points 3 and 4 in the CNP input stanza in order for PFC to work):

Table 491: Default Output Flow Control Profile

IEEE 802.1p Priority Specified in Received PFC Frame	Paused Output Queue
0 (000)	—

Table 491: Default Output Flow Control Profile *(continued)*

IEEE 802.1p Priority Specified in Received PFC Frame	Paused Output Queue
1 (001)	—
2 (010)	—
3 (011)	3
4 (100)	4
5 (101)	—
6 (110)	—
7 (111)	—

Table 492 on page 5438 is an example of a user-configured output flow control profile. Using the example from the preceding section, the CNP output stanza configures flow control on output queue 5, and also explicitly configures output flow control on queues 3 and 4 for the fcoe and no-loss forwarding classes. (If you explicitly configure an output CNP, you must explicitly configure every output queue that you want to respond to PFC messages, because the user-configured profile overrides the default profile. If this example did not include queues 3 and 4, those queues would no longer respond to received PFC messages.)

Table 492: User-Configred Output Flow Control Profile

IEEE 802.1p Priority Specified in Received PFC Frame	Paused Output Queue
0 (000)	—
1 (001)	—
2 (010)	—
3 (011)	3
4 (100)	4
5 (101)	5
6 (110)	—
7 (111)	—

Remember that you must also enable PFC on code points 3, 4, and 5 in the CNP input stanza for this configuration to work. When you configure the CNP on an interface, all ingress and egress traffic is blocked until the configuration is implemented, then the interface is unblocked and traffic resumes. During the time the interface is blocked, all queues on the interface experience packet loss.

Configuring PFC Across Layer 3 Interfaces on QFX5100 Switches

Enabling PFC on traffic flows is based on the IEEE 802.1p code point (priority) in the priority code point (PCP) field of the Ethernet frame header (sometimes known as the CoS bits). To enable PFC on traffic that crosses Layer 3 interfaces, the traffic must be classified by its IEEE 802.1p code point, not by its DSCP (or DSCP IPv6) code point.

See "Understanding PFC Functionality Across Layer 3 Interfaces" on page 5465 for a conceptual overview of how to enable PFC on traffic across Layer 3 interfaces. See "Example: Configuring PFC Across Layer 3 Interfaces" on page 5651 for an example of how to configure PFC on traffic that traverses Layer 3 interfaces.

Configuring DCBX (Application Protocol TLV Exchange)

For applications that require lossless transport, DCBX exchanges application protocol TLVs with the connected peer interface. By default, DCBX advertises FCoE application protocol TLVs on all interfaces that are enabled for DCBX, and by default, DCBX is enabled on all interfaces. DCBX advertises no other applications by default.

For each application (for example, iSCSI) that you want to configure for lossless transport, you must enable the interfaces which carry that application traffic to exchange DCBX protocol TLVs with the connected peer. The TLV exchange allows the peer interfaces to negotiate a compatible configuration to support the application.

If you configure DCBX to advertise any application, the default DCBX advertisement is overridden, and DCBX advertises only the configured applications. If you want an interface to advertise only the FCoE application, you do not have to configure DCBX application protocol TLV exchange; instead, you can use the default configuration.

If you want DCBX to advertise other applications, you must explicitly configure an application map and apply it to the interfaces on which you want to exchange protocol TLVs for those applications. If you want to exchange FCoE application protocol TLVs in addition to other application protocol TLVs, you must also explicitly configure the FCoE application in the application map. "Understanding DCBX Application Protocol TLV Exchange" on page 4915 describes how application mapping works.

NOTE: Lossless transport also requires that you enable PFC on the correct priority (IEEE 802.1p code point) on the ingress interfaces using an input CNP. If the priority you pause at the ingress interfaces is not mapped to queue 3 or queue 4 (the two output queues that are enabled for PFC pause flow control by default), then you must also enable the output queues that correspond to paused input priorities to pause using the output stanza of the CNP.

Fate Sharing Among Traffic Classes

You can configure different lossless (or lossy) traffic flows to share fate—that is, to receive the same CoS treatment.

Fate sharing is not desirable for I/O convergence. Instead of independent control of the fate of each type of flow, different types of flows receive the same treatment. Fate sharing is particularly undesirable for lossless flows. If one lossless flow experiences congestion and must be paused, that affects flows that share fate with the congested flow even if the other flows are not experiencing congestion, and also can cause ingress port congestion. If your network requires that all 802.1p priorities be lossless, you can achieve that by allowing some fate sharing among the eight priorities by spreading them across up to six lossless forwarding classes.

If the number of lossless priorities is less than or equal to the number of configured lossless forwarding classes, then you can avoid fate sharing by configuring a one-to-one mapping of forwarding classes to IEEE 802.1p code points (priorities) and output queues. (Each forwarding class should be mapped to a different output queue and classified to a different priority.)

If you want to configure different traffic flows to share fate, the QFX Series supports two fate-sharing configurations: mapping one forwarding class to more than one IEEE 802.1p code point (priority), and mapping two forwarding classes to the same output queue:

1. If you map one lossless forwarding class to more than one priority, the traffic tagged with each of the priorities uses the same CoS properties associated (the CoS properties associated with the forwarding class). For example, configuring a forwarding class called fc1, mapping it to queue 1, and mapping it to code points 101 and 110 using a classifier named classify1 results in the traffic tagged with priorities 101 and 110 sharing fate:

   ```
   user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
   user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1 loss-priority low code-points 101
   user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1 loss-priority low code-points 110
   ```

   In this case, if the traffic mapped to either priority experiences congestion, both priorities are paused because they are mapped to the same forwarding class and are therefore treated similarly.

2. If you map multiple lossless forwarding classes to the same output queue, the traffic mapped to the forwarding classes uses the same output queue. This increases the amount of traffic the queue needs to buffer and forward, and can create congestion that affects all of the traffic flows that are mapped to the queue. For example, configuring two forwarding classes called fc1 and fc2, mapping both forwarding classes to queue 1, and mapping the forwarding classes to code points 101 and 110 (respectively) using a classifier named classify1 results in the traffic tagged with priorities 101 and 110 sharing fate on the same output queue:

   ```
   user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
   user@switch# set class-of-service forwarding-classes class fc2 queue-num 1 no-loss
   user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1 loss-priority low code-points 101
   user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc2 loss-priority low code-points 110
   ```

   in this case, even though the two forwarding classes use different IEEE 802.1p priorities, if one forwarding class experiences congestion, it affects the other forwarding class.

The reason is that if the output queue is paused because of congestion on either forwarding class, all traffic that uses that queue is paused. Since both forwarding classes are mapped to the queue, the traffic mapped to both forwarding classes is paused.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

Transit Switch Configuration Versus FCoE-FC Gateway Configuration

On a transit switch (all Ethernet ports, no native FC ports) that forwards FCoE traffic (or other traffic that requires lossless transport across the Ethernet network), the configuration of classifiers, lossless forwarding classes, DCBX, and PFC on ingress and egress interfaces to support lossless transport is as described in this document.

When the QFX Series acts as an FCoE-FC gateway, the system uses native FC interfaces (NP_Ports) to connect to the FC switch (or FCoE forwarder) at the FC network edge. You cannot apply CNPs or DCBX to native FC interfaces, only to Ethernet interfaces.

On an FCoE-FC gateway, the Ethernet interface configuration of classifiers, DCBX, and PFC is the same as the Ethernet interface configuration on a transit switch. The configuration of lossless forwarding classes is also the same.

However, supporting lossless transport on native FC interfaces requires that you rewrite the IEEE 802.1p priority value *if* your network uses any priority other than 3 (IEEE code point 011) for FCoE traffic. If your network uses priority 3 for FCoE traffic, you can and should use the default configuration on native FC interfaces.

By default, native FC interfaces tag packets with priority 3 when they encapsulate the incoming FC packets in Ethernet. If your FCoE network uses a different priority than 3 for FCoE traffic, you need to rewrite the priority value to the value that your network uses on the FC interface, classify the FCoE traffic to the correct priority on the Ethernet interfaces, and enable PFC on the correct priority on the Ethernet interfaces, as described in "Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway" on page 5446.

Configuration Results and Commit Checks

Different configurations of forwarding classes and their drop attributes, classifiers, CNPs (PFC flow control), and Ethernet PAUSE (IEEE 802.3X flow control) result in different system behaviors.

Table 493 on page 5442 describes the results of the possible lossless transport configurations in each case. The assumption in the *Result* column is that the system's buffer headroom calculation resulted in a successful configuration.

However, if the system calculates that there is insufficient buffer space to support the configuration, a commit check prevents you from committing the configuration on an individual Ethernet interface. For LAG interfaces, the system does not issue a commit check error but instead issues a syslog message.

NOTE: After you configure lossless transport for a LAG interface, be sure to check the syslog messages to confirm that the commit was successful.

Table 493: Results of Lossless Priority Configuration

Classifier Configuration	Congestion Notification Profile Configuration	Ethernet PAUSE (IEEE 802.3X) Configuration	Result
None (default classifier)	None	None	System default configuration. No flows are lossless. To achieve lossless behavior for the default fcoe and no-loss forwarding classes, you must configure a CNP to enable PFC on their IEEE 802.1p code points (011 and 100 respectively).
Classifier with no lossless forwarding classes	None	None	No lossless traffic flows are configured; all traffic is best effort.
Classifier with at least one lossless forwarding class	None	None	Because no CNP is attached to interfaces, PFC is not enabled on the code point of the lossless traffic and no headroom buffer is allocated to the lossless queue, so packets can drop during periods of congestion. This configuration does not achieve lossless behavior.
None (default classifier)	PFC enabled on the fcoe and no-loss forwarding class code points (priorities)	None	The default classifier classifies traffic into two lossless forwarding classes, fcoe and no-loss. The CNP enables PFC on the priorities mapped to both lossless forwarding classes, resulting in lossless behavior for traffic mapped to the fcoe and no-loss forwarding classes.
None (default classifier)	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length. The system does not calculate buffer headroom for individual output queues. Because Ethernet PAUSE is enabled on the link instead of PFC being enabled on the lossless priorities, the entire link is paused during periods of congestion. This configuration results in lossless behavior for all of the forwarding classes on the link, but because all traffic is paused, this can cause greater overall network congestion.

Table 493: Results of Lossless Priority Configuration *(continued)*

Classifier Configuration	Congestion Notification Profile Configuration	Ethernet PAUSE (IEEE 802.3X) Configuration	Result
Classifier with at least one lossless forwarding class	PFC enabled on the lossless forwarding class code points (priorities)	None	Headroom buffer allocated only to priorities that are mapped to the lossless forwarding classes and on which PFC is enabled. This configuration achieves lossless behavior for the lossless forwarding classes.
Classifier with no lossless forwarding classes	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.
Classifier with at least one lossless forwarding class	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.
Classifier with at least one lossless forwarding class	PFC enabled on the lossless forwarding class code points (priorities)	Flow control enabled on a *different* interface than the interface with the CNP	The system checks the available buffer space for both the PFC-enabled priorities and for the other link. If sufficient buffer space is available, the lossless forwarding classes configured with PFC on one interface and also all of the traffic on the link with Ethernet PAUSE enabled achieve lossless behavior.

NOTE: If you attempt to configure both PFC and Ethernet PAUSE on a link, the system returns a commit error. PFC and Ethernet PAUSE are mutually exclusive configurations on an interface.

Backward Compatibility with Junos OS Releases Earlier Than Release 12.3

The addition of the no-loss packet drop attribute to forwarding class configuration means that when you upgrade from an earlier release to Junos OS Release 12.3, the new software might not preserve the lossless forwarding class configuration of the fcoe and no-loss forwarding classes.

If you used the default forwarding class configuration for the fcoe and no-loss forwarding classes, the CoS configuration is backward-compatible. You do not have to do anything to preserve the lossless behavior of traffic that uses those forwarding classes when you upgrade to Junos OS Release 12.3. (This is because the default configuration of these two forwarding classes includes the no-loss packet drop attribute.)

However, if you explicitly configured the fcoe or the no-loss forwarding class by including the **set forwarding-classes class *forwarding-class-name* queue-num *queue-number*** statement at the **[edit class-of-service]** hierarchy level, then those forwarding classes are no longer lossless, they are lossy. (They are lossy because explicit configuration in releases earlier than Junos OS Release 12.3 did not use the no-loss packet drop attribute.) In Junos OS Release 12.3 and later, you must include the no-loss packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

For example, before Junos OS Release 12.3, the following explicit configuration resulted in a lossless forwarding class:

`user@switch#` **set class-of-service forwarding-classes class fcoe queue-num 3**

However, in Junos OS Release 12.3, this configuration is lossy because it does not include the no-loss packet drop attribute. To preserve lossless behavior, after upgrading to Junos OS Release 12.3, you need to add the no-loss drop attribute:

`user@switch#` **set class-of-service forwarding-classes class fcoe queue-num 3 no-loss**

Alternatively, you can delete the explicit configuration before you upgrade to Junos OS Release 12.3 so that the system uses the default forwarding class, which is lossless:

`user@switch#` **delete class-of-service forwarding-classes class fcoe queue-num 3**

NOTE: The explicit configuration of other forwarding classes does not affect the lossless (or lossy) state of the fcoe and no-loss forwarding classes, because only the fcoe and no-loss forwarding classes were lossless forwarding classes before Junos OS Release 12.3. For example, if you explicitly configured the best-effort forwarding class but you used the default fcoe and no-loss forwarding classes in Junos OS Release 12.2, then when you upgrade to Junos OS Release 12.3, the fcoe and no-loss forwarding classes are still lossless (and the best-effort forwarding classes retains its explicit configuration).

NOTE: To achieve lossless behavior for the traffic belonging to any forwarding class, you must also use a CNP to enable PFC on the IEEE 802.1p priority mapped to the forwarding class and apply the CNP to the relevant interfaces, and ensure that DCBX exchanges the protocol TLVs for the application with the connected peer.

Configuration Rules and Recommendations

Keep in mind the following configuration rules and recommendations when you configure lossless traffic flows:

- You can configure a maximum of six lossless forwarding classes (forwarding classes with the no-loss packet drop attribute).
- All forwarding classes that you map to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes must be lossless).
- You cannot configure flow control to pause a multidestination output queue. You can configure PFC flow control only to pause unicast output queues.
- Forwarding classes mapped to multidestination queues (queues 8 through 11) cannot have the no-loss packet drop attribute. (Multidestination forwarding classes cannot be configured as lossless forwarding classes.)
- Do not configure weighted random early detection (WRED) on lossless forwarding classes. (Do not associate a drop profile with a forwarding class that has the no-loss packet drop attribute.)

Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway

When the QFX Series acts as an FCoE-FC gateway, it connects an Ethernet network that carries Fibre Channel over Ethernet (FCoE) traffic to a Fibre Channel (FC) network. Ethernet interfaces connect to the FCoE network. Native FC interfaces (NP_Ports) connect to the FC network.

FCoE traffic typically uses IEEE 802.1p priority 3 (code point 011). The QFX Series default configuration maps priority 3 traffic to the FCoE forwarding class. If your FCoE network uses priority 3 for FCoE traffic, you do not need to remap priorities, because the default configuration maps priority 3 to the FCoE forwarding class. (But you do need to enable PFC on IEEE 802.1p code point 3 on the Ethernet interfaces to achieve lossless behavior.)

However, if the FCoE network uses a different IEEE 802.1p priority than priority 3 for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that priority (and classified to that priority on the FCoE Ethernet interfaces in the ingress classifier). You specify the lossless forwarding class used for the FCoE traffic by configuring a fixed classifier and applying it to the native FC (NP_Port) interface. All traffic received from the FC SAN on that NP_Port interface is classified into the forwarding class specified in the fixed classifier.

When native FC interfaces on the FCoE-FC gateway encapsulate incoming FC traffic in Ethernet to create FCoE frames, by default they assign IEEE 802.1p code point 011 to the FCoE traffic, forward the traffic internally to the gateway Ethernet interfaces, and then forward the traffic to the FCoE network. Setting a rewrite value for the IEEE 802.1p code point configures the gateway native FC interface to assign the rewrite value priority to the FCoE frames when the native FC interface forwards the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

You can configure one rewrite value for each local FCoE-FC gateway fabric. All of the native FC interfaces in a particular fabric must use the same rewrite value. Native FC interfaces that belong to different FCoE-FC gateway fabrics can use different rewrite values.

Priority Remapping Configuration

Native FC interfaces on an FCoE-FC gateway receive native FC traffic from the FC SAN and encapsulate it in Ethernet to create FCoE frames. Priority remapping enables you to map the encapsulated FC traffic (the FCoE traffic) to any IEEE 802.1p priority. (This is similar to the rewrite rules you can configure to remap forwarding classes to code points on Ethernet egress interfaces, but the rewrite takes place at the ingress FC interface so that the QFX Series uses the correct priority for FCoE traffic on the converged Ethernet network.)

To support lossless traffic flows, you must configure the remapped priority correctly on the native FC interfaces and also on the Ethernet interfaces that connect to the FCoE network. Achieving lossless behavior for FCoE traffic when you remap the FCoE priority requires configuring:

- A lossless forwarding class for FCoE traffic (or using the default *fcoe* forwarding class)
- A behavior aggregate (BA) classifier on the FCoE Ethernet interfaces to map the FCoE forwarding class to the IEEE 802.1p code points (priority) used for FCoE traffic on the FCoE network (the ingress classifier priority for the forwarding class must be the same as the rewrite value priority)
- A fixed classifier on the FCoE-FC gateway FC interface that maps all traffic from the FC network into the lossless FCoE forwarding class (the forwarding class must be lossless)
- A priority rewrite value that remaps the IEEE 802.1p code point on the FCoE-FC gateway FC interface to the priority used for FCoE traffic on the FCoE network
- An input congestion notification profile (CNP) to enable priority-based flow control (PFC) on the FCoE code point (the code point used as the rewrite value) at the Ethernet ingress interfaces

The ingress and egress configurations must match to achieve lossless behavior. The priority and the forwarding class specified in the BA classifier and in the CNP on the Ethernet ingress interfaces must match the fixed classifier and rewrite value on the FC interfaces. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

For example, if you configure a lossless forwarding class named *my_fcoe_fc* and your Ethernet network uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic, then:

- The forwarding class configuration, the BA classifier, and the fixed classifier all specify *my_fcoe_fc* as the forwarding class
- The BA classifier, the input CNP, and the rewrite value all specify the IEEE 802.1p code point 101

Configuration Rules

The following configuration rules apply when you remap priorities on an FCoE-FC gateway:

- Each native FC interface (NP_Port) supports one IEEE 802.1p priority value. The interface rewrites the IEEE 802.1p code point of all incoming traffic on the interface to the rewrite value. (The FC interface uses either the default value of 3 or the rewrite value for all incoming traffic.)
- Ports in the same FCoE-FC gateway local fc-fabric must use the same rewrite value. For example, if ports fc-0/0/0 and fc-0/0/1 are in the same local FCoE-FC gateway fabric, they must use the same rewrite value. If you attempt to commit a configuration that uses different IEEE 802.1p priority rewrite values, the system returns a commit error.

- Ports in different FCoE-FC gateway local fc-fabrics can use different rewrite values. An example scenario is:
  - Interfaces fc-0/0/0 and fc-0/0/1 are in FCoE-FC gateway fc-fabric *my_fc_fab1*.
  - Interfaces fc-0/0/4 and fc-0/0/5 are in FCoE-FC gateway fc-fabric *my_fc_fab2*.

  In this scenario, interfaces fc-0/0/0 and fc-0/0/1 must use the same rewrite value because they belong to the same local FC fabric on the gateway. Interfaces fc-0/0/4 and fc-0/0/5 also must use the same rewrite value because they belong to the same local FC fabric. However, the rewrite value you use for interfaces fc-0/0/0 and fc-0/0/1 can be different than the rewrite value you use for interfaces fc-0/0/4 and fc-0/0/5 because the interfaces belong to different local FC fabrics.
- You can apply the rewrite value only to native FC interfaces; you cannot apply the rewrite value configuration to Ethernet interfaces.
- The forwarding class specified in the fixed classifier on the native FC interface must be a lossless forwarding class. You cannot apply a fixed classifier to a native FC interface unless the associated forwarding class is lossless. (The forwarding class must be one of the two default lossless forwarding classes, or you must explicitly configure the forwarding class with the *no-loss* drop attribute.)
- The lossless forwarding class and IEEE 802.1p priority configuration must match on the FCoE-FC gateway native FC interfaces and Ethernet interfaces:
  - The same IEEE 802.1p priority (code point) must be enabled for PFC on the Ethernet ingress interfaces, classified to the lossless forwarding class used in the native FC interface fixed classifier, and set as the rewrite value on the native FC interfaces.
  - The same lossless forwarding class must be used in the fixed classifier on the native FC interfaces and in the classifier configuration on the Ethernet interfaces.

Fate Sharing

To ensure that congestion on one interface does not affect the fate of traffic on a native FC interface on which you remap priorities, avoid fate sharing (different traffic flows receiving the same CoS treatment) configurations.

You can avoid fate sharing by ensuring that the remapping priority (code point) on the native FC interface is classified only to the forwarding class used in the fixed classifier on all other interfaces. For example, if you configure a fixed classifier on an FC interface that classifies all of the traffic into lossless forwarding class myfcoe1 and remaps the priority to priority 5 (IEEE 802.1p code point 101), then in all other classifier configurations on all other interfaces, priority 5 should always be classified to forwarding class myfcoe1. If you classify priority 6 on another interface to forwarding class myfcoe1, then congestion on priority 6 traffic affects priority 5 traffic unfairly.

Understanding DCB Features and Requirements

Data center bridging (DCB) is a set of enhancements to the IEEE 802.1 bridge specifications. DCB modifies and extends Ethernet behavior to support I/O convergence in the data center. I/O convergence includes but is not limited to the transport of Ethernet LAN traffic and Fibre Channel (FC) storage area network (SAN) traffic on the same physical Ethernet network infrastructure.

A converged architecture saves cost by reducing the number of networks and switches required to support both types of traffic, reducing the number of interfaces required, reducing cable complexity, and reducing administration activities.

The Juniper Networks QFX Series supports the DCB features required to transport converged Ethernet and FC traffic while providing the class-of-service (CoS) and other characteristics FC requires for transmitting storage traffic. To accommodate FC traffic, DCB specifications provide:

- A flow control mechanism called priority-based flow control (PFC, described in IEEE 802.1Qbb) to help provide lossless transport.
- A discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network, called Data Center Bridging Capability Exchange protocol (DCBX), which is an extension of Link Layer Data Protocol (LLDP, described in IEEE 802.1AB).
- A bandwidth management mechanism called enhanced transmission selection (ETS, described in IEEE 802.1Qaz).
- A congestion management mechanism called quantized congestion notification (QCN, described in IEEE 802.1Qau).

The switch supports the PFC, DCBX, and ETS standards but does not support QCN. The switch also provides the high-bandwidth interfaces (10-Gbps minimum) required to support DCB and converged traffic.

This topic describes the DCB standards and requirements the switch supports:

Lossless Transport

FC traffic requires lossless transport (defined as no frames dropped because of congestion). Standard Ethernet does not support lossless transport, but the DCB extensions to Ethernet along with proper buffer management enable an Ethernet network to provide the level of class of service (CoS) necessary to transport FC frames encapsulated in Ethernet over an Ethernet network.

This section describes these factors in creating lossless transport over Ethernet:

PFC

PFC is a link-level flow control mechanism similar to Ethernet PAUSE (described in IEEE 802.3x). Ethernet PAUSE stops all traffic on a link for a period of time. PFC enables you to divide traffic on a link into eight priorities and stop the traffic of a selected priority without stopping the traffic assigned to other priorities on the link.

Pausing the traffic of a selected priority enables you to provide lossless transport for traffic assigned that priority and at the same time use standard lossy Ethernet transport for the rest of the link traffic.

Buffer Management

Buffer management is critical to the proper functioning of PFC, because if buffers are allowed to overflow, frames are dropped and transport is not lossless.

For each lossless flow priority, the switch requires sufficient buffer space to:

- Store frames sent during the time it takes to send the PFC pause frame across the cable between devices.
- Store the frames that are already on the wire when the sender receives the PFC pause frame.

The propagation delay due to cable length and speed, as well as processing speed, determines the amount of buffer space needed to prevent frame loss due to congestion.

The switch automatically sets the threshold for sending PFC pause frames to accommodate delay from cables as long as 150 meters (492 feet) and to accommodate large frames that might be on the wire when the switch sends the pause frame. This ensures that the switch sends pause frames early enough to allow the sender to stop transmitting before the receive buffers on the switch overflow.

Physical Interfaces

The switch supports 10-Gbps, full-duplex interfaces. The switch enables DCB capability only on 10-Gbps (or faster) Ethernet interfaces.

ETS

PFC divides traffic into up to eight separate streams (priorities, configured on the switch as forwarding classes) on a physical link. ETS enables you to manage the link bandwidth by:

- Grouping the priorities into priority groups (configured on the switch as forwarding class sets).
- Specifying the bandwidth available to each of the priority groups as a percentage of the total available link bandwidth.

- Allocating the bandwidth to the individual priorities in the priority group.

The available link bandwidth is the bandwidth remaining after servicing strict priority flows.

Managing link bandwidth with ETS provides several advantages:

- There is uniform management of all types of traffic on the link, both congestion-managed traffic and standard Ethernet traffic.
- When a priority group does not use all of its allocated bandwidth, other priority groups on the link can use that bandwidth as needed.

  When a priority in a priority group does not use all of its allocated bandwidth, other priorities in the group can use that bandwidth.

  The result is better bandwidth utilization, because priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.
- You can assign traffic types with different service needs to different priorities so that each traffic type receives appropriate treatment.
- Strict priority traffic retains its allocated bandwidth.

DCBX

DCB devices use DCBX to exchange configuration information with directly connected peers (switches and endpoints such as servers). DCBX is an extension of LLDP. If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit fails.

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for PFC, ETS, and for Layer 2 and Layer 4 applications such as FCoE and iSCSI. DCBX is enabled or disabled on a per-interface basis.

Understanding DCBX

Data Center Bridging Capability Exchange protocol (DCBX) is an extension of Link Layer Data Protocol (LLDP). If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails. Data center bridging (DCB) devices use DCBX to exchange configuration information with directly connected peers.

This topic describes:

DCBX Basics

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for priority-based flow control (PFC), Layer 2 and Layer 4 applications such as FCoE and iSCSI, and ETS. DCBX is enabled or disabled on a per-interface basis.

By default, for PFC and ETS, DCBX automatically negotiates administrative state and configuration with each interface's connected peer. To enable DCBX negotiation for applications, you must configure the applications, map them to IEEE 802.1p code points in an application map, and apply the application map to interfaces.

The FCoE application only needs to be included in an application map when you want an interface to exchange type, length, and values (TLVs) for other applications in addition to FCoE. If FCoE is the only application you want an interface to advertise, then you do not need to use an application map. For ETS, DCBX pushes the switch configuration to peers if they are set to learn the configuration from the switch (unless you disable sending the ETS recommendation TLV on interfaces in IEEE DCBX mode).

You can override the default behavior for PFC, for ETS, or for all applications mapped to an interface by turning off autonegotiation to force an interface to enable or disable that feature. You can also disable DCBX autonegotiation for applications on an interface by excluding those applications from the application map you apply to that interface or by deleting the application map from the interface.

The default autonegotiation behavior for applications that are mapped to an interface is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

During negotiation of capabilities, the switch can push the PFC configuration to an attached peer if the peer is configured as “willing” to learn the PFC configuration from other peers. The Juniper Networks switch does not support self autoprovisioning and does not change its configuration during autonegotiation to match the peer configuration. (The Juniper switch is not “willing” to learn the PFC configuration from peers.)

NOTE: When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors, so that the switch can interoperate with a wider variety of converged network adapters (CNAs) and Layer 2 switches that support DCBX.

DCBX Modes and Support

This section describes DCBX support on the QFX Series:

DCBX Modes (Versions)

The QFX Series supports the two most common DCBX modes:

- IEEE DCBX—The newest DCBX version. Different TLVs have different subtypes (for example, the subtype for the ETS configuration TLV is 9); the IEEE DCBX Organizationally Unique Identifier (OUI) is 0x0080c2.
- DCBX version 1.01—The Converged Enhanced Ethernet (CEE) version of DCBX. It has a subtype of 2 and an OUI of 0x001b21.

IEEE DCBX and DCBX version 1.01 differ mainly in frame format. DCBX version 1.01 uses one TLV that includes all DCBX attribute information, which is sent as sub-TLVs. IEEE DCBX uses a unique TLV for each DCB attribute.

NOTE: The QFX Series does not support pre-CEE (pre-DCB) DCBX versions. Unsupported older versions of DCBX have a subtype of 1 and an OUI of 0x001b21. The QFX Series drops LLDP frames that contain pre-CEE DCBX TLVs.

Table 378 on page 4907 summarizes the differences between IEEE DCBX and DCBX version 1.01, including show command output:

Table 494: Summary of Differences Between IEEE DCBX and DCBX Version 1.01

Characteristic	IEEE DCBX	DCBX Version 1.01
OUI	0x0080c2	0x001b21
Frame Format	Sends a separate, unique TLV for each DCBX attribute. For example, IEEE DCBX uses separate TLVs for ETS, PFC, and each application. Configuration and Recommendation information is sent in different TLVs	Sends one TLV that includes all DCBX attribute information organized in sub-TLVs. The “willing” bit determines whether or not an interface can change its configuration to match the connected peer.
Symmetric/asymmetric configuration with peer	Asymmetric or symmetric	Symmetric only
Differences in the **show dcbx interface *interface-name*** operational command	• Synchronization information is not shown because symmetric configuration is not required. • Operational state information is not shown because the operational states do not have to be symmetric. • TLV type is shown because unique TLVs are sent for each DCBX attribute. • ETS peer Configuration TLV and Recommendation TLV information is shown separately because they are different TLVs.	• Synchronization information is shown because symmetric configuration is required. • Operational state information is shown because the operational states do have to be symmetric. • TLV type is not shown because one TLV is used for all attribute information. • Recommendation TLV is not sent (DCBX Version 1.01 uses the “willing” bit to determine whether or not an interface uses the peer interface configuration).

For more information about how each DCBX mode exchanges TLVs, see the following specifications:

- For DCBX version 1.01—http://www.ieee802.org/1/files/public/docs2008/az-wadekar-dcbx-capability-exchange-discovery-protocol-1108-v1.01.pdf
- For IEEE DCBX—http://www.ieee802.org/1/files/private/az-drafts/d2/802-1az-d2-4.pdf

NOTE: As of Junos OS Release 12.2, this document is located in a private area of the IEEE website, and access requires a password from the IEEE organization. If you are not an IEEE member, you might not be able to access this document until it moves to the public area of the IEEE website.

You can configure interfaces to use the following DCBX modes:

- IEEE DCBX—The interface uses IEEE DCBX regardless of the configuration on the connected peer.

- DCBX version 1.01—The interface uses DCBX version 1.01 regardless of the configuration on the connected peer.
- Autonegotiation—The interface automatically negotiates with the connected peer to determine the DCBX version the peers use. Autonegotiation is the default DCBX mode.

If you configure a DCBX mode on an interface, the interface ignores DCBX protocol data units (PDUs) it receives from the connected peer if the PDUs do not match the DCBX version configured on the interface. For example, if you configure an interface to use IEEE DCBX and the connected peer sends DCBX version 1.01 LLDP PDUs, the interface ignores the version 1.01 PDUs. If you configure an interface to use DCBX version 1.01 and the peer sends IEEE DCBX LLDP PDUs, the interface ignores the IEEE DCBX PDUs.

NOTE: On interfaces that use the IEEE DCBX mode, the **show dcbx neighbors interface *interface-name*** operational command does not include application, PFC, or ETS operational state in the output.

Autonegotiation

Autonegotiation is the default DCBX mode. Each interface automatically negotiates with its connected peer to determine the DCBX version that both interfaces use to exchange DCBX information.

When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives one IEEE DCBX PDU from the peer, the interface sets the DCBX mode as IEEE DCBX. If the interface receives three DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.

Autonegotiation works slightly differently on QFX3500 switches and QFabric systems:

- QFX3500 switch—When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives an IEEE DCBX TLV from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.
- QFabric system—When an interface connects to its peer interface, the interface advertises DCBX version 1.01 TLVs to the peer. If the interface receives an IEEE DCBX TLVs from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface retains DCBX version 1.01 as the DCBX mode.

NOTE: If the link flaps or the LLDP process restarts, the interface starts the autonegotiation process again. The interface does not use the last received DCBX communication mode.

CNA Support for DCBX Modes

Different CNA vendors support different versions and capabilities of DCBX. The DCBX configuration you use on QFX Series interfaces depends on the DCBX features that the CNAs in your network support.

Interface Support for DCBX

You can configure DCBX on 10-Gigabit Ethernet interfaces and on link aggregation group (LAG) interfaces whose member interfaces are all 10-Gigabit Ethernet interfaces.

DCBX Attribute Types

DCBX has three attribute types:

- Informational—These attributes are exchanged using LLDP, but do not affect DCBX state or operation; they only communicate information to the peer. For example, application priority TLVs are informational TLVs.
- Asymmetric—The values for these types of attributes do not have to be the same on the connected peer interfaces. Peers exchange asymmetric attributes when the attribute values can differ on each peer interface. The peer interface configurations might match or they might differ. For example, ETS Configuration and Recommendation TLVs are asymmetric TLVs.
- Symmetric—The intention is that the values for these types of attributes should be the same on both of the connected peer interfaces. Peer interfaces exchange symmetric attributes to ensure symmetric DCBX configuration for those attributes. For example, PFC Configuration TLVs are symmetric TLVs.

The following sections describe asymmetric and symmetric DCBX attributes:

- Asymmetric Attributes on page 5456
- Symmetric Attributes on page 5457

Asymmetric Attributes

DCBX passes asymmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features). The resulting configuration for an attribute might be different on each peer, so the parameters configured on one interface might not match the parameters on the connected peer interface.

There are two types of asymmetric attribute TLVs:

- Configuration TLV—Configuration TLVs communicate the current operational state and the state of the “willing” bit. The “willing” bit communicates whether or not the interface is willing to accept and use the configuration from the peer interface. If an interface is “willing,” the interface uses the configuration it receives from the peer interface. (The peer interface configuration can override the configuration on the “willing” interface.) If an interface is “not willing”, the configuration on the interface cannot be overridden by the peer interface configuration.
- Recommendation TLV—Recommendation TLVs communicate the parameters the interface recommends that the connected peer interface should use. When an interface

sends a Recommendation TLV, if the connected peer is “willing,” the connected peer changes its configuration to match the parameters in the Recommendation TLV.

Symmetric Attributes

DCBX passes symmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features), with the objective that both interfaces should use the same configuration. The intent is that the parameters configured on one interface should match the parameters on the connected peer interface.

There is one type of symmetric attribute TLV, the Configuration TLV. As with asymmetric attributes, symmetric attribute Configuration TLVs communicate the current operational state and the state of the “willing” bit. “Willing” interfaces use the peer interface parameter values for the attribute. (The attribute configuration of the peer overrides the configuration on the “willing” interface.)

DCBX Application Protocol TLV Exchange

DCBX advertises the switch’s capabilities for Layer 2 applications such as FCoE and Layer 4 applications such as iSCSI:

Application Protocol TLV Exchange

For all applications, DCBX advertises the application’s state and IEEE 802.1p code points on the interfaces to which the application is mapped. If an application is not mapped to an interface, that interface does not advertise the application’s TLVs. There is an exception for FCoE application protocol TLV exchange when FCoE is the only application you want DCBX to advertise on an interface.

FCoE Application Protocol TLV Exchange

Protocol TLV exchange for the FCoE application depends on whether FCoE is the only application you want the interface to advertise or whether you want the interface to exchange other application TLVs in addition to FCoE TLVs.

If FCoE is the only application you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

NOTE: If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

If you want DCBX to advertise FCoE and other applications on an interface, you must specify all of the applications, including FCoE, in an application map, and apply the application map to the desired interfaces.

NOTE: **If an application map is applied to an interface, the FCoE application must be explicitly configured in the application map, or the interface does not exchange FCoE TLVs.**

When DCBX advertises the FCoE application, it advertises the FCoE state and IEEE 802.1p code points. If a peer device connected to a switch interface does not support FCoE, DCBX uses autonegotiation to mark the interface as "FCoE down," and FCoE is disabled on that interface.

Disabling Application Protocol TLV Exchange

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface** ***interface-name*** **applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

DCBX and PFC

After you enable PFC on a switch interface, DCBX uses autonegotiation to control the operational state of the PFC functionality.

If the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled. (PFC must be symmetrical.)

If the peer advertises that it is "willing" to learn its PFC configuration from the switch, DCBX pushes the switch's PFC configuration to the peer and does not check the peer's administrative state.

You can manually override DCBX control of the PFC operational state on a per-interface basis by disabling autonegotiation. If you disable autonegotiation on an interface on which you have configured PFC, then PFC is enabled on that interface regardless of the peer configuration. To disable PFC on an interface, do not configure PFC on that interface.

DCBX and ETS

This section describes:

Default DCBX ETS Advertisement

If you do not configure ETS on an interface, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The default priority group is transparent. It does not appear in the configuration and is used for DCBX advertisement. DCBX advertises the default priority group, its priorities, and the assigned bandwidth.

If you configure ETS on an interface, DCBX advertises:

- Each priority group on the interface
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

Any priority on that interface that is not part of an explicitly configured priority group (forwarding class set) is assigned to the automatically generated default priority group and receives no bandwidth. If you configure ETS on an interface, every forwarding class (priority) on that interface for which you want to forward traffic must belong to a forwarding class set (priority group).

ETS Advertisement and Peer Configuration

DCBX does not control the switch's ETS (hierarchical scheduling) operational state. If the connected peer is configured as "willing," DCBX pushes the switch's ETS configuration to the switch's peers if the ETS Recommendation TLV is enabled (it is enabled by default). If the peer does not support ETS or is not consistently provisioned with the switch, DCBX does not change the ETS operational state on the switch. The ETS operational state remains enabled or disabled based only on the switch hierarchical scheduling configuration and is enabled by default.

When ETS is configured, DCBX advertises the priority groups, the priorities in the priority groups, and the bandwidth configuration for the priority groups and priorities. Any priority (essentially a forwarding class or queue) that is not part of a priority group has no scheduling properties and receives no bandwidth.

You can manually override whether DCBX advertises the ETS state to the peer on a per-interface basis by disabling autonegotiation. This does not affect the ETS state on the switch or on the peer , but it does prevent the switch from sending the Recommendation TLV or the Configuration TLV to the connected peer. To disable ETS on an interface, do not configure priority groups (forwarding class sets) on the interface.

ETS Recommendation TLV

The ETS Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," it changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV by including the **no-recommendation-tlv** statement at the **[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]** hierarchy level.

NOTE: You can disable the ETS Recommendation TLV only when the DCBX mode on the interface is IEEE DCBX. Disabling the ETS Recommendation TLV has no effect if the DCBX mode on the interface is DCBX version 1.01. (IEEE DCBX uses separate application attribute TLVs, but DCBX version 1.01 sends all application attributes in the same TLV and uses sub-TLVs to separate the information.)

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

For example, if you want a CNA connected to a switch interface to have different bandwidth allocations than the switch ETS configuration, you can disable the ETS Recommendation TLV and configure the CNA for the desired bandwidth. The switch interface and the CNA exchange configuration parameters, but the CNA does not change its configuration to match the switch interface configuration.

Understanding DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers. DCBX also advertises the capabilities of applications on interfaces by exchanging application protocol information through application type, length, and value (TLV) elements. DCBX is an extension of Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

NOTE: LLDP and DCBX are enabled by default on all interfaces.

Setting up application protocol exchange consists of:

- Defining applications
- Mapping the applications to IEEE 802.1p code points in an *application map*
- Configuring classifiers to prioritize incoming traffic and map the incoming traffic to the application by the traffic code points
- Applying the application maps and classifiers to interfaces

You need to explicitly define the applications that you want an interface to advertise. The FCoE application is a special case (see "Applications" on page 4915) and only needs to be defined on an interface if you want DCBX to exchange application protocol TLVs for other applications in addition to FCoE on that interface.

You also need to explicitly map all defined applications that you want an interface to advertise to IEEE 802.1p code points in an application map. The FCoE application is a special case (see "Application Maps" on page 4916) and only requires inclusion in an application map when you want an interface to use DCBX for other applications in addition to FCoE, as described later in this topic.

This topic describes:

Applications

Before an interface can exchange application protocol information, you need to define the applications that you want to advertise, except FCoE if FCoE is the only application that you want the interface to advertise.

NOTE: If FCoE is the only application that you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class and applied to the interface)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

If you apply an application map to an interface, then all applications that you want DCBX to advertise must be defined and configured in the application map, including the FCoE application.

If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

You can define:

- Layer 2 applications by EtherType
- Layer 4 applications by a combination of protocol (TCP or UDP) and destination port number

The EtherType is a two-octet field in the Ethernet frame that denotes the protocol encapsulated in the frame. For a list of common EtherTypes, see http://standards.ieee.org/develop/regauth/ethertype/eth.txt on the IEEE standards organization website. For a list of port numbers and protocols, see the *Service Name and Transport Protocol Port Number Registry* at http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml on the Internet Assigned Numbers Authority (IANA) website.

You must explicitly define each application that you want to advertise, except FCoE. The FCoE application is defined by default (EtherType 0x8906).

Application Maps

An application map maps defined applications to one or more IEEE 802.1p code points. Each application map contains one or more applications. DCBX includes the configured application code points in the protocol TLVs exchanged with the connected peer.

To exchange protocol TLVs for an application, you must include the application in an application map. The FCoE application is a special case:

- If you want DCBX to exchange application protocol TLVs for more than one application on a particular interface, you must configure the applications, define an application map to map the applications to code points, and apply the application map to the interface. In this case, you must also define the FCoE application and add it to the application map.

This is the same process and treatment required for all other applications. In addition, for DCBX to exchange FCoE application TLVs, you must enable priority-based flow control (PFC) on the FCoE priority (the FCoE IEEE 802.1p code point) on the interface.

- If FCoE is the only application that you want DCBX to advertise on an interface, then you do not need to configure an application map and apply it to the interface. By default, when an interface has no application map, and the interface carries traffic mapped to the FCoE forwarding class, and PFC is enabled on the FCoE priority, the interface advertises FCoE TLVs (autonegotiation mode). DCBX exchanges FCoE application protocol TLVs by default until you apply an application map to the interface, remove the FCoE traffic from the interface (you can do this by removing the or editing the classifier for FCoE traffic), or disable PFC on the FCoE priority.

  If you apply an application map to an interface that did not have an application map and was exchanging FCoE application TLVs, and you do not include the FCoE application in the application map, the interface stops exchanging FCoE TLVs. Every interface that has an application map must have FCoE included in the application map (and PFC enabled on the FCoE priority) in order for DCBX to exchange FCoE TLVs.

Mapping an application to code points does two things:

- Maps incoming traffic with the same code points to that application
- Allows you to configure classifiers that map incoming application traffic, by code point, to a forwarding class and a loss priority, in order to apply class of service (CoS) to application traffic and prioritize application traffic

You apply an application map to an interface to enable DCBX application protocol exchange on that interface for each application specified in the application map. All of the applications that you want an interface to advertise must be configured in the application map that you apply to the interface, with the previously noted exception for the FCoE application when FCoE is the only application for which you want DCBX to exchange protocol TLVs on an interface.

Classifying and Prioritizing Application Traffic

When traffic arrives at an interface, the interface classifies the incoming traffic based on its code points. Classifiers map code points to loss priorities and forwarding classes. The loss priority prioritizes the traffic. The forwarding class determines the traffic output queue and CoS service level.

When you map an application to an IEEE 802.1p code point in an application map and apply the application map to an interface, incoming traffic on the interface that matches the application code points is mapped to the appropriate application. The application receives the loss priority and the CoS associated with the forwarding class for those code points, and is placed in the output queue associated with the forwarding class.

You can use the default classifier or you can configure a classifier to map the application code points defined in the application map to forwarding classes and loss priorities.

Enabling Interfaces to Exchange Application Protocol Information

Each interface with the **fcoe** forwarding class and PFC enabled on the FCoE code point is enabled for FCoE application protocol exchange by default until you apply an application map to the interface. If you apply an application map to an interface and you want that interface to exchange FCoE application protocol TLVs, you must include the FCoE application in the application map. (In all cases, to achieve lossless transport, you must also enable PFC on the FCoE code point or code points.)

Except when FCoE is the only protocol you want DCBX to advertise on an interface, interfaces on which you want to exchange application protocol TLVs must include the following two items:

- The application map that contains the application(s)
- A classifier

NOTE: You must also enable PFC on the code point of any traffic for which you want to achieve lossless transport.

Disabling DCBX Application Protocol Exchange

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable sending the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers.

QFX5100 Switches Only

- Understanding PFC Functionality Across Layer 3 Interfaces on page 5465

Understanding PFC Functionality Across Layer 3 Interfaces

Priority-based flow control (PFC) allows you to select traffic flows within a link and pause them, so that the output queues associated with the flows do not overflow and drop packets. (PFC is more granular than Ethernet PAUSE, which pauses all traffic on a physical link.) PFC helps you configure lossless transport for traffic flows across a data center bridging network.

However, you might want to create a traffic flow that losslessly traverses the Layer 2 data center bridging network *and* also losslessly traverses a Layer 3 network that connects Ethernet hosts in different Layer 2 networks. On a QFX5100 switch running the Enhanced Layer 2 Software (ELS) CLI, in addition to configuring PFC on Layer 2 (bridging) interfaces, you can configure PFC on traffic that traverses Layer 3 interfaces. This enables you to preserve the lossless characteristics that PFC provides on traffic, even when the traffic crosses Layer 3 interfaces that connect two Layer 2 networks.

PFC works the same way across Layer 3 interfaces as it works across Layer 2 interfaces. When an output queue buffer reaches a certain fill level threshold, the switch sends a PFC pause message to the connected peer to pause transmission of the traffic on which PFC is enabled. Pausing the incoming traffic prevents the queue buffer from overflowing and dropping packets, just as on Layer 2 interfaces. When the queue buffer fill level decreases below a certain threshold, the interface sends a message to the connected peer to restart traffic transmission.

Although PFC is a data center bridging technology, PFC also works on Layer 3 interfaces because PFC operates at the queue level. When you use an IEEE 802.1p classifier to classify incoming traffic (map incoming traffic to a forwarding class and a loss priority based on the IEEE 802.1p code point in the Ethernet frame header) and you enable PFC on the appropriate priority (IEEE 802.1p code point), PFC works on Layer 2 and Layer 3 interfaces.

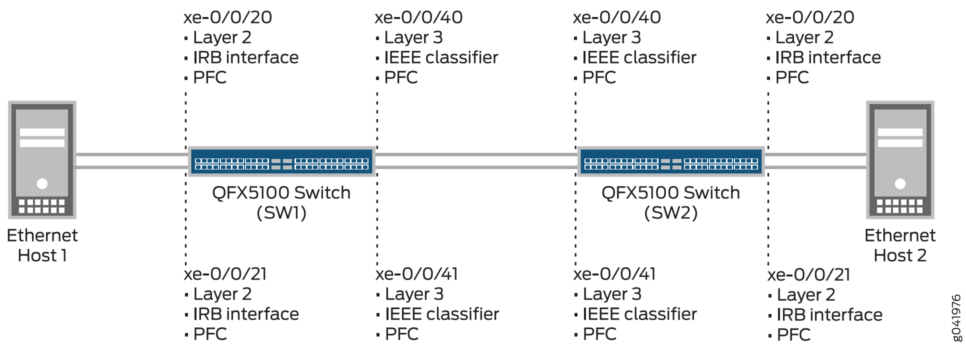
NOTE: Lossless traffic on Layer 3 interfaces *must* use an IEEE 802.1p classifier to classify incoming traffic, because PFC does not use DSCP or DSCP IPv6 code points to identify traffic for flow control. PFC cannot pause traffic flows unless the incoming traffic is classified by an IEEE 802.1p classifier. Do not apply a DSCP (or a DSCP IPv6) classifier to Layer 3 traffic on which you want to enable PFC.

Because PFC functionality relies on the mapping (classifying) of traffic to IEEE 802.1p code points and on enabling PFC on the correct code point(s) at each interface, you must ensure that incoming traffic has the correct 3-bit IEEE 802.1p code point (priority) in the priority code point (PCP) field of the Ethernet frame header (sometimes known as the CoS bits).

NOTE: **Layer 3 interfaces do not support FCoE traffic. FCoE traffic must use Layer 2 interfaces and cannot use Layer 3 interfaces. Therefore, you cannot enable PFC on FCoE traffic across Layer 3 interfaces.**

Figure Figure 198 on page 5466 shows a topology in which two Ethernet hosts in Layer 2 networks communicate across a Layer 3 network, with PFC enabled on all of the Layer 2 and Layer 3 switch interfaces.

Figure 198: Enabling PFC Across Layer 3 Interface Hops



The Ethernet host-facing interfaces (xe-0/0/20 and xe-0/0/21 on both switches) and the Layer 3 network-facing interfaces (interfaces xe-0/0/40 and xe-0/0/41 on both switches) require different interface configurations to enable PFC on the Layer 3 interfaces. In addition, the class of service (CoS) for each interface must be configured correctly, including enabling PFC on the traffic that you want to treat as lossless traffic:

Ethernet-host facing interfaces (xe-0/0/20 and xe-0/0/21) require the following configuration:

- Set interfaces as family ethernet-switching
- Set the interface mode as trunk mode
- Create VLANs to carry the traffic
- Create IRB interfaces to place the Layer 2 VLAN traffic on Layer 3 for transport between IP networks
- Create an IEEE 802.1p classifier to classify incoming traffic into the correct forwarding class, based on the IEEE 802.1p code point
- Create a congestion notification profile (CNP) to configure PFC on the IEEE 802.1p code point of the traffic that you want treat as lossless traffic
- Apply the classifier and the CNP to the Layer 2 interfaces
- Configure CoS: lossless forwarding classes, hierarchical port scheduling (also known as enhanced transmission selection) and apply it to the Layer 2 interfaces

Layer 3 IP network-facing interfaces (xe-0/0/40 and xe-0/0/41) require the following configuration:

- Set interfaces as family inet
- Set VLAN tagging on the interfaces
- Create VLANs to carry the traffic
- Create an IEEE 802.1p classifier to classify incoming traffic into the correct forwarding class, based on the IEEE 802.1p code point (do not use a DSCP or DSCP IPv6 classifier)
- Create a congestion notification profile (CNP) to configure PFC on the IEEE 802.1p code point of the traffic that you want treat as lossless traffic on the Layer 3 interfaces
- Apply the IEEE 802.1p classifier and the CNP to the Layer 3 interfaces
- Configure CoS: lossless forwarding classes, hierarchical port scheduling (enhanced transmission selection) and apply it to the Layer 3 interfaces

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

When you configure the Layer 2 and Layer 3 interfaces correctly, the switch enables PFC on the traffic between Ethernet Host 1 and Ethernet Host 2 across the entire path between the two hosts. If any output queue in the path on which PFC is enabled experiences congestion, PFC pauses the traffic and prevents packet loss for the flow.

QFX3500 and QFX3600 Virtual Chassis Only

- CoS on QFX Series Virtual Chassis Switch Ports on page 5468

CoS on QFX Series Virtual Chassis Switch Ports

QFX Series Virtual Chassis devices have access ports to connect to external peer devices, just as other QFX Series devices have access ports. QFX Series Virtual Chassis devices also have Virtual Chassis ports (VCPs) to interconnect members of the Virtual Chassis, in a similar way that QFabric system Node devices have fabric (fte) ports to connect to the QFabric system Interconnect device. VCPs are not used for external access.

Class of service (CoS) on Virtual Chassis access ports is the same as CoS on other QFX Series device access ports, except for shared buffer settings. However, CoS on VCPs differs in several ways from CoS on QFabric system Node device fabric ports.

This topic describes CoS support on Virtual Chassis access interfaces and on VCPs:

Access Interface CoS Support

CoS on Virtual Chassis access interfaces is the same as CoS on QFX Series device access interfaces, except for shared buffer settings. The documentation for QFX Series CoS on access interfaces applies to Virtual Chassis access interfaces, except some of the shared buffer documentation.

Similarities in CoS Support on Virtual Chassis Access Interfaces and Other QFX Series Access Interfaces

Virtual Chassis access interfaces support the following CoS features in the same way as other QFX Series device access interfaces:

- Forwarding classes—The default forwarding classes, queue mapping, and packet drop attributes (Table 495 on page 5469) are the same as on other QFX Series access interfaces:

Table 495: Default Forwarding Class Configuration

Default Forwarding Class	Default Queue Mapping	Default Packet Drop Attribute
best-effort (be)	0	drop
fcoe	3	no-loss
no-loss	4	no-loss
network-control (nc)	7	drop
mcast	8	drop

- Packet classification—Classifier default settings and configuration are the same as on other QFX Series access interfaces. Support for behavior aggregate, multifield, multidestination, and fixed classifiers is the same as on other QFX Series access interfaces.
- Enhanced transmission selection (ETS)—This data center bridging (DCB) feature that supports hierarchical scheduling has the same defaults and user configuration as on other QFX Series access interfaces, including forwarding class set (priority group) and traffic control profile configuration.
- Priority-based flow control (PFC)—This DCB feature that supports lossless transport has the same defaults and user configuration as on other QFX Series access interfaces, including support for six lossless priorities (forwarding classes).
- Ethernet PAUSE—This feature has the same defaults and configuration as on other QFX Series access interfaces.
- Queue scheduling—This feature has the same defaults, configuration, and scheduler-to-forwarding-class mapping as on other QFX Series access interfaces. Queue scheduling is a subset of hierarchical scheduling.
- Priority group (forwarding class set) scheduling—This feature has the same defaults and configuration as on other QFX Series access interfaces. Priority group scheduling is a subset of hierarchical scheduling.
- Tail-drop profiles—This feature has the same defaults and configuration as on other QFX Series access interfaces.

- Code-point aliases—This feature has the same defaults and configuration as on other QFX Series access interfaces.
- Rewrite rules—As on other QFX Series access interfaces, there are no default rewrite rules applied to egress traffic.
- Host outbound traffic—This feature has the same defaults and configuration as on other QFX Series access interfaces.

Differences in CoS Support on Virtual Chassis Access Interfaces and Other QFX Series Access Interfaces

The default shared buffer settings and the way in which you configure shared buffers are the same on Virtual Chassis access interfaces as on other QFX Series device access interfaces. The difference is that on Virtual Chassis access interfaces, the shared buffer configuration is global and applies to all access ports on all members of the Virtual Chassis. (On other QFX Series device access interfaces, you can configure different buffer settings on different standalone systems or on different QFabric system Node devices.)

You cannot configure different shared buffer settings for different Virtual Chassis members. All members of a Virtual Chassis use the same shared buffer configuration.

VCP Interface CoS Support

CoS on the VCP interfaces that connect the Virtual Chassis members is similar to CoS on the fabric interfaces of QFabric system Node devices, but there are several important differences:

- Similarities in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces on page 5470
- Differences in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces on page 5471

Similarities in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces

VCP interfaces support full hierarchical scheduling (ETS). ETS includes the following CoS features. VCP interfaces support no other CoS features.

- Creating forwarding class sets (priority groups) and mapping forwarding classes to forwarding class sets.
- Scheduling individual output queues. The scheduler defaults and configuration are the same as the scheduler on access interfaces.
- Scheduling priority groups (forwarding class sets) using a traffic control profile. The defaults and configuration are the same as on access interfaces.

NOTE: You cannot attach classifiers, congestion notification profiles, or rewrite rules to VCP interfaces. Also, you cannot configure buffer settings on VCP interfaces. Similar to fabric interfaces on QFabric system Node devices, you can only attach forwarding class sets and traffic control profiles to VCP interfaces.

The behavior of lossless traffic across 40-Gigabit VCP interfaces is the same as the behavior of lossless traffic across QFabric system Node device fabric ports. The system automatically enables flow control for lossless forwarding classes (priorities). The system dynamically calculates buffer headroom that is allocated from the global lossless-headroom buffer for the lossless forwarding classes on each 40-Gigabit VCP interface. If there is not enough global lossless-headroom buffer space to support the number of lossless flows on a 40-Gigabit VCP interface, the system generates a syslog message.

NOTE: **After you configure lossless transport on a Virtual Chassis, check the syslog messages to ensure that there is sufficient buffer space to support the configuration.**

NOTE: **If you break out a 40-Gigabit VCP interface into 10-Gigabit VCP interfaces, lossless transport is not supported on the 10-Gigabit VCP interfaces. Lossless transport is supported only on 40-Gigabit VCP interfaces. (10-Gigabit access interfaces support lossless transport.)**

Differences in CoS Support on VCP Interfaces and QFabric System Node Device Fabric Interfaces

Although most of the CoS behavior on VCP interfaces is similar to CoS behavior on the fabric ports of QFabric system Node devices, there are some important differences:

- Hierarchical scheduling (queue and priority group scheduling)—On QFabric system Node device fabric interfaces, you can apply a different hierarchical scheduler (traffic control profile) to different priority groups (forwarding class sets) on different interfaces. However, on VCP interfaces, the schedulers that you apply to priority groups are global to all VCP interfaces. One hierarchical scheduler controls scheduling for a priority group on all VCP interfaces.

  You attach a scheduler to VCP interfaces using the global identifier (vcp-*) for VCP interfaces. For example, if you want to apply a traffic control profile (traffic control profiles contain both queue and priority group scheduling configuration) named *vcp-hpc-tcp* to a forwarding class set named *vcp-hpc-fcset*, you include the following statement in the configuration:

  ```
  [edit]
  user@switch# set class-of-service interfaces vcp-* forwarding-class-set vcp-hpc-fcset
  output-traffic-control-profile vcp-hpc-tcp
  ```

  The system applies the hierarchical scheduler *vcp-hpc-tcp* to the traffic mapped to the priority group *vcp-hpc-fcset* on all VCP interfaces.

- You cannot attach classifiers, congestion notification profiles, or rewrite rules to VCP interfaces. Also, you cannot configure buffer settings on VCP interfaces. Similar to QFabric system Node device fabric interfaces, you can only attach forwarding class sets and traffic control profiles to VCP interfaces.

- Lossless transport is supported only on 40-Gigabit VCP interfaces. If you break out a 40-Gigabit VCP interface into 10-Gigabit VCP interfaces, lossless transport is not supported on the 10-Gigabit VCP interfaces.

CPU-Generated Host Outbound Traffic

CPU-generated host outbound traffic is forwarded on the network-control forwarding class, which is mapped to queue 7. If you use the default scheduler, the network-control queue receives a guaranteed minimum bandwidth (transmit rate) of 5 percent of port bandwidth. The guaranteed minimum bandwidth is more than sufficient to ensure lossless transport of host outbound traffic.

However, if you configure and apply a scheduler instead of using the default scheduler, you must ensure that the network-control forwarding class (or whatever forwarding class you configure for host outbound traffic) receives sufficient guaranteed bandwidth to prevent packet loss.

TIP: If you configure a scheduler instead of using the default scheduler, we recommend that you configure the network-control queue (or the queue you configure for host outbound traffic if it is not the network-control queue) as a strict-high priority queue. Strict-high priority queues receive the bandwidth required to transmit their entire queues before other queues are served.

As with all strict-high priority traffic, if you configure the network-control queue (or any other queue) as a strict-high priority queue, you must also create a separate forwarding class set (priority group) that contains only strict-high priority traffic, and apply the strict-high priority forwarding class set and its traffic control profile (hierarchical scheduler) to the VCP interfaces.

CHAPTER 63

Configuration

Configuration Examples

- Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic on page 5541
- Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic on page 5547

Example: Configuring CoS Hierarchical Port Scheduling (ETS)

Hierarchical port scheduling defines the class-of-service (CoS) properties of output queues, which are mapped to forwarding classes (forwarding classes are mapped to IEEE 802.1p priorities, so mapping queues to forwarding classes also maps queues to priorities). Hierarchical port scheduling enables you to group priorities that require similar CoS resources into priority groups. You define the port bandwidth resources for a priority group, and you define the amount of the priority group's resources that each priority in the group can use.

Hierarchical port scheduling is the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz). One major benefit of hierarchical port scheduling is greater port bandwidth utilization. If a priority group on a port does not use all of its allocated bandwidth, other priority groups on that port can use that bandwidth. Also, if a priority within a priority group does not use its allocated bandwidth, other priorities within that priority group can use that bandwidth.

Configuring hierarchical scheduling is a multistep procedure that includes:

- Mapping forwarding classes to queues
- Defining forwarding class sets (priority groups)
- Defining behavior aggregate classifiers
- Configuring priority-based flow control (PFC) for lossless priorities (queues)
- Applying classifiers and PFC configuration to ingress interfaces
- Defining drop profiles
- Defining schedulers
- Mapping forwarding classes to schedulers
- Defining traffic control profiles
- Assigning priority groups and traffic control profiles to egress ports

This example describes how to configure hierarchical scheduling:

- Requirements on page 5475
- Overview on page 5475
- Configuration on page 5478
- Verification on page 5486

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Keep the following considerations in mind when you plan the port bandwidth allocation for priority groups and for individual priorities:

- How much traffic and what types of traffic you expect to traverse the system.
- How you want to divide different types of traffic into priorities (forwarding classes, also called queues) to apply different CoS treatment to the traffic. Dividing traffic into priorities includes:
  - Mapping the code points of ingress traffic to forwarding classes using behavior aggregate (BA) classifiers. This classifies incoming traffic into the appropriate forwarding class.
  - Mapping forwarding classes to output queues. This defines the output queue for each type of traffic.
  - Attaching the BA classifier to the desired ingress interfaces so that incoming traffic maps to the desired forwarding classes and queues.
- How you want to organize priorities into priority groups (forwarding class sets).

  Traffic that requires similar treatment usually belongs in the same priority group. To do this, place forwarding classes that require similar bandwidth, loss, and other characteristics in the same forwarding class set. For example, you can map all types of best-effort traffic forwarding classes into one forwarding class set.
- How much of the port bandwidth you want to allocate to each priority group and to each of the priorities in each priority group. The following considerations apply to bandwidth allocation:
  - Estimate how much traffic you expect in each forwarding class (output queue) and how much traffic you expect in each forwarding class set (the aggregate amount of traffic in the forwarding classes that belong to the forwarding class set).
  - The combined minimum guaranteed bandwidth of the priorities (forwarding classes) in a priority group should not exceed the minimum guaranteed bandwidth of the priority group. The transmit rate scheduler parameter defines the minimum guaranteed bandwidth for forwarding classes. Scheduler maps associate schedulers with forwarding classes.
  - The combined minimum guaranteed bandwidth of the priority groups (forwarding class sets) on a port should not exceed the port's total bandwidth. Traffic control profiles define the minimum bandwidth for a forwarding class set. Associating a scheduler map with a traffic control profile sets the scheduling for the individual forwarding classes in the forwarding class set.

This example creates hierarchical port scheduling by defining priority groups for best effort, guaranteed delivery, and high-performance computing (HPC) traffic. Each priority group includes priorities that need to receive similar CoS treatment. Each priority group and each priority within each priority group receive the CoS resources needed to service their flows. Lossless priorities use PFC to prevent packet loss when the network experiences congestion.

Topology

Table 496 on page 5476 shows the configuration components for this example.

Table 496: Components of the Hierarchical Port Scheduling (ETS) Configuration Topology

Property	Settings
Hardware	QFX3500 switch
Mapping of forwarding classes (priorities) to queues	**best-effort** to queue **0** **be** to queue **1** **fcoe** (Fibre Channel over Ethernet) to queue **3** **no-loss** to queue **4** **hpc** (high-performance computing) to queue **5** **network-control** to queue **7** NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.
Forwarding class sets (priority groups)	**best-effort-pg**: contains forwarding classes **best-effort**, **be**, and **network control** **guar-delivery-pg**: contains forwarding classes **fcoe** and **no-loss** **hpc-pg**: contains forwarding class **hpc**
Behavior aggregate classifier (maps forwarding classes and loss priorities to incoming packets by IEEE 802.1 code point)	Name—**hsclassifier1** Code point mapping: • **000** to forwarding class **best-effort** and loss priority **low** • **001** to forwarding class **be** and loss priority **high** • **011** to forwarding class **fcoe** and loss priority **low** • **100** to forwarding class **no-loss** and loss priority **low** • **101** to forwarding class **hpc** and loss priority **low** • **110** to forwarding class **network-control** and loss priority **low**

Table 496: Components of the Hierarchical Port Scheduling (ETS) Configuration Topology *(continued)*

Property	Settings
PFC	Congestion notification profile name—**gd-cnp** PFC enabled on code points: **011** (**fcoe** priority), **010** (**no-loss** priority)
Drop profiles NOTE: The **fcoe** and **no-loss** priorities (queues) do not use drop profiles because they are lossless traffic classes.	**dp-be-low**: drop start point **25**, drop end point **50**, maximum drop rate **80** **dp-be-high**: drop start point **10**, drop end point **40**, maximum drop rate **100** **dp-hpc**: drop start point **75**, drop end point **90**, maximum drop rate **75** **dp-nc**: drop start point **80**, drop end point **100**, maximum drop rate **100**
Queue schedulers	**be-sched**: minimum bandwidth **3g**, maximum bandwidth **100%**, priority **low**, drop profiles **dp-be-low** and **dp-be-high** **fcoe-sched**: minimum bandwidth **2.5g**, maximum bandwidth **100%**, priority **low** **hpc-sched**: minimum bandwidth **2g**, maximum bandwidth **100%**, priority **low**, drop profile **dp-hpc** **nc-sched**: minimum bandwidth **500m**, maximum bandwidth **100%**, priority **low**, drop profile **dp-nc** **nl-sched**: minimum bandwidth **2g**, maximum bandwidth **100%**, priority **low**
Forwarding class-to-scheduler mapping	Scheduler map **be-map**: Forwarding class **best-effort**, scheduler **be-sched** Forwarding class **be**, scheduler **be-sched** Forwarding class **network-control**, scheduler **nc-sched** Scheduler map **gd-map**: Forwarding class **fcoe**, scheduler **fcoe-sched** Forwarding class **no-loss**, scheduler **nl-sched** Scheduler map **hpc-map**: Forwarding class **hpc**, scheduler **hpc-sched**
Traffic control profiles	**be-tcp**: scheduler map **be-map**, minimum bandwidth **3.5g**, maximum bandwidth **100%** **gd-tcp**: scheduler map **gd-map**, minimum bandwidth **4.5g**, maximum bandwidth **100%** **hpc-tcp**: scheduler map **hpc-map**, minimum bandwidth **2g**, maximum bandwidth **100%**
Interfaces	This example configures hierarchical port scheduling on interfaces **xe-0/0/20** and **xe-0/0/21**. Because traffic is bidirectional, you apply the ingress and egress configuration components to both interfaces: • Classifier Name—**hsclassifier1** • Forwarding class sets—**best-effort-pg**, **guar-deliver-pg**, **hpc-pg** • Congestion notification profile—**gd-cnp**

Figure 199 on page 5478 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example. You can perform the configuration steps in a different sequence if you want.

Figure 199: Hierarchical Port Scheduling Components Block Diagram

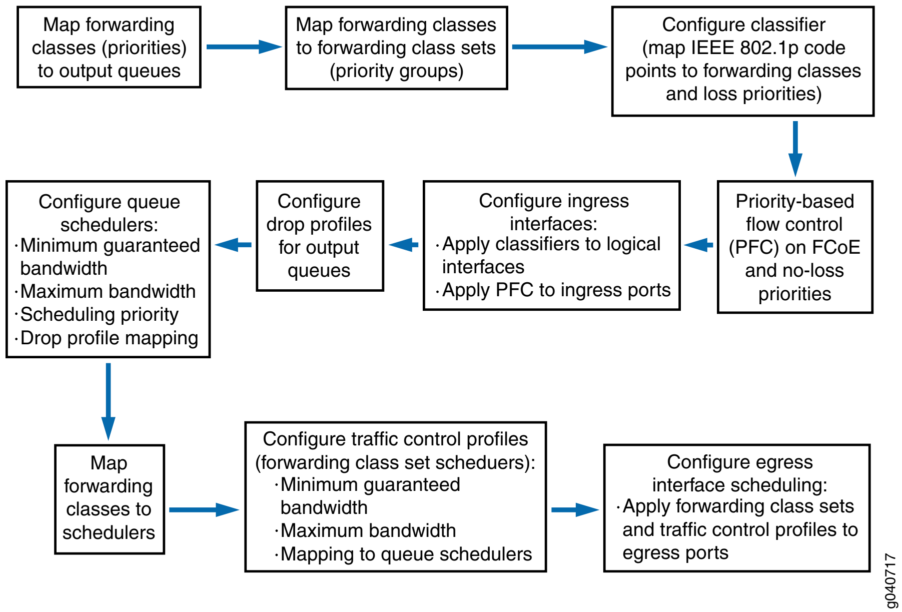

Figure 200 on page 5478 shows a block diagram of the hierarchical scheduling packet flow from ingress to egress.

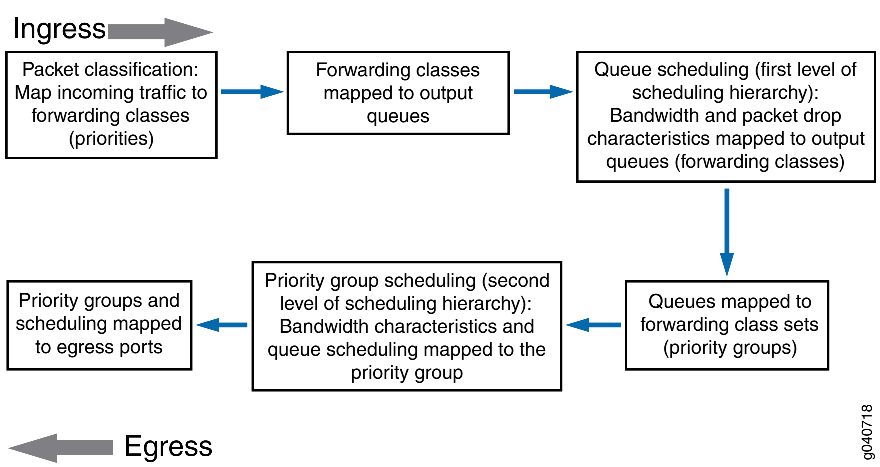
Figure 200: Hierarchical Port Scheduling Packet Flow Block Diagram



Configuration

CLI Quick Configuration

To quickly configure hierarchical port scheduling, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set forwarding-classes class best-effort queue-num 0
set forwarding-classes class be2 queue-num 1
set forwarding-classes class hpc queue-num 5
set forwarding-classes class network-control queue-num 7
set forwarding-class-sets best-effort-pg class best-effort
set forwarding-class-sets best-effort-pg class be2
set forwarding-class-sets best-effort-pg class network-control
set forwarding-class-sets guar-delivery-pg class fcoe
set forwarding-class-sets guar-delivery-pg class no-loss
set forwarding-class-sets hpc-pg class hpc
set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort loss-priority low code-points 000
set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority high code-points 001
set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority low code-points 011
set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority low code-points 100
set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low code-points 101
set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control loss-priority low code-points 110
set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011 pfc
set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100 pfc
set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 hsclassifier1
set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 hsclassifier1

```

set traffic-control-profiles hpc-tcp scheduler-map hpc-map guaranteed-rate 2g
set traffic-control-profiles hpc-tcp shaping-rate percent 100
set interfaces xe-0/0/20 forwarding-class-set best-effort-pg output-traffic-control-profile be-tcp
set interfaces xe-0/0/20 forwarding-class-set guar-delivery-pg output-traffic-control-profile gd-tcp
set interfaces xe-0/0/20 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp
set interfaces xe-0/0/21 forwarding-class-set best-effort-pg output-traffic-control-profile be-tcp
set interfaces xe-0/0/21 forwarding-class-set guar-delivery-pg output-traffic-control-profile gd-tcp
set interfaces xe-0/0/21 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp

Step-by-Step Procedure

To perform a step-by-step configuration of the forwarding classes (priorities), forwarding class sets (priority groups), classifiers, queue schedulers, PFC, traffic control profiles, and interfaces to set up hierarchical port scheduling (ETS):

1. Configure the forwarding classes (priorities) and map them to unicast output queues (do not explicitly map the **fcoe** and **no-loss** forwarding classes to output queues; use the default configuration):

```
[edit class-of-service]
user@switch# set forwarding-classes class best-effort queue-num 0
user@switch# set forwarding-classes class be2 queue-num 1
user@switch# set forwarding-classes class hpc queue-num 5
user@switch# set forwarding-classes class network-control queue-num 7
```

2. Configure forwarding class sets (priority groups) to group forwarding classes (priorities) that require similar CoS treatment:

```
[edit class-of-service]
user@switch# set forwarding-class-sets best-effort-pg class best-effort
user@switch# set forwarding-class-sets best-effort-pg class be2
user@switch# set forwarding-class-sets best-effort-pg class network-control
user@switch# set forwarding-class-sets guar-delivery-pg class fcoe
user@switch# set forwarding-class-sets guar-delivery-pg class no-loss
user@switch# set forwarding-class-sets hpc-pg class hpc
```

3. Configure a classifier to set the loss priority and IEEE 802.1 code points assigned to each forwarding class at the ingress:

```
[edit class-of-service]
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort
loss-priority low code-points 000
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority
high code-points 001
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority
low code-points 011
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority
low code-points 100
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low
code-points 101
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control
loss-priority low code-points 110
```

4. Configure a congestion notification profile to enable PFC on the FCoE and no-loss queue IEEE 802.1 code points:

```
[edit class-of-service]
user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011
pfc
user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100
pfc
```

5. Assign the classifier to the interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 hsclassifier1
   user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 hsclassifier1
   ```

6. Apply the PFC configuration to the interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 congestion-notification-profile gd-cnp
   user@switch# set interfaces xe-0/0/21 congestion-notification-profile gd-cnp
   ```

7. Configure the drop profile for the best-effort low loss-priority queue:

   ```
   [edit class-of-service]
   user@switch# set drop-profiles dp-be-low interpolate fill-level 25 fill-level 50
   drop-probability 0 drop-probability 80
   ```

8. Configure the drop profile for the best-effort high loss-priority queue:

   ```
   [edit class-of-service]
   user@switch# set drop-profiles dp-be-high interpolate fill-level 10 fill-level 40
   drop-probability 0 drop-probability 100
   ```

9. Configure the drop profile for the network-control queue:

   ```
   [edit class-of-service]
   user@switch# set drop-profiles dp-nc interpolate fill-level 80 fill-level 100 drop-probability
   0 drop-probability 100
   ```

10. Configure the drop profile for the high-performance computing queue:

    ```
    [edit class-of-service]
    user@switch# set drop-profiles dp-hpc interpolate fill-level 75 fill-level 90 drop-probability
    0 drop-probability 75
    ```

11. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profiles for the best-effort queue:

    ```
    [edit class-of-service]
    user@switch# set schedulers be-sched priority low transmit-rate 3g
    user@switch# set schedulers be-sched shaping-rate percent 100
    user@switch# set schedulers be-sched drop-profile-map loss-priority low protocol any
    drop-profile dp-be-low
    user@switch# set schedulers be-sched drop-profile-map loss-priority high protocol any
    drop-profile dp-be-high
    ```

12. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the FCoE queue:

    ```
    [edit class-of-service]
    user@switch# set schedulers fcoe-sched priority low transmit-rate 2500m
    user@switch# set schedulers fcoe-sched shaping-rate percent 100
    ```

13. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the high-performance computing queue:

    ```
    [edit class-of-service]
    user@switch# set schedulers hpc-sched priority low transmit-rate 2g
    user@switch# set schedulers hpc-sched shaping-rate percent 100
    user@switch# set schedulers hpc-sched drop-profile-map loss-priority low protocol any
    drop-profile dp-hpc
    ```

14. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the network-control queue:

    ```
    [edit class-of-service]
    user@switch# set schedulers nc-sched priority low transmit-rate 500m
    user@switch# set schedulers nc-sched shaping-rate percent 100
    user@switch# set schedulers nc-sched drop-profile-map loss-priority low protocol any drop-profile dp-nc
    ```

15. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the no-loss queue:

    ```
    [edit class-of-service]
    user@switch# set schedulers nl-sched priority low transmit-rate 2g
    user@switch# set schedulers nl-sched shaping-rate percent 100
    ```

16. Map the schedulers to the appropriate forwarding classes (queues):

    ```
    [edit class-of-service]
    user@switch# set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
    user@switch# set scheduler-maps be-map forwarding-class be2 scheduler be-sched
    user@switch# set scheduler-maps be-map forwarding-class network-control scheduler nc-sched
    user@switch# set scheduler-maps gd-map forwarding-class fcoe scheduler fcoe-sched
    user@switch# set scheduler-maps gd-map forwarding-class no-loss scheduler nl-sched
    user@switch# set scheduler-maps hpc-map forwarding-class hpc scheduler hpc-sched
    ```

17. Define the traffic control profile for the best-effort priority group (queue scheduler to mapping, minimum guaranteed bandwidth, and maximum bandwidth):

    ```
    [edit class-of-service]
    user@switch# set traffic-control-profiles be-tcp scheduler-map be-map guaranteed-rate 3500m
    user@switch# set traffic-control-profiles be-tcp shaping-rate percent 100
    ```

18. Define the traffic control profile for the guaranteed delivery priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):

    ```
    [edit class-of-service]
    user@switch# set traffic-control-profiles gd-tcp scheduler-map gd-map guaranteed-rate 4500m
    user@switch# set traffic-control-profiles gd-tcp shaping-rate percent 100
    ```

19. Define the traffic control profile for the high-performance computing priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):

    ```
    [edit class-of-service]
    user@switch# set traffic-control-profiles hpc-tcp scheduler-map hpc-map guaranteed-rate 2g
    user@switch# set traffic-control-profiles hpc-tcp shaping-rate percent 100
    ```

20. Apply the three priority groups (forwarding class sets) and the appropriate traffic control profiles to the egress ports:

    ```
    [edit class-of-service]
    user@switch# set interfaces xe-0/0/20 forwarding-class-set best-effort-pg output-traffic-control-profile be-tcp
    user@switch# set interfaces xe-0/0/20 forwarding-class-set guar-delivery-pg output-traffic-control-profile gd-tcp
    user@switch# set interfaces xe-0/0/20 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp
    ```

```
user@switch# set interfaces xe-0/0/21 forwarding-class-set best-effort-pg
output-traffic-control-profile be-tcp
user@switch# set interfaces xe-0/0/21 forwarding-class-set guar-delivery-pg
output-traffic-control-profile gd-tcp
user@switch# set interfaces xe-0/0/21 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** and **no-loss** lossless forwarding classes):

```
user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 hsclassifier1 {
    forwarding-class best-effort {
      loss-priority low code-points 000;
    }
    forwarding-class be2 {
      loss-priority high code-points 001;
    }
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
    forwarding-class no-loss {
      loss-priority low code-points 100;
    }
    forwarding-class hpc {
      loss-priority low code-points 101;
    }
    forwarding-class network-control {
      loss-priority low code-points 110;
    }
  }
  drop-profiles {
    dp-be-low {
      interpolate {
        fill-level [ 25 50 ];
        drop-probability [ 0 80 ];
      }
    }
    dp-be-high {
      interpolate {
        fill-level [ 10 40 ];
        drop-probability [ 0 100 ];
      }
    }
    dp-hpc {
      interpolate {
        fill-level [ 75 90 ];
        drop-probability [ 0 75 ];
      }
    }
    dp-nc {
      interpolate {
```

```
            fill-level [ 80 100 ];
            drop-probability [ 0 100 ];
        }
    }
}

            transmit-rate 2g;
            shaping-rate percent 100;
            priority low;
        }
    }
```

TIP: To quickly configure the interfaces, issue the **load merge terminal** command, and then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the hierarchical port scheduling components have been created and are operating properly, perform these tasks:

- Verifying That the Forwarding Classes (Priorities) Have Been Created on page 5487
- Verifying That the Forwarding Class Sets (Priority Groups) Have Been Created on page 5487
- Verifying That the Classifier Has Been Created on page 5488
- Verifying That Priority-Based Flow Control Has Been Enabled on page 5488
- Verifying That the Output Queue Schedulers Have Been Created on page 5489
- Verifying That the Drop Profiles Have Been Created on page 5492

- Verifying That the Priority Group Output Schedulers (Traffic Control Profiles) Have Been Created on page 5493
- Verifying the Interface Configuration on page 5494

Verifying That the Forwarding Classes (Priorities) Have Been Created

Purpose Verify that the forwarding classes have been created and mapped to the correct queues. (The system shows only the explicitly configured forwarding classes. It does not show default forwarding classes such as **fcoe** and **no-loss**.)

Action List the forwarding classes using the operational mode command **show class-of-service forwarding-class**:

```
user@switch> show class-of-service forwarding-class
Forwarding class                       ID      Queue  Policing priority  No-Loss

  best-effort                          0        0         normal        Disabled

  be2                                  1        3         normal        Disabled

  hpc                                  2        4         normal        Disabled

  network-control                      3        7         normal        Disabled

  mcast                                8        8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command lists all of the configured forwarding classes, the internal identification number of each forwarding class, the queues that are mapped to the forwarding classes, the policing priority, and whether the forwarding class is lossless (no-loss packet drop attribute enabled) or lossy forwarding class (no-loss packet drop attribute disabled). The command output shows that:

- Forwarding class **best-effort** maps to queue **0** and is lossy
- Forwarding class **be2** maps to queue **1** and is lossy
- Forwarding class **hpc** maps to queue **5** and is lossy
- Forwarding class **network-control** maps to queue **7** and is lossy

In addition, the command lists the default multicast (multidestination) forwarding class and the default queue to which it is mapped.

Verifying That the Forwarding Class Sets (Priority Groups) Have Been Created

Purpose Verify that the priority groups have been created and that the correct priorities (forwarding classes) belong to the appropriate priority group.

Action List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set**:

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: best-effort-pg, Type: normal-type, Forwarding class set
index: 19907
  Forwarding class                       Index
  best-effort                              0
```

```
  be2                                     1
  network-control                         5

Forwarding class set: guar-delivery-pg, Type: normal-type, Forwarding class set
index: 43700
  Forwarding class                      Index
  fcoe                                    2
  no-loss                                 3

Forwarding class set: hpc-pg, Type: normal-type, Forwarding class set index: 60758

  Forwarding class                      Index
  hpc                                     4
```

Meaning The **show class-of-service forwarding-class-set** command lists all of the configured forwarding class sets (priority groups), the forwarding classes (priorities) that belong to each priority group, and the internal index number of each priority group. The command output shows that:

- The forwarding class set **best-effort-pg** includes the forwarding classes **best-effort**, **be2**, and **network-control**.
- The forwarding class set **guar-delivery-pg** includes the forwarding classes **fcoe** and **no-loss**.
- The forwarding class set **hpc-pg** includes the forwarding class **hpc**.

Verifying That the Classifier Has Been Created

Purpose Verify that the classifier maps forwarding classes to the correct IEEE 802.1p code points and packet loss priorities.

Action List the classifier configured for hierarchical port scheduling using the operational mode command **show class-of-service classifier name hsclassifier1**:

```
user@switch> show class-of-service classifier name hsclassifier1
Classifier: hsclassifier1, Code point type: ieee-802.1, Index: 43607
  Code point         Forwarding class                   Loss priority
  000                best-effort                        low
  001                be2                                high
  011                fcoe                               low
  100                no-loss                            low
  101                hpc                                low
  110                network-control                    low
```

Meaning The **show class-of-service classifier name hsclassifier1** command lists all of the IEEE 802.1p code points and the loss priorities mapped to all of the forwarding classes in the classifier. The command output shows that the forwarding classes **best-effort**, **be2**, **no-loss**, **fcoe**, **hpc**, and **network-control** have been created and mapped to IEEE 802.1p code points and loss priorities.

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the correct priorities for lossless transport.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Type: Input, Name: gd-cnp, Index: 51687
Cable Length: 100 m
  Priority      PFC          MRU
  000           Disabled
  001           Disabled
  010           Disabled
  011           Enabled      2500
  100           Enabled      2500
  101           Disabled
  110           Disabled
  111           Disabled
Type: Output
  Priority      Flow-Control-Queues
  000
                0
  001
                1
  010
                2
  011
                3
  100
                4
  101
                5
  110
                6
  111
                7
```

Meaning The **show class-of-service congestion-notification** command lists all of the congestion notification profiles and the IEEE 802.1p code points with PFC enabled. The command output shows that PFC is enabled for code points **011** (**fcoe** priority and queue) and **100** (**no-loss** priority and queue) for the **gd-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying That the Output Queue Schedulers Have Been Created

Purpose Verify that the output queue schedulers have been created with the correct bandwidth parameters and priorities, mapped to the correct queues, and mapped to the correct drop profiles.

Action List the scheduler maps using the operational mode command **show class-of-service scheduler-map**:

```
user@switch> show class-of-service scheduler-map
Scheduler map: be-map, Index: 64023

  Scheduler: be-sched, Forwarding class: best-effort, Index: 13005
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
```

```
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         55387    dp-be-low
      Medium high     any             1    <default-drop-profile>
      High            any          4369    dp-be-high

  Scheduler: be-sched, Forwarding class: be2, Index: 13005
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         55387    dp-be-low
      Medium high     any             1    <default-drop-profile>
      High            any          4369    dp-be-high

  Scheduler: nc-sched, Forwarding class: network-control, Index: 45740
    Transmit rate: 500000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         44207    dp-nc
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>

Scheduler map: gd-map, Index: 61447

  Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
    Transmit rate: 2500000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         44207    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>

  Scheduler: nl-sched, Forwarding class: no-loss, Index: 29359
    Transmit rate: 2000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any         44207    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>

Scheduler map: hpc-map, Index: 56941
```

```
Scheduler: hpc-sched, Forwarding class: hpc, Index: 55900
  Transmit rate: 2000000000 bps, Rate Limit: none, Buffer size: remainder,
  Buffer Limit: none, Priority: low
  Excess Priority: unspecified
  Shaping rate: 100 percent,
  drop-profile-map-set-type: mark
  Drop profiles:
    Loss priority   Protocol    Index    Name
    Low             any         57716    dp-hpc
    Medium high     any             1    <default-drop-profile>
    High            any             1    <default-drop-profile>
```

Meaning The **show class-of-service scheduler-map** command lists all of the configured scheduler maps. For each scheduler map, the command output includes:

- The name of the scheduler map (**scheduler-map** field)
- The name of the scheduler (**scheduler** field)
- The forwarding classes mapped to the scheduler (**forwarding-class** field)
- The minimum guaranteed queue bandwidth (**transmit-rate** field)
- The scheduling priority (**priority** field)
- The maximum bandwidth in the priority group the queue can consume (**shaping-rate** field)
- The drop profile loss priority (**loss priority** field) for each drop profile name (**name** field)

The command output shows that:

- The scheduler map **be-map** has been created and has these properties:
  - There are two schedulers, **be-sched** and **nc-sched**.
  - The scheduler **be-sched** has two forwarding classes, **best-effort** and **be2**.
  - Scheduler **be-sched** forwarding classes **best-effort** and **be2** share a minimum guaranteed bandwidth of **3000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and use the drop profile **dp-be-low** for low loss-priority traffic, the default drop profile for medium-high loss-priority traffic, and the drop profile **dp-be-high** for high loss-priority traffic.
  - The scheduler **nc-sched** has one forwarding class, **network-control**.
  - The **network-control** forwarding class has a minimum guaranteed bandwidth of **500000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-nc** for low loss-priority traffic and the default drop profile for medium-high and high loss priority traffic.
- The scheduler map **gd-map** has been created and has these properties:
  - There are two schedulers, **fcoe-sched** and **nl-sched**.
  - The scheduler **fcoe-sched** has one forwarding class, **fcoe**.

- The **fcoe** forwarding class has a minimum guaranteed bandwidth of **2500000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
- The scheduler **nl-sched** has one forwarding class, **no-loss**.
- The **no-loss** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.

- The scheduler map **hpc-map** has been created and has these properties:
  - There is one scheduler, **hpc-sched**.
  - The scheduler **hpc-sched** has one forwarding class, **hpc**.
  - The **hpc** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-hpc** for low loss-priority traffic and the default drop profile for medium-high and high loss-priority traffic.

Verifying That the Drop Profiles Have Been Created

Purpose Verify that the drop profiles **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc** have been created with the correct fill levels and drop probabilities.

Action List the drop profiles using the operational mode command **show configuration class-of-service drop-profiles**:

```
user@switch> show configuration class-of-service drop-profiles
dp-be-low {
    interpolate {
        fill-level [ 25 50 ];
        drop-probability [ 0 80 ];
    }
}
dp-be-high {
    interpolate {
        fill-level [ 10 40 ];
        drop-probability [ 0 100 ];
    }
}
dp-hpc {
    interpolate {
        fill-level [ 75 90 ];
        drop-probability [ 0 75 ];
    }
}
dp-nc {
    interpolate {
        fill-level [ 80 100 ];
        drop-probability [ 0 100 ];
    }
```

Meaning The **show configuration class-of-service drop-profiles** command lists the drop profiles and their properties. The command output shows that there are four drop profiles configured, **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc**. The output also shows that:

- For **dp-be-low**, the drop start point (the first fill level) is when the queue is 25 percent filled, the drop end point (the second fill level) occurs when the queue is 50 percent filled, and the drop probability at the drop end point is 80 percent.
- For **dp-be-high**, the drop start point (the first fill level) is when the queue is 10 percent filled, the drop end point (the second fill level) occurs when the queue is 40 percent filled, and the drop probability at the drop end point is 100 percent.
- For **dp-hpc**, the drop start point (the first fill level) is when the queue is 75 percent filled, the drop end point (the second fill level) occurs when the queue is 90 percent filled, and the drop probability at the drop end point is 75 percent.
- For **dp-nc**, the drop start point (the first fill level) is when the queue is 80 percent filled, the drop end point (the second fill level) occurs when the queue is 100 percent filled, and the drop probability at the drop end point is 100 percent.

Verifying That the Priority Group Output Schedulers (Traffic Control Profiles) Have Been Created

Purpose Verify that the traffic control profiles **be-tcp**, **gd-tcp**, and **hpc-tcp** have been created with the correct bandwidth parameters and scheduler mapping.

Action List the traffic control profiles using the operational mode command **show class-of-service traffic-control-profile**:

```
user@switch> show class-of-service traffic-control-profile
Traffic control profile: be-tcp, Index: 40535
  Shaping rate: 100 percent
  Scheduler map: be-map
  Guaranteed rate: 3500000000

Traffic control profile: gd-tcp, Index: 37959
  Shaping rate: 100 percent
  Scheduler map: gd-map
  Guaranteed rate: 4500000000

Traffic control profile: hpc-tcp, Index: 47661
  Shaping rate: 100 percent
  Scheduler map: hpc-map
  Guaranteed rate: 2000000000
```

Meaning The **show class-of-service traffic-control-profile** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**traffic-control-profile**)
- The maximum port bandwidth the priority group can consume (**shaping-rate**)
- The scheduler map associated with the traffic control profile (**scheduler-map**)
- The minimum guaranteed priority group port bandwidth (**guaranteed-rate**)

The command output shows that:

- The traffic control profile **be-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **be-map**, and has a minimum guaranteed bandwidth of **3500000000 bps**.
- The traffic control profile **gd-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **gd-map**, and has a minimum guaranteed bandwidth of **4500000000 bps**.
- The traffic control profile **hpc-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **hpc-map**, and has a minimum guaranteed bandwidth of **2000000000 bps**.

Verifying the Interface Configuration

Purpose Verify that the classifier, the congestion notification profile, and the forwarding class sets are configured on interfaces **xe-0/0/20** and **xe-0/0/21**.

Action List the interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hsclassifier1;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/21
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hsclassifier1;
    }
}
```

Meaning

The **show configuration class-of-service interfaces** ***interface-name*** command shows that each interface includes the forwarding class sets **best-effort-pg**, **guar-delivery-pg**, and **hpc-pg**, congestion notification profile **gd-cnp**, and the IEEE 802.1p classifier **hsclassifier1**.

Example: Configuring Unicast Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. You apply classifiers to ingress interfaces.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP or DSCP IPv6) value, IEEE 802.1p value, or MPLS EXP value.
- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

NOTE: **You must assign unicast traffic and multidestination (multicast, broadcast, and destination lookup fail) traffic to different classifiers. One classifier cannot include both unicast and multidestination forwarding classes. A unicast classifier can include only forwarding classes for unicast traffic.**

This example describes how to configure a BA classifier called **ba-ucast-classifier** as the default IEEE 802.1 map and apply it to ingress interface **xe-0/0/10**. The BA classifier assigns loss priorities, as shown in Table 497 on page 5496, to incoming packets in the four forwarding classes.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

Table 497: ba-ucast-classifier Loss Priority Assignments

Unicast Forwarding Class	For CoS Traffic Type	ba-ucast-classifier Loss Priority to IEEE 802.1p Code Point Mapping	Packet Drop Attribute
be	Best-effort traffic	Low loss priority code point: **000**	drop
fcoe	Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic	Low loss priority code point: **011**	no-loss

Table 497: ba-ucast-classifier Loss Priority Assignments *(continued)*

Unicast Forwarding Class	For CoS Traffic Type	ba-ucast-classifier Loss Priority to IEEE 802.1p Code Point Mapping	Packet Drop Attribute
no-loss	Guaranteed delivery for TCP traffic	Low loss priority code point: **100**	no-loss
nc	Network-control traffic	Low loss priority code point: **110**	drop

Configuring Unicast Classifiers

To configure a unicast IEEE 802.1 BA classifier named **ba-ucast-classifier** as the default IEEE 802.1 map:

1. Associate code point **000** with forwarding class **be** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 ba-ucast-classifier import default forwarding-class be loss-priority low code-points 000
   ```
2. Associate code point **011** with forwarding class **fcoe** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class fcoe loss-priority low code-points 011
   ```
3. Associate code point **100** with forwarding class **no-loss** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class no-loss loss-priority low code-points 100
   ```
4. Associate code point **110** with forwarding class **nc** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class nc loss-priority low code-points 110
   ```
5. Apply the unicast classifier to ingress interface **xe-0/0/10**:

   ```
   [edit class-of-service interfaces]
   user@switch# set xe-0/0/10 unit 0 classifiers ieee-802.1 ba-ucast-classifier
   ```

Verification

To verify the unicast classifier configuration, perform these tasks:

- Verifying the Unicast Classifier Configuration on page 5497
- Verifying the Ingress Interface Configuration on page 5498

Verifying the Unicast Classifier Configuration

Purpose Verify that you configured the unicast classifier with the correct forwarding classes, loss priorities, and code points.

Action List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier
```

```
    forwarding-class be {
        loss-priority low code-points 000;
    }
    forwarding-class fcoe {
        loss-priority low code-points 011;
    }
    forwarding-class no-loss {
        loss-priority low code-points 100;
    }
    forwarding-class nc
        loss-priority low code-points 110;
    }
```

Verifying the Ingress Interface Configuration

Purpose Verify that the unicast classifier **ba-ucast-classifier** is attached to ingress interface **xe-0/0/10**.

Action List the ingress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/10**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/10
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 ba-ucast-classifier;
    }
}
```

Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class.

- Requirements on page 5499
- Overview on page 5499
- Configuring Multidestination Classifiers on page 5500
- Verification on page 5500

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.

  NOTE: **DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.**

- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield traffic classifiers—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

NOTE: **You must assign unicast traffic and multicast traffic to different classifiers. One classifier cannot include both unicast and multicast forwarding classes. A multidestination classifier can include only forwarding classes for multicast traffic.**

The following example describes how to configure a BA classifier called **ba-mcast-classifier**, which is applied to all of the switch interfaces. The BA classifier assigns loss priorities, as shown in Table 498 on page 5500, to incoming packets in the multidestination forwarding class.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

Table 498: BA-mcast-classifier Loss Priority Assignments

Multicast Forwarding Class	For CoS Traffic Type	ba-mcast-classifier Assignment
mcast	Best-effort multicast traffic	Low loss priority code point: **000**

Configuring Multidestination Classifiers

To configure a multicast IEEE 802.1 BA classifier named **ba-mcast-classifier**:

1. Associate code point **000** with forwarding class **mcast** and loss priority **low**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 ba-mcast-classifier forwarding-class mcast-be loss-priority
   low code-points 000
   ```
2. Configure the classifier as a multidestination classifier:

   ```
   [edit class-of-service]
   user@switch# set multi-destination classifiers ieee-802.1 ba-mcast-classifier
   ```

Verification

To verify the multidestination classifier configuration, perform these tasks:

- Verifying the IEEE 802.1 Multidestination Classifier on page 5500
- Verifying the Multidestination Classifier Configuration on page 5500

Verifying the IEEE 802.1 Multidestination Classifier

Purpose Verify that the classifier **ba-mcast-classifier** is configured as the IEEE 802.1 multidestination classifier:

Action Verify the results of the classifier configuration using the operational mode command **show configuration class-of-service multi-destination classifiers ieee-802.1**:

```
user@switch> show configuration class-of-service multi-destination classifiers ieee-802.1
ba-mcast-classifier;
```

Verifying the Multidestination Classifier Configuration

Purpose Verify that you configured the multidestination classifier with the correct forwarding classes, loss priorities, and code points.

Action List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier
    forwarding-class mcast {
        loss-priority low code-points 000;
    }
```

Related Documentation

- Example: Configuring Unicast Classifiers on page 5495
- Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers on page 5675
- Monitoring CoS Classifiers on page 5809

Example: Configuring Tail-Drop Profiles

You can configure an interpolated weighted random early detection (WRED) tail-drop profile to control packet drop characteristics for different traffic loss priorities.

NOTE: You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

You associate a tail-drop profile with a loss priority in a scheduler. When you attach the scheduler to a forwarding class (queue), you apply the interpolated drop profile to traffic of the specified loss priority in that queue. *Interpolated* means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point:

- Drop start point—Percentage of average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop.
- Drop end point—Average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.)
- Maximum drop rate—Drop probability when the average queue fill level reaches the drop end point.

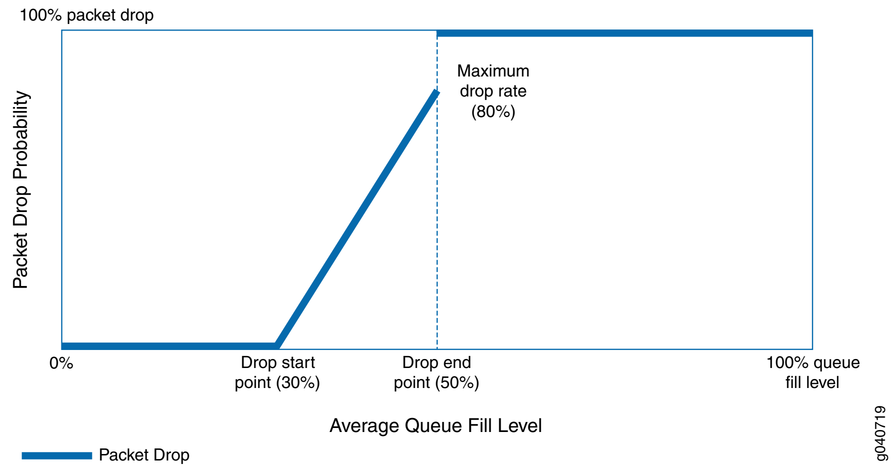
You set the drop start point and the drop end point by specifying two queue fill level percentage values. The first value is the drop start point and the second value is the drop end point.

You set the maximum drop rate by specifying two drop probability percentage values. The first value is always zero (0), which is the minimum drop rate, the probability of dropping a packet at the drop start point. The second value is the maximum drop rate at the drop end point.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

Figure 201 on page 5502 shows the graph for a drop profile with a drop start point of 30 percent, a drop end point of 50 percent, and a maximum drop rate of 80 percent.

Figure 201: Tail-Drop Profile Packet Drop Example



The graph shows that when the queue fill level is less than 30 percent, the packet drop rate is zero. When the queue fill level reaches 30 percent, packets begin to drop. As the queue fills, a higher percentage of packets drop. When the queue fill level reaches 50 percent, the packet drop rate has climbed to 80 percent. When the queue fill level exceeds 50 percent, all packets drop.

This example describes how to configure the drop profile shown in Figure 201 on page 5502. The drop profile will have:

- The name **be-dp1**
- 30 percent for the drop start point (first **fill-level** setting)
- 50 percent for the drop end point (second **fill-level** setting)
- 0 percent for the minimum drop rate (first **drop-probability** setting)
- 80 percent for the maximum drop rate (second **drop-probability** setting)

You apply a drop profile by configuring a drop profile map that maps the drop profile to a packet loss priority and associates the drop profile and packet loss priority with a scheduler. When you associate the scheduler with a forwarding class (queue), the switch applies the drop profile to the packets in the forwarding class that have a matching packet loss priority.

Configuring a Drop Profile

1. Set the drop start point at **30** percent, the drop end point at **50** percent, the minimum drop rate at **0** percent, and the maximum drop rate at **80** percent for the drop profile **be-dp1**:

```
[edit class-of-service]
user@switch# set drop-profile be-dp1 interpolate fill-level 30 fill-level 50 drop-probability
0 drop-probability 80
```

Verification

Verifying the Drop Profile Configuration

Purpose Verify that you configured the drop profile **be-dp1** with the correct drop start and end points and with the correct drop rates.

Action Verify the results of the drop profile configuration using the operational mode command **show configuration class-of-service drop-profiles be-dp1**:

```
user@switch> show configuration class-of-service drop-profiles be-dp1
interpolate {
    fill-level [ 30 50 ];
    drop-probability [ 0 80 ];
}
```

- Example: Configuring Queue Schedulers on page 5511
- Example: Configuring Drop Profile Maps on page 5503
- Configuring CoS Tail-Drop Profiles on page 5676
- Understanding CoS Tail-Drop Profiles on page 5409

Example: Configuring Drop Profile Maps

A drop-profile map associates a tail-drop profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified tail-drop profile to traffic in the forwarding class that matches the specified loss priority.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

The following example describes how to configure a drop profile map for a scheduler named **mylan** that includes:

- A drop profile called **lp-profile** for low-priority traffic
- A drop profile called **mh-profile** for medium-high priority traffic
- A drop profile called **h-profile** for high-priority traffic

You apply the drop profiles in the drop profile map to a forwarding class by associating the scheduler **mylan** with a forwarding class in a scheduler map.

Configuring a Drop Profile Map

1. Configure the drop profile for low-priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority low protocol any drop-profile lp-profile
```

2. Configure the drop profile for medium-high priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority medium-high protocol any drop-profile mh-profile
```

3. Configure the drop profile for high-priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority high protocol any drop-profile h-profile
```

Verification

Verifying the Drop Profile Map Configuration

Purpose Verify that you configured the drop profile map for the scheduler **mylan** with the correct loss priorities and drop profiles.

Action Verify the results of the drop profile map configuration using the operational mode command **show configuration class-of-service schedulers mylan**:

```
user@switch> show configuration class-of-service schedulers mylan
transmit-rate 3g;
shaping-rate percent 100;
priority low;
drop-profile-map loss-priority low protocol any drop-profile lp-profile;
drop-profile-map loss-priority medium-high protocol any drop-profile mh-profile;
drop-profile-map loss-priority high protocol any drop-profile h-profile;
```

NOTE: This example does not include configuring scheduler bandwidth and priority. This information (transmit rate, shaping rate, and priority) is shown for completeness.

Example: Configuring Forwarding Classes

Forwarding classes allow you to group packets for transmission. You assign packets to unicast or multidestination (multicast, broadcast, and destination lookup fail) output queues based on forwarding classes.

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The switch supports a total of 12 forwarding classes. In order to forward traffic, you must map (assign) the forwarding classes to unicast or multidestination output queues. The switch has 12 queues. Queues 0 through 7 are for unicast traffic, and queues 8 through 11 are for multidestination traffic. The switch supports up to two lossless forwarding classes.

By default, four categories of unicast forwarding classes and one multidestination forwarding class are defined. You can define the remaining seven forwarding classes and configure them as unicast or multidestination by mapping them to unicast or multidestination queues. The type of queue, unicast or multidestination, determines the type of forwarding class.

The four default unicast forwarding classes are:

- **be**—Best-effort traffic
- **fcoe**—Guaranteed delivery for Fibre Channel over Ethernet traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **nc**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue. The statement format is:

```
[edit class-of-service forwarding-classes]
user@switch# class class-name queue-num queue-number;
```

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

NOTE: Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

```
[edit class-of-service forwarding-classes]
user@switch# queue queue-number class-name
```

The **queue** statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the **queue** statement to map forwarding classes to queues, edit the configuration to replace the **queue** statement with the **class** statement.

NOTE: The QFX Series uses hierarchical scheduling to control output queue forwarding. When you define a forwarding class that will carry traffic on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

Table 499 on page 5507 shows the configuration forwarding-class-to-queue mapping for this example:

Table 499: Forwarding-Class-to-Queue Example Configuration

Forwarding Class	Queue
best-effort	0
nc	7
mcast	8

Configuring Forwarding Classes

To configure CoS forwarding classes, map the forwarding classes to queues:

1. Map the **best-effort** forwarding class to queue **0**:

   ```
   [edit class-of-service forwarding-classes]
   user@switch# set class best-effort queue-num 0
   ```

2. Map the **nc** forwarding class to queue **7**:

   ```
   [edit class-of-service forwarding-classes]
   user@switch# set class nc queue-num 7
   ```

3. Map the **mcast-be** forwarding class to queue **8**:

   ```
   [edit class-of-service forwarding-classes]
   user@switch# set class mcast-be queue-num 8
   ```

Verification

Verifying the Forwarding-Class-to-Queue Mapping

Purpose Verify the forwarding-class-to-queue mapping. (The system shows only the explicitly configured forwarding classes; it does not show default forwarding classes such as **fcoe** and **no-loss**.)

Action Verify the results of the forwarding class configuration using the operational mode command **show configuration class-of-service forwarding-classes**:

```
user@switch> show configuration class-of-service forwarding-classes
class best-effort queue-num 0;
class network-control queue-num 7;
class mcast queue-num 8;
```

- Overview of CoS Changes Introduced in Junos OS Release 12.2 on page 5304
- Understanding CoS Forwarding Classes on page 5354

Example: Configuring Forwarding Class Sets

A forwarding class set (fc-set) is a priority group for enhanced transmission selection (ETS) traffic control. Each fc-set consists of one or more forwarding classes (output queues).

ETS enables you to configure link resources (bandwidth and bandwidth sharing characteristics) for a priority group, and then allocate the priority group's resources among the forwarding classes that belong to the priority group. This is called two-tier, or hierarchical, scheduling. Traffic control profiles control the scheduling for the priority group, and schedulers control the scheduling for individual forwarding classes.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

You can configure up to three unicast fc-sets and one multicast fc-set. A common way to configure unicast priority groups is to configure separate fc-sets for local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and then assign the appropriate forwarding classes to each fc-set.

NOTE: **If you configure strict-high priority queues, you must create an fc-set that is dedicated only to strict-high priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.**

To apply ETS, you map one or more fc-sets to a physical egress port. You can map up to three forwarding class sets to each port. When you map an fc-set to a port, the port uses hierarchical scheduling to allocate port resources to the priority group (fc-set) and to allocate the priority group resources to the queues (forwarding classes) that belong to the priority group.

This example describes how to:

- Configure three fc-sets called **lan-pg**, **san-pg**, and **hpc-pg**.
- Assign forwarding classes to each of the fc-sets.
- Apply the fc-sets and their output traffic control profiles to an egress interface.

This example does not describe how to configure the forwarding classes assigned to the fc-sets or how to configure traffic control profiles. Table 500 on page 5509 shows the configuration components for this example:

Table 500: Components of the Forwarding Class Sets Configuration Example

Component	Settings
Hardware	QFX3500 switch
LAN traffic priority group	Forwarding class set: **lan-pg** Forwarding classes: **best-effort-1**, **best-effort-2**
SAN traffic priority group	Forwarding class set: **san-pg** Forwarding classes: **fcoe**, **fcoe-2**
HPC traffic priority group	Forwarding class set: **hpc-pg** Forwarding classes: **nc**, **high-perf**
Egress interface	**xe-0/0/7**

Configuring Forwarding Class Sets

1. Define the **lan-pg** priority group (fc-set) and assign to it the forwarding classes **best-effort-1** and **best-effort-2**:

```
[edit class-of-service]
user@switch# set forwarding-class-sets lan-pg class best-effort-1
user@switch# set forwarding-class-sets lan-pg class best-effort-2
```

2. Define the **san-pg** priority group and assign to it the forwarding classes **fcoe** and **fcoe-2**:

```
[edit class-of-service]
```

```
user@switch# set forwarding-class-sets san-pg class fcoe
user@switch# set forwarding-class-sets san-pg class fcoe-2
```

3. Define the **hpc-pg** priority group and assign to it the forwarding classes **nc** and **high-perf**:

```
[edit class-of-service]
user@switch# set forwarding-class-sets hpc-pg class nc
user@switch# set forwarding-class-sets hpc-pg class high-perf
```

4. Map the three forwarding class sets to an interface (the output traffic control profiles associated with the forwarding class sets determine the class of service scheduling for the priority groups):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile lan-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set san-pg
output-traffic-control-profile san-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp
```

Verification

To verify the priority group configuration, perform these tasks:

- Verifying Forwarding Class Set Membership on page 5510
- Verifying the Egress Interface Configuration on page 5510

Verifying Forwarding Class Set Membership

Purpose Verify that you configured the **lan-pg**, **san-pg**, and **hpc-pg** priority groups with the correct forwarding classes.

Action List the forwarding class set member configuration using the operational mode command **show configuration class-of-service forwarding-class-sets**:

```
user@switch> show configuration class-of-service forwarding-class-sets
lan-pg {
    class best-effort-1;
    class best-effort-2;
}
san-pg {
    class fcoe;
    class fcoe-2;
}
hpc-pg {
    class high-perf;
    class nc;
}
```

Verifying the Egress Interface Configuration

Purpose Verify that egress interface **xe-0/0/7** is associated with the **lan-pg**, **san-pg**, and **hpc-pg** priority groups and with the correct output traffic control profiles.

Action Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    lan-pg {
        output-traffic-control-profile lan-tcp;
    }
    san-pg {
        output-traffic-control-profile san-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
```

Example: Configuring Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, and the tail-drop profiles associated with the queue.

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

Scheduler parameters define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each queue mapped to the scheduler receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue. You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

  NOTE: The **transmit-rate** setting works only if you also configure the **guaranteed-rate** in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the **guaranteed-rate**, the **transmit-rate** does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate. If you configure transmit rates whose sum exceeds the forwarding class set guaranteed rate, the commit check fails, and the system rejects the configuration.

  NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each queue receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

  NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:
  - **low**—The scheduler has low priority.
  - **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **drop-profile-map**—Mapping of a drop profile to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.

NOTE: Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

NOTE: Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

Scheduler maps associate schedulers with forwarding classes (queues). After defining schedulers and mapping them to queues in a scheduler map, to configure hardware queue scheduling (port scheduling) you:

1. Associate a scheduler map with a traffic control profile (a traffic control profile schedules resources for a group of forwarding classes, called a *forwarding class set* or *priority group*).
2. Attach a forwarding class and a traffic control profile to an interface.

You can associate up to four user-defined scheduler maps with forwarding class sets.

This process configures the hardware queues, packet schedulers, and WRED characteristics that operate according to the scheduler mapping. The traffic control profile uses the scheduler CoS properties to determine the resources that should be allocated to the individual output queues from the total resources available to the priority group.

Table 501 on page 5513 shows the configuration components for this example.

Table 501: Components of the Queue Scheduler Configuration Example

Component	Settings
Hardware	QFX3500 switch

Table 501: Components of the Queue Scheduler Configuration Example *(continued)*

Component	Settings
Scheduler	Name: **be-sched** Transmit rate: **20%** Shaping rate: **40%** Buffer size: **20%** Priority: **low** Drop profile: **be-dp**
Scheduler map	Name: **be-map** Forwarding class to associate with the **be-sched** scheduler: **best-effort**
Traffic control profile	Name: **be-tcp** NOTE: This topic does not describe how to define a traffic control profile.
Forwarding class set	Name: **lan-pg**

Configuring a CoS Scheduler

To configure a CoS scheduler using the CLI:

1. Create a scheduler (**be-sched**) with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, low priority, and map it to the drop profile **be-dp**:

   ```
   [edit class-of-service schedulers]
   user@switch# set be-sched transmit-rate percent 20
   user@switch# set be-sched shaping-rate percent 40
   user@switch# set be-sched buffer-size percent 20
   user@switch# set be-sched priority low
   user@switch# set be-sched drop-profile-map loss-priority low protocol any drop-profile
   be-dp
   ```

2. Configure a scheduler map (**be-map**) that associates the scheduler (**be-sched**) with the forwarding class (**best-effort**):

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set be-map forwarding-class best-effort scheduler be-sched
   ```

3. Associate the scheduler map **be-map** with a traffic control profile (**be-tcp**):

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set be-tcp scheduler-map be-map
   ```

4. Associate the traffic control profile **be-tcp** with a forwarding class set (**lan-pg**) and a 10-Gigabit Ethernet interface (**xe-0/0/7**):

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
   output-traffic-control-profile be-tcp
   ```

5. Alternatively, you can assign the scheduler map (**be-map**) to all the 10-Gigabit Ethernet interfaces using wildcards (**xe-***):

   ```
   [edit class-of-service interfaces]
   user@switch# set xe-* forwarding-class-set lan-pg output-traffic-control-profile be-tcp
   ```

Verification

To verify that the queue scheduler has been created and is mapped to the correct interfaces, perform these tasks:

- Verifying the Scheduler Configuration on page 5515
- Verifying the Scheduler Map Configuration on page 5515
- Verifying That the Scheduler Is Associated with the Interface on page 5516

Verifying the Scheduler Configuration

Purpose Verify that the queue scheduler **be-sched** has been created with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, the priority set to **low**, and the drop profile **be-dp**.

Action Display the scheduler using the operational mode command **show configuration class-of-service schedulers be-sched**:

```
user@switch> show configuration class-of-service schedulers be-sched
transmit-rate percent 20;
shaping-rate percent 40;
buffer-size percent 20
priority low;
drop-profile-map loss-priority low protocol any drop-profile be-dp;
```

Verifying the Scheduler Map Configuration

Purpose Verify that the scheduler map **be-map** has been created and associates the forwarding class **best-effort** with the scheduler **be-sched**, and also that the scheduler map is attached to the traffic control profile **be-tcp**.

Action Display the scheduler map using the operational mode command **show configuration class-of-service scheduler-maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Display the traffic control profile to verify that the scheduler map **be-map** is attached using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

NOTE: This topic does not describe how to configure a traffic control profile or its allocation of port bandwidth. Using a traffic control profile to configure the port resource allocation to the priority group is necessary to implement hierarchical scheduling.

Verifying That the Scheduler Is Associated with the Interface

Purpose Verify that the forwarding class set (**lan-pg**) and the traffic control profile (**be-tcp**) that are associated with the queue scheduler are attached to the interface **xe-0/0/7**.

Action List the interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    lan-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

Example: Configuring Queue Scheduling Priority

You can configure the bandwidth scheduling priority of individual queues by specifying the priority in a scheduler, and then using a scheduler map to associate the scheduler with a queue.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch

- Junos OS Release 11.1 or later for the QFX Series

Overview

Queues can have one of two bandwidth priorities:

- **strict-high**—You can configure only one queue as a strict-high or high-priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

  NOTE: If you configure **strict-high** priority queues, you must create an fc-set that is dedicated only to **strict-high** priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.

Table 502 on page 5517 shows the configuration components for this example.

This example describes how to set the queue priority for two forwarding classes (queues) named **fcoe** and **no-loss**. Both queues have a priority of **low**. The scheduler for the **fcoe** queue is named **fcoe-sched** and the scheduler for the **no-loss** queue is named **nl-sched**. One scheduler map, **schedmap1**, associates the schedulers to the queues.

Table 502: Components of the Queue Scheduler Priority Configuration Example

Component	Settings
Hardware	QFX3500 switch
Schedulers	**fcoe-sched** for FCoE traffic **nl-sched** for no-loss traffic
Priority	**low** for FCoE traffic **low** for no-loss traffic
Scheduler map	**schedmap1**: FCoE mapping: scheduler **fcoe-sched** to forwarding class **fcoe** No-loss mapping: scheduler **nl-sched** to forwarding class **no-loss**

Configuring Queue Scheduling Priority

To configure queue priority using the CLI:

1. Create the FCoE scheduler with **low** priority:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low
```

2. Create the no-loss scheduler with **low** priority:

```
[edit class-of-service]
user@switch# set schedulers nl-sched priority low
```

3. Associate the schedulers with the desired queues in the scheduler map:

```
[edit class-of-service]
user@switch# set scheduler-maps schedmap1 forwarding-class fcoe scheduler fcoe-sched
user@switch# set scheduler-maps schedmap1 forwarding-class no-loss scheduler nl-sched
```

Verification

To verify that you configured the queue scheduling priority for bandwidth and mapped the schedulers to the correct forwarding classes, perform these tasks:

- Verifying the Queue Scheduling Priority on page 5518
- Verifying the Scheduler-to-Forwarding-Class Mapping on page 5518

Verifying the Queue Scheduling Priority

Purpose Verify that you configured the queue schedulers **fcoe-sched** and **nl-sched** with **low** queue scheduling priority.

Action Display the **fcoe-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers fcoe-sched priority**:

```
user@switch> show configuration class-of-service schedulers fcoe-sched priority
priority low;
```

Display the **nl-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers nl-sched priority**:

```
user@switch> show configuration class-of-service schedulers nl-sched priority
priority low;
```

Verifying the Scheduler-to-Forwarding-Class Mapping

Purpose Verify that you configured the scheduler map **schedmap1** to map scheduler **fcoe-sched** to forwarding class **fcoe** and schedule **nl-sched** to forwarding class **no-loss**.

Action Display the scheduler map **schedmap1** using the operational mode command **show configuration class-of-service scheduler-maps schedmap1**:

```
user@switch> show configuration class-of-service scheduler-maps schedmap1
forwarding-class fcoe scheduler fcoe-sched;
forwarding-class no-loss scheduler nl-sched;
```

- Example: Configuring Queue Schedulers on page 5511
- Defining CoS Queue Scheduling Priority on page 5682
- Monitoring CoS Scheduler Maps on page 5813

Example: Configuring Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each priority group receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

  NOTE: In order for the transmit-rate option (minimum bandwidth for a queue that you set using scheduler configuration) to work properly, you must configure the **guaranteed-rate** for the priority group. If a priority group does not have a guaranteed minimum bandwidth, the queues (forwarding classes) that belong to the priority group cannot have a guaranteed minimum bandwidth.

  NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each priority group receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

NOTE: Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

NOTE: Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

For example, if you map three priority groups to a 10-Gigabit Ethernet port, the queues associated with all three of the priority groups share the 10-Gbps bandwidth as defined by the traffic control profiles. Therefore, the total combined **guaranteed-rate** value of the three priority groups should not exceed 10 Gbps. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

The sum of the queue (forwarding class) transmit rates cannot exceed the total **guaranteed-rate** of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

If you configure the **guaranteed-rate** of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

Configuring a Traffic Control Profile

This example describes how to configure a traffic control profile named **san-tcp** with a scheduler map named **san-map1**and allocate to it a minimum bandwidth of 4 Gbps and a maximum bandwidth of 8 Gbps:

1. Create the traffic control profile and set the **guaranteed-rate** (minimum guaranteed bandwidth) to **4g**:

   ```
   [edit class-of-service]
   ```

```
user@switch# set traffic-control-profiles san-tcp guaranteed-rate 4g
```

2. Set the **shaping-rate** (maximum guaranteed bandwidth) to **8g**:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp shaping-rate 8g
```

3. Associate the scheduler map **san-map1** with the traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp scheduler-map san-map1
```

Verification

Verifying the Traffic Control Profile Configuration

Purpose Verify that the traffic control profile **san-tcp** has been created with a minimum guaranteed bandwidth of 4 Gbps, a maximum bandwidth of 8 Gbps, and the scheduler map **san-map1**.

Action List the traffic control profile using the operational mode command **show configuration class-of-service traffic-control-profiles san-tcp**:

```
user@switch> show configuration class-of-service traffic-control-profiles san-tcp
scheduler-map san-map1;
shaping-rate percent 8g;
guaranteed-rate 4g;
```

Example: Configuring Minimum Guaranteed Output Bandwidth

Scheduling the minimum guaranteed output bandwidth for a queue (forwarding class) requires configuring both tiers of the two-tier hierarchical scheduler. One tier is scheduling the resources for the individual queue. The other tier is scheduling the resources for the priority group (forwarding class set) to which the queue belongs.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The priority group minimum guaranteed bandwidth defines the minimum total amount of bandwidth available for all of the queues in the priority group to meet their minimum bandwidth requirements.

The **transmit-rate** setting in the scheduler configuration determines the minimum guaranteed bandwidth for an individual queue. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

The **guaranteed-rate** setting in the traffic control profile configuration determines the minimum guaranteed bandwidth for a priority group. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

NOTE: You must configure both the **transmit-rate** value for the queue and the **guaranteed-rate** value for the priority group in order to set a valid minimum bandwidth guarantee for a queue. (If the priority group does not have a guaranteed minimum bandwidth, there is no guaranteed bandwidth pool from which the queue can take its guaranteed minimum bandwidth.)

The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

NOTE: When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

NOTE: You cannot configure minimum guaranteed bandwidth on strict-high priority queues or on a priority group that contains strict-high priority queues.

This example describes how to:

- Configure a transmit rate (minimum guaranteed queue bandwidth) of 2 Gbps for queues in a scheduler named **be-sched**.
- Configure a guaranteed rate (minimum guaranteed priority group bandwidth) of 4 Gbps for a priority group in a traffic control profile named **be-tcp**.
- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the minimum guaranteed bandwidth scheduling to the egress interface **xe-0/0/7**.

Table 503 on page 5523 shows the configuration components for this example:

Table 503: Components of the Minimum Guaranteed Output Bandwidth Configuration Example

Component	Settings
Hardware	QFX3500 switch
Minimum guaranteed queue bandwidth	Transmit rate: **2g**
Minimum guaranteed priority group bandwidth	Guaranteed rate: **4g**
Scheduler	**be-sched**
Scheduler map	**be-map**
Traffic control profile	**be-tcp**
Forwarding class set (priority group)	**be-pg**
Queue (forwarding class)	**best-effort**
Egress interface	**xe-0/0/7**

Configuring Guaranteed Minimum Bandwidth

To configure the minimum guaranteed bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the minimum guaranteed queue bandwidth of 2 Gbps for scheduler **be-sched**:

   ```
   [edit class-of-service schedulers]
   user@switch# set be-sched transmit-rate 2g
   ```

2. Configure the minimum guaranteed priority group bandwidth of 4 Gbps for traffic control profile **be-tcp**:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp guaranteed-rate 4g
```

3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

4. Associate the scheduler map with the traffic control profile:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

5. Assign the **best-effort** queue to the priority group **be-pg**:

```
[edit class-of-service forwarding-class-sets]
user@switch# set be-pg class best-effort
```

6. Apply the configuration to interface **xe-0/0/7**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

Verification

To verify the minimum guaranteed output bandwidth configuration, perform these tasks:

- Verifying the Minimum Guaranteed Queue Bandwidth on page 5524
- Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association on page 5524
- Verifying the Scheduler Map Configuration on page 5525
- Verifying Queue (Forwarding Class) Membership in the Priority Group on page 5525
- Verifying the Egress Interface Configuration on page 5525

Verifying the Minimum Guaranteed Queue Bandwidth

Purpose Verify that you configured the minimum guaranteed queue bandwidth as **2g** in the scheduler **be-sched**.

Action Display the minimum guaranteed bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched transmit-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched transmit-rate
2g;
```

Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association

Purpose Verify that the minimum guaranteed priority group bandwidth is **4g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

Action Display the minimum guaranteed bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate
4g;
```

Display the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

Verifying the Scheduler Map Configuration

Purpose Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

Action Display the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service schedulers maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Verifying Queue (Forwarding Class) Membership in the Priority Group

Purpose Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.

Action Display the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:

```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

Verifying the Egress Interface Configuration

Purpose Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.

Action Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

Example: Configuring Maximum Output Bandwidth

Scheduling the maximum output bandwidth for a queue (forwarding class) requires configuring both tiers of the hierarchical scheduler. One tier is scheduling the resources for the individual queue. The other tier is scheduling the resources for the priority group (forwarding class set) to which the queue belongs.

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

The priority group maximum bandwidth defines the maximum total amount of bandwidth available for all of the queues in the priority group.

The **shaping-rate** setting in the scheduler configuration determines the maximum bandwidth for an individual queue.

The **shaping-rate** setting in the traffic control profile configuration determines the maximum bandwidth for a priority group.

NOTE: When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

NOTE: When you set the maximum bandwidth (**shaping-rate**) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate** value.

This example describes how to:

- Configure a maximum rate of 4 Gbps for queues in a scheduler named **be-sched**.
- Configure a maximum rate of 6 Gbps for a priority group in a traffic control profile named **be-tcp**.
- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the bandwidth scheduling to the interface **xe-0/0/7**.

Table 504 on page 5527 shows the configuration components for this example:

Table 504: Components of the Maximum Output Bandwidth Configuration Example

Component	Settings
Hardware	QFX3500 switch
Maximum queue bandwidth	Shaping rate: **4g**
Maximum priority group bandwidth	Shaping rate: **6g**
Scheduler	**be-sched**
Scheduler map	**be-map**
Traffic control profile	**be-tcp**
Forwarding class set (priority group)	**be-pg**
Queue (forwarding class)	**best-effort**
Egress interface	**xe-0/0/7**

Configuring Maximum Bandwidth

To configure the maximum bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the maximum queue bandwidth of 4 Gbps for scheduler **be-sched**:

   ```
   [edit class-of-service schedulers]
   user@switch# set be-sched shaping-rate 4g
   ```

2. Configure the maximum priority group bandwidth of 6 Gbps for traffic control profile **be-tcp**:

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set be-tcp shaping-rate 6g
   ```

3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

4. Associate the scheduler map with the traffic control profile:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

5. Assign the **best-effort** queue to the priority group **be-pg**:

```
[edit class-of-service forwarding-class-sets]
user@switch# set be-pg class best-effort
```

6. Apply the configuration to interface **xe-0/0/7**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

Verification

To verify the maximum output bandwidth configuration, perform these tasks:

- Verifying the Maximum Queue Bandwidth on page 5528
- Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association on page 5528
- Verifying the Scheduler Map Configuration on page 5529
- Verifying Queue (Forwarding Class) Membership in the Priority Group on page 5529
- Verifying the Egress Interface Configuration on page 5529

Verifying the Maximum Queue Bandwidth

Purpose Verify that you configured the maximum queue bandwidth as **4g** in the scheduler **be-sched**.

Action List the maximum bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched shaping-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched shaping-rate
4g;
```

Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association

Purpose Verify that the maximum priority group bandwidth is **6g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

Action List the maximum bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp shaping-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp shaping-rate
4g;
```

List the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

Verifying the Scheduler Map Configuration

Purpose Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

Action List the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service schedulers maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Verifying Queue (Forwarding Class) Membership in the Priority Group

Purpose Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.

Action List the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:

```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

Verifying the Egress Interface Configuration

Purpose Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.

Action List the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) unicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic.

From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort unicast traffic, more buffer space needs to be allocated to lossy buffers, and less buffer space should be allocated to lossless buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly unicast traffic.

Topology

Table 505 on page 5532 shows the configuration components for this example.

Table 505: Components of the Recommended Shared Buffer Configuration for Best-Effort Unicast Network Topologies

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly best-effort unicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent 100
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress buffer-partition lossless percent 5
   user@switch# set ingress buffer-partition lossless-headroom percent 0
   ```

```
user@switch# set ingress buffer-partition lossy percent 95
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 75
user@switch# set egress buffer-partition multicast percent 20
```

Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
```

```
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless         :  360.10 KB
    Lossless Headroom :  0.00 KB
    Lossy            :  6841.90 KB

  Lossless Headroom Utilization:
  Node Device        Total         Used                 Free
  0                  0.00 KB       0.00 KB              0.00 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless         :  332.80 KB
    Multicast        :  1331.20 KB
    Lossy            :  4992.00 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer

as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 1331.20 KB to multicast traffic
  - 4992 KB to lossy unicast traffic

NOTE: The output values are valid for QFX3500 and QFX3600 switches. QFX5100 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 switches.

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) traffic on links with Ethernet PAUSE (IEEE 802.3X) enabled. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)

- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort traffic on links enabled for Ethernet PAUSE, more buffer space needs to be allocated to ingress dedicated port buffers, and less buffer space should be allocated to ingress shared buffers. Also, more buffer space needs to be allocated to lossless-headroom buffers, and less space to ingress lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly best-effort traffic on links enabled for Ethernet PAUSE.

Topology

Table 506 on page 5537 shows the configuration components for this example.

Table 506: Components of the Recommended Shared Buffer Configuration for Best-Effort Network Topologies with Links Enabled for Ethernet PAUSE

Component	Settings
Hardware	QFX3500 switch

Table 506: Components of the Recommended Shared Buffer Configuration for Best-Effort Network Topologies with Links Enabled for Ethernet PAUSE *(continued)*

Component	Settings
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 70% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 80% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 15%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 70
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 15
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links Enabled for Ethernet PAUSE

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent 70
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress buffer-partition lossless percent 5
   user@switch# set ingress buffer-partition lossless-headroom percent 80
   user@switch# set ingress buffer-partition lossy percent 15
   ```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 75
user@switch# set egress buffer-partition multicast percent 20
```

Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 70;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 15;
    }
    buffer-partition lossless-headroom {
        percent 80;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  4318.60 KB
```

```
  Shared Buffer    :  5041.40 KB
    Lossless          :  252.07 KB
    Lossless Headroom :  4033.12 KB
    Lossy             :  756.21 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  332.80 KB
    Multicast         :  1331.20 KB
    Lossy             :  4992.00 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 4318.6 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 70 percent of the available (user-configurable) buffer space.
- With the ingress shared buffer pool configured as 70 percent of the available buffers, the total size of the ingress shared buffer pool is 5041.4 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 252.07 KB to lossless traffic
  - 4033.12 KB to lossless headroom traffic
  - 756.21 KB to lossy unicast traffic

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 1331.20 KB to multicast traffic

- 4992 KB to lossy unicast traffic

NOTE: The output values are valid for QFX3500 and QFX3600 switches. QFX5100 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 switches.

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly multicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly multicast traffic, more buffer space needs to be allocated to lossy buffers, less buffer space should be allocated to lossless buffers, and more space needs to be allocated to egress multicast buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly multicast traffic.

Topology

Table 507 on page 5543 shows the configuration components for this example.

Table 507: Components of the Recommended Shared Buffer Configuration for Multicast Network Topologies

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 20% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 75%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly multicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 20
set egress buffer-partition multicast percent 75
```

Configuring the Global Shared Buffer Pool for Networks with Mostly Multicast Traffic

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly multicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent 100
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress buffer-partition lossless percent 5
   user@switch# set ingress buffer-partition lossless-headroom percent 0
   user@switch# set ingress buffer-partition lossy percent 95
   ```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set egress percent 100
   ```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set egress buffer-partition lossless percent 5
   user@switch# set egress buffer-partition lossy percent 20
   user@switch# set egress buffer-partition multicast percent 75
   ```

Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
```

```
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 20;
    }
    buffer-partition multicast {
        percent 75;
    }
}
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless          :  360.10 KB
    Lossless Headroom :  0.00 KB
    Lossy             :  6841.90 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                 Free
  0                   0.00 KB        0.00 KB              0.00 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  332.80 KB
    Multicast         :  4992.00 KB
    Lossy             :  1331.20 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the

shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 4992 KB to multicast traffic
  - 1331.20 KB to lossy unicast traffic

NOTE: The output values are valid for QFX3500 and QFX3600 switches. QFX5100 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 switches.

Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly lossless traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

NOTE: **When we discuss lossless buffers, we mean buffers that handle traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x).**

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

- Requirements on page 5548
- Overview on page 5548
- Configuration on page 5549
- Verification on page 5551

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.

- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly lossless traffic, more buffer space needs to be allocated to lossless buffers, and less buffer space should be allocated to lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly lossless traffic.

Topology

Table 508 on page 5549 shows the configuration components for this example.

Table 508: Components of the Recommended Shared Buffer Configuration for Lossless Network Topologies

Component	Settings
Hardware	QFX3500 switch
Ingress shared buffer	Percentage of available ingress buffer space allocated to the ingress shared buffer: 100% Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 15% Percentage of ingress buffer space allocated to lossless headroom traffic (lossless headroom buffer partition): 80% Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 5%
Egress shared buffer	Percentage of available egress buffer space allocated to the egress shared buffer: 100% Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 90% Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 5% Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 5%

Configuration

CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly lossless traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 15
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 5
set egress percent 100
```

set egress buffer-partition lossless percent 90
set egress buffer-partition lossy percent 5
set egress buffer-partition multicast percent 5

Configuring the Global Shared Buffer Pool for Networks with Mostly Lossless Traffic

Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly lossless traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 15
user@switch# set ingress buffer-partition lossless-headroom percent 80
user@switch# set ingress buffer-partition lossy percent 5
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 90
user@switch# set egress buffer-partition lossy percent 5
user@switch# set egress buffer-partition multicast percent 5
```

Results

Display the results of the configuration:

```
rroot@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 15;
    }
    buffer-partition lossy {
        percent 5;
    }
    buffer-partition lossless-headroom {
        percent 80;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 90;
    }
    buffer-partition lossy {
        percent 5;
    }
    buffer-partition multicast {
```

```
            percent 5;
        }
    }
```

Verification

Verify that the shared buffer configuration has been created properly.

Verifying the Shared Buffer Configuration

Purpose Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

Action List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless          :  1080.30 KB
    Lossless Headroom :  5761.60 KB
    Lossy             :  360.10 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                  Free
  0                   5761.60 KB     0.00 KB               5761.60 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  5990.40 KB
    Multicast         :  332.80 KB
    Lossy             :  332.80 KB
```

Meaning The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 1080 KB to lossless traffic

  - 5761.60 KB to lossless headroom traffic
  - 360.10 KB to lossy unicast traffic

- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Of the total available lossless headroom buffer space of 5761.60 KB, currently no buffer space is being used, so all 5761.60 KB of buffer space is free.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 5990.40 KB to lossless traffic
  - 332.80 KB to multicast traffic
  - 332.80 KB to lossy unicast traffic

NOTE: The output values are valid for QFX3500 and QFX3600 switches. QFX5100 switches have larger buffers (12MB instead of 9MB), so the total buffer size and the sizes of each buffer partition are larger on QFX5100 switches.

Configuration Examples (QFX Series Standalone Switches, QFabric Systems Only)

Example: Configuring CoS PFC for FCoE Traffic

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.
- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless **fcoe** forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

This example describes how to configure PFC for FCoE traffic:

Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

Overview

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).
- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

Topology

Table 379 on page 4923 shows the configuration components for this example.

Table 509: Components of the PFC for FCoE Traffic Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Behavior aggregate classifier (maps the FCoE forwarding class to incoming packets by IEEE 802.1 code point)	Code point **011** to forwarding class **fcoe** and loss priority **low** Ingress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**
PFC congestion notification profile	**fcoe-cnp**: Code point **011** Ingress interfaces: **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, **xe-0/0/34**

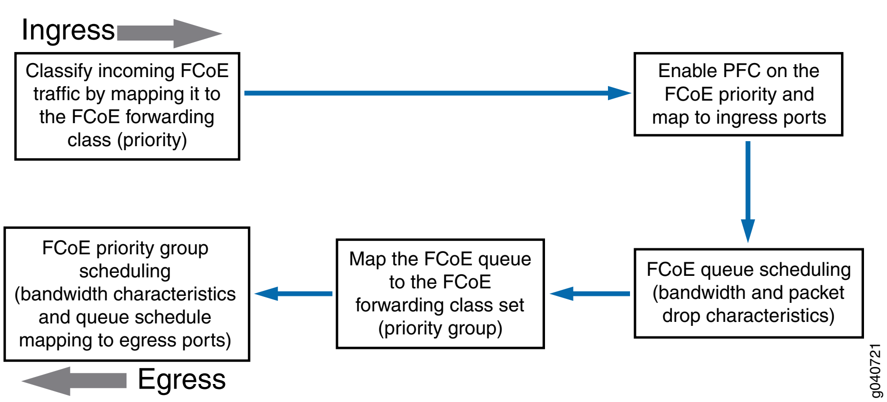
Figure 179 on page 4924 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

Figure 202: PFC for FCoE Traffic Configuration Components Block Diagram



Configuration

CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100
set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
```

Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:

   ```
   [edit class-of-service]
   user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
   ```

2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point **011**:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
   ```

3. Apply the PFC configuration to the ingress interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
   ```

4. Assign the classifier to the ingress interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
   user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
   ```

```
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
```

5. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

6. Map the FCoE forwarding class to the FCoE scheduler:

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

7. Configure the forwarding class set for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

8. Define the traffic control profile for the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 fcoe-classifier {
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
  }
  traffic-control-profiles {
    fcoe-tcp {
      scheduler-map fcoe-map;
      shaping-rate percent 100;
      guaranteed-rate 3000000000;
    }
  }
  forwarding-class-sets {
    fcoe-pg {
```

```
      class fcoe;
    }
  }
  congestion-notification-profile {
    fcoe-cnp {
      input {
        ieee-802.1 {
          code-point 011 {
            pfc;
          }
        }
      }
    }
  }
  interfaces {
    xe-0/0/31 {
      congestion-notification-profile fcoe-cnp;
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      unit 0 {
        classifiers {
          ieee-802.1 fcoe-classifier;
        }
      }
    }
    xe-0/0/32 {
      congestion-notification-profile fcoe-cnp;
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      unit 0 {
        classifiers {
          ieee-802.1 fcoe-classifier;
        }
      }
    }
    xe-0/0/33 {
      congestion-notification-profile fcoe-cnp;
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      unit 0 {
        classifiers {
          ieee-802.1 fcoe-classifier;
        }
      }
    }
    xe-0/0/34 {
      congestion-notification-profile fcoe-cnp;
```

```
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-classifier;
            }
        }
    }
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {
        transmit-rate 3000000000;
        shaping-rate percent 100;
        priority low;
    }
}
```

TIP: To quickly configure the interfaces, issue the **load merge terminal** command and then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- Verifying That Priority-Based Flow Control Has Been Enabled on page 5559
- Verifying the Ingress Interface PFC Configuration on page 5560

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the FCoE queue to enable lossless transport.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Type: Input, Name: fcoe-cnp, Index: 51697
Cable Length: 100 m
  Priority      PFC          MRU
  000           Disabled
  001           Disabled
  010           Disabled
  011           Enabled      2500
  100           Disabled
```

```

              6
  111
              7
```

Meaning The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point **011** for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying the Ingress Interface PFC Configuration

Purpose Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

Action List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
```

```
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces** commands list the congestion notification profile that is mapped to the interface (**fcoe-cnp**) and the IEEE 802.1p classifier associated with the interface (**fcoe-classifier**).

Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX Series switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

NOTE: **This example uses Junos OS without support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see** “Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG” on page 5002.

You can use an MC-LAG to provide a redundant aggregation layer for Fiber Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX Series switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

NOTE: This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two QFX Series switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the QFX Series switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see "Example: Configuring Multichassis Link Aggregation" on page 1904. However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

QFX Series switches support MC-LAGs. QFabric system Node devices do not support MC-LAGs, and QFX3500 and QFX3600 Virtual Chassis switches do not support FCoE.

This topic describes:

Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX3500 Switches that provide FCoE server access in transit switch mode and that connect to the MC-LAG switches. These switches can be standalone QFX3500 switches or they can be Node devices in a QFabric system.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 12.2 or later for the QFX Series.

Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX3500 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).

> NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Disable IGMP snooping on the FCoE VLAN.
- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

Topology

QFX3500 switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in Figure 180 on page 4942.

Figure 203: Supported Topology for an MC-LAG on an FCoE Transit Switch

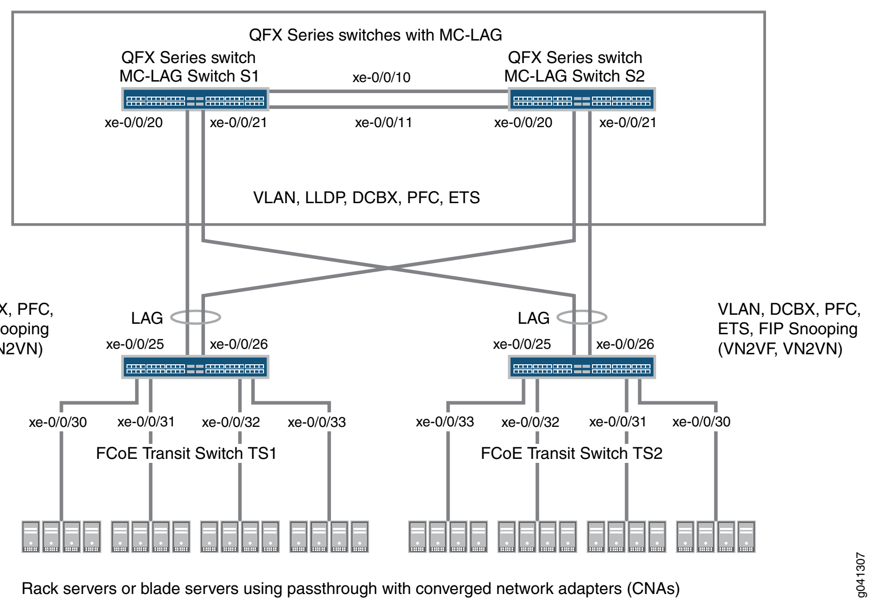

Table 383 on page 4943 shows the configuration components for this example.

Table 510: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology

Component	Settings
Hardware	Four QFX3500 switches (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access).
Forwarding class (all switches)	Default **fcoe** forwarding class.
Classifier (forwarding class mapping of incoming traffic to IEEE priority)	Default IEEE 802.1p trusted classifier on all FCoE interfaces.
LAGs and MC-LAG	S1—Ports xe-0/0/10 and x-0/0/11 are members of LAG **ae0**, which connects Switch S1 to Switch S2. Ports xe-0/0/20 and xe-0/0/21 are members of MC-LAG **ae1**. All ports are configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. S2—Ports xe-0/0/10 and x-0/0/11 are members of LAG **ae0**, which connects Switch S2 to Switch S1. Ports xe-0/0/20 and xe-0/0/21 are members of MC-LAG **ae1**. All ports are configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. NOTE: Ports xe-0/0/20 and xe-0/0/21 on Switches S1 and S2 are the members of the MC-LAG. TS1—Ports xe-0/0/25 and x-0/0/26 are members of LAG **ae1**, configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. Ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are configured in **tagged-access** port mode, with an MTU of **2180**. TS2—Ports xe-0/0/25 and x-0/0/26 are members of LAG **ae1**, configured in **trunk** port mode, as **fcoe-trusted**, and with an MTU of **2180**. Ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are configured in **tagged-access** port mode, with an MTU of **2180**.
FCoE queue scheduler (all switches)	**fcoe-sched**: Minimum bandwidth **3g** Maximum bandwidth **100%** Priority **low**
Forwarding class-to-scheduler mapping (all switches)	Scheduler map **fcoe-map**: Forwarding class **fcoe** Scheduler **fcoe-sched**

Table 510: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology *(continued)*

Component	Settings
Forwarding class set (FCoE priority group, all switches)	**fcoe-pg**: Forwarding class **fcoe** Egress interfaces: • S1—LAG **ae0** and MC-LAG **ae1** • S2—LAG **ae0** and MC-LAG **ae1** • TS1—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** • TS2—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**
Traffic control profile (all switches)	**fcoe-tcp**: Scheduler map **fcoe-map** Minimum bandwidth **3g** Maximum bandwidth **100%**
PFC congestion notification profile (all switches)	**fcoe-cnp**: Code point **011** Ingress interfaces: • S1—LAG **ae0** and MC-LAG **ae1** • S2—LAG **ae0** and MC-LAG **ae1** • TS1—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** • TS2—LAG **ae1**, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33**
FCoE VLAN name and tag ID	Name—**fcoe_vlan** ID—**100** Include the FCoE VLAN on the interfaces that carry FCoE traffic on all four switches. Disable IGMP snooping on the interfaces that belong to the FCoE VLAN on all four switches.
FIP snooping	Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping. This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration.

NOTE: This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode and tagged access mode ports if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is queue **3**.

  NOTE: In Junos OS Release 12.2, traffic mapped to explicitly configured forwarding classes, even lossless forwarding classes such as **fcoe**, is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. To receive lossless treatment in Release 12.2, traffic must use one of the default lossless forwarding classes (**fcoe** or **no-loss**).

  In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.

- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk and tagged-access port modes. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (**011**) to the FCoE forwarding class. If you choose to configure the BA classifier instead of using the default classifier, you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.
- Configure a congestion notification profile that enables PFC on the FCoE code point (code point **011** in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers and how to disable IGMP snooping on the FCoE VLAN. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ("Example: Configuring Multichassis Link Aggregation" on page 1904 describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ("Configuring Link Aggregation" on page 2019 describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

Configuration

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the **[edit]** hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

Switch S1 and Switch S2

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g
set class-of-service schedulers fcoe-sched shaping-rate percent 100
set class-of-service scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set class-of-service forwarding-class-sets fcoe-pg class fcoe
set class-of-service traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate
3g
set class-of-service traffic-control-profiles fcoe-tcp shaping-rate percent 100
set class-of-service interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces ae0 congestion-notification-profile fcoe-cnp
set class-of-service interfaces ae1 congestion-notification-profile fcoe-cnp
set vlans fcoe_vlan vlan-id 100
set protocols igmp-snooping vlan fcoe_vlan disable
set interfaces xe-0/0/10 ether-options 802.3ad ae0
```

```
set interfaces xe-0/0/11 ether-options 802.3ad ae0
set interfaces xe-0/0/20 ether-options 802.3ad ae1
set interfaces xe-0/0/21 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
set interfaces ae0 mtu 2180
set interfaces ae1 mtu 2180
set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for Transit Switch TS1 and Transit Switch TS2 at the **[edit]** hierarchy level. The configurations on Switches TS1 and TS2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

Switch TS1 and Switch TS2

Configuring MC-LAG Switches S1 and S2

Step-by-Step Procedure

To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

   ```
   [edit class-of-service]
   user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
   user@switch# set schedulers fcoe-sched shaping-rate percent 100
   ```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
   ```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

   ```
   [edit class-of-service]
   user@switch# set forwarding-class-sets fcoe-pg class fcoe
   ```

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
   guaranteed-rate 3g
   user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
   ```

5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
   fcoe-tcp
   user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
   fcoe-tcp
   ```

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
   011 pfc
   ```

7. Apply the PFC configuration to the LAG and MC-LAG interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
   user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
   ```

8. Configure the VLAN for FCoE traffic (**fcoe_vlan**):

   ```
   [edit vlans]
   user@switch# set fcoe_vlan vlan-id 100
   ```

9. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG between the two MC-LAG switches:

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```

11. Add the member interfaces to the MC-LAG:

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```

12. Configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe_vlan**)for the LAG (**ae0**) and for the MC-LAG (**ae1**):

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and MC-LAG interfaces. 2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes:

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```

14. Set the LAG and MC-LAG interfaces as FCoE trusted ports. Ports that connect to other switches should be trusted and should not perform FIP snooping:

```
[edit]
user@switch# set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

Configuring FCoE Transit Switches TS1 and TS2

Step-by-Step Procedure

The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

[edit class-of-service]
user@switch# **set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched**

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

   [edit class-of-service]
   user@switch# **set forwarding-class-sets fcoe-pg class fcoe**

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

   [edit class-of-service]
   user@switch# **set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g**
   user@switch# **set traffic-control-profiles fcoe-tcp shaping-rate percent 100**

5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:

   [edit class-of-service]
   user@switch# **set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp**
   user@switch# **set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp**
   user@switch# **set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp**
   user@switch# **set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp**
   user@switch# **set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp**

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:

   [edit class-of-service]
   user@switch# **set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc**

7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:

   [edit class-of-service]
   user@switch# **set interfaces ae1 congestion-notification-profile fcoe-cnp**
   user@switch# **set class-of-service interfaces xe-0/0/30 congestion-notification-profile fcoe-cnp**
   user@switch# **set class-of-service interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp**
   user@switch# **set class-of-service interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp**
   user@switch# **set class-of-service interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp**

8. Configure the VLAN for FCoE traffic (**fcoe_vlan**):

   [edit vlans]
   user@switch# **set fcoe_vlan vlan-id 100**

9. Disable IGMP snooping on the FCoE VLAN:

   [edit protocols]
   user@switch# **set igmp-snooping vlan fcoe_vlan disable**

10. Add the member interfaces to the LAG:

    [edit interfaces]
    user@switch# **set xe-0/0/25 ether-options 802.3ad ae1**

```
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```

11. On the LAG (**ae1**), configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan members fcoe_vlan
```

12. On the FCoE access interfaces (**xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**), configure the port mode as **tagged-access** and membership in the FCoE VLAN (**fcoe_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching port-mode tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching port-mode tagged-access vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and FCoE access interfaces. 2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes:

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

14. Set the LAG interface as an FCoE trusted port. Ports that connect to other switches should be trusted and should not perform FIP snooping:

```
[edit]
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

NOTE: Access ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are not configured as FCoE trusted ports. The access ports remain in the default state as untrusted ports because they connect directly to FCoE devices and must perform FIP snooping to ensure network security.

15. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN_Port FIP snooping; the example is equally valid if you use VN2VF_Port FIP snooping):

```
[edit]
user@switch# set ethernet-switching-options secure-access-port vlan fcoe_vlan examine-fip examine-vn2vn beacon-period 90000
```

Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are the same):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
interfaces {
  ae0 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  ae1 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
```

```
      shaping-rate percent 100;
      priority low;
    }
}
```

NOTE: The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

For MC-LAG verification commands, see "Example: Configuring Multichassis Link Aggregation" on page 1904.

Display the results of the CoS configuration on FCoE Transit Switch TS1 and on FCoE Transit Switch TS2 (the results on both transit switches are the same):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
interfaces {
  xe-0/0/30 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  xe-0/0/31 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
```

```
        }
        congestion-notification-profile fcoe-cnp;
    }
    xe-0/0/32 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
    xe-0/0/33 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
    ae1 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {
        transmit-rate 3000000000;
        shaping-rate percent 100;
        priority low;
    }
}
```

NOTE: The forwarding class and classifier configurations are not shown because the **show** command does not display default portions of the configuration.

Verification

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

Verifying That the Output Queue Schedulers Have Been Created

Purpose Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

Action List the scheduler map using the operational mode command **show class-of-service scheduler-map fcoe-map**:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023

  Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
    Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
    Buffer Limit: none, Priority: low
    Excess Priority: unspecified
    Shaping rate: 100 percent,
    drop-profile-map-set-type: mark
    Drop profiles:
      Loss priority   Protocol    Index    Name
      Low             any             1    <default-drop-profile>
      Medium high     any             1    <default-drop-profile>
      High            any             1    <default-drop-profile>
```

Meaning The **show class-of-service scheduler-map fcoe-map** command lists the properties of the scheduler map **fcoe-map**. The command output includes:

- The name of the scheduler map (**fcoe-map**)
- The name of the scheduler (**fcoe-sched**)
- The forwarding classes mapped to the scheduler (**fcoe**)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)

- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created

Purpose Verify that the traffic control profile **fcoe-tcp** has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

Action List the FCoE traffic control profile properties using the operational mode command **show class-of-service traffic-control-profile fcoe-tcp**:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
  Shaping rate: 100 percent
  Scheduler map: fcoe-map
  Guaranteed rate: 3000000000
```

Meaning The **show class-of-service traffic-control-profile fcoe-tcp** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**fcoe-tcp**)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (**fcoe-map**)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

Verifying That the Forwarding Class Set (Priority Group) Has Been Created

Purpose Verify that the FCoE priority group has been created and that the **fcoe** priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

Action List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class                       Index
  fcoe                                     1
```

Meaning The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

Verifying That Priority-Based Flow Control Has Been Enabled

Purpose Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

Action List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2500
  100          Disabled
  101          Disabled
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
               6
  111
               7
```

Meaning The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point **011** (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

Verifying That the Interface Class of Service Configuration Has Been Created

Purpose Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

Action List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}

ae1 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/30 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/31 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/32 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
xe-0/0/33 {
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
ae1 {
    forwarding-class-set {
```

```
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    congestion-notification-profile fcoe-cnp;
}
```

Meaning The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

NOTE: Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33, which are not members of a LAG.

Verifying That the Interfaces Are Correctly Configured

Purpose Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

Action List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
```

```
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
ae0 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/25 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/26 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/30 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/31 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
```

```
                vlan {
                    members fcoe_vlan;
                }
            }
        }
    }
    xe-0/0/32 {
        mtu 2180;
        unit 0 {
            family ethernet-switching {
                port-mode tagged-access;
                vlan {
                    members fcoe_vlan;
                }
            }
        }
    }
    xe-0/0/33 {
        mtu 2180;
        unit 0 {
            family ethernet-switching {
                port-mode tagged-access;
                vlan {
                    members fcoe_vlan;
                }
            }
        }
    }

    ae1 {
        mtu 2180;
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan {
                    members fcoe_vlan;
                }
            }
        }
    }
```

Meaning The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The port mode (**trunk** mode for interfaces that connect two switches, **tagged-access** mode for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe_vlan**)

Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces

Purpose Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Transit Switch TS1 and TS2 FCoE access ports.

Action List the port security configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration ethernet-switching-options secure-access-port**:

```
user@switch> show configuration ethernet-switching-options secure-access-port
interface ae1.0 {
    fcoe-trusted;
}
vlan fcoe_vlan {
    examine-fip {
        examine-vn2vn {
            beacon-period 90000;
        }
    }
}
```

Meaning The **show configuration ethernet-switching-options secure-access-port** command lists port security information, including whether a port is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- FIP snooping is enabled (**examine-fip**) on the FCoE VLAN (**fcoe_vlan**), the type of FIP snooping is VN2VN_Port FIP snooping (**examine-vn2vn**) and the beacon period is set to 90000 milliseconds. On Transit Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Transit Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

Verifying That the FIP Snooping Mode Is Correct on FCoE Transit Switches TS1 and TS2

Purpose Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Transit Switch TS1 and TS2 FCoE access ports.

Action List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
```

```
VLAN: fcoe_vlan,    Mode: VN2VN Snooping
  FC-MAP: 0e:fd:00
...
```

NOTE: The output has been truncated to show only the relevant information.

Meaning The **show fip snooping brief** command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe_vlan**
- The FIP snooping mode is VN2VN_Port FIP snooping (**VN2VN Snooping**)

Verifying That IGMP Snooping Is Disabled on the FCoE VLAN

Purpose Verify that IGMP snooping is disabled on the FCoE VLAN on all four switches.

Action List the IGMP snooping protocol information on each of the four switches using the **show configuration protocols igmp-snooping** command:

```
user@switch> show configuration protocols igmp-snooping
vlan fcoe_vlan {
    disable;
}
```

Meaning The **show configuration protocols igmp-snooping** command lists the IGMP snooping configuration for the VLANs configured on the switch. The command output shows that IGMP snooping is disabled on the FCoE VLAN (**fcoe_vlan**).

Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your network uses a different priority than 3 for FCoE traffic, you need to configure lossless FCoE transport on that priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic instead of using priority 3.

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

Overview

Although FCoE traffic typically uses IEEE 802.1p priority 3 on converged Ethernet networks, some networks use a different priority for FCoE traffic. Regardless of the priority used, FCoE traffic must receive lossless treatment. Supporting lossless behavior for FCoE traffic when your network does not use priority 3 requires configuring:

- A lossless forwarding class for FCoE traffic.
- A behavior aggregate (BA) classifier to map the FCoE forwarding class to the appropriate IEEE 802.1p priority.
- A congestion notification profile (CNP) to enable PFC on the FCoE code point at the interface ingress and to configure flow control on the interface egress. Flow control on the interface egress enables the interface to respond to PFC messages received from the connected peer and pause the correct IEEE 802.1p priority on the correct output queue.

  NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- A DCBX application and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priority. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure one lossless FCoE traffic class, map it to a priority other than priority 3, and configure flow control to ensure lossless behavior on the interfaces. This example uses two Ethernet interfaces, xe-0/0/25 and xe-0/0/26. The interfaces connect to a converged Ethernet network that uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic.

The configuration on the two interfaces is the same. Both interfaces use the same explicitly configured lossless FCoE forwarding class and the same ingress classifier. Both interfaces enable PFC on priority 5 and enable flow control on the same output queue (which is mapped to the lossless FCoE forwarding class).

Table 511 on page 5586 shows the configuration components for this example.

Table 511: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3

Component	Settings
Hardware	QFX3500 switch
Forwarding class	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.
BA classifier	Name—**fcoe_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**.

Table 511: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3 *(continued)*

Component	Settings
PFC configuration (CNPs)	CNP name—**fcoe_p5_cnp** Input CNP code point—**101** MRU—**2240** bytes Cable length—**100** meters Output CNP code point—**101** Output CNP flow control queue—**5** NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.
DCBX application mapping	Application name—**fcoe_p5_app** Application EtherType—**0x8906** Application map name—**fcoe_p5_app_map** Application map code points—**101** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure a lossless FCoE forwarding class that uses a different priority than IEEE 802.1p priority 3 for FCoE traffic on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101
pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 100
```

set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
set class-of-service interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
set applications application fcoe_p5_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map

Configuring A Lossless FCoE Forwarding Class On IEEE 802.1p Priority 5

Step-by-Step Procedure

To configure a lossless forwarding class for FCoE traffic on IEEE 802.1p priority 5 (code point 101), classify FCoE traffic into the lossless forwarding class, configure a congestion notification profile to enable PFC on the FCoE priority and output queue, and configure DCBX application protocol TLV exchange for traffic on the FCoE priority:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue **5**) for FCoE traffic on IEEE 802.1p priority 5:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

2. Configure the ingress classifier (**fcoe_p5**). The classifier maps the FCoE priority (code point **101**) to the lossless FCoE forwarding class **fcoe1**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
   101
   ```

3. Apply the classifier to interfaces **xe-0/0/25** and **xe-0/026**:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
   user@switch# set interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
   ```

4. Configure the CNP. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
   101 pfc mru 2240
   user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 100
   user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
   101 pfc flow-control-queue 5
   ```

5. Apply the CNP to the interfaces:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
   user@switch# set interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
   ```

6. Configure the DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priority 5 instead of on the default priority 3:

   ```
   [edit]
   user@switch# set applications application fcoe_p5_app ether-type 0x8906
   ```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set policy-options application-maps fcoe_p5_app_map application
fcoe_p5_app code-points 101
```

8. Apply the application map to the Ethernet interfaces so that DCBX exchanges FCoE application TLVs on the correct code point:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
user@switch# set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map
```

Verification

To verify the configuration and proper operation of the lossless forwarding class and IEEE 802.1p priority, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5589
- Verifying the Behavior Aggregate Classifier Configuration on page 5590
- Verifying the PFC Flow Control Configuration (CNP) on page 5590
- Verifying the Interface Configuration on page 5591
- Verifying the DCBX Application Configuration on page 5591
- Verifying the DCBX Application Map Configuration on page 5591
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5592

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                        ID       Queue   Policing priority  No-Loss

  best-effort                          0          0          normal         Disabled

  fcoe                                 1          3          normal         Enabled

  no-loss                              2          4          normal         Enabled

  network-control                      3          7          normal         Disabled

  fcoe1                                4          5          normal         Enabled

  mcast                                8          8          normal         Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifier configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065
  Code point         Forwarding class                    Loss priority
  101                fcoe1                               low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**, and all other priorities to the **best-effort** forwarding class with a packet loss priority of **high**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priority and that flow control is configured on the correct output queue in the CNP.

Action Display the congestion notification profile using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p5_cnp, Index: 12137
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the configured CNPs.

The **fcoe_p5_cnp** CNP input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

Verifying the Interface Configuration

Purpose Verify that the correct classifier and congestion notification profile are configured on the interfaces.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/25** and **show configuration class-of-service interfaces xe-0/0/26**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/25
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/26
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}
```

Meaning Both the **show configuration class-of-service interfaces xe-0/0/25** command and the **show configuration class-of-service interfaces xe-0/0/26** command show that the congestion notification profile **fcoe_p5_cnp** is configured on each interface, and that the IEEE 802.1p classifier associated with each interface is **fcoe_p5**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX application for FCoE is configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_p5_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe_p5_app** is configured with an EtherType of **0x8906**.

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map is configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe_p5_app_map** consists of the application named **fcoe_p5_app**, which is mapped to IEEE 802.1p code point **101**.

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application map is applied to the correct interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/25.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/26.0 {
    application-map fcoe_p5_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/25.0** and **xe-0/0/26.0** use application map **fcoe_p5_app_map**.

- Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows on page 5427
- Understanding CoS Flow Control (Ethernet PAUSE and PFC) on page 4885

Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your converged Ethernet network uses more than one priority for FCoE traffic, you need to configure lossless transport for each FCoE priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses both priority 3 (IEEE 802.1p code point 011) and priority 5 (IEEE 802.1p code point 101) for FCoE traffic.

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, a converged Ethernet network might include two separate FCoE networks that use different priorities to identify traffic. Interfaces that carry traffic for both FCoE networks need to support lossless FCoE transport on both priorities.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class).
- A behavior aggregate (BA) classifier to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities).
- A congestion notification profile (CNP) to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifier, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure two lossless FCoE traffic classes on an interface, map them to two different priorities, and configure flow control to ensure lossless behavior. This example uses two Ethernet interfaces, xe-0/0/20 and xe-0/0/21, that are connected to the converged Ethernet network. Both interfaces transport FCoE traffic on priorities 3 (011) and 5 (101), and must support lossless transport of that traffic.

Table 512 on page 5594 shows the configuration components for this example.

Table 512: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Forwarding classes	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. Name—**fcoe** This is the default lossless FCoE forwarding class, so no configuration required. The **fcoe** forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of **no-loss**.

Table 512: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology *(continued)*

Component	Settings
BA classifier	Name—**fcoe_classifier** FCoE priority mapping for forwarding class **fcoe**—mapped to code point **011** (IEEE 802.1p priority 3) and a packet loss priority of **low**. FCoE priority mapping for forwarding class **fcoe1**—mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**.
PFC configuration (CNP)	CNP name—**fcoe_cnp** Input CNP code points—**011** and **101** MRU—2240 bytes Cable length—100 meters Output CNP code points—**011** and **101** Output CNP flow control queues—**3** and **5** NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for PFC pause unless they are included in the explicitly configured output CNP. In this example, because the explicit output CNP overwrites the default output CNP, we must explicitly configure flow control on queue 3.
DCBX application mapping	Application name—**fcoe_app** Application EtherType—**0x8906** Application map name—**fcoe_app_map** Application map code points—**011** and **101** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.
Interfaces	Interfaces **xe-0/0/20** and **xe-0/0/21** use the same configuration: • Classifier—**fcoe_classifier** • CNP—**fcoe_cnp** • DCBX application map—**fcoe_app_map**

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch interface, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_classifier forwarding-class fcoe1 loss-priority low
code-points 101set class-of-service interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
set class-of-service interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
set class-of-service congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 011 pfc
mru 2240
set class-of-service congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 101 pfc
mru 2240
set class-of-service congestion-notification-profile fcoe_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 011
pfc flow-control-queue 3
set class-of-service congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 101
pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
set class-of-service interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
set applications application fcoe_app ether-type 0x8906
set policy-options application-maps fcoe_app_map application fcoe_app code-points [011 101]
set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on the same interface, classify FCoE traffic into the forwarding classes, configure CNPs to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

```
[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
```

NOTE: This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier. The classifier maps the FCoE priorities (IEEE 802.1p code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1 fcoe_classifier forwarding-class fcoe1 loss-priority low
code-points 101
```

3. Apply the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
```

4. Configure the CNP. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
```

5. Apply the CNP to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
```

6. Configure a DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on both of the IEEE 802.1p priorities used for FCoE transport:

```
[edit]
user@switch# set applications application fcoe_app ether-type 0x8906
```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priorities:

```
[edit]
user@switch# set policy-options application-maps fcoe_app_map application fcoe_app code-points [011 101]
```

8. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5598
- Verifying the Behavior Aggregate Classifier Configuration on page 5598
- Verifying the PFC Flow Control Configuration (CNP) on page 5599
- Verifying the Interface Configuration on page 5599
- Verifying the DCBX Application Configuration on page 5600

- Verifying the DCBX Application Map Configuration on page 5600
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5600

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                          ID       Queue  Policing priority  No-Loss

  best-effort                            0          0         normal         Disabled

  fcoe                                    1          3         normal         Enabled

  no-loss                                 2          4         normal         Enabled

  network-control                        3          7         normal         Disabled

  fcoe1                                   4          5         normal         Enabled

  mcast                                  8          8         normal         Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifiers using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_classifier, Code point type: ieee-802.1, Index: 10964
  Code point          Forwarding class                    Loss priority
  011                 fcoe                                low
  101                 fcoe1                               low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe_classifier** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities.

Action List the CNPs using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_cnp, Index: 46504
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2240
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  011
               3
  101
               5
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the CNP.

The CNP **fcoe_cnp** input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the interface cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

Verifying the Interface Configuration

Purpose Verify that the classifier and congestion notification profile are configured on the interfaces. Both interfaces should show the same configuration.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
ccongestion-notification-profile fcoe_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/21
congestion-notification-profile fcoe_cnp;
unit 0 {
```

```
    classifiers {
        ieee-802.1 fcoe_classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_classifier**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_classifier**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX application for FCoE is configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe_app** is configured with an EtherType of **0x8906**.

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map is configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_app_map {
    application fcoe_app code-points [011 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe_app_map** consists of the application named **fcoe_app**, which is mapped to IEEE 802.1p code points **011** and **101** (priorities 3 and 5, respectively).

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application map is applied to the interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
```

```
interface xe-0/0/20.0 {
    application-map fcoe_app_map;
}
interface xe-0/0/21.0 {
    application-map fcoe_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/20.0** and **xe-0/0/21.0** use application map **fcoe_app_map**.

Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic if it uses different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and map them to two different priorities on an FCoE transit switch.

- Requirements on page 5601
- Overview on page 5602
- Configuration on page 5606
- Verification on page 5609

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, when the QFX3500 switch acts as a transit switch, it could be connected to two QFX3500 switches in FCoE-FC gateway mode. Each of the gateway switches could connect a set of FCoE clients to a different SAN, and each set of FCoE clients could use a different priority for FCoE traffic to avoid fate sharing and maintain separation of the two FCoE networks. In this case, you need to configure two forwarding classes for FCoE traffic, each mapped to a different output queue and a different priority.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- Behavior aggregate (BA) classifiers to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer

  NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure two lossless FCoE traffic classes, map them to two different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses three Ethernet interfaces, xe-0/0/20, xe-0/0/21, and xe-0/0/22:

- Interface xe-0/0/20 connects to an FCoE-FC gateway that connects to Fibre Channel (FC) SAN 1. FCoE traffic to and from FC SAN 1 uses the default **fcoe** forwarding class and the default mapping to priority 3 (IEEE 802.1p code point 011) and output queue 3.
- Interface xe-0/0/21 connects to another FCoE-FC gateway that connects to Fibre Channel (FC) SAN 2. FCoE traffic to and from FC SAN-2 uses an explicitly configured FCoE forwarding class that is mapped to priority 5 (code point 101) and output queue 5.
- Interface xe-0/0/22 connects to FCoE devices on the converged Ethernet network and handles traffic destined for FC SAN 1 and FC SAN 2. Interface xe-0/0/22 must properly handle lossless FCoE traffic of both priorities (both FCoE forwarding classes), including pausing the traffic on ingress or egress as required.

Figure 204 on page 5603 shows the topology for this example, and Table 513 on page 5603 shows the configuration components for this example.

Figure 204: Topology of the Two Lossless FCoE Priorities Example

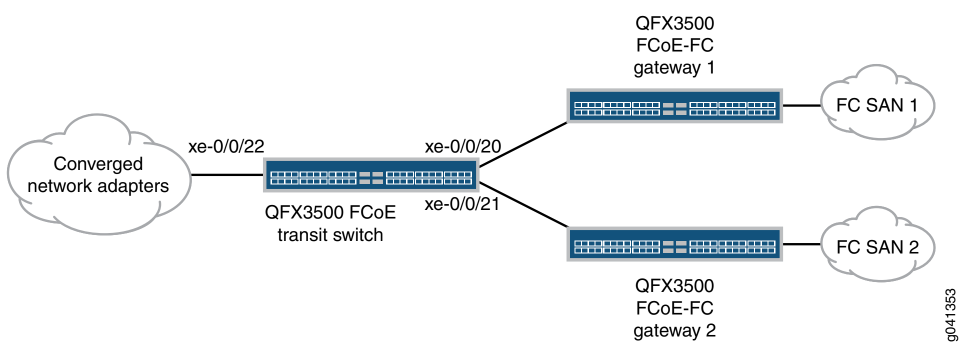

Table 513: Components of the Two Lossless FCoE Priorities Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Forwarding classes	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. Name—**fcoe** This is the default lossless FCoE forwarding class, so no configuration required. The **fcoe** forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of **no-loss**

Table 513: Components of the Two Lossless FCoE Priorities Configuration Topology *(continued)*

Component	Settings
BA classifiers	Each interface requires a different classifier because each interface handles a different subset of FCoE traffic. • Interface xe-0/0/20 classifier: Name—**fcoe_p3** FCoE priority mapping—Forwarding class **fcoe** mapped to code point **011** (IEEE 802.1p priority 3) and a packet loss priority of **low**. • Interface xe-0/0/21 classifier: Name—**fcoe_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**. • Interface xe-0/0/22 classifier: Name—**fcoe_p3_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** and a packet loss priority of **low**, and forwarding class **fcoe** mapped to code point **011** and a packet loss priority of **low**.

Table 513: Components of the Two Lossless FCoE Priorities Configuration Topology *(continued)*

Component	Settings
PFC configuration (CNPs)	Each interface requires a different CNP because each interface handles a different subset of FCoE traffic and must pause that traffic on different priorities. • Interface xe-0/0/20 CNP: CNP name—**fcoe_p3_cnp** Input CNP code point—**011** MRU—2240 bytes Cable length—100 meters NOTE: Because interface xe-0/0/20 uses the default FCoE configuration, output queue 3 is paused by default and you do not need to configure the output stanza of the CNP. • Interface xe-0/0/21 CNP: CNP name—**fcoe_p5_cnp** Input CNP code point—**101** MRU—**2240** bytes Cable length—**150** meters Output CNP code point—**101** Output CNP flow control queue—**5** • Interface xe-0/0/22 CNP: CNP name—**fcoe_p3_p5_cnp** Input CNP code points—**011** and **101** MRU—**2240** bytes (both priorities) Cable length—**100** meters Output CNP code points—**011** (for queue **3**) and **101** (for queue **5**) Output CNP flow control queues—**3** for priority 3 (code point 011) and **5** for priority 5 (code point 101) NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.

Table 513: Components of the Two Lossless FCoE Priorities Configuration Topology *(continued)*

Component	Settings
DCBX application mapping	Interface xe-0/0/20 does not need an application map because DCBX exchanges application protocol TLVs only on the default FCoE priority (priority 3). Interface xe-0/0/21 requires an application map that enables DCBX application protocol TLV exchange on priority 5 (code point 101) for FCoE traffic. Interface xe-0/0/22 requires an application map that enables DCBX application protocol TLV exchange both on priority 3 (code point 011) and on priority 5 (code point 101) for FCoE traffic. • Interface xe-0/0/21 DCBX application mapping: Application name—**fcoe_p5_app** Application ether-type—**0x8906** Application map name—**fcoe_p5_app_map** Application map code points—**101** • Interface xe-0/0/22 DCBX application mapping: Application name—**fcoe_all_app** Application ether-type—**0x8906** Application map name—**fcoe_all_app_map** Application map code points—**011** and **101** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
set class-of-service interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
set class-of-service congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 011
pfc mru 2240
```

set class-of-service congestion-notification-profile fcoe_p3_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 150
set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 011 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp

set applications application fcoe_p5_app ether-type 0x8906
set applications application fcoe_all_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set policy-options application-maps fcoe_all_app_map application fcoe_all_app code-points [011 101]
set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map

Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on different interfaces, classify FCoE traffic into the forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

   NOTE: This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier (**fcoe_p3**) for interface **xe-0/0/20**. The classifier maps the FCoE priority (IEEE 802.1p code point **011**) to lossless FCoE forwarding class **fcoe**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low code-points 011
   ```

3. Configure the ingress classifier (**fcoe_p5**) for interface **xe-0/0/21**. The classifier maps the FCoE priority (IEEE 802.1p code point **101**) to lossless FCoE forwarding class **fcoe1**:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points 101
   ```

4. Configure the ingress classifier (**fcoe_p3_p5**) for interface **xe-0/0/22**. The classifier maps the two FCoE priorities (IEEE 802.1p code points **011** and **101**) to the two lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points 011
   user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points 101
   ```

5. Apply each classifier to the appropriate interface:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
   user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
   user@switch# set interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
   ```

6. Configure the CNP input stanza for interface xe-0/0/20 to enable PFC on the FCoE priority (IEEE 802.1p code point 011), set the MRU value (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queue 3 is paused by default on priority 3, and we are not explicitly configuring output queue flow control for any other queues.

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 011 pfc mru 2240
   user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100
   ```

7. Configure the CNP for interface xe-0/0/21. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point 101), sets the MRU value (2240 bytes), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
   user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
   user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
   ```

8. Configure the CNP for interface xe-0/0/22. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 011 pfc mru 2240
   user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
   user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
   user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
   user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
   ```

9. Apply each CNP to the appropriate interface:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp
   ```

```
user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/22 congestion-notification-profile fcoe_p3_p5_cnp
```

10. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/21. Interface xe-0/0/21 uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on priority 5 on interface xe-0/0/21. Configure an application named **fcoe_p5_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe_p5_app_map** to map the application to code point 101:

    ```
    [edit]
    user@switch# set applications application fcoe_p5_app ether-type 0x8906
    user@switch# set policy-options application-maps fcoe_p5_app_map application
    fcoe_p5_app code-points 101
    ```

    NOTE: Interface xe-0/0/20 uses the default FCoE configuration (priority 3). DCBX exchanges protocol TLVs for the FCoE application by default, so you do not need to configure DCBX explicitly on interface xe-0/0/20.

11. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/22. Interface xe-0/0/22 uses both priority 3 (IEEE 802.1p code point 011) and priority 5 for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on both priority 3 and priority 5. Configure an application named **fcoe_all_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe_all_app_map** to map the application to code points 011 and 101:

    ```
    [edit]
    user@switch# set applications application fcoe_all_app ether-type 0x8906
    user@switch# set policy-options application-maps fcoe_all_app_map application
    fcoe_all_app code-points [011 101]
    ```

12. Apply the application maps to the interfaces xe-0/0/21 and xe-0/0/22 so that DCBX exchanges FCoE application TLVs on the correct code points on each interface:

    ```
    [edit]
    user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
    user@switch# set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map
    ```

Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5610
- Verifying the Behavior Aggregate Classifier Configuration on page 5610
- Verifying the PFC Flow Control Configuration (CNP) on page 5611
- Verifying the Interface Configuration on page 5613
- Verifying the DCBX Application Configuration on page 5613
- Verifying the DCBX Application Map Configuration on page 5614
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5614

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                      ID      Queue  Policing priority  No-Loss

  best-effort                        0         0         normal       Disabled

  fcoe                               1         3          normal       Enabled

  no-loss                            2         4          normal       Enabled

  network-control                    3        7         normal       Disabled

  fcoe1                              4         5          normal       Enabled

  mcast                              8         8         normal       Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch>  show class-of-service classifier
Classifier: fcoe_p3, Code point type: ieee-802.1, Index: 13913
  Code point         Forwarding class                       Loss priority
  011                fcoe                                   low

Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065
  Code point         Forwarding class                       Loss priority
  101                fcoe1                                  low

Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 10964
  Code point         Forwarding class                       Loss priority
  011                fcoe                                   low
  101                fcoe1                                  low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are three classifiers, **fcoe_p3**, **fcoe_p5**, and **fcoe_p3_p5**.

Classifier **fcoe_p3** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**.

Classifier **fcoe_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe_p3_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p3_cnp, Index: 12037
Type: Input
Cable Length: 100 m
  Priority     PFC         MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2240
  100          Disabled
  101          Disabled
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  000
               0
  001
               1
  010
               2
  011
               3
  100
               4
  101
               5
  110
               6
  111
               7

Name: fcoe_p3_p5_cnp, Index: 46484
Type: Input
Cable Length: 100 m
  Priority     PFC         MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2240
```

```
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  011
               3
  101
               5

Name: fcoe_p5_cnp, Index: 12133
Type: Input
Cable Length: 150 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2240
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the three CNPs. For CNP **fcoe_p3_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows the default mapping of priorities to output queues.

NOTE: By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queue 3 responds to pause messages from the connected peer on interfaces that use CNP **fcoe_p3_cnp**, because the input stanza enables PFC priority 3 only.

For CNP **fcoe_p3_p5_cnp**, the input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

For CNP **fcoe_p5_cnp**, the input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **150** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

Verifying the Interface Configuration

Purpose Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20**, **show configuration class-of-service interfaces xe-0/0/21**, and **show configuration class-of-service interfaces xe-0/0/22**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
ccongestion-notification-profile fcoe_p3_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/21
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/22
congestion-notification-profile fcoe_p3_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_p5;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe_p3_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p5**.

The **show configuration class-of-service interfaces xe-0/0/22** command shows that the congestion notification profile **fcoe_p3_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3_p5**.

Verifying the DCBX Application Configuration

Purpose Verify that the two DCBX applications for FCoE are configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_all_app {
    ether-type 0x8906;
```

```
application fcoe_p5_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe_all_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic) and that the application **fcoe_p5_app** is also configured with an EtherType of **0x8906**.

Verifying the DCBX Application Map Configuration

Purpose Verify that the application maps are configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_all_app_map {
    application fcoe_all_app code-points [011 101];
}
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there are two application maps.

Application map **fcoe_all_app_map** consists of the application named **fcoe_all_app** mapped to IEEE 802.1p code points **011** (priority 3) and **101** (priority 5).

Application map **fcoe_p5_app_map** consists of the application named **fcoe_p5_app** mapped to IEEE 802.1p code point **101** (priority 5).

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps are applied to the correct interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/21.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/22.0 {
    application-map fcoe_all_app_map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/21.0** uses application map **fcoe_p5_app_map** and interface **xe-0/0/22.0** uses application map **fcoe_all_app_map**.

NOTE: Because interface xe-0/0/20 uses the default lossless FCoE configuration, you do not configure application mapping to interface xe-0/0/20. The default configuration automatically exchanges application protocol TLVs for the default FCoE configuration on priority 3 (IEEE 802.1p code point 011).

Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic on different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, and map the forwarding classes to three different priorities. (The converged Ethernet network includes two FCoE networks, each of which uses a different priority to identify FCoE traffic, and an iSCSI network.)

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode

- Junos OS Release 12.3 or later for the QFX Series

Overview

Some converged Ethernet networks support FCoE on more than one IEEE 802.1p priority and also require supporting other lossless traffic classes. Interfaces that carry multiple lossless forwarding classes need to support lossless behavior for the priorities mapped to those forwarding classes. To support the two FCoE forwarding classes and the iSCSI forwarding class used in this example, you need to configure:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- A lossless forwarding class for iSCSI traffic
- Behavior aggregate (BA) classifiers to map the lossless forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE and iSCSI code points at the interface ingress, and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer

NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- DCBX applications and an application map to support DCBX application TLV exchange for the FCoE and iSCSI traffic on the configured lossless priorities. By default, DCBX is enabled on all Ethernet interfaces for FCoE, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure two lossless FCoE traffic classes and one lossless iSCSI traffic class, map them to three different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses four Ethernet interfaces, xe-0/0/31, xe-0/0/32, xe-0/0/33, and xe-0/0/34:

- Interface xe-0/0/31 handles FCoE traffic on priority 3 (IEEE 802.1p code point 011) and iSCSI traffic on priority 4 (code point 100).
- Interface xe-0/0/32 handles FCoE traffic on priority 5 (code point 101) and iSCSI traffic on priority 4.
- Interface xe-0/0/33 handles FCoE traffic on priority 3 and priority 5.
- Interface xe-0/0/34 handles iSCSI traffic on priority 4.

Figure 205 on page 5617 shows the topology for this example, and Table 514 on page 5617 shows the configuration components for this example.

Figure 205: Topology of the Lossless FCoE and iSCSI Priorities Example

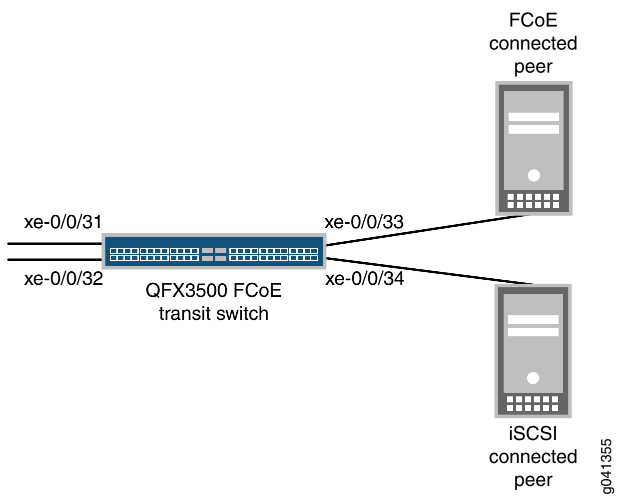

Table 514: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology

Component	Settings
Hardware	QFX3500 switch

Table 514: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology *(continued)*

Component	Settings
Forwarding classes	This example uses one explicitly configured lossless FCoE forwarding class, the default lossless FCoE forwarding class, and one explicitly configured iSCSI forwarding class. • iSCSI forwarding class: Name—**iscsi** Queue mapping—queue **4** Packet drop attribute—**no-loss** • FCoE forwarding class (explicitly configured): Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: A lossless forwarding class can be mapped to any output queue. However, because the **fcoe1** forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. • FCoE forwarding class (default) Name—**fcoe** The default **fcoe** forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of **no-loss**.
BA classifiers	Each interface requires a different classifier because each interface handles a different subset of FCoE traffic. • Interface xe-0/0/31 classifier: Name—**fcoe_p3_iscsi** FCoE priority mapping—Forwarding class **fcoe** mapped to code point **011** (IEEE 802.1p priority 3) and a packet loss priority of **low**. iSCSI priority mapping—Forwarding class **iscsi** mapped to code point **100** (priority 4) and a packet loss priority of **low**. • Interface xe-0/0/32 classifier: Name—**fcoe_p5_iscsi** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (IEEE 802.1p priority 5) and a packet loss priority of **low**. iSCSI priority mapping—Forwarding class **iscsi** mapped to code point **100** (priority 4) and a packet loss priority of **low**. • Interface xe-0/0/33 classifier: Name—**fcoe_p3_p5** FCoE priority mapping—Forwarding class **fcoe1** mapped to code point **101** (priority 5) and a packet loss priority of **low**, and forwarding class **fcoe** mapped to code point **011** and a packet loss priority of **low**. • Interface xe-0/0/34 classifier: Name—**iscsi_classifier** iSCSI priority mapping—Forwarding class **iscsi** mapped to code point **100** (priority 4) and a packet loss priority of **low**.

Table 514: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology *(continued)*

Component	Settings
PFC configuration (CNPs)	Each interface requires a different CNP because each interface handles a different subset of FCoE and iSCSI traffic, and must pause that traffic on different priorities. • Interface xe-0/0/31 CNP: CNP name—**fcoe_p3_cnp** Input CNP code points—**011** and **100** MRU—2240 bytes for code point **011**, default value (2500 bytes) for code point **100** Cable length—100 meters NOTE: On interface xe-0/0/31, the FCoE forwarding class is mapped to queue 3 and priority 3 (code point 011), and the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Therefore, interface xe-0/0/31 does not require an output CNP configuration because queue 3 and queue 4 are enabled for PFC flow control by default on code points 011 and 100, respectively. • Interface xe-0/0/32 CNP: CNP name—**fcoe_p5_cnp** Input CNP code points—**100** and **101** MRU—Default value (2500 bytes) for code point **100**, **2240** bytes for code point **101** Cable length—**150** meters Output CNP code points—**100** and **101** Output CNP flow control queues—**4** and **5** • Interface xe-0/0/33 CNP: CNP name—**fcoe_p3_p5_cnp** Input CNP code points—**011** and **101** MRU—**2240** bytes (both priorities) Cable length—**100** meters Output CNP code points—**011** and **101** Output CNP flow control queues—**3** and **5** • Interface xe-0/0/34 CNP: CNP name—**iscsi_cnp** Input CNP code point—**100** MRU—**2500** bytes (default value) Cable length—**100** meters NOTE: On interface xe-0/0/34, the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Interface xe-0/0/34 does not require an output CNP configuration because queue 4 is enabled for PFC flow control by default on code point 100. NOTE: When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.

Table 514: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology *(continued)*

Component	Settings
DCBX application mapping	This example requires configuring applications for FCoE and iSCSI, including them in the same application map, and applying the application map to all four interfaces. Application map name—**dcbx_iscsi_fcoe_app_map** • FCoE application name—**fcoe_app** Application ether-type—**0x8906** Application map code points—**011** and **101** • iSCSI application name—**iscsi_app** Application protocol type—**tcp** Application destination port—**3260** Application map code point—**100** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

Configuration

CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes and one lossless iSCSI forwarding class and map them to different priorities, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class iscsi queue-num 4 no-loss
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low
code-points 100
set class-of-service classifiers ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low
code-points 100
set class-of-service classifiers ieee-802.1 fcoe_p5_iscsi forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low
code-points 011

set protocols dcbx interface xe-0/0/34 application-map dcbx_iscsi_fcoe_app_map

Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, classify the traffic into the three forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding classes **iscsi** for iSCSI traffic and **fcoe1** for FCoE traffic (this example uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class) and map them to output queues:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class iscsi queue-num 4 no-loss
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

2. Configure the ingress classifier (**fcoe_p3_iscsi**) for interface **xe-0/0/31**. The classifier maps the FCoE priority (code point **011**) to lossless FCoE forwarding class **fcoe** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

   ```
   [edit class-of-service classifiers]
   ```

user@switch# **set ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low code-points 011**
user@switch# **set ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low code-points 100**

3. Configure the ingress classifier (**fcoe_p5_iscsi**) for interface **xe-0/0/32**. The classifier maps the FCoE priority (code point **101**) to lossless FCoE forwarding class **fcoe1** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

   [edit class-of-service classifiers]
   user@switch# **set ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low code-points 100**
   user@switch# **set ieee-802.1 fcoe_p5_iscsi forwarding-class fcoe1 loss-priority low code-points 101**

4. Configure the ingress classifier (**fcoe_p3_p5**) for interface **xe-0/0/33**. The classifier maps the two FCoE priorities (code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

   [edit class-of-service classifiers]
   user@switch# **set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points 011**
   user@switch# **set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points 101**

5. Configure the ingress classifier (**iscsi_classifier**) for interface **xe-0/0/34**. The classifier maps the iSCSI priority (code point **101**) to lossless iSCSI forwarding class **iscsi**:

   [edit class-of-service classifiers]
   user@switch# **set ieee-802.1 iscsi_classifier forwarding-class iscsi loss-priority low code-points 100**

6. Apply each classifier to the appropriate interface:

   [edit class-of-service]
   user@switch# **set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe_p3_iscsi**
   user@switch# **set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe_p5_iscsi**
   user@switch# **set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe_p3_p5**
   user@switch# **set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 iscsi_classifier**

7. Configure the CNP input stanza for interface xe-0/0/31 to enable PFC on the FCoE and iSCSI priorities that the interface handles (code points 011 and 100), set the MRU value for the FCoE traffic (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queues 3 and 4 are paused by default on priorities 3 and 4, respectively, and we are not explicitly configuring output queue flow control for any other queues.

   [edit class-of-service]
   user@switch# **set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 011 pfc mru 2240**
   user@switch# **set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 100 pfc**
   user@switch# **set congestion-notification-profile fcoe_p3_cnp input cable-length 100**

8. Configure the CNP for interface xe-0/0/32. The input stanza enables PFC on the FCoE priority (code point 101), sets the MRU value for FCoE traffic (2240 bytes), enables PFC on the iSCSI priority (code point 100), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority and on output queue 4 on the iSCSI priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 100 pfc
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point 100 pfc flow-control-queue 4
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
```

9. Configure the CNP for interface xe-0/0/33. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
```

10. Configure the CNP input stanza for interface xe-0/0/34 to enable PFC on the iSCSI priority (code point 100) and set the cable length value (100 meters). No output stanza is needed because queue 4 is paused by default on priority 4, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile iscsi_cnp input ieee-802.1 code-point 100 pfc
user@switch# set congestion-notification-profile iscsi_cnp input cable-length 100
```

11. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe_p3_cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe_p3_p5_cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile iscsi_cnp
```

12. Configure the DCBX applications for FCoE and iSCSI to map to the interfaces so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priorities used for FCoE and iSCSI traffic:

```
[edit]
user@switch# set applications application fcoe_app ether-type 0x8906
user@switch# set applications application iscsi_app protocol tcp destination-port 3260
```

13. Configure a DCBX application map to map the FCoE and iSCSI applications to the correct priorities:

```
[edit]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application fcoe_app code-points [011 101]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application iscsi_app code-points 100
```

14. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/31 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/32 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/33 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/34 application-map
dcbx_iscsi_fcoe_app_map
```

Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5624
- Verifying the Behavior Aggregate Classifier Configuration on page 5625
- Verifying the PFC Flow Control Configuration (CNP) on page 5625
- Verifying the Interface Configuration on page 5628
- Verifying the DCBX Application Configuration on page 5629
- Verifying the DCBX Application Map Configuration on page 5629
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5630

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding classes **iscsi** and **fcoe1** have been created and that the default lossless forwarding class **fcoe** is still enabled for lossless transport.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch> show class-of-service forwarding-class
Forwarding class                        ID      Queue  Policing priority  No-Loss

  best-effort                          0         0         normal        Disabled

  fcoe                                 1          3         normal         Enabled

  iscsi                                2          4         normal         Enabled

  network-control                      3         7         normal        Disabled

  fcoe1                                4          5         normal         Enabled

  mcast                                8         8         normal        Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **iscsi** and **fcoe1** forwarding classes are configured on output queues **4** and **5**, respectively, with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default **fcoe** forwarding class, it remains in its default state (lossless configuration).

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the four classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p3_iscsi, Code point type: ieee-802.1, Index: 13915
  Code point         Forwarding class                    Loss priority
  011                fcoe                                low
  100                iscsi                               low

Classifier: fcoe_p5_iscsi, Code point type: ieee-802.1, Index: 62035
  Code point         Forwarding class                    Loss priority
  100                iscsi                               low
  101                fcoe1                               low

Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 17774
  Code point         Forwarding class                    Loss priority
  011                fcoe                                low
  101                fcoe1                               low

Classifier: iscsi_classifier, Code point type: ieee-802.1, Index: 31635
  Code point         Forwarding class                    Loss priority
  100                iscsi                               low
```

Meaning The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are four classifiers, **fcoe_p3_iscsi**, **fcoe_p5_iscsi**, **fcoe_p3_p5**, and **iscsi_classifier**.

Classifier **fcoe_p3_iscsi** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and code point **100** (priority 4) to explicitly configured lossless forwarding class **iscsi**.

Classifier **fcoe_p5_iscsi** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**, and code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe_p3_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **iscsi_classifier** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**.

Verifying the PFC Flow Control Configuration (CNP)

Purpose Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

Action List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p3_cnp, Index: 12037
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Enabled      2240
  100          Enabled      9216
  101          Disabled

```

Meaning The **show class-of-service congestion-notification** command shows the input and output stanzas of the four CNPs.

For CNP **fcoe_p3_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3) with an MRU of **2240** bytes, and cable length of **100** meters. The input stanza also shows that PFC is enabled on code point **100** (priority 4) with the default MRU value of **9216** bytes. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

NOTE: By default, only queues 3 and 4 are enabled respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queues 3 and 4 respond to pause messages from the connected peer on interfaces that use CNP **fcoe_p3_cnp** because the input stanza enables PFC only on priorities 3 and 4.

For CNP **fcoe_p3_p5_cnp**, the input stanza shows that PFC is enabled on code points **011** and **101** (priority 5), the MRU is **2240** bytes on both priorities, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

For CNP **fcoe_p5_cnp**, the input stanza shows that PFC is enabled on code points **100** and **101**. The MRU for code point **101** (FCoE traffic) is **2240** bytes and the MRU for code point **100** is **9216**. The interface cable length is **150** meters. The CNP output stanza shows that output flow control is configured on queue **4** for code point **100** and on queue **5** for code point **101**.

For CNP **iscsi_cnp**, the input stanza shows that PFC is enabled on code point **100**, the MRU value is **9216** bytes, and the interface cable length is **100** meters. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

Verifying the Interface Configuration

Purpose Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

Action List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/31**, **show configuration class-of-service interfaces xe-0/0/32**, **show configuration class-of-service interfaces xe-0/0/33**, and **show configuration class-of-service interfaces xe-0/0/34**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe_p3_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_iscsi;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5_iscsi;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe_p3_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_p5;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile iscsi_cnp;
unit 0 {
    classifiers {
        ieee-802.1 iscsi_classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/31** command shows that the congestion notification profile **fcoe_p3_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/32** command shows that the congestion notification profile **fcoe_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p5_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/33** command shows that the congestion notification profile **fcoe_p3_p5_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_p3_p5**.

The **show configuration class-of-service interfaces xe-0/0/34** command shows that the congestion notification profile **iscsi_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **iscsi_classifier**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX applications for FCoE and iSCSI are configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application iscsi_app {
    protocol tcp;
    destination-port 3260;
}
application fcoe_app {
    ether-type 0x8906;
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **iscsi_app** is configured with a protocol value of **tcp** and a destination port value of **3260**, and that the application **fcoe_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map is configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iscsi_app code-points 100;
    application fcoe_app code-points [011 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there is one application map named **dcbx-iscsi-fcoe_app_map**. It consists of the application **iscsi_app** mapped to code point **100** and the application **fcoe_app** mapped to code points **011** and **101**.

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps are applied to the correct interfaces.

Action List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/31.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/32.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/33.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/34.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that all four interfaces use the application map **dcbx-iscsi-fcoe-app-map**.

Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway

FCoE traffic typically uses IEEE 802.1p priority 3 (code point 011). However, if your FCoE network uses a different IEEE 802.1p priority than priority 3 for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that priority. You specify the lossless forwarding class used for the FCoE traffic by configuring a fixed classifier and applying it to the native FC (NP_Port) interface. All traffic received from the FC SAN on that NP_Port interface is classified into the forwarding class specified in the fixed classifier.

When native FC interfaces on the FCoE-FC gateway encapsulate incoming FC traffic in Ethernet to create FCoE frames, by default they assign IEEE 802.1p code point 011 to the FCoE traffic, forward the traffic internally to the gateway Ethernet interfaces, and then forward the traffic to the FCoE network. Setting a rewrite value for the IEEE 802.1p code point configures the gateway native FC interface to assign the rewrite value priority to the FCoE frames when the native FC interface forwards the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

You can configure one rewrite value for each local FCoE-FC gateway fabric. All of the native FC interfaces in a particular fabric must use the same rewrite value. Native FC interfaces that belong to different FCoE-FC gateway fabrics can use different rewrite values.

This example shows how to configure FCoE priority remapping for a converged Ethernet network that uses priority 5 (IEEE code point 101) for FCoE traffic. If your network uses priority 3 for FCoE traffic, then you do not need to remap the FCoE priority, because the default configuration supports lossless FCoE transport on priority 3.

Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

Overview

Native FC interfaces on an FCoE-FC gateway receive native FC traffic from the FC SAN and encapsulate it in Ethernet to create FCoE frames. Priority remapping enables you to map the encapsulated FC traffic (the FCoE traffic) to any IEEE 802.1p priority.

To support lossless FCoE traffic flows, you must configure the remapped priority correctly on the native FC interfaces and also on the Ethernet interfaces that connect to the FCoE network. Achieving lossless behavior for FCoE traffic when you remap the FCoE priority requires configuring:

- A lossless forwarding class for FCoE traffic (or using the default **fcoe** forwarding class)
- A behavior aggregate (BA) classifier on the FCoE Ethernet interfaces to map the FCoE forwarding class to the IEEE 802.1p code points (priority) used for FCoE traffic on the FCoE network (the ingress classifier priority for the forwarding class must be the same as the rewrite value priority)
- A fixed classifier on the FCoE-FC gateway FC interface that maps all traffic from the FC network into the lossless FCoE forwarding class (the forwarding class must be lossless)
- A priority rewrite value that remaps the IEEE 802.1p code point on the FCoE-FC gateway FC interface to the priority used for FCoE traffic on the FCoE network
- An input congestion notification profile (CNP) to enable priority-based flow control (PFC) on the FCoE code point (the code point used as the rewrite value) at the Ethernet interface ingress and an output CNP to configure flow control to pause the correct output queue at the Ethernet interface egress

> NOTE: **Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.**

- A DCBX application and application map on the Ethernet interface to support DCBX application TLV exchange for the lossless FCoE traffic on the FCoE priority

The priority specified in the BA classifier, CNP, and DCBX application map on the Ethernet ingress interfaces must match the priority specified in the fixed classifier and rewrite value configurations on the FC interfaces. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

Topology

This example shows how to configure priority remapping of FCoE traffic on one native FC interface (fc-0/0/2) connected to the FC SAN and on one Ethernet interface (xe-0/0/27) connected to the converged Ethernet (FCoE) network. Both the native FC interface and the Ethernet interface belong to the same local FC fabric on the FCoE-FC gateway.

The converged Ethernet network uses priority 5 (IEEE 80.21p code point 101) for FCoE traffic. The native FC interface on the FCoE-FC gateway receives FC traffic from the FC SAN. The native FC interface encapsulates the FC traffic in Ethernet to create FCoE frames, tags the frames with the IEEE 802.1p priority value 101, and then forwards the

FCoE frames to the FCoE-FC gateway Ethernet interface. Because traffic marked with IEEE 802.1p priority 5 is mapped to a lossless FCoE forwarding class, the traffic receives lossless treatment. The Ethernet interface forwards the FCoE traffic on to the Ethernet network.

FCoE traffic (tagged with priority 5) arriving at the FCoE-FC gateway from the Ethernet network receives lossless treatment and is forwarded to the native FC interface. The native FC interface removes the Ethernet encapsulation from the FCoE frames and forwards the resulting native FC traffic to the FC SAN.

Figure 206 on page 5633 shows the topology for this example, and Table 515 on page 5633 shows the configuration components for this example.

Figure 206: Topology of the IEEE 802.1p Priority Remapping Example

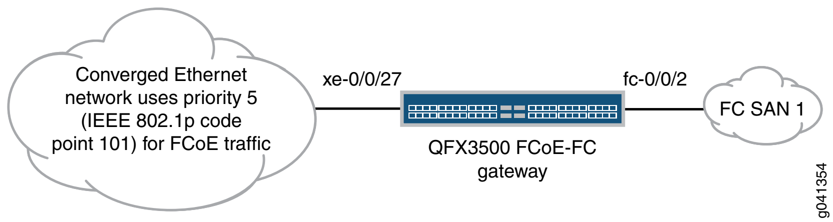

Table 515: Components of the IEEE 802.1p Priority Remapping Configuration Topology

Component	Settings
Hardware	QFX3500 switch
Forwarding class configuration	Name—**fcoe1** Queue mapping—queue **5** Packet drop attribute—**no-loss** NOTE: The lossless forwarding class can be mapped to any output queue. However, because FCoE uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.
BA classifier (Ethernet interface)	Name—**fcoe_gw_classifier** Maps code point **101** (IEEE 802.1p priority 5) to the **fcoe1** forwarding class and assigns traffic a packet loss priority of **low**. The classifier is applied to Ethernet interface **xe-0/0/27**.
Fixed classifier (native FC interface)	Forwarding class—**fcoe1** The classifier is applied to native FC interface **fc-0/0/2**
Rewrite value	IEEE 802.1p code point—**101** The rewrite value is applied to native FC interface **fc-0/0/2**

Table 515: Components of the IEEE 802.1p Priority Remapping Configuration Topology *(continued)*

Component	Settings
PFC configuration (CNP on Ethernet interface)	Name—**fcoe1_p5_rewrite_cnp** Input CNP code point—**101** Output CNP code point—**101** Output CNP flow control queue—**5** Interface—**xe-0/0/27**
DCBX application mapping	Application name—**myfcoe5** Application ether-type—**0x8906** Application map name—**myfcoe5_map** Application map code points—**101** Interface—**xe-0/0/27** NOTE: LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.

The priority used to identify FCoE traffic (5, IEEE 802.1p code point 101) is configured for lossless transport across the QFX device on interfaces xe-0/0/27 and fc-0/0/2, which belong to the same local FC fabric on the FCoE-FC gateway.

On the Ethernet interface, the classifier maps priority 5 to a lossless forwarding class (fcoe1), the input CNP enables PFC on incoming priority 5 traffic, and the output CNP enables output queue 5 to respond to pause messages received from the peer on traffic tagged with priority 5. On the native FC interface, FC traffic is remapped from priority 3 (the default mapping) to priority 5 and assigned to the same lossless forwarding class, fcoe1, because of the fixed classifier configuration. In this way, traffic tagged with priority 5 on interfaces xe-0/0/27 and fc-0/0/2 receives lossless treatment.

NOTE: To avoid fate sharing, ensure that the remapped priority is classified only to the forwarding class used in the fixed classifier on all other interfaces. For example, if you configure a fixed classifier on an FC interface that classifies all of the traffic into lossless forwarding class fcoe1 and remaps the priority to priority 5 (IEEE 802.1p code point 101), then in all other classifier configurations on all other interfaces, priority 5 should always be classified to forwarding class fcoe1. If you classify priority 6 on another interface to forwarding class fcoe1, then congestion on priority 6 traffic affects priority 5 traffic unfairly.

NOTE: This example does not include scheduling (bandwidth allocation) configuration or the local FC fabric configuration. This examples focuses only on priority remapping.

Configuration

CLI Quick Configuration

To quickly configure IEEE 802.1p priority remapping on an FCoE-FC gateway, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_gw_classifier forwarding-class fcoe1 loss-priority
low code-points 101
set class-of-service interfaces xe-0/0/27 unit 0 classifiers ieee-802.1 fcoe_gw_classifier
set class-of-service interfaces fc-0/0/2 forwarding-class fcoe1
set class-of-service interfaces fc-0/0/2 rewrite-value input ieee-802.1p code-point 101
set class-of-service congestion-notification-profile fcoe1_p5_rewrite_cnp input ieee-802.1
code-point 101 pfc
set class-of-service congestion-notification-profile fcoe1_p5_rewrite_cnp output ieee-802.1
code-point 101 flow-control-queue 5
set class-of-service interfaces xe-0/0/27 congestion-notification-profile fcoe1_p5_rewrite_cnp
set applications application myfcoe5 ether-type 0x8906
set policy-options application-maps myfcoe5_app_map application myfcoe5 code-points 101
set protocols dcbx interface xe-0/0/27 application-map myfcoe5_app_map
```

Step-by-Step Procedure

To configure a lossless forwarding class for FCoE traffic, classify FCoE traffic into that forwarding class, configure a rewrite value on the native FC interface for the FCoE traffic, and enable PFC on the Ethernet interface, and configure DCBX application protocol TLV exchange for FCoE traffic:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue **5**) for FCoE traffic that uses IEEE 802.1p priority 5:

   ```
   [edit class-of-service]
   user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
   ```

2. Configure an ingress classifier named **fcoe_gw_classifier** to map the FCoE priority (IEEE 802.1p code point **101**) to the lossless FCoE forwarding class (**fcoe1**):

   ```
   [edit class-of-service classifiers]
   user@switch# set ieee-802.1 fcoe_gw_classifier forwarding-class fcoe1 loss-priority low
   code-points 101
   ```

3. Apply the classifier named **fcoe_gw_classifier** to Ethernet interface **xe-0/0/27**:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/27 unit 0 classifiers ieee-802.1 fcoe_gw_classifier
   ```

4. Configure the fixed classifier on the native FC interface, using the lossless FCoE forwarding class **fcoe1** (all traffic from the FC SAN is classified into the specified forwarding class). The traffic classified into this forwarding class is tagged with the priority value configured in the next step.

   ```
   [edit class-of-service]
   user@switch# set interfaces fc-0/0/2 forwarding-class fcoe1
   ```

5. Configure the rewrite value (IEEE 802.1p code point **101**) applied to all incoming traffic from the FC SAN on the native FC interface. The rewrite value is the IEEE 802.1p priority that the encapsulated FCoE traffic classified into the **fcoe1** forwarding class uses on the converged Ethernet network.

   ```
   [edit class-of-service]
   user@switch# set interfaces fc-0/0/2 rewrite-value input ieee-802.1p code-point 101
   ```

6. Configure the input stanza of the CNP (named **fcoe1_p5_rewrite_cnp**) to enable PFC on the FCoE priority on the Ethernet interface:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe1_p5_rewrite_cnp input ieee-802.1 code-point 101 pfc
   ```

7. Configure the output stanza of the CNP to enable output queue 5 to respond to pause messages received from the peer on traffic tagged with priority 5:

   ```
   [edit class-of-service]
   user@switch# set congestion-notification-profile fcoe1_p5_rewrite_cnp output ieee-802.1 code-point 101 flow-control-queue 5
   ```

8. Apply the CNP named **fcoe1_p5_rewrite_cnp** to Ethernet interface **xe-0/0/27**:

   ```
   [edit class-of-service]
   user@switch# set interfaces xe-0/0/27 congestion-notification-profile fcoe1_p5_rewrite_cnp
   ```

9. Configure a DCBX application for FCoE to map to the Ethernet interface, so that DCBX can exchange application protocol TLVs on the correct (remapped) IEEE 802.1p FCoE priority:

   ```
   [edit]
   user@switch# set applications application myfcoe5 ether-type 0x8906
   ```

10. Configure a DCBX application map to map the FCoE application to the correct (remapped) IEEE 802.1p FCoE priority:

    ```
    [edit]
    user@switch# set policy-options application-maps myfcoe5_app_map application myfcoe5 code-points 101
    ```

11. Apply the application map to the Ethernet interface so that DCBX exchanges FCoE application TLVs on the correct code point:

    ```
    [edit]
    user@switch# set protocols dcbx interface xe-0/0/27 application-map myfcoe5_app_map
    ```

Verification

To verify the configuration and proper operation of IEEE 802.1p priority remapping on an FCoE-FC gateway, perform these tasks:

- Verifying the Forwarding Class Configuration on page 5637
- Verifying the Behavior Aggregate Classifier Configuration on page 5637
- Verifying the FC Interface Configuration (Fixed Classifier, Rewrite Value) on page 5638
- Verifying the Ethernet Interface PFC Configuration (CNP) on page 5638
- Verifying the Ethernet Interface Configuration on page 5639

- Verifying the DCBX Application Configuration on page 5639
- Verifying the DCBX Application Map Configuration on page 5639
- Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5640

Verifying the Forwarding Class Configuration

Purpose Verify that the lossless forwarding class **fcoe1** has been created.

Action Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
Forwarding class                       ID      Queue  Policing priority  No-Loss

  best-effort                         0        0          normal         Disabled

  fcoe                                 1        3          normal         Enabled

  no-loss                              2        4          normal         Enabled

  network-control                     3        7          normal         Disabled

  fcoe1                                4        5          normal         Enabled

  mcast                               8        8          normal         Disabled
```

Meaning The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

Verifying the Behavior Aggregate Classifier Configuration

Purpose Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

Action List the classifier configured for priority remapping using the operational mode command **show class-of-service classifier name fcoe_gw_classifier**:

```
user@switch> show class-of-service classifier name fcoe_gw_classifier
Classifier: fcoe_gw_classifier, Code point type: ieee-802.1, Index: 13100
  Code point         Forwarding class                    Loss priority
  101                fcoe1                               low
```

Meaning The **show class-of-service classifier name fcoe_gw_classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in the classifier. The command output shows that the classifier maps forwarding class **fcoe1** to IEEE 802.1p code point **101** (priority 5) with a packet loss priority of **low**.

Verifying the FC Interface Configuration (Fixed Classifier, Rewrite Value)

Purpose Verify that the native FC interface (NP_Port) classifies incoming traffic into forwarding class **fcoe1** and that the interface rewrite value is priority 5 (IEEE code point 101).

Action Display the FC interface configuration using the operational mode command **show configuration class-of-service interfaces fc-0/0/2**:

```
user@switch> show configuration class-of-service interfaces fc-0/0/2
rewrite-value {
    input {
        ieee-802.1 {
            code-point {
                101;
            }
        }
    }
}
forwarding-class fcoe1;
```

Meaning The **show configuration class-of-service interfaces fc-0/0/2** command shows that the rewrite value for incoming (input) traffic is IEEE 802.1p code point **101** (priority 5), and that the interface uses forwarding class **fcoe1** as the fixed classifier for all incoming traffic.

Verifying the Ethernet Interface PFC Configuration (CNP)

Purpose Verify that PFC is enabled on the correct priority (IEEE 802.1p code point **101**) for lossless transport and that flow control is enabled on the correct output queue (queue **5**) on the Ethernet interface.

Action List the congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe1_p5_rewrite_cnp**:

```
user@switch> show class-of-service congestion-notification fcoe1_p5_rewrite_cnp
Name: fcoe1_p5_rewrite_cnp, Index: 7061
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2500
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

Meaning The **show class-of-service congestion-notification fcoe1_p5_rewrite_cnp** command shows the input and output stanzas of the CNP. The input stanza shows that PFC is enabled on IEEE 802.1p code point 101 (priority 5). The input stanza also shows that the CNP uses the default values of 100 meters for the cable length value and 2500 bytes for the maximum receive unit (MRU) value.

The output stanza shows that flow control is enabled on output queue **5** for IEEE 802.1p priority code point **101** (priority 5).

Verifying the Ethernet Interface Configuration

Purpose Verify that the classifier **fcoe_gw_classifier** and the congestion notification profile **fcoe1_p5_rewrite_cnp** are configured on Ethernet interface **xe-0/0/27**.

Action List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces xe-0/0/27**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/27
congestion-notification-profile fcoe1_p5_rewrite_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_gw_classifier;
    }
}
```

Meaning The **show configuration class-of-service interfaces xe-0/0/27** command shows that the congestion notification profile **fcoe1_p5_rewrite_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe_gw_classifier**.

Verifying the DCBX Application Configuration

Purpose Verify that the DCBX application named **myfcoe5** for FCoE is configured.

Action List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application myfcoe5 {
    ether-type 0x8906;
}
```

Meaning The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **myfcoe5** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

Verifying the DCBX Application Map Configuration

Purpose Verify that the application map **myfcoe5_app_map** is configured.

Action List the application map by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
myfcoe5_app_map {
    application myfcoe5 code-points 101;
}
```

Meaning

The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there is one application map, **myfcoe5_app_map**, which consists of the application named **myfcoe5** mapped to IEEE 802.1p code point **101** (priority 5).

Verifying the DCBX Application Protocol Exchange Interface Configuration

Purpose

Verify that the application map is applied to the correct interface (**xe-0/0/27**).

Action

List the application maps using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/27.0 {
    application-map myfcoe5_app_map;
}
```

Meaning

The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/27** uses application map **myfcoe5_app_map**.

Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The QFX Series handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the QFX Series exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE priority (the FCoE IEEE 802.1p code point). The default priority mapping for the FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).

- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX Series device
- Junos OS Release 12.1 or later for the QFX Series

Overview

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

NOTE: DCBX also advertises PFC and enhanced transmission selection (ETS) information. See “Configuring DCBX Autonegotiation” on page 5076 for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.
- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. Table 380 on page 4931 shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode. Table 381 on page 4932 shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

Table 516: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Table 517: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low

Table 517: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier) *(continued)*

Code Point	Forwarding Class	Loss Priority
010	best-effort	low
011	best-effort	low
100	best-effort	low
101	best-effort	low
110	best-effort	low
111	best-effort	low

Topology

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

NOTE: You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 382 on page 4932 shows the configuration components for this example.

Table 518: Components of DCBX Application Protocol Exchange Configuration Topology

Component	Settings
Hardware	QFX Series device
LLDP	Enabled by default on Ethernet interfaces
DCBX	Enabled by default on Ethernet interfaces
iSCSI application (Layer 4)	Application name—**iscsi** protocol—**TCP** destination-port—**3260** code-points—**111**

Table 518: Components of DCBX Application Protocol Exchange Configuration Topology *(continued)*

Component	Settings
PTP application (Layer 2)	Application name—**ptp** ether-type—**0x88F7** code-points—**001, 101**
FCoE application (Layer 2)	Application name—**fcoe** ether-type—**0x8906** code-points—**011** NOTE: You explicitly configure the FCoE application because you are applying an application map to the interface. When you apply an application map to an interface, all applications must be explicitly configured and included in the application map.
Application maps	**dcbx-iscsi-fcoe-app-map**—Maps the iSCSI and FCoE applications to IEEE 802.1p code points **dcbx-iscsi-ptp-app-map**—Maps iSCSI and PTP applications to IEEE 802.1p code points
Interfaces	**xe-0/0/10**—Configured to exchange FCoE and iSCSI application TLVs (uses application map **dcbx-iscsi-fcoe-app-map**, carries FCoE traffic, and has PFC enabled on the FCoE priority) **xe-0/0/11**—Configured to exchange iSCSI and PTP application TLVs (uses application map **dcbx-iscsi-ptp-app-map**)
PFC congestion notification profile for FCoE application exchange	**fcoe-cnp**: • Code point—**011** • Interface—**xe-0/0/10**
Behavior aggregate classifiers (map forwarding classes to incoming packets by the packet's IEEE 802.1 code point)	**fcoe-iscsi-cl1**: • Maps the **fcoe** forwarding class to the IEEE 802.1p code point used for the FCoE application (**011**) and a loss priority of **high** • Maps the **network-control** forwarding class to the IEEE 802.1p code point used for the iSCSI application (**111**) and a loss priority of **high** • Applied to interface **xe-0/0/10** **iscsi-ptp-cl2**: • Maps the **network-control** forwarding class to the IEEE 802.1p code point used for the iSCSI application (**111**) and a loss priority of **low** • Maps the **best-effort** forwarding class to the IEEE 802.1p code points used for the PTP application (**001** and **101**) and a loss priority of **low** • Applied to interface **xe-0/0/11**

NOTE: This example does not include scheduling (bandwidth allocation) configuration or lossless configuration for the iSCSI forwarding class.

Configuration

CLI Quick Configuration

To quickly configure DCBX application protocol exchange, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set applications application iSCSI protocol tcp destination-port 3260
set applications application FCoE ether-type 0x8906
set applications application PTP ether-type 0x88F7
set policy-options application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
set policy-options application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]
set protocols dcbx interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
set protocols dcbx interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority high code-points 011
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control loss-priority high code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control loss-priority low code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort loss-priority low code-points [001 101]
set class-of-service interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

Configuring DCBX Application Protocol TLV Exchange

Step-by-Step Procedure

To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.

   ```
   [edit applications]
   user@switch# set application iSCSI protocol tcp destination-port 3260
   user@switch# set application FCoE ether-type 0x8906
   user@switch# set application PTP ether-type 0x88F7
   ```

2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.

   ```
   [edit policy-options]
   user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
   user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
   ```

3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]
```

4. Apply the iSCSI and FCoE application map to interface **xe-0/0/10**, and apply the iSCSI and PTP application map to interface **xe-0/0/11**.

```
[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
```

5. Create the congestion notification profile to enable PFC on the FCoE code point (**011**), and apply the congestion notification profile to interface **xe-0/0/10**.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
```

6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control loss-priority high code-points 111
```

7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- Verifying the Application Configuration on page 5646
- Verifying the Application Map Configuration on page 5647
- Verifying DCBX Application Protocol Exchange Interface Configuration on page 5648
- Verifying the PFC Configuration on page 5648
- Verifying the Classifier Configuration on page 5649

Verifying the Application Configuration

Purpose Verify that DCBX applications have been configured.

Action List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application iSCSI {
   protocol tcp;
   destination-port 3260;
}

application fcoe {
   ether-type 0x8906;
}

application ptp {
   ether-type 0x88F7;
}
```

Meaning The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

Verifying the Application Map Configuration

Purpose Verify that the application maps have been configured.

Action List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
   application iSCSI code-points 111;
   application FCoE code-points 011;
}

dcbx-iscsi-ptp-app-map {
   application iSCSI code-points 111;
   application PTP code-points [001 101];
}
```

Meaning The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ptp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the FCoE application, which is mapped to IEEE 802.1p code point **011**.

The application map **dcbx-iscsi-ptp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the PTP application, which is mapped to IEEE 802.1p code points **001** and **101**.

Verifying DCBX Application Protocol Exchange Interface Configuration

Purpose Verify that the application maps have been applied to the correct interfaces.

Action List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
   application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
   application-map dcbx-iscsi-ptp-app-map;
}
```

Meaning The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

Verifying the PFC Configuration

Purpose Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

Action Display the PFC configuration to verify that PFC is enabled on the FCoE code point (**011**) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
        }
    }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
}
```

NOTE: The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

Meaning The **show class-of-service congestion-notification-profile** configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile **fcoe-cnp** has been configured and has enabled PFC on the IEEE 802.1p code point **011** (the default FCoE code point).

The **show class-of-service interfaces** configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile **fcoe-cnp**, which enables PFC on the FCoE code point, is applied to interface **xe-0/0/10**.

Verifying the Classifier Configuration

Purpose Verify that the classifiers have been configured and applied to the correct interfaces.

Action Display the classifier configuration by using the configuration mode command **show class-of-service**:

```
user@switch# show class-of-service
classifiers {
    ieee-802.1 fcoe-iscsi-cl1 {
        import default;
        forwarding-class network-control {
            loss-priority high code-points 111;
        }
        forwarding-class fcoe {
            loss-priority high code-points 011;
        }
    }
    ieee-802.1 iscsi-ptp-cl2 {
        import default;
        forwarding-class network-control {
            loss-priority low code-points 111;
        }
        forwarding-class best-effort {
            loss-priority low code-points [ 001 101 ];
        }
    }
}
interfaces {
    xe-0/0/10 {
        congestion-notification-profile fcoe-cnp;
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-iscsi-cl1;
            }
        }
    }
    xe-0/0/11 {
        unit 0 {
            classifiers {
                ieee-802.1 iscsi-ptp-cl2;
            }
        }
    }
}
```

NOTE: The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

Meaning

The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ptp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

Configuration Examples (QFX5100 Switches Only)

Example: Configuring PFC Across Layer 3 Interfaces

Priority-based flow control (PFC) helps ensure lossless transport across data center bridging interfaces by pausing incoming traffic when output queue buffers fill to a certain threshold. On a QFX5100 switch running the Enhanced Layer 2 Software (ELS) CLI, in addition to configuring PFC on Layer 2 (bridging) interfaces, you can configure PFC on traffic that traverses Layer 3 interfaces. This enables you to preserve the lossless characteristics that PFC provides on traffic, even when the traffic crosses Layer 3 interfaces that connect two Layer 2 networks.

Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX5100 Switches
- Junos OS Release 13.2 or later for the QFX Series
- Two Ethernet hosts

Overview

On a network that uses two QFX5100 switches to connect hosts on two different Ethernet networks across a Layer 3 network, to configure PFC across the Layer 2 and Layer 3 interfaces, you must:

- Configure the Layer 2 and Layer 3 interfaces on the switches
- Configure VLANs to carry the traffic across the Layer 2 and Layer 3 networks
- Configure integrated routing and bridging (IRB) interfaces on the Layer 2 interfaces to move the Layer 2 VLAN traffic to Layer 3
- Configure and apply the appropriate classifiers to the interfaces
- Configure and apply congestion notification profiles (CNPs) on the interfaces to enable PFC on the traffic that you want to be lossless

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- Configure lossless forwarding classes and hierarchical port scheduling (also known as enhanced transmission selection) on the interfaces

NOTE: PFC operates at the queue level, based on the IEEE 802.1p code point in the priority code point (PCP) field of the Ethernet frame header (sometimes known as the CoS bits). For this reason, traffic on Layer 3 interfaces on which you want to enable PFC must use an IEEE 802.1p classifier to map incoming traffic to forwarding classes (which are in turn mapped to output queues) and loss priorities. You cannot use a DSCP or DSCP IPv6 classifier to classify Layer 3 traffic if you want to enable PFC on traffic flows.

Topology

Figure 207 on page 5652 shows the topology for this example.

Figure 207: Enabling PFC Across Layer 3 Interface Hops

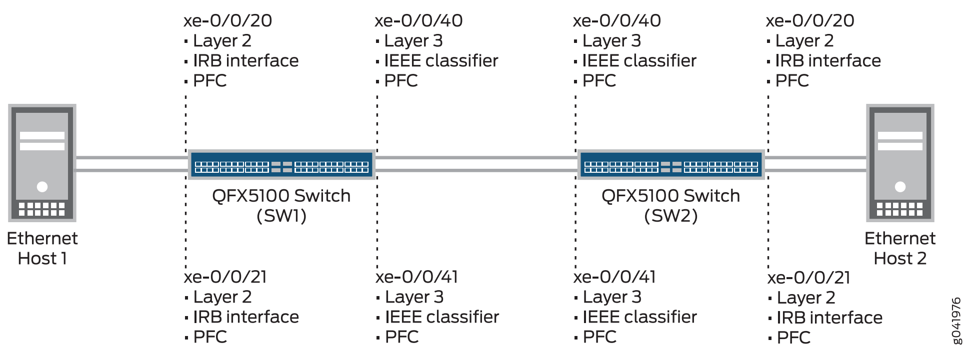

Table 519 on page 5652 shows the configuration components for this example. On the two QFX5100 switches, the Ethernet host-facing interfaces use the same interface names and configuration, and the Layer 3 network-facing interfaces use the same interface names and configuration.

Table 519: Components of the PFC Across Layer 3 Interfaces Topology

Component	Settings
Hardware	Two QFX5100 switches Two Ethernet hosts

Table 519: Components of the PFC Across Layer 3 Interfaces Topology *(continued)*

Component	Settings
Layer 3 interfaces (xe-0/0/40 and xe-0/0/41) and VLANs	Interface xe-0/0/40: • Interface family—inet • Interface IP address—100.103.1.2/24 • VLAN tagging—enabled • Interface VLAN ID—103 Interface xe-0/0/41: • Interface family—inet • Interface IP address—100.104.1.2/24 • VLAN tagging—enabled • Interface VLAN ID—104
Layer 2 interfaces (xe-0/0/20 and xe-0/0/21) and VLAN membership	Family: Ethernet switching Interface mode—trunk Interface xe-0/0/20 VLAN membership—vlan105 Interface xe-0/0/21 VLAN membership—vlan106
VLANs for the IRB interfaces	VLAN unit 105—family inet, IP address 100.105.1.1/24 VLAN unit 106—family inet, IP address 100.106.1.1/24
Layer 2 IRB interfaces	Interface xe-0/0/20: • IRB interface unit—105 • IRB interface family—inet • IRB interface IP address—100.105.1.1/24 • IRB interface VLAN ID—105 • Layer 3 interface name—irb.105 Interface xe-0/0/21: • IRB interface unit—106 • IRB interface family—inet • IRB interface IP address—100.106.1.1/24 • IRB interface VLAN ID—106 • Layer 3 interface name—irb.106

Table 519: Components of the PFC Across Layer 3 Interfaces Topology *(continued)*

Component	Settings
Forwarding classes (both switches)	Name—lossless-3 Queue mapping—queue 3 Packet drop attribute—no-loss Name—lossless-4 Queue mapping—queue 4 Packet drop attribute—no-loss NOTE: Matching the forwarding class names (lossless-*3* and lossless-*4*) to the queue number and to the classified IEEE 802.1p code point (priority) creates a configuration that is logical and easy to map because the forwarding class, queue, and priority all use the same number. Name—all-others Queue mapping—queue 0 Packet drop attribute—none NOTE: The forwarding class *all-others* is for best-effort traffic that traverses the interfaces.
Layer 2 interface behavior aggregate (BA) classifier	Name—lossless-3-4-ieee Forwarding class lossless-3—mapped to code point 011 (IEEE 802.1p priority 3) and a packet loss priority of low Forwarding class lossless-4—mapped to code point 100 (IEEE 802.1p priority 4) and a packet loss priority of low Apply the Layer 2 IEEE 802.1p classifier to both the Layer 2 and the Layer 3 interfaces (xe-0/0/20, xe-0/0/21, xe-0/040, and xe-0/0/41).
Congestion notification profile (PFC, both switches)	Name—lossless-cnp PFC enabled on IEEE 802.1p code points—011 (lossless-3 forwarding class and priority), 100 (lossless-4 forwarding class and priority) Apply the CNP to both the Layer 2 and the Layer 3 interfaces (xe-0/0/20, xe-0/0/21, xe-0/040, and xe-0/0/41) to enable PFC on IEEE 802.1p code points 011 and 100.

Table 519: Components of the PFC Across Layer 3 Interfaces Topology *(continued)*

Component	Settings
Hierarchical port scheduling (ETS)	Hierarchical port scheduling (ETS) includes configuring: • Schedulers to assign bandwidth to traffic • Scheduler mapping to forwarding classes • Grouping of the forwarding classes (priorities) in forwarding class sets (priority groups) • A traffic control profile to assign bandwidth to the forwarding class set and to associate the forwarding class set with the scheduler mapping Hierarchical port scheduling also includes applying the hierarchical scheduler (defined in the traffic control profile) to the interfaces. This example focuses on configuring PFC across the Layer 2 and Layer 3 interfaces. To maintain this focus, this example includes the CLI statements needed to configure hierarchical port scheduling, but does not include descriptive explanations of the configuration. The *Related Documentation* section provides links to example documents that show how to configure hierarchical port scheduling. Apply the scheduling configuration to both the Layer 2 and the Layer 3 interfaces (xe-0/0/20, xe-0/0/21, xe-0/040, and xe-0/0/41).

Configuration

CLI Quick Configuration

To configure PFC across Layer 3 interfaces, copy the following commands, paste them in a text file, remove the line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. The same configuration applies to both QFX5100 Switch SW1 and QFX5100 Switch SW2:

```
set interfaces xe-0/0/40 vlan-tagging
set interfaces xe-0/0/40 unit 0 vlan-id 103
set interfaces xe-0/0/40 unit 0 family inet address 100.103.1.2/24
set interfaces xe-0/0/41 vlan-tagging
set interfaces xe-0/0/41 unit 0 vlan-id 104
set interfaces xe-0/0/41 unit 0 family inet address 100.104.1.2/24
set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan105
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan106
set interfaces vlan unit 105 family inet address 100.105.1.1/24
set interfaces vlan unit 106 family inet address 100.106.1.1/24
set interfaces irb unit 105 family inet address 100.105.1.1/24
set interfaces irb unit 106 family inet address 100.106.1.1/24
set vlans vlan105 vlan-id 105
set vlans vlan106 vlan-id 106
set vlans vlan105 l3-interface irb.105
set vlans vlan106 l3-interface irb.106
```

```
set class-of-service forwarding-classes class lossless-3 queue-num 3 no-loss
set class-of-service forwarding-classes class lossless-4 queue-num 4 no-loss

set class-of-service interfaces xe-0/0/41 congestion-notification-profile lossless-cnp
set class-of-service interfaces xe-0/0/41 classifiers ieee-802.1 lossless-3-4-ieee
```

Step-by-Step Procedure

Step-by-Step Procedure

The following step-by-step procedure shows you how to configure the interfaces, VLANs, lossless forwarding classes, classifiers, and PFC settings to enable PFC across Layer 3 interfaces. For completeness, the class-of-service scheduling configuration (hierarchical port scheduling) is included in the procedure, but without explanatory text. See the *Related Documentation* links for detailed examples of the scheduling elements of the configuration.

1. Configure the Layer 3 interface VLANs and IP addresses:

```
[edit interfaces]
user@switch# set xe-0/0/40 vlan-tagging
user@switch# set xe-0/0/40 unit 0 vlan-id 103
user@switch# set xe-0/0/40 unit 0 family inet address 100.103.1.2/24
user@switch# set xe-0/0/41 vlan-tagging
user@switch# set xe-0/0/41 unit 0 vlan-id 104
user@switch# set xe-0/0/41 unit 0 family inet address 100.104.1.2/24
```

2. Configure the Layer 2 interface VLAN membership and interface mode:

```
[edit interfaces]
user@switch# set xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
user@switch# set xe-0/0/20 unit 0 family ethernet-switching vlan members vlan105
user@switch# set xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
user@switch# set xe-0/0/21 unit 0 family ethernet-switching vlan members vlan106
```

3. Configure the VLANs for the IRB interfaces:

```
[edit interfaces]
user@switch# set vlan unit 105 family inet address 100.105.1.1/24
user@switch# set vlan unit 106 family inet address 100.106.1.1/24
```

4. Configure the IRB interfaces and VLANs to transport incoming Layer 2 traffic assigned to VLANs vlan105 (of which interface xe-0/0/20 is a member) and vlan106 (of which interface xe-0/0/21 is a member) across Layer 3:

```
[edit]
user@switch# set interfaces irb unit 105 family inet address 100.105.1.1/24
user@switch# set interfaces irb unit 106 family inet address 100.106.1.1/24
user@switch# set vlans vlan105 vlan-id 105
user@switch# set vlans vlan106 vlan-id 106
user@switch# set vlans vlan105 l3-interface irb.105
user@switch# set vlans vlan106 l3-interface irb.106
```

5. Configure the lossless forwarding classes and a best-effort forwarding class for any other traffic that might use the interfaces:

```
[edit class-of-service]
user@switch# set forwarding-classes class lossless-3 queue-num 3 no-loss
user@switch# set forwarding-classes class lossless-4 queue-num 4 no-loss
user@switch# set forwarding-classes class all-others queue-num 0
```

6. Configure the IEEE classifier for the Layer 2 and Layer 3 interfaces to classify incoming traffic into the lossless forwarding classes based on the IEEE 802.1p code point of the traffic:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 lossless-3-4-ieee forwarding-class lossless-3 loss-priority low code-points 011
```

```
user@switch# set ieee-802.1 lossless-3-4-ieee forwarding-class lossless-4 loss-priority low code-points 100
```

7. Configure the CNP to enable PFC on the lossless priorities (the lossless forwarding classes mapped to IEEE 802.1p code points 3 and 4):

```
[edit class-of-service congestion-notification-profile]
user@switch# set lossless-cnp input ieee-802.1 code-point 011 pfc
user@switch# set lossless-cnp input ieee-802.1 code-point 100 pfc
```

8. Configure hierarchical scheduling to support the lossless configuration (included here for completeness; see the *Related Documentation* links for detailed examples of scheduling configuration) and apply it to the Layer 2 and Layer 3 interfaces:

```
[edit class-of-service]
set schedulers lossless_sch transmit-rate 6g
set schedulers lossless_sch shaping-rate percent 100
set schedulers all-others_sch transmit-rate 4g
set scheduler-maps lossless_map forwarding-class lossless-3 scheduler lossless_sch
set scheduler-maps lossless_map forwarding-class lossless-4 scheduler lossless_sch
set scheduler-maps all-others_map forwarding-class all-others scheduler all-others_sch
set forwarding-class-sets lossless_fc_set class lossless-3
set forwarding-class-sets lossless_fc_set class lossless-4
set forwarding-class-sets all-others_fc_set class all-others
set traffic-control-profiles lossless_tcp scheduler-map lossless_map
set traffic-control-profiles lossless_tcp guaranteed-rate percent 60
set traffic-control-profiles lossless_tcp shaping-rate percent 100
set traffic-control-profiles all-others_tcp scheduler-map all-others_map
set traffic-control-profiles all-others_tcp guaranteed-rate percent 40
set interfaces xe-0/0/20 forwarding-class-set lossless_fc_set output-traffic-control-profile lossless_tcp
set interfaces xe-0/0/20 forwarding-class-set all-others_fc_set output-traffic-control-profile all-others_tcp
set interfaces xe-0/0/21 forwarding-class-set lossless_fc_set output-traffic-control-profile lossless_tcp
set interfaces xe-0/0/21 forwarding-class-set all-others_fc_set output-traffic-control-profile all-others_tcp
set interfaces xe-0/0/40 forwarding-class-set lossless_fc_set output-traffic-control-profile lossless_tcp
set interfaces xe-0/0/40 forwarding-class-set all-others_fc_set output-traffic-control-profile all-others_tcp
set interfaces xe-0/0/41 forwarding-class-set lossless_fc_set output-traffic-control-profile lossless_tcp
set interfaces xe-0/0/41 forwarding-class-set all-others_fc_set output-traffic-control-profile all-others_tcp
```

9. Apply the Layer 2 IEEE 802.1p classifier and the CNP to the Layer 3 interfaces:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/40 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# set xe-0/0/40 congestion-notification-profile lossless-cnp
user@switch# set xe-0/0/41 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# set xe-0/0/41 congestion-notification-profile lossless-cnp
```

10. Apply the Layer 2 IEEE 802.1p classifier and the CNP to the Layer 2 interfaces:

```
[edit class-of-service interfaces]
user@switch# xe-0/0/20 unit 0 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# xe-0/0/20 congestion-notification-profile lossless-cnp
user@switch# xe-0/0/21 unit 0 classifiers ieee-802.1 lossless-3-4-ieee
user@switch# xe-0/0/21 congestion-notification-profile lossless-cnp
```

Results

Display the results of the interface, VLAN, and class-of-service configurations (the system shows only the explicitly configured parameters; it does not show default parameters). The results are valid for both QFX5100 Switch SW1 and QFX5100 Switch SW2 because the same configuration is used on both switches.

Display the results of the interface configuration:

```
user@switch# show configuration interfaces
xe-0/0/20 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members vlan105;
            }
        }
    }
}
xe-0/0/21 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members vlan106;
            }
        }
    }
}
xe-0/0/40 {
    vlan-tagging;
    unit 0 {
        vlan-id 103;
        family inet {
            address 100.103.1.2/24;
        }
    }
}
xe-0/0/41 {
    vlan-tagging;
    unit 0 {
        vlan-id 104;
        family inet {
            address 100.104.1.2/24;
        }
    }
}
irb {
    unit 105 {
        family inet {
            address 100.105.1.1/24;
        }
    }
    unit 106 {
        family inet {
            address 100.106.1.1/24;
        }
    }
}
```

```
vlan {
    unit 105 {
        family inet {
            address 100.105.1.1/24;
        }
    }
    unit 106 {
        family inet {
            address 100.106.1.1/24;
        }
    }
}
```

Display the results of the vlan configuration:

```
user@switch# show configuration vlans
vlan105 {
    vlan-id 105;
    l3-interface irb.105;
}
vlan106 {
    vlan-id 106;
    l3-interface irb.106;
}
```

Display the results of the class-of-service configuration:

```
user@switch# show configuration class-of-service
classifiers {
    ieee-802.1 lossless-3-4-ieee {
        forwarding-class lossless-3 {
            loss-priority low code-points 011;
        }
        forwarding-class lossless-4 {
            loss-priority low code-points 100;
        }
    }
}
forwarding-classes {
    class lossless-3 queue-num 3 no-loss;
    class lossless-4 queue-num 4 no-loss;
    class all-others queue-num 0;
}

    }
```

TIP: To quickly configure the switch, issue the **load merge terminal** command, and then copy the hierarchies and paste them into the switch terminal window.

Verification

To verify that the PFC across Layer 3 interfaces configuration has been created and is operating properly, perform these tasks:

- Verifying the Interface Configuration on page 5663
- Verifying the VLAN Configuration on page 5665
- Verifying the PFC Configuration (Congestion Notification Profile) on page 5665
- Verify the Forwarding Class Configuration on page 5666

Verifying the Interface Configuration

Purpose Verify that the Layer 2 Ethernet interfaces, Layer 3 IP interfaces, IRB interfaces, and VLAN interfaces have been created on the switch and are correctly configured.

Action Display the switch interface configuration using the **show configuration interfaces** command:

```
user@switch> show configuration interfaces
xe-0/0/20 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members vlan105;
            }
        }
    }
}
xe-0/0/21 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members vlan106;
            }
        }
    }
}
xe-0/0/40 {
    vlan-tagging;
    unit 0 {
        vlan-id 103;
        family inet {
            address 100.103.1.2/24;
        }
    }
}
xe-0/0/41 {
    vlan-tagging;
    unit 0 {
        vlan-id 104;
        family inet {
            address 100.104.1.2/24;
        }
    }
}
irb {
    unit 105 {
        family inet {
            address 100.105.1.1/24;
        }
    }
    unit 106 {
        family inet {
            address 100.106.1.1/24;
        }
    }
}
vlan {
    unit 105 {
        family inet {
            address 100.105.1.1/24;
        }
    }
```

```
        unit 106 {
            family inet {
                address 100.106.1.1/24;
            }
        }
    }
```

Meaning The **show configuration interfaces** command displays all of the interfaces configured on the switch. The command output shows that:

- Interfaces xe-0/0/20 and xe-0/0/21 are Ethernet interfaces (family ethernet-switching) in trunk interface mode. Interface xe-0/0/20 is a member of VLAN vlan105, and interface xe-0/0/21 is a member of VLAN vlan106.
- Interfaces xe-0/0/40 and xe-0/0/41 are IP interfaces (family inet) with VLAN tagging enabled. Interface xe-0/0/40 has an IP address of 100.103.1.2/24 and a VLAN ID of 103. Interface xe-0/0/41 has an IP address of 100.104.1.2/24 and a VLAN ID of 104.
- Two IRB interfaces are configured, IRB unit 105 with an IP address of 100.105.1.1/24 and IRB unit 106 with an IP address of 100.106.1.1/24.
- Two VLAN interfaces are configured, VLAN unit 105 with an IP address of 100.105.1.1/24 (for IRB interface unit 105) and VLAN unit 106 with an IP address of 100.106.1.1/24 (for IRB interface unit 106).

Verifying the VLAN Configuration

Purpose Verify that VLANs have been created on the switch and are correctly configured.

Action Display the VLAN configuration using the **show configuration vlans** command:

```
user@switch> show configuration vlans
vlan105 {
    vlan-id 105;
    l3-interface irb.105;
}
vlan106 {
    vlan-id 106;
    l3-interface irb.106;
}
```

Meaning The **show configuration vlans** command displays all of the VLANs configured on the switch. The command output shows that:

- VLAN vlan105 has been configured with VLAN ID 105 on IRB interface irb.105.
- VLAN vlan106 has been configured with VLAN ID 106 on IRB interface irb.106.

Verifying the PFC Configuration (Congestion Notification Profile)

Purpose Verify that PFC has been enabled on the correct IEEE 802.1p code points (priorities) in the CNP.

Action Display the PFC configuration using the **show configuration class-of-service congestion-notification-profile** command:

```
user@switch> show configuration class-of-service congestion-notification-profile
lossless-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
            code-point 100 {
                pfc;
            }
        }
    }
}
```

Meaning The **show configuration class-of-service congestion-notification-profile** command displays all of the CNPs configured on the switch. The command output shows that:

- The CNP named **lossless-cnp** is configured on the switch.
- The CNP **lossless-cnp** enables PFC on IEEE 802.1p code points 100 and 100.

Verify the Forwarding Class Configuration

Purpose Verify that the two lossless forwarding classes and the best-effort forwarding class have been configured on the switch.

Action Display the forwarding class configuration using the **show configuration class-of-service forwarding-classes** command:

```
user@switch> show configuration class-of-service forwarding-classes
class lossless-3 queue-num 3 no-loss;
class lossless-4 queue-num 4 no-loss;
class all-others queue-num 0;
```

Meaning The **show configuration class-of-service forwarding-classes** command displays all of the forwarding classes configured on the switch (default forwarding classes are not displayed). The command output shows that:

- Forwarding class **lossless-3** is mapped to queue 3 and is configured as a lossless forwarding class (the **no-loss** attribute is applied)
- Forwarding class **lossless-4** is mapped to queue 4 and is configured as a lossless forwarding class (the **no-loss** attribute is applied)
- Forwarding class **all-others** is mapped to queue 0. It is not a lossless forwarding class (the **no-loss** attribute is not applied).

Verifying the Classifier Configuration

Purpose Verify that the IEEE 802.1p classifier has been configured on the switch.

Action Display the classifier configuration using the **show configuration class-of-service classifiers** command:

```
user@switch> show configuration class-of-service classifiers
ieee-802.1 lossless-3-4-ieee {
    forwarding-class lossless-3 {
        loss-priority low code-points 011;
    }
    forwarding-class lossless-4 {
        loss-priority low code-points 100;
    }
}
```

Meaning The **show configuration class-of-service classifiers** command displays all of the classifiers configured on the switch. The command output shows that the Layer 2 IEEE 802.1p classifier **lossless-3-4-ieee** classifiers traffic with the code point 011 into the **lossless-3** forwarding class with a loss priority of **low**, and classifies traffic with the code point 100 into the **lossless-4** forwarding class with a loss priority of **low**.

Verifying the Interface CoS Configuration (Hierarchical Scheduling, PFC, and Classifier Mapping to Interfaces)

Purpose Verify that the interfaces have the correct hierarchical scheduling, PFC, and classifier configurations.

Action Display the interface CoS configuration using the **show configuration class-of-service interfaces** command:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/20 {
    forwarding-class-set {
        lossless_fc_set {
            output-traffic-control-profile lossless_tcp;
        }
        all-others_fc_set {
            output-traffic-control-profile all-others_tcp;
        }
    }
    congestion-notification-profile lossless-cnp;
    unit 0 {
        classifiers {
            ieee-802.1 lossless-3-4-ieee;
        }
    }
}
xe-0/0/21 {
    forwarding-class-set {
        all-others_fc_set {
            output-traffic-control-profile all-others_tcp;
        }
        lossless_fc_set {
            output-traffic-control-profile lossless_tcp;
        }
    }
    congestion-notification-profile lossless-cnp;
    unit 0 {
        classifiers {
            ieee-802.1 lossless-3-4-ieee;
        }
    }
}
xe-0/0/40 {
    forwarding-class-set {
        lossless_fc_set {
            output-traffic-control-profile lossless_tcp;
        }
        all-others_fc_set {
            output-traffic-control-profile all-others_tcp;
        }
    }
    congestion-notification-profile lossless-cnp;
    classifiers {
        ieee-802.1 lossless-3-4-ieee;
    }
}
xe-0/0/41 {
    forwarding-class-set {
        lossless_fc_set {
            output-traffic-control-profile lossless_tcp;
        }
        all-others_fc_set {
            output-traffic-control-profile all-others_tcp;
        }
    }
    congestion-notification-profile lossless-cnp;
```

```
    classifiers {
        ieee-802.1 lossless-3-4-ieee;
    }
}
```

Meaning The **show configuration class-of-service interfaces** command displays all of the CoS components configured on the switch interfaces. The command output shows that:

- The configuration on Layer 2 Ethernet interfaces xe-0/0/20 and xe-0/0/21 includes:
  - Hierarchical scheduling—The forwarding class set **lossless_fc_set** with the traffic control profile **lossless_tcp** for the lossless traffic, and the forwarding class set **all-others_fc_set** with the traffic control profile **all-others_tcp** for the best-effort traffic are applied to both interfaces.
  - PFC—The **lossless-cnp** congestion notification profile is applied to both interfaces.
  - Classifiers—The Layer 2 IEEE 802.1p classifier **lossless-3-4-ieee** is applied to both interfaces.
- The configuration on Layer 3 IP interfaces xe-0/0/40 and xe-0/0/41 includes:
  - Hierarchical scheduling—The forwarding class set **lossless_fc_set** with the traffic control profile **lossless_tcp** for the lossless traffic, and the forwarding class set **all-others_fc_set** with the traffic control profile **all-others_tcp** for the best-effort traffic are applied to both interfaces.
  - PFC—The **lossless-cnp** congestion notification profile is applied to both interfaces.
  - Classifiers—The Layer 2 IEEE 802.1p classifier **lossless-3-4-ieee** is applied to both interfaces. Traffic that would use a DSCP or a DSCP IPv6 classifier if it were configured uses the IEEE 802.1p classifier instead. Using the IEEE 802.1p classifier allows the interface to use PFC to pause traffic during periods of congestion to prevent packet loss.

Configuration Tasks

Configuring CoS

The class-of-service topics describe how to configure the Junos CoS components for the QFX Series. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue. After defining the CoS components, you assign classifiers to the required physical and logical interfaces.

You can configure various CoS components individually or in combination to define CoS services.

NOTE: **When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.**

The following topics describe how to configure CoS components :

- Example: Configuring Unicast Classifiers on page 5495
- Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers on page 5498
- Example: Configuring Tail-Drop Profiles on page 5501
- Example: Configuring Drop Profile Maps on page 5503
- Example: Configuring Forwarding Classes on page 5505

- Configuring an Application Map for DCBX Application Protocol TLV Exchange on page 5081
- Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange on page 5082

Defining CoS Code-Point Aliases

You can use code-point aliases to streamline the process of configuring CoS features on your switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- DSCP or DSCP IPv6—Handles incoming IPv4 or IPv6 packets.
- IEEE 802.1p—Handles Layer 2 CoS.

To configure a code-point alias:

1. Specify a CoS marker type (IEEE 802.1 or DSCP).
2. Assign an alias.
3. Specify the code point that corresponds to the alias.

```
[edit class-of-service code-point-aliases]
user@switch# set (dscp | dscp-ipv6 | ieee-802.1) alias-name code-point-bits
```

For example, to configure a code-point alias for an IEEE 802.1 CoS marker type that has the alias name fcoe1 and maps to the code-point bits 011:

```
[edit class-of-service code-point-aliases]
user@switch# set ieee-802.1 fcoe1 011
```

Defining CoS Unicast BA Classifiers (DSCP, DSCP IPv6, IEEE 802.1p)

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP or DSCP IPv6) value, the IEEE 802.1p CoS value, or the MPLS EXP value in the packet header to determine the CoS settings applied to the packet. (See "Configuring a Global MPLS EXP Classifier" on page 3782 for how to define EXP classifiers for MPLS traffic.) BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

Unicast traffic must use different classifiers than multidestination (mulitcast, broadcast, and destination lookup fail) traffic.

To configure a unicast DSCP, DSCP IPv6, or IEEE 802.1p BA classifier using the CLI:

1. Create a unicast BA classifier:

   - To create a unicast DSCP, DSCP IPv6, or IEEE 802.1p BA classifier based on the default classifier, import the default DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

     `[edit class-of-service classifiers]`
     `user@switch#` **set (dscp | ieee-802.1)** ***classifier-name*** **import default forwarding-class** ***forwarding-class-name*** **loss-priority** ***level*** **code-points [*aliases*] [*bit-patterns*]**

   - To create a unicast BA classifier that is not based on the default classifier, create a DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

     `[edit class-of-service classifiers]`
     `user@switch#` **set (dscp | ieee-802.1)** ***classifier-name*** **forwarding-class** ***forwarding-class-name*** **loss-priority** ***level*** **code-points [*aliases*] [*bit-patterns*]**

2. Apply the unicast classifier to a specific 10-Gigabit Ethernet interface or to all 10-Gigabit Ethernet interfaces or to all Fibre Channel interfaces on the switch.

   - To apply the classifier to a specific interface:

     `[edit class-of-service interfaces]`
     `user@switch#` **set** ***interface-name*** **unit** ***unit*** **classifiers (dscp | ieee-802.1)** ***classifier-name***

   - To apply the classifier to all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

     `[edit class-of-service interfaces]`
     `user@switch#` **set xe-* unit * classifiers (dscp | ieee-802.1)** ***classifier-name***

Configuring a Global MPLS EXP Classifier

EXP packet classification associates incoming packets with a particular MPLS CoS servicing level. EXP behavior aggregate (BA) classifiers examine the MPLS EXP value in the packet header to determine the CoS settings applied to the packet. EXP BA classifiers allow you to set the forwarding class and loss priority of an MPLS packet based on the incoming CoS value.

You can configure as many EXP classifiers as you want, however, the switch uses only one MPLS EXP classifier as a global classifier on all interfaces. All switch interfaces use the global EXP classifier to classify MPLS traffic.

If an EXP classifier is configured, MPLS traffic uses the EXP classifier. If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

NOTE: There is no default MPLS EXP classifier. If you want to use an MPLS EXP classifier, you must configure it. The MPLS EXP classifier is global and applies to all interfaces on the switch that transport MPLS traffic. You can configure as many MPLS EXP classifiers as you want, but you can only use one MPLS EXP classifier on switch interfaces at any time.

To configure a unicast MPLS EXP classifier using the CLI:

1. Create an EXP classifier and associate it with a forwarding class, a loss priority, and a code point:

   [edit class-of-service classifiers]
   user@switch# **set (dscp | ieee-802.1 | exp)** ***classifier-name*** **forwarding-class** ***forwarding-class-name*** **loss-priority** ***level*** **code-points [*aliases*] [*bit-patterns*]**
2. Apply the EXP classifier to the switch interfaces:

   [edit class-of-service]
   user@switch# **set system-defaults classifiers exp** ***classifier-name***

Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP) value or IEEE 802.1p CoS value in the packet header to determine the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

NOTE: **DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.**

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

Unicast and multidestination traffic must use different classifiers.

To configure a multidestination BA classifier using the CLI:

1. Create a DSCP or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

   ```
   [edit class-of-service classifiers]
   user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
   ```
2. Configure the classifier as a multidestination classifier:

   ```
   [edit class-of-service]
   user@switch# set multi-destination classifiers (dscp | ieee-802.1) classifier-name
   ```

Configuring CoS Tail-Drop Profiles

You can configure an interpolated weighted random early detection (WRED) tail-drop profile to control packet drop characteristics for different traffic loss priorities.

NOTE: You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

Interpolated means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point.

The drop start point is the average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop. Specify the drop start point using the first of two **fill-level** statements.

The drop end point is the average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.) Specify the drop end point using the second of two **fill-level** statements.

The minimum drop rate is always **0**. Specify the minimum drop rate using the first of two **drop-probability** statements. The maximum drop rate is the drop probability when the average queue fill level reaches the drop end point. Specify the maximum drop rate using the second of two **drop-probability** statements.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

  `[edit class-of-service]`
  `user@switch#` **set drop-profile** ***drop-profile-name*** **interpolate fill-level** ***percentage*** **fill-level** ***percentage*** **drop-probability 0 drop-probability** ***percentage***

Configuring CoS Drop Profile Maps

A drop-profile map associates a tail-drop profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified tail-drop profile to traffic in the forwarding class that matches the specified loss priority.

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

To configure a drop-profile map using the CLI:

- For the desired scheduler, configure the traffic loss priority and specify the drop profile you want to use to control the drop characteristics for traffic of that loss priority:

  `[edit class-of-service]`
  `user@switch#` **set schedulers *scheduler-name* drop-profile-map loss-priority *level* protocol any drop-profile *drop-profile-name***

Defining CoS Forwarding Classes

Forwarding classes allow you to group packets for transmission. The switch supports a total of 12 forwarding classes. In order to forward traffic, you map (assign) the forwarding classes to unicast or multidestination (multicast, broadcast, and destination lookup fail) output queues.

The switch has 12 output queues. Queues 0 through 7 are for unicast traffic and queues 8 through 11 are for multicast traffic. Forwarding classes mapped to unicast queues must carry unicast traffic, and forwarding classes mapped to multidestination queues must carry multidestination traffic. There are four default unicast forwarding classes and one default multidestination forwarding class.

The default unicast forwarding classes are:

- **best-effort**—Best-effort traffic
- **fcoe**—Guaranteed delivery for FCoE traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **network-control**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. In addition, all forwarding classes mapped to a particular queue must be either lossless or lossy. You cannot mix lossless and lossy forwarding classes (traffic) on the same queue. Also, you cannot mix unicast and multicast forwarding classes on the same queue.

```
[edit class-of-service forwarding-classes]
user@switch# class class-name queue-num queue-number <no-loss>
```

NOTE: If you are using Junos OS Release 12.2 or later, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment unless you include the optional **no-loss** packet drop attribute introduced in Junos OS Release 12.3 in the forwarding class configuration..

NOTE: Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

```
[edit class-of-service forwarding-classes]
user@switch# queue queue-number class-name
```

The **queue** statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the **queue** statement to map forwarding classes to queues, edit the configuration to replace the **queue** statement with the **class** statement.

Defining CoS Forwarding Class Sets

A forwarding class set is a priority group for enhanced transmission selection (ETS) traffic control. Each forwarding class set consists of one or more forwarding classes (priorities, which can also be considered as output queues).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set.

To configure a forwarding class set using the CLI:

1. Assign one or more forwarding classes to the forwarding class set:

   `[edit class-of-service]`
   `user@switch#` **set forwarding-class-sets** ***forwarding-class-set-name*** **class** ***forwarding-class-name***

2. Map the forwarding class set to an interface:

   `[edit class-of-service]`
   `user@switch#` **set interfaces** ***interface-name*** **forwarding-class-set** ***forwarding-class-set-name***

Defining CoS Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, the tail-drop profiles associated with the queue, and the queue buffer size.

The parameters you configure in a scheduler define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR), set as a percentage rate or as an absolute value in bits per second. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

  NOTE: **Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.**

  NOTE: **You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.**

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR), set as a percentage rate or as an absolute value in bits per second.

  NOTE: **Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.**

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:
  - **low**—The scheduler has low priority.
  - **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **drop-profile-map**—Drop profile mapping to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.

NOTE: Ingress port congestion can occur during periods of egress port congestion if an ingress port forwards traffic to more than one egress port, and at least one of those egress ports experiences congestion. If this occurs, the congested egress port can cause the ingress port to exceed its fair allocation of ingress buffer resources. When the ingress port exceeds its buffer resource allocation, frames are dropped at the ingress. Ingress port frame drop affects not only the congested egress ports, but also all of the egress ports to which the congested ingress port forwards traffic.

If a congested ingress port drops traffic that is destined for one or more uncongested egress ports, configure a weighted random early detection (WRED) drop profile and apply it to the egress queue that is causing the congestion. The drop profile prevents the congested egress queue from affecting egress queues on other ports by dropping frames at the egress instead of causing congestion at the ingress port.

NOTE: Do not configure drop profiles for the fcoe and no-loss forwarding classes. FCoE and other lossless traffic queues require lossless behavior. Use priority-based flow control (PFC) to prevent frame drop on lossless priorities.

To apply scheduling properties to traffic, map schedulers to forwarding classes using a scheduler map, and then associate the scheduler map with the interfaces. This applies the configured scheduling to the traffic in the specified forwarding class on the associated interface. Using different scheduler maps, you can map different schedulers to the same traffic (the same forwarding class) to apply different scheduling to that traffic on different interfaces.

To configure a scheduler using the CLI:

1. Name the scheduler and define the minimum guaranteed bandwidth for the queue:

   `[edit class-of-service]`
   `user@switch#` **set schedulers *scheduler-name* transmit-rate (*rate* | percent *percentage*)**

2. Define the maximum bandwidth for the queue:

   `[edit class-of-service schedulers scheduler-name]`
   `user@switch#` **set shaping-rate (*rate* | percent *percentage*)**

3. Define the queue priority:

   `[edit class-of-service schedulers scheduler-name]`
   `user@switch#` **set priority *level***

4. Define the drop profile using a drop profile map:

   `[edit class-of-service schedulers scheduler-name]`
   `user@switch#` **set drop-profile-map loss-priority (low | medium-high | high) protocol *protocol* drop-profile *drop-profile-name***

5. Configure the size of the port dedicated buffer space for the queue:

   `[edit class-of-service schedulers scheduler-name]` user@switch# **set buffer-size percent 20**

6. Configure a scheduler map to map the scheduler to a forwarding class, which applies the scheduler's properties to the traffic in that forwarding class:

   [edit class-of-service]
   user@switch# **set scheduler-maps *scheduler-map-name* forwarding-class *forwarding-class-name* scheduler *scheduler-name***

7. Assign the scheduler map and its associated schedulers to one or more interfaces using hierarchical scheduling. See "Example: Configuring CoS Hierarchical Port Scheduling (ETS)" on page 5474 for a detailed example of hierarchical scheduling.

   [edit class-of-service]
   user@switch# **set traffic-control-profiles *tcp-name* scheduler-map *scheduler-map-name***
   user@switch# **set interfaces *interface-name* forwarding-class-set *fc-set-name* output-traffic-control-profile *tcp-name***

Defining CoS Queue Scheduling Priority

You can configure the scheduling priority of individual queues by specifying the priority in a scheduler, and then associating the scheduler with a queue by using a scheduler map. Queues can have one of two bandwidth priorities:

- **strict-high** —The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.

- To configure queue priority using the CLI:

  [edit class-of-service]
  user@switch# **set schedulers *scheduler-name* priority *level***

Changing the Host Outbound Traffic Default Queue Mapping

If you do not want to use the default mapping of host Routing Engine and CPU outbound traffic to queues, you can change the default output queue. You can also change the default DSCP bits used in the type of service (ToS) field of packets generated by the Routing Engine.

Configuring a queue for host outbound traffic maps all traffic that the host generates to one forwarding class (queue). The configuration is global and applies to all host-generated traffic on the switch. Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

NOTE: Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the fcoe queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (fcoe) across the Interconnect device (fabric) and the egress Node device.

To change the host outbound traffic egress queue by including the **host-outbound-traffic** statement at the **[edit class-of-service]** hierarchy level:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class class-name;
  dscp-code-point code-point;
}
```

For example, to map host outbound traffic to queue 7 (the network control forwarding class) and set the DSCP code point value to 101010:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class network-control;
  dscp-code-point 101010
}
```

Related Documentation

Defining CoS Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) contained in a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

  NOTE: You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR).
- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

NOTE: Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

To configure a traffic control profile using the CLI:

1. Name the traffic control profile and define the minimum guaranteed bandwidth for the priority group:

   ```
   [edit class-of-service ]
   user@switch# set traffic-control-profiles traffic-control-profile-name guaranteed-rate (rate | percent percentage)
   ```

2. Define the maximum bandwidth for the priority group:

   ```
   [edit class-of-service traffic-control-profiles traffic-control-profile-name]
   user@switch# set shaping-rate (rate | percent percentage)
   ```

3. Attach a scheduler map to the traffic control profile:

   ```
   [edit class-of-service traffic-control-profiles traffic-control-profile-name]
   user@switch# set scheduler-map scheduler-map-name
   ```

Configuring CoS PFC (Congestion Notification Profiles)

A congestion notification profile (CNP) enables priority-based flow control (PFC) on specified IEEE 802.1p priorities (code points). A CNP has two components:

- Input CNP:
  - Enable PFC on a specified priority.
  - Configure the maximum receive unit (MRU) on an interface for traffic that matches the PFC priority (optional).
  - Specify the length of the attached cable on the ingress interface (optional)
- Output CNP (optional): Configure flow control to enable PFC pause on specific output queues for specified priorities.

NOTE: By default, output queues 3 and 4 (which are mapped to default lossless forwarding classes **fcoe** and **no-loss**, respectively) are configured to respond to PFC pause messages received from the connected peer on priorities 3 and 4 (code points 011 and 100, respectively). If you explicitly configure flow control on any output queue, you must configure flow control on every output queue that you want to respond to pause messages. (The explicit configuration overrides the default configuration.)

To achieve lossless behavior, the output queue priorities on which you enable PFC flow control must match the PFC priorities on which you enable PFC on the input interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101) in the output component of the CNP, then you must also enable pause on priorities 3 and 5 on the input component of the CNP. (In addition, the forwarding classes mapped to the paused output queues must be lossless forwarding classes.)

Associating a CNP with an interface enables PFC on the ingress traffic that matches the priority specified in the input CNP, and programs the queues listed in the output CNP to pause when the interface receives a PFC pause message from the connected peer. Configure PFC on a priority end to end along the entire data path to create a lossless lane of traffic on the network.

NOTE: You must enable PFC on the priority used by FCoE traffic on ingress interfaces (input CNP). Enable PFC on the FCoE priority on every interface that carries FCoE traffic. By convention, FCoE traffic uses priority 3 (code point 011), which maps to queue 3. If your network uses priority 3 for FCoE traffic, the default forwarding class and classifier configuration support lossless transport, but you must still configure a CNP and apply it to the correct ingress interfaces to enable PFC and achieve lossless transport.

If your network does not use priority 3 for FCoE traffic, you need to configure a classifier that classifies FCoE traffic into a lossless forwarding class, based on the priority your network uses for FCoE traffic. If you are not using the default lossless forwarding class configuration, then you also need to ensure that the output queue mapped to the lossless FCoE forwarding class is programmed to pause.

You can attach only one CNP to an interface. There is no limit to the total number of CNPs you can create.

Configuring a CNP consists of:

- Naming the CNP.
- Specifying the IEEE 802.1 code point (priority) on which you want to enable PFC on ingress interfaces (input CNP).
- Optionally, specifying the MRU and the length of the attached cable on ingress interfaces (input CNP).
- Optionally, configuring flow control (PFC pause) on specified output queues if you want queues other than queues 3 and 4 to respond to pause messages received from the connected peer (output CNP).
- Mapping the CNP to an interface.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

1. Enable PFC on the desired priority in the input CNP and optionally configure the interface MRU for traffic on that priority:

   `[edit class-of-service]`
   `user@switch#` **set congestion-notification-profile** ***cnp-name*** **input ieee-802.1 code-point** ***code-point bits*** **pfc mru** ***mru-value***

   For example, to configure a CNP named **fcoe-cnp** that enables PFC on IEEE 802.1 code point **011** and configures an MRU value of **2240**:

   `[edit class-of-service]`
   `user@switch#` **set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc mru 2240**

2. Configure the length of the cable attached to the ingress interface (optional):

   `[edit class-of-service]`
   `user@switch#` **set congestion-notification-profile** ***cnp-name*** **input cable-length** ***cable-length-value***

   For example, to configure a CNP named **fcoe-cnp** that sets the length of the ingress interface cable to **100** meters:

   `[edit class-of-service]`
   `user@switch#` **set congestion-notification-profile fcoe-cnp input cable-length 100**

3. (Optional) Configure flow control on output queues:

   `[edit class-of-service]`
   `user@switch#` **set congestion-notification-profile** ***cnp-name*** **output ieee-802.1 code-point** ***code-point-bits*** **flow-control-queue [*queue* | *list-of-queues*]**

   For example, to configure a CNP named **fcoe-cnp** that enables PFC pause flow control on output queues 3 and 5 for FCoE traffic that uses priority 3 (code point **011**) and on output queue 4 for traffic that uses priority 4 (code point **100**):

   `[edit class-of-service]`
   `user@switch#` **set congestion-notification-profile** ***cnp-name*** **output ieee-802.1 code-point 011 flow-control-queue [3 5]**
   `user@switch#` **set congestion-notification-profile** ***cnp-name*** **output ieee-802.1 code-point 100 flow-control-queue 4**

4. Map the CNP to an interface:

   `[edit class-of-service]`
   `user@switch#` **set interfaces** ***interface*** **congestion-notification-profile** ***cnp-name***

   For example, to map the CNP **fcoe-cnp** to the interface **xe-0/0/7**:

   `[edit class-of-service]`
   `user@switch#` **set interfaces xe-0/0/7 congestion-notification-profile fcoe-cnp**

Enabling and Disabling CoS Symmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to Ethernet link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Symmetric flow control means that an interface has the same PAUSE configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled, or they are both disabled.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. If you attempt to configure both features, the switch returns a commit error. Ethernet PAUSE and PFC are also mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

By default, all flow control features are disabled. You enable symmetric flow control on the interfaces on which you want to PAUSE all of the traffic on a link.

- To enable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
user@switch# set flow-control
```

- To disable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]
user@switch# set no-flow-control
```

Related Documentation

Configuring CoS Asymmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction.

Symmetric flow control means that the interface has the same configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled or they are both disabled. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

Asymmetric flow control provides the ability to configure the receive buffer and transmit buffer Ethernet PAUSE actions independently on an interface. The buffers perform the following actions:

- The receive buffers generate and send PAUSE messages to the connected peer to ask the peer to stop sending traffic for a time period specified in the PAUSE frame. The peer interface's buffers may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.
- The transmit buffers respond to PAUSE messages received from the connected peer to stop sending traffic to the peer. The transmit buffer may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to PAUSE messages:

- Receive buffers on—Enable PAUSE transmission (generate and send PAUSE frames)
- Transmit buffers on—Enable PAUSE reception (respond to received PAUSE frames)

You must explicitly set both the receive buffer and the transmit buffer to configure asymmetric flow control.

- To configure asymmetric flow control on an interface:

  `[edit interfaces *interface-name* ether-options]` `user@switch#` **set configured-flow-control rx-buffers (on | off) tx-buffers (on | off)**

For example, to configure interface **xe-0/0/24** to generate and send PAUSE messages but not to respond to received PAUSE messages:

set interfaces xe-0/0/24 ether-options configured-flow-control rx-buffers on tx-buffers off

For example, to configure interface **xe-0/0/30** to respond to received PAUSE messages but not to generate and send PAUSE messages:

set interfaces xe-0/0/30 ether-options configured-flow-control rx-buffers off tx-buffers on

NOTE: If you configure both buffers to be on, that is equivalent to symmetric flow control. If you configure both buffers to be off, there is no flow control (flow control is disabled).

Configuring Global Ingress and Egress Shared Buffers

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of ingress and egress buffers to better support different mixes of network traffic.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best-effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly best-effort traffic on links enabled for Ethernet PAUSE, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from one of the recommended configurations, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffer allocation and partitioning using the CLI:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

   ```
   [edit class-of-service shared-buffer]
   user@switch# set ingress percent percent
   ```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent percent
user@switch# set ingress buffer-partition lossless-headroom percent percent
user@switch# set ingress buffer-partition lossy percent percent
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent percent
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent percent
user@switch# set egress buffer-partition lossy percent percent
user@switch# set egress buffer-partition multicast percent percent
```

Defining CoS Rewrite Rules

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on an interface (EXP rewrite rules can only be enabled on logical interfaces, not on physical interfaces). You can also apply an existing rewrite rule on an interface.

NOTE: On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

NOTE: To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the existing rewrite rule and then apply the new rule.

NOTE: For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

To create rewrite rules and enable them on interfaces:

- To create an 802.1p rewrite rule named **customup-rw** in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class fcoe loss-priority low code-point 011
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority low code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority high code-point 101
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority low code-point 110
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority high code-point 111
```

- To enable an 802.1p rewrite rule named **customup-rw** on a Layer 2 interface:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/7 unit 0 rewrite-rules ieee-802.1
customup-rw
```

NOTE: All forwarding classes assigned to port xe-0/0/7 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

- To enable an 802.1p rewrite rule named **customup-rw** on all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical interface (unit) number:

```
[edit]
user@switch# set class-of-service interfaces xe-* unit * rewrite-rules customup-rw
```

NOTE: In this case, *all* forwarding classes assigned to *all* 10-Gigabit Ethernet ports must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

Configuring Rewrite Rules for MPLS EXP Classifiers

You configure EXP rewrite rules to alter CoS values in outgoing MPLS packets on the outbound interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure an EXP CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on a logical interface. EXP rewrite rules can only be enabled on logical interfaces, not on physical interfaces. You can also apply an existing EXP rewrite rule on a logical interface.

NOTE: There are no default rewrite rules.

You can configure as many EXP rewrite rules as you want, but you can only use 16 EXP rewrite rules at any time on the switch. On a given logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

NOTE: On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

NOTE: To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the existing rewrite rule and then apply the new rule.

To create an EXP rewrite rule for MPLS traffic and enable it on a logical interface:

1. Create an EXP rewrite rule:

   `user@switch#` **set class-of-service rewrite-rules exp *rewrite-rule-name* forwarding-class *forwarding-class-name* loss-priority *level* code-points [*aliases*] [*bit-patterns*]**

   For example, to configure an EXP rewrite rule named **exp-rr-1** for a forwarding class named **mpls-1** with a loss priority of **low** that rewrites the EXP code point value to **001**:

   `user@switch#` **set class-of-service rewrite-rules exp exp-rr-1 forwarding-class mpls-1 loss-priority low code-points 001**

2. Apply the rewrite rule to a logical interface:

   `user@switch #` **set class-of-service interfaces *interface-name* unit *logical-unit* rewrite-rules exp *rewrite-rule-name***

   For example, to apply a rewrite rule named **exp-rr-1** to logical interface **xe-0/0/10.0**:

```
user@switch# set class-of-service interfaces xe-0/0/10 unit 0 rewrite-rules exp exp-rr-1
```

NOTE: In this example, all forwarding classes assigned to port xe-0/0/10 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same interface.

Assigning CoS Components to Interfaces

After you define the following CoS components, you assign them to physical or logical interfaces. Components that you assign to physical interfaces are valid for all of the logical interfaces configured on the physical interface. Components that you assign to a logical interface are valid only for that logical interface.

- Classifiers—Assign only to logical interfaces.
- Congestion notification profiles—Assign only to physical interfaces.
- Forwarding classes—Assign to interfaces by mapping to forwarding class sets.
- Forwarding class sets—Assign only to physical interfaces.
- Output traffic control profiles—Assign only to physical interfaces (with a forwarding class set).
- Rewrite rules—Assign only to logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wildcards. You can also assign a congestion notification profile or a forwarding class set globally to all interfaces.

To assign CoS components to interfaces:

Assign CoS components to a single interface by associating a CoS component (for example a forwarding class set named **san-priority-group**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set san-priority-group
```

Assign a CoS component to multiple interfaces by associating a CoS component (for example, a rewrite rule named **customup-rw**) to all 10-Gigabit Ethernet interfaces on the switch, use wildcard characters for the interface name and logical interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set xe-* unit * rewrite-rules ieee-802.1 customup-rw
```

Assign a congestion notification profile or a forwarding class set globally to all interfaces using the **set class-of-service interfaces all** statement. For example, to assign a forwarding class set named **be_fcset** to all interfaces:

```
[edit class-of-service interfaces]
user@switch# set all forwarding-class-set be_fcset
```

NOTE: If there is an existing CoS configuration of any type on an interface, the global configuration is not applied to that particular interface. The global configuration is applied to all interfaces that do not have an existing CoS configuration.

For example, if you configure a rewrite rule, assign it to interfaces xe-0/0/20.0 and xe-0/0/22.0, and then configure a congestion notification profile and apply it to all interfaces, the congestion notification profile is applied to every interface except xe-0/0/20 and xe-0/0/22.

Configuration Tasks (QFX Series Standalone Switches, QFabric Systems Only)

Configuring CoS Fixed Classifier Rewrite Values for Native FC Interfaces (NP_Ports)

Fibre Channel over Ethernet (FCoE) traffic typically uses IEEE 802.1p priority 3 (code point 011). When Fibre Channel (FC) traffic arrives on a native FC interface (NP_Port) on an FCoE-FC gateway, the interface encapsulates the FC traffic in Ethernet to create FCoE frames. By default, the native FC interface assigns priority 3 to the FCoE traffic. The traffic is then forwarded internally to the gateway Ethernet interfaces, and then forwarded to the FCoE network.

If your FCoE network uses priority 3 for FCoE traffic, you do not need to use a rewrite value to remap the FCoE priority on native FC interfaces, because the default configuration maps priority 3 to the FCoE forwarding class.

However, if the FCoE network uses a different priority than priority 3 for FCoE traffic, then you can configure a rewrite value to remap incoming traffic from the FC SAN to that priority after the interface encapsulates the FC packets in Ethernet. Setting a rewrite value for the IEEE 802.1p code point (priority) configures the gateway native FC interface to assign the rewrite value to the encapsulated FCoE frames before forwarding the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

Traffic coming from the FC SAN is classified into a lossless forwarding class, and that lossless forwarding class is mapped to the rewrite value (the priority used for FCoE traffic on the converged Ethernet network). You specify the lossless forwarding class used for FCoE traffic on a native FC interface by configuring a fixed classifier and applying it to the native FC interface. (The same forwarding class must also be mapped to the rewrite value priority in the ingress classifier applied to the FCoE Ethernet interfaces.) All traffic received from the FC SAN on that FC interface is encapsulated in Ethernet, classified into the forwarding class specified in the fixed classifier, and assigned the rewrite value priority.

Configuring a rewrite value consists of:

- Configuring a fixed classifier on the native FC interface. The fixed classifier assigns all the traffic that arrives at the interface from the connected peer in the FC SAN to one fixed forwarding class. The forwarding class must be a lossless forwarding class and must be classified to the rewrite value priority in the ingress classifier configuration on the FCoE Ethernet interfaces.
- Specifying an IEEE 802.1p rewrite value for the native FC interface. The traffic mapped to the forwarding class in the fixed classifier is marked with the priority you specify in the rewrite value when the traffic is encapsulated in Ethernet. The rewrite value must be the IEEE 802.1p priority used for FCoE traffic in your converged Ethernet network.

You can configure one rewrite value for each local FCoE-FC gateway fabric. All of the native FC interfaces in a particular fabric must use the same rewrite value. Native FC interfaces that belong to different FCoE-FC gateway fabrics can use different rewrite values.

1. Configure a fixed classifier on the native FC interface:

   ```
   [edit class-of-service]
   ```

user@switch# **set** interfaces ***fc-interface-name*** forwarding-class ***lossless-forwarding-class-name***

For example, to configure a fixed classifier on native FC interface **fc-0/0/2** that specifies the lossless forwarding class **fcoe1**:

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 forwarding-class fcoe1
```

2. Configure a rewrite value for the traffic classified into the fixed classifier (this must be the IEEE 802.1p priority used for the traffic on your converged Ethernet network):

   [edit class-of-service]
   user@switch# **set** interfaces ***fc-interface-name*** rewrite-value input ieee-802.1 code-point ***code-point-bits***

   For example, to configure a rewrite value on native FC interface **fc-0/0/2** that specifies an IEEE 802.1p priority of **101** (the lossless forwarding class specified in the fixed classifier must be classified to this priority in the ingress classifier configuration on the FCoE Ethernet interfaces):

   ```
   [edit class-of-service]
   user@switch# set interfaces fc-0/0/2 rewrite-value input ieee-802.1 code-point 101
   ```

In the example, all traffic from the FC SAN that arrives at FCoE-FC gateway interface fc-0/0/2 is encapsulated in Ethernet, classified into the lossless fcoe1 forwarding class, and tagged with the IEEE 802.1p priority 5 (code point 101). In this example, we assume that the converged Ethernet network uses priority 5 for FCoE traffic, and that the fcoe1 forwarding class is mapped to priority 5 in the ingress classifier configuration on the Ethernet interfaces. To achieve lossless transport, you must also enable PFC on priority 5 on the Ethernet interfaces that connect the FCoE traffic to the Ethernet network.

Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. QFX Systems support three DCBX modes:

- Autonegotiation—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- IEEE DCBX—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- DCBX Version 1.01—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric Node devices come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

NOTE: QFX Systems do not support pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00. If a QFX Series interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

  ```
  [edit protocols dcbx]
  user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |
  dcbx-version-1.01)
  ```

  For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

  ```
  user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
  ```

  To configure IEEE DCBX on all interfaces:

  ```
  user@switch# set protocols dcbx interface all mode ieee-dcbx
  ```

Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

NOTE: **LLDP and DCBX are enabled by default on all interfaces.**

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as “willing”).

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

NOTE: **If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as “FCoE down” and disables FCoE on the interface.**

When DCBX marks an interface as “FCoE down,” the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as “FCoE down.”

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

   [edit]
   user@switch# **set protocols dcbx interface *interface-name* priority-flow-control no-auto-negotiation**

2. Turn off autonegotiation for applications.

   [edit]
   user@switch# **set protocols dcbx interface *interface-name* applications no-auto-negotiation**

3. Turn off autonegotiation for ETS.

   [edit]
   user@switch# **set protocols dcbx interface *interface-name* enhanced-transmission-selection no-auto-negotiation**

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- [edit protocols dcbx interface *interface-name*]
  user@switch# **set enhanced-transmission-selection no-recommendation-tlv**

Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is “willing,” the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

NOTE: **Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.**

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- `[edit protocols dcbx interface` *`interface-name`*`]`
  `user@switch#` **set enhanced-transmission-selection no-recommendation-tlv**

Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

  `[edit applications]`
  `user@switch#` **set application *application-name* ether-type *ether-type***

  For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

  `user@switch#` **set applications application ptp ether-type 0x88F7**

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

  `[edit]`
  `user@switch#` **set applications application *application-name* protocol (tcp | udp) destination-port** *`port-value`*

  For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

  `user@switch#` **set applications application iscsi protocol tcp destination-port 3260**

Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

  `[edit policy-options]`
  `user@switch#` **set application-maps** ***application-map-name*** **application** ***application-name*** **code-points [** ***aliases*** **] [** ***bit-patterns*** **]**

  For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

  `user@switch#` **set policy-options application-maps ptp-app-map application ptp code points [001 101]**

Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange

After you define applications and map them to IEEE 802.1p code points in an application map, apply the application map to the interfaces on which you want DCBX to exchange the application protocol information with connected peers. (See *Related Documentation* for how to define applications and configure application maps to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

NOTE: **In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.**

- To apply an application map to a DCBX interface, specify the DCBX interface and the application map name:

  ```
  [edit protocols]
  user@switch# set dcbx interface interface-name application-map application-map-name
  ```

  For example, to apply an application map named **ptp-app-map** on interface **xe-0/0/11**:

  ```
  user@switch# set protocols dcbx interface xe-0/0/11 application-map ptp-app-map
  ```

Configuration Statements

buffer-partition (Egress)

Syntax

```
buffer-partition (lossless | lossy | multicast) {
  percent percent;
}
```

Hierarchy Level [edit class-of-service shared-buffer egress]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description The egress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best-effort, lossless, and multicast traffic (multicast also includes broadcast and destination lookup fail traffic). To better support the mix of traffic on your network, you can optimize the allocation of egress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three egress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ports. All ports on the switch receive the same allocation of egress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Default The default egress buffer partition shown in Table 520 on page 5710 supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

Table 520: Default Egress Shared Buffer Partitioning

Lossless Partition	Lossy Partition	Multicast Partition
50%	31%	19%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages must always total 100 percent.

Options **lossless**—Shared buffer space reserved for all lossless egress traffic.

lossy—Shared buffer space for best-effort unicast egress traffic.

multicast—Shared buffer space reserved for all multicast (including broadcast and destination lookup fail) egress traffic.

percent *percent*—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossy, or multicast buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

buffer-partition (Ingress)

Syntax

```
buffer-partition (lossless | lossless-headroom | lossy) {
  percent percentage;
}
```

Hierarchy Level [edit class-of-service shared-buffer ingress]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description The ingress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best effort (best-effort unicast and multicast) and lossless traffic. To better support the mix of traffic on your network, you can optimize the allocation of ingress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three ingress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ingress traffic. All ports on the switch receive the same allocation of ingress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

Default The default ingress buffer partition shown in Table 521 on page 5712 supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

Table 521: Default Ingress Shared Buffer Partitioning

Lossless Partition	Lossless-Headroom Partition	Lossy Partition
9%	45%	46%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages always must total 100 percent.

Options **lossless**—Shared buffer space reserved for all lossless ingress traffic.

lossless-headroom—Shared buffer space reserved to store packets received while either an 802.3x Ethernet PAUSE or a priority-based flow control (PFC) pause is asserted. (When an ingress interface pauses traffic, it must have the buffer space to store all of the packets currently in the buffer, and also all of the packets received before the connected peer stops sending traffic and the wire is cleared of packets.)

lossy—Shared buffer space for best-effort ingress traffic.

percent *percent*—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossless-headroom, or lossy buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

buffer-size

Syntax buffer-size (percent *percent* | remainder);

Hierarchy Level [edit class-of-service schedulers *scheduler-name*]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Set the dedicated buffer size of the egress queue that you bind the scheduler to in the scheduler map configuration. The switch allocates space from the global dedicated buffer pool to ports and queues in a hierarchical manner. The switch allocates an equal number of dedicated buffers to each egress port, so each egress port receives the same amount of dedicated buffer space. The amount of dedicated buffer space per port is not configurable.

However, the **buffer-size** statement allows you to control the way each port allocates its share of dedicated buffers to its queues. For example, if a port only uses two queues to forward traffic, you can configure the port to allocate all of its dedicated buffer space to those two ports and avoid wasting buffer space on queues that are not in use. We recommend that the buffer size should be the same size as the minimum guaranteed transmission rate (the **transmit-rate**).

You configure the proportion of port dedicated buffers allocated to a particular output queue using the following process:

1. Configure a scheduler and set the **buffer-size** option to match the scheduler **transmit-rate** value.
2. Use a scheduler map to map the scheduler to the forwarding class that is mapped to the queue to which you want to apply the buffer size.

   For example, suppose that you want to change the dedicated buffer allocation for FCoE traffic. FCoE traffic is mapped to the fcoe forwarding class, and the fcoe forwarding class is mapped to queue 3 (this is the default configuration). To use default FCoE traffic mapping, in the scheduler map configuration, map the scheduler to the **fcoe** forwarding class.
3. Associate the scheduler map with the traffic control profile you want to use on the egress ports that carry FCoE traffic.
4. Associate the traffic control profile that includes the scheduler map with the desired egress ports. For this example, you associate the traffic control profile with the ports that carry FCoE traffic.

   Queue 3, which is mapped to the fcoe forwarding class and therefore to the FCoE traffic, receives the dedicated buffer allocation specified in the **buffer-size** statement.

NOTE: The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

Default The port allocates dedicated buffers to queues that have an explicitly configured scheduler buffer size. If you do not explicitly configure a scheduler buffer size for a queue, the port serves the explicitly configured queues first. Then the port divides the remaining dedicated buffers equally among the queues that have an explicitly attached scheduler *without* an explicitly configured buffer size configuration. (If you configure a scheduler, but you do not configure the buffer size parameter, the default is equivalent to configuring the buffer size with the **remainder** option.)

If you use the default scheduler and scheduler map on a port (no explicit scheduler configuration), then the port allocates its dedicated buffer pool to queues based on the default scheduling, as shown in Table 522 on page 5715. The default buffer size is the same as the default transmit rate for each default queue:

Table 522: Default Output Queue Buffer Sizes

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
0	best-effort	5%	5%
3	fcoe	35%	35%
4	no-loss	35%	35%
7	network-control	5%	5%
8	mcast	20%	20%

Because the default scheduler includes only five forwarding classes, only the queues mapped to those forwarding classes receive dedicated buffers from the port buffer pool. (Buffers are not wasted on queues that do not carry traffic.)

Options **percent** ***percent***—Percentage of the port dedicated buffer pool allocated to the queue (or queues) mapped to the scheduler.

remainder—Remaining dedicated buffer pool after the port satisfies the needs of the explicitly configured buffers. The port divides the remaining buffers equally among the queues that are explicitly attached to a scheduler but that do not have an explicit buffer size configuration (or are configured with **remainder** as the buffer size).

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

cable-length (Congestion Notification)

Syntax cable-length *cable-length-value*;

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* input]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Specify the length of the cable between the interface and its peer interface in meters. The system uses the cable length and the maximum receive unit (MRU) to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The the shorter the cable length and lower the MRU, the less headroom buffer space is required for PFC.

NOTE: You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the **mtu** statement at the **[edit interfaces *interface-name*]** hierarchy level.

Default The default cable length value is 100 meters (approximately 328 feet).

Options *cable-length-value*—Length of the cable in meters. (Generally from 1 to 300 meters, but there is no configuration restriction.)

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

class (Forwarding Classes)

Syntax

```
class {
  class-name {
    queue-num queue-number <no-loss>;
  }
}
```

Hierarchy Level [edit class-of-service forwarding-classes]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

Description Map one or more forwarding classes to a single queue. You can map unicast forwarding classes to a unicast queue (0 through 7) and multidestination forwarding classes to a multicast queue (8 through 11). The queue to which you map a forwarding class determines if the forwarding class is a unicast or multicast forwarding class.

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the **fcoe** and **no-loss** forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the **no-loss** option. If you do not specify the **no-loss** option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the **fcoe** forwarding class and you do not include the **no-loss** option, the **fcoe** forwarding class is lossy, not lossless.

Options *class-name* —Name of the forwarding class.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

code-point (Output Congestion Notification)

Syntax

```
code-point [ code-point-bits ] {
  flow-control-queue [ queue | list-of-queues ];
}
```

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* output ieee-802.1]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Specify the IEEE 802.1p code point bits that identify the traffic you want to enable for priority-based flow control (PFC) pause.

Default By default, IEEE 802.1p priorities 3 and 4 (code points 011 and 100, respectively) are enabled for PFC pause on all Ethernet interfaces. If you explicitly configure priorities to pause and the output queues on which to enable pause, the explicit configuration overrides the default configuration. When you apply an explicit output congestion notification profile to an interface, only the priorities and queues specified in the output congestion notification profile are enabled for pause on that interface.

For example, if you configure an output congestion notification profile that specifies priority 2 (code point 010), then traffic with IEEE 802.1p priority 2 is paused on the configured output queue during periods of congestion. However, traffic with priority 3 and priority 4 is not programmed to pause, because the explicit configuration overwrites the default configuration, and the explicit configuration does not pause priority 3 and priority 4. If you configure an explicit output congestion notification profile, all of the priorities you want to enable for PFC and all of the output queues you want to pause must be explicitly configured.

Options ***code-point-bits***—3-bit value in decimal form.

The remaining statements are described separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

configured-flow-control

Syntax

```
configured-flow-control {
  rx-buffers (on | off);
  tx-buffers (on | off);
}
```

Hierarchy Level [edit interfaces *interface-name* ether-options]

Description Configure Ethernet PAUSE asymmetric flow control on an interface. You can set an interface to generate and send PAUSE messages, and you can set an interface to respond to PAUSE messages sent by the connected peer. You must set both the **rx-buffers** and the **tx-buffers** values when you configure asymmetric flow control.

Use the **flow-control** and **no-flow-control** statements to enable and disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC) by applying a congestion notification profile to the interface.

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

        flow-control-queue [queue | list-of-queues];
      }
    }
  }
}
```

Interface Congestion Notification Profile Association

congestion-notification-profile *profile-name* {

Hierarchy Level

[edit class-of-service],
[edit class-of-service interfaces *interface-name*]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure a congestion notification profile to enable priority-based flow control (PFC) on traffic specified by an IEEE 802.1 code point, and apply the profile to an interface.

NOTE: You must configure PFC for FCoE traffic. Each interface that carries FCoE traffic should be configured for PFC on the FCoE code point (usually 011).

You can attach a maximum of one congestion notification profile to an interface. There is no limit to the total number of congestion notification profiles you can create.

NOTE: Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

Options ***profile-name***—Name of the congestion notification profile.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

drop-probability

Syntax drop-probability 0 drop-probability *high-value*;

Hierarchy Level [edit class-of-service drop-profiles *profile-name* interpolate]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description When configuring WRED, map the packet **drop-probability** to the fullness of a queue (fill-level). You configure the **fill-level** and **drop-probability** statements in related pairs by specifying a low **fill-level** value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high **fill-level** value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability.

Options 0—Probability that packets will drop at the lowest **fill-level** value. This is always zero, because until the queue reaches the specified low **fill-level** value, no packets are scheduled to drop.

high-value—The maximum probability that packets will drop before queue fullness exceeds the high value of the queue **fill-level**, expressed as a percentage. If the queue fills beyond the high **fill-level** value, all packets drop.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

egress (Buffer Configuration)

Syntax

```
egress {
  percent percent;
  buffer-partition (lossless | lossy | multicast) {
    percent percent;
  }
}
```

Hierarchy Level [edit class-of-service shared-buffer]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global shared buffer pool allocation for egress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for other buffers such as dedicated buffers (buffers allocated permanently to ports).

The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports. However, on a port, you can configure the portion of dedicated port buffer space allocated to each queue in the scheduler configuration using the **buffer-size** option.)

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

You can also partition the shared buffer pool to adjust the egress buffer allocations for different mixes of network traffic using the **buffer-partition** statement.

Default The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)

Options **percent *percent***—Percentage of available egress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

enhanced-transmission-selection

Syntax

```
enhanced-transmission-selection {
  no-auto-negotiation;
  no-recommendation-tlv;
  recommendation-tlv {
    no-auto-negotiation;
  }
}
```

Hierarchy Level [edit protocols dcbx interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Disable advertising the enhanced transmission selection (ETS) state of the interface to the peer. To disable ETS on the interface, do not enable ETS on the interface in the class-of-service (CoS) configuration.

Disabling ETS autonegotiation stops the QFX Series from advertising the ETS Configuration TLV and the ETS Recommendation TLV.

Disabling the ETS recommendation TLV stops the QFX Series from advertising the ETS Recommendation TLV, but the ETS Configuration TLV is still advertised.

Options **no-auto-negotiation**—Disable automatic negotiation of ETS (Configuration TLV and Recommendation TLV)

no-recommendation-tlv—Disable automatic negotiation of the ETS Recommendation TLV

recommendation-tlv—Enable automatic negotiation of ETS Recommendation TLV

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

}
```

Global Classifier Association with Interfaces

exp *classifier-name*;

Hierarchy Level

[edit class-of-service classifiers],
[edit class-of-service rewrite-rules]
[edit class-of-service system-defaults classifiers]

Release Information

Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description

Define the EXP code point mapping that is applied to MPLS packets. EXP classifiers are not applied to any traffic except MPLS traffic.

You can configure as many EXP classifiers as you want. However, the switch uses only one EXP classifier as a global MPLS classifier on all interfaces. You specify the global EXP classifier in the **[edit class-of-service system-defaults]** hierarchy.

Options

classifier-name—Name of the EXP classifier.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

fill-level

Syntax fill-level *low-value* fill-level *high-value*;

Hierarchy Level [edit class-of-service drop-profiles *profile-name* interpolate]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description When configuring random early detection (RED), map the fullness of a queue to a packet drop-probability value. You configure the **fill-level** and **drop-probability** statements in related pairs by specifying a low **fill-level** value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high **fill-level** value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability.

Options *low-value*—Fullness of the queue before packets begin to drop, expressed as a percentage. The low value must be less than the high value.

Range: 0 through 100

high-value—Fullness of the queue before it reaches the maximum drop probability. If the queue fills beyond the fill level high value, all packets drop. The high value must be greater than the low value.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Tail-Drop Profiles on page 5501
- Understanding CoS Tail-Drop Profiles on page 5409

flow-control

Syntax (flow-control | no-flow-control);

Hierarchy Level [edit interfaces *interface-name* ether-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.

You can configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces *interface-name* ether-options** hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual "lanes" of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

- **flow-control**—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.
- **no-flow-control**—Disable flow control.

Default Flow control is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

flow-control-queue (Output Congestion Notification)

Syntax flow-control-queue [*queue* | *list-of-queues*];

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* output ieee-802.1 code-point *code-point-bits*]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Specify one or more output queues to pause, to support priority-based flow control (PFC). The specified queues pause when the interface receives a PFC frame with a matching IEEE 802.1p code point.

Default Queue 3 (mapped to the fcoe forwarding class) and queue 4 (mapped to the no-loss forwarding class) are programmed as flow control queues to pause. No other output queues are programmed to pause by default.

If you configure flow control queues explicitly, only the queues that you specify are programmed to pause. The explicit flow control queue to pause configuration overrides the default setting, so the queues paused in the default configuration are no longer paused by default.

For example, if you configure queue 2 as a flow control queue, then queue 2 pauses when congestion occurs, but queues 3 and 4 do not pause because they were not explicitly specified. To enable pause on output queues 2, 3, and 4, you must explicitly configure all three of the queues as flow control queues.

The same behavior applies to the IEEE 802.1p code points (priorities) on which PFC is enabled. By default, priorities 3 (011) and 4 (100) are enabled for PFC pause. If you explicitly configure flow control queues to pause, you must also explicitly configure pause for each priority (code point) that you want to pause, because the explicit configuration overrides the default configuration.

Options [***queue*** | ***list-of-queues***]—The output queue or a list of output queues to pause.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

forwarding-classes

Syntax

```
forwarding-classes {
  class {
    class-name {
      queue-num queue-number <no-loss>;
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

Description Map one or more forwarding classes to a single queue. You can configure up to 12 forwarding classes (8 unicast forwarding classes on queues 0 through 7 and 4 multidestination forwarding classes on queues 8 through 11) and map them to queues. You can map multiple forwarding classes to a single queue using the **class** statement. All forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the **fcoe** and **no-loss** forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the **no-loss** option. If you do not specify the **no-loss** option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the **fcoe** forwarding class and you do not include the **no-loss** option, the **fcoe** forwarding class is lossy, not lossless.

Options The statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

guaranteed-rate

Syntax guaranteed-rate (*rate*| percent *percentage*);

Hierarchy Level [edit class-of-service traffic-control-profiles *traffic-control-profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a guaranteed minimum rate of transmission for a traffic control profile. The sum of the guaranteed rates of all of the forwarding class sets (priority groups) on a port should not exceed the total port bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group (forwarding class set) can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

NOTE: You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.

Default If you do not specify a guaranteed rate, the guaranteed rate is zero (0) and there is no minimum guaranteed bandwidth.

NOTE: If you do not configure a guaranteed rate for a traffic control profile, the queues that belong to any forwarding class set (priority group) that uses that traffic control profile cannot have a configured transmit rate. The result is that there is no minimum guaranteed bandwidth for those queues and that those queues can be starved during periods of congestion.

Options percent *percentage*—Minimum percentage of transmission capacity allocated to the forwarding class set or logical interface.

Range: 1 through 100 percent

rate—Minimum transmission rate allocated to the forwarding class set or logical interface, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Range: 1000 through 10,000,000,000 bps

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

host-outbound-traffic

Syntax

```
host-outbound-traffic {
  forwarding-class class-name;
  dscp-code-point code-point;
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Allow queue selection for traffic generated by the Routing Engine (host). The selected queue must be configured properly. You can also configure specific DSCP code point bits for the type of service (ToS) field of the generated packets. This configuration does not affect transit packets or incoming packets. This is a global configuration that only affects packets originating on the Routing Engine. If you do not configure an output queue for host outbound traffic, the switch uses the default queue mapping.

Options The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit class-of-service code-point-aliases],
[edit class-of-service multi-destination classifiers],
[edit class-of-service interfaces *interface-name* unit *logical-unit-number* classifiers],
[edit class-of-service interfaces *interface-name* unit *logical-unit-number* rewrite-rules],
[edit class-of-service rewrite-rules]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure an IEEE 802.1 classifier, configure an IEEE 802.1 code-point alias, apply a fixed IEEE 802.1 classifier to an interface, or apply an IEEE-802.1 rewrite rule.

Options

classifier-name—Name of the classifier.

The remaining statements are explained separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

ieee-802.1 (Input Congestion Notification)

Syntax

```
ieee-802.1 {
  code-point [code-point-bits] {
    pfc {
      mru mru-value;
    }
  }
}
```

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* input]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure an IEEE 802.1 code point and apply priority-based flow control (PFC) to packets with that code point.

Options The statements are described separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

import

Syntax import (*import* | default);

Hierarchy Level [edit class-of-service classifiers (dscp | dscp-ipv6 | ieee-802.1) *classifier-name*],
[edit class-of-service rewrite-rules (dscp | dscp-ipv6 | ieee-802.1) *classifier-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a default or previously defined classifier.

Options *import* —Name of the classifier mapping configured at the **[edit class-of-service classifiers]** hierarchy level.

default—Default classifier mapping.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

ingress (Buffer Configuration)

Syntax

```
ingress {
  buffer-partition (lossless | lossless-headroom | lossy) {
    percent percent;
  }
  percent percent;
}
```

Hierarchy Level [edit class-of-service shared-buffer]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global shared buffer pool allocation for ingress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for buffers such as dedicated buffers (buffers allocated permanently to ports) and headroom buffers (buffers that help prevent packet loss on lossless flows).

The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared ingress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.**

You can also partition the shared buffer pool to adjust the ingress buffer allocations for different mixes of network traffic using the **buffer-partition** statement.

Default The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)

Options **percent *percent***—Percentage of available ingress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

input (Congestion Notification)

Syntax

```
input {
  ieee-802.1 {
    code-point [code-point-bits] {
      pfc {
        mru mru-value;
      }
    }
  }
  cable-length cable-length-value;
}
```

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure priority-based flow control (PFC) on incoming traffic.

Options The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

interfaces (Class of Service)

Syntax

```
interfaces {
interface-name  {
  congestion-notification-profile profile-name {
  }
  forwarding-class lossless-forwarding-class-name;
  forwarding-class-set forwarding-class-set-name {
    output-traffic-control-profile profile-name;
  }
  rewrite-value {
    input {
      ieee-802.1{
        code-point code-point-bits;
      }
    }
  }
  unit logical-unit-number {
    classifiers {
      (dscp | dscp-ipv6 | ieee-802.1 | exp) (classifier-name | default);
    }
    forwarding-class class-name;
    rewrite-rules {
      (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure interface-specific CoS properties for incoming packets.

Options *interface-name*—Name of the interface.

The statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interpolate

Syntax

```
interpolate {
  fill-level low-value fill-level high-value;
  drop-probability 0 drop-probability high-value;
}
```

Hierarchy Level [edit class-of-service drop-profiles *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify values for interpolating the relationship between queue fill level and drop probability.

The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Tail-Drop Profiles on page 5501

loss-priority (Classifiers)

Syntax

```
loss-priority level {
  code-points [ aliases ] [ bit-patterns ];
}
```

Hierarchy Level [edit class-of-service classifiers (dscp | dscp-ipv6 | ieee-802.1) *classifier-name* forwarding-class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure packet loss priority value for a specific set of code-point aliases and bit patterns.

Options *level*—Can be one of the following:

- **low**—Packet has low loss priority.
- **medium-high**—Packet has medium-high loss priority.
- **high**—Packet has high loss priority.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Unicast Classifiers on page 5495
- Understanding CoS Classifiers on page 5334

loss-priority (Drop Profiles)

Syntax loss-priority *level* protocol *protocol* drop-profile *profile-name*;

Hierarchy Level [edit class-of-service schedulers *scheduler-name* drop-profile-map]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure packet loss priority value for a drop profile mapped to a system drop profile.

Options *level*—Can be one of the following:

- **low**—Packet has low loss priority.
- **medium-high**—Packet has medium-high loss priority.
- **high**—Packet has high loss priority.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

loss-priority (Rewrite Rules)

Syntax

```
loss-priority level {
  code-point (alias | bit-pattern);
}
```

Hierarchy Level

[edit class-of-service rewrite-rules (dscp | dscp-ipv6 | ieee-802.1) *rewrite-name*
forwarding-class *class-name*]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Specify a loss priority to which to apply a rewrite rule. The rewrite rule sets the code-point aliases and bit patterns for a specific forwarding class and loss priority. Packets that match the forwarding class and loss priority are rewritten with the rewrite code-point alias or bit pattern.

Options

level—Can be one of the following:

- **low**—Packet has low loss priority.
- **medium-high**—Packet has medium-high loss priority.
- **high**—Packet has high loss priority.

The remaining statement is explained separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Defining CoS Rewrite Rules on page 5693

multi-destination

Syntax

```
multi-destination {
  classifiers {
    (dscp | ieee-802.1) classifier-name;
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a multicast CoS behavior aggregate (BA) classifier.

Options The statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers on page 5498
- Assigning CoS Components to Interfaces on page 5696
- Understanding CoS Classifiers on page 5334

mru

Syntax mru *mru-value*;

Hierarchy Level [edit class-of-service congestion-notification-profile *profile-name* input ieee-802.1 code-point *code-point-bits* pfc]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the maximum receive unit (MRU) of the interface in bytes (incoming packet sizes must be less than or equal to the MRU, or the packets are dropped). The system uses the MRU and the cable length to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The lower the MRU and the shorter the cable length, the less headroom buffer space is required for PFC.

NOTE: You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the **mtu** statement at the **[edit interfaces** ***interface-name*****]** hierarchy level.

Default For priority 3 traffic, the default MRU value is 2500 bytes.

For priority 4 traffic, the default MRU value is 9612 bytes.

Options *mru-value*—Value of the maximum packet receive unit size in bytes (generally from 1500 to 9216 bytes, but there is no configuration restriction).

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

policy-options

Syntax

```
policy-options
  application-maps application-map-name {
    application application-name {
      code-points [ aliases ] [ bit-patterns ];
    }
  }
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list prefix-list-name;
        prefix-list-filter prefix-list-name match-type <actions>;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then actions;
    }
  }
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.
Statement introduced in Junos OS Release 12.1 for the EX Series.

Description Configure options such as application maps for DCBX application protocol exchange and policy statements.

Required Privilege Level storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Related Documentation

priority (Schedulers)

Syntax priority *priority*;

Hierarchy Level [edit class-of-service schedulers *scheduler-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the packet-scheduling drop priority value.

Options *priority*—It can be one of the following:

- **low**—Scheduler has low priority.
- **strict-high**—Scheduler has strict high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

priority-flow-control

Syntax

```
priority-flow-control {
  no-auto-negotiation;
}
```

Hierarchy Level [edit protocols dcbx interface (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.

Description Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.

Options **no-auto-negotiation**—Disable automatic negotiation of PFC.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

protocol (Drop Profile Map)

Syntax protocol *protocol* drop-profile *profile-name*;

Hierarchy Level [edit class-of-service schedulers *scheduler-name* drop-profile-map loss-priority (low | medium-high | high)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the protocol type for the specified drop profile.

Options *protocol*—Type of protocol. The protocol can be:

- **any**—Accept any protocol type.

The remaining statement is explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

queue-num

Syntax queue-num *queue-number* <no-loss>;

Hierarchy Level [edit class-of-service forwarding-classes class *class-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
No-loss option introduced in Junos OS Release 12.3 for the QFX Series.

Description Map a forwarding class to an output queue number. Optionally, configure the forwarding class as a lossless forwarding class.

You can map some or all of the eight unicast forwarding classes to a unicast queue (0 through 7) or some or all of the four multidestination (multicast, broadcast, destination lookup fail) forwarding classes to the same multidestination queue (8 through 11), providing that you do not map one forwarding class to more than one queue. The queue to which you map a forwarding class determines if the forwarding class is a unicast or multidestination forwarding class.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

NOTE: If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the **fcoe** and **no-loss** forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the **no-loss** option. If you do not specify the **no-loss** option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the **fcoe** forwarding class and you do not include the **no-loss** option, the **fcoe** forwarding class is lossy, not lossless.

Options *queue-number*—Number of the CoS unicast queue (0 through 7) or the CoS multidestination queue (8 through 11).

no-loss—Optional packet drop attribute keyword to configure the forwarding class as lossless.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

rewrite-rules

Syntax

```
rewrite-rules {
  (dscp | dscp-ipv6 | ieee-802.1 | exp) rewrite-name {
    import (rewrite-name | default);
    forwarding-class class-name {
      loss-priority priority code-point (alias | bits);
    }
  }
}
```

Interface Association

```
rewrite-rules {
  (dscp | dscp-ipv6 | ieee-802.1 | exp) rewrite-name;
}
```

Hierarchy Level [edit class-of-service],
[edit class-of-service interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
EXP statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure rewrite rules that map traffic to code points when traffic exits the system, and apply the rewrite rules to a specific interface.

MPLS EXP rewrite rules can only be bound to logical interfaces, not to physical interfaces. You can configure as many EXP rewrite rules as you want, but you can use only 16 EXP rewrite rules on switch interfaces at any given time.

Options The statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

rx-buffers

Syntax rx-buffers (on | off);

Hierarchy Level [edit interfaces *interface-name* ether-options configured-flow-control]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.

Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the **rx-buffers** statement with the **tx-buffers** statement to configure asymmetric Ethernet PAUSE on an interface. (Use the **flow-control** statement to enable symmetric PAUSE and the **no-flow-control** statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options **on | off**—Enable or disable an interface to generate and send Ethernet PAUSE messages.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

scheduler-maps

Syntax

```
scheduler-maps {
  map-name {
    forwarding-class class-name scheduler scheduler-name;
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a scheduler map name to map a scheduler configuration to a forwarding class.

Options *map-name*—Name of the scheduler map.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5474

schedulers

Syntax

```
schedulers {
  scheduler-name {
    buffer-size (percent percentage | remainder);
    drop-profile-map loss-priority (low | medium-high | high) protocol protocol drop-profile
      drop-profile-name;
    priority priority;
    shaping-rate (rate | percent percentage);
    transmit-rate (percent percentage);
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify scheduler name and parameter values such minimum bandwidth (**transmit-rate**), maximum bandwidth (**shaping-rate**), and priority (**priority**).

Options ***scheduler-name*** —Name of the scheduler.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

shaping-rate

Syntax shaping-rate (*rate* | percent *percentage*);

Hierarchy Level [edit class-of-service schedulers *scheduler-name*],
[edit class-of-service traffic-control-profiles *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the shaping rate. The shaping rate throttles the rate of packet transmission by setting a maximum bandwidth (rate in bits per second) or a maximum percentage of bandwidth for a queue or a forwarding class set. You specify the maximum bandwidth for a queue by using a scheduler map to associate a forwarding class (queue) with a scheduler that has a configured shaping rate. You specify the maximum bandwidth for a forwarding class set by setting the shaping rate for a traffic control profile, and then applying the traffic control profile and a forwarding class set to an interface.

We recommend that you configure the shaping rate as an absolute maximum usage and not as additional usage beyond the configured transmit rate (the minimum guaranteed bandwidth for a queue) or the configured guaranteed rate (the minimum guaranteed bandwidth for a forwarding class set).

NOTE: When you set the maximum bandwidth (**shaping-rate** value) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate** value.

Default If you do not configure a shaping rate, the default shaping rate is 100 percent (all of the available bandwidth), which is the equivalent of no rate shaping.

Options **percent *percentage***—Shaping rate as a percentage of the available interface bandwidth.

Range: 1 through 100 percent

rate—Peak (maximum) rate, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Range: 1000 through 10,000,000,000 bps

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5474
- Example: Configuring Queue Schedulers on page 5511
- Example: Configuring Traffic Control Profiles (Priority Group Scheduling) on page 5519

- Understanding CoS Traffic Control Profiles on page 5381

shared-buffer

Syntax

```
shared-buffer {
  egress {
    buffer-partition (lossless | lossy | multicast) {
      percent percent
    }
    percent percent;
  }
  ingress {
    percent percent;
    buffer-partition (lossless | lossless-headroom | lossy) {
      percent percent
    }
  }
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global shared buffer pool allocation to ports. Shared buffers are a pool of buffer space that the system can allocate dynamically across all of its ports as memory space is needed. Some buffer space is reserved for dedicated buffers (buffers allocated permanently to ports), headroom buffers (buffers that help prevent packet loss on lossless flows), and other buffers.

Configure the way the system uses the available (user-configurable) buffer space by setting the **shared-buffer** percentage for the ingress buffer pool and for the egress buffer pool.

The percentage you specify is the percentage of available buffer space allocated to the global shared ingress buffer pool or to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)

CAUTION: **Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until the buffer reprogramming is complete.**

You can also partition the ingress shared buffer pool and the egress shared buffer pool to adjust the buffer allocations for different mixes of network traffic (best-effort, lossless, multicast) using the **buffer-partition** statement.

Options The statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

system-defaults

Syntax

```
system-defaults {
  classifiers exp classifier-name;
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure the global EXP classifier used on all interfaces to classify MPLS traffic.

Although you can configure as many EXP classifiers as you want, the switch uses only one EXP classifier as a global MPLS classifier on all interfaces. All switch interfaces use the EXP classifier specified as the system default to classify MPLS traffic.

Options The statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

traceoptions (Class of Service)

Syntax

```
traceoptions {
  file filename <size size> <files number>
  <world-readable | no-world-readable>;
  flag flag <flag-modifier>;
  no-remote-trace
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set class-of-service (CoS) tracing options.

NOTE: **The traceoptions statement is not supported on the QFabric system.**

Default Traceoptions is disabled.

Options **file *filename***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**. The traceoption output continues in a second trace file named ***trace-file*.1**. When ***trace-file*.1** reaches its maximum size, output continues in a third file named ***trace-file*.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

Range: 2 through 1000 files

Default: 1 trace file

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **asynch**—Trace asynchronous configuration processing.
- **chassis-scheduler**—Trace chassis stream scheduler processing.
- **cos-adjustment**—Trace CoS rate adjustments.
- **dynamic**—Trace dynamic CoS functions.
- **hardware-database**—Trace the chassis hardware database related processing.
- **init**—Trace initialization events.

- **performance-monitor**—Trace performance monitor countors.
- **process**—Trace configuration processing.
- **restart**—Trace restart processing.
- **route-socket**—Trace route-socket events.
- **show**—Trace show command servicing.
- **snmp**—Trace SNMP-related processing.
- **util**—Trace utilities.

The following are the global tracing options:

- **all**—Perform all tracing operations
- **parse**—Trace parser processing.

no-remote-trace—(Optional) Disable remote tracing.

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0.** Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

traffic-control-profiles

Syntax

```
traffic-control-profiles profile-name {
  guaranteed-rate (rate| percent percentage);
  scheduler-map map-name;
  shaping-rate (rate| percent percentage);
}
```

Hierarchy Level [edit class-of-service]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure traffic shaping and scheduling profiles for forwarding class sets (priority groups) to implement enhanced transmission selection (ETS) or for logical interfaces.

Options ***profile-name***—Name of the traffic-control profile. This name is also used to specify an output traffic control profile.

The remaining statements are explained separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

transmit-rate

Syntax transmit-rate (*rate* | percent *percentage*);

Hierarchy Level [edit class-of-service schedulers *scheduler-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the minimum transmission rate or percentage for a queue (forwarding class) scheduler. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

NOTE: The **transmit-rate** setting works only if you also configure the guaranteed-rate in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed rate, the minimum guaranteed rate for individual queues that you set using the **transmit-rate** statement does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate.

NOTE: You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

NOTE: For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

Default If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 11 are:

Queue Number	Default Minimum Guaranteed Bandwidth
0 (best-effort)	5 %
1	0
2	0
3 (fcoe)	35 %
4 (no-loss)	35 %
5	0
6	0
7 (network control)	5 %
8 (mcast)	20 %
9	0
10	0
11	0

Configure schedulers if you want to change the minimum guaranteed bandwidth and other queue characteristics.

Options

rate—Minimum transmission rate for the queue, in bps. You can specify a value in bits-per-second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), m (1,000,000), or **g** (1,000,000,000).

Range: 1000 through 10,000,000,000 bps

percent ***percentage***—Minimum percentage of transmission capacity allocated to the queue. A percentage of zero means that there is no minimum bandwidth guarantee for the queue.

Range: 0 through 100 percent

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5474
- Example: Configuring Queue Schedulers on page 5511

tx-buffers

Syntax tx-buffers (on | off);

Hierarchy Level [edit interfaces *interface-name* ether-options configured-flow-control]

Release Information Statement introduced in Junos OS Release 12.1 for the QFX Series.

Description Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.

Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the **tx-buffers** statement with the **rx-buffers** statement to configure asymmetric Ethernet PAUSE on an interface. (Use the **flow-control** statement to enable symmetric PAUSE and the **no-flow-control** statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)

NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).

Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

Default Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.

Options **on | off**—Enable or disable an interface to respond to an Ethernet PAUSE message.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

applications (DCBX)

Syntax

```
applications {
  no-auto-negotiation;
}
```

Hierarchy Level [edit protocols dcbx interface *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.1 for the EX Series

Description Configure Data Center Bridging Capability Exchange protocol (DCBX) applications on an interface.

Options The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

code-point (Fibre Channel Interfaces)

Syntax code-point *code-point-bits*;

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name* rewrite-value input ieee-802.1]

Description Configure the IEEE 802.1p code point value assigned to all traffic received from the Fibre Channel (FC) network on the specified FC interface (NP_Port). When native FC traffic from the FC SAN arrives at the NP_Port interface, the NP_Port interface encapsulates it in Ethernet to create FCoE packets before forwarding the traffic onto the FCoE network. Instead of using the default value of priority 3 (code point 011) for the FCoE traffic, the interface rewrites the IEEE 802.1p code point to the value specified in the rewrite value code points.

After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE traffic typically uses priority 3 (IEEE code point 011). The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

Options ***code-point-bits***—Value of the code-point bits, in decimal form.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

dcbx

Syntax

```
dcbx {
  disable;
  interface (interface-name | all) {
    disable;
    application-map application-map-name;
    applications {
      no-auto-negotiation;
    }
    enhanced-transmission-selection {
      no-auto-negotiation;
      no-recommendation-tlv;
      recommendation-tlv {
        no-auto-negotiation;
      }
    }
    dcbx-version (auto-negotiate | ieee-dcbx | dcbx-version-1.01);
    priority-flow-control {
      no-auto-negotiation;
    }
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 11.3 for EX Series switches.
mode and **recommendation-tlv** statements introduced in Junos OS Release 12.2 for the QFX Series.

Description Configure DCBX properties.

Options The statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

dcbx-version

Syntax dcbx-version (auto-negotiate | ieee-dcbx | dcbx-version-1.01);

Hierarchy Level [edit protocols dcbx interface (all | *interface-name*)]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Set the DCBX version for the specified interface or interfaces.

QFX3500 switches come up in IEEE DCBX mode and then autonegotiate with the connected peer to set the DCBX version.

QFabric system Node devices come up using DCBX version 1.01, and then autonegotiate with the connected peer to set the DCBX mode.

Default The default DCBX mode is autonegotation.

Options **auto-negotiate**—Automatically negotiate the DCBX version with the connected peer.

ieee-dcbx—Force the interface to use IEEE DCBX mode, regardless of the peer configuration.

dcbx-version-1.01—Force the interface to use version 1.01 DCBX mode, regardless of the peer configuration.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

forwarding-class (Fibre Channel Interfaces)

Syntax forwarding-class *lossless-forwarding-class-name*;

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name*]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

Description Configure a Layer 3 fixed classifier on a Fibre Channel (FC) interface. The fixed classifier places all traffic received from the FC network into the specified forwarding class. The forwarding class must be lossless. (That is, the forwarding class must be either the default **fcoe** or **no-loss** forwarding class, or the forwarding class must be configured with the **no-loss** drop attribute.) If you attempt to specify a lossy forwarding class, the system returns a commit error.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. If the IEEE 802.1p code point value that the Ethernet network uses for FCoE traffic is different than code point 3, you can rewrite the code point to the value used in your Ethernet (FCoE) network. The lossless forwarding class specified in the fixed classifier uses the **rewrite-value** statement as the IEEE 802.1p code point (priority) for FCoE traffic on the FCoE network.

To rewrite the code point value, include the **rewrite-value input ieee code-point *code-point-bits*** statement at the [**edit class-of-service interfaces *fc-interface-name***] hierarchy level.

NOTE: If you are not using the default configuration (priority 3 for FCoE traffic), the lossless forwarding class specified in the FC interface fixed classifier must be mapped to the IEEE 802.1p code point specified in the rewrite value statement.

In order to avoid fate sharing (separate flows that affect each other's throughput), the code point (priority) used for the lossless forwarding class (the code point specified in the rewrite value statement) should be the only code point classified to that forwarding class (at the [**edit class-of-service classifiers**] hierarchy level). For example, if the rewrite value uses code point 101 for lossless FCoE forwarding class fcoe_fc1, then in the classifier configuration attached to ingress Ethernet interfaces, code point 101 is the only code point that should be classified to the fcoe_fc1 forwarding class. Now if you also attach a classifier to an interface that maps code point 110 to forwarding class fcoe_fc1, then congestion on priority 110 unfairly (and unintentionally) affects the FCoE traffic that uses priority 101. Both priorities 101 and 110 are classified into forwarding class fcoe_fc1, so the traffic from both priorities shares the same fate.

Options ***lossless-forwarding-class-name***—Name of the lossless forwarding class.

Required Privilege Level
interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

ieee-802.1 (Fibre Channel Interfaces)

Syntax

```
ieee-802.1 {
  code-point code-point-bits;
}
```

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name* rewrite-value input]

Description Configure the IEEE 802.1p code point value to which all traffic received from the Fibre Channel (FC) network on the specified FC interface is rewritten. After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

The statement is described separately.

Required Privilege Level interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

recommendation-tlv

Syntax

```
recommendation-tlv {
  no-auto-negotiation;
}
```

Hierarchy Level [edit protocols dcbx interface *interface-name* enhanced-transmission-selection]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description Disable or enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.)

Default DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.

Options **no-auto-negotiation**—Disable sending of the ETS recommendation TLV.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- show dcbx neighbors on page 5177
- Configuring DCBX Autonegotiation on page 5076

rewrite-value (Fibre Channel Interfaces)

Syntax

```
rewrite-value {
  input {
    ieee-802.1{
      code-point code-point-bits;
    }
  }
}
```

Hierarchy Level [edit class-of-service interfaces *fibre-channel-interface-name*]

Description Configure the IEEE 802.1p code point value (priority) for all traffic received from the Fibre Channel (FC) network on the specified FC interface. Instead of using the default priority 3 (011) for FCoE traffic, the priority is rewritten to the specified priority before being forwarded. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE traffic typically uses priority 3 (IEEE code point 011). The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011) for FCoE traffic.

The system supports only one IEEE 802.1p code point value per FC interface, so you cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

NOTE: In order to avoid fate sharing (separate flows that affect each others' throughput), the code point used for the rewrite value should be the only code point used for the lossless FCoE forwarding class (the forwarding class used for the fixed classifier on the Fibre Channel interface). When you configure classifiers for ingress Ethernet interfaces, map only the rewrite value code point to the forwarding class.

For example, if the rewrite value uses code point 101 for lossless FCoE forwarding class fcoe_fc1, then in the classifier configuration attached to ingress Ethernet interfaces, code point 101 is the only code point that should be classified to the fcoe_fc1 forwarding class. Now if you also attach a classifier to an interface that maps code point 110 to forwarding class fcoe_fc1, then congestion on priority 110 unfairly (and unintentionally) affects the FCoE traffic that uses priority 101. Both priorities 101 and 110 are classified into forwarding class fcoe_fc1, so the traffic from both priorities shares the same fate.

The remaining statements are described separately.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

CHAPTER 64

Administration

Routine Monitoring

Monitoring CoS Classifiers

Purpose Display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

Action To monitor CoS classifiers in the CLI, enter the CLI command:

user@switch> **show class-of-service classifier**

To monitor a particular classifier in the CLI, enter the CLI command:

user@switch> **show class-of-service classifier name *classifier-name***

To monitor a particular type of classifier in the CLI, enter the CLI command:

user@switch> **show class-of-service classifier type *classifier-type***

Meaning Table 523 on page 5809 summarizes key output fields for CoS classifiers.

Table 523: Summary of Key CoS Classifier Output Fields

Field	Values
Classifier	Name of a classifier.

Table 523: Summary of Key CoS Classifier Output Fields *(continued)*

Field	Values
Code point type	Type of classifier: • **dscp**—All classifiers of the DSCP type. • **ieee-802.1**—All classifiers of the IEEE 802.1 type. • **ieee-mcast**—All classifiers of the IEEE 802.1 multicast type.
Index	Internal index of the classifier.
Code point	DSCP or IEEE 802.1 code point value of the incoming packets, in bits. These values are used for classification.
Forwarding Class	Name of the forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.
Loss Priority	Loss priority value that the classifier assigns to the incoming packet based on its code point value.

Related Documentation

- Defining CoS Unicast BA Classifiers (DSCP, DSCP IPv6, IEEE 802.1p) on page 5673
- Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers on page 5675

Monitoring CoS Forwarding Classes

Purpose Use the monitoring functionality to view the current assignment of CoS forwarding classes to queue numbers on the system.

Action To monitor CoS forwarding classes in the CLI, enter the following CLI command:

user@switch> **show class-of-service forwarding-class**

Meaning Table 524 on page 5811 summarizes key output fields for CoS forwarding classes.

Table 524: Summary of Key CoS Forwarding Class Output Fields

Field	Values
Forwarding Class	Names of forwarding classes assigned to queue numbers. By default, the following unicast forwarding classes are assigned to queues 0, 3, 4, and 7, respectively: • **best-effort**—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value. • **fcoe**—Provides guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic. • **no-loss**—Provides guaranteed delivery for TCP lossless traffic • **network-control**—Packets can be delayed but not dropped. By default, the following multidestination forwarding class is assigned to queue 8: • **mcast**—Provides no special CoS handling of packets.
Queue	Queue number corresponding to the forwarding class name. By default, four queues (0, 3, 4, and 7) are assigned to unicast forwarding classes and one queue (8) is assigned to a multidestination forwarding class.
No-Loss	Packet drop attribute associated with each forwarding class: • Disabled—The forwarding class is configured for lossy transport (packets might drop during periods of congestion) • Enabled—The forwarding class is configured for lossless transport NOTE: To achieve lossless transport, you must ensure that priority-based flow control (PFC) and DCBX are properly configured on the lossless priority (IEEE 802.1p code point), and that sufficient port bandwidth is reserved for the lossless traffic flows.

Related Documentation

- Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 5474

Monitoring Interfaces That Have CoS Components

Purpose Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

Action To monitor interfaces that have CoS components in the CLI, enter the command:

user@switch> **show class-of-service interface**

To monitor a specific interface in the CLI, enter the command:

user@switch> **show class-of-service interface** ***interface-name***

Meaning Table 525 on page 5812 summarizes key output fields for CoS interfaces.

Table 525: Summary of Key CoS Interfaces Output Fields

Field	Values
Physical interface	Name of a physical interface to which CoS components are assigned.
Index	Index of this interface or the internal index of a specific object.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Scheduler map	Name of the scheduler map associated with this interface.
Congestion-notification	Status of congestion notification (enabled or disabled).
Rewrite Input IEEE Code-point	(Fibre Channel NP_Port interfaces only) IEEE 802.1p code point (priority) the interface assigns to incoming Fibre Channel (FC) traffic when the interface encapsulates the FC traffic in Ethernet before forwarding it onto the FCoE network.
Logical Interface	Name of a logical interface on the physical interface to which CoS components are assigned.
Object	Category of an object—for example, **classifier**, **scheduler-map**, or **rewrite**.
Name	Name of the object—for example, **ba-classifier**.
Type	Type of the object—for example, **ieee8021p** for a classifier.

Related Documentation

- Assigning CoS Components to Interfaces on page 5696

Monitoring CoS Rewrite Rules

Purpose Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

Action To monitor CoS rewrite rules in the CLI, enter the CLI command:

user@switch> **show class-of-service rewrite-rule**

To monitor a particular rewrite rule in the CLI, enter the CLI command:

user@switch> **show class-of-service rewrite-rule name *rewrite-rule-name***

To monitor a particular type of rewrite rule (for example, DSCP, DSCP IPv6, or IEEE-802.1) in the CLI, enter the CLI command:

user@switch> **show class-of-service rewrite-rule type *rewrite-rule-type***

Meaning Table 526 on page 5813 summarizes key output fields for CoS rewrite rules.

Table 526: Summary of Key CoS Rewrite Rule Output Fields

Field	Values
Rewrite rule	Name of the rewrite rule.
Code point type	Rewrite rule type: • **dscp**—For IPv4 DiffServ traffic. • **dscp-ipv6**—For IPv6 Diffserv traffic. • **ieee-802.1**—For Layer 2 traffic.
Index	Internal index for the rewrite rule.
Forwarding class	Name of the forwarding class that is used to determine CoS values for rewriting in combination with loss priority. Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.
Loss priority	Level of loss priority that is used to determine CoS values for rewriting in combination with forwarding class.
Code point	Rewrite code point value.

Related Documentation

- Defining CoS Rewrite Rules on page 5693

Monitoring CoS Scheduler Maps

Purpose Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

Action To monitor CoS scheduler maps in the CLI, enter the CLI command:

user@switch> **show class-of-service scheduler-map**

To monitor a specific scheduler map in the CLI, enter the CLI command:

user@switch> **show class-of-service scheduler-map *scheduler-map-name***

Meaning Table 527 on page 5813 summarizes key output fields for CoS scheduler maps.

Table 527: Summary of Key CoS Scheduler Maps Output Fields

Field	Values
Scheduler map	Name of the scheduler map.
Index	Index of a specific object—scheduler maps, schedulers, or drop profiles.

Table 527: Summary of Key CoS Scheduler Maps Output Fields *(continued)*

Field	Values
Scheduler	Name of the scheduler.
Forwarding class	Names of the forwarding classes to which the scheduler is assigned.
Transmit rate	Configured transmit rate of the scheduler as a percentage of the total interface bandwidth.
Priority	Scheduling priority of a queue: • **strict-high** or **high**—Packets in this queue are transmitted first. Only one queue can be configured as **strict-high** or **high**. • **low**—Packets in this queue are transmitted after packets in the **strict-high** queue.
Drop Profiles	Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.
Loss Priority	Drop profile associated with each packet loss priority. You can configure different drop profiles for **low**, **medium-high**, and **high** loss priority traffic.
Protocol	Transport protocol of the drop profile for the particular priority.
Name	Name of the drop profile.

Monitoring CoS Value Aliases

Purpose Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP and IEEE 802.1p code point bits.

Action To monitor CoS value aliases in the CLI, enter the CLI command:

user@switch> **show class-of-service code-point-aliases**

To monitor a specific type of code-point alias (for example, DSCP or IEEE 802.1) in the CLI, enter the CLI command:

user@switch> **show class-of-service code-point-aliases ieee-802.1**

Meaning Table 528 on page 5815 summarizes key output fields for CoS value aliases.

Table 528: Summary of Key CoS Value Alias Output Fields

Field	Values
Code point type	Type of the CoS value: • **dscp**—Examines Layer 3 packet headers for IP packet classification. • **ieee-802.1**—Examines Layer 2 packet headers for packet classification.
Alias	Name given to a set of bits—for example, **af11** is a name for bits **001010**.
Bit pattern	Set of bits associated with the alias.

show class-of-service

Syntax show class-of-service

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the class-of-service (CoS) information.

Required Privilege Level view

List of Sample Output show class-of- service on page 5818

Output Fields Table 529 on page 5817 lists the output fields for the **show class-of-service** command. Output fields are listed in the approximate order in which they appear.

Table 529: show class-of-service Output Fields

Field Name	Field Description	Level of Output
Forwarding class	The forwarding class configuration: • **Forwarding class**—Name of the forwarding class. • **ID**—Forwarding class ID. • **Queue**—Queue number.	All levels
Code point type	The type of code-point alias: • **dscp**—Aliases for DiffServ code point (DSCP) values. • **ieee–802.1**—Aliases for IEEE 802.1p values.	All levels
Alias	Names given to CoS values.	All levels
Bit pattern	Set of bits associated with an alias.	All levels
Classifier	Name of the classifier.	All levels
Code point	Code-point values.	All levels
Loss priority	Loss priority assigned to specific CoS values and aliases of the classifier.	All levels
Rewrite rule	Name of the rewrite rule if one has been configured.	All levels

Table 529: show class-of-service Output Fields *(continued)*

Field Name	Field Description	Level of Output
Drop profile	Name of the drop profile.	All levels
Type	Type of drop profile. QFX Series supports only the **discrete** type of drop-profile.	All levels
Fill level	Percentage of queue buffer fullness in a drop profile at which packets begin to drop during periods of congestion.	All levels
Scheduler map	Name of the scheduler map.	All levels
Scheduler	Name of the scheduler.	All levels
Transmit rate	Transmission rate of the scheduler.	All levels
Buffer size	Delay buffer size in the queue.	All levels
Drop profiles	Drop profiles configured for the specified scheduler.	All levels
Protocol	Transport protocol corresponding to the drop profile.	All levels
Name	Name of the drop profile.	All levels
Queues supported	Number of queues that can be configured on the interface.	All levels
Queues in use	Number of queues currently configured.	All levels
Physical interface	Name of the physical interface.	All levels
Scheduler map	Name of the scheduler map.	All levels
Congestion-notification	Enabled if a congestion notification profile is applied to the interface; disabled if no congestion notification profile is applied to the interface.	All levels
Forwarding class set	Name of the forwarding class set (priority group).	
Index	Internal index of an object.	All levels

Sample Output

show class-of- service

```
user@switch> show class-of-service
Forwarding class                       ID      Queue

show class-of-service classifier

Syntax

show class-of-service classifier
<name *name*>
<type dscp | type dscp-ipv6 | type exp | type ieee-802.1 | type inet-precedence>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

For each class-of-service (CoS) classifier, display the mapping of code point value to forwarding class and loss priority.

Options

none—Display all classifiers.

name ***name***—(Optional) Display named classifier.

type dscp—(Optional) Display all classifiers of the Differentiated Services code point (DSCP) type.

type dscp-ipv6—(Optional) Display all classifiers of the DSCP for IPv6 type.

type exp—(Optional) Display all classifiers of the MPLS experimental (EXP) type.

type ieee-802.1—(Optional) Display all classifiers of the ieee-802.1 type.

type inet-precedence—(Optional) Display all classifiers of the inet-precedence type.

Required Privilege Level

view

List of Sample Output

show class-of-service classifier type ieee-802.1 on page 5822
show class-of-service classifier type ieee-802.1 (QFX Series) on page 5822

Output Fields

Table 530 on page 5821 describes the output fields for the **show class-of-service classifier** command. Output fields are listed in the approximate order in which they appear.

Table 530: show class-of-service classifier Output Fields

Field Name	Field Description
Classifier	Name of the classifier.
Code point type	Type of the classifier: **exp** (not on EX Series switch), **dscp**, **dscp-ipv6** (not on EX Series switch), **ieee-802.1**, or **inet-precedence**.
Index	Internal index of the classifier.
Code point	Code point value used for classification
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.

Table 530: show class-of-service classifier Output Fields *(continued)*

Field Name	Field Description
Loss priority	Loss priority value used for classification. For most platforms, the value is **high** or **low**. For some platforms, the value is **high**, **medium-high**, **medium-low**, or **low**.

Sample Output

show class-of-service classifier type ieee-802.1

```
user@host> show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point         Forwarding Class                  Loss priority
  000              best-effort                         low
  001              best-effort                         high
  010              expedited-forwarding                low
  011              expedited-forwarding                high
  100              assured-forwarding                  low
  101              assured-forwarding                  medium-high
  110              network-control                     low
  111              network-control                     high

Classifier: users-ieee802.1, Code point type: ieee-802.1

  111                mcast                               low
```

show class-of-service code-point-aliases

Syntax show class-of-service code-point-aliases
<dscp | dscp-ipv6 | exp | ieee-802.1 | inet-precedence>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns.

Options **none**—Display code point aliases of all code point types.

dscp—(Optional) Display Differentiated Services code point (DSCP) aliases.

dscp-ipv6—(Optional) Display IPv6 DSCP aliases.

exp—(Optional) Display MPLS EXP code point aliases.

ieee-802.1—(Optional) Display IEEE-802.1 code point aliases.

inet-precedence—(Optional) Display IPv4 precedence code point aliases.

Required Privilege Level view

List of Sample Output show class-of-service code-point-aliases exp on page 5824

Output Fields Table 531 on page 5823 describes the output fields for the **show class-of-service code-point-aliases** command. Output fields are listed in the approximate order in which they appear.

Table 531: show class-of-service code-point-aliases Output Fields

Field Name	Field Description
Code point type	Type of the code points displayed: **dscp**, **dscp-ipv6** (not on EX Series switch), **exp** (not on EX Series switch or the QFX Series), **ieee-802.1**, or **inet-precedence** (not on the QFX Series).
Alias	Alias for a bit pattern.
Bit pattern	Bit pattern for which the alias is displayed.

Sample Output

show class-of-service code-point-aliases exp

```
user@host> show class-of-service code-point-aliases exp
Code point type: exp
  Alias              Bit pattern
  af11               100
  af12               101
  be                 000
  be1                001
  cs6                110
  cs7                111
  ef                 010
  ef1                011
  nc1                110
  nc2                111
```

show class-of-service congestion-notification

Syntax show class-of-service congestion-notification

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display whether priority-based flow control (PFC) is enabled for each IEEE 802.1p code point.

Options **none**—Display the PFC state for all IEEE 802.1p code points.

Required Privilege Level view

- Troubleshooting Dropped FCoE Traffic on page 5279

Output Fields Table 532 on page 5825 describes the output fields for the **show class-of-service congestion-notification** command. Output fields are listed in the approximate order in which they appear.

Table 532: show class-of-service congestion-notification Output Fields

Field Name	Field Description
Type	Type of interfaces on which congestion notification is applied. Congestion notification is applied on input interfaces.
Index	Index of this congestion notification profile.
Name	Name of the congestion notification profile.
Cable Length	Length of the attached physical cable in meters. The default value is 100 meters.
Priority	IEEE 802.1p code point.
PFC	State of PFC for the corresponding code point, either **enabled** or **disabled**.
MRU	Maximum receive unit of the interface in bytes. (Incoming traffic that exceeds the MRU size of an interface is dropped.) The default values are: • 2500 bytes for priority 3 traffic • 9216 bytes for priority 4 traffic NOTE: If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.

Table 532: show class-of-service congestion-notification Output Fields *(continued)*

Field Name	Field Description
Flow-Control-Queues	Output queue mapping to IEEE 802.1p code points (priorities). Explicit output queue to priority mapping overwrites the default configuration, and only explicitly mapped queues are displayed in the output. Flow control is only enabled on a queue when you enable PFC on the corresponding priority in the input stanza of the congestion notification profile.

Sample Output

show class-of-service congestion-notification

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p3_cnp, Index: 12037
Type: Input
Cable Length: 100 m
  Priority      PFC         MRU
  000           Disabled
  001           Disabled
  010           Disabled
  011           Enabled     2500

show class-of-service drop-profile

Syntax

show class-of-service drop-profile
<profile-name *profile-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display data points for each class-of-service (CoS) random early detection (RED) drop profile.

Options

none—Display all drop profiles.

profile-name ***profile-name***—(Optional) Display the specified profile only.

Required Privilege Level

view

List of Sample Output

show class-of-service drop-profile on page 5829
show class-of-service drop-profile (EX4200 Switch) on page 5829
show class-of-service drop-profile (EX8200 Switch) on page 5829

Output Fields

Table 533 on page 5828 describes the output fields for the **show class-of-service drop-profile** command. Output fields are listed in the approximate order in which they appear.

Table 533: show class-of-service drop-profile Output Fields

Field Name	Field Description
Drop profile	Name of a drop profile.
Type	Type of drop profile: • **discrete** (default) • **interpolated** (EX8200 switches only)
Index	Internal index of this drop profile.
Fill Level	Percentage fullness of a queue.
Drop probability	Drop probability at this fill level.

Sample Output

show class-of-service drop-profile

```
user@host> show class-of-service drop-profile
Drop profile: <default-drop-profile>, Type: discrete, Index: 1
  Fill level    Drop probability
         100                 100
Drop profile: user-drop-profile, Type: interpolated, Index: 2989
  Fill level    Drop probability
           0                   0
           1                   1
           2                   2
           4                   4
           5                   5
           6                   6
           8                   8

```

show class-of-service forwarding-class

Syntax show class-of-service forwarding-class

Release Information Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about forwarding classes, including the mapping of forwarding classes to queue numbers.

Required Privilege Level view

Related Documentation

- *Example: Configuring CoS on EX Series Switches*
- *Monitoring CoS Forwarding Classes*
- *Defining CoS Forwarding Classes (CLI Procedure)*

List of Sample Output

Output Fields Table 534 on page 5831 describes the output fields for the **show class-of-service forwarding-class** command. Output fields are listed in the approximate order in which they appear.

Table 534: show class-of-service forwarding-class Output Fields

Field Name	Field Description
Forwarding class	Name of the forwarding class.
ID	Forwarding class identifier.
Queue	CoS queue mapped to the forwarding class.
Policing priority	Not supported on EX Series switches or the QFX Series and can be ignored.
Fabric priority	(EX8200 switches only) Fabric priority for the forwarding class, either **high** or **low**. Determines the priority of packets entering the switch fabric.

Table 534: show class-of-service forwarding-class Output Fields *(continued)*

Field Name	Field Description
No-Loss	(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes: • Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is **drop**). • Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is **no-loss**).

Sample Output

show class-of-service forwarding-class

```
user@switch> show class-of-service forwarding-class
Forwarding class                ID                        Queue  Policing priority
  best-effort                         0                        0            normal
  expedited-forwarding                1                        5            normal
  assured-forwarding                  2                        1            normal
  network-control                     3                        7            normal
```

Sample Output

show class-of-service forwarding-class (EX8200 Switch)

```
user@switch> show class-of-service forwarding-class
Forwarding class                        ID       Queue   Fabric priority
  best-effort                            0        0       low
  expedited-forwarding                   1        5       low
  assured-forwarding                     2        1       low
  network-control                        3        7       low
  mcast-be                               4        2       low
  mcast-ef                               5        4       low
  mcast-af                               6        6       low
```

Sample Output

show class-of-service forwarding-class (QFX Series)

```
user@switch> show class-of-service forwarding-class
Forwarding class                        ID       Queue   Policing priority  No-Loss

  best-effort                           0         0         normal         Disabled

  fcoe                                   1         3         normal         Enabled

  no-loss                                2         4         normal         Enabled

  network-control                       3         7         normal         Disabled

  mcast                                 8         8         normal         Disabled
```

show class-of-service forwarding-class-set

Syntax show class-of-service forwarding-class-set
<*forwarding-class-set-name*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the forwarding classes associated with each forwarding class set.

Options **none**—Display all forwarding class sets.

forwarding-class-set-name—(Optional) Display the forwarding classes associated with the specified forwarding class set.

Required Privilege Level view

Output Fields Table 535 on page 5833 describes the output fields for the **show class-of-service forwarding-class-set** command. Output fields are listed in the approximate order in which they appear.

Table 535: show class-of-service forwarding-class-set Output Fields

Field Name	Field Description
Forwarding class set	Name of the forwarding class set.
Type	Internal Junos OS type.
Forwarding class set index	Index of this forwarding class set.
Forwarding class	Name of a forwarding class.
Index	Index of this forwarding class.

Sample Output

show class-of-service forwarding-class-set

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: san_fcset, Type: normal-type, Forwarding class set index:
37839
  Forwarding class                       Index
  fcoe                                     1

Forwarding class set: lan_fcset, Type: normal-type, Forwarding class set index:
37840
  Forwarding class                       Index
```

```
  best-effort                              0

Forwarding class set: multicast_fcset, Type: normal-type, Forwarding class set
index: 37841
  Forwarding class                       Index
  mcast                                    8
```

show class-of-service forwarding-table

Syntax show class-of-service forwarding-table

Syntax (TX Matrix and TX Matrix Plus Router) show class-of-service forwarding-table
<lcc *number*> | <sfc *number*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the entire class-of-service (CoS) configuration as it exists in the forwarding table. Executing this command is equivalent to executing all **show class-of-service forwarding-table** commands in succession.

Options **lcc** ***number***—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the forwarding table configuration for a specific T640 router (or line-card chassis) configured in a routing matrix. On a TX Matrix Plus router, display the forwarding table configuration for a specific router (or line-card chassis) configured in the routing matrix.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc ***number***—(TX Matrix Plus routers only) (Optional) Display the forwarding table configuration for the TX Matrix Plus router. Replace ***number*** with **0**.

Required Privilege Level view

show class-of-service forwarding-table classifier

Syntax show class-of-service forwarding-table classifier

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the mapping of code point value to queue number and loss priority for each classifier as it exists in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table classifier on page 5839

Output Fields Table 536 on page 5839 describes the output fields for the **show class-of-service forwarding-table classifier** command. Output fields are listed in the approximate order in which they appear.

Table 536: show class-of-service forwarding-table classifier Output Fields

Field Name	Field Description
Classifier table index	Index of the classifier table.
entries	Total number of entries.
Table type	Type of code points in the table: **DSCP**, **EXP** (not on the QFX Series), **IEEE 802.1**, **IPv4 precedence** (not on the QFX Series), or **IPv6 DSCP**.
Entry #	Entry number.
Code point	Code point value used for classification.
Forwarding-class #	Forwarding class to which the code point is assigned.
PLP	Packet loss priority value set by classification. For most platforms, the value can be **0** or **1**. For some platforms, the value is **0**, **1**, **2**, or **3**. The value **0** represents low PLP. The value **1** represents **high** PLP. The value **2** represents medium-low PLP. The value **3** represents medium-high PLP.

Sample Output

show class-of-service forwarding-table classifier

```
user@host> show class-of-service forwarding-table classifier
Classifier table index: 62436, # entries: 64, Table type: DSCP

Entry #    Code point    Forwarding-class #    PLP
```

```
    0          000000       0                   0

   63          111111       0                   0
```

show class-of-service forwarding-table classifier mapping

Syntax show class-of-service forwarding-table classifier mapping

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table classifier mapping on page 5841

Output Fields Table 537 on page 5841 describes the output fields for the**show class-of-service forwarding-table classifier mapping** command. Output fields are listed in the approximate order in which they appear.

Table 537: show class-of-service forwarding-table classifier mapping Output Fields

Field Name	Field Description
Table index/ Q num	If the table type is **Fixed**, the number of the queue to which the interface is mapped. For all other types, this value is the classifier index number.
Interface	Name of the logical interface. This field can also show the physical interface (QFX Series).
Index	Logical interface index.
Table type	Type of code points in the table: **DSCP**, **EXP** (not on the QFX Series), **Fixed**, **IEEE 802.1**, **IPv4 precedence** (not on the QFX Series),or **IPv6 DSCP**.

Sample Output

show class-of-service forwarding-table classifier mapping

```
user@host> show class-of-service forwarding-table classifier mapping
                       Table index/
Interface      Index     Q num      Table type
so-5/0/0.0        10     62436      DSCP
so-0/1/0.0        11     62436      DSCP
so-0/2/0.0        12         1      Fixed
so-0/2/1.0        13     62436      DSCP
so-0/2/1.0        13     62437      IEEE 802.1
so-0/2/2.0        14     62436      DSCP
so-0/2/2.0        14     62438      IPv4 precedence
```

show class-of-service forwarding-table drop-profile

Syntax show class-of-service forwarding-table drop-profile

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the data points of all random early detection (RED) drop profiles as they exist in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table drop-profile on page 5843

Output Fields Table 538 on page 5843 describes the output fields for the **show class-of-service forwarding-table drop-profile** command. Output fields are listed in the approximate order in which they appear.

Table 538: show class-of-service forwarding-table drop-profile Output Fields

Field Name	Field Description
RED drop profile index	Index of this drop profile.
# entries	Number of entries in a particular RED drop profile index.
Entry	Drop profile entry number.
Fullness(%)	Percentage fullness of a queue.
Drop probability(%)	Drop probability at this fill level.

Sample Output

show class-of-service forwarding-table drop-profile

```
user@host> show class-of-service forwarding-table drop-profile
RED drop profile index: 4, # entries: 1
                                 Drop
Entry       Fullness(%)   Probability(%)
    0               100              100

```

show class-of-service forwarding-table rewrite-rule

Syntax show class-of-service forwarding-table rewrite-rule

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display mapping of queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table rewrite-rule on page 5845

Output Fields Table 539 on page 5845 describes the output fields for the **show class-of-service forwarding-table rewrite-rule** command. Output fields are listed in the approximate order in which they appear.

Table 539: show class-of-service forwarding-table rewrite-rule Output Fields

Field Name	Field Description
Rewrite table index	Index for this rewrite rule.
# entries	Number of entries in this rewrite rule.
Table type	Type of table: **DSCP**, **EXP** (not on the QFX Series), **EXP-PUSH-3** (not on the QFX Series), **EXP-SWAP-PUSH-2**,(J Series routers only), **IEEE 802.1**,**IPv4 precedence** (not on the QFX Series), **IPv6 DSCP**, or **Fixed**.
Q#	Queue number to which this entry is assigned.
Low bits	Code point value for low-priority loss profile.
State	State of this code point: **enabled**, **rewritten**, or **disabled**.
High bits	Code point value for high-priority loss profile.

Sample Output

show class-of-service forwarding-table rewrite-rule

```
user@host> show class-of-service forwarding-table rewrite-rule
Rewrite table index: 3753, # entries: 4, Table type: DSCP
Q#     Low bits  State      High bits  State
 0      000111   Enabled     001010    Enabled
 2      000000   Disabled    001100    Enabled
```

```
1       101110  Enabled       110111   Enabled
3       110000  Enabled       111000   Enabled
```

show class-of-service forwarding-table rewrite-rule mapping

Syntax show class-of-service forwarding-table rewrite-rule mapping

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each logical interface, display the table identifier of the rewrite rule map for each code point type.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table rewrite-rule mapping on page 5847

Output Fields Table 540 on page 5847 describes the output fields for the **show class-of-service forwarding-table rewrite-rule mapping** command. Output fields are listed in the approximate order in which they appear.

Table 540: show class-of-service forwarding-table rewrite-rule mapping Output Fields

Field Name	Field Description
Interface	Name of the logical interface. This field can also show the physical interface (QFX Series).
Index	Logical interface index.
Table index	Rewrite table index.
Type	Type of classifier: **DSCP**, **EXP** (not on the QFX Series), **EXP-PUSH-3** (not on the QFX Series), **EXP-SWAP-PUSH-2** (not on the QFX Series),**Frame-Relay DE** (J Series routers only)**, IEEE 802.1**, **IPv4 precedence** (not on the QFX Series), **IPv6 DSCP**, or **Fixed**.

Sample Output

show class-of-service forwarding-table rewrite-rule mapping

```
user@host> show class-of-service forwarding-table rewrite-rule mapping
Interface       Index   Table index   Type
so-5/0/0.0         10          3753   DSCP
so-0/1/0.0         11          3753   DSCP

```

show class-of-service forwarding-table scheduler-map

Syntax show class-of-service forwarding-table scheduler-map

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description For each physical interface, display the scheduler map information as it exists in the forwarding table.

Options This command has no options.

Required Privilege Level view

List of Sample Output show class-of-service forwarding-table scheduler-map on page 5849

Output Fields Table 541 on page 5848 describes the output fields for the **show class-of-service forwarding-table scheduler-map** command. Output fields are listed in the approximate order in which they appear.

Table 541: show class-of-service forwarding-table scheduler-map Output Fields

Field Name	Field Description
Interface	Name of the physical interface.
Index	Physical interface index.
Map index	Scheduler map index.
Num of queues	Number of queues defined in this scheduler map.
Entry	Number of this entry in the scheduler map.
Scheduler index	Scheduler policy index.
Forwarding-class #	Forwarding class number to which this entry is applied.
Tx rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword **remainder**, which indicates that the scheduler receives the remaining bandwidth of the interface.
Max buffer delay	Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword **remainder**, which indicates that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	• **high**—Queue priority is high. • **low**—Queue priority is low.
PLP high	Drop profile index for a high packet loss priority profile.

Table 541: show class-of-service forwarding-table scheduler-map Output Fields *(continued)*

Field Name	Field Description
PLP low	Drop profile index for a low packet loss priority profile.
PLP medium-high	Drop profile index for a medium-high packet loss priority profile.
PLP medium-low	Drop profile index for a medium-low packet loss priority profile.
TCP PLP high	Drop profile index for a high TCP packet loss priority profile.
TCP PLP low	Drop profile index for a low TCP packet loss priority profile.
Policy is exact	If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled.

Sample Output

show class-of-service forwarding-table scheduler-map

```
user@host> show class-of-service forwarding-table scheduler-map
Interface: so-5/0/0 (Index: 9, Map index: 17638, Num of queues: 2):

    Priority low
    PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low: 8742
```

show class-of-service interface

Syntax

show class-of-service interface
<**comprehensive | detail**> <*interface-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Forwarding class map information added in Junos OS Release 9.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.
Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.

Description

Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

Options

none—Display CoS associations for all physical and logical interfaces.

comprehensive—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

detail—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface
- Information about filters or policers for the logical interface
- CoS information about the logical interface

interface-name—(Optional) Display class-of-service (CoS) associations for the specified interface.

Required Privilege Level

view

Output Fields

Table 542 on page 5851 describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

Table 542: show class-of-service interface Output Fields

Field Name	Field Description
Physical interface	Name of a physical interface.
Index	Index of this interface or the internal index of this object.
Dedicated Queues	Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Total non-default queues created	Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.
Rewrite Input IEEE Code-point	(QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.
Shaping rate	Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the **Shaping rate** field is displayed for either the physical interface or the logical interface.
Scheduler map	Name of the output scheduler map associated with this interface.
Scheduler map forwarding class sets	(QFX Series only) Name of the fabric forwarding class set scheduler map associated with a QFabric system Interconnect device interface.
Input shaping rate	For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.
Input scheduler map	For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.
Chassis scheduler map	Name of the scheduler map associated with the packet forwarding component queues.
Rewrite	Name and type of the rewrite rules associated with this interface.
Classifier	Name and type of classifiers associated with this interface.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Forwarding-class-map	Name of the forwarding map associated with this interface.
Congestion-notification	(QFX Series only) Congestion notification state, **enabled** or **disabled**.
Logical interface	Name of a logical interface.
Object	Category of an object: **Classifier**, **Fragmentation-map** (for LSQ interfaces only), **Scheduler-map**, **Rewrite**, or **Translation Table** (for IQE PICs only).
Name	Name of an object.
Type	Type of an object: **dscp**, **dscp-ipv6**, **exp**, **ieee-802.1**, **ip**, or **inet-precedence**.
Link-level type	Encapsulation on the physical interface.
MTU	MTU size on the physical interface.
Speed	Speed at which the interface is running.
Loopback	Whether loopback is enabled and the type of loopback.
Source filtering	Whether source filtering is enabled or disabled.
Flow control	Whether flow control is enabled or disabled.
Auto-negotiation	(Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status. • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Device flags	The **Device flags** field provides information about the physical device and displays one or more of the following values: • **Down**—Device has been administratively disabled. • **Hear-Own-Xmit**—Device receives its own transmissions. • **Link-Layer-Down**—The link-layer protocol has failed to connect with the remote endpoint. • **Loopback**—Device is in physical loopback. • **Loop-Detected**—The link layer has received frames that it sent, thereby detecting a physical loopback. • **No-Carrier**—On media that support carrier recognition, no carrier is currently detected. • **No-Multicast**—Device does not support multicast traffic. • **Present**—Device is physically present and recognized. • **Promiscuous**—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media. • **Quench**—Transmission on the device is quenched because the output buffer is overflowing. • **Recv-All-Multicasts**—Device is in multicast promiscuous mode and therefore provides no multicast filtering. • **Running**—Device is active and enabled.

Interface flags	The **Interface flags** field provides information about the physical interface and displays one or more of the following values:
	• **Admin-Test**—Interface is in test mode and some sanity checking, such as loop detection, is disabled.
	• **Disabled**—Interface is administratively disabled.
	• **Down**—A hardware failure has occurred.
	• **Hardware-Down**—Interface is nonfunctional or incorrectly connected.
	• **Link-Layer-Down**—Interface keepalives have indicated that the link is incomplete.
	• **No-Multicast**—Interface does not support multicast traffic.
	• **No-receive No-transmit**—Passive monitor mode is configured on the interface.
	• **Point-To-Point**—Interface is point-to-point.
	• **Pop all MPLS labels from packets of depth**—MPLS labels are removed as packets arrive on an interface that has the **pop-all-labels** statement configured. The depth value can be one of the following:
	  ◦ **1**—Takes effect for incoming packets with one label only.
	  ◦ **2**—Takes effect for incoming packets with two labels only.
	  ◦ **[1 2]**—Takes effect for incoming packets with either one or two labels.
	• **Promiscuous**—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.
	• **Recv-All-Multicasts**—Interface is in multicast promiscuous mode and provides no multicast filtering.
	• **SNMP-Traps**—SNMP trap notifications are enabled.
	• **Up**—Interface is enabled and operational.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Flags	The **Logical interface flags** field provides information about the logical interface and displays one or more of the following values: • **ACFC Encapsulation**—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer). • **Device-down**—Device has been administratively disabled. • **Disabled**—Interface is administratively disabled. • **Down**—A hardware failure has occurred. • **Clear-DF-Bit**—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit. • **Hardware-Down**—Interface protocol initialization failed to complete successfully. • **PFC**—Protocol field compression is enabled for the PPP session. • **Point-To-Point**—Interface is point-to-point. • **SNMP-Traps**—SNMP trap notifications are enabled. • **Up**—Interface is enabled and operational.
Encapsulation	Encapsulation on the logical interface.
Admin	Administrative state of the interface (**Up** or **Down**)
Link	Status of physical link (**Up** or **Down**).
Proto	Protocol configured on the interface.
Input Filter	Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.
Output Filter	Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.
Link flags	Provides information about the physical link and displays one or more of the following values: • **ACFC**—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option. • **Give-Up**—Link protocol does not continue connection attempts after repeated failures. • **Loose-LCP**—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational. • **Loose-LMI**—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational. • **Loose-NCP**—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational. • **Keepalives**—Link protocol keepalives are enabled. • **No-Keepalives**—Link protocol keepalives are disabled. • **PFC**—Protocol field compression is configured. The PPP session negotiates the PFC option.
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.
CoS queues	Number of CoS queues configured.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**
Statistics last cleared	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.
Input errors	Input errors on the interface. The labels are explained in the following list: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Bucket Drops**—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **HS link FIFO overflows**—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Output errors	Output errors on the interface. The labels are explained in the following list: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the **Drops** field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **HS link FIFO underflows**—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeds the MTU of the interface.
Egress queues	Total number of egress queues supported on the specified interface.
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism. NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the **Dropped packets** field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.
SONET alarms **SONET defects**	(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: **SONET PHY**, **SONET section**, **SONET line**, and **SONET path**.
SONET PHY	Counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET PHY** field has the following subfields: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
SONET section	Counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET section** field has the following subfields: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOS**—Loss of signal • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)
SONET line	Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET line** field has the following subfields: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
SONET path	Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. A state other than **OK** indicates a problem. The **SONET path** field has the following subfields: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload (signal) label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **ES-PFE**—Errored seconds (far-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)
Received SONET overhead **Transmitted SONET overhead**	Values of the received and transmitted SONET overhead: • **C2**—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • **F1**—Section user channel byte. This byte is set aside for the purposes of users. • **K1** and **K2**—These bytes are allocated for APS signaling for the protection of the multiplex section. • **J0**—Section trace. This byte is defined for STS-1 number 1 of an STS-*N* signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • **S1**—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-*N* signal. • **Z3** and **Z4**—Allocated for future use.
Received path trace **Transmitted path trace**	SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.
Forwarding classes	Total number of forwarding classes supported on the specified interface.
Egress queues	Total number of egress queues supported on the specified interface.
Queue	Queue number.
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets queued to this queue.
Queued Bytes	Number of bytes queued to this queue. The byte counts vary by PIC type.
Transmitted Packets	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.
Transmitted Bytes	Number of bytes transmitted by this queue. The byte counts vary by PIC type.
Tail-dropped packets	Number of packets dropped because of tail drop.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description

RED-dropped packets	Number of packets dropped because of random early detection (RED).
	• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories:
	  ◦ **Low, non-TCP**—Number of low-loss priority non-TCP packets dropped because of RED.
	  ◦ **Low, TCP**—Number of low-loss priority TCP packets dropped because of RED.
	  ◦ **High, non-TCP**—Number of high-loss priority non-TCP packets dropped because of RED.
	  ◦ **High, TCP**—Number of high-loss priority TCP packets dropped because of RED.
	• (MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories:
	  ◦ **Low**—Number of low-loss priority packets dropped because of RED.
	  ◦ **Medium-low**—Number of medium-low loss priority packets dropped because of RED.
	  ◦ **Medium-high**—Number of medium-high loss priority packets dropped because of RED.
	  ◦ **High**—Number of high-loss priority packets dropped because of RED.
	NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.

RED-dropped bytes	Number of bytes dropped because of RED. The byte counts vary by PIC type.
	• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories:
	  ◦ **Low, non-TCP**—Number of low-loss priority non-TCP bytes dropped because of RED.
	  ◦ **Low, TCP**—Number of low-loss priority TCP bytes dropped because of RED.
	  ◦ **High, non-TCP**—Number of high-loss priority non-TCP bytes dropped because of RED.
	  ◦ **High, TCP**—Number of high-loss priority TCP bytes dropped because of RED.
	NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.

Transmit rate	Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.
Rate Limit	Rate limiting configuration of the queue. Possible values are : • **None**—No rate limit. • **exact**—Queue transmits at the configured rate.
Buffer size	Delay buffer size in the queue.
Priority	Scheduling priority configured as **low** or **high**.
Excess Priority	Priority of the excess bandwidth traffic on a scheduler: **low**, **medium-low**, **medium-high**, **high**, or **none**.

Table 542: show class-of-service interface Output Fields *(continued)*

Field Name	Field Description
Drop profiles	Display the assignment of drop profiles. • **Loss priority**—Packet loss priority for drop profile assignment. • **Protocol**—Transport protocol for drop profile assignment. • **Index**—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles. • **Name**—Name of the drop profile. • **Type**—Type of the drop profile: **discrete** or **interpolated**. • **Fill Level**—Percentage fullness of a queue. • **Drop probability**—Drop probability at this fill level.
Excess Priority	Priority of the excess bandwidth traffic on a scheduler.
Drop profiles	Display the assignment of drop profiles. • **Loss priority**—Packet loss priority for drop profile assignment. • **Protocol**—Transport protocol for drop profile assignment. • **Index**—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles. • **Name**—Name of the drop profile. • **Type**—Type of the drop profile: **discrete** or **interpolated**. • **Fill Level**—Percentage fullness of a queue. • **Drop probability**—Drop probability at this fill level.

Adjustment information	Display the assignment of shaping-rate adjustments on a scheduler node or queue.
	• **Adjusting application**—Application that is performing the shaping-rate adjustment.
	  ◦ The adjusting application can appear as **ancp LS-0**, which is the Junos OS Access Node Control Profile process (**ancpd**) that performs shaping-rate adjustments on schedule nodes.
	  ◦ The adjusting application can also appear as **pppoe**, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).
	• **Adjustment type**—Type of adjustment: **absolute** or **delta**.
	• **Configured shaping rate**—Shaping rate configured for the scheduler node or queue.
	• **Adjustment value**—Value of adjusted shaping rate.
	• **Adjustment target**—Level of shaping-rate adjustment performed: **node** or **queue**.
	• **Adjustment overhead-accounting mode**—Configured shaping mode: **frame** or **cell**.

```

show class-of-service multi-destination

Syntax

show class-of-service multi-destination

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

For each class-of-service (CoS) multidestination classifier, display the classifier type.

Options

none—Display all multidestination classifiers.

Required Privilege Level

view

Related Documentation

- show class-of-service classifier on page 5821

Output Fields

Table 543 on page 5876 describes the output fields for the **show class-of-service multi-destination** command. Output fields are listed in the approximate order in which they appear.

Table 543: show class-of-service multi-destination Output Fields

Field Name	Field Description
Family ethernet	Family to which the classifier belongs.
Classifier Name	Name of the classifier.
Classifier Type	Type of the classifier: **dscp** or **ieee-802.1**.
Classifier Index	Internal index of the classifier.

Sample Output

show class-of-service multi-destination

user@switch> show class-of-service multi-destination

```
Family ethernet:
Classifier Name             Classifier Type            Classifier Index
  ba-mcast-classifier         ieee-802.1                 62376
```

show class-of-service rewrite-rule

Syntax

show class-of-service rewrite-rule
<name *name*>
<type *type*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the mapping of forwarding classes and loss priority to code point values.

Options

none—Display all rewrite rules.

name *name*—(Optional) Display the specified rewrite rule.

type *type*—(Optional) Display the rewrite rule of the specified type. The rewrite rule type can be one of the following:

- **dscp**—For IPv4 traffic.
- **dscp-ipv6**—For IPv6 traffic.
- **exp**—For MPLS traffic.
- **frame-relay-de**—(J Series routers only) For Frame Relay traffic.
- **ieee-802.1**—For Layer 2 traffic.
- **inet-precedence**—For IPv4 traffic.

Required Privilege Level

view

List of Sample Output

show class-of-service rewrite-rule type dscp on page 5878
show class-of-service rewrite-rule type dscp (QFX Series) on page 5878

Output Fields

Table 544 on page 5877 describes the output fields for the **show class-of-service rewrite-rule** command. Output fields are listed in the approximate order in which they appear.

Table 544: show class-of-service rewrite-rule Output Fields

Field Name	Field Description
Rewrite rule	Name of the rewrite rule.
Code point type	Type of rewrite rule: **dscp**, **dscp-ipv6**, **exp**, **frame-relay-de**, or **inet-precedence**.
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router or switch.
Index	Internal index for this particular rewrite rule.
Loss priority	Loss priority for rewriting.

Table 544: show class-of-service rewrite-rule Output Fields *(continued)*

Field Name	Field Description
Code point	Code point value to rewrite.

Sample Output

show class-of-service rewrite-rule type dscp

```
user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp
  Forwarding class                    Loss priority       Code point

show class-of-service scheduler-map

Syntax show class-of-service scheduler-map
<*name*>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the mapping of schedulers to forwarding classes and a summary of scheduler parameters for each entry.

Options **none**—Display all scheduler maps.

name—(Optional) Display a summary of scheduler parameters for each forwarding class to which the named scheduler is assigned.

Required Privilege Level view

List of Sample Output show class-of-service scheduler-map on page 5880

Output Fields Table 545 on page 5879 describes the output fields for the **show class-of-service scheduler-map** command. Output fields are listed in the approximate order in which they appear.

Table 545: show class-of-service scheduler-map Output Fields

Field Name	Field Description
Scheduler map	Name of the scheduler map.
Index	Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.
Scheduler	Name of the scheduler.
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
Transmit rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword **remainder**, which indicates that the scheduler receives the remaining bandwidth of the interface.
Rate Limit	Rate limiting configuration of the queue. Possible values are **none**, meaning no rate limiting, and **exact**, meaning the queue only transmits at the configured rate.
Maximum buffer delay	Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword **remainder** to indicate that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	Scheduling priority: **low** or **high**.

Table 545: show class-of-service scheduler-map Output Fields *(continued)*

Field Name	Field Description
Excess priority	Priority of excess bandwidth: **low**, **medium-low**, **medium-high**, **high**, or **none**.
Adjust minimum	Minimum shaping rate for an adjusted queue, in bps.
Adjust percent	Bandwidth adjustment applied to a queue, in percent.
Drop profiles	Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.
Loss priority	Packet loss priority for drop profile assignment.
Protocol	Transport protocol for drop profile assignment.
Name	Name of the drop profile.

Sample Output

show class-of-service scheduler-map

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84

  Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
   Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
   Priority: high
   Drop profiles:
    Loss priority    Protocol    Index    Name
     Low             non-TCP     8724     aa-drop-profile
     Low             TCP         9874     bb-drop-profile
     High            non-TCP     8833     cc-drop-profile
     High            TCP         8484     dd-drop-profile

  Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
   Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
   Priority: high
   Drop profiles:
    Loss priority    Protocol    Index    Name
     Low             non-TCP     8724     aa-drop-profile
     Low             TCP         9874     bb-drop-profile
     High            non-TCP     8833     cc-drop-profile
     High            TCP         8484     dd-drop-profile
```

show class-of-service shared-buffer

Syntax

show class-of-service shared-buffer
<egress | ingress>

Release Information

Command introduced in Junos OS Release 12.3 for the QFX Series.

Description

Display the shared buffer allocation and partitioning configuration.

Options

none—Display ingress and egress shared buffer settings.

egress—(Optional) Display the egress shared buffer settings.

ingress—(Optional) Display the ingress shared buffer settings.

Required Privilege Level

List of Sample Output

show class-of-service shared-buffer on page 5882

Output Fields

Table 546 on page 5881 describes the output fields for the **show class-of-service shared-buffer** command. Output fields are listed in the approximate order in which they appear.

Table 546: show class-of-service shared-buffer Output Fields

Field Name	Field Description
Ingress	Ingress shared buffer configuration.
Total Buffer	Total buffer space available to the ports in KB. This is the combined dedicated buffer pool and shared buffer pool.
Dedicated Buffer	Buffer space allocated to the dedicated buffer pool in KB.
Shared Buffer	Buffer space allocated to the shared buffer pool in KB.
Lossless	Buffer space allocated to the lossless traffic buffer pool in KB.

Table 546: show class-of-service shared-buffer Output Fields *(continued)*

Field Name	Field Description
Lossless Headroom	Buffer space allocated to the lossless headroom traffic buffer pool to support priority-based flow control (PFC) and Ethernet PAUSE in KB. (Ingress ports only.)
Lossy	Buffer space allocated to the lossy (best-effort) traffic buffer pool in KB.
Lossless Headroom Utilization	Utilization of the ingress lossless headroom buffer pool. (These fields can help you to determine how much headroom buffer space you need to reserve to support PFC and Ethernet PAUSE for lossless flows.)
Node Device	Index number that identifies the switch. On a QFX3500 switch, this field always has a value of zero (0).
Total	Size of the lossless headroom ingress buffer pool in KB.
Used	Amount in KB of lossless headroom ingress buffer used.
Free	Amount in KB of lossless headroom ingress buffer free (unused).
Egress	Egress shared buffer configuration.
Multicast	Buffer space allocated to the multicast traffic buffer pool in KB. (Egress ports only.)

Sample Output

show class-of-service shared-buffer

```
user@switch> show class-of-service shared-buffer
Ingress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2158.00 KB
  Shared Buffer    :  7202.00 KB
    Lossless          :  648.18 KB
    Lossless Headroom :  3240.90 KB
    Lossy             :  3312.92 KB

  Lossless Headroom Utilization:
  Node Device         Total          Used                  Free
  0                   3240.90 KB     0.00 KB               3240.90 KB

Egress:
  Total Buffer     :  9360.00 KB
  Dedicated Buffer :  2704.00 KB
  Shared Buffer    :  6656.00 KB
    Lossless          :  3328.00 KB
    Multicast         :  1264.64 KB
    Lossy             :  2063.36 KB
```

show class-of-service traffic-control-profile

Syntax

show class-of-service traffic-control-profile
<*profile-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Routers.

Description

For Gigabit Ethernet IQ PICs, Channelized IQ PICs, EQ DPCs, and Trio MPC/MIC interfaces only, display traffic shaping and scheduling profiles.

(ACX Series routers) For ATM IMA pseudowire interfaces, display traffic shaping and scheduling profiles.

Options

none—Display all profiles.

profile-name—(Optional) Display information about a single profile.

Required Privilege Level

view

List of Sample Output

show class-of-service traffic-control-profile on page 5885
show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC) on page 5885
show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces) on page 5885

Output Fields

Table 547 on page 5883 describes the output fields for the **show class-of-service traffic-control-profile** command. Output fields are listed in the approximate order in which they appear.

Table 547: show class-of-service traffic-control-profile Output Fields

Field Name	Field Description
Traffic control profile	Name of the traffic control profile.
Index	Index number of the traffic control profile.
ATM Service	(MX Series routers with ATM Multi-Rate CE MIC) Configured category of ATM service. Possible values: • cbr—Constant bit rate. • rtvbr—Real time variable bit rate. • nrtvbr—Non real time variable bit rate. • ubr—Unspecified bit rate.
Maximum Burst Size	Configured maximum burst size, in cells.
Peak rate	Configured peak rate, in cps.

Table 547: show class-of-service traffic-control-profile Output Fields *(continued)*

Field Name	Field Description
Sustained rate	Configured sustained rate, in cps.
Shaping rate	Configured shaping rate, in bps. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) Configured peak rate, in cps.
Shaping rate burst	Configured burst size for the shaping rate, in bytes. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.
Shaping rate priority high	Configured shaping rate for high-priority traffic, in bps.
Shaping rate priority medium	Configured shaping rate for medium-priority traffic, in bps.
Shaping rate priority low	Configured shaping rate for low-priority traffic, in bps.
Shaping rate excess high	Configured shaping rate for high-priority excess traffic, in bps.
Shaping rate excess low	Configured shaping rate for low-priority excess traffic, in bps.
Scheduler map	Name of the associated scheduler map.
Delay Buffer rate	Configured delay buffer rate, in bps.
Excess rate	Configured excess rate, in percent or proportion.
Excess rate high	Configured excess rate for high priority traffic, in percent or proportion.
Excess rate low	Configured excess rate for low priority traffic, in percent or proportion.
Guaranteed rate	Configured guaranteed rate, in bps or cps. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: • **cbr**—Guaranteed rate is equal to the configured peak rate in cps. • **rtvbr**—Guaranteed rate is equal to the configured sustained rate in cps. • **nrtvbr**—Guaranteed rate is equal to the configured sustained rate in cps.
Guaranteed rate burst	Configured burst size for the guaranteed rate, in bytes.
adjust-minimum	Configured minimum shaping rate for an adjusted queue, in bps.

Table 547: show class-of-service traffic-control-profile Output Fields *(continued)*

Field Name	Field Description
overhead accounting mode	Configured shaping mode: **Frame Mode** or **Cell Mode**.
Overhead bytes	Configured byte adjustment value.

Sample Output

show class-of-service traffic-control-profile

```
user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3
  Delay Buffer rate: 800000
  Guaranteed rate: 3000000
 .Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
  Scheduler map: m4
  Delay Buffer rate: 750000
  Guaranteed rate: 4000000
..adjust-minimum 20000000
```

show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```
user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
  ATM Service: RTVBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
  Shaping rate: 1000 cps
  Shaping rate burst: 500 cells
  Delay Buffer rate: 2000 cps
  Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
  ATM Service: UBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
```

show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces)

```
user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
  ATM Service: RTVBR
  Shaping rate: 2000 cps
```

```
Shaping rate burst: 200 cells
Scheduler map: <default>
Delay Buffer rate: 1000 cps
Guaranteed rate: 1700 cps
```

show dcbx

Syntax show dcbx

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description List DCBX status (enabled or disabled) and the interfaces on which DCBX is enabled.

Required Privilege Level view

Related Documentation

- show dcbx neighbors on page 5177
- Configuring DCBX Autonegotiation on page 5076

Output Fields Table 395 on page 5176 lists the output fields for the **show dcbx** command. Output fields are listed in the approximate order in which they appear.

Table 548: show dcbx output fields

Field Name	Field Description
DCBX	Status of DCBX on the switch or for the specified interface: • Enabled—DCBX is enabled on the switch or on the specified interface • Disabled—DCBX is disabled on the switch or on the specified interface
Interface	Name of the interface

Sample Output

show dcbx

```
user@switch> show dcbx
DCBX                                : Enabled
Interface         DCBX
xe-0/0/9.0        enabled
xe-0/0/32.0       enabled
xe-0/0/36.0       enabled
```

show dcbx neighbors

Syntax

show dcbx neighbors
<**interface** *interface-name*>
<**terse**>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 11.3 for EX Series switches.

Description

Display information about Data Center Bridging Capability Exchange protocol (DCBX) neighbor interfaces.

Options

none—Display information about all DCBX neighbor interfaces.

interface-name—(Optional) Display information for the specified interface.

terse—Display the specified level of output.

Required Privilege Level

Output Fields

Table 396 on page 5177 lists the output fields for the **show dcbx neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 549: show dcbx neighbors Output Fields

Field Name	Field Description
Interface	Name of the interface.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
Parent Interface		Name of the link aggregation group (LAG) interface to which the DCBX interface belongs.
Active-application-map		Name of the application map applied to the interface.
Protocol-Mode		(QFX Series) DCBX protocol mode the interface uses: • IEEE DCBX Version—The interface uses IEEE DCBX mode. • DCBX Version 1.01—The interface uses DCBX version 1.01. NOTE: On interfaces that use the IEEE DCBX mode, the **show dcbx neighbors interface** ***interface-name*** operational command does not include application, PFC, or ETS operational state in the output.
Protocol-State		(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.
Local-Advertisement		(DCBX Version 1.01 only) Status of advertisements that the local interface sends to the peer.
	Operational version	Version of the DCBX standard used.
	sequence-number	Number of state change messages sent to the peer. If the interface **Protocol-State** value is **in-sync**, this number should match the **acknowledge-id** number in the **Peer-Advertisement** section. If the interface **Protocol-State** value is **ack-pending**, this number does not match the **acknowledge-id** number in the **Peer-Advertisement** section.
	acknowledge-id	Number of acknowledge messages received from the peer. If the **Protocol-State** value is **in-sync**, this number should match the **sequence-number** value in the **Peer-Advertisement** section. If the **Protocol-State** value is **ack-pending**, this number does not match the **sequence-number** value in the **Peer-Advertisement** section.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
Peer-Advertisement		(DCBX Version 1.01 only) Status of advertisements that the peer sends to the local interface.
	Operational version	Version of the DCBX standard used.
	sequence-number	Number of state change messages the peer sent to the local interface. If this number matches the **acknowledge-id** number in the **Local-Advertisement** field, this indicates that the local interface has acknowledged all of the peer's state change messages and is synchronized. If this number does not match the **acknowledge-id** number in the **Local-Advertisement** field, this indicates that the peer has not yet received an acknowledgment for a state change message from the local interface.
	acknowledge-id	Number of acknowledge messages the peer has received from the local interface. If this number matches the **sequence-number** value in the **Local-Advertisement** field, this indicates that the peer has acknowledged all of the local interface's state change messages and is in synchronization. If this number does not match the **sequence-number** value in the **Local-Advertisement** field, this indicates that the peer has not yet sent an acknowledgment for a state change message from the local interface.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: PFC			Priority-based flow control (PFC) feature DCBX state information.
	Protocol-State		(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface. • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface. • **not-applicable**—PFC autonegotiation is disabled.
	Operational State		(DCBX Version 1.01 only) Operational state of the feature: **enabled** or **disabled**.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		Willing	Willingness of the local interface to learn the PFC configuration from the peer using DCBX: • **Yes**—The local interface is willing to learn the PFC configuration from the peer. • **No**—The local interface is not willing to learn the PFC configuration from the peer.
		Mac auth Bypass Capability	(IEEE DCBX only) (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. This is not supported, so the only value seen in the local advertisement field is **no**.
		Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
		Operational State	PFC operational state on the interface: • Enabled—PFC is enabled on the interface • Disabled—PFC is disabled on the interface
		Maximum Traffic Classes capable to support PFC	Largest number of traffic classes the local interface supports for PFC: • **6** (EX Series switches) • **8** (QFX Series)
		Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
		Admin Mode	PFC administrative state for each code point on the local interface: • **Enabled**—PFC is enabled for the code point. • **Disabled**—PFC is disabled for the code point.
		Operational Mode	(QFX Series) PFC operational mode for each code point: • Enable—PFC is enabled on the code point. • Disable—PFC is disabled on the code point.
	Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
		Enable	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		Willing	Willingness of the peer to learn the PFC configuration from the local interface using DCBX: • **Yes**—The peer is willing to learn the PFC configuration from the local interface. • **No**—The peer is not willing to learn the PFC configuration from the local interface.
		Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Operational State	PFC operational state on the interface: • Enabled—PFC is enabled on the interface • Disabled—PFC is disabled on the interface
	Mac auth Bypass Capability	(IEEE DCBX only) (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. Although the QFX Series does not support this feature, the connected peer might support it. This field reports the peer state: • **Yes**—The connected peer supports MAC authentication bypass. • **No**—The connected peer does not support MAC authentication bypass.
	Maximum Traffic Classes capable to support PFC	Largest number of traffic classes the peer supports for PFC: • **6** (EX Series switches) • **8** (QFX Series)
	Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Admin Mode	PFC administrative state for each code point on the peer: • **Enabled**—PFC is enabled for the code point. • **Disabled**—PFC is disabled for the code point.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: Application			State information for the DCBX application.
	Protocol-State		(DCBX Version 1.01 only) DCBX protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface. • **not-applicable**—The local interface is set to **no-auto-negotiation** (autonegotiation is disabled). If the interface is associated with an FCoE forwarding class, the interface advertises FCoE capability even if the connected peer does not advertise FCoE capability.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer. If the local interface is set to **no-auto-negotiation** (autonegotiation is disabled), the local advertisement portion of the output is not shown.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		Willing	(DCBX Version 1.01 only) Willingness of the local interface to learn the FCoE interface state from the peer using DCBX: • **Yes**—The local interface is willing to learn the FCoE interface state from the peer. • **No**—The local interface is not willing to learn the FCoE interface state from the peer.
		Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. The local and peer configuration are compatible. • **Yes**—Error detected. The local and peer configuration are not compatible.
		Appl-Name	Name of the application:

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
	Ethernet-Type	(DCBX Version 1.01 only) Ethernet type (EtherType) of the application. For example, **0x8906** indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Socket-Number	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
	Priority-Field or **Priority-Map**	Priority assigned to the application. For EX Series switches, the priority of the FCoE application is determined by the PFC congestion notification profile that has been configured and associated with the FCoE interface. For other applications, the priority is based on the application map.
	Status	(DCBX Version 1.01 only) Local status when autonegotiation is enabled: • **Enabled**—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.) • **Disabled**—The local configuration and the peer configuration do not match. NOTE: If there is a configuration mismatch in one application between the switch and the peer, all the other applications including FCoE are disabled.
Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
	Enable	(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
	Willing	(DCBX Version 1.01 only) Willingness of the peer to learn the FCoE interface state from the local interface using DCBX: • **Yes**—The peer is willing to learn the FCoE interface state from the local interface. • **No**—The peer is not willing to learn the FCoE interface state from the local interface.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Error	(DCBX Version 1.01 only) Configuration compatibility error status: • **No**—No error detected. Local and peer configuration are compatible. • **Yes**—Error detected. Local and peer configuration are not compatible.
Appl-Name	Name of the application: • **FCoE**—Fibre Channel over Ethernet
Ethernet-Type	Ethernet type (EtherType) of the application. For example, **0x8906** indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket-Number (for Layer 4 applications) of the application is displayed in the output.
Socket-Number	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
Priority-Field or **Priority-Map**	Priority assigned to the application.
Status	(DCBX Version 1.01 only) Peer interface status: • **Enabled**—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.) • **Disabled**—The local configuration and the peer configuration do not match.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
Feature: ETS			Enhanced Transmission Selection (ETS) DCBX state information.
	Protocol-State		(DCBX Version 1.01 only) ETS protocol state synchronization status: • **in-sync**—The local interface received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface. • **ack-pending**—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.
	Operational State		(DCBX Version 1.01 only) Operational state of the feature, **enabled** or **disabled**.
	Local-Advertisement		Status of advertisements that the local interface sends to the peer.
		Enable	(DCBX Version 1.01 only) State that the local interface advertises to the peer: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
		TLV Type	(IEEE DCBX only) Type of ETS TLV: • Configuration—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration. • Recommendation—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration. • Recommendation-or-Configuration—Advertises both TLVs.
		Willing	Willingness of the local interface to learn the ETS state from the peer using DCBX (EX Series switches always advertise **No** for this field): • **Yes**—Local interface is willing to learn the ETS state from the peer. • **No**—Local interface is not willing to learn the ETS state from the peer.
		Credit Based Shaper	

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name			Field Description
			(IEEE DCBX only) Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always **No**.
		Error	(DCBX Version 1.01 only) Configuration error status: • **No**—No error. This should always be the switch ETS error state. • **Yes**—Error detected.
		Maximum Traffic Classes capable to support PFC	(DCBX Version 1.01 only) Largest number of traffic classes the local interface supports for PFC.
		Maximum Traffic Classes supported	(IEEE DCBX only) Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
		Code Point	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
		Priority-Group	Class-of-service (CoS) priority group (forwarding class set) identification number.
		Percentage B/W	Configured minimum percentage of link bandwidth allocated to the priority group. Only explicitly configured values appear in this output column. If the link bandwidth is the default percentage, it is not shown. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
		Transmission Selection Algorithm	(IEEE DCBX only) The transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is **ETS**.
	Peer-Advertisement		Status of advertisements that the peer sends to the local interface.
		Enable	

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
		(DCBX Version 1.01 only) State that the peer advertises to the local interface: • **Yes**—The feature is enabled. • **No**—The feature is disabled.
	TLV Type	(IEEE DCBX only) Type of ETS TLV: • Configuration—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration. • Recommendation—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration. • Configuration/Recommendation—Advertises both TLVs.
	Willing	Willingness of the peer to learn the ETS state from the local interface using DCBX: • **Yes**—Peer is willing to learn the ETS state from the local interface. • **No**—Peer is not willing to learn the ETS state from the local interface.
	Credit Based Shaper	(IEEE DCBX only) Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always **No**.
	Error	(DCBX Version 1.01 only) Configuration error status of the peer: • **No**—No error in peer ETS TLV. • **Yes**—Error in peer ETS TLV.
	Maximum Traffic Classes capable to support PFC	(DCBX Version 1.01 only) Largest number of traffic classes the local interface supports for PFC.
	Maximum Traffic Classes supported	(IEEE DCBX only) Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
	Code Point	

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name		Field Description
		PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
	Priority-Group	CoS priority group (forwarding class set) identification number.
	Percentage B/W	Configured minimum percentage of link bandwidth allocated to the priority group. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
	Transmission Selection Algorithm	(IEEE DCBX only) Transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is **ETS**.
PFC		(QFX Series, **terse** option only) DCBX TLV advertisement state for PFC: • Disabled—PFC configuration matches the configuration on the connected peer and PFC is disabled • Enabled—PFC configuration matches the configuration on the connected peer and PFC is enabled • Not Advt—Interface does not advertise PFC to the connected peer
ETS		(**terse** option only) Local DCBX TLV advertisement state for ETS: • Advt—Interface advertises ETS TLVs • Disabled—ETS is disabled on the interface (interface does not advertise ETS)
ETS Rec		(**terse** option only) DCBX TLV peer advertisement state for ETS (state received from the connected DCBX peer): • Advt—Peer interface advertises ETS TLVs • Not Advt—Peer interface does not advertise ETS NOTE: When the DCBX mode is DCBX version 1.01, no peer information is displayed.

Table 549: show dcbx neighbors Output Fields *(continued)*

Field Name	Field Description
Version	(**terse** option only) The DCBX version used on the interface and whether the DCBX version was autonegotiated or explicitly configured: • **IEEE**—The interface uses IEEE DCBX. • **1.01**—The interface uses DCBX version 1.01. When the DCBX version used is the result of autonegotiation, the term **(Auto)** appears next to the version. For example, **IEEE (Auto)** indicates that the interface autonegotiated with the connected peer to use IEEE DCBX. Autonegotiation is enabled by default.

show interfaces queue

Syntax

show interfaces queue
<aggregate | remaining-traffic>
<both-ingress-egress>
<egress>
<forwarding-class *forwarding-class*>
<ingress>
<interface-name *interface-name*>
<l2-statistics>

Release Information

Command introduced before Junos OS Release 7.4.
both-ingress-egress, **egress**, and **ingress** options introduced in Junos OS Release 7.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
l2-statistics option introduced in Junos OS Release 12.1.

Description

Display class-of-service (CoS) queue information for physical interfaces.

Options

none—Show detailed CoS queue statistics for all physical interfaces.

aggregate—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

both-ingress-egress—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

egress—(Optional) Display egress queue statistics.

forwarding-class *forwarding-class*—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

ingress—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

interface-name *interface-name*—(Optional) Show detailed CoS queue statistics for the specified interface.

l2-statistics—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

remaining-traffic—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.

Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in Table 189 on page 2201. Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in Table 189 on page 2201.

Table 550: Layer 2 Overhead, Transmitted Packets/Bytes

Protocol	Fragmentation		LFI
	First fragmentation	Second to n fragmentations	
	Bytes	Bytes	
MLPPP (Long)	13	12	8
MLPPP (short)	11	10	8
MLFR (FRF15)	12	10	8
MFR (FRF16)	10	8	-
MCMLPPP(Long)	13	12	-
MCMLPPP(Short)	11	10	-

Layer 2 Statistics - Fragmentation Overhead Calculation

```
MLPPP/MC-MLPPP Overhead details:
   ===============================
   Fragment 1:

    Outer PPP header                           : 4 bytes
    Long or short sequence MLPPP header        : 4 bytes or 2 bytes
    Inner PPP header                           : 1 byte
    HDLC flag and FCS bytes                    : 4 bytes

   Fragments 2 .. n :

    Outer PPP header                           : 4 bytes
    Long or short sequence MLPPP header        : 4 bytes or 2 bytes
    HDLC flag and FCS bytes                    : 4 bytes

   MLFR (FRF15) Overhead details:
   =============================
   Fragment 1:
       Framerelay header     :  2 bytes
       Control,NLPID         :  2 bytes
       Fragmentaion header   :  2 bytes
       Inner proto           :  2 bytes
       HDLC flag and  FCS    :  4 bytes

   Fragments 2 ...n :

       Framerelay header     :  2 bytes
       Control,NLPID         :  2 bytes
       Fragmentaion header   :  2 bytes
       HDLC flag and  FCS    :  4 bytes

   MFR (FRF16) Overhead details:
   ==============================
```

```
   Fragment 1:
      Fragmentaion header   :  2 bytes
      Framerelay header     :  2 bytes
      Inner proto           :  2 bytes
      HDLC flag and  FCS    :  4 bytes

   Fragments 2 ...n :
      Fragmentaion header   :  2 bytes
      Framerelay header     :  2 bytes
      HDLC flag and  FCS    :  4 bytes
```

Overhead with LFI

```
MLPPP(Long & short sequence):
   ============================
       Outer PPP header      :  4 bytes
       HDLC flag and  FCS    :  4 bytes

  MLFR (FRF15):
  =============
       Framerelay header     :  2 bytes
       Control,NLPID         :  2 bytes
       HDLC flag and  FCS    :  4 bytes
```

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

remaining-traffic—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs), rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

NOTE: For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the CLI Explorer.

show interfaces queue ingress (Gigabit Ethernet IQ2 PIC) on page 5931
show interfaces queue egress (Gigabit Ethernet IQ2 PIC) on page 5932
show interfaces queue remaining-traffic (Gigabit Ethernet Enhanced DPC) on page 5933
show interfaces queue (Channelized OC12 IQE Type 3 PIC in SONET Mode) on page 5936
show interfaces queue (QFX Series) on page 5946
show interfaces queue l2-statistics (lsq interface) on page 5947

Output Fields Table 190 on page 2204 lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

Table 551: show interfaces queue Output Fields

Field Name	Field Description
Physical interface	Name of the physical interface.
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.
Interface index	Physical interface's index number, which reflects its initialization sequence.
SNMP ifIndex	SNMP index number for the interface.
Forwarding classes supported	Total number of forwarding classes supported on the specified interface.
Forwarding classes in use	Total number of forwarding classes in use on the specified interface.
Ingress queues supported	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface.
Ingress queues in use	On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.
Output queues supported	Total number of output queues supported on the specified interface.
Output queues in use	Total number of output queues in use on the specified interface.
Egress queues supported	Total number of egress queues supported on the specified interface.
Egress queues in use	Total number of egress queues in use on the specified interface.
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.
Burst size	(Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.
The following output fields are applicable to both interface component and Packet Forwarding component in the **show interfaces queue** command:	
Queue	Queue number.
Forwarding classes	Forwarding class name.

Table 551: show interfaces queue Output Fields *(continued)*

Field Name	Field Description
Queued Packets	Number of packets queued to this queue. NOTE: For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router. For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see "Additional Information" on page 2202.
Queued Bytes	Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see Table 191 on page 2207. For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see "Additional Information" on page 2202.
Transmitted Packets	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values. NOTE: For Layer 2 statistics, see "Overhead for Layer 2 Statistics" on page 2200
Transmitted Bytes	Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see Table 191 on page 2207. NOTE: On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation. NOTE: For Layer 2 statistics, see "Overhead for Layer 2 Statistics" on page 2200
Tail-dropped packets	Number of packets dropped because of tail drop.
RL-dropped packets	Number of packets dropped due to rate limiting. For rate-limited interfaces hosted on MICs or MPCs only, this statistic is not included in the queued traffic statistics. For more information, see "Additional Information" on page 2202.
RL-dropped bytes	Number of bytes dropped due to rate limiting. For rate-limited interfaces hosted on MICs or MPCs only, this statistic is not included in the queued traffic statistics. For more information, see "Additional Information" on page 2202.

Table 551: show interfaces queue Output Fields *(continued)*

<table>
<tr><th>Field Name</th><th>Field Description</th></tr>
<tr><td>RED-dropped packets</td><td>Number of packets dropped because of random early detection (RED).
(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories:
Low, non-TCP—Number of low-loss priority non-TCP packets dropped because of RED.
Low, TCP—Number of low-loss priority TCP packets dropped because of RED.
High, non-TCP—Number of high-loss priority non-TCP packets dropped because of RED.
High, TCP—Number of high-loss priority TCP packets dropped because of RED.
(J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories:
Low—Number of low-loss priority packets dropped because of RED.
Medium-low—Number of medium-low loss priority packets dropped because of RED.
Medium-high—Number of medium-high loss priority packets dropped because of RED.
High—Number of high-loss priority packets dropped because of RED.
NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</td></tr>
<tr><td>RED-dropped bytes</td><td>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see Table 191 on page 2207.
(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories:
Low, non-TCP—Number of low-loss priority non-TCP bytes dropped because of RED.
Low, TCP—Number of low-loss priority TCP bytes dropped because of RED.
High, non-TCP—Number of high-loss priority non-TCP bytes dropped because of RED.
High, TCP—Number of high-loss priority TCP bytes dropped because of RED.
(J Series routers only) The output classifies dropped bytes into the following categories:
Low—Number of low-loss priority bytes dropped because of RED.
Medium-low—Number of medium-low loss priority bytes dropped because of RED.
Medium-high—Number of medium-high loss priority bytes dropped because of RED.
High—Number of high-loss priority bytes dropped because of RED.
NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</td></tr>
</table>

Byte counts vary by interface hardware. Table 191 on page 2207 shows how the byte counts on the outbound interfaces vary depending on the interface hardware. Table 191 on page 2207 is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 552: Byte Count by Interface Hardware

Interface Hardware	Output Level	Byte Count Includes	Comments
Gigabit Ethernet IQ and IQE PICs	Interface	Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes	The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type. For RED dropped, 6 bytes are added for the source MAC address.
	Packet forwarding component	Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet	–
Non-IQ PIC	Interface	T Series, TX Series, T1600, and MX Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet. T4000 routers with Type 5 FPCs : • Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Inter frame Gap. • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Interframe Gap. M Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead. PTX Series Packet Transport Routers: • Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes FCS + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). • RED dropped: 478 bytes of Layer 3 packet + 22 bytes special header. To the TQ, this packet has 4 bytes more than queued or transmitted.	The Layer 2 overhead is 14 bytes for non-VLAN traffic and 18 bytes for VLAN traffic.

Table 552: Byte Count by Interface Hardware *(continued)*

Interface Hardware	Output Level	Byte Count Includes	Comments
IQ and IQE PICs with a SONET/SDH interface	Interface	Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes	The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.
	Packet forwarding component	Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes	For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.
Non-IQ PIC with a SONET/SDH interface	Interface	T Series, TX Series, T1600, and MX Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet. M Series routers: • Queued: 478 bytes of Layer 3 packet. • Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes • RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet	For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP).
Interfaces configured with Frame Relay Encapsulation	Interface	The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.	
1-port 10-Gigabit Ethernet IQ2 and IQ2–E PICs 4-port 1G IQ2 and IQ2-E PICs 8-port 1G IQ2 and IQ2-E PICs	Interface	Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC. Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.	The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.
	Packet forwarding component	Queued: 478 bytes of Layer 3 packet. Transmitted: 478 bytes of Layer 3 packet.	–

Sample Output

show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

```
user@host> show interfaces queue ge-4/2/0
Physical interface: ge-4/2/0, Enabled, Physical link is Up

show pfe next-hop

Syntax

show pfe next-hop
<interface *interface-name*>

Syntax (TX Matrix and TX Matrix Plus Routers)

show pfe next-hop
<fpc *slot*>
<interface *interface-name*>
<lcc *number*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Packet Forwarding Engine next-hop information.

Options

none—Display all Packet Forwarding Engine next-hop information.

fpc ***slot***—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**.
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe next-hop fpc 1 lcc 1
user@host> show pfe next-hop fpc 9
```

interface ***interface-name***—(Optional) Display the Packet Forwarding Engine next-hop interface.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine next-hop interface for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine next-hop interface for the router (or line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Required Privilege Level admin

<mpls>
<summary>

Syntax (TX Matrix and TX Matrix Plus Routers)

show pfe route
<fpc *slot*>
<<inet6 | ip | iso> <prefix *prefix*> | <table <*table-name*> <index *index*> <prefix *prefix*>>>
<lcc *number*>
<mpls>
<summary>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.

NOTE: **The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the show route forwarding table command. For more information, see the** CLI Explorer.

Options

none—Display all Packet Forwarding Engine forwarding table information.

fpc ***slot***—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc** *number* option (the recommended method), replace ***slot*** with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **31**
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc** *number* option (the recommended method), replace ***slot***

with a value from **0** through **7**. Otherwise, replace ***slot*** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

index ***index***—(Optional) Display table index.

inet6—(Optional) Display Packet Forwarding Engine IPv6 routes.

ip—(Optional) Display Packet Forwarding Engine IPv4 routes.

iso —(Optional) Display ISO version routing tables.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

mpls—(Optional) Display Packet Forwarding Engine MPLS information.

prefix ***prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

summary—(Optional) Display summary of Packet Forwarding Engine information.

table <*table-name*>—(Optional) Display table information.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display Packet Forwarding Engine status information.

Options

none—Display brief information about the Packet Forwarding Engine.

all-members—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for all members in the Virtual Chassis configuration.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine information for a T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine information for the router (or line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display Packet Forwarding Engine status information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display Packet Forwarding Engine information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display Packet Forwarding Engine information for the TX Matrix Plus router (or switch-fabric chassis).

CHAPTER 65

Troubleshooting

Troubleshooting Procedures

Troubleshooting Dropped FCoE Traffic

Problem Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

Cause There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.

6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

Solution The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

   If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

   If you explicitly configured a forwarding class for FCoE traffic, ensure that:

   - You specified the **no-loss** packet drop attribute in the forwarding class configuration
   - The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
   - The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

   For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority     PFC          MRU
  000          Disabled
  001          Disabled
  010          Disabled
  011          Disabled
  100          Disabled
  101          Enabled      2500
  110          Disabled
  111          Disabled
Type: Output
  Priority     Flow-Control-Queues
  101
               5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.

3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces** ***interface-name***.

4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the ***scheduler-name***) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

   Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the ***traffic-control-profile***) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.

7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See "Example: Configuring CoS PFC for FCoE Traffic" on page 4921 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

Problem The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

Solution When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

Related Documentation

- **shaping-rate on page 5777**
- Example: Configuring Maximum Output Bandwidth on page 5526
- Example: Configuring Queue Schedulers on page 5511
- Understanding CoS Output Queue Schedulers on page 5371

Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

Problem The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

NOTE: **The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)**

Solution When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

- Understanding CoS Output Queue Schedulers on page 5371

Troubleshooting Egress Queue Bandwidth Impacted by Congestion

Problem Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

Cause Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

Solution The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

Related Documentation

Troubleshooting an Unexpected Rewrite Value

Problem Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

NOTE: For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

Cause If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

Solution If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

TIP: If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

NOTE: There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

```
[edit class-of-service rewrite-rules]
```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

Problem In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

Cause Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

Solution If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

   [edit class-of-service]
   user@switch# **set schedulers *scheduler-name* shaping-rate (*rate* | percent *percentage*)**

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

   [edit class-of-service]
   user@switch# **set scheduler-maps *scheduler-map-name* forwarding-class *forwarding-class-name* scheduler *scheduler-name***

3. Associate the scheduler map with a traffic control profile:

   [edit class-of-service]
   user@switch# **set traffic-control-profiles *traffic-control-profile-name* scheduler-map *scheduler-map-name***

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

   [edit class-of-service]
   user@switch# **set interfaces *interface-name* forwarding-class-set *fc-set-name* output-traffic-control-profile *traffic-control-profile-name***

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues. Table 553 on page 5971 shows the topology for this example:

Table 553: Components of the Rate Shaping Troubleshooting Example

Component	Settings
Affected interface	**shpnode:xe-0/0/10**
Scheduler (strict-high priority scheduler)	Name: **shp-sched** Shaping rate: **7g** Priority: **strict-high** NOTE: This example assumes that the scheduler already exists and has been configured as **strict-high** priority, but that rate shaping to prevent the strict-high priority traffic from using all of the port bandwidth has not been applied.
Scheduler map	Name: **shp-map** Forwarding class to associate with the **shp-sched** scheduler: **strict-high** NOTE: This example assumes that a strict-high priority forwarding class has been configured and assigned the name **strict-high**.
Traffic control profile	Name: **shp-tcp** NOTE: This example does not describe how to define a complete traffic control profile.

Table 553: Components of the Rate Shaping Troubleshooting Example *(continued)*

Component	Settings
Forwarding class set	Name: **shp-pg**

To configure the scheduler, map it to the strict-high priority forwarding class, and apply it to interface **shpnode:xe-0/0/10** using the CLI:

1. Specify the scheduler for the strict-high priority queue (**shp-sched**) with a maximum bandwidth of 7 Gbps:

   ```
   [edit class-of-service schedulers]
   user@switch# set shp-sched shaping-rate 7g
   ```

2. Configure a scheduler map (**shp-map**) that associates the scheduler (**shp-sched**) with the forwarding class (**strict-high**):

   ```
   [edit class-of-service scheduler-maps]
   user@switch# set shp-map forwarding-class strict-high scheduler shp-sched
   ```

3. Associate the scheduler map **shp-map** with a traffic control profile (**shp-tcp**):

   ```
   [edit class-of-service traffic-control-profiles]
   user@switch# set shp-tcp scheduler-map shp-map
   ```

4. Associate the traffic control profile **shp-tcp** with a forwarding class set (**shp-pg**) and the affected interface (**shpnode:xe-0/0/10**):

   ```
   [edit class-of-service]
   user@switch# set interfaces shpnode:xe-0/0/10 forwarding-class-set shp-pg
   output-traffic-control-profile shp-tcp
   ```

PART 20

Network Management and Monitoring

CHAPTER 66

Overview

Network Management

Understanding Device and Network Management Features

After you install a QFX Series product in your network, you need to manage the device. The QFX Series products support features that you use to manage the device within the network, including the management of configuration, system performance, fault monitoring, and remote access.

Table 554 on page 5975 lists the device and network management features on the QFX Series.

Table 554: Device and Network Management Features on the QFX Series

Feature	Typical Uses	Documentation
AI-Scripts and Advanced Insight Manager (AIM)—Automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems, and submit problem reports to Juniper Support Systems.	Fault management	*Advanced Insight Scripts (AI-Scripts) Release Notes*

Table 554: Device and Network Management Features on the QFX Series *(continued)*

Feature	Typical Uses	Documentation
Alarms and LEDs on the switch—Show status of hardware components and indicate warning or error conditions.	Fault management	"Chassis Alarm Messages on a QFX3500 Device" on page 6430
Firewall filters—Control the packets that are sent to and from the network, balance network traffic, and optimize performance.	Performance management	• *Routing Policy Feature Guide for Routing Devices* • Overview of Firewall Filters on page 4409
In-band management—Enables connection to the switch using the same interfaces through which customer traffic flows. Communication between the switch and a remote console is typically enabled using SSH and Telnet services. SSH provides secure encrypted communications, whereas Telnet provides unencrypted, and therefore less secure, access to the switch.	Remote access management	• Configuring SSH Service for Remote Access to the Router or Switch on page 1243 • *Configuring Telnet Service for Remote Access to a Router or Switch*
Juniper Networks Junos OS automation scripts—Configuration and operations automation tools provided by Junos OS. These tools include commit scripts, operation scripts, event scripts, and event policies. Commit scripts enforce custom configuration rules, whereas operation scripts, event policies, and event scripts automate network troubleshooting and management.	• Configuration management • Performance management • Fault management	*Junos OS Automation Library*
Junos OS command-line interface (CLI)—CLI configuration statements that enable you to configure the switch based on your networking requirements, such as security, service, and performance.	• Configuration management • Performance management • User access management • Remote access management	*CLI User Guide*
Junos Space software—Multipurpose GUI-based network management system that includes a base platform, the Network Application Platform, and other optional applications such as Ethernet Design, Service Now, Service Insight, and Virtual Control.	• Configuration management • Performance management • Fault management	• Understanding Junos Space Support on page 5999 • *Junos Space Network Application Platform User Guide*
Junos XML API—XML representation of Junos OS configuration statements and operational mode commands. Junos XML configuration tag elements are the content to which the Junos XML protocol operations apply. Junos XML operational tag elements are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device. The Junos XML API also includes tag elements that are the counterpart to Junos CLI configuration statements.	• Configuration management • Performance management • Fault management	• *Junos XML API Configuration Developer Reference* • *Junos XML API Operational Developer Reference*

Table 554: Device and Network Management Features on the QFX Series *(continued)*

Feature	Typical Uses	Documentation
NETCONF XML management protocol—XML-based management protocol that client applications use to request and change configuration information on routing, switching, and security platforms running Junos OS. The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as **show**, **set**, and **commit** to perform those operations.	• Configuration management • Performance management • Fault management	*NETCONF XML Management Protocol Developer Guide*
Operational mode commands—May be used to do the following: • Monitor switch performance. For example, the **show chassis routing-engine** command shows the CPU utilization of the Routing Engine. High CPU utilization of the Routing Engine can affect performance of the switch. • View current activity and status of the device or network. For example, you can use the **ping** command to monitor and diagnose connectivity problems, and the **traceroute** command to locate points of failure on the network.	• Performance management • Fault management	CLI Explorer
Out-of-band management—Enables connection to the switch through a management interface. Out-of-band management is supported on two dedicated management Ethernet interfaces as well as on the console and auxiliary ports. The management Ethernet interfaces connect directly to the Routing Engine. No transit traffic is allowed through the interfaces, separating customer and management traffic and ensuring that congestion or failures in the transit network do not affect the management of the switch.	Remote access management	• *Connecting a QFX3500 Device to a Network for Out-of-Band Management* • *Connecting a QFX Series Device to a Management Console* • Configuring Console and Auxiliary Port Properties on page 6101
SNMP Configuration Management MIB—Provides notification for configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable.	Configuration management	*SNMP MIBs and Traps Reference*

Table 554: Device and Network Management Features on the QFX Series *(continued)*

Feature	Typical Uses	Documentation
SNMP MIBs and traps—Enable the monitoring of network devices from a central location. Use SNMP requests such as **get** and **walk** to monitor and view system activity. The QFX3500 switch supports SNMP Version 1 (v1), v2, and v3, and both standard and Juniper Networks enterprise-specific MIBs and traps.	Fault management	• *SNMP MIBs and Traps Reference* • Understanding the Implementation of SNMP on page 6021
System log messages—Log details of system and user events, including errors. You can specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	• Fault management • User access management	• *Junos OS System Log Messages Reference* • Overview of Junos OS System Log Messages on page 6068 • Overview of Single-Chassis System Logging Configuration on page 6069

Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log *filename*** operational mode command to view messages.
- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.
- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

Understanding Telnet on the QFabric System

This topic describes the support for the Telnet protocol on QFabric systems.

Telnet service is available for devices running Junos OS, including QFX Series devices. However, on QFabric systems, Telnet support is limited and the following conditions apply:

- You can telnet from a QFabric system to external devices that are connected to the QFabric system by way of the network Node group. To connect to these external devices, issue the **telnet** command from the QFabric default partition CLI.
- You cannot use the Telnet protocol to connect from the QFabric system default partition CLI to individual components. To access system components, you must issue the **request component login** command instead.

Understanding Tracing and Logging Operations

Tracing and logging operations enable you to track events that occur in the switch—both normal operations and error conditions—and to track the packets that are generated by or passed through the switch. The results of tracing and logging operations are placed in files in the **/var/log** directory on the switch.

The Junos OS supports remote tracing for the following processes:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

You configure remote tracing by using the **tracing** statement at the **[edit system]** hierarchy level.

NOTE: **The tracing statement is not supported on the QFX3000 QFabric system.**

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit *process-name* traceoptions]** hierarchy level. This feature does not alter local tracing functionality in any way, and logging files are stored on the switch.

Logging operations use a system logging mechanism similar to the UNIX **syslogd** utility to record systemwide, high-level operations, such as interfaces going up or down and users logging in to or out of the switch. You configure these operations by using the **syslog** statement at the **[edit system]** hierarchy level and by using the **options** statement at the **[edit ethernet-switching-options]** hierarchy level.

Tracing operations record more detailed information about the operations of the switch, including packet forwarding and routing information. To configure tracing operations, use the **traceoptions** statement.

NOTE: **The traceoptions statement is not supported on the QFX3000 QFabric system.**

You can define tracing operations in different portions of the switch configuration:

- SNMP agent activity tracing operations—Define tracing of the activities of SNMP agents on the switch. You configure SNMP agent activity tracing operations at the **[edit snmp]** hierarchy level.
- Global switching tracing operations—Define tracing for all switching operations. You configure global switching tracing operations at the **[edit ethernet-switching-options]** hierarchy level of the configuration.
- Protocol-specific tracing operations—Define tracing for a specific routing protocol. You configure protocol-specific tracing operations in the **[edit protocols]** hierarchy when configuring the individual routing protocol. Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.
- Tracing operations within individual routing protocol entities—Some protocols allow you to define more granular tracing operations. For example, in Border Gateway Protocol (BGP), you can configure peer-specific tracing operations. These operations override any equivalent BGP-wide operations or, if there are no equivalents, supplement them. If you do not specify any peer-specific tracing operations, the peers inherit, first, all the BGP-wide tracing operations and, second, the global tracing operations.
- Interface tracing operations—Define tracing for individual interfaces and for the interface process itself. You define interface tracing operations at the **[edit interfaces]** hierarchy level of the configuration.
- Remote tracing—To enable system-wide remote tracing, configure the **destination-override syslog host** statement at the **[edit system tracing]** hierarchy level. This specifies the remote host running the system log process (syslogd), which collects the traces. Traces are written to files on the remote host in accordance with the syslogd configuration in **/etc/syslog.conf**. By default, remote tracing is not configured.

  To override the system-wide remote tracing configuration for a particular process, include the **no-remote-trace** statement at the **[edit *process-name* traceoptions]** hierarchy. When **no-remote-trace** is enabled, the process does local tracing.

To collect traces, use the **local0** facility as the selector in the **/etc/syslog.conf** file on the remote host. To separate traces from various processes into different files, include the process name or trace-file name (if it is specified at the [edit ***process-name*** **traceoptions file**] hierarchy level) in the Program field in the **/etc/syslog.conf** file. If your system log server supports parsing hostname and program name, then you can separate traces from the various processes.

NOTE: During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

Automation

Overview of QFX5100 Switch Automation Enhancements

The QFX5100 switch automation enhancements introduced in Junos OS Release 13.2X51-D15 are designed to support the increasing needs of large data centers for more automation and programmability.

Features of the QFX5100 Switch Automation Enhancements

To use the QFX5100 switch automation enhancements, you must install the jinstall-qfx-5-flex-x.tgz software bundle. This software bundle is identical to the other QFX5100 switch software bundle except that Veriexec is disabled, which enables you to run unsigned programs, such as programs that you develop with Python, Chef, and Puppet. The QFX5100 switch automation enhancements include the following features:

- The factory default configuration is a Layer 3 configuration. (The standard default factory configuration is Layer 2.)
- Safeguards ensure that you cannot overwrite essential Junos OS files, including system log notifications.
- Zero Touch Provisioning (ZTP) allows you to provision new switches in your network automatically, without manual intervention. See *Understanding Zero Touch Provisioning*.
- The installation automatically sets up and reserves a 1-gigabit user partition on your system. You can use this partition to store your binaries and additional packages.
- The user partition is not overwritten when you upgrade or downgrade the software to a QFX5100 switch Junos OS image that does not contain the automation enhancements.

NOTE: **If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.**

- The Python interpreter is included by default.
  - You can invoke Python directly from the shell. See "Invoking the Python Interpreter" on page 6104.
- Chef for Junos OS and Puppet for Junos OS automation tools for provisioning and managing computer networking and storage resources can be downloaded separately from the Juniper Networks site.
  - For further information on Chef, see Chef for Junos Getting Started Guide.
  - For further information on Puppet, see Puppet for Junos OS Documentation.

NOTE: **For full compatibility, you must use only Chef for Junos OS and Puppet for Junos OS rather than the standard FreeBSD versions of Chef and Puppet software.**

- The QFX5100 switch automation enhancements also support the following libraries:
  - **ncclient** (Juniper Networks edition) — NETCONF base library. See https://github.com/juniper/ncclient for more information.
  - **lxml** — XML programming library. See http://lxml.de/index.html for more information.
  - **jinja2** — Templating library. See http://jinja.pocoo.org/ for more information.
  - **JVAS** — Java script library.
  - **JDE2** — Java Development Environment for Emacs or XEmacs.

CAUTION: **Download additional third party packages at your own risk.**

Overview of Python with QFX5100 Switch Automation Enhancements

Python is a programming language that lets you work more quickly and integrate your systems more effectively. The Python interpreter is included within the Junos operating system (Junos OS) jinstall-qfx-5-flex-x.tgz software bundle.

You can extend the Python interpreter with new functions and data types implemented in C or C++ (or other languages callable from C). Python is also suitable as an extension language for customizable applications. For information on using Python, refer to your Python documentation.

Understanding Automation Scripts Support

This document describes the support for the Junos OS automation scripts on the QFabric system Director devices.

Junos OS automation consists of a suite of tools used to automate operational and configuration tasks on network devices running Junos OS. The automation tools, which leverage the native XML capabilities of the Junos OS, include commit scripts, operation (op) scripts, event policies and event scripts, and macros.

NOTE: Event policies and event scripts are not supported on the QFabric system at this time.

The QFabric system supports Junos OS automation scripts that are written in Stylesheet Language Alternative Syntax (SLAX) version 1.0.

Commit scripts automate the commit process and enforce custom configuration rules. You can use commit scripts to generate specific errors and warnings, and customize configurations and configuration templates. When a candidate configuration is committed, it is inspected by each active commit script. If a configuration violates your custom rules and the scripts generate an error, the commit fails. If the commit is successful, any configuration changes (both transient and permanent) are incorporated into the active configuration before it is passed to the Director software, which distributes the configuration to all applicable QFabric system components, including Node devices and Node servers.

Op scripts automate operational and troubleshooting tasks. Op scripts can be executed manually from the Junos OS CLI or NETCONF XML management protocol, or they can be called from another script.

The QFabric system supports the following automation script features:

- Commit scripts and op scripts are supported.
- Scripts written in SLAX version 1 are supported.
- Scripts are configured and deployed from the Director group. Since there is more than one Director device in a Director group, scripts must be deployed by each Director device or deployed in the shared media space.
- Scripts are stored in the shared media at this location: **/pbdata/mgd_shared/*partition-ip*/var/db/scripts**. Under this directory, commit scripts are stored in the **commit** subdirectory, and op scripts are stored in the **op** subdirectory.
- Scripts are not stored in flash memory.

How Commit Scripts Work

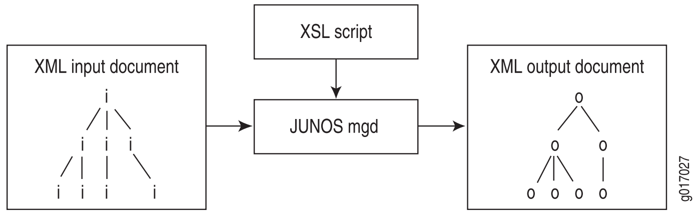
You enable commit scripts by listing the names of one or more commit script files at the **[edit system scripts commit]** hierarchy level. These scripts contain instructions that enforce custom configuration rules. Commit scripts are invoked during the commit process before the standard Junos OS validity checks are performed.

When you perform a commit operation, Junos OS executes each script in turn, passing the information in the candidate configuration to the scripts. The script inspects the configuration, performs the necessary tests and validations, and generates a set of instructions for performing certain actions. These actions include generating error, warning, and system log messages. If errors are generated, the commit operation fails and the candidate configuration remains unchanged. This is the same behavior that occurs with standard commit errors.

Commit scripts can also generate changes to the system configuration. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 208 on page 5985 shows the flow of commit script input and output.

Figure 208: Commit Script Input and Output



Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

The following sections discuss several important concepts related to the commit script input and output:

- Commit Script Input on page 5985
- Commit Script Output on page 5986
- Commit Scripts and the Junos OS Commit Model on page 5987

Commit Script Input

The input for a commit script is the postinheritance candidate configuration in Junos XML API format. The term *postinheritance* means that all configuration group values have been inherited by their targets in the candidate configuration and the inactive portions of the configuration have been removed. For more information about configuration groups, see the *CLI User Guide*.

When you issue the **commit** command, Junos OS automatically generates the candidate configuration in XML format and reads it into the management (mgd) process, at which time the input is evaluated by any commit scripts.

To display the XML format of the postinheritance configuration, issue the **show | display commit-scripts view** command:

```
[edit]
user@host# show | display commit-scripts view
```

To display all configuration groups data, including script-generated changes to the groups, issue the **show groups | display commit-scripts** command:

```
[edit]
user@host# show groups | display commit-scripts
```

To save the commit script input to a file, add the **save** command to the command line:

```
[edit]
user@host# show | display commit-scripts view | save filename.xml
```

By default, the file is placed in your home directory on the switch, router, or security device.

Commit Script Output

To specify the desired commit script output—including warning, error, and system log messages, persistent changes, and transient changes—the script can contain tags that appear in any order, in any number. The tags for specifying output are as follows:

- **<xnm:warning>**—Generates a warning message
- **<xnm:error>**—Generates an error message.
- **<syslog><message>**—Generates a system log message.
- **<change>**—Generates a persistent change to the configuration.
- **<transient-change>**—Generates a transient change to the configuration.
- **<xsl:call-template name="jcs:emit-change">**
  <xsl:with-param name="content">—Generates a persistent change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
  <xsl:with-param name="tag" select="'transient-change'"/>
  <xsl:with-param name="content">—Generates a transient change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
  <xsl:with-param name="message">
  <xsl:text>—Generates a warning message in conjunction with a configuration change. You can use this set of tags to generate a notification that the configuration has been changed.

Junos OS processes this output and performs the appropriate actions. Errors and warnings are passed back to the Junos OS CLI or to a Junos XML protocol client application. The presence of an error automatically causes the commit operation to fail. Persistent and transient changes are loaded into the appropriate configuration database.

To test the output of error, warning, and system log messages from commit scripts, issue the **commit check | display xml** command:

```
[edit]
user@host# commit check | display xml
```

To display a detailed trace of commit script processing, issue the **commit check | display detail** command:

```
[edit]
user@host# commit check | display detail
```

NOTE: System log messages do not appear in the trace output, so you cannot use the commit check operation to test script-generated system log messages. Furthermore, system log messages are written to the system log during a commit operation, but not during a commit check operation.

Commit Scripts and the Junos OS Commit Model

Junos OS uses a commit model to update the device's configuration. This model allows you to make a series of changes to a candidate configuration without affecting the operation of the device. When the changes are complete, you can commit the configuration. The commit operation saves the candidate configuration changes into the current configuration.

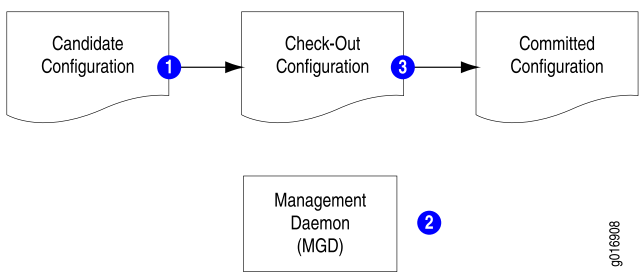
When you commit a set of changes in the candidate configuration, two methods are used to forward these changes to the current configuration:

- Standard commit model—Used when no commit scripts are active on the device.
- Commit script model—Incorporates commit scripts into the commit model.

Standard Commit Model

In the standard commit model, the management (mgd) process validates the candidate configuration based on standard Junos validation rules. If the configuration file is valid, it becomes the current active configuration. Figure 209 on page 5987 and the accompanying discussion explain how the standard commit model works:

Figure 209: Standard Commit Model



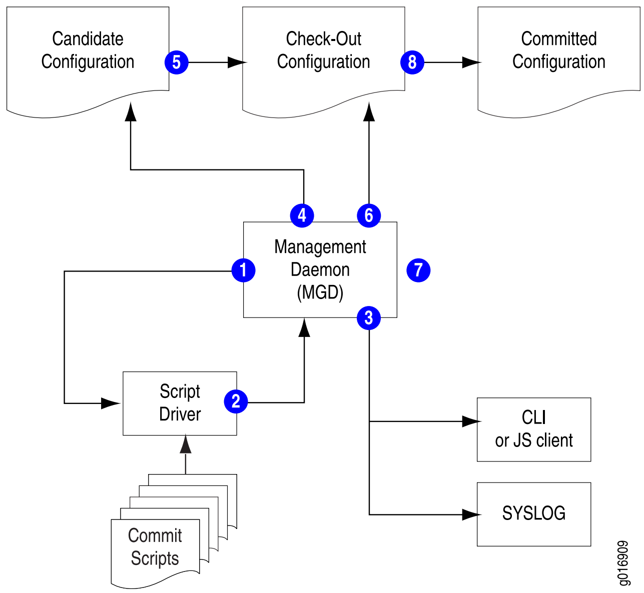
In the standard commit model, the software performs the following steps:

1. When the candidate configuration is committed, it is copied to become the checkout configuration.
2. The mgd process validates the checkout configuration.
3. If no error occurs, the checkout configuration is copied as the current active configuration.

Commit Model with Commit Scripts

When commit scripts are added to the standard commit model, the process becomes more complex. The mgd process first passes an XML-formatted checkout configuration to a script driver, which handles the verification of the checkout configuration by the commit scripts. When verification is complete, the script driver returns an XML *action file* to the mgd process. The mgd process follows the instructions in the action file to update the candidate and checkout configurations, issue messages to the CLI, and write information to the system log as required. After processing the action file, the mgd process performs the standard Junos OS validation. Figure 210 on page 5988 and the accompanying discussion explain this process.

Figure 210: Commit Model with Commit Scripts Added



In the commit script model, Junos OS performs the following steps:

1. When the candidate configuration is committed, the mgd process sends the XML-formatted candidate configuration to the script driver.
2. Each enabled commit script is invoked against the candidate configuration, and each script can generate a set of actions for the mgd process to perform. The actions are collected in an XML action file.
3. The mgd process performs the following actions in response to **<error>**, **<warning>**, and **<syslog>** tag elements in the action file:
   - **<error>**—The mgd process halts the commit process (that is, the commit operation fails), returns an error message to the CLI or Junos XML protocol client, and takes no further action.
   - **<warning>**—The mgd process forwards the message to the CLI or the Junos XML protocol client.
   - **<syslog>**—The mgd process forwards the message to the system log process.
4. If the action file includes any **<change>** tag elements, the mgd process loads the requested changes into the candidate configuration.
5. The candidate configuration is copied to become the checkout configuration.
6. If the action file includes any **<transient-change>** tag elements, the mgd process loads the requested changes into the checkout configuration.

7. The mgd process validates the checkout configuration.
8. If there are no validation errors, the checkout configuration is copied to become the current active configuration.

NOTE: **Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.**

Changes that are made to the candidate configuration during the commit operation are not evaluated by the custom rules during that commit operation. However, persistent changes are maintained in the candidate configuration and are evaluated by the custom rules during subsequent commit operations. For more information about how commit scripts change the candidate configuration, see "Avoiding Potential Conflicts When Using Multiple Commit Scripts" on page 5989.

Transient changes are never evaluated by the custom rules in commit scripts, because they are made to the checkout configuration only after the commit scripts have evaluated the candidate configuration and the candidate is copied to become the checkout configuration. To remove a transient change from the configuration, remove, disable, or deactivate the commit script (as discussed in *Controlling Execution of Commit Scripts During Commit Operations*), or comment out the code that generates the transient change.

For more information about differences between persistent and transient changes, see "Overview of Generating Persistent or Transient Configuration Changes" on page 5990.

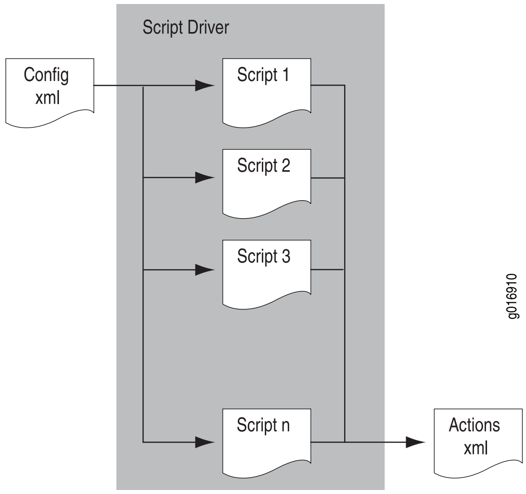
Related Documentation

- Avoiding Potential Conflicts When Using Multiple Commit Scripts on page 5989

Avoiding Potential Conflicts When Using Multiple Commit Scripts

When you use multiple commit scripts, each script evaluates the original candidate configuration file. Changes made by one script are not evaluated by the other scripts. This means that conflicts between scripts might not be resolved when the scripts are first applied to the configuration. The commit scripts are executed in the order they are listed at the **[edit system scripts commit]** hierarchy level, as illustrated in Figure 211 on page 5990.

Figure 211: Configuration Evaluation by Multiple Commit Scripts



As an example of a conflict between commit scripts, suppose that commit script **A.xsl** is created to ensure that the device uses the domain name server with IP address 192.168.0.255. Later, the DNS server's address is changed to 192.168.255.255 and a second script, **B.xsl**, is added to check that the device uses the DNS server with that address. However, script **A.xsl** is not removed or disabled.

Because each commit script evaluates the original candidate configuration, the final result of executing both scripts **A.xsl** and **B.xsl** depends on which DNS server address is configured in the original candidate configuration. If the now outdated address of 192.168.0.255 is configured, script **B.xsl** changes it to 192.168.255.255. However, if the correct address of 192.168.255.255 is configured, script **A.xsl** changes it to the incorrect value 192.168.0.255.

As another example of a potential conflict between commit scripts, suppose that a commit script protects a hierarchy using the **protect** attribute. If a second commit script attempts to modify or delete the hierarchy or the statements within the hierarchy, Junos OS issues a warning during the commit process and prevents the configuration change.

Exercise care to ensure that you do not introduce conflicts between scripts like those described in the examples. As a method of checking for conflicts with persistent changes, you can issue two separate **commit** commands.

Related Documentation

- How Commit Scripts Work on page 5984

Overview of Generating Persistent or Transient Configuration Changes

Junos OS commit scripts enforce custom configuration rules. When a candidate configuration includes statements that you have decided must not be included in your configuration, or when the candidate configuration omits statements that you have decided are required, commit scripts can automatically change the configuration and thereby correct the problem.

Differences Between Persistent and Transient Changes

Configuration changes made by commit scripts can be *persistent* or *transient*.

A persistent change remains in the candidate configuration and affects routing operations until you explicitly delete it, even if you subsequently remove or disable the commit script that generated the change and reissue the **commit** command. In other words, removing the commit script does not cause a persistent change to be removed from the configuration.

A transient change, in contrast, is made in the *checkout configuration* but not in the candidate configuration. The checkout configuration is the configuration database that is inspected for standard Junos OS syntax just before it is copied to become the active configuration on the device. If you subsequently remove or disable the commit script that made the change and reissue the **commit** command, the change is no longer made to the checkout configuration and so does not affect the active configuration. In other words, removing the commit script effectively removes a transient change from the configuration.

A common use for transient changes is to eliminate the need to repeatedly configure and display well-known policies, thus allowing these policies to be enforced implicitly. For example, if MPLS must be enabled on every interface with an International Organization for Standardization (ISO) protocol enabled, the change can be transient, so that the repetitive or redundant configuration data need not be carried or displayed in the candidate configuration. Furthermore, transient changes allow you to write script instructions that apply the change only if a set of conditions is met.

Persistent and transient changes are loaded into the configuration in the same manner that the **load replace** configuration mode command loads an incoming configuration. When generating a persistent or transient change, adding the **replace="replace"** attribute to a configuration element produces the same behavior as a **replace:** tag in a **load replace** operation.

By default, Junos OS merges the incoming configuration and the candidate configuration. New statements and hierarchies are added, and conflicting statements are overridden. When generating a persistent or transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing configuration element with the incoming configuration element. If the **replace="replace"** attribute is added to a configuration element, but there is no existing element of the same name in the current configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.

Persistent and transient changes are loaded before the standard Junos validation checks are performed. This means any configuration changes introduced by a commit script are validated for correct syntax. If the syntax is correct, the new configuration becomes the active, operational device configuration.

Protected elements in the configuration hierarchy cannot be modified or deleted by either a persistent or a transient change. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made, and proceeds with the commit.

Persistent and transient changes have several important differences, as described in Table 555 on page 5992.

Table 555: Differences Between Persistent and Transient Changes

Persistent Changes	Transient Changes
A persistent change is represented in a commit script by the **<change>** tag. Another way to represent a persistent change is with the **content** parameter inside a call to the **jcs:emit-change** template. The **jcs:emit-change** template is a helper template contained in the **junos.xsl** import file.	A transient change is represented in a commit script by the **<transient-change>** tag. Another way to represent a transient change is to use the **content** parameter and the **tag transient** parameter inside a call to the **jcs:emit-change** template.
You can use persistent changes to perform any Junos XML protocol operation, such as activate, deactivate, delete, insert (reorder), comment (annotate), and replace sections of the configuration.	Like persistent changes, you can use transient changes to perform any Junos XML protocol operation. However, some Junos XML protocol operations do not make sense to use with transient changes, such as generating comments and inactive settings.
Persistent changes are always loaded during the commit process if no errors are generated by any commit scripts or by the standard Junos OS validity check.	For transient changes to be loaded, you must include the **allow-transients** statement at the **[edit system scripts commit]** hierarchy level. If you enable a commit script that generates transient changes and you do not include the **allow-transients** statement in the configuration, the CLI generates an error message and the commit operation fails. Like persistent changes, transient changes must pass the standard Junos OS validity check. You cannot use a commit script to generate the **allow-transients** statement at the **[edit system scripts commit]** hierarchy level. Rather, you must include this statement directly by using the CLI.

Table 555: Differences Between Persistent and Transient Changes *(continued)*

Persistent Changes	Transient Changes
Persistent changes work like the **load replace** configuration mode command, and the change is added to the candidate configuration. When generating a persistent change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing element in the candidate configuration with the incoming configuration element. If there is no existing element of the same name in the candidate configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.	Transient changes work like the **load replace** configuration mode command, and the change is added to the checkout configuration. When generating a transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing element in the checkout configuration with the incoming configuration element. If there is no existing element of the same name in the checkout configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration. Transient changes are not copied to the candidate configuration. For this reason, transient changes are not saved in the configuration if the associated commit script is deleted or deactivated.
After a persistent change is committed, the software treats it like a change you make by directly editing and committing the candidate configuration. After the persistent changes are copied to the candidate configuration, they are copied to the checkout configuration. If the changes pass the standard Junos OS validity checks, the changes are propagated to the switch, router, or security device components.	Each time a transient change is committed, the software updates the checkout configuration database. After the transient changes pass the standard Junos OS validity checks, the changes are propagated to the device components.
After committing a script that causes a persistent change to be generated, you can view the persistent change by issuing the **show** configuration mode command: user@host# **show** This command displays persistent changes only, not transient changes.	After committing a script that causes a transient change to be generated, you can view the transient change by issuing the **show | display commit-scripts** configuration mode command: user@host# **show | display commit-scripts** This command displays both persistent and transient changes.
Persistent changes must conform to your custom configuration design rules as dictated by commit scripts. This does not become apparent until after a second commit operation because persistent changes are not evaluated by commit script rules on the current commit operation. The subsequent commit operation fails if the persistent changes do not conform to the rules imposed by the commit scripts configured during the first commit operation.	Transient changes are never tested by and do not need to conform to your custom rules. This is caused by the order of operations in the Junos OS commit model, which is explained in detail in "Commit Scripts and the Junos OS Commit Model" on page 5987.
A persistent change remains in the configuration even if you delete, disable, or deactivate the commit script instructions that generated the change.	If you delete, disable, or deactivate the commit script instructions that generate a transient change, the change is removed from the configuration after the next commit operation. In short, if the associated instructions or the entire commit script is removed, the transient change is also removed.

Table 555: Differences Between Persistent and Transient Changes *(continued)*

Persistent Changes	Transient Changes
As with direct CLI configuration, you can remove a persistent change by rolling back to a previous configuration that did not include the change and issuing the **commit** command. However, if you do not disable or deactivate the associated commit script, and the problem that originally caused the change to be generated still exists, the change is automatically regenerated when you issue another **commit** command.	You cannot remove a transient change by rolling back to a previous configuration.
You can alter persistent changes directly by editing the configuration using the CLI.	You cannot directly alter or delete a transient change by using the Junos OS CLI, because the change is not in the candidate configuration. To alter the contents of a transient change, you must alter the statements in the commit script that generates the transient change.

Interaction of Configuration Changes and Configuration Groups

Any configuration change you can make by directly editing the configuration using the Junos OS command-line interface (CLI) can also be generated by a commit script as a persistent or transient change. This includes values specified at a specific hierarchy level or in configuration groups. As with direct CLI configuration, values specified in the *target* override values inherited from a configuration group. The target is the statement to which you apply a configuration group by including the **apply-groups** statement.

If you define persistent or transient changes as belonging to a configuration group, the configuration groups are applied in the order you specify in the **apply-groups** statements, which you can include at any hierarchy level except the top level. You can also disable inheritance of a configuration group by including the **apply-groups-except** statement at any hierarchy level except the top level.

CAUTION: Each commit script inspects the postinheritance view of the configuration. If a candidate configuration contains a configuration group, be careful when using a commit script to change the related target configuration, because doing so might alter the intended inheritance from the configuration group.

Also be careful when using a commit script to change a configuration group, because the configuration group might be generated by an application that performs a **load replace** operation on the group during each commit operation.

For more information about configuration groups, see the *CLI User Guide*.

Tag Elements and Templates for Generating Changes

To generate changes, you can use the **jcs:emit-change** template, which implicitly includes **<change>** and **<transient-change>** XML elements; or you can explicitly include **<change>**

and **<transient-change>** XML elements. Using the **jcs:emit-change** template allows you to set the hierarchical context of the change once rather than multiple times.

The **<change>** and **<transient-change>** elements are similar to the **<load-configuration>** operation defined by the Junos XML management protocol. The possible contents of the **<change>** and **<transient-change>** elements are the same as the contents of the **<configuration>** tag element used in the Junos XML protocol operation **<load-configuration>**. For complete details about the **<load-configuration>** element, see the *Junos XML Management Protocol Developer Guide*.

Required Boilerplate for Commit Scripts

When you write commit scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all commit scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make commit scripts easier to read and write, which you import from a file called **junos.xsl**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Commit scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all commit scripts that you create. The XSLT boilerplate follows:

XSLT Boilerplate for Commit Scripts

```
1  <?xml version="1.0" standalone="yes"?>
2  <xsl:stylesheet version="1.0"
3      xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4      xmlns:junos="http://xml.juniper.net/junos/*/junos"
5      xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6      xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7      <xsl:import href="../import/junos.xsl"/>

8      <xsl:template match="configuration">
        <!-- ... Insert your code here ... -->
9      </xsl:template>
10 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI). This PI specifies that the code is written in XML using version 1.0. The XML PI, if present, must be the first noncomment token in the script file.

```
1  <?xml version="1.0"?>
```

Lines 2 through 6 set the style sheet element and the associated namespaces. Line 2 sets the style sheet version as 1.0. Lines 3 through 6 list all the namespace mappings commonly used in commit scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
2  <xsl:stylesheet version="1.0"
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as **../import/junos.xsl**, which ships as part of the Junos OS. The **junos.xsl** file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7    <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the **<configuration>** element, which is the node selected by the **<xsl:template match="/">** template, contained in the **junos.xsl** import file. The **<xsl:template match="configuration">** element allows you to exclude the **/configuration/** root element from all XML Path Language (XPath) expressions in the script and begin XPath expressions with the top Junos OS hierarchy level. For more information, see *XPath Overview*.

```
8    <xsl:template match="configuration">
```

Add your code between Lines 8 and 9.

Line 9 closes the template.

```
9    </xsl:template>
```

Line 10 closes the style sheet and the commit script.

```
10  </xsl:stylesheet>
```

SLAX Boilerplate for Commit Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;
ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match configuration {
  /*
  * Insert your code here
  */
}
```

How Op Scripts Work

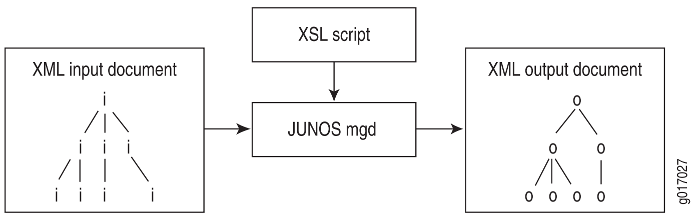
Op scripts execute Junos OS operational commands and inspect the resulting output. After inspection, op scripts can automatically correct errors within the device running Junos OS based on this output.

You add op scripts to device operations by listing the filenames of one or more op script files within the **[edit system scripts op]** hierarchy level. These files must be added to the appropriate op script file directory. For more information about op script file directories, see *Storing Scripts in Flash Memory*. Once added to the device, op scripts are invoked from the command line, using the **op *filename*** command.

You can use op scripts to generate changes to the device configuration by including the **<load-configuration>** tag element. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 212 on page 5997 shows a high-level view of the flow of op script input and output.

Figure 212: Op Script Input and Output



Required Boilerplate for Op Scripts

When you write operation (op) scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all op scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make scripts easier to read and write, which you import from a file called **junos.xsl**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Op scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all op scripts that you create. The XSLT boilerplate follows:

XSLT Boilerplate for Op Scripts

```
<?xml version="1.0" standalone="yes"?>
<xsl:stylesheet version="1.0"
    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:junos="http://xml.juniper.net/junos/*/junos"
    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
    <xsl:import href="../import/junos.xsl"/>

    <xsl:template match="/">
```

```
9        <op-script-results>
         <!-- ... insert your code here ... -->
10       </op-script-results>
11     </xsl:template>
   <!-- ... insert additional template definitions here ... -->
12 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI), which marks this file as XML and specifies the version of XML as 1.0. The XML PI, if present, must be the first non-comment token in the script file.

```
1 <?xml version="1.0"?>
```

Line 2 opens the style sheet and specifies the XSLT version as 1.0.

```
2 <xsl:stylesheet version="1.0"
```

Lines 3 through 6 list all the namespace mappings commonly used in operation scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
3     xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4     xmlns:junos="http://xml.juniper.net/junos/*/junos"
5     xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6     xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as **../import/junos.xsl**, which ships as part of Junos OS (in the file **/usr/libdata/cscript/import/junos.xsl**). The **junos.xsl** file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7     <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the **</>** element. The **<xsl:template match="/">** element is the root element and represents the top level of the XML hierarchy. All XML Path Language (XPath) expressions in the script must start at the top level. This allows the script to access all possible Junos XML and Junos XML protocol remote procedure calls (RPCs). For more information, see *XPath Overview*.

```
8     <xsl:template match="/">
```

After the **<xsl:template match="/">** tag element, the **<op-script-results>** and **</op-script-results>** container tags must be the top-level child tags, as shown in Lines 9 and 10.

```
9        <op-script-results>
         <!-- ... insert your code here ... -->
10       </op-script-results>
```

Line 11 closes the template.

```
11     </xsl:template>
```

Between Line 11 and Line 12, you can define additional XSLT templates that are called from within the **<xsl:template match="/">** template.

Line 12 closes the style sheet and the op script.

```
12   </xsl:stylesheet>
```

SLAX Boilerplate for Op Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match / {
  <op-script-results> {
    /*
      * Insert your code here
    */
  }
}
```

Junos Space

Understanding Junos Space Support

The Juniper Networks Junos Space application, running on a JA1500 appliance or a Junos Space Virtual Appliance, is a comprehensive platform for building and deploying applications for collaboration, productivity, and network infrastructure and operations management. Junos Space provides a runtime environment implemented as a fabric of virtual and physical appliances.

The Junos Space Network Management Platform software comprises various applications for network management and configuration, including:

- Junos Space Administration—Provides management of Junos Space fabric, databases, licenses, applications, authentication servers, tags, permission labels, DMI schemas, and troubleshooting.
- Network Director—Provides unified management of supported Juniper Networks devices in your network. By providing full network life cycle management, Network Director simplifies the discovery, configuration, visualization, monitoring, and administration of large networks.
- Service Automation—Provides an end-to-end solution designed to streamline operations and enable proactive network management for Junos OS devices. The solution consists of Advanced Insight Scripts (AI-Scripts), Junos Space Service Now and Service Insight applications, and Juniper Support Systems (JSS).

NOTE: **Do not install Junos Space and AI-Scripts on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system**

Before you can use Junos Space Network Director to manage the QFX Series device, you must ensure that the configuration on the device meets the requirements for all managed devices. For example:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

For more information about Network Director requirements, see the *Network Director Quick Start Guide* at:

http://www.juniper.net/techpubs/en_US/network-director1.5/information-products/pathway-pages/index.html

For more information about Junos Space, go to:

http://www.juniper.net/techpubs/en_US/release-independent/junos-space/index.html

Network Analytics

Network Analytics Overview

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed. The analytics manager (analyticsm) in the Packet Forwarding Engine collects traffic and queue statistics, and the analytics daemon (analyticsd) in the Routing Engine analyzes the data and generates reports. You can enable network analytics by configuring microburst monitoring and high-frequency traffic statistics monitoring.

NOTE: In Junos OS Release 13.2X51-D15, the network analytics feature has been enhanced, and extensive changes have been made to the CLI statements and hierarchies. If you upgrade to Junos OS Release 13.2X51-D15, network analytics configurations committed in previous releases will appear on your device, but the feature is disabled. To enable this feature, you must reconfigure it using the new CLI statements and hierarchies.

For more information, see:

- Analytics Feature Overview on page 6001
- Network Analytics Enhancements Overview on page 6002
- Summary of CLI Changes on page 6003

Analytics Feature Overview

You enable network analytics by configuring queue (microburst) monitoring and high-frequency traffic statistics monitoring.You use microburst monitoring to look at traffic queue conditions in the network. A microburst occurrence indicates to the Packet Forwarding Engine that a user-specified queue depth or latency threshold is reached. The queue depth is the buffer (in bytes) containing the data, and latency is the time (in nanoseconds or microseconds) the data stays in the queue.

You can configure queue monitoring based on either queue depth or latency (but not both), and configure the frequency (polling interval) at which the Packet Forwarding Engine checks for microbursts and sends the data to the Routing Engine for processing. You may configure queue monitoring globally for all physical interfaces on the system, or for a specific interface on the switch. However, the specified queue monitoring interval applies either to all interfaces, or none; you cannot configure the interval for each interface.

You use high-frequency traffic statistics monitoring to collect traffic statistics at specified polling intervals. Similar to the queue monitoring interval, the traffic monitoring interval applies either to all interfaces, or none; you cannot configure the interval for each interface.

Both traffic and queue monitoring are disabled by default. You must configure each type of monitoring using the CLI. In each case, the configuration for an interface always takes precedence over the global configuration.

NOTE: You can configure traffic and queue monitoring for physical interfaces only; logical interfaces and Virtual Chassis port (VCP) interfaces are not supported.

The analyticsd daemon in the Routing Engine generates local log files containing queue and traffic statistics records. You can specify the log filename and size, and the number of log files. If you do not configure a filename, the data is not saved.

You can display the local log file or specify a server to receive the streaming data containing the queue and traffic statistics.

For each port, information for the last 10 records of traffic statistics and 100 records of queue statistics is cached. You may view this information by using the **show analytics** commands.

To store traceoptions data, you configure the **traceoptions** statement at the **[edit services analytics]** hierarchy level.

Network Analytics Enhancements Overview

Beginning in Junos OS Release 13.2X51-D15, the network analytics feature provides the following enhancements:

- Resources—Consist of interfaces and system. The interfaces resource allows you to configure an interface name and an associated resource profile name for each interface. With the system resource, you can configure the polling intervals for queue monitoring and traffic monitoring, and an associated resource profile for the system.
- Resource profile—A template that contains the configurations for queue and traffic monitoring, such as depth threshold and latency threshold values, and whether each type of monitoring is enabled or disabled. Once a resource profile is configured, you apply it to a system or interfaces resource.
- Collector—A server for collecting queue and traffic monitoring statistics, and can be a local or remote server. You can configure a local server to store monitoring statistics in a log file, or a remote server to receive streamed statistics data.
- Export profile—You must configure an export profile if you wish to send streaming data to a remote collector. In the export profile, you define the category of streamed data (system-wide or interface-specific) to determine stream type the collector will receive. You can specify both system and interface stream categories. System data includes system information and status of queue and traffic monitoring. Interface-specific data includes interface information, queue and traffic statistics, and link, queue, and traffic status.
- Google Protocol Buffers (GBP) stream format—A new streaming format for monitoring statistics data that is sent to a remote collector in a single AnRecord message. This stream format provides nine types of information, including:
  - System information
  - System queue status
  - System traffic status
  - Interface information
  - Queue statistics for interfaces
  - Traffic statistics for interfaces
  - Link status for interfaces
  - Queue status for interfaces
  - Traffic status for interfaces

- The **analytics.proto** file—Provides a template for the GBP stream format. This file can be used for writing your analytics server application. To download the file, go to:

  http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/proto-files/analytics-proto.txt
- Use of threshold values—The Analytics Manager (analyticsm) will generate a queue statistics record when the lower queue depth or latency threshold value is exceeded.
- User Datagram Protocol (UDP)—Additional transport protocol you can configure, in addition to Transmission Control Protocol (TCP), for the remote streaming server port.
- Single file for local logging—Replaces the separate log files for queue and traffic statistics.
- Change in latency measurement—Configuration and reporting of latency values have changed from microseconds to nanoseconds.
- Change in reporting of the collection time in UTC format—Statistics collection time is reported in microseconds instead of milliseconds.
- New operational mode command **show analytics collector**—Replaces the **show analytics streaming-server** command.
- Changes in command output format—Includes the following changes:
  - Addition of unicast, multicast, and broadcast packet counters in queue and traffic statistics.
  - Reversal of the sequence of statistics information in the output. The most recent record is displayed at the beginning, and the oldest record at the end of the output.
  - Removal of the **Auto** status from the output for **show analytics configuration** command if there is no global configuration for traffic and queue monitoring.
  - Addition of **n/a** to the **show analytics configuration** and **show analytics status** commands if a parameter is not configured (for example, depth threshold or latency threshold).

Summary of CLI Changes

Beginning in Junos OS Release 13.2X51-D15, enhancements to the network analytics feature result in changes in the CLI when you configure the feature. See Table 556 on page 6004 for a summary of CLI changes.

Table 556: Network Analytics CLI Changes

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later

Configuring global queue and traffic monitoring polling interval	**[edit services]**
	
	analytics {
	traffic-statistics {
	interval *interval*;
	}
	queue-statistics {
	interval *interval*;
	}
	}
		[edit services analytics]
		
		resource {
		system {
		polling-interval {
		queue-monitoring *interval*;
		traffic-monitoring *interval*;
		}
		}
		}

Configuring local files for traffic and queue statistics reporting	**[edit services]**
	
	analytics {
	traffic-statistics {
	file *filename*;
	size *size*;
	files *number*;
	}
	queue-statistics {
	file *filename*;
	size *size*;
	files *number*;
	}
	}
		[edit services analytics]
		
		collector {
		local {
		file *filename* {
		files *number*;
		size *size*;
		}
		}
		}

Enabling queue statistics and traffic monitoring, and specifying the depth threshold for all interfaces (globally)	**[edit services]**
	
	analytics {
	interfaces {
	all {
	queue-statistics;
	traffic-statistics;
	depth-threshold {
	high *number*;
	low *number*;
	}
	}
	}
	}
		Requires defining a resource profile and applying it to the system:
		
		1. To define a resource profile:
		
		[edit services analytics]
		
		resource-profiles {
		profile-name{
		queue-monitoring;
		traffic-monitoring;
		depth-threshold {
		high *number*;
		low *number*;
		}
		}
		}
		
		2. To apply a profile to the system:
		
		[edit services analytics]
		
		resource {
		system {
		resource-profile *profile-name*;
		}
		}

Table 556: Network Analytics CLI Changes *(continued)*

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later

Enabling queue statistics and traffic monitoring, and specifying the latency threshold for one interface	**[edit services]**
	
	analytics {
	interfaces {
	interface{
	queue-statistics;
	traffic-statistics;
	latency-threshold
	high *number*;
	low *number*;
	}
	}
	}
		Requires defining a resource profile and applying it to the interface:
		
		1. To define a resource profile:
		
		[edit services analytics]
		
		resource-profiles {
		profile-name{
		queue-monitoring;
		traffic-monitoring;
		latency-threshold {
		high *number*;
		low *number*;
		}
		}
		}
		
		2. To apply a profile to the interface:
		
		[edit services analytics]
		
		resource {
		interfaces {
		interface-name {
		resource-profile *profile-name*;
		}
		}
		}

Configuring the streaming data format (JSON, CSV, or TSV) to send to a remote server
 	
NOTE: Junos OS Release 13.2X51-D15 adds support for the GPB stream format and configuration of the transport protocols (TCP or UDP).
	[edit services]
	
	analytics {
	streaming-servers {
	address *ip-address* {
	port *number* {
	stream-format *format*;
	}
	}
	}
	}
		Requires defining the stream format in an export profile and applying the profile to the collector.
		
		1. To configure the stream format:
		
		[edit services analytics]
		
		export-profiles {
		profile-name {
		stream-format *format*;
		}
		}
		
		2. To apply an export profile to the collector:
		
		[edit services analytics]
		
		collector {
		address *ip-address* {
		port *number* {
		transport *protocol* {
		export-profile *profile-name*;
		}
		}
		}
		}

Table 556: Network Analytics CLI Changes *(continued)*

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later

Configuring the streaming message types (queue or traffic statistics) to send to a remote server	**[edit services]**
	
	streaming-servers {
	address *ip-address* {
	port *number* {
	stream-type *type*;
	stream-type *type*;
	}
	}
	}
		Requires defining an export profile and applying it to the collector:
		
		1. To define an export profile:
		
		[edit services analytics]
		
		export-profiles {
		profile-name {
		interface {
		information;
		statistics {
		queue;
		traffic;
		}
		status {
		link;
		queue;
		traffic;
		}
		}
		system {
		information;
		status {
		queue;
		traffic;
		}
		}
		}
		}
		
		2. To apply an export profile to the collector:
		
		[edit services analytics]
		
		collector {
		address *ip-address* {
		port *number* {
		export-profile *profile-name*;
		}
		}
		}

Configuring the transport protocol for sending streaming data to an external server	Supports the TCP protocol only.	Supports both the TCP and UDP protocols.
		
		[edit services analytics]
		
		collector {
		address *ip-address* {
		port *number1* {
		transport tcp;
		}
		port *number2* {
		transport udp;
		}
		}
		}

Table 556: Network Analytics CLI Changes *(continued)*

Task	CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10	CLI for Junos OS Release 13.2X51-D15 and later
Show information about remote streaming server or collector	Issue the **show analytics streaming-sever** command.	Issue the **show analytics collector** command.

Related Documentation

Understanding Network Analytics Configuration and Status

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. You can enable network analytics by configuring traffic and queue statistics monitoring.

NOTE: This topic describes the configuration and status output from Junos OS Release 13.2X50-D15 and 13.2X51-D10 only.

If you had enabled traffic or queue monitoring, you can issue the **show analytics configuration** and **show analytics status** commands to view the global interface configuration and status and that of specific interfaces. The output that is displayed depends on your configuration at the global interface and specific interface levels. For example:

- A global interface configuration (for all interfaces) to disable monitoring supersedes the configuration to enable it on an interface.
- The interface configuration to enable or disable monitoring supersedes the global interface configuration, unless monitoring had been disabled globally for all interfaces.
- If there is no configuration, whether for all interfaces or a specific interface, monitoring is disabled by default (see Table 557 on page 6007).

Table 557 on page 6007 describes the correlation between the user configuration and the settings that are displayed.

Table 557: Configuration and Status Output in Junos OS Release 13.2X51-D10 and 13.2X50-D15

User Configuration	Global or System Settings		Specific Interface Settings	
	Configuration	Status	Configuration	Status
No global or specific interface configuration. This is the default setting.	Auto	Auto	Auto	Disabled
No global interface configuration but the specific interface monitoring is disabled.	Auto	Auto	Disabled	Disabled

Table 557: Configuration and Status Output in Junos OS Release 13.2X51-D10 and 13.2X50-D15 *(continued)*

User Configuration	Global or System Settings		Specific Interface Settings	
	Configuration	Status	Configuration	Status
No global interface configuration but the specific interface monitoring is enabled.	Auto	Auto	Enabled	Enabled
Monitoring is disabled globally and there is no interface configuration.	Disabled	Disabled	Auto	Disabled
Monitoring is disabled at both the global and specific interface levels.	Disabled	Disabled	Disabled	Disabled
Monitoring is disabled at the global interface level but is enabled at the specific interface level. The global interface *Disabled* setting supersedes the *Enabled* setting for a specific interface.	Disabled	Disabled	Enabled	Disabled
Monitoring is enabled for all interfaces but there is no configuration for the specific interface .	Enabled	Enabled	Auto	Enabled
Monitoring is enabled at both the global and specific interface levels.	Enabled	Enabled	Enabled	Enabled
Monitoring is enabled for all interfaces but is disabled for the specific interface.	Enabled	Enabled	Disabled	Disabled

Understanding Network Analytics Streaming Data

This topic describes the network analytics queue and traffic statistics that are streamed to remote servers.

You can configure one or more remote servers to receive streamed data containing queue and traffic statistics. The format of the streamed data can be Javascript Object Notification (JSON), Comma-separated Values (CSV), or Tab-separated Values (TSV).

NOTE: The output shown in this topic applies to Junos OS Release 13.2X51-D10 or later, and displays the time in the Unix epoch format (also known as Unix time or POSIX time).

The following examples show the streamed queue statistics data output in different formats.

- JSON format:

```
{"record-type":"queue-stats","time":1383453988263,"router-id":"qfx5100-switch",
"port":"xe-0/0/18","latency":0,"queue-depth":208}
```

- CSV format:

```
q,1383454067604,qfx5100-switch,xe-0/0/18,0,208
```

- TSV format:

```
q       585870192561703872      qfx5100-switch       xe-0/0/18       (null)
208     2
```

Table 558 on page 6009 describes the output fields for streamed queue statistics data in the order they appear.

Table 558: Streamed Queue Statistics Data Output Fields

Field	Description
record-type	Type of statistics. Displayed as: • **queue-stats** (JSON format) • **q** (CSV or TSV format)
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
latency	Traffic queue latency in milliseconds.
queue depth	Depth of the traffic queue in bytes.

The following examples show the streamed traffic statistics data output in different formats.

- JSON format:

```
{"record-type":"traffic-stats","time":1383453986763,"router-id":"qfx5100-switch",
"port":"xe-0/0/16","rxpkt":26524223621,"rxpps":8399588,"rxbyte":3395100629632,
"rxbps":423997832,"rxdrop":0,"rxerr":0,"txpkt":795746503,"txpps":0,"txbyte":101855533467,
"txbps":0,"txdrop":0,"txerr":0}
```

- CSV format:

```
t,1383454072924,qfx5100-switch,xe-0/0/19,1274299748,82950,163110341556,85603312,0,0,

```

- TSV format:

```
t       1383454139025   qfx5100-switch  xe-0/0/19       1279874033      82022
163823850036    84801488        0       0       27811618258     8199630
3559887126455   919998736       27827356915     3561901685120
```

Table 559 on page 6010 describes the output fields for streamed traffic statistics data in the order they appear.

Table 559: Streamed Traffic Statistics Data Output Fields

Field	Description
record-type	Type of statistics. Displayed as: • **traffic-stats** (JSON format) • **t** (CSV or TSV format)
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
rxpkt	Total packets received.
rxpps	Total packets received per second.
rxbyte	Total bytes received.
rxbps	Total bytes received per second.
rxdrop	Total incoming packets dropped.
rxerr	Total packets with errors.
txpkt	Total packets transmitted.
txpps	Total packets transmitted per second.
txbyte	Total bytes transmitted.
txbps	Total bytes transmitted per second.
txdrop	Total transmitted bytes dropped.
txerr	Total transmitted packets with errors (dropped).

Understanding Enhanced Network Analytics Streaming Data

Network analytics monitoring data can be streamed to remote servers called collectors. You can configure one or more collectors to receive streamed data containing queue and traffic statistics. This topic describes the streamed data output in the formats supported, including information about enhancements introduced in Junos OS Release 13.2X51-D15.

Starting in Junos OS Release 13.2X51-D15, network analytics supports the following streaming data formats and output:

Google Protocol Buffer (GPB)

Support for the Google Protocol Buffer (GPB) streaming format has been added in Junos OS Release 13.2X51-D15. This streaming format provides:

- Support for nine types of messages, based on resource type (system-wide or interface-specific).
- Sends messages in a hierarchical format.
- You can generate other stream format messages (JSON, CSV, TSV) from GPB formatted messages.
- Includes a 12-byte message header. See Table 560 on page 6011 for more information.

Table 560 on page 6011 describes the GPB stream format message header.

Table 560: GPB Stream Format Message Header Information

Byte Position	Field	Additional Information
0, 1, 2, 3	Message length	Length prefixed message
4	Message version	Version = 1
5, 6	Message type	System = 1, interface = 2
7, 8, 9, 10, 11	Reserved	For future use

The following GPB prototype file (**analytics.proto**) provides details about the streamed data:

```
package analytics;

// Traffic statistics related info
message TrafficStatus {
    optional uint32             status          = 1;
    optional uint32             poll_interval   = 2;
}

// Queue statistics related info
message QueueStatus {
    optional uint32             status          = 1;
    optional uint32             poll_interval   = 2;
    optional uint64             lt_high         = 3;
    optional uint64             lt_low          = 4;
    optional uint64             dt_high         = 5;
    optional uint64             dt_low          = 6;
}

message LinkStatus {
    optional uint64             speed           = 1;
    optional uint32             duplex          = 2;
    optional uint32             mtu             = 3;
    optional bool               state           = 4;
    optional bool               auto_negotiation= 5;
}

    repeated Interface          interface       = 3;
}
```

Javascript Object Notification (JSON)

The Javascript Object Notification (JSON) streaming format supports the following data:

- Queue statistics data. For example:

```
{"record-type":"queue-stats","time":1383453988263,"router-id":"qfx5100-switch",
"port":"xe-0/0/18","latency":0,"queue-depth":208}
```

See Table 558 on page 6009 for more information about queue statistics output fields.

- Traffic statistics. For example:

```
{"record-type":"traffic-stats","time":1383453986763,"router-id":"qfx5100-switch",
"port":"xe-0/0/16","rxpkt":26524223621,"rxpps":8399588,"rxbyte":3395100629632,
"rxbps":423997832,"rxdrop":0,"rxerr":0,"txpkt":795746503,"txpps":0,"txbyte":101855533467,
"txbps":0,"txdrop":0,"txerr":0}
```

See Table 559 on page 6010 for more information about traffic statistics output fields.

Comma-separated Values (CSV)

The Comma-separated Values (CSV) streaming format supports the following data:

- Queue statistics. For example:

```
q,1383454067604,qfx5100-switch,xe-0/0/18,0,208
```

See Table 558 on page 6009 for more information about queue statistics output fields.

- Traffic statistics. For example:

```
t,1383454072924,qfx5100-switch,xe-0/0/19,1274299748,82950,163110341556,85603312,0,0,
27254178291,8300088,3488534810679,600002408,27268587050,3490379142400
```

See Table 559 on page 6010 for more information about traffic statistics output fields.

Tab-separated Values (TSV)

The Tab-separated Values (TSV) streaming format supports the following data:

- Queue statistics. For example:

```
q       585870192561703872      qfx5100-switch      xe-0/0/18       (null)
208     2
```

See Table 558 on page 6009 for more information about queue statistics output fields.

- Traffic statistics. For example:

```
t       1383454139025   qfx5100-switch  xe-0/0/19       1279874033      82022
163823850036    84801488        0       0       27811618258     8199630
3559887126455   919998736       27827356915     3561901685120
```

See Table 559 on page 6010 for more information about traffic statistics output fields.

Queue Statistics Output for JSON, CSV, and TSV

Table 558 on page 6009 describes the output fields for streamed queue statistics data in the order they appear.

Table 561: Streamed Queue Statistics Data Output Fields

Field	Description
record-type	Type of statistics. Displayed as: • **queue-stats** (JSON format) • **q** (CSV or TSV format)
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
latency	Traffic queue latency in milliseconds.
queue depth	Depth of the traffic queue in bytes.

Traffic Statistics Output for JSON, CSV, and TSV

Table 559 on page 6010 describes the output fields for streamed traffic statistics data in the order they appear.

Table 562: Streamed Traffic Statistics Data Output Fields

Field	Description
record-type	Type of statistics. Displayed as: • **traffic-stats** (JSON format) • **t** (CSV or TSV format)
time	Time (in Unix epoch format) at which the statistics were captured.
router-id	ID of the network analytics host device.
port	Name of the physical port configured for network analytics.
rxpkt	Total packets received.
rxpps	Total packets received per second.
rxbyte	Total bytes received.
rxbps	Total bytes received per second.
rxdrop	Total incoming packets dropped.
rxerr	Total packets with errors.
txpkt	Total packets transmitted.

Table 562: Streamed Traffic Statistics Data Output Fields *(continued)*

Field	Description
txpps	Total packets transmitted per second.
txbyte	Total bytes transmitted.
txbps	Total bytes transmitted per second.
txdrop	Total transmitted bytes dropped.
txerr	Total transmitted packets with errors (dropped).

sFlow Techology

Understanding How to Use sFlow Technology for Network Monitoring on a Switch

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology randomly samples network packets and sends the samples to a monitoring station called a *collector*. You can configure sFlow technology on a Juniper Networks switch to continuously monitor traffic at wire speed on all interfaces simultaneously.

This topic describes:

Sampling Mechanism and Architecture of sFlow Technology on Switches

sFlow technology uses the following two sampling mechanisms:

- Packet-based sampling—Samples one packet out of a specified number of packets from an interface enabled for sFlow technology. Only the first 128 bytes of each packet are sent to the collector. Data collected include the Ethernet, IP, and TCP headers, along with other application-level headers (if present). Although this type of sampling might not capture infrequent packet flows, the majority of flows are reported over time, allowing the collector to generate a reasonably accurate representation of network activity. To configure packet-based sampling, you must specify a sample rate.
- Time-based sampling—Samples interface statistics at a specified interval from an interface enabled for sFlow technology. Statistics such as Ethernet interface errors are captured. To configure time-based sampling, you must specify a polling interval.

The sampling information is used to create a network traffic visibility picture. The Juniper Networks Junos operating system (Junos OS) fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks* (see http://faqs.org/rfcs/rfc3176.html).

NOTE: **sFlow technology on the switches samples only raw packet headers. A raw Ethernet packet is the complete Layer 2 network frame.**

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent’s two main activities are random sampling and statistics gathering. It combines interface counters and flow samples and sends them across the network to the sFlow collector as UDP datagrams, directing those datagrams to the IP address and UDP destination port of the collector. Each datagram contains the following information:

- The IP address of the sFlow agent
- The number of samples
- The interface through which the packets entered the agent
- The interface through which the packets exited the agent
- The source and destination interface for the packets
- The source and destination VLAN for the packets

EX Series switches, QFX Series switches, and the QFabric systems adopt the distributed sFlow architecture. The sFlow agent has two separate sampling entities that are associated with each Packet Forwarding Engine in case of switches and nodes in case of a QFabric system. These sampling entities are known as subagents. Each subagent has a unique ID that is used by the collector to identify the data source. A subagent has its own independent state and forwards its own sample messages to the sFlow agent. The sFlow agent is responsible for packaging the samples into datagrams and sending them to the sFlow collector. Because sampling is distributed across subagents, the protocol overhead associated with sFlow technology is significantly reduced at the collector.

NOTE: On the QFabric system, an sFlow collector must be reachable through the data network. Because each Node device has all routes stored in the default routing instance, the collector IP address should be included in the default routing instance to ensure the collector's reachability from the Node device.

NOTE: You cannot configure sFlow monitoring on a link aggregation group (LAG), but you can configure it individually on a LAG member interface.

Infrequent sampling flows might not be reported in the sFlow information, but over time the majority of flows are reported. Based on a configured sampling rate *N*, 1 out of *N* packets is captured and sent to the collector. This type of sampling does not provide a 100 percent accurate result in the analysis, but it does provide a result with quantifiable accuracy. A user-configured polling interval defines how often the sFlow data for a specific interface are sent to the collector, but an sFlow agent can also schedule polling.

NOTE: We recommend that you configure the same sample rate for all the ports in a line card. If you configure different sample rates, the lowest value is used for all ports on the line card..

NOTE: If the mastership assignment changes in a Virtual Chassis setup, sFlow technology continues to function.

Adaptive Sampling

To ensure sampling accuracy and efficiency, EX Series switches and QFX Series devices use adaptive sFlow sampling. Adaptive sampling monitors the overall incoming traffic rate on the device and provides feedback to the interfaces to dynamically adapt their sampling rate to traffic conditions. The sFlow agent reads the statistics on the interfaces every few seconds (12 seconds for EX Series switches and 5 seconds for QFX Series devices) and identifies five interfaces with the highest number of samples.

On a Flexible PIC Concentrator (FPC), when the CPU processing limit is reached because of sflow sample processing, a binary backoff algorithm is initiated. This reduces the sampling load, arriving through the top five sample-producing interfaces on that FPC by half. The backoff algorithm achieves this by doubling the sampling rate on these five earmarked interfaces. This process is repeated until the CPU-load due to sflow on the given FPC comes down to an acceptable level.

On a QFabric system, sFlow technology monitors the interfaces on each node device as a group, and implements the binary backoff algorithm based on the traffic on that group of interfaces.

NOTE: **On the QFX Series standalone switches, if you configure sFlow technology monitoring on multiple interfaces and with a high sampling rate, we recommend that you specify a collector that is on the data network instead of on the management network. Having a high volume of sFlow technology monitoring traffic on the management network might interfere with other management interface traffic.**

Using adaptive sampling prevents overloading of the CPU and keeps the device operating at its optimum level even when there is a change in traffic patterns on the interfaces. The reduced sampling rate is used until the device is rebooted or when a new sampling rate is configured.

NOTE: **sFlow technology on EX Series switches does not support graceful restart. When a graceful restart occurs, the adaptive sampling rate is set to the user-configured sampling rate.**

sFlow Agent Address Assignment

The sFlow collector uses the sFlow agent's IP address to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID of the sFlow agent remains constant. If you do not specify the IP address to be assigned to the agent, an IP address is automatically assigned to the agent based on the following order of priority of interfaces configured on the device:

EX Series Devices	QFX Series Devices
1. Virtual Management Ethernet (VME) interface 2. Management Ethernet interface	1. Management Ethernet interface me0 IP address 2. Any Layer 3 interface if the me0 IP address is not available

If a particular interface is not configured, the IP address of the next interface in the priority list is used as the IP address for the agent. Once an IP address is assigned to the agent, the agent ID is not modified until the sFlow service is restarted. At least one interface has to be configured for an IP address to be assigned to the agent. When the agent's IP address is assigned automatically, the IP address is dynamic and changes when the switch reboots.

On the QFabric system, the following default values are used if the optional parameters are not configured:

- Agent ID is the management IP address of the default partition.
- Source IP is the management IP address of the default partition.

In addition, the QFabric system subagent ID (which is included in the sFlow datagrams) is the ID of the node group from which the datagram is sent to the collector.

sFlow data can be used to provide network traffic visibility information. You can explicitly configure the source IP address to be assigned to the sFlow datagrams. If you do not explicitly configure the IP address, the IP address of any of the configured Layer 3 network interfaces is used as the source IP address. If a Layer 3 IP address is not configured, then the agent IP address is used as the source IP address.

sFlow Limitations on Switches

On the QFX Series, limitations of sFlow traffic sampling include the following:

- sFlow sampling on ingress interfaces does not capture CPU-bound traffic.
- sFlow sampling on egress interfaces does not support broadcast and multicast packets.
- Egress samples do not contain modifications made to the packet in the egress pipeline.
- If a packet is discarded because of a firewall filter, the reason code for discarding the packet is not sent to the collector.
- The out-priority field for a VLAN is always set to 0 (zero) on ingress and egress samples.
- On QFX5100 standalone switches and the QFX Series Virtual Chassis (including mixed QFX Series Virtual Chassis), egress firewall filters are not applied to sFlow sampling packets. On these platforms, the software architecture is different from that on other QFX Series devices—sFlow packets are sent by the Routing Engine (not the line card on the host) and do not transit the switch. Egress firewall filters affect data packets that are transiting a switch, but do not affect packets sent by the Routing Engine. As a result, sFlow sampling packets are always sent to the sFlow collector.

EX9200 switches support configuration of only one sampling rate (inclusive of ingress and egress rates) on an FPC. To support compatibility with the sflow configuration of other Juniper Networks products, EX9200 switches still accept multiple rate configuration on different interfaces of the same FPC. However, the switch programs the lowest rate as the sampling rate for all the interfaces of that FPC. The sFlow show command (**show sflow interfaces**) displays the configured rate and the actual (effective) rate. However, different rates on different FPCs is still supported on EX9200 switches.

SNMP

Understanding the Implementation of SNMP

The QFX Series products support the Simple Network Management Protocol (SNMP) that is implemented in the Junos OS software.

NOTE: By default, SNMP is not enabled on devices running Junos OS. For information on enabling SNMP on a device running Junos OS, see "Configuring SNMP" on page 1237.

A typical SNMP implementation includes the following components:

- Network management system (NMS)—The NMS is a combination of hardware and software that is used to monitor and administer a network. Software running on the NMS includes the SNMP manager, which collects information about network connectivity, activity, and events by polling the managed devices.
- Managed device—A managed device (also called a network element) is any device managed by the NMS. Routers and switches are common examples of managed devices. The SNMP agent is the SNMP process that resides on the managed device and communicates with the NMS.
- SNMP agent—The SNMP agent exchanges network management information with SNMP manager software running on an NMS, or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

SNMP data is stored in a highly structured, hierarchical format known as a management information base (MIB). The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device. The SNMP implementation in Junos OS uses both standard (developed by IETF and documented in RFCs) and Juniper Networks enterprise-specific MIBs.

Communication between the agent and the manager occurs in one of the following forms:

- **Get**, **GetBulk**, and **GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

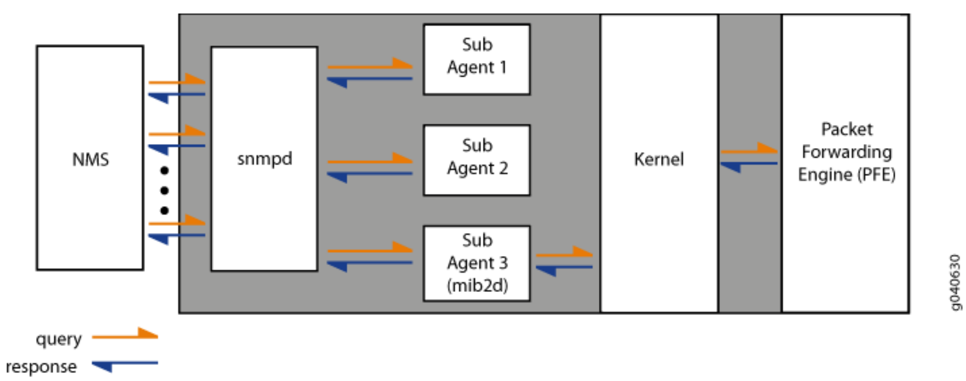
The processes maintaining the SNMP management data include:

- A master SNMP agent (known as SNMP process, or snmpd) that resides on the managed device and is managed by the NMS or host.
- Various subagents that reside on different modules of Junos OS, such as the Routing Engine, and are managed by the master SNMP agent.
- Junos OS processes that share data with the subagents when polled for SNMP data (for example, interface-related MIBs).

When an NMS polls the master agent for data, the master agent immediately shares the data with the NMS if the requested data is available from the master agent or one of the subagents. However, if the requested data is not maintained by the master agent or subagents, the subagent polls the Junos OS kernel or the process that maintains that data. The Junos OS kernel may need to get the data from the Packet Forwarding Engine. On receiving the required data, the subagent passes the response back on to the master agent, which in turn passes it on to the NMS.

Figure 213 on page 6022 shows the communication flow among the NMS, SNMP master agent (snmpd), SNMP subagents, Junos OS kernel, and Packet Forwarding Engine.

Figure 213: SNMP Communication Flow



When a significant event, most often an error or a failure, occurs on a network device, the SNMP agent sends notifications to the SNMP manager. SNMP notifications can be sent as traps (unconfirmed notifications) or inform requests (confirmed notifications).

Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and control the trap traffic. On QFX Series products, the maximum size of trap queues (throttle queue plus destination queue) is 40,960 traps. The maximum size of any one queue is 20,480 traps.

Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and it adds the subsequent traps to the same destination to the queue. Junos OS checks for availability of routes every 30 seconds, and sends the traps from the destination queue in a round-robin fashion.

If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is ten. After ten unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

Junos OS also has a throttle mechanism to control the number of traps (throttle threshold) sent during a particular time period (throttle interval). The throttle mechanism ensures consistency in trap traffic, especially when large numbers of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The default throttle threshold is 500 traps, and the throttle interval default is 5 seconds.

NOTE: You cannot configure trap queueing in Junos OS. You cannot view information about trap queues except for what is provided in the system logs.

Understanding the Implementation of SNMP on the QFabric System

SNMP monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

NOTE: In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device does. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your **mibwalk** command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

  NOTE: Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)
  - RFC 1215, *A Convention for Defining Traps for use with the SNMP*
  - RFC 1901, *Introduction to Community-based SNMPv2*
  - RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
  - RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*
  - RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*
  - RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2*
  - RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*
  - RFC 2233, *The Interfaces Group MIB Using SMIv2*

- RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access) (excluding SNMPv3)
- RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access) (excluding SNMPv3)
- RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2579, *Textual Conventions for SMIv2*
- RFC 2580, *Conformance Statements for SMIv2*
- RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*
- RFC 2863, *The Interfaces Group MIB*
- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework* (excluding SNMPv3)
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Framework* (excluding SNMPv3)
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (excluding SNMPv3)
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications* (excluding SNMPv3)
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*
- RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
- RFC 4188, *Definitions of Managed Objects for Bridges*
- RFC 4293, *Management Information Base for the Internet Protocol (IP)*
- RFC 4363b, *Q-Bridge VLAN MIB*

- Support for the following Juniper Networks enterprise-specific MIBs:
  - Chassis MIB (mib-jnx-chassis.txt)
  - Class-of-Service MIB (mib-jnx-cos.txt)
  - Configuration Management MIB (mib-jnx-cfgmgmt.txt)
  - Fabric Chassis MIB (mib-jnx-fabric-chassis.txt)
  - Interface MIB Extensions (mib-jnx-if-extensions.txt)
  - Power Supply Unit MIB (mib-jnx-power-supply-unit.txt)

  - QFabric MIB (mib-jnx-qf-smi.txt)
  - Utility MIB (mib-jnx-util.txt)

- Support for operational mode commands—Limited to the **show snmp statistics** command. You may issue other SNMP requests, including **get**, **get next**, and **walk** requests, by using external SNMP client applications.

Fabric Chassis MIB

The Juniper Networks enterprise-specific SNMP Fabric Chassis MIB (mib-jnx-fabric-chassis) provides hardware information about the QFabric system and its component devices in a single MIB. The Fabric Chassis MIB is based on the Juniper Networks enterprise-specific Chassis MIB that provides information for individual devices. Unlike the Chassis MIB, the Fabric Chassis MIB represents the QFabric system component devices as part of the QFabric system. Only the information from the Fabric Chassis MIB (and not from individual Chassis MIBs) is available to SNMP management clients of the QFabric system.

The Fabric Chassis MIB uses the basic information structure of the Chassis MIB, but adds another level of indexing that provides detailed information about QFabric system devices. Each physical device in a QFabric system (such as a Node device or an Interconnect device) is represented with its hardware components, including the power supply, fans, and front and rear cards.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent (snmpd) resides in the QFabric system Director software and is responsible for receiving and distributing all traps as well as responding to all queries from the SNMP manager. In addition, there is an SNMP subagent running in the Routing Engine of each Node group and Interconnect device. The SNMP subagent manages the information about the component device, and that information is communicated to the SNMP agent in the Director software as needed. Traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

Table 563 on page 6026 describes the tables and objects in the Fabric Chassis MIB.

Table 563: Fabric Chassis MIB Tables and Objects

Table or Object Name	Root OID	Description
Tables with Counterparts in the Chassis MIB		

Table 563: Fabric Chassis MIB Tables and Objects *(continued)*

Table or Object Name	Root OID	Description
jnxFabricContainersTable	1.3.6.1.4.1.2636.3.42.2.2.2	Provides information about different types of containers in QFabric system devices. • Containers for Interconnect devices include fan trays, power supply units, control boards, and so on. • Containers for Node devices include fan trays, power supply units, Flexible PIC Concentrator (FPC), PICs, and so on. • Containers for the Director devices include CPU, memory, fan trays, power supply units, and hard disks. The containers have a non-hierarchical or flat structure, and components in them are organized as siblings to each other.
jnxFabricContentsTable	1.3.6.1.4.1.2636.3.42.2.2.3	Contains contents that are present across all devices represented in the jnxFabricDeviceTable object. This table includes all field replaceable units (FRUs) and non-FRUs for QFabric system devices. • Contents in the Interconnect devices include fan trays and control boards. • Contents in the Node devices include fan trays and power supply units. • Contents in the Director devices include CPUs, memory, fan trays, power supply units, and hard disks, but do not include network interface cards (NICs).
jnxFabricFilledTable	1.3.6.1.4.1.2636.3.42.2.2.4	Shows the status of containers in QFabric devices. The jnxFabricFilledState object represents the state of the component: (1) unknown, (2) empty, or (3) filled. NOTE: The jnxFabricFilledTable object does not contain information about the Director group.
jnxFabricOperatingTable	1.3.6.1.4.1.2636.3.42.2.2.5	Represents different operating parameters for the contents that are populated in the jnxFabricContentsTable object. • Contents in each Node device and Interconnect device include fan trays, power supply units, FPC, PIC, and Routing Engine. • Contents in the Director device include CPUs, memory, fan trays, power supply units, and hard disks, but do not include network interface cards (NICs). The jnxFabricOperatingState object provides the state of the device: (1) unknown, (2) running, (3) ready, (4) reset, (5) runningAtFullSpeed (for fans only), (6) down, (6) off (for power supply units), or (7) standby.

Table 563: Fabric Chassis MIB Tables and Objects *(continued)*

Table or Object Name	Root OID	Description
jnxFabricRedundancyTable	1.3.6.1.4.1.2636.3.42.2.2.6	Represents the redundancy information that is available at different subsystem levels across the QFabric system. Information about the Routing Engines in Node devices is included, but there are no corresponding entries for Interconnect devices in this table. The jnxFabricRedundancyState object indicates the state of the subsystem: (1) unknown, (2) master, (3) backup, or (4) disabled. NOTE: Information about redundant Director devices, virtual machines (VMs) within Director groups, and Virtual Chassis devices is not available at this time.
jnxFabricFruTable	1.3.6.1.4.1.2636.3.42.2.2.7	Contains all FRUs for the QFabric system in the jnxFabricDeviceTable table. The FRUs are listed regardless of whether or not they are installed or online. The jnxFabricFruState object represents the state of the FRU, including online, offline, or empty, and so on. This table also contains information about each FRU, such as name, type, temperature, time last powered on, and time last powered off. NOTE: The jnxFabricFruTable table does not include network interface cards (NICs) on Director devices.
Table Specific to the Fabric Chassis MIB		
jnxFabricDeviceTable	1.3.6.1.4.1.2636.3.42.2.2.1	Contains information about all devices in the QFabric system. This table organizes scalar variables represented in the Chassis MIB into a table format for the QFabric system component devices. Columns in this table include device information such as model, device alias, and serial number. The jnxFabricDeviceIndex identifies each QFabric system device (Node device, Interconnect device, and Director device). NOTE: At this time, information about the Virtual Chassis is not available. NOTE: The following objects are not supported: • jnxFabricDeviceEntryRevision • jnxFabricDeviceEntryFirmwareRevision • jnxFabricDeviceEntryKernelMemoryUsedPercent
Scalar Variables		

Table 563: Fabric Chassis MIB Tables and Objects *(continued)*

Table or Object Name	Root OID	Description
The following scalar variables are supported: • jnxFabricClass • jnxFabricDescr • jnxFabricSerialNo • jnxFabricRevision • jnxFabricLastInstalled • jnxFabricContentsLastChange • jnxFabricFilledLastChange	1.3.6.1.4.1.2636.3.42.2.1	Describe the QFabric system as a whole. NOTE: The jnxFabricFirmwareRevision scalar variable is not supported at this time.

Table 564 on page 6029 describes the SNMPv2 traps that are defined in the Fabric Chassis MIB.

NOTE: Only SNMPv2 traps are supported on the QFabric system.

Table 564: Fabric Chassis MIB SNMPv2 Traps

Trap Group and Name	Root OID	Description
jnxFabricChassisTraps group—Includes the following traps: • jnxFabricPowerSupplyFailure • jnxFabricFanFailure • jnxFabricOverTemperature • jnxFabricRedundancySwitchover • jnxFabricFruRemoval • jnxFabricFruInsertion • jnxFabricFruPowerOff • jnxFabricFruPowerOn • jnxFabricFruFailed • jnxFabricFruOffline • jnxFabricFruOnline • jnxFabricFruCheck • jnxFabricFEBSwitchover • jnxFabricHardDiskFailed • jnxFabricHardDiskMissing • jnxFabricBootFromBackup	1.3.6.1.4.1.2636.4.19	Indicates an alarm condition. NOTE: Hardware events on the Director group are detected by scanning. As a result, a trap may not be generated until up to 30 seconds after the event has occurred. NOTE: The software does not distinguish between the fan removal and fan failure events on the Director group. In each case, both the jnxFabricFanFailure and jnxFabricFruFailed traps are generated. NOTE: The software does not distinguish between the fan insertion and fan OK events on the Director group. In each case, both the jnxFabricFanOK and jnxFabricFruOK traps are generated.

Table 564: Fabric Chassis MIB SNMPv2 Traps *(continued)*

Trap Group and Name	Root OID	Description
jnxFabricChassisOKTraps group—Includes the following traps: • jnxFabricPowerSupplyOK • jnxFabricFanOK • jnxFabricTemperatureOK • jnxFabricFruOK	1.3.6.1.4.1.2636.4.20	Indicates an alarm cleared condition.

Utility MIB

The Juniper Networks enterprise-specific Utility MIB, whose object ID is {jnxUtilMibRoot 1}, defines objects for counters, integers, and strings. The Utility MIB contains one table for each of the following five data types:

- 32-bit counters
- 64-bit counters
- Signed integers
- Unsigned integers
- Octet strings

Each data type has an arbitrary ASCII name, which is defined when the data is populated, and a timestamp that shows the last time when the data instance was modified. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/ reference/mibs/mib-jnx-util.txt .

For information about the enterprise-specific Utility MIB objects, see the following topics:

SNMPv3 Overview

The QFX3500 switch supports SNMP version 3 (SNMPv3). SNMPv3 enhances the functionality of SNMPv1 and SNMPv2c by supporting user authentication and data encryption. SNMPv3 uses the user-based security model (USM) to provide security for SNMP messages, and the view-based access control model (VACM) for user access control.

SNMPv3 features include:

- With USM, the SNMP messages between the SNMP manager and the agent can have the message source authenticated and the data integrity checked. USM reduces messaging delays and message replays by enforcing timeout limits and by checking for duplicate message request IDs.
- VACM complements USM by providing user access control for SNMP queries to the agent. You define access privileges that you wish to extend to a group of one or more users. Access privileges are determined by the security model parameters (**usm**, **v1**, or **v2**) and security level parameters (**authentication**, **privacy**, or **none**). For each security level, you must associate one MIB view for the group. Associating a MIB view with a group grants the read, write, or notify permission to a set of MIB objects for the group.
- You configure security parameters for each user, including the username, authentication type and authentication password, and privacy type and privacy password. The username given to each user is in a format that is dependent on the security model configured for that user.
- To ensure messaging security, another type of username, called the security name, is included in the messaging data that is sent between the local SNMP server and the destination SNMP server. Each user name is mapped to a security name, but the security name is in a format that is independent of the security model.
- Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag that defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines the address of an SNMP management application and other attributes used in sending notifications. Target parameters define the message processing and security parameters used in sending notifications to a particular target.

Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the **[edit snmp v3]** and **[edit snmp]** hierarchy levels:

NOTE: You must configure at least one view (notify, read, or write) at the **[edit snmp view-name]** hierarchy level.

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {
  security-name security-name;
}
target-address target-address-name {
  address address;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  local-engine {
    user username {
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
```

```
        }
      }
      security-to-group {
        security-model (usm | v1 | v2c) {
          security-name security-name {
            group group-name;
          }
        }
      }
    }
```

Understanding RMON

RMON Overview

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

An operational support system (OSS) or a fault-monitoring system can be used to automatically monitor events that track many different metrics, including performance, availability, faults, and environmental data. For example, an administrator might want to know when the internal temperature of a chassis has risen above a configured threshold, which might indicate that a chassis fan tray is faulty, the chassis air flow is impeded, or the facility cooling system in the vicinity of the chassis is not operating normally.

The RMON MIB also defines tables that store various statistics for Ethernet interfaces, including the **etherStatsTable** and the **etherHistoryTable**. The **etherStatsTable** contains cumulative real-time statistics for Ethernet interfaces, such as the number of unicast, multicast, and broadcast packets received on an interface. The **etherHistoryTable** maintains a historical sample of statistics for Ethernet interfaces. The control of the **etherHistoryTable**, including the interfaces to track and the sampling interval, is defined by the RMON **historyControlTable**.

To enable RMON alarms, you perform the following steps:

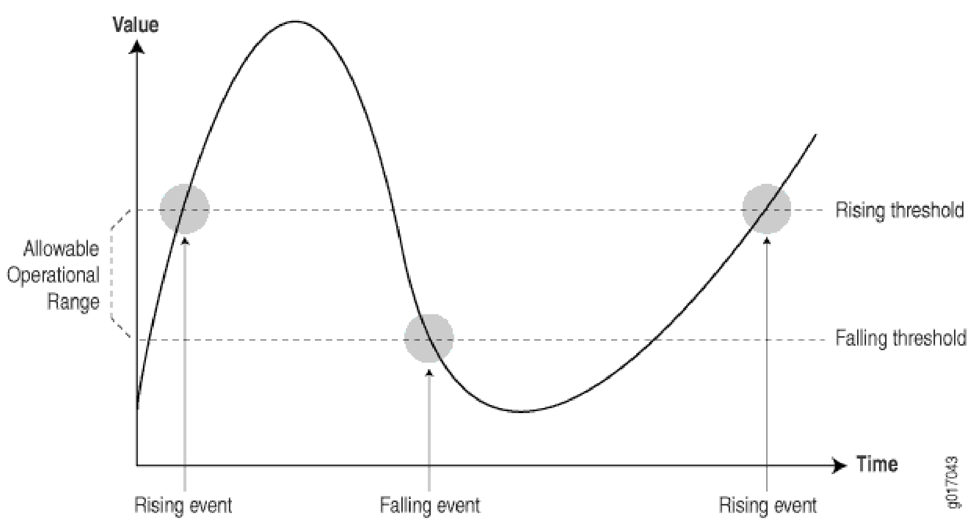
1. Configure SNMP, including trap groups. You configure SNMP at the [**edit snmp**] hierarchy level.
2. Configure rising and falling events in the **eventTable**, including the event types and trap groups. You can also configure events using the CLI at the [**edit snmp rmon event**] hierarchy level.
3. Configure alarms in the **alarmTable**, including the variables to monitor, rising and falling thresholds, the sampling types and intervals, and the corresponding events to generate when alarms occur. You can also configure alarms using the CLI at the [**edit snmp rmon alarm**] hierarchy level.

   Extensions to the **alarmTable** are defined in the Juniper Networks enterprise-specific MIB **jnxRmon** (mib-jnx-rmon.txt).

Alarm Thresholds and Events

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range (see Figure 214 on page 6034).

Figure 214: Setting Thresholds



Events are only generated when the alarm threshold is first crossed in any one direction rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs. This considerably reduces the quantity of events that are produced by the system, making it easier for operations staff to react when events do occur.

Before you configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least

3 months is not unusual when you first identify the operational ranges and define thresholds, but baseline monitoring should continue over the life span of each monitored variable.

RMON MIB Event, Alarm, Log, and History Control Tables

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

Table 565 on page 6035 provides each field in the RMON eventTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [**edit snmp rmon**] hierarchy level.

Table 565: RMON Event Table

Field	Description	Statement [edit snmp rmon]
eventDescription	Text description of this event.	**description**
eventType	Type of event (for example, log, trap, or log and trap).	**type**
eventCommunity	Trap group to which to send this event, as defined in the Junos OS configuration. (This is not the same as the SNMP community.)	**community**
eventOwner	Entity (for example, manager) that created this event.	—
eventStatus	Status of this row (for example, valid, invalid, or createRequest).	—

Table 566 on page 6035 provides each field in the RMON alarmTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [**edit snmp rmon**] hierarchy level.

Table 566: RMON Alarm Table

Field	Description	Statement [edit snmp rmon]
alarmStatus	Status of this row (for example, valid, invalid, or createRequest)	—
alarmInterval	Sampling period (in seconds) of the monitored variable	**interval**
alarmVariable	Object identifier (OID) and instance of the variable to be monitored	—

Table 566: RMON Alarm Table *(continued)*

Field	Description	Statement [edit snmp rmon]
alarmValue	Actual value of the sampled variable	—
alarmSampleType	Sample type (absolute or delta changes)	**sample-type**
alarmStartupAlarm	Initial alarm (rising, falling, or either)	**startup-alarm**
alarmRisingThreshold	Rising threshold against which to compare the value	**rising-threshold**
alarmFallingThreshold	Falling threshold against which to compare the value	**falling-threshold**
alarmRisingEventIndex	Index (row) of the rising event in the event table	**rising-event-index**
alarmFallingEventIndex	Index (row) of the falling event in the event table	**falling-event-index**

Table 567 on page 6036 provides each field in the jnxRmon jnxRmonAlarmTable, which is an extension to the RMON alarmTable. You can troubleshoot the RMON agent, rmopd, that runs on a switch by inspecting the contents of the jnxRmonAlarmTable object.

Table 567: jnxRmon Alarm Table

Field	Description
jnxRmonAlarmGetFailCnt	Number of times the internal **Get** request for the variable failed
jnxRmonAlarmGetFailTime	Value of the sysUpTime object when the last failure occurred
jnxRmonAlarmGetFailReason	Reason why the **Get** request failed
jnxRmonAlarmGetOkTime	Value of the sysUpTime object when the variable moved out of failure state
jnxRmonAlarmState	Status of this alarm entry

Table 568 on page 6036 provides each field in the RMON historyControlTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [**edit snmp rmon history**] hierarchy level. The historyControlTable controls the RMON etherHistoryTable.

Table 568: RMON History Control Table

Field	Description	Statement [edit snmp rmon history]
historyControlDataSource	Identifies the source of the data for which historical data was collected.	**interface**

Table 568: RMON History Control Table *(continued)*

Field	Description	Statement [edit snmp rmon history]
historyControlBucketsRequested	Requested number of discrete time intervals over which data is to be saved.	**bucket-size**
historyControlBucketsGranted	Number of discrete sampling intervals over which data is to be saved.	—
historyControlInterval	Interval, in seconds, over which the data is sampled for each bucket.	**interval**
historyControlOwner	Entity that configured this entry.	**owner**
historyControlStatus	Status of this entry.	—

Understanding Health Monitoring

Health monitoring is an SNMP feature that extends the RMON alarm infrastructure to provide monitoring for a predefined set of objects (such as file system usage, CPU usage, and memory usage), and for Junos OS processes.

You enable the health monitor feature using the **health-monitor** statement at the **[edit snmp]** hierarchy level. You can also configure health monitor parameters such as a falling threshold, rising threshold, and interval. If the value of a monitored object exceeds the rising or falling threshold, an alarm is triggered and an event may be logged.

The falling threshold is the lower threshold for the monitored object instance. The rising threshold is the upper threshold for the monitored object instance. Each threshold is expressed as a percentage of the maximum possible value. The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

Events are only generated when a threshold is first crossed in any one direction, rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs.

System log entries for health monitor events have a corresponding HEALTHMONITOR tag and not a generic SNMPD_RMON_EVENTLOG tag. However, the health monitor sends generic RMON risingThreshold and fallingThreshold traps. You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

When you configure the health monitor, monitoring information for certain object instances is available, as shown in Table 569 on page 6038.

Table 569: Monitored Object Instances

Object	Description
jnxHrStoragePercentUsed.1	Monitors the **/dev/ad0s1a:** file system on the switch. This is the root file system mounted on /.
jnxHrStoragePercentUsed.2	Monitors the **/dev/ad0s1e:** file system on the switch. This is the configuration file system mounted on **/config**.
jnxOperatingCPU (RE0)	Monitors CPU usage by the Routing Engine (RE0).
jnxOperatingBuffer (RE0)	Monitors the amount of memory available on the Routing Engine (RE0).
sysApplElmtRunCPU	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
sysApplElmtRunMemory	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

SNMP MIBs Support

The QFX Series standalone switches, QFX Series Virtual Chassis, and QFabric systems support standard MIBs and Juniper Networks enterprise-specific MIBs.

For more information, see:

- MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis on page 6038
- MIBs Supported on QFabric Systems on page 6047

MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

The QFX Series standalone switches and QFX Series Virtual Chassis support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- Table 570 on page 6039 for standard MIBs.
- Table 571 on page 6044 for Juniper Networks enterprise-specific MIBs.

Table 570: Standard MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

RFC	Additional Information
IEEE 802.1ab section 12.1, *Link Layer Discovery Protocol (LLDP) MIB*	Supported tables and objects: • lldpRemManAddrOID • lldpLocManAddrOID • lldpReinitDelay • lldpNotificationInterval • lldpStatsRxPortFramesDiscardedTotal • lldpStatsRxPortFramesError • lldpStatsRxPortTLVsDiscardedTotal • lldpStatsRxPortTLVsUnrecognizedTotal • lldpStatsRxPortAgeoutsTotal
IEEE 802.3ad, *Aggregation of Multiple Link Segments*	The following tables and objects are supported: • dot3adAggPortTable, dot3adAggPortListTable, dot3adAggTable, and dot3adAggPortStatsTable • dot3adAggPortDebugTable (only dot3adAggPortDebugRxState, dot3adAggPortDebugMuxState, dot3adAggPortDebugActorSyncTransitionCount, dot3adAggPortDebugPartnerSyncTransitionCount, dot3adAggPortDebugActorChangeCount, and dot3adAggPortDebugPartnerChangeCount) • dot3adTablesLastChanged
RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*	—
RFC 1157, *A Simple Network Management Protocol (SNMP)*	—
RFC 1212, *Concise MIB Definitions*	—

RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II*	The following areas are supported:
	• MIB II and its SNMP version 2 derivatives, including:
	  ◦ Statistics counters
	  ◦ IP, except for ipRouteTable, which has been replaced by ipCidrRouteTable (RFC 2096, *IP Forwarding Table MIB*)
	  ◦ ipAddrTable
	  ◦ SNMP management
	  ◦ Interface management
	• SNMPv1 **Get**, **GetNext** requests, and SNMPv2 **GetBulk** request
	• Junos OS-specific secured access list
	• Master configuration keywords
	• Reconfigurations upon SIGHUP

Table 570: Standard MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

RFC	Additional Information
RFC 1215, *A Convention for Defining Traps for use with the SNMP*	Support is limited to MIB II SNMP version 1 traps and version 2 notifications.
RFC 1286, *Definitions of Managed Objects for Bridges*	—
RFC 1657, *Definitions of Managed Objects for the Fourth Version of the Border Gateway Protocol (BGP-4) using SMIv2*	—
RFC 1850, *OSPF Version 2 Management Information Base*	The following table, objects, and traps are not supported: • Host Table • ospfOriginateNewLsas and ospfRxNewLsas objects • ospfOriginateLSA, ospfLsdbOverflow, and ospfLsdbApproachingOverflow traps
RFC 1901, *Introduction to Community-based SNMPv2*	—
RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*	—
RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*	—
RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*	—
RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2*	—
RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*	—
RFC 2233, *The Interfaces Group MIB Using SMIv2*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.
RFC 2287, *Definitions of System-Level Managed Objects for Applications*	The following objects are supported: • sysApplInstallPkgTable • sysApplInstallElmtTable • sysApplElmtRunTable • sysApplMapTable

Table 570: Standard MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

RFC	Additional Information
RFC 2570, *Introduction to Version 3 of the Internet-standard Network Management Framework*	—
RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access)	NOTE: RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.
RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access)	NOTE: RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.
RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	NOTE: RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.
RFC 2578, *Structure of Management Information Version 2 (SMIv2)*	—
RFC 2579, *Textual Conventions for SMIv2*	—
RFC 2580, *Conformance Statements for SMIv2*	—
RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*	—
RFC 2787, *Definitions of Managed Objects for the Virtual Router Redundancy Protocol*	Support does not include row creation, the Set operation, and the vrrpStatsPacketLengthErrors object.
RFC 2790, *Host Resources MIB*	Support is limited to the following objects: • Only hrStorageTable. The file systems **/**, **/config**, **/var**, and **/tmp** always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change. • Only the objects of the hrSystem and hrSWInstalled groups.
RFC 2819, *Remote Network Monitoring Management Information Base*	The following objects are supported: • etherStatsTable (for Ethernet interfaces only), alarmTable, eventTable, and logTable. • historyControlTable and etherHistoryTable (except the etherHistoryUtilization object).
RFC 2863, *The Interfaces Group MIB*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.
RFC 2932, *IPv4 Multicast Routing MIB*	—

Table 570: Standard MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

RFC	Additional Information
RFC 2933, *Internet Group Management Protocol (IGMP) MIB*	—
RFC 2934, *Protocol Independent Multicast MIB for IPv4*	In Junos OS, RFC 2934 is implemented based on a draft version, *pimmib.mib*, of the now standard RFC.
RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*	—
RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*	NOTE: RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.
RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.
RFC 3413, *Simple Network Management Protocol (SNMP) Applications*	All MIBs are supported except for the Proxy MIB.
RFC 3414, *User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)*	—
RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*	—
RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.
RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*	—
RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.
RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	—
RFC 3826, *The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model*	—

Table 570: Standard MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

RFC	Additional Information
RFC 4188, *Definitions of Managed Objects for Bridges*	The QFX3500 and QFX3600 switches support 802.1D STP (1998) and the following subtrees and objects only: • dot1dTp subtree—dot1dTpFdbAddress, dot1dTpFdbPort, and dot1dTpFdbStatus objects from the dot1dTpFdbTable table. • dot1dBase subtree—dot1dBasePort and dot1dBasePortIfIndex objects from the dot1dBasePortTable table. NOTE: On QFX3500 and QFX3600 switches, the dot1dTpFdbTable table is populated only with MAC addresses learned on the default VLAN. To see the MAC addresses of all VLANs, specify the dot1qTpFdbTable table (RFC 4363b, *Q-Bridge VLAN MIB*) when you issue the **show snmp mib walk** command.
RFC 4293, *Management Information Base for the Internet Protocol (IP)*	Supports the ipAddrTable table only.
RFC 4318, *Definitions of Managed Objects for Bridges with Rapid Spanning Tree Protocol*	Supports 802.1w and 802.1t extensions for RSTP.
RFC 4363b, *Q-Bridge VLAN MIB*	NOTE: On QFX3500 and QFX3600 switches, the dot1dTpFdbTable table (RFC 4188, *Definitions of Managed Objects for Bridges*) is populated only with MAC addresses learned on the default VLAN. To see the MAC addresses of all VLANs, specify the dot1qTpFdbTable table (in this MIB) when you issue the **show snmp mib walk** command.
RFC 4444, *IS-IS MIB*	—
Internet Assigned Numbers Authority, *IANAiftype Textual Convention MIB* (referenced by RFC 2233)	See http://www.iana.org/assignments/ianaiftype-mib .
Internet draft draft-reeder-snmpv3-usm-3desede-00.txt, *Extension to the User-Based Security Model (USM) to Support Triple-DES EDE in 'Outside' CBC Mode*	—
Internet draft draft-ietf-idmr-igmp-mib-13.txt, *Internet Group Management Protocol (IGMP) MIB*	—
ESO Consortium MIB	NOTE: The ESO Consortium MIB has been replaced by RFC 3826. See http://www.snmp.com/eso/ .

Table 571: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

MIB	Description
Alarm MIB (mib-jnx-chassis-alarm)	Provides support for alarms from the switch. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis-alarm.txt . For more information, see *Alarm MIB*.
Analyzer MIB (mib-jnx-analyzer)	Contains analyzer and remote analyzer data related to port mirroring. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt . For more information, see *Analyzer MIB*.
Chassis MIB (mib-jnx-chassis)	Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs. NOTE: The jnxLEDTable table has been deprecated. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis.txt . For more information, see *Chassis MIBs*.
Chassis Definitions for Router Model MIB (mib-jnx-chas-defines)	Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify routing and switching platforms and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chas-defines.txt . For more information, see *Chassis MIBs*.
Class-of-Service MIB (mib-jnx-cos)	Provides support for monitoring interface output queue statistics per interface and per forwarding class. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt . For more information, see *Class-of-Service MIB*.

Table 571: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

MIB	Description
Configuration Management MIB (mib-jnx-cfgmgmt)	Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt . For more information, see *Configuration Management MIB*.
Ethernet MAC MIB (mib-jnx-mac)	Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, inoctets, inframes, outoctets, and outframes on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mac.txt . For more information, see *Ethernet MAC MIB*.
Event MIB (mib-jnx-event)	Defines a generic trap that can be generated using an operations script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found. In Junos OS release 13.2X51-D10 or later, if you configured an event policy to raise a trap when a new SNMP trap target is added, the SNMPD_TRAP_TARGET_ADD_NOTICE trap is generated with information about the new target. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-event.txt . For more information, see *Event MIB*.
Firewall MIB (mib-jnx-firewall)	Provides support for monitoring firewall filter counters. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-firewall.txt . For more information, see *Firewall MIB*.

Table 571: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

MIB	Description
Host Resources MIB (mib-jnx-hostresources)	Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt . For more information, see *Host Resources MIB*.
Interface MIB (Extensions) (mib-jnx-if-extensions)	Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt . For more information, see *Interface MIB*.
MPLS MIB (mib-jnx-mpls)	Provides MPLS information and defines MPLS notifications. NOTE: This MIB is not supported on the QFX5100 switch. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls.txt For more information, see *MPLS MIB*.
MPLS LDP MIB (mib-jnx-mpls-ldp)	Contains object definitions as described in RFC 3815, *Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)*. NOTE: This MIB is not supported on the QFX5100 switch. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls-ldp.txt For more information, see *MPLS LDP MIB*.
Ping MIB (mib-jnx-ping)	Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-ping.txt . For more information, see *PING MIB*.

Table 571: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis *(continued)*

MIB	Description
RMON Events and Alarms MIB (mib-jnx-rmon)	Supports Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments the alarmTable object with additional information about each alarm. Two additional traps are also defined to indicate when problems are encountered with an alarm. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-rmon.txt . For more information, see *RMON Events and Alarms MIB*.
Structure of Management Information MIB (mib-jnx-smi)	Explains how the Juniper Networks enterprise-specific MIBs are structured. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-smi.txt . For more information, see *Structure of Management Information MIB*.
System Log MIB (mib-jnx-syslog)	Enables notification of an SNMP trap-based application when an important system log message occurs. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-syslog.txt . For more information, see *System Log MIB*.
Utility MIB (mib-jnx-util)	Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt . For more information, see “Utility MIB” on page 6030 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 6330.
VLAN MIB (mib-jnx-vlan)	Contains information about prestandard IEEE 802.10 VLANs and their association with LAN emulation clients. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-vlan.txt . For more information, see *VLAN MIB*.

MIBs Supported on QFabric Systems

The QFabric systems support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- Table 572 on page 6048 for standard MIBs.
- Table 573 on page 6051 for Juniper Networks enterprise-specific MIBs.

Table 572: Standard MIBs Supported on QFabric Systems

RFC	Additional Information
RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*	—
RFC 1157, *A Simple Network Management Protocol (SNMP)*	—
RFC 1212, *Concise MIB Definitions*	—

RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II*	The following areas are supported:
	• MIB II and its SNMP version 2 derivatives, including:
	  ◦ Statistics counters
	  ◦ IP, except for ipRouteTable, which has been replaced by ipCidrRouteTable (RFC 2096, *IP Forwarding Table MIB*)
	  ◦ ipAddrTable
	  ◦ SNMP management
	  ◦ Interface management
	• SNMPv1 **Get**, **GetNext** requests, and version 2 **GetBulk** request
	• Junos OS-specific secured access list
	• Master configuration keywords
	• Reconfigurations upon SIGHUP

RFC 1215, *A Convention for Defining Traps for use with the SNMP*	Support is limited to MIB II SNMP version 1 traps and version 2 notifications.
RFC 1286, *Definitions of Managed Objects for Bridges*	—
RFC 1901, *Introduction to Community-based SNMPv2*	—
RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*	—
RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*	—
RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*	NOTE: On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.

Table 572: Standard MIBs Supported on QFabric Systems *(continued)*

RFC	Additional Information
RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2*	—
RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*	—
RFC 2233, *The Interfaces Group MIB Using SMIv2*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863. NOTE: The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.
RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access)	NOTE: RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.
RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access)	NOTE: RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.
RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	NOTE: RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.
RFC 2578, *Structure of Management Information Version 2 (SMIv2)*	—
RFC 2579, *Textual Conventions for SMIv2*	—
RFC 2580, *Conformance Statements for SMIv2*	—
RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*	The QFabric system supports the following tables only: • dot3StatsTable—There is one row with statistics for each Ethernet-like interface in the QFabric system. The dot3StatsIndex is an interface index that is unique across the system. • dot3ControlTable—There is one row in this table for each Ethernet-like interface in the QFabric system that implements the MAC control sublayer. OIDs supported are dot3ControlFunctionsSupported and dot3ControlInUnknownOpcode. • dot3PauseTable—There is one row in this table for each Ethernet-like interface in the QFabric system that supports the MAC control PAUSE function. OIDS supported are dot3PauseAdminMode, dot3PauseOperMode, dot3InPauseFrames, and dot3OutPauseFrames. NOTE: Scalar variables are not supported on the QFabric system.

Table 572: Standard MIBs Supported on QFabric Systems *(continued)*

RFC	Additional Information
RFC 2863, *The Interfaces Group MIB*	NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863. NOTE: The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.
RFC 2933, *Internet Group Management Protocol (IGMP) MIB*	—
RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*	—
RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*	NOTE: RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.
RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.
RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.
RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*	—
RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*	NOTE: RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.
RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*	—
RFC 4188, *Definitions of Managed Objects for Bridges*	The QFabric system support is limited to the following objects: • Under the dot1dBase OID, the dot1dBasePortTable table supports only the first two columns in the table: dot1dBasePort and dot1dBasePortIfIndex. • The system does not implement the optional traps supporting dot1dNotifications (dot1dBridge 0). • Under the dot1dStp OID, supports only the dot1dStpPortTable table. Does not support the scalar variables under dot1dStp. • The system does not support scalar variables under dot1dTp, but under that, the dot1dTpFdbTable table is supported (dot1dBridge 4). • For OIDS with tables support only, scalar values that are returned by the SNMP agent may not be meaningful and are therefore not recommended for use.

Table 572: Standard MIBs Supported on QFabric Systems *(continued)*

RFC	Additional Information
RFC 4293, *Management Information Base for the Internet Protocol (IP)*	Supports the ipAddrTable table only. On the QFabric system, supported objects in the ipAddrTable table include: ipAdEntAddr, ipAdEntIfIndex, ipAdEntNetMask, ipAdEntBcastAddr, and ipAdEntReasmMaxSize. NOTE: On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.
RFC 4363b, *Q-Bridge VLAN MIB*	The QFabric system supports the following tables only: • dot1qTpFdbTable • dot1qVlanStaticTable • dot1qPortVlanTable • dot1qFdbTable

Table 573: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems

MIB	Description
Analyzer MIB (mib-jnx-analyzer)	Contains analyzer and remote analyzer data related to port mirroring. The QFabric system supports: • Analyzer table—jnxAnalyzerName, jnxMirroringRatio, jnxLossPriority. • Analyzer input table—jnxAnalyzerInputValue, jnxAnalyzerInputOption, jnxAnalyzerInputType. • Analyzer output table—jnx AnalyzerOutputValue, jnxAnalyzerOutputType. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt . For more information, see *Analyzer MIB*.
Chassis MIB (mib-jnx-chassis)	NOTE: The Chassis MIB has been deprecated for the QFabric system. We recommend that you use the Fabric Chassis MIB (mib-jnx-fabric-chassis) for information about the QFabric system.

Table 573: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems *(continued)*

MIB	Description
Class-of-Service MIB (mib-jnx-cos)	Provides support for monitoring interface output queue statistics per interface and per forwarding class. The QFabric system supports the following tables and objects: • Jnxcosifstatflagtable—jnxCosIfstatFlags and jnxCosIfIndex. • Jnxcosqstattable—jnxCosQstatTxedPkts, jnxCosQstatTxedPktRate, jnxCosQstatTxedBytes, and jnxCosQstatTxedByteRate. • Jnxcosfcidtable—jnxCosFcIdToFcName. • Jnxcosfctable—jnxCosFcQueueNr. The QFabric system does not support any traps for this MIB. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt . For more information, see *Class-of-Service MIB*.
Configuration Management MIB (mib-jnx-cfgmgmt)	Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable. NOTE: On the QFabric system, these conditions apply: • All scalar variables under the jnxCmCfgChg table are supported. • Supported scalar OIDs are jnxCmCfgChgLatestIndex, jnxCmCfgChgLatestTime, jnxCmCfgChgLatestDate, jnxCmCfgChgLatestSource, jnxCmCfgChgLatestUser, and jnxCmCfgChgMaxEventEntries. • Scalar variables under the jnxCmRescueChg table are not supported. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt . For more information, see *Configuration Management MIB*.
Fabric Chassis MIB (mib-jnx-fabric-chassis)	Provides hardware information about the QFabric system and its component devices. This MIB is based on the Juniper Networks enterprise-specific Chassis MIB but adds another level of indexing that provides information for QFabric system component devices. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt . For more information, see “Fabric Chassis MIB” on page 6026.

Table 573: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems *(continued)*

MIB	Description
Host Resources MIB (mib-jnx-hostresources)	Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt . For more information, see *Host Resources MIB*.
Interface MIB (Extensions) (mib-jnx-if-extensions)	Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables. NOTE: On the QFabric system, scalar variables are not supported. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt . For more information, see *Interface MIB*.
Power Supply Unit MIB (mib-jnx-power-supply-unit)	Provides support for environmental monitoring of the power supply unit for the Interconnect device of the QFabric system. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-power-supply-unit.txt . For more information, see *Power Supply Unit MIB*. NOTE: On the QFabric system, scalar variables for the jnxPsuObjects 1 object ID in the jnxPsuScalars table are not supported.
QFabric MIB (jnx-qf-smi)	Explains how the Juniper Networks enterprise-specific QFabric MIBs are structured. Defines the MIB objects that are reported by the QFabric system and the contents of the traps that can be issued by the QFabric system. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-qf-smi.txt .
Utility MIB (mib-jnx-util)	Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations. For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt . For more information, see “Utility MIB” on page 6030 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 6330.

SNMP Traps Support

The QFX Series standalone switches, QFX Series Virtual Chassis, and QFabric systems support standard SNMP traps and Juniper Networks enterprise-specific traps.

For more information, see:

- SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis on page 6054
- SNMP Traps Supported on QFabric Systems on page 6062

SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

QFX Series standalone switches and QFX Series Virtual Chassis support SNMPv1 and v2 traps. For more information, see:

- SNMPv1 Traps on page 6054
- SNMPv2 Traps on page 6058

SNMPv1 Traps

QFX Series standalone switches and QFX Series Virtual Chassis support both standard SNMPv1 traps and Juniper Networks enterprise-specific SNMPv1 traps. See:

- Table 574 on page 6054 for standard SNMPv1 traps.
- Table 575 on page 6057 for enterprise-specific SNMPv1 traps.

The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

SNMP Traps Supported on QFabric Systems

QFabric systems support standard SNMPv2 traps and Juniper Networks enterprise-specific SNMPv2 traps.

NOTE: QFabric systems do not support SNMPv1 traps.

For more information, see:

- Table 578 on page 6063 for standard SNMPv2 traps
- Table 579 on page 6064 for Juniper Networks enterprise-specific SNMPv2 traps

MIB Objects for the QFX Series

This topic lists the Juniper Networks enterprise-specific SNMP Chassis MIB definition objects for the QFX Series:

QFX Series Standalone Switches

```
jnxProductLineQFXSwitch       OBJECT IDENTIFIER ::= { jnxProductLine      82 }
  jnxProductNameQFXSwitch       OBJECT IDENTIFIER ::= { jnxProductName      82 }
  jnxProductModelQFXSwitch      OBJECT IDENTIFIER ::= { jnxProductModel     82 }
  jnxProductVariationQFXSwitch  OBJECT IDENTIFIER ::= { jnxProductVariation 82 }
    jnxProductQFX3500s          OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 1 }
    jnxProductQFX360016QS       OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 2 }
    jnxProductQFX350048T4QS     OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 3 }
    jnxProductQFX510024Q        OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 4 }
    jnxProductQFX510048S6Q      OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 5 }

  jnxChassisQFXSwitch           OBJECT IDENTIFIER ::= { jnxChassis          82 }

  jnxSlotQFXSwitch              OBJECT IDENTIFIER ::= { jnxSlot             82 }
    jnxQFXSwitchSlotFPC         OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch   1 }
    jnxQFXSwitchSlotHM          OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch   2 }
    jnxQFXSwitchSlotPower       OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch   3 }
    jnxQFXSwitchSlotFan         OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch   4 }
    jnxQFXSwitchSlotFPB         OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch   5 }

  jnxMediaCardSpaceQFXSwitch    OBJECT IDENTIFIER ::= { jnxMediaCardSpace   82 }
    jnxQFXSwitchMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXSwitch 1 }
```

QFabric Systems

```
jnxProductLineQFX3000        OBJECT IDENTIFIER ::= { jnxProductLine 84 }
  jnxProductNameQFX3000         OBJECT IDENTIFIER ::= { jnxProductName 84 }
  jnxProductModelQFX3000        OBJECT IDENTIFIER ::= { jnxProductModel 84 }
  jnxProductVariationQFX3000    OBJECT IDENTIFIER ::= { jnxProductVariation 84 }
   jnxProductQFX3000-G          OBJECT IDENTIFIER ::= { jnxProductVariationQFX3000 1 }
   jnxProductQFX3000-M          OBJECT IDENTIFIER ::= { jnxProductVariationQFX3000 2 }
  jnxChassisQFX3000             OBJECT IDENTIFIER ::= { jnxChassis          84 }
```

QFabric System QFX3100 Director Device

```
jnxProductLineQFX3100 OBJECT IDENTIFIER ::= { jnxProductLine      100 }
  jnxProductNameQFX3100 OBJECT IDENTIFIER ::= { jnxProductName      100 }
  jnxProductModelQFX3100 OBJECT IDENTIFIER ::= { jnxProductModel      100 }
  jnxProductVariationQFX3100  OBJECT IDENTIFIER ::= { jnxProductVariation 100 }
  jnxChassisQFX3100      OBJECT IDENTIFIER ::= { jnxChassis          100 }

  jnxSlotQFX3100             OBJECT IDENTIFIER ::= { jnxSlot             100 }
    jnxQFX3100SlotCPU        OBJECT IDENTIFIER ::= { jnxSlotQFX3100    1 }
    jnxQFX3100SlotMemory     OBJECT IDENTIFIER ::= { jnxSlotQFX3100    2 }
    jnxQFX3100SlotPower      OBJECT IDENTIFIER ::= { jnxSlotQFX3100    3 }
    jnxQFX3100SlotFan        OBJECT IDENTIFIER ::= { jnxSlotQFX3100    4 }
    jnxQFX3100SlotHardDisk   OBJECT IDENTIFIER ::= { jnxSlotQFX3100    5 }
    jnxQFX3100SlotNIC        OBJECT IDENTIFIER ::= { jnxSlotQFX3100    6 }
```

QFabric System QFX3008-I Interconnect Device

```
jnxProductLineQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductLine      60 }
  jnxProductNameQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductName      60 }
  jnxProductModelQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductModel      60 }
  jnxProductVariationQFXInterconnect  OBJECT IDENTIFIER ::= { jnxProductVariation 60 }
    jnxProductQFX3008            OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 1 }
jnxProductQFXC083008         OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 2 }
    jnxProductQFX3008I           OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 3 }

  jnxChassisQFXInterconnect      OBJECT IDENTIFIER ::= { jnxChassis          60 }

  jnxSlotQFXInterconnect         OBJECT IDENTIFIER ::= { jnxSlot             60 }
    jnxQFXInterconnectSlotFPC    OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect    1 }
    jnxQFXInterconnectSlotHM     OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect    2 }
    jnxQFXInterconnectSlotPower OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect    3 }
    jnxQFXInterconnectSlotFan    OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect    4 }
    jnxQFXInterconnectSlotCBD    OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect    5 }
    jnxQFXInterconnectSlotFPB    OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect    6 }

  jnxMediaCardSpaceQFXInterconnect     OBJECT IDENTIFIER ::= { jnxMediaCardSpace    60 }
    jnxQFXInterconnectMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXInterconnect 1 }

  jnxMidplaneQFXInterconnect     OBJECT IDENTIFIER ::= { jnxBackplane        60 }
```

QFabric System QFX3600-I Interconnect Device

```
jnxProductLineQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductLine      91 }
  jnxProductNameQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductName      91 }
  jnxProductModelQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductModel      91 }
  jnxProductVariationQFXMInterconnect  OBJECT IDENTIFIER ::= { jnxProductVariation 91 }
    jnxProductQFX3600I           OBJECT IDENTIFIER ::= { jnxProductVariationQFXMInterconnect 1 }

  jnxChassisQFXMInterconnect      OBJECT IDENTIFIER ::= { jnxChassis          91 }

System Logging

Overview of Junos OS System Log Messages

The Junos OS, running on the QFX Series, generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Messages Reference*.

Related Documentation

- Junos OS System Log Configuration Statements on page 6127
- Junos OS Minimum System Logging Configuration on page 6126

Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 6141.

You direct messages to one or more destinations by including the appropriate statement at the **[edit system syslog]** hierarchy level:

- To a named file in a local file system, by including the **file** statement. See "Directing System Log Messages to a Log File" on page 6128.
- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the **user** statement. See "Directing System Log Messages to a User Terminal" on page 6130.
- To the switch console, by including the **console** statement. See "Directing System Log Messages to the Console" on page 6130.
- To a remote machine that is running the **syslogd** utility, by including the **host** statement. See "Directing System Log Messages to a Remote Machine" on page 6129.

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see "Logging Messages in Structured-Data Format" on page 6134.
- A message's facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the **explicit-priority** statement. For more information, see "Including Priority Information in System Log Messages" on page 6132.
- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see "Including the Year or Millisecond in Timestamps" on page 6134.

- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see "Directing System Log Messages to a Remote Machine" on page 6129.
- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see "Using Regular Expressions to Refine the Set of Logged Messages" on page 6146.

NOTE: During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log (syslog) messages as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log *filename*** operational mode command to view the messages.

NOTE: On the QFabric system, a syslog file named **messages** with a size of 100 MB is configured by default. If you do not configure a filename, you can use the default filename **messages** with the **show log *filename*** command.

All messages with a severity level of **notice** or higher are logged. Messages with a facility level of **interactive-commands** on Node devices are not logged.

The QFabric system supports the following system log message features:

- The **file *filename*** and **host *hostname*** statements at the **[edit system syslog]** hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the **show log *filename*** command by configuring the **file *filename* archive *maximum-file-size*** statement.
- You can specify that one or more system log message servers receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.
- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- The unit of time is is measured and displayed in seconds, and not milliseconds. If you attempt to configure the **time-format** option in milliseconds, the log output displays 000.

Starting in Junos OS Release 13.1, the QFabric system supports these additional syslog features:

- You can filter the output of the **show log *filename*** operational mode command by device type and device ID or device alias when you specify the ***device-type* (*device-id* | *device-alias*)** optional parameters. Device types include **director-device**, **infrastructure-device**, **interconnect-device**, and **node-device**.
- You can specify the syslog structured data output format when you configure the **structured-data** statement at the **[edit system syslog file *filename*]** and **[edit system syslog host *hostname*]** hierarchy levels.

  NOTE: Information displayed in the structured data output for system logs originating from the Director software may not be complete.

- You can filter the types of logs that the Director group collects from a component device when you configure the **filter all *facility severity*** or **filter all match "*regular-expression*"** statements at the **[edit system syslog]** hierarchy level.

Unsupported syslog features include:

- File access to syslog messages
- Monitoring of syslog messages

CHAPTER 67

Configuration

Configuration Examples

Examples: Configuring System Logging

The system log provides an excellent way of tracking all management activity on the switch by recording events such as user authentication, access authorization, and command execution. Logged command executions include commands entered by users at the CLI prompt or by client applications such as the Junos XML protocol or NETCONF XML client. Because system log files contain information about commands executed on the switch and the user who executed the commands, checking system log files for failed authentication events can help identify attempts to hack in to the switch. You can also analyze network activity by correlating executed commands with events and changes that occurred on the network at a particular time.

System log files are stored locally on the switch in the default **/var/log** directory.

The following example shows how to configure system log messages to record all commands entered by users and all authentication or authorization attempts. Logged commands include those entered by users at the CLI prompt and by client applications. Authentication and authorization attempts include events that are saved in the file named **cli-commands** and those that are sent to the terminal of a user who is logged in.

```
[edit system]
syslog {
   file cli-commands {
      interactive-commands info;
      authorization info;
   }
   user * {
      interactive-commands info;
      authorization info;
   }
}
```

The following example shows how to log all alarms state changes to the file **/var/log/alarms**:

```
[edit system]
syslog {
   file alarms {
      kernel warning;
   }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user alex, to a remote machine, and to the console:

```
[edit system]
syslog {
   /* write all security-related messages to file /var/log/security */
   file security {
      authorization info;
      interactive-commands info;
   }
   /* write messages about potential problems to file /var/log/messages: */
   /* messages from &ldquo;authorization&rdquo; facility at level &ldquo;notice&rdquo;
      and above, */
   /* messages from all other facilities at level &ldquo;warning&rdquo; and above */
   file messages {
      authorization notice;
      any warning;
   }
   /* write all messages at level &ldquo;critical&rdquo; and above to terminal of user
      &ldquo;alex&rdquo; if */
   /* that user is logged in */
   user alex {
```

```
        any critical;
    }
    /* write all messages from the &ldquo;daemon&rdquo; facility at level &ldquo;info&rdquo;
        and above, and */
    /* messages from all other facilities at level &ldquo;warning&rdquo; and above, to the
        */
    /* machine monitor.mycompany.com */
    host monitor.mycompany.com {
        daemon info;
        any warning;
    }
    /* write all messages at level &ldquo;error&rdquo; and above to the system console */
    console {
        any error;
    }
}
```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the interactive-commands facility at the info, notice, and warning severity levels:

```
[edit system]
file user-actions {
    interactive-commands info;
    }
    user philip {
        interactive-commands notice;
    }
    console {
        interactive-commands warning;
    }
}
```

The following list describes the security levels used in the example:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file **/var/log/user-actions**.
- **notice**—Logs a message when users issue the configuration mode command **commit**. The example writes the messages to the terminal of user philip.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

Examples: Assigning an Alternative Facility

This topic contains examples of configuring system log messages to use an alternative facility for logging.

The following example shows how to log all messages generated on the switch at the **error** level or higher to the **local0** facility on the remote host called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example contains two sets of statements that show how to configure switches located in California and in New York to send messages to a single remote host called **central-logger.mycompany.com.** The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- The following statements configure the California switch to aggregate messages in the **local0** facility:

  ```
  [edit system syslog]
  host central-logger.mycompany.com {
    change-log info;
    facility-override local0;
  }
  ```

- The following statements configure the New York switch to aggregate messages in the **local2** facility:

  ```
  [edit system syslog]
  host central-logger.mycompany.com {
    change-log info;
    facility-override local2;
  }
  ```

On the remote host named **central-logger** you can subsequently configure the system logging utility to write messages from the **local0** facility to one file (for example, **california-config**) and the messages from the **local2** facility to another file (for example, **new-york-config**).

Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- Requirements on page 6077
- Overview on page 6077
- Configuration on page 6077

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

   ```
   [edit system syslog]
   user@switch# set host 10.1.1.12 any error
   ```

NOTE: You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

NOTE: On the QFabric system, a syslog file named **messages** is configured implicitly with facility and severity levels of **any any** and a file size of 100 MBs. Therefore, you cannot specify the filename **messages** in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
user@switch# set file qflogs
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

Results

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Example: Monitoring Network Traffic Using sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow monitoring on a QFX3500 switch in standalone mode.

Requirements

This example uses the following hardware and software components:

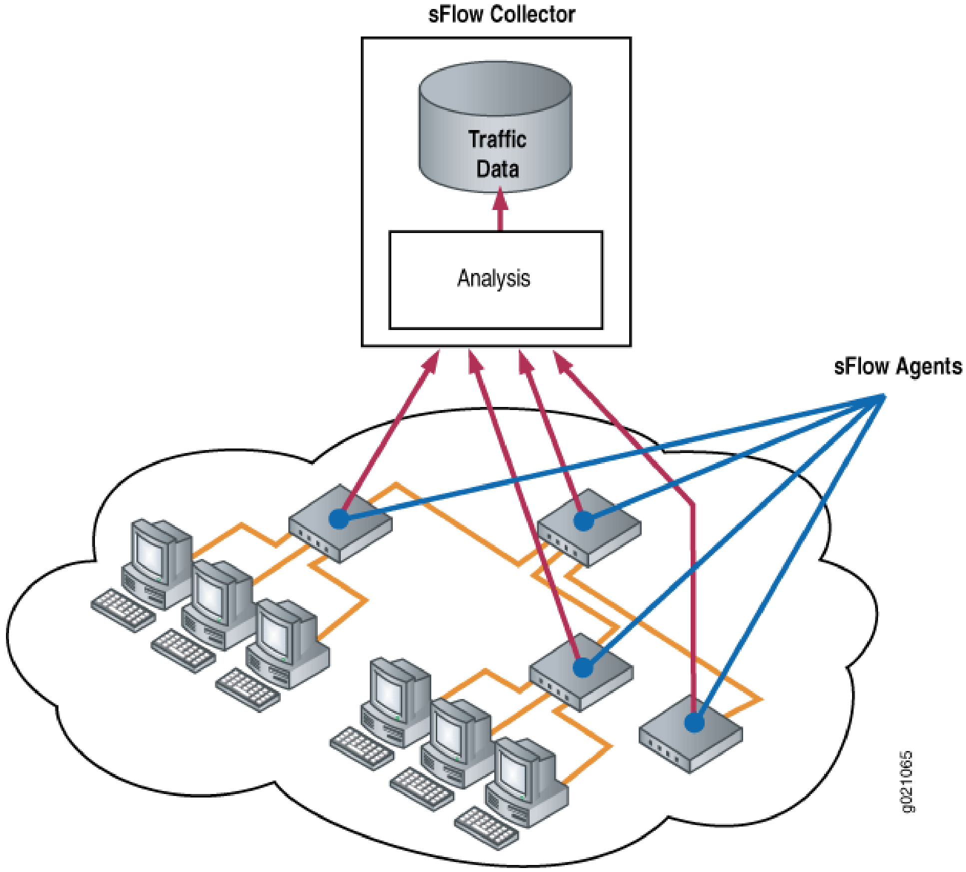
- Junos OS Release 11.3 or later
- One QFX3500 switch

Overview

An sFlow monitoring system consists of an sFlow agent embedded in the device and a centralized collector on the network. The two main activities of the sFlow agent are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them to the IP address and UDP destination port of the sFlow collector in UDP datagrams.

Figure 215 on page 6080 depicts the basic elements of an sFlow system.

Figure 215: sFlow Technology Monitoring System



Configuration

CLI Quick Configuration

To quickly configure sFlow technology, copy the following commands and paste them into the terminal window of the switch:

```
[edit protocols sflow]
set collector 10.204.32.46 udp-port 5600
set interfaces xe-0/0/1.0
set polling-interval 20
set sample-rate 1000
```

Step-by-Step Procedure

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

   ```
   [edit protocols sflow]
   user@switch# set collector 10.204.32.46 udp-port 5600
   ```

   The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@switch# set interfaces xe-0/0/1.0
   ```

NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example, ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled at the global level. The following example sets a sample rate of 1 in 1000 packets:

```
[edit protocols sflow]
user@switch# set sample-rate 1000
```

Results Check the results of the configuration:

```
[edit]
user@switch# show protocols
sflow {
  collector 10.204.32.46 {
    udp-port 5600;
  }
  interfaces xe-0/0/1.0 {
    polling-interval 20;
    sample-rate 1000;
  }
}
```

Verification

To confirm that the configuration is correct, perform these tasks:

- Verifying That sFlow Technology Has Been Configured Properly on page 6081
- Verifying That sFlow Technology Is Enabled on an Interface on page 6082
- Verifying the sFlow Collector Configuration on page 6082

Verifying That sFlow Technology Has Been Configured Properly

Purpose Verify that sFlow technology has been configured properly.

Action Enter the **show sflow** operational mode command:

```
user@switch> show sflow
```

```
sFlow            : Enabled
Sample limit     : 300 packets/second
Polling interval : 20 second
Sample rate      : 1:1000
Agent ID         : 10.1.1.2
```

NOTE: The sample limit cannot be configured and is set to 300 packets per second.

Meaning The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and sampling rate.

Verifying That sFlow Technology Is Enabled on an Interface

Purpose Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

Action Enter the **show sflow interface** operational mode command:

```
user@switch> show sflow interface
Interface       Status      Sample     Polling
                             rate      interval
xe-0/0/1.0   Enabled       1000         20
```

Meaning The output indicates that sFlow technology is enabled on the **Node1:xe-0/0/1.0** interface on the Node device with a sampling rate of 1000 and a polling interval of 20 seconds.

Verifying the sFlow Collector Configuration

Purpose Verify the sFlow collector configuration.

Action Enter the **show sflow collector** operational mode command:

```
user@switch> show sflow collector
Collector        Udp-port     No. of samples
 address
10.204.32.46         5600           7516
```

Meaning The output displays the IP address of the collector, the UDP port, and the number of samples collected.

- *Overview of sFlow Technology*

Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- Requirements on page 6083
- Overview on page 6083
- Configuration on page 6083

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name “snmp qfabric” description “qfabric0 switch”
set snmp location “Lab 4 Row 11” contact “qfabric-admin@qfabric0”
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group “qf-traps” destination-port 155 targets 192.168.0.100
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

NOTE: **If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").**

1. Configure the SNMP system name:

   [edit snmp]
   user@switch# **set name “snmp qfabric”**

2. Specify a description.

   [edit snmp]
   user@switch# **set description “qfabric0 system”**

   This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

   [edit snmp]
   user@switch# **set location “Lab 4 Row 11”**

   This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

   [edit snmp]
   user@switch# **set contact “qfabric-admin@qfabric0”**

   This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

   NOTE: **The read-write option is not supported on the QFabric system.**

   [edit snmp]
   user@switch# **set community public authorization read-only**

6. Create a client list with a set of IP addresses that can use the SNMP community.

   [edit snmp]
   user@switch# **set client-list list0 192.168.0.0/24**
   user@switch# **set community public client-list-name list0**

7. Specify IP addresses of clients that are restricted from using the community.

   [edit snmp]
   user@switch# **set community public clients 192.170.0.0/24 restrict**

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group “qf-traps” destination-port 155 targets 192.168.0.100
```

NOTE: You do not need to include the **destination-port** statement if you use the default port 162.

The trap group qf-traps is configured to send traps to 192.168.0.100.

Results From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
  snmp {
    name "snmp qfabric";
    description "qfabric0 system";
    location "Lab 4 Row 11";
    contact "qfabric-admin@qfabric0";
    client-list list0 {
      192.168.0.0/24;
    }
    community public {
      authorization read-only;
      clients {
        197.170.0.0/24 restrict;
      }
    }
    trap-group qf-traps {
      destination-port 155;
      targets {
        192.168.0.100;
      }
    }
  }
```

If you are done configuring the device, enter **commit** from configuration mode.

Example: Configuring Network Analytics

This example shows how to configure network analytics which includes queue and traffic monitoring on a QFX3500 standalone switch.

NOTE: The configuration shown in this example is supported only on Junos OS Release 13.2X50-D15 and 13.2X51-D10.

Requirements

This example uses the following hardware and software components:

- A QFX3500 standalone switch
- A external streaming server to collect data
- Junos OS Release 13.2X50-D15 software
- TCP server software (for remote streaming servers)

Before you configure network analytics, be sure you have:

- Junos OS Release 13.2X50-D15 or later software installed and running on the QFX3500 switch
- (Optional for streaming servers) TCP server software set up for processing records separated by a newline character (\n) on the remote streaming server
- All other devices running

Overview

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed. You can enable network analytics by configuring queue and traffic statistics monitoring.

Topology

In this example, the QFX3500 switch is connected to an external server used for streaming statistics data.

Configuration

To configure network analytics, perform these tasks:

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set services analytics interfaces all queue-statistics
set services analytics interfaces all latency-threshold high 900 low 300
set services analytics interfaces xe-0/0/1 traffic-statistics
set services analytics queue-statistics file qstats1.qs files 3 size 10
set services analytics queue-statistics interval 10
set services analytics traffic-statistics file tstats1.ts files 3 size 10
set services analytics traffic-statistics interval 2
set services analytics streaming-servers address 10.94.198.11 port 50001 stream-format
  json stream-type queue-statistics
set services analytics streaming-servers address 10.94.198.11 port 50005 stream-format
  csv stream-type traffic-statistics
```

Configuring Queue and Traffic Statistics Monitoring

Step-by-Step Procedure

To configure queue and traffic monitoring on physical interfaces:

NOTE: You can configure queue and traffic monitoring on physical network interfaces only; logical interfaces and Virtual Chassis physical (VCP) interfaces are not supported.

NOTE: Disabling of the queue or traffic monitoring supersedes the configuration (enabling) of this feature. You disable monitoring by issuing the **no-queue-statistics** or **no-traffic-statistics** at the **[edit services analytics interfaces]** hierarchy level.

1. Configure all interfaces for queue monitoring and set the latency thresholds (in microseconds):

   ```
   [edit]
   set services analytics interfaces all queue-statistics
   set services analytics interfaces all latency-threshold high 900 low 300
   ```

2. Configure one interface for traffic monitoring:

   ```
   [edit]
   set services analytics interfaces xe-0/0/1 traffic-statistics
   ```

Configuring Local Statistics Files

Step-by-Step Procedure

To configure local statistics files:

1. Configure the number of queue statistics files, and each file size in MB:

   ```
   [edit]
   ```

set services analytics queue-statistics file qstats1.qs files 3 size 10m

2. Configure the queue statistics collection interval in milliseconds

   [edit]
   set services analytics queue-statistics interval 10

3. Configure the number of traffic statistics files, and each file size in MB:

   [edit]
   set services analytics traffic-statistics file tstats1.ts files 3 size 10m

4. Configure the traffic statistics collection interval in seconds:

   [edit]
   set services analytics traffic-statistics interval 2

Configuring Streaming Servers

Step-by-Step Procedure

To configure streaming servers for receiving monitoring data:

> NOTE: In addition to configuring streaming servers, you must also set up the TCP client software to process records that are separated by the newline character (\n) on the remote server.

1. Configure a server IP address and port for queue statistics monitoring:

   [edit]
   set services analytics streaming-servers address 10.94.198.11 port 50001 stream-format json stream-type queue-statistics

2. Configure a server IP address and port for traffic statistics monitoring:

   [edit]
   set services analytics streaming-servers address 10.94.198.11 port 50005 stream-format csv stream-type traffic-statistics

Results

Display the results of the configuration:

```
[edit services analytics]
user@switch> show configuration
  queue-statistics {
    file qstats1.qs size 10m files 3;
    interval 10;
  }
  traffic-statistics {
    file tstats1.ts size 10m files 3;
    interval 2;
  }
  interfaces {
    xe-0/0/1 {
      traffic-statistics;
    }
    all {
```

```
        queue-statistics;
        latency-threshold high 900 low 300;
      }
    }
```

Verification

Confirm that the configuration is correct and works as expected by performing these tasks:

Verifying the Network Analytics Configuration

Purpose Verify the configuration for network analytics.

Action From operational mode, enter the **show analytics configuration** command to display the traffic and queue monitoring configuration.

```
user@host> show analytics configuration
Global configurations:
   Traffic statistics: Auto, Poll interval: 2 seconds
   Queue statistics: Enabled, Poll interval: 10 milliseconds
   Depth threshold high: 0 bytes, low: 0 bytes
   Latency threshold high: 900 microseconds, low: 300 microseconds
Interface      Traffic       Queue        Depth-threshold      Latency-threshold
             Statistics    Statistics      High       Low         High       Low
                                              (bytes)             (microseconds)
xe-0/0/1      Enabled      Auto             0          0          900        300
```

Meaning The output displays information about traffic and queue monitoring on the switch.

Verifying the Network Analytics Status

Purpose Verify the network analytics operational status of the switch.

Action From operational mode, enter the **show analytics status** command to display the traffic and queue monitoring status.

```
user@host> show analytics status
Global configurations:
   Traffic statistics: Auto, Poll interval: 2 seconds
   Queue statistics: Auto, Poll interval: 10 milliseconds
   Depth threshold high: 1228800 bytes, low: 1024 bytes
   Latency threshold high: 900 microseconds, low: 300 microseconds
Interface     Traffic       Queue        Depth-threshold      Latency-threshold
            Statistics    Statistics      High      Low          High      Low
                                             (bytes)            (microseconds)
xe-0/0/1     Enabled       Auto          1228800   1024          900       300
xe-0/0/7     Auto          Auto          1228800   1024          900       300
xe-0/0/8     Auto          Auto          1228800   1024          900       300
```

Verifying Streaming Servers Configuration

Purpose Verify the configuration for streaming data to remote servers is working.

Action From operational mode, enter the **show analytics streaming-servers** command to display the streaming servers configuration.

```
user@host> show analytics streaming-servers
Address          Port     Stream-Format     Stream-Type   State         Sent
10.94.198.11     50001    json              QS            Established   1100
10.94.198.11     50005    csv               TS/QS         In Progress      0
```

Meaning The output displays information about the remote streaming server.

Verifying Queue Statistics

Purpose Verify that queue statistics collection is working.

Action From operational mode, enter the **show analytics queue-statistics** command to display the queue statistics.

```
user@host> show analytics queue-statistics
Time                Interface   Queue-length (bytes)   Latency (us)
Apr 6 0:17:18.224  xe-0/0/1            1043952            835
Apr 6 0:17:18.234  xe-0/0/1            1053520            842
Apr 6 0:17:18.244  xe-0/0/1            1055184            844
```

Meaning The output displays queue-statistics information as expected.

Verifying Traffic Statistics

Purpose Verify that traffic statistics collection is working.

Action From operational mode, enter the **show analytics traffic-statistics** command to display the traffic statistics.

```
user@host> show analytics traffic-statistics
Time: Apr 5 19:52:48.549, Physical interface: xe-0/0/1
  Traffic Statistics:                  Receive          Transmit
  Total octets:                  4797548752936      408886273632
  Total packet:                     5658257464        3190613435
  Octets per second:                         0                 0
  Packet per second:                         0                 0

- **show analytics streaming-servers on page 6363**

Example: Configuring Enhanced Network Analytics Features

This example shows how to configure the enhanced network analytics feature, including queue and traffic monitoring, on a QFX5100 standalone switch.

Requirements

This example uses the following hardware and software components:

- A QFX5100 standalone switch
- A external streaming server to collect data
- Junos OS Release 13.2X51-D15 software
- TCP server software (for remote streaming servers)

Before you configure network analytics, be sure you have:

- Junos OS Release 13.2X51-D15 or later software installed and running on the QFX5100 switch.
- (Optional for streaming servers for the JSON, CSV, and TSV formats) TCP or UDP server software set up for processing records separated by a newline character (\n) on the remote streaming server.
- (Optional for streaming servers for the GPB format) TCP or UDP build streaming server using the **analytics.proto** file.
- All other network devices running.

Overview

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed.

You enable network analytics by first defining a resource profile template, and then applying the profile to the system (for a global configuration) or to individual interfaces.

NOTE: You can configure queue and traffic monitoring on physical network interfaces only; logical interfaces and Virtual Chassis physical (VCP) interfaces are not supported.

Disabling of the queue or traffic monitoring supersedes the configuration (enabling) of this feature. You disable monitoring by applying a resource profile that includes the **no-queue-monitoring** or **no-traffic-monitoring** configuration statement at the **[edit services analytics resource-profiles]** hierarchy level.

Topology

In this example, the QFX5100 switch is connected to an external server used for streaming statistics data.

Configuration

To configure the network analytics features, perform these tasks:

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set services analytics resource system polling-interval queue-monitoring 1000
set services analytics resource system polling-interval traffic-monitoring 5
set services analytics collector local file an.stats
set services analytics collector local file an files 3
set services analytics collector local file an size 10m
set services analytics resource-profiles sys-rp queue-monitoring
set services analytics resource-profiles sys-rp traffic-monitoring
set services analytics resource-profiles sys-rp depth threshold high 999999 low 99
set services analytics resource system resource-profile sys-rp
set services analytics resource-profiles if-rp queue-monitoring
set services analytics resource-profiles if-rp traffic-monitoring
set services analytics resource-profiles if-rp latency-threshold high 2300 low 20
set services analytics resource interfaces xe-0/0/16 resource-profile if-rp
set services analytics resource interfaces xe-0/0/18 resource-profile if-rp
set services analytics resource interfaces xe-0/0/19 resource-profile if-rp
set services analytics export-profiles ep stream-format gpb
set services analytics export-profiles ep interface information
set services analytics export-profiles ep interface statistics queue
set services analytics export-profiles ep interface statistics traffic
set services analytics export-profiles ep interface status link
set services analytics export-profiles ep system information
set services analytics export-profiles ep system status queue
set services analytics export-profiles ep system status traffic
set services analytics collector address 10.94.198.11 port 50001 transport tcp export-profile
  ep
set services analytics collector address 10.94.184.25 port 50013 transport udp
  export-profile ep
```

Configuring the Polling Interval for Queue and Traffic Monitoring

Step-by-Step Procedure

To configure the polling interval queue and traffic monitoring globally:

1. Configure the queue monitoring polling interval (in milliseconds) for the system:

   ```
   [edit]
   set services analytics resource system polling-interval queue-monitoring 1000
   ```

2. Configure the traffic monitoring polling interval (in seconds) for the system:

```
[edit]
set services analytics resource system polling-interval traffic-monitoring 5
```

Configuring a Local Statistics File

Step-by-Step Procedure

To configure a file for local statistics collection:

1. Configure the filename:

   ```
   [edit]
   set services analytics collector local file an.stats
   ```

2. Configure the number of files:

   ```
   [edit]
   set services analytics collector local file an files 3
   ```

3. Configure the file size:

   ```
   [edit]
   set services analytics collector local file an size 10m
   ```

Configuring and Applying a Resource Profile for the System

Step-by-Step Procedure

To define a resource profile template for queue and traffic monitoring resources:

1. Configure a resource profile and enable queue monitoring:

   ```
   [edit]
   set services analytics resource-profiles sys-rp queue-monitoring
   ```

2. Enable traffic monitoring in the profile:

   ```
   [edit]
   set services analytics resource-profiles sys-rp traffic-monitoring
   ```

3. Configure the depth-threshold (high and low values) for queue monitoring in the profile:

   ```
   [edit]
   set services analytics resource-profiles sys-rp depth threshold high 999999 low 99
   ```

4. Apply the resource profile template to the system resource type for a global configuration:

   ```
   [edit]
   set services analytics resource system resource-profile sys-rp
   ```

Configuring and Applying a Resource Profile for an Interface

Step-by-Step Procedure

You can configure queue and traffic monitoring for one or more specific interfaces. The interface-specific configuration supersedes the global (system) configuration. To define a resource profile template for queue and traffic monitoring resources for an interface:

1. Configure a resource profile and enable queue monitoring:

   ```
   [edit]
   set services analytics resource-profiles if-rp queue-monitoring
   ```

2. Enable traffic monitoring in the profile:

[edit]
set services analytics resource-profiles if-rp traffic-monitoring

3. Configure the latency-threshold (high and low values) for queue monitoring in the profile:

   [edit]
   set services analytics resource-profiles if-rp latency-threshold high 2300 low 20

4. Apply the resource profile template to the interfaces resource type for specific interfaces:

   [edit]
   set services analytics resource interfaces xe-0/0/16 resource-profile if-rp
   set services analytics resource interfaces xe-0/0/18 resource-profile if-rp
   set services analytics resource interfaces xe-0/0/19 resource-profile if-rp

Configuring an Export Profile and Collector for Streaming Data

Step-by-Step Procedure

To configure a collector (streaming server) for receiving monitoring data:

1. Create an export profile and specify the stream format:

   [edit]
   set services analytics export-profiles ep stream-format gpb

2. Configure the export profile to include interface information:

   [edit]
   set services analytics export-profiles ep interface information

3. Configure the export profile to include interface queue statistics:

   [edit]
   set services analytics export-profiles ep interface statistics queue

4. Configure the export profile to include interface traffic statistics:

   [edit]
   set services analytics export-profiles ep interface statistics traffic

5. Configure the export profile to include interface status link information:

   [edit]
   set services analytics export-profiles ep interface status link

6. Configure the export profile to include system information:

   [edit]
   set services analytics export-profiles ep system information

7. Configure the export profile to include system queue status:

   [edit]
   set services analytics export-profiles ep system status queue

8. Configure the export profile to include system traffic status:

   [edit]
   set services analytics export-profiles ep system status traffic

9. Configure the transport protocol for the collector addresses and apply an export profile:

```
[edit]
set services analytics collector address 10.94.198.11 port 50001 transport tcp
  export-profile ep
set services analytics collector address 10.94.184.25 port 50013 transport udp
  export-profile ep
```

NOTE: If you configure the **tcp** or **udp** option for the JSON, CSV, and TSV formats, you must also set up the TCP or UDP client software on the remote collector to process records that are separated by the newline character (\n) on the remote server.

If you configure the **tcp** or **udp** option for the GPB format, you must also set up the TCP or UDP build streaming server using the **analytics.proto** file.

Results Display the results of the configuration:

```
[edit services analytics]
user@switch# run show configuration
collector {
  local {
    file an.stats {
      size 10m;
      files 3;
    }

        queue-monitoring;
        traffic-monitoring;
    }
    sys-rp {
        depth-threshold {
            high 99999;
            low 99;
        }
        queue-monitoring;
        traffic-monitoring;
    }
}
```

Verification

Confirm that the configuration is correct and works as expected by performing these tasks:

- Verifying the Network Analytics Configuration on page 6098
- Verifying the Network Analytics Status on page 6098
- Verifying the Collector Configuration on page 6099
- Verifying Queue Statistics on page 6099
- Verifying Traffic Statistics on page 6100

Verifying the Network Analytics Configuration

Purpose Verify the configuration for network analytics.

Action From operational mode, enter the **show analytics configuration** command to display the traffic and queue monitoring configuration.

```
user@host> show analytics configuration
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring polling interval : 1000 milliseconds
Queue depth high threshold : 1000000000 bytes
Queue depth low threshold : 99 bytes
Queue latency high threshold : 2300 nanoseconds
Queue latency low threshold : 20 nanoseconds

Interface      Traffic       Queue        Queue depth                 Latency
             Statistics    Statistics      threshold                 threshold
                                          High          Low       High       Low
                                             (bytes)              (nanoseconds)
xe-0/0/16    n/a           enabled        n/a           n/a       2300       20
xe-0/0/18    n/a           enabled        n/a           n/a       2300       20
xe-0/0/19    n/a           enabled        n/a           n/a       2300       20
```

Meaning The output displays the traffic and queue monitoring configuration information on the switch.

Verifying the Network Analytics Status

Purpose Verify the network analytics operational status of the switch.

Action From operational mode, enter the **show analytics status global** command to display global traffic and queue monitoring status.

```
user@host> show analytics status global
Traffic monitoring status is auto
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring polling interval : 1000 milliseconds
Queue depth high threshold : 1000000000 bytes
Queue depth low thresdhold : 99 bytes
```

From operational mode, enter the **show analytics status** command to display both the interface and global queue monitoring status.

```
user@host> show analytics status
Traffic monitoring status is auto
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring polling interval : 1000 milliseconds
Queue depth high threshold : 1000000000 bytes
Queue depth low thresdhold : 99 bytes

Interface     Traffic       Queue        Queue depth          Latency
            Statistics    Statistics      threshold          threshold
                                        High        Low      High      Low
                                           (bytes)           (nanoseconds)
xe-0/0/16     enabled     enabled       1000000000  99       n/a       n/a
xe-0/0/18     disabled    enabled       1000000000  99       n/a       n/a
xe-0/0/19     enabled     enabled       1000000000  99       n/a       n/a
```

Meaning The output displays the global and interface status of traffic and queue monitoring on the switch.

Verifying the Collector Configuration

Action Verify the configuration for the collector for streamed data is working.

From operational mode, enter the **show analytics collector** command to display the streaming servers configuration.

```
user@host> show analytics collector
Address         Port   Transport  Stream format  State            Sent
10.94.184.25    50013  udp        gpb            n/a              8710
10.94.198.11    50001  tcp        gpb            Not initialized  0
```

Meaning The output displays the collector configuration.

Verifying Queue Statistics

Purpose Verify that queue statistics collection is working.

Action From operational mode, enter the **show analytics queue-statistics** command to display the queue statistics.

```
user@host> show analytics queue-statistics
CLI issued at 2014-01-07 17:20:29.978561
Time                       Interface        Queue-depth        Latency
                                            (bytes)            (nanoseconds)
00:00:00.870058 ago        xe-0/0/19        1369680            1095744
00:00:01.875049 ago        xe-0/0/19        1381952            1105561
00:00:02.875053 ago        xe-0/0/19        1387776            1110220
00:00:03.876047 ago        xe-0/0/19        1387568            1110054
00:00:04.873045 ago        xe-0/0/19        1388192            1110553
00:00:05.871044 ago        xe-0/0/19        1385904            1108723
00:00:06.873354 ago        xe-0/0/19        1371552            1097241
```

Meaning The output displays queue-statistics information, with the latest record at the top of the report.

Verifying Traffic Statistics

Purpose Verify that traffic statistics collection is working.

Action From operational mode, enter the **show analytics traffic-statistics** command to display the traffic statistics.

```
user@host> show analytics traffic-statistics
CLI issued at 2014-01-07 17:22:28.952677
Time: 00:00:03.480244 ago, Physical interface: xe-0/0/19

Configuration Tasks for Network Management

Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data terminal may be connected to the switch. The console port is enabled by default, and its speed is 9600 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

   ```
   [edit system ports]
   user@switch# set console log-out-on-disconnect
   ```

2. To specify the auxiliary port terminal type:

   ```
   [edit system ports]
   user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
   ```

   For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

   ```
   [edit system ports]
   user@switch# set auxiliary type xterm
   ```

3. To check the configuration:

   ```
   [edit system ports]
   user@switch# show
   console log-out-on-disconnect;
   auxiliary type xterm;
   ```

Related Documentation

- auxiliary on page 231
- console (Physical Port) on page 240
- ports on page 272

Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
   ciphers [ cipher-1 cipher-2 cipher-3 ...]
   client-alive-count-max number;
   client-alive-interval seconds;
   connection-limit limit;
   hostkey-algorithm <algorithm | no-algorithm>;
   key-exchange algorithm;
   macs algorithm;
   max-sessions-per-connection number;
   no-tcp-forwarding;
   protocol-version [v1 v2] ;
   rate-limit limit;
   root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit** *limit*—Maximum number of simultaneous connections per protocol (IPV4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection** *number*—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit** *limit*—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

For information about other configuration settings, see the following topics:

- Configuring the Root Login Through SSH on page 6102
- Configuring the SSH Protocol Version on page 6103
- Configuring the Client Alive Mechanism on page 6103

Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit systems services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

allow—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

deny—Disables users from logging in to the router or switch as root through SSH.

deny-password—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

Configuring Telnet Service for Remote Access to a Switch

Telnet provides unencrypted access to network devices. Configuring Telnet service for a switch enables in-band remote access to the switch.

By default, the switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute. Optionally, you can change the default Telnet settings by configuring the connection limit and rate limit at the **[edit system services telnet]** hierarchy level.

The connection limit is the maximum number of simultaneous connections per protocol (IPv4). The range is from **1** through **250**. The default is **75**.

The rate limit is the maximum number of connection attempts accepted per minute per protocol. The range is from **1** through **250**. The default is **150**.

To configure Telnet service:

1. To specify the connection limit:

   [edit system services]
   user@switch# **set telnet connection-limit** *connection-limit*

2. To specify the rate limit:

   [edit system services]
   user@switch# **set telnet rate-limit** *rate-limit*

3. Check that the Telnet connection limit and rate limit show the values you specified:

```
[edit system services]
user@switch# show
  telnet {
    connection-limit 50;
    rate-limit 100;
  }
```

Configuration Tasks for Automation

Invoking the Python Interpreter

The Python interpreter is available by default with Junos operating system (Junos OS) software. You can invoke Python by entering the **python** command at the shell script.

To invoke the Python interpreter:

1. Start the shell interface:

   `user@switch>` **start shell**

2. Enter the **python** command without any parameters:

   `%` **python**

NOTE: The Python interpreter is designated with the prompt >>> at the beginning of a line or ... to indicate the continuation of a line.

Controlling the Execution of Commit Scripts

This document describes the tasks that affect the way commit scripts are executed. In the QFabric system, commit scripts are stored in the in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit** directory that is shared among Director devices in a Director group.

To determine which commit scripts are currently enabled on the QFabric system, use the **show** command to display the files included at the **[edit system scripts commit]** hierarchy level. To ensure that the enabled files are on the device, list the contents of the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit** directory using the **file list** operational mode command.

See the following tasks:

- Enabling Commit Scripts to Execute on page 6105
- Removing Commit Scripts from the Configuration on page 6106
- Deactivating Commit Scripts on page 6107
- Activating Inactive Commit Scripts on page 6107

Enabling Commit Scripts to Execute

The commit operation requires that all scripts be included in configuration at the **[edit system scripts commit file]** hierarchy level for all QFabric Director devices.

If you need to temporarily remove a script from a commit operation but do not want to remove it from the configuration permanently, you may configure the **optional** statement at the **[edit system scripts commit file *filename*]** hierarchy level to enable the commit operation to succeed even if a script is missing from the commit script directory.

CAUTION: When you include the **optional** statement at the **[edit system scripts commit file *filename*]** hierarchy level, no error message is generated during the commit operation if the file does not exist. As a result, you might not be aware that a script has not been executed as expected.

The filename of a commit script written in SLAX must include the **.slax** extension for the script to be executed.

To enable a commit script to execute during a commit operation:

1. Ensure that the commit script is located in the correct directory: **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit** directory on the Director device.
2. Configure the commit script.

   ```
   [edit system scripts commit]
   user@switch# set file filename <optional>
   ```

3. Commit the configuration.

   ```
   [edit system scripts commit]
   user@switch# top
   [edit]
   user@switch# commit
   ```

Removing Commit Scripts from the Configuration

You can prevent commit scripts from executing during a commit operation by removing the scripts from the commit directory in the configuration.

NOTE: You can also deactivate a script using the **deactivate** statement instead of removing it from the configuration. Deactivated scripts may be reactivated later.

To prevent a commit script from executing during a commit operation:

1. Delete the commit script file from the commit directory in the configuration.

   ```
   [edit system scripts commit]
   user@switch# delete file filename
   ```

2. Commit the configuration.

   ```
   [edit system scripts commit]
   user@switch# top
   [edit]
   user@switch# commit
   ```

3. Remove the commit script from the **/pbdata/mgd_shared/** directory on the Director device.

   BEST PRACTICE: Although removing the commit script is not necessary, we recommend deleting unused files from the system.

Deactivating Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration. The script is not executed during the commit operation, but you can reactivate the script by using the **activate** statement.

To deactivate the commit script:

1. Deactivate the script.

   [edit]
   user@switch **deactivate system scripts commit file** ***filename***

2. Commit your changes.

   [edit]
   user@switch# **commit**

3. Verify that the commit script is deactivated.

   [edit]
   user@switch# **show system scripts commit**
   inactive: file mycommit.slax

Activating Inactive Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration and is therefore not executed during the commit operation.

To activate an inactive commit script:

1. Activate the script.

   [edit]
   user@switch# **activate system scripts commit file** ***filename***

2. Commit your changes.

   [edit]
   user@switch# **commit**

Configuration Tasks for sFlow Technology

• Configuring sFlow Technology on page 6108

Configuring sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

On the QFabric system, the sFlow monitoring global configuration that is defined on the Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

   ```
   [edit protocols sflow]
   user@host# set collector ip-address udp-port port-number
   ```

   The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

   ```
   [edit protocols sflow]
   user@host# set interfaces interface-name
   ```

   NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

   You cannot enable sFlow technology on a LAG interface (for example ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

   ```
   [edit protocols sflow]
   user@host# set polling-interval seconds
   ```

   NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets are sampled at the global level. For example, configuring a ***number*** of 1000 sets a sample rate of 1 in 1000 packets.

   ```
   [edit protocols sflow]
   user@host# set sample-rate number
   ```

5. (Optional) You can also configure the polling interval and sample rate at the interface level:

   ```
   [edit protocols sflow]
   ```

```
user@host# set interfaces interface-name polling-interval seconds sample-rate number
```

NOTE: The interface-level configuration overrides the global configuration for the specified interface.

Configuration Tasks for SNMP

Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
```

```
community community-name {
  authorization authorization;
  client-list-name client-list-name;
  clients {
    address restrict;
  }
  logical-system logical-system-name {
    routing-instance routing-instance-name {
      clients {
      addresses;
      }
    }
  }
  routing-instance routing-instance-name {
    clients {
    addresses;
    }
  }
  view view-name;
}
contact contact;
description description;
filter-duplicates;
filter-interfaces;
health-monitor {
  falling-threshold integer;
  interval seconds;
  rising-threshold integer;
}
interface [ interface-names ];
location location;
name name;
nonvolatile {
  commit-delay seconds;
}
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type type;
  }
  history history-index {
```

```
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regular-expression>;
  flag flag;
}
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance routing-instance-name;
  targets {
    address;
  }
  version (all | v1 | v2);
}
trap-options {
  agent-address outgoing-interface;
  source-address address;
}
v3 {
  notify name {
    tag tag-name;
    type trap;
  }
  notify-filter profile-name {
    oid object-identifier (include | exclude);
  }
  snmp-community community-index {
    community-name community-name;
    security-name security-name;
    tag tag-name;
  }
  target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system logical-system;
    port port-number;
    retry-count number;
    routing-instance routing-instance-name;
    tag-list tag-list;
    target-parameters target-parameters-name;
    timeout seconds;
  }
  target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
      message-processing-model (v1 | v2c | V3);
      security-level (authentication | none | privacy);
      security-model (usm | v1 | v2c);
```

```
        security-name security-name;
      }
    }
    usm {
      local-engine {
        user username {
          authentication-sha {
            authentication-password authentication-password;
          }
          authentication-md5 {
            authentication-password authentication-password;
          }
          authentication-none;
          privacy-aes128 {
            privacy-password privacy-password;
          }
          privacy-des {
            privacy-password privacy-password;
          }
          privacy-3des {
            privacy-password privacy-password;
          }
          privacy-none;
        }
      }
      remote-engine engine-id {
        user username {
          authentication-sha {
            authentication-password authentication-password;
          }
          authentication-md5 {
            authentication-password authentication-password;
          }
          authentication-none;
          privacy-aes128 {
            privacy-password privacy-password;
          }
          privacy-des {
            privacy-password privacy-password;
          }
          privacy-3des {
            privacy-password privacy-password;
          }
          privacy-none {
            privacy-password privacy-password;
          }
        }
      }
    }
    vacm {
      access {
        group group-name {
          (default-context-prefix | context-prefix context-prefix) {
            security-model (any | usm | v1 | v2c) {
              security-level (authentication | none | privacy) {
                notify-view view-name;
```

```
                        read-view view-name;
                        write-view view-name;
                    }
                }
            }
        }
    }
    security-to-group {
        security-model (usm | v1 | v2c) {
            security-name security-name {
                group group-name;
            }
        }
    }
  }
}
view view-name {
    oid object-identifier (include | exclude);
}
}
```

Related Documentation

- snmp on page 1334

Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
community name {
    authorization authorization;
    clients {
        default restrict;
        address restrict;
    }
    view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see "Configuring MIB Views" on page 6116.

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For ***address***, you must specify an IPv4 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local switch.

NOTE: Community names must be unique within each SNMP system.

Related Documentation

- Configuring SNMP on page 1237

Configuring SNMP Trap Groups

Before any SNMP traps can be sent, you must configure a trap group, the categories of traps the group can receive, and the targets (systems) that will receive the traps. To create and name an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 address of each recipient and not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement.

A trap group can receive the following categories of traps:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications such as up-down transitions
- **remote-operations**—Remote operation notifications
- **startup**—System warm and cold starts

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see version.

- *Standard SNMP Version 2 Traps*
- *Juniper Networks Enterprise-Specific SNMP Version 1 Traps*
- *Juniper Networks Enterprise-Specific SNMP Version 2 Traps*

Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name *name*** statement at the **[edit snmp community *community-name*]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  client-list client-list-name {
  ip-addresses;
}
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list** statement, see the *Routing Policy Feature Guide for Routing Devices*.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]
client-list-name client-list-name;
```

NOTE: The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
  client-list clentlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
  }
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]
```

```
snmp {
  community community1 {
    authorization read-only;
    client-list-name clientlist1;
  }
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
  prefix-list prefixlist {
  10.3.3.3/32;
  10.5.5.5/32;
  }
}
snmp {
  community community2 {
  client-list-name prefixlist;
  }
}
```

Related Documentation

- client-list on page 1289
- client-list-name on page 1290

Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

Related Documentation

- *Configuring SNMP on a Device Running Junos OS*
- *Configuration Statements at the [edit snmp] Hierarchy Level*
- *Example: Configuring Secured Access List Checking*
- Configuring SNMP on page 1237

Configuring MIB Views

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
view view-name {
   oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

NOTE: **To remove an OID completely, use the delete view all oid *oid-number* command but omit the include parameter.**

To associate MIB views with a community, include the **view** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]
view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the *PING MIB* topic in the *SNMP MIBs and Traps Reference*.

- view (Associating MIB View with a Community) on page 6297
- *oid*

Configuring RMON Alarms and Events

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

To configure RMON alarms and events using the CLI, perform these tasks:

1. Configuring SNMP on page 6118
2. Configuring an Event on page 6118
3. Configuring an Alarm on page 6119

Configuring SNMP

To configure SNMP:

1. Grant read-only access to all SNMP clients:

   ```
   [edit snmp]
   user@switch# set community community-name authorization authorization
   ```

   For example:

   ```
   [edit snmp]
   user@switch# set community public authorization read-only
   ```
2. Grant read-write access to the **RMON** and **jnx-rmon** MIBs:

   ```
   [edit snmp]
   user@switch# set view view-name oid object-identifier include
   user@switch# set view view-name oid object-identifier include
   user@switch# set community community-name authorization authorization view view-name
   ```

   For example:

   ```
   [edit snmp]
   user@switch# set view rmon-mib-view oid .1.3.6.1.2.1.16 include
   user@switch# set view rmon-mib-view oid .1.3.6.1.4.1.2636.13 include
   user@switch# set community private authorization read-write view rmon-mib-view
   ```

   OIDs 1.3.6.1.2.1.16 and 1.3.6.1.4.1.2636.13 correspond to the **RMON** and **jnxRmon** MIBs.

3. Configure an SNMP trap group:

   ```
   [edit snmp]
   user@switch# set trap-group group-name categories category
   user@switch# set trap-group group-name targets address
   ```

   For example:

   ```
   [edit snmp]
   user@switch# set trap-group rmon-trap-group categories rmon-alarm
   user@switch# set trap-group rmon-trap-group targets 192.168.5.5
   ```

   The trap group **rmon-trap-group** is configured to send RMON traps to 192.168.5.5.

Configuring an Event

To configure an event:

1. Configure an event index, community name, and type:

   ```
   [edit snmp rmon]
   user@switch# set event index community community-name  typetype
   ```

   For example:

   ```
   [edit snmp rmon]
   user@switch# set event 1 community rmon-trap-group type log-and-trap
   ```

   The event community corresponds to the SNMP trap group and is not the same as an SNMP community. This event generates an SNMP trap and adds an entry to the **logTable** in the RMON MIB.

2. Configure a description for the event:

   ```
   [edit snmp rmon]
   user@switch# set event index description description
   ```

For example:

```
[edit snmp rmon]
user@switch# set event 1 description "rmon event"
```

Configuring an Alarm

To configure an alarm:

1. Configure an alarm index, the variable to monitor, the rising and falling thresholds, and the corresponding rising and falling events:

   ```
   [edit snmp rmon]
   user@switch# set alarm index variable oid-variable falling-threshold integer rising-threshold integer rising-event-index index falling-event-index index
   ```

   For example:

   ```
   [edit snmp rmon]
   user@switch# set alarm 5 variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 falling-threshold 75 rising-threshold 90 rising-event-index 1 falling-event-index 1
   ```

   The variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 corresponds to the **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The falling and rising threshold integers are 75 and 90. The rising and falling events both generate the same event (event index 1).

2. Configure the sample interval and type and the alarm type:

   ```
   [edit snmp rmon]
   user@switch# set alarm index interval seconds sample-type (absolute-value | delta-value) startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm)
   ```

   For example:

   ```
   [edit snmp rmon]
   user@switch# set alarm 5 interval 30 sample-type absolute-value startup-alarm rising-or-falling-alarm
   ```

   The absolute value of the monitored variable is sampled every 30 seconds. The initial alarm can occur because of rising above the rising threshold or falling below the falling threshold.

Configuring Health Monitoring

This topic describes how to configure the health monitor feature for QFX Series devices.

The health monitor feature extends the SNMP RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (such as file system usage, CPU usage, and memory usage) and dynamic object instances (such as Junos OS processes).

To configure health monitoring:

1. Configure the health monitor:

   [edit snmp]
   user@switch# **set health-monitor**

2. Configure the falling threshold:

   [edit snmp]
   user@switch# **set health-monitor falling-threshold** *percentage*

   For example:

   user@switch# **set health-monitor falling-threshold 85**

3. Configure the rising threshold:

   [edit snmp]
   user@switch# **set health-monitor rising-threshold** *percentage*

   For example:

   user@switch# **set health-monitor rising-threshold 75**

4. Configure the interval:

   [edit snmp]
   user@switch# **set health-monitor interval** *seconds*

   For example:

   user@switch# **set health-monitor interval 600**

Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

NOTE: You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

username is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
  privacy-password privacy-password;
}
privacy-3des {
  privacy-password privacy-password;
}
privacy-none;
```

Configuring Access Privileges for a Group

In SNMPv3, you can configure a group that sets the same access privileges for one or more users. Configuring a group includes defining the security model and security level, and associating one or more MIB view permissions for the group.

NOTE: You must associate at least one MIB view with the group. You can associate multiple MIB views (read, notify, write) to authorize different permissions based on the view. The view name cannot exceed 32 characters.

To configure access privileges for a group:

1. To configure the group:

   ```
   [edit snmp v3 vacm access]
   user@switch# edit group group-name
   ```

2. To configure the context prefix of the SNMP instance for the group:

   ```
   [edit snmp v3 vacm access group group-name]
   user@switch# edit (default-context-prefix | context-prefix context-prefix)
   ```

   For example, to configure the default context prefix:

   ```
   [edit snmp v3 vacm access group group-name]
   ```

user@switch# **edit default-context-prefix**

3. To configure the security model:

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*)]
   user@switch# **edit security-model (any | usm | v1 | v2c)**

   For example, to configure the SNMPv3 user-based security model (USM):

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*)]
   user@switch# **edit security-model usm**

4. To configure the security level:

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c)]
   user@switch# **edit security-level (authentication | none | privacy)**

   For example, to configure a security level requiring user authentication and encryption:

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c)]
   user@switch# **edit security-level privacy**

   NOTE: Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or v2c security model, use **none** as your security level. If you are configuring the SNMPv3 security model (USM), use the **authentication**, **none**, or **privacy** security level.

5. (Optional) To associate a read-only MIB view with an SNMP group:

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]
   user@switch# **edit read-view *view-name***

6. (Optional) To associate a MIB view with an SNMP notification permission for an SNMP group:

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]
   user@switch# **edit notify-view *view-name***

7. (Optional) To associate a MIB view with write permission for an SNMP group:

   [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]
   user@switch# **edit write-view *view-name***

Assigning a Security Name to a Group

In SNMPv3, each username is associated with a security name. The security name, together with the SNMP engine ID, is included in SNMP messages to ensure messaging security.

Before you assign a security name to a group, first create the security name. For an SNMPv3 client, the security name is the username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 or v2c clients, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Assigning a security name to a group includes configuring a security model for the group, assigning the security name to the group, and configuring the group.

To assign an SNMP security name to a group:

1. To configure a security model for the group:

   ```
   [edit snmp v3 vacm security-to-group]
   user@switch# edit security-model (usm | v1 | v2c)
   ```

   For example, to configure the SNMPv3 user-based security model (USM):

   ```
   [edit snmp v3 vacm security-to-group]
   user@switch# edit security-model usm
   ```

2. To associate the security name with a group:

   ```
   [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
   user@switch# edit security-name security-name
   ```

3. To configure a group of SNMPv3 security names with the same security policy:

   ```
   [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
     security-name]
   user@switch# edit group group-name
   ```

- security-name (Security Group) on page 6269

Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see “Configuring SNMP Informs” on page 6125.

The target address defines a management application's address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the **[edit snmp v3 vacm access]** and **[edit snmp v3 vacm security-to-group]** hierarchy levels.

To configure SNMP traps, include the following statements at the **[edit snmp v3]** hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type trap;
}
notify-filter name {
  oid object-identifier (include | exclude);
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system (SNMP logical-system;
  port port-number;
  routing-instance instance;
  tag-list tag-list;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

Configuring SNMP Informs

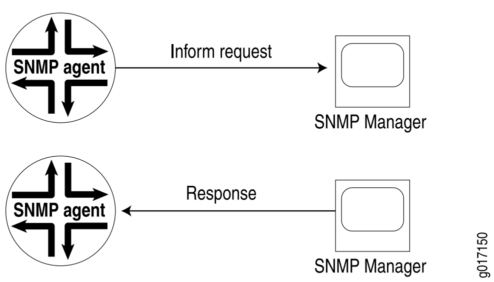
Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see Figure 216 on page 6125). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

Figure 216: Inform Request and Response



For information about configuring SNMP traps, see “Configuring SNMPv3 Traps on a Device Running Junos OS” on page 6123.

Configuration Tasks for System Log Messages

Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in Table 580 on page 6126. For more information about the configuration statements, see *Single-Chassis System Logging Configuration Overview*.

Table 580: Minimum Configuration Statements for System Logging

Destination	Minimum Configuration Statements

File	[edit system syslog]
	file *filename* {
	  facility severity;
	}

Terminal session of one, several, or all users	[edit system syslog]
	user (*username* | *) {
	  facility severity;
	}

Table 580: Minimum Configuration Statements for System Logging *(continued)*

Destination	Minimum Configuration Statements

Router or switch console	[edit system syslog]
	console {
	facility severity;
	}

Remote machine or the other Routing Engine on the router or switch	[edit system syslog]
	host (*hostname* | other-routing-engine) {
	facility severity;
	}

Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the **syslog** statement at the **[edit system]** hierarchy level:

```
[edit system]
syslog {
  archive <files number> <size size> <world-readable | no-world-readable>;
  console {
    facility severity;
  }
  file filename {
    facility severity;
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
      <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
      no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
      brief;
    }
  }
  host hostname {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string
    match "regular-expression";
  }
  source-address source-address;
  time-format (year | millisecond | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
```

```
  }
}
```

Related Documentation

- Overview of Junos OS System Log Messages on page 6068

Adding a Text String to System Log Messages

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign (=) and the colon (:). It also cannot include the space character; do not enclose the string in quotation marks (“ ”) in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
}
```

When these configuration statements are included on an M120 router called origin1, a message in the system log on hardware-logger.mycompany.com looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user ‘root’, command ‘run
  show version’
```

Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- Specifying Log File Size, Number, and Archiving Properties on page 6139
- Overview of Single-Chassis System Logging Configuration on page 6069

Directing System Log Messages to a Log File

To direct system log messages to a file in the **/var/log** directory of the local Routing Engine, include the **file** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
file filename {
  facility severity;
```

```
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
      <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
      no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
      brief;
    }
  }
```

For the list of facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the **archive** statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see "Specifying Log File Size, Number, and Archiving Properties" on page 6139.

For information about the following statements, see the indicated sections:

- **explicit-priority**—See "Including Priority Information in System Log Messages" on page 6132
- **match**—See "Using Regular Expressions to Refine the Set of Logged Messages" on page 6146
- **structured-data**—See *Logging Messages in Structured-Data Format*

Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- Overview of Junos OS System Log Messages on page 6068
- Logging Messages in Structured-Data Format on page 6134
- *Examples: Configuring System Logging*
- Examples: Configuring System Logging on page 6073

Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the **host** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the **host *hostname*** statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard **syslogd** utility. We do not recommend directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the **host** statement, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 6141.

To record facility and severity level information in each message, include the **explicit-priority** statement. For more information, see "Including Priority Information in System Log Messages" on page 6132.

For information about the **match** statement, see "Using Regular Expressions to Refine the Set of Logged Messages" on page 6146.

When directing messages to remote machines, you can include the **source-address** statement to specify the IP address of the switch that is reported in the messages as their source. In each **host** statement, you can also include the **facility-override** statement to assign an alternative facility and the **log-prefix** statement to add a string to each message.

Related Documentation

- Overview of Single-Chassis System Logging Configuration on page 6069

Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
  facility severity;
  match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (*****) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*. For information about the **match** statement, see "Using Regular Expressions to Refine the Set of Logged Messages" on page 6146.

Related Documentation

Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
   facility severity;
}
```

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

Related Documentation

- Overview of Single-Chassis System Logging Configuration on page 6069
- *Examples: Configuring System Logging*
- Examples: Configuring System Logging on page 6073

Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the ***facility*** **none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the **any *severity*** statement and then a ***facility*** **none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
console {
   any error;
   daemon none;
   kernel none;
}
file internals {
   daemon info;
   kernel info;
}
```

Related Documentation

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
```

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K

- Interpreting Messages Generated in Structured-Data Format on page 6135

Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level:

[edit system syslog file *filename*]
facility severity;
explicit-priority;

NOTE: Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the **[edit system syslog host (*hostname* | other-routing-engine)]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
explicit-priority;
```

NOTE: The **other-routing-engine** option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see "Changing the Alternative Facility Name for Remote System Log Messages" on page 6144.

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

FACILITY-severity[-*TAG*]

(The tag is a unique identifier assigned to some Junos OS system log messages; for more information, see the *Junos OS System Log Messages Reference*.)

In the following example, the **CHASSISD_PARSE_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info** (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
  Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
  configuration
```

For more information about message formatting, see the *Junos OS System Log Messages Reference*.

- *Examples: Configuring System Logging*

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 15:36:30
```

To include the year, the millisecond, or both, in the timestamp, include the **time-format** statement at the [**edit system syslog**] hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the [**edit system syslog**] hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Aug 21 15:36:30.401 2010
```

NOTE: By default, messages logged in structured-data format include the year and millisecond. If you include the **structured-data** statement at the [**edit system syslog file *filename***] hierarchy level along with the **time-format** statement, the **time-format** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see "Logging Messages in Structured-Data Format" on page 6134. For information about interpreting messages in a structured-data format, see "Interpreting Messages Generated in Structured-Data Format" on page 6135.

Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft **draft-ietf-syslog-protocol-21.txt**. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the [**edit system syslog file** *filename*] hierarchy level:

```
[edit system syslog file filename]
facility severity;
structured-data {
 brief;
}
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data–format message, see "Interpreting Messages Generated in Structured-Data Format" on page 6135.

The structured format is used for all messages logged to the file that are generated by a Junos OS process or software library.

NOTE: If you include either or both of the **explicit-priority** and **time-format** statements along with the **structured-data** statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

Interpreting Messages Generated in Structured-Data Format

By default, Junos OS processes and software libraries write messages to the system log file in structured-data format. For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*.

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

<priority code>version timestamp hostname process processID TAG [junos@2636.platform variable-value-pairs] message-text

Table 581 on page 6136 describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen (-) appears instead.

Table 581: Fields in Structured-Data Messages

Field	Description	Examples
<priority code>	Number that indicates the facility and severity of a message. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see *Specifying the Facility and Severity of Messages to Include in the Log*.	<165> for a message from the **pfe** facility (facility=20) with severity **notice** (severity=5).
version	Version of the Internet Engineering Task Force (IETF) system logging protocol specification.	1 for the initial version
timestamp	Time when the message was generated, in one of two representations: • *YYYY-MM-DDTHH:MM:SS.MSZ* is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC) • *YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM* is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC	2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007. 2007-02-15T01:17:15.719 -08:00 is the same timestamp expressed as Pacific Standard Time in the United States.
hostname	Name of the host that originally generated the message.	switch1
process	Name of the Junos OS process that generated the message.	mgd
processID	UNIX process ID (PID) of the Junos process that generated the message.	3046
TAG	Junos OS system log message tag, which uniquely identifies the message.	UI_DBASE_LOGOUT_EVENT
junos@2636.*platform*	An identifier for the type of hardware platform that generated the message. The junos@2636 prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type.	junos@2636.1.1.1.2.18
variable-value-pairs	A variable-value pair for each element in the *message-text* string that varies depending on the circumstances that triggered the message. Each pair appears in the format ***variable* = "*value*"**.	username="regress"

Table 581: Fields in Structured-Data Messages *(continued)*

Field	Description	Examples
message-text	English-language description of the event or error (omitted if the brief statement is included at the [**edit system syslog file *filename* structured-data**] hierarchy level).	User 'regress' exiting configuration mode

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
  [junos@2636.1.1.1.2.18 username="regress"] User 'regress' exiting configuration mode
```

When the brief statement is included at the [**edit system syslog file *filename* structured-data**] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
  [junos@2636.1.1.1.2.18 username="regress"]
```

Table 582 on page 6137 maps the codes that appear in the ***priority-code*** field to facility and severity level.

NOTE: Not all of the facilities and severities listed in Table 582 on page 6137 can be included in statements at the [**edit system syslog**] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 6141.

Table 582: Facility and Severity Codes in the priority-code Field

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug

Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the **explicit-priority** statement is included at the [**edit system syslog file *filename***] or [**edit system syslog host *hostname***] hierarchy level, a system log message has the following syntax:

  ```
  timestamp  message-source: %facility-severity-TAG: message-text
  ```

- When directed to the console or to users, or when the **explicit-priority** statement is not included for files or remote hosts, a system log message has the following syntax:

  ```
  timestamp  message-source: TAG: message-text
  ```

Table 583 on page 6139 describes the message fields.

Table 583: Fields in Standard-Format Messages

Field	Description
timestamp	Time at which the message was logged.
message-source	Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format: `hostname process[process-ID]`
facility	Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: **Facility Codes Reported in Priority Information** in "Including Priority Information in System Log Messages" on page 6132.
severity	Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: **Numerical Codes for Severity Levels Reported in Priority Information** in "Including Priority Information in System Log Messages" on page 6132.
TAG	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix. Not all processes on a routing platform use tags, so this field does not always appear.
message-text	Text of the message.

Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches and J Series routers
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called ***logfile*** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file ***logfile*.0.gz**. The logging utility then opens and writes to a new active file called ***logfile***. This process is also known as file rotation. When the new ***logfile*** reaches the configured maximum size, ***logfile*.0.gz** is renamed ***logfile*.1.gz**, and the new ***logfile*** is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the **root** user and users who have the Junos OS **maintenance** permission.

Junos OS provides a configuration statement **log-rotate-frequency** that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the **log-rotate-frequency** statement at the **[edit system syslog]** hierarchy level.

You can include the **archive** statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the **archive** statement at the **[edit system syslog]** hierarchy level:

archive <files *number*> <size *size*> <world-readable | no-world-readable>;

To configure values that apply to a specific log file, include the **archive** statement at the **[edit system syslog file *filename*]** hierarchy level:

archive <archive-sites (*ftp-url* <password *password*>)> <files *number*> <size *size*>
<start-time "*YYYY-MM-DD.hh:mm*"> <transfer-interval *minutes*> <world-readable |
no-world-readable> ;

archive-sites *site-name* specifies a list of archive sites that you want to use for storing files. The ***site-name*** value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see "Format for Specifying Filenames and URLs in Junos OS CLI Commands" on page 57.

binary-data Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the **no-binary-data** statement.

files *number* specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

size *size* specifies the maximum size of each file. The value can be from 64 KB (64k) through 1 gigabyte (1g); to represent megabytes, use the letter **m** after the integer. There is no space between the digits and the **k**, **m**, or **g** units letter.

start-time "*YYYY-MM-DD.hh:mm*" defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval *interval* defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

world-readable enables all users to read log files. To restore the default permissions, include the **no-world-readable** statement.

Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level or higher are logged to the destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  facility severity;
}
```

Junos OS System Logging Facilities and Message Severity Levels

Table 584 on page 6141 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

Table 584: Junos OS System Logging Facilities

Facility	Type of Event or Error
any	All (messages from all facilities)
authorization	Authentication and authorization attempts
change-log	Changes to the Junos OS configuration
conflict-log	Specified configuration is invalid on the router type

Table 584: Junos OS System Logging Facilities *(continued)*

Facility	Type of Event or Error
daemon	Actions performed or errors encountered by system processes
dfc	Events related to dynamic flow capture
firewall	Packet filtering actions performed by a firewall filter
ftp	Actions performed or errors encountered by the FTP process
interactive-commands	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
kernel	Actions performed or errors encountered by the Junos OS kernel
pfe	Actions performed or errors encountered by the Packet Forwarding Engine
user	Actions performed or errors encountered by user-space processes

Table 585 on page 6142 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see "Disabling the System Logging of a Facility" on page 6131.

Table 585: System Log Message Severity Levels

Severity Level	Description
any	Includes all severity levels
none	Disables logging of the associated facility to a destination
emergency	System panic or other condition that causes the router to stop functioning
alert	Conditions that require immediate correction, such as a corrupted system database
critical	Critical conditions, such as hard errors
error	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
warning	Conditions that warrant monitoring
notice	Conditions that are not errors but might warrant special handling

Table 585: System Log Message Severity Levels *(continued)*

Severity Level	Description
info	Events or nonerror conditions of interest

System Log Default Facilities for Messages Directed to a Remote Destination

Table 586 on page 6143 lists the default alternative facility name next to the Junos OS-specific facility name for which it is used. For facilities that are not listed, the default alternative name is the same as the local facility name.

Table 586: Default Facilities for Messages Directed to a Remote Destination

Junos OS–specific Local Facility	Default Facility When Directed to Remote Destination
change-log	local6
conflict-log	local5
dfc	local1
firewall	local3
interactive-commands	local7
pfe	local4

Related Documentation

- *Single-Chassis System Logging Configuration Overview*
- Overview of Single-Chassis System Logging Configuration on page 6069

Junos OS System Log Alternate Facilities for Remote Logging

Table 587 on page 6143 lists the facilities that you can specify in the **facility-override** statement.

Table 587: Facilities for the facility-override Statement

Facility	Description
authorization	Authentication and authorization attempts
daemon	Actions performed or errors encountered by system processes

Table 587: Facilities for the facility-override Statement *(continued)*

Facility	Description
ftp	Actions performed or errors encountered by the FTP process
kernel	Actions performed or errors encountered by the Junos OS kernel
local0	Local facility number 0
local1	Local facility number 1
local2	Local facility number 2
local3	Local facility number 3
local4	Local facility number 4
local5	Local facility number 5
local6	Local facility number 6
local7	Local facility number 7
user	Actions performed or errors encountered by user-space processes

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

Related Documentation

- *Examples: Assigning an Alternative Facility*
- *Single-Chassis System Logging Configuration Overview*
- Overview of Single-Chassis System Logging Configuration on page 6069

Changing the Alternative Facility Name for Remote System Log Messages

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see Table 584 on page 6141). In the recommended configuration, a remote machine designated at the **[edit system syslog host *hostname*]** hierarchy level is not a Juniper Networks router or switch, so its syslogd utility cannot interpret the Junos OS-specific names. To enable the standard syslogd utility to handle messages from these facilities when messages are directed to a remote machine, a standard **local*X*** facility name is used instead of the Junos OS-specific facility name.

Table 586 on page 6143 lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The syslogd utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called **local-router** direct messages from the **authorization** facility to the remote machine *monitor.mycompany.com*:

```
[edit system syslog]
host monitor.mycompany.com {
   authorization info;
}
```

The default alternative facility for the local **authorization** facility is also **authorization**. If the syslogd utility on **monitor** is configured to write messages belonging to the **authorization** facility to the file **/var/log/auth-attempts**, then the file contains the messages generated when users log in to **local-router** and the messages generated when users log in to **monitor**. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the **auth-attempts** file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on **local-router** when they are directed to **monitor**. You can then configure the syslogd utility on **monitor** to write messages with the alternative facility to a different file from messages generated on **monitor** itself.

To change the facility used for all messages directed to a remote machine, include the **facility-override** statement at the **[edit system syslog host *hostname*]** hierarchy level:

```
[edit system syslog host hostname]
facility severity;
facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the **local*X*** facilities. On the remote machine, you must also configure the syslogd utility to handle the messages in the desired manner.

Table 587 on page 6143 lists the facilities that you can specify in the **facility-override** statement.

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the error level or higher to the local0 facility on the remote machine called monitor.mycompany.com:

```
[edit system syslog]
host monitor.mycompany.com {
   any error;
   facility-override local0;
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called central-logger.mycompany.com. The messages from California are assigned to alternative facility local0 and the messages from New York are assigned to alternative facility local2.

- Configure California routers to aggregate messages in the local0 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- Configure New York routers to aggregate messages in the local2 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On central-logger, you can then configure the system logging utility to write messages from the local0 facility to the file **change-log** and the messages from the local2 facility to the file **new-york-config**.

Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

match "*regular-expression*";

You can include this statement at the following hierarchy levels:

- **[edit system syslog file *filename*]** (for a file)
- **[edit system syslog user (*username* | *)]** (for a specific user session or for all user sessions on a terminal)
- **[edit system syslog host (*hostname* | other-routing-engine)]** (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, http://www.ieee.org).

Table 588 on page 6147 specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term term refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

NOTE: **The match statement is not case-sensitive.**

Table 588: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
| (pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets. One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
$ (dollar sign)	End of a line.
[ ] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
( ) (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

Using Regular Expressions

Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
 interactive-commands any;
 match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
   'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
 daemon error;
 match "!(.*snmpd.*)";
}
file snmpd-errors {
 daemon error;
 match ".*snmpd.*";
}
```

Configuration Statements for Network Management

connection-limit

Syntax connection-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).

Options *limit*—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).

Range: 1 through 250

Default: 75

NOTE: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured connection-limit value if the system resources are limited.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

destination-override

Syntax

```
destination-override {
  syslog host ip-address;
}
```

Hierarchy Level [edit system tracing]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Override the system-wide configuration of the switch at the **[edit system tracing]** hierarchy level. This statement has no effect if system tracing is not configured.

Options **syslog**—System process log files to send to the remote tracing host.

- **syslog**—System process log files to send to the remote tracing host.
- **host *ip-address***—IP address to which to send tracing information.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding Tracing and Logging Operations on page 5979
- tracing on page 304

no-remote-trace

Syntax no-remote-trace

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch to disable remote tracing after remote tracing has been enabled.

Default Remote tracing is disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- tracing on page 304

protocol-version

Syntax protocol-version *version*;

Hierarchy Level [edit system services ssh]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the secure shell (SSH) protocol version.

Default **v2**—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.

Options ***version***—SSH protocol version: **v1**, **v2**, or both.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the SSH Protocol Version on page 1244

rate-limit

Syntax rate-limit *limit*;

Hierarchy Level
[edit system services finger],
[edit system services ftp],
[edit system services netconf ssh],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.

Default 150 connections

Options **rate-limit** ***limit***—(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6).

Range: 1 through 250

Default: 150

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- *Configuring clear-text or SSL Service for Junos XML Protocol Client Applications*

ssh

Syntax

```
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...];
  client-alive-count-max seconds;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm|no-algorithm>;
  key-exchange <algorithm>;
  macs <algorithm>;
  max-sessions-per-connection <number>;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login (allow | deny | deny-password);
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
client-alive-interval and **client-alive-max-count** statements introduced in Junos OS Release 12.2.

Description Allow SSH requests from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring SSH Service for Remote Access to the Router or Switch on page 1243

telnet

Syntax

```
telnet {
  connection-limit limit;
  rate-limit limit;
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Provide Telnet connections from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Configuring Telnet Service for Remote Access to a Router or Switch*

tracing

Syntax

```
tracing {
  destination-override syslog host ip-address;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch to enable remote tracing to a specified host IP address.

NOTE: **The tracing statement is not supported on the QFX3000 QFabric system.**

The following processes are supported:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit system *process-name* traceoptions]** hierarchy level.

Default Remote tracing is disabled by default.

Options **destination-override syslog host *ip-address***—Overrides the global configuration for system tracing and has no effect if the **tracing** statement is not configured.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Understanding Tracing and Logging Operations on page 5979
- **destination-override on page 245**

Configuration Statements for Automation

allow-transients

Syntax allow-transients;

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, enable transient configuration changes to be committed.

Default Transient changes are disabled by default. If you do not include the **allow-transients** statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- *Generating a Persistent or Transient Change*
- *Creating a Macro to Read the Custom Syntax and Generate Related Configuration Statements*

apply-macro

Syntax

```
apply-macro apply-macro-name {
  parameter-name parameter-value;
}
```

Hierarchy Level All hierarchy levels

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description With commit script macros, use custom syntax in your configuration.

Macros work by locating **apply-macro** statements that you include in the candidate configuration and using the values specified in the **apply-macro** statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.

In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or *hooks*) that are used by commit script macros.

You can include the **apply-macro** statement at any level of the configuration hierarchy. You can include multiple **apply-macro** statements at each level of the configuration hierarchy; however, each must have a unique name.

Options *apply-macro-name*—Name of the **apply-macro** statement.

parameter-name—One or more parameters. Parameters can be any text you want to include in your configuration.

parameter-value—A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.

Required Privilege Level configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.

Related Documentation

- *Overview of Creating Custom Configuration Syntax with Macros*

checksum

Syntax checksum (md5 | sha-256 | sha1) *hash*;

Hierarchy Level [edit event-options event-script file *filename*],
[edit system scripts commit file *filename*],
[edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event, commit, or op script, Junos OS verifies the authenticity of the script by using the configured checksum hash.

Options **md5** ***hash***—MD5 checksum of this script.

sha-256 ***hash***—SHA-256 checksum of this script.

sha1 ***hash***—SHA-1 checksum of this script.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

- file checksum sha1 on page 337 command in the *System Basics and Services Command Reference*

command

Syntax command *filename-alias*;

Hierarchy Level [edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, configure a filename alias for the script file. This allows you to run the script by referencing either the script filename or the filename alias.

Options ***filename-alias***—Alias for the script file.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Enabling an Op Script and Defining a Script Alias*

commit

Syntax

```
commit {
  allow-transients;
  direct-access;
  file filename {
    checksum (md5 | sha-256 | sha1) hash;
    optional;
    refresh;
    refresh-from url;
    source url;
  }
  max-datasize
  refresh;
  refresh-from url;
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit system scripts]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, configure the commit-time scripting mechanism.

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- *Storing and Enabling Scripts*

description

Syntax description *descriptive-text*;

Hierarchy Level [edit system scripts op file *filename*]
[edit system scripts op file *filename* arguments *argument-name*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, provide a help-text string that appears in the command-line interface (CLI).

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Configuring Help Text for Op Scripts*
- *Declaring Arguments in Op Scripts*
- file (Op Scripts) on page 6163

direct-access

Syntax direct-access;

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 9.1.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify that commit scripts read input configurations directly from the database when inspecting these scripts for errors.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Executing Large Commit Scripts*

file (Commit Scripts)

Syntax

```
file filename {
  checksum (md5 | sha-256 | sha1) hash;
  optional;
  refresh;
  refresh-from url;
  source url;
}
```

Hierarchy Level [edit system scripts commit]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, enable a commit script that is located in the **/var/db/scripts/commit** directory.

Options ***filename***—Name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing a commit script.

The remaining statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Controlling Execution of Commit Scripts During Commit Operations*

file (Op Scripts)

Syntax

```
file filename {
  arguments {
    argument-name {
      description descriptive-text;
    }
  }
  checksum (md5 | sha-256 | sha1) hash;
  command filename-alias;
  description descriptive-text;
  refresh;
  refresh-from url;
  source url;
}
```

Hierarchy Level [edit system scripts op]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, enable an op script that is located in the **/var/db/scripts/op** directory.

Options *filename*—The name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing an op script.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Enabling an Op Script and Defining a Script Alias*

no-allow-url

Syntax	no-allow-url;
Hierarchy Level	[edit system scripts op]
Release Information	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS op scripts, prohibit the remote execution of scripts. When you include this configuration statement, the **op url** operational mode command generates an error and does not permit you to execute the op script from a remote site.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	• file (Op Scripts) on page 6163 • *Executing an Op Script from a Remote Site*

op

Syntax

```
op {
  file filename {
    arguments {
      argument-name {
        description descriptive-text;
      }
    }
    checksum (md5 | sha-256 | sha1) hash;
    command filename-alias;
    description descriptive-text;
    max-datasize
    refresh;
    refresh-from url;
    source url;
  }
  no-allow-url
  refresh;
  refresh-from url;
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit system scripts]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS op scripts, configure an operation scripting mechanism.

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- *Storing and Enabling Scripts*

optional

Syntax optional;

Hierarchy Level [edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the **file** statement is missing from the **/var/db/scripts/commit** directory on the device.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Controlling Execution of Commit Scripts During Commit Operations*

refresh (Commit Scripts)

Syntax refresh;

Hierarchy Level [edit system scripts commit],
[edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the **/var/db/scripts/commit** directory with the copy located at the source URL, as specified in the **source** statement at the same hierarchy level.

The update operation occurs as soon as you issue the **set refresh** configuration mode command. Issuing the **set refresh** command does not add the **refresh** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/commit/** directory on the Director device.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Using a Master Source Location for a Script*
- refresh-from (Commit Scripts) on page 6169
- source (Commit Scripts) on page 6172

refresh (Op Scripts)

Syntax refresh;

Hierarchy Level [edit system scripts op],
[edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 on the QFX Series.

Description For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the **/var/db/scripts/op** directory with the copy located at the source URL, specified in the **source** statement at the same hierarchy level.

The update operation occurs as soon as you issue the **set refresh** configuration mode command. Issuing the **set refresh** command does not add the **refresh** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: On the QFabric system, op scripts are stored in the /pbdata/mgd_shared/*partition-ip*/var/db/scripts/op/ directory on the Director device.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Using a Master Source Location for a Script*
- refresh-from (Op Scripts) on page 6170
- source (Op Scripts) on page 6173

refresh-from (Commit Scripts)

Syntax refresh-from *url*;

Hierarchy Level [edit system scripts commit],
[edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the **/var/db/scripts/commit** directory with the copy located at a URL other than the URL specified in the **source** statement.

The update operation occurs as soon as you issue the **set refresh-from *url*** configuration mode command. Issuing the **set refresh-from** command does not add the **refresh-from** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: This statement is not supported on the QFabric system.

Options *url*—The source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Using an Alternate Source Location for a Script*
- refresh (Commit Scripts) on page 6167
- source (Commit Scripts) on page 6172

refresh-from (Op Scripts)

Syntax refresh-from *url*;

Hierarchy Level [edit system scripts op],
[edit system scripts op file *filename*]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 11.1 on the QFX Series.

Description For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the **/var/db/scripts/op** directory with the copy located at a URL other than the URL specified in the **source** statement.

The update operation occurs as soon as you issue the **set refresh-from *url*** configuration mode command. Issuing the **set refresh-from** command does not add the **refresh-from** statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

NOTE: This statement is not supported on the QFabric system.

Options *url*—Source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

scripts

Syntax

```
scripts {
  commit {
    allow-transients;
    direct-access;
    file filename {
      checksum (md5 | sha-256 | sha1) hash;
      optional;
      refresh;
      refresh-from url;
      source url;
    }
    max-datasize
    refresh;
    refresh-from url;
    traceoptions {
      file <filename> <files number> <size size> <world-readable | no-world-readable>;
      flag flag;
      no-remote-trace;
    }
  }
  load-scripts-from-flash;
  op {
    file filename {
      arguments {
        argument-name {
          description descriptive-text;
        }
      }
      checksum (md5 | sha-256 | sha1) hash;
      command filename-alias;
      description descriptive-text;
      max-datasize
      refresh;
      refresh-from url;
      source url;
    }
    no-allow-url
    refresh;
    refresh-from url;
    traceoptions {
      file <filename> <files number> <size size> <world-readable | no-world-readable>;
      flag flag;
      no-remote-trace;
    }
  }
  synchronize;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit or op scripts, configure scripting mechanisms.

NOTE: **The traceoptions statement is not supported on QFabric systems.**

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- *Storing and Enabling Scripts*

source (Commit Scripts)

Syntax source *url*;

Hierarchy Level [edit system scripts commit file *filename*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description For Junos OS commit scripts, specify the location of the source file for an enabled script located in the **/var/db/scripts/commit** directory. When you include the **refresh** statement at the same hierarchy level and commit the configuration, the local copy is overwritten by the version stored at the specified URL.

NOTE: On the QFabric system, commit scripts are stored in the **/pbdata/mgd_shared/*partition-ip*/var/db/scripts/op/** directory on the Director device.

Options *url*—The source specified as an HTTP URL, FTP URL, or scp-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Configuration Statements for Network Analytics

address (Analytics Collector)

Syntax

```
address ip-address {
  port number {
    transport protocol {
      export-profile profile-name;
    }
  }
}
```

Hierarchy Level [edit services analytics collector]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure the address of a remote server to receive streamed analytics (queue and traffic statistics) data.

NOTE: **The address statement is available in Junos OS Release 13.2X51-D15 or later.**

Options ***ip-address***—IP address of the remote server receiving the streamed data.

port *number*—Port number of the remote server receiving the streaming data.

export-profile *profile-name*—Name of the export profile containing the parameters for the analytics data being streamed.

transport *protocol*—A transport protocol used to stream data to the port.

Values:

- **tcp**—Transmission Control Procol (TCP)
- **udp**—User Datagram Protocol (UDP)

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

      size size;
    }
    interval interval;
  }
}
```

Hierarchy Level [edit services]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure the network analytics feature that includes monitoring for traffic and queue statistics. The network analytics processes running on the Packet Forwarding Engine and Routing Engine collect and analyze the data, and generate reports that may be saved in log files or sent as streaming data to remote servers.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

collector (Analytics)

Syntax

```
collector {
  local {
    file filename {
      size size;
      files number;
    }
  }
  address ip-address {
    port number {
      transport protocol {
        export-profile profile-name;
      }
    }
  }
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure a local file for storing network analytics statistics and/or a remote server for receiving streamed statistics data.

NOTE: **The collector statement is available in Junos OS Release 13.2X51-D15 or later.**

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

depth-threshold

Syntax

```
depth-threshold {
  high number;
  low number;
}
```

Hierarchy Level

[edit services analytics interfaces]
[edit services analytics resource-profiles]

Release Information

Statement introduced in Junos OS Release 13.2 for the QFX Series.
Statement in the **[edit services analytics resource-profiles]** hierarchy level introduced in Junos OS Release 13.2X51-D15.

Description

If network analytics queue statistics monitoring is enabled, specify the high and low values (in bytes) of the queue depth (buffer) threshold. If you configure a depth threshold, you cannot configure the latency threshold. You can configure the depth threshold for one interface or all interfaces. Specify the high and low queue depth threshold numbers:

NOTE: **The configuration for a specific interface supersedes the global configuration for all interfaces.**

Options

high *number*—Specify the maximum value for the depth threshold.

Range: 1 to 1,250,000,000 bytes

Default:

- Junos OS Release 13.2X51-D10 or later—0 bytes
- Junos OS Release 13.2X50-D15—14,680,064 bytes (14 MB)

low *number*—Specify the minimum value for the depth threshold.

Range: 1 to 1,250,000,000 bytes

Default:

- Junos OS Release 13.2X51-D10 or later—0 bytes
- Junos OS Release 13.2X50-D15—1024 bytes (1 KB)

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

export-profiles

Syntax

```
export-profiles {
  profile-name {
    interface {
      information;
      statistics {
        queue;
        traffic;
      }
      status {
        link;
        queue;
        traffic;
      }
    }
    stream-format format;
    system {
      information;
      status {
        queue;
        traffic;
      }
    }
  }
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure an profile to specify the network analytics data being streamed to remote servers. Each profile is a template that defines the type of data being streamed.

NOTE: **The export-profile statement is available in Junos OS Release 13.2X51-D15 or later.**

Options *profile-name*—Name of the export profile containing the configuration of the data being streamed.

stream-format *format*—Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

Values:

- **csv**—Comma-separated Values (CSV). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface.Each record contains either a “q” for a queue statistics, or a “t” for a traffic statistics.

- **gpb**—Google Protocol Buffers (GPB). Data sent in this format has a hierachical format, and is categorized by resource type (system or interfaces), which is specified in the message header. You can generate data formatted in other formats (CSV, TSV, and JSON) from GPB-encoded data.

  Each message includes a 8-byte header containing the following information:

  - Bytes 0 to 3—Length of the message.
  - Byte 4—Message version.
  - Bytes 5 to 7—Reserved for future use.

  NOTE: **A schema file called analytics.proto containing the definitions of the GPB messages is available for downloading from the following location:**

  http://www.juniper.net/techpubs/en_US/junos13.2/information-products/pathway-pages/qfx-series/network-mgmt.html

- **json**—JavaScript Object Notation (JSON). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface. Each record contains either “queue-statistics” or “traffic-statistics” in the “record type” field.
- **tsv**—Tab-separated Values (TSV). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface. Each record contains a “q” for a queue statistics, or a “t” for a traffic statistics.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

file (Analytics)

Syntax

```
file filename {
  files number-of-files;
  size size;
}
```

Hierarchy Level

[edit services analytics collector local]
[edit services analytics queue-statistics]
[edit services analytics traffic-statistics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Enable the logging of queue or traffic monitoring statistics in a local file. This statement does not enable monitoring.

Default This feature is disabled by default.

Options ***filename***—Specify a filename for storing queue and traffic monitoring statistics in the Comma-separated Values (CSV) format. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

NOTE: **In Junos OS Release 13.2X51-D15 or later, you configure a single filename to store both queue and traffic monitoring statistics. In Junos OS Release 13.2X51-D10 and earlier, you configure separate files for storing monitoring data, one for queue statistics, and another for traffic statistics.**

files *number-of-files*—Specify the number of files to store locally. After the number of files with the maximum file size is reached, the system starts over and writes the data to the first file.

Range: 2 to 1,000 files.

size *size*—Configure the file size in megabytes (MB).

Syntax: ***x*m** to specify MB.

Range: 10 to 4095 MB

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interface (Export Profiles)

Syntax

```
interface {
  information;
  statistics {
    queue;
    traffic;
  }
  status {
    link;
    queue;
    traffic;
  }
}
```

Hierarchy Level [edit services analytics export-profiles]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure an export profile for streaming network analytics data for a specific interface to remote servers. Each profile is a template that defines the type of data being streamed for that interface.

NOTE: **The interface statement is available in Junos OS Release 13.2X51-D15 or later.**

Options **information**—Information for the specified interface.

statistics—Type of monitoring statistics to be streamed.

Values:

- **queue**
- **traffic**

status—Status information about the interface to be streamed.

Values:

- **link**
- **queue**
- **traffic**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000

interfaces (Analytics Resource)

Syntax

```
interfaces {
  interface-name {
    resource-profile profile-name;
  }
}
```

Hierarchy Level [edit services analytics resource]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Apply the network analytics resource profile to an interface for which you wish to enable queue or traffic statistics monitoring. The resource profile is a template that specifies the parameters for queue and traffic monitoring, as well as for the depth and latency thresholds.

NOTE: **The interfaces statement in the [edit services analytics resource] hierarchy is available in Junos OS Release 13.2X51-D15 or later.**

Options ***interface-name***—Name of the interface for which a resource profile has been configured.

resource-profile ***profile-name***—Name of a resource profile containing the analytics parameters that have been specified for interfaces. Information contained in a resource profile includes the configuration of queue and traffic monitoring (whether enabled or disabled), and values for the depth and latency thresholds (if applicable).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

interfaces (Analytics)

Syntax

```
interfaces {
  all {
    depth-threshold high number low number;
    latency-threshold high number low number;
    queue-statistics;
    no-queue-statistics;
    traffic-statistics;
    no-traffic-statistics;
  }
  interface-name {
    depth-threshold high number low number;
    latency-threshold high number low number;
    queue-statistics;
    no-queue-statistics;
    traffic-statistics;
    no-traffic-statistics;
  }
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure physical interfaces for monitoring traffic and queue statistics by the network analytics processes running on the Packet Forwarding Engine and Routing Engine. You may specify one interface or all interfaces in your configuration.

NOTE: The configuration for a specific interface supersedes the global configuration for all interfaces. You can configure traffic and queue monitoring for physical interfaces only; logical interfaces and Virtual Chassis port (VCP) interfaces are not supported.

NOTE: Disabling the queue or traffic monitoring (using the **no-queue-statistics** or **no-traffic-statistics** configuration statements) supersedes the configuration (enabling) of the feature.

Options **all**—Configure all interfaces on the device for high-frequency monitoring.

interface-name—Name of the interface to configure for high-frequency monitoring.

no-queue-statistics—Disable the collection of queue statistics.

NOTE: The **no-queue-statistics** statement supersedes the **queue-statistics** statement.

no-traffic-statistics—Disable the collection of traffic statistics.

NOTE: The **no-traffic-statistics** statement supersedes the **traffic-statistics** statement.

queue-statistics—Enable the collection of queue statistics for a specific interface or all interfaces.

traffic-statistics—Enable the collection of traffic statistics for a specific interface or all interfaces.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

latency-threshold

Syntax

```
latency-threshold {
  high number;
  low number;
}
```

Hierarchy Level

[edit services analytics interfaces]
[edit services analytics resource-profiles]

Release Information

Statement introduced in Junos OS Release 13.2 for the QFX Series.
Statement in the **[edit services analytics resource-profiles]** hierarchy level introduced in Junos OS Release 13.2X51-D15.

Description

If network analytics queue statistics monitoring is enabled, specify the high and low values (in microseconds) of the latency threshold of the queue. If you configure a latency threshold, you cannot configure the depth threshold. You can configure the latency threshold for one interface or all interfaces. Specify the high and low latency threshold numbers:

NOTE: **The configuration for a specific interface supersedes the global configuration for all interfaces.**

Options

high ***number***—Specify the maximum value for the latency threshold.

Range:

- Junos OS Release 13.2X51-D15 or later—1 to 100,000,000 nanoseconds (0.001 to 100,000 microseconds)
- Junos OS Release 13.2X51-D10 or earlier—1 to 100,000 microseconds

Default:

- Junos OS Release 13.2X51-D15 or later—1,000,000 nanoseconds (1000 microseconds or 1 millisecond)
- Junos OS Release 13.2X51-D10—1000 microseconds
- Junos OS Release 13.2X50-D15—900 microseconds

low ***number***—Specify the minimum value for the latency threshold.

Range:

- Junos OS Release 13.2X51-D15 or later—1 to 100,000,000 nanoseconds
- Junos OS Release 13.2X51-D10 or earlier—1 to 100,000 microseconds

Default:

- Junos OS Release 13.2X51-D15 or later—100 nanoseconds (0.1 microseconds)
- Junos OS Release 13.2X51-D10—50 microseconds

- Junos OS Release 13.2X50-D15—300 microseconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000
- analytics on page 6176
- depth-threshold on page 6181

local (Analytics Collector)

Syntax

```
local {
  file filename {
    size size;
    files number;
  }
}
```

Hierarchy Level [edit services analytics collector]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure a local file for logging network analytics (queue and traffic) statistics.

NOTE: The local statement is available in Junos OS Release 13.2X51-D15 or later.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000
- collector (Analytics) on page 6180

queue-statistics

Syntax

```
queue-statistics {
  file filename {
    files number-of-files;
    size size;
  }
  interval interval;
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Enable the logging of queue statistics in a local file. This statement does not enable queue statistics monitoring.

To enable queue monitoring, you must specify the **queue-statistics** configuration statement at the **[edit services analytics interfaces]** hierarchy level.

Default This feature is disabled by default.

Options **interval** ***interval***—Configure the polling interval in milliseconds.

NOTE: You can configure the polling interval for queue statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

Range:

- Junos OS Release 13.2X50-D15—8 to 1000 milliseconds (8 milliseconds to 1 second)
- Junos OS Release 13.2X51-D10 or later—10 to 1000 milliseconds (10 milliseconds to 1 second)

NOTE: In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 10 milliseconds, the following warning messages appear during the commit process: **Queue statistics polling interval can not be less than 10 milliseconds** and **Setting Queue statistics polling interval to 10 milliseconds**. These messages do not stop the commit operation, but the interval is automatically set to 10 milliseconds.

Default:

- Junos OS Release 13.2X50-D15—8 milliseconds
- Junos OS Release 13.2X51-D10 or later—10 milliseconds

The remaining statements are explained separately.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000
- analytics on page 6176

resource (Analytics)

Syntax

```
resource {
  interfaces {
    interface-name {
      resource-profile profile-name;
    }
  }
  system {
    polling-interval {
      queue-monitoring interval;
      traffic-monitoring interval;
    }
    resource-profile profile-name;
  }
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure network analytics resources such as resource profiles (for interfaces and system), and polling intervals (for queue and traffic monitoring).

NOTE: **The resource statement is available in Junos OS Release 13.2X51-D15 or later.**

The remaining statements are explained separately.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

resource-profiles (Analytics)

Syntax

```
resource-profiles {
  profile-name {
    depth-threshold {
      high number;
      low number;
    }
    latency-threshold {
      high number;
      low number;
    }
    no-queue-monitoring;
    no-traffic-monitoring;
    queue-monitoring;
    traffic-monitoring;
  }
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure resource profiles that are used as templates for specifying network analytics parameters. You use resource profiles to enable and disable queue and traffic monitoring, and specify depth and latency thresholds as applicable. Once you have defined a resource profile, you can apply it specifically to individual interfaces, or globally to a system.

NOTE: **The resource-profiles statement is available in Junos OS Release 13.2X51-D15 or later.**

The remaining statements are explained separately.

Options ***profile-name***—Specify a name for the resource profile.

no-queue-monitoring—Disable queue monitoring.

no-traffic-monitoring—Disable traffic monitoring.

queue-monitoring—Enable queue monitoring.

traffic-monitoring—Enable traffic monitoring.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000

streaming-servers

Syntax

```
streaming-servers {
  address ip-address {
    port number {
      stream-format format;
      stream-type type
    }
  }
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure remote servers to receive streaming output for the network analytics monitoring of traffic and queue statistics. The streaming function supports TCP connections only, and sends records separated by a newline character.

NOTE: **Before you use the remote server to receive streaming data, you must set up the TCP server software to process records that are separated by the newline character (\n).**

You can configure multiple servers and multiple ports on each server to receive the streaming data. You can configure different streaming data types and formats for different ports on a server, but you can configure only one streaming type and one format for each port on a server.

Options **address *ip-address***—IP address of the remote server receiving the streaming data.

port *number*—Port number of the remote server receiving the streaming data.

stream-format *format*—Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

Values:

- **csv**—Comma-separated Values (CSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.
- **json**—JavaScript Object Notification (JSON). Records sent in this format contain “queue-statistics” or “traffic-statistics” in the “record type” field.
- **tsv**—Tab-separated Values (TSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.

stream-type *type*—Type of streaming data sent to a port. You can specify different types of streaming data to be sent to different ports on the same server.

Values:

- **queue-statistics**

- **traffic-statistics**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- **analytics on page 6176**

system (Analytics Resource)

Syntax

```
system {
  polling-interval {
    queue-monitoring interval;
    traffic-monitoring interval;
  }
  resource-profile profile-name;
}
```

Hierarchy Level [edit services analytics resource]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Apply a network analytics resource profile to a system for which you wish to enable queue or traffic monitoring. The resource profile is a template that specifies the parameters for queue and traffic monitoring, as well as for the depth and latency thresholds.

NOTE: **The system statement in the [edit services analytics resource]** hierarchy is available in Junos OS Release 13.2X51-D15 or later.

Options **polling-interval**—Configure the polling interval for queue and traffic monitoring:

- **queue-monitoring *polling-interval***—Configure the queue monitoring interval in milliseconds.

  Range: 1 to 1000 milliseconds (1 millisecond to 1 second)

- **traffic-monitoring *polling-interval***—Configure the traffic monitoring interval in seconds.

  Range: 1 to 300 seconds (1 second to 5 minutes)

resource-profile *profile-name*—Name of a resource profile containing the global analytics parameters that have been configured for the system. Information contained in a resource profile includes the configuration of queue and traffic monitoring (whether enabled or disabled), and values for the depth and latency thresholds (if applicable).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000

system (Export Profiles)

Syntax

```
system {
  information;
  status {
    queue;
    traffic;
  }
}
```

Hierarchy Level [edit services analytics export-profiles]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure a system-wide export profile for streaming network analytics data to remote servers. Each profile is a template that defines the type of data being streamed for that system.

NOTE: **The system statement is available in Junos OS Release 13.2X51-D15 or later.**

Options **information**—Information for the system.

status—System status information to be streamed.

Values:

- **queue**
- **traffic**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traceoptions (Analytics)

Syntax

```
traceoptions {
  file filename;
  files number-of-files;
  size size;
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Configure traceoptions for the network analytics daemon (analyticsd) running on the Routing Engine.

Options

file ***filename***—Specify a filename for storing the traceoptions data. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

files ***number-of-files***—Specify the number of files to store locally. After the number files witsh the maximum file size is reached, the system starts over and writes the data to the first file.

Range: 2 to 1,000 files.

size ***size***—Configure the file size in megabytes (MB).

Syntax: ***x*m** to specify MB.

Range: 10 to 4095 MB

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000
- **analytics on page 6176**

traffic-statistics

Syntax

```
traffic-statistics {
  file filename {
    files number-of-files;
    size size;
  }
  interval interval;
}
```

Hierarchy Level [edit services analytics]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description Enable the logging of traffic statistics in a local file. This statement does not enable traffic statistics monitoring.

To enable the monitoring of traffic statistics, configure the **traffic-statistics** configuration statement at the **[edit services analytics interfaces]** hierarchy level.

Default This feature is disabled by default.

Options **file *filename***—Specify a filename for storing the traffic statistics in the JavaScript Object Notification (JSON) format. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

files *number-of-files*—Specify the number of files to store locally. After the number files with the maximum file size is reached, the system starts over and writes the data to the first file.

Range: 2 to 1,000 files.

interval *interval*—Configure the polling interval in seconds.

NOTE: You can configure the polling interval for traffic statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

Range:

- Junos OS Release 13.2X51-D10 or later—2 to 300 seconds (2 seconds to 5 minutes)
- Junos OS Release 13.2X50-D15—1 to 300 seconds (1 second to 5 minutes)

NOTE: In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 2 seconds, the following warning messages appear during the commit process:

Traffic statistics polling interval can not be less than 2 seconds, and

Setting Traffic statistics polling interval to 2 seconds.

These messages do not stop the commit operation, but the interval is automatically set to 2 seconds.

Default:

- Junos OS Release 13.2X50-D15—1 second
- Junos OS Release 13.2X51-D10 or later—2 seconds

size *size*—Configure the file size in megabytes (MB).

Syntax: ***x*m** to specify MB.

Range: 10 to 4095 MB

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Network Analytics Overview on page 6000
- **analytics on page 6176**

Configuration Statements for sFlow Technology

agent-id

Syntax agent-id *ip-address*;

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the IP address of the sFlow agent. If you do not configure the sFlow agent ID, the IP address for the agent is dynamically created using the IP address of an interface configured on the QFX Series device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- **sflow on page 6205**

collector (sFlow Technology)

Syntax

```
collector ip-address {
    udp-port port-number;
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the configured collector for analysis. You can configure up to four collectors on the device. You specify the IP address for each collector you configure.

The remaining statement is explained separately.

Options *ip-address*—IP address of the collector.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- Example: Monitoring Network Traffic Using sFlow Technology on page 6079

interfaces (sFlow)

Syntax

```
interfaces interface-name {
  polling-interval seconds;
  sample-rate number;
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure sFlow network traffic monitoring on the specified interface on the device. You can configure sFlow parameters (polling interval, sample rate) with different values on different interfaces.

The remaining statements are explained separately.

Options *interface-name*—Name of the interface on which to configure sFlow parameters.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- Example: Monitoring Network Traffic Using sFlow Technology on page 6079

polling-interval

Syntax polling-interval *seconds*;

Hierarchy Level [edit protocols sflow],
[edit protocols sflow interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the rate (in seconds) at which successive samples of interface statistics (counters) are taken.

Default If no polling interval is configured for a particular interface, the device uses the global polling interval configured at the **[edit protocols sflow]** hierarchy level. If no global interval is configured, the device uses the default polling interval of 20 seconds.

Options *seconds*—Number of seconds between successive samples of interface statistics. Specifying a value of **0** (zero) disables the polling.

Range: 0 through 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- Example: Monitoring Network Traffic Using sFlow Technology on page 6079

sample-rate

Syntax sample-rate *number*;

Hierarchy Level [edit protocols sflow],
[edit protocols sflow interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Specify the denominator (***number***) of the ratio that is the sample rate in sFlow traffic monitoring. For example, to configure a sample rate of 1 in 1000 packets, you specify a ***number*** of 1000.

Default If no sample rate is configured for a particular interface, the device uses the global sample rate configured at the **[edit protocols sflow]** hierarchy level. If no global rate is configured, the device uses the default sample rate of 1 in 2000 packets.

Options *number*—Denominator of the ratio representing the sample rate (one packet out of *number*).

Range: 1 through 16,777,215

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- Example: Monitoring Network Traffic Using sFlow Technology on page 6079

sflow

Syntax

```
sflow {
  agent-id ip-address;
  collector ip-address {
    udp-port port-number;
  }
  interfaces interface-name {
    polling-interval number;
    sample-rate {
      egress number;
      ingress number;
    }
  }
  polling-interval number;
  sample-rate {
    egress number;
    ingress number;
  }
  source-ip ip-address;
  traceoptions {
    file filename <files number> <no-stamp> <replace> <size size> <world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure sFlow technology to monitor traffic continuously on specified interfaces simultaneously. sFlow data can be used to characterize network activity.

The remaining statements are explained separately.

Default The sFlow protocol is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- Example: Monitoring Network Traffic Using sFlow Technology on page 6079

source-ip

Syntax source-ip *ip-address*;

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the source IP address to be used for sFlow datagrams. If you do not configure a source IP address, it is dynamically created based on the IP address of an Ethernet interface configured on the QFX Series device.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring sFlow Technology on page 6108
- **sflow on page 6205**

traceoptions (sFlow Technology)

Syntax

```
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable |
    no-world-readable>;
  flag flag;
}
```

Hierarchy Level [edit protocols sflow]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Define tracing operations for sFlow technology.

Default The **traceoptions** feature is disabled.

Options

file *filename*—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the **/var/log/** directory.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify the maximum number of files, you must also specify the maximum file size using the **size** option.

Range: 2 through 1000 files

Default: 1 trace file

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

- all—Trace all sFlow monitoring events.
- client-server—Trace sFlow monitoring client-server events.
- configuration—Trace sFlow monitoring configuration events.
- interface—Trace sFlow monitoring interface events.
- rtsock—Trace routing socket code events.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

no-world-readable—(Optional) Prevent any user from reading the trace file.

replace—(Optional) Replace an existing trace file if there is one.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size of 4 GB

Default: 128 KB

world-readable—(Optional) Allow any user to read the trace file.

Required Privilege Level
routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

Related Documentation
- *Overview of sFlow Technology*

udp-port

Syntax udp-port *port-number*;

Hierarchy Level [edit protocols sflow collector]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the UDP port for a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the collector for analysis.

Default Port 6343

Options *port-number*—UDP port number for this collector.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring sFlow Technology on page 6108
- Example: Monitoring Network Traffic Using sFlow Technology on page 6079

Configuration Statements for SNMP

access (SNMP)

Syntax

```
access {
  group group-name {
    (default-context-prefix | context-prefix context-prefix) {
      security-model (any | usm | v1 | v2c) {
        security-level (authentication | none | privacy) {
          notify-view view-name;
          read-view view-name;
          write-view view-name;
        }
      }
    }
  }
}
```

Hierarchy Level [edit snmp v3 vacm]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set SNMP access limits.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

address (SNMP)

Syntax address *address*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the SNMP target address for receiving traps or informs.

Options *address*—IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Understanding the Implementation of SNMP on the QFabric System on page 6023
- Configuring SNMP on page 1237
- Example: Configuring SNMP on page 6083

address-mask

Syntax address-mask *address-mask*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 on the QFX Series.

Description Define and verify the source addresses for a group of target addresses for SNMP traps and informs.

Options ***address-mask***—Define a range of addresses.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Address Mask*

agent-address

Syntax agent-address outgoing-interface;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is **outgoing-interface**, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Options **outgoing-interface**—Value of the agent address of all SNMPv1 traps generated by this router or switch. The **outgoing-interface** option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Default: Disabled (the agent address is not specified in SNMPv1 traps).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Agent Address for SNMP Traps*

alarm (SNMP RMON)

Syntax

```
alarm index {
  description description;
  falling-event-index index;
  falling-threshold integer;
  falling-threshold-interval seconds;
  interval seconds;
  request-type (get-next-request | get-request | walk-request);
  rising-event-index index;
  rising-threshold integer;
  sample-type (absolute-value | delta-value);
  startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
  syslog-subtag syslog-subtag;
  variable oid-variable;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure RMON alarm entries.

Options *index*—Identifies this alarm entry as an integer.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

authentication-md5

Syntax

```
authentication-md5 {
  authentication-password authentication-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user username]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure MD5 as the authentication type for the SNMPv3 user.

NOTE: You can only configure one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring MD5 Authentication*

authentication-none

Syntax authentication-none;

Hierarchy Level [edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure that there should be no authentication for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring No Authentication*

authentication-password

Syntax authentication-password *authentication-password*;

Hierarchy Level [edit snmp v3 usm local-engine user *username* authentication-md5],
[edit snmp v3 usm local-engine user *username* authentication-sha],
[edit snmp v3 usm remote-engine *engine-id* user *username* authentication-md5],
[edit snmp v3 usm remote-engine *engine-id* user *username* authentication-sha]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the password for user authentication.

Options *authentication-password*—Password that a user enters. The password is then converted into a key that is used for authentication.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include lowercase letters, uppercase letters, numbers, and the following special characters:

  , . / \ < > ; : ' [ ] { } ~ ! @ # $ % ^ * _ + = - `

  In addition, the following special characters are also supported, but you must enclose them within quotation marks (“”) if you enter them on the CLI; if you use a Network Management System to enter the password, the quotation marks are not required:

  | & ( ) ?

  Control characters—entered by simultaneously pressing the Ctrl key and additional keys—are not supported.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring MD5 Authentication*
- *Configuring SHA Authentication*

authentication-sha

Syntax

```
authentication-sha {
  authentication-password authentication-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring SHA Authentication*

authorization

Syntax authorization *authorization*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the access authorization for SNMP **Get**, **GetBulk**, **GetNext**, and **Set** requests.

Options *authorization*—Access authorization level:

- **read-only**—Enable **Get**, **GetNext**, and **GetBulk** requests.
- **read-write**—Enable all requests, including **Set** requests. You must configure a view to enable **Set** requests.

NOTE: **The read-write option is not supported on the QFX3000 QFabric system.**

Default: read-only

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String on page 6113

bucket-size

Syntax bucket-size *number*;

Hierarchy Level [edit snmp rmon history *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the sampling of Ethernet statistics for network fault diagnosis, planning, and performance tuning.

Default 50

Options *number*—Number of discrete samples of Ethernet statistics requested.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Understanding RMON on page 6033
- *Junos OS Network Management Configuration Guide*

categories

Syntax

```
categories {
  category;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the types of traps that are sent to the targets of the named trap group.

Default If you omit the **categories** statement, all trap types are included in trap notifications.

Options *category*—Name of a trap type: **authentication**, **chassis**, **configuration**, **link**, **remote-operations**, **rmon-alarm**, or **startup**.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6114

client-list

Syntax

```
client-list client-list-name {
  ip-addresses;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a list of SNMP clients.

Options ***client-list-name***—Name of the client list.

ip-addresses—IP addresses of the SNMP clients to be added to the client list,

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Adding a Group of Clients to an SNMP Community on page 6115

client-list-name

Syntax client-list-name *client-list-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Add a client list or prefix list to an SNMP community.

Options ***client-list-name***—Name of the client list or prefix list.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Adding a Group of Clients to an SNMP Community on page 6115

clients

Syntax

```
clients {
  address <restrict>;
}
```

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.

Default If you omit the **clients** statement, all SNMP clients using this community string are authorized to access the switch.

Options ***address***—Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple ***address*** options.

restrict—(Optional) Do not allow the specified SNMP client to access the switch.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the SNMP Community String*

commit-delay

Syntax commit-delay *seconds*;

Hierarchy Level [edit snmp nonvolatile]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the timer for the SNMP **Set** reply and start of the commit.

Options ***seconds***—Delay between an affirmative SNMP **Set** reply and start of the commit operation.

Default: 5 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Commit Delay Timer*

community (SNMP)

Syntax

```
community community-name {
  authorization authorization;
  client-list-name client-list-name;
  clients {
    address restrict;
  }
  view view-name;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

NOTE: **The authorization read-write option is not supported on the QFX3000 QFabric system.**

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

Default If you omit the **community** statement, all SNMP requests are denied.

Options *community-name*—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the SNMP Community String on page 6113

community (RMON)

Syntax community *community-name*;

Hierarchy Level [edit snmp rmon event *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the SNMP trap group that is used when generating a trap (if the eventType object is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group that has the rmon-alarm category configured.

The event community is not the same as an SNMP community.

Options ***community-name***—Name of the trap group that is used when generating a trap if the event is configured to send traps.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- RMON MIB Event, Alarm, Log, and History Control Tables on page 6035

- Monitoring RMON MIB Tables on page 6323
- Understanding RMON on page 6033
- *Junos OS Network Management Configuration Guide*

community-name (SNMP)

Syntax community-name *community-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11. for the QFX Series.

Description Define an SNMP community to authorize SNMPv1 or SNMPv2c clients in an SNMPv3 system. When you configure a community in SNMPv3, you can also specify a security name. The access privileges associated with the security name determine which MIB objects are available and which operations (read, write, or notify) are allowed on those objects.

Options ***community-name***—Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose the name in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the **[edit snmp community]** and **[edit snmp v3 snmp-community *community-index*]** hierarchy levels.

The community name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level is encrypted and not displayed in the command-line interface (CLI).

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the SNMPv3 Community*

contact

Syntax contact *contact*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysContact** object, which is the contact person for the managed system.

Options ***contact***—Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Contact on a Device Running Junos OS*

description (SNMP)

Syntax description *description*;

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysDescription** object, which is the description of the system being managed.

Options ***description***—System description. If the name includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Description on a Device Running Junos OS*

description (RMON)

Syntax description *description*;

Hierarchy Level [edit snmp rmon alarm *index*],
[edit snmp rmon event *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Text description of alarm or event.

Options *description*—Text description of an alarm or event entry. If the description includes spaces, enclose it in quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

- *Junos OS Network Management Configuration Guide*

destination-port (SNMP)

Syntax destination-port *port-number*;

Hierarchy Level [edit snmp trap-group]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Assign a trap port number other than the default.

Default If you omit this statement, the default port is 162.

Options *port-number*—SNMP trap port number.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6114

engine-id

Syntax

```
engine-id {
  (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks* and cannot be configured. The suffix is configured here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.

By default, the engine ID suffix is configured with the MAC address of the management interface (the **use-mac-address** option) on the QFX Series. You can override this configuration by using the **local** ***engine-id-suffix*** or **use-default-ip-address** option.

Default **use-mac-address**

Options **local** ***engine-id-suffix***—The engine ID suffix is set based on the data entered.

use-default-ip-address—The engine ID suffix is generated from the default IP address.

use-mac-address—The engine ID suffix is generated from the MAC address of the management interface on the switch.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

event

Syntax

event *index* {
  community *community-name*;
  description *description*;
  type (RMON Notification) *type*;
}

Hierarchy Level

[edit snmp rmon]

Release Information

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure RMON event entries.

Options

index—Identifier for a specific event entry.

The remaining statements are explained separately.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Understanding RMON on page 6033
- *Junos OS Network Management Configuration Guide*

falling-event-index (RMON)

Syntax falling-event-index *index*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the index number of the event entry that is used when a falling threshold is crossed. You specify the falling-event index when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.

Options *index*—Index of the event entry that is used when a falling threshold is crossed.

Range: 0 through 65,535

Default: 0

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Junos OS Network Management Configuration Guide*

falling-threshold (Health Monitor)

Syntax falling-threshold *percentage*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options ***percentage***—Lower threshold for the alarm entry.

Range: 1 through 100

Default: 70 percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- **rising-threshold on page 1331**
- Configuring Health Monitoring on page 6119

falling-threshold (RMON)

Syntax falling-threshold *integer*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the lower threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options *integer*—Lower threshold for the alarm entry.

Range: –2,147,483,648 through 2,147,483,647

Default: 20 percent less than the **rising-threshold** value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

falling-threshold-interval

Syntax falling-threshold-interval *seconds*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the interval between samples after the rising threshold is exceeded and the value of the sample starts to drop. If the value of the sample drops and exceeds the falling threshold, the regular sampling interval is used.

Options ***interval***—Time between samples, in seconds.

Range: 1 through 2,147,483,647 seconds

Default: 60 seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

filter-duplicates

Syntax filter-duplicates;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Filter duplicate **Get**, **GetNext**, or **GetBulk** SNMP requests.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Understanding the Implementation of SNMP on the QFabric System on page 6023

filter-interfaces

Syntax

```
filter-interfaces {
  all-internal-interfaces;
  interfaces interface
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Filter out information related to specific interfaces from the output of SNMP **Get** and **GetNext** requests performed on interface-related MIBs.

Options **all-internal-interfaces**—Filter out information from SNMP **Get** and **GetNext** requests for all internal interfaces.

interfaces—Filter out information from SNMP **Get** and **GetNext** requests for the specified interface.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Filtering Interface Information Out of SNMP Get and GetNext Output*

group (Associating a Security Name)

Syntax group *group-name*;

Hierarchy Level [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name *security-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate a security name with a group composed of users with the same access privileges. The security name is used during authentication of SNMP messages, and is mapped to a username.

Options ***group-name***—Collection of SNMP security names that share the same SNMPv3 access privileges.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Group*

group (Configuring Access Privileges)

Syntax

```
group group-name {
  (default-context-prefix | context-prefix context-prefiix){
    security-model (any | usm | v1 | v2c) {
      security-level (authentication | none | privacy) {
        notify-view view-name;
        read-view view-name;
        write-view view-name;
      }
    }
  }
}
```

Hierarchy Level

[edit snmp v3 vacm access]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix *context-prefix*** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

Options

group-name—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Group*

health-monitor

Syntax

```
health-monitor {
  falling-threshold percentage;
  interval seconds;
  rising-threshold percentage;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure health monitoring.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6119
- Understanding Health Monitoring on page 6037

history

Syntax

```
history history-index {
  bucket-size number;
  interface interface-name;
  interval seconds;
  owner owner-name;
}
```

Hierarchy Level [edit snmp rmon]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent on the network to monitor all the traffic flowing among devices on all connected LAN segments. The RMON history feature collects statistics in accordance with user-configurable parameters.

The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. If you use the **history** statement, you must also configure the **interface** ***interface-name*** statement.

Options *history-index*—Provide a number for this history entry.

Range: 1 through 655535

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

interface (SNMP)

Syntax interface [*interface-names*];

Hierarchy Level [edit snmp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interfaces on which SNMP requests can be accepted.

Default If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.

Options *interface-names*—Names of one or more logical interfaces.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 6116

interface (RMON)

Syntax interface *interface-name*;

Hierarchy Level [edit snmp rmon history *history-index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the interface to be monitored in the specified RMON history entry.

Only one interface can be specified for a particular RMON history index. There is a one-to-one relationship between the interface and the history index. The interface must be specified in order for the RMON history to be created.

Options ***interface-name***—Specify the interface to be monitored within the specified entry of the RMON history of Ethernet statistics.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

interval (Health Monitor)

Syntax interval *seconds*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interval between sampling of the object being monitored by the health monitor.

Options ***seconds***—Time between samples, in seconds.

Range: **1** through **2147483647** seconds

Default: **300** seconds

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6119

interval (RMON)

Syntax interval *seconds*;

Hierarchy Level [edit snmp rmon alarm *index*],
[edit snmp rmon history *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interval over which data is to be sampled for the specified alarm or interface.

Default **60 sec** for alarm sampling.

1800 sec for history sampling.

Options ***seconds***—Interval at which data is to be sampled for the specified alarm or interface.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

local-engine

Syntax

```
local-engine {
  user username {
    authentication-md5 {
      authentication-password authentication-password;
    }
    authentication-none;
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-aes128 {
      privacy-password privacy-password;
    }
    privacy-des {
      privacy-password privacy-password;
    }
    privacy-3des {
      privacy-password privacy-password;
    }
    privacy-none {
      privacy-password privacy-password;
    }
  }
}
```

Hierarchy Level [edit snmp v3 usm]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure local engine information for the user-based security model (USM).

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Creating SNMPv3 Users on page 6120

location

Syntax location *location*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the value of the MIB II **sysLocation** object, which is the physical location of the managed system.

Options *location*—Location of the local system. You must enclose the name within quotation marks (" ").

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the System Location for a Device Running Junos OS*

message-processing-model

Syntax message-processing-model (v1 | v2c | v3);

Hierarchy Level [edit snmp v3 target-parameters *target-parameter-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the message processing model to be used when generating SNMP notifications.

Options **v1**—SNMPv1 message process model.

v2c—SNMPv2c message process model.

v3—SNMPv3 message process model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Message Processing Model*

name

Syntax name *name*;

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the system name from the command-line interface.

Options *name*—System name override.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the System Name*

nonvolatile

Syntax

```
nonvolatile {
  commit-delay seconds;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure options for SNMP **Set** requests.

The statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Commit Delay Timer*
- *commit-delay*

notify

Syntax

```
notify name {
  tag tag-name;
  type (trap | inform);
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
type inform option added in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Select management targets for SNMPv3 notifications as well as the type of notifications. Notifications can be either traps or informs.

Options ***name***—Name assigned to the notification.

tag-name—Notifications are sent to all targets configured with this tag.

type—Notification type is **trap** or **inform**. Traps are unconfirmed notifications. Informs are confirmed notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Inform Notification Type and Target Address*
- *Configuring the SNMPv3 Trap Notification*

notify-filter (Applying to the Management Target)

Syntax notify-filter *profile-name*;

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the notify filter applied to a specific set of SNMPv3 target parameters. Target parameters are the message processing and security parameters for notifications sent to a target SNMP manager.

Options ***profile-name***—Name of the notify filter to apply to notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Applying the Trap Notification Filter*

notify-filter (Configuring the Profile Name)

Syntax

```
notify-filter profile-name {
  oid oid (include | exclude);
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a group of MIB objects for which you define access. The notify filter limits the type of traps or informs sent to the network management system.

Options ***profile-name***—Name assigned to the notify filter.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Trap Notification Filter*
- *oid (SNMP)*

notify-view

Syntax notify-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate the notify view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options ***view-name***—Name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring MIB Views on page 6116
- *Configuring the Notify View*

oid

Syntax oid *object-identifier* (exclude| include);

Hierarchy Level [edit snmp view *view-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects.

Options **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

object-identifier—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring MIB Views on page 6116

oid (SNMPv3)

Syntax oid *oid* (include | exclude);

Hierarchy Level [edit snmp v3 notify-filter *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify an object identifier (OID) used to represent a subtree of MIB objects. This OID is a prefix that the represented MIB objects have in common.

Options **exclude**—Exclude the subtree of MIB objects represented by the specified OID.

include—Include the subtree of MIB objects represented by the specified OID.

oid—Object identifier used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

parameters

Syntax

```
parameters {
  message-processing-model (v1 | v2c | v3);
  security-level (none | authentication | privacy);
  security-model (usm | v1 | v2c);
  security-name security-name;
}
```

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a set of target parameters for message processing and security.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Defining and Configuring the Trap Target Parameters*

port (SNMP)

Syntax port *port-number*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a UDP port number for an SNMP target.

Default If you omit this statement, the default port is 162.

Options ***port-number***—Port number for the SNMP target.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Port*

privacy-3des

Syntax

```
privacy-3des {
  privacy-password privacy-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the triple Data Encryption Standard (3DES) as the privacy type for the SNMPv3 user.

Options

privacy-password ***privacy-password***—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the Advanced Encryption Standard encryption algorithm (CFB128-AES-128 Privacy Protocol) for the SNMPv3 user.

Options

privacy-password ***privacy-password***—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

privacy-des

Syntax

```
privacy-des {
  privacy-password privacy-password;
}
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the Data Encryption Standard (DES) as the privacy type for the SNMPv3 user.

Options

privacy-password ***privacy-password***—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

privacy-none

Syntax

```
privacy-none;
```

Hierarchy Level

[edit snmp v3 usm local-engine user *username*],
[edit snmp v3 usm remote-engine *engine-id* user *username*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure that no encryption be used for the SNMPv3 user.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Encryption Type*

privacy-password

Syntax privacy-password *privacy-password*;

Hierarchy Level [edit snmp v3 usm local-engine user *username* privacy-3des],
[edit snmp v3 usm local-engine user *username* privacy-aes128],
[edit snmp v3 usm local-engine user *username* privacy-des],
[edit snmp v3 usm remote-engine *engine-id* user *username* privacy-3des],
[edit snmp v3 usm remote-engine *engine-id* user *username* privacy-aes128],
[edit snmp v3 usm remote-engine *engine-id* user *username* privacy-des]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a privacy password for the SNMPv3 user.

Options *privacy-password*—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

read-view

Syntax read-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate the read-only view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options ***view-name***—The name of the view to which the SNMP user group has access.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

remote-engine

Syntax

```
remote-engine engine-id {
  user username {
    authentication-md5 {
      authentication-password authentication-password;
    }
    authentication-none;
    authentication-sha {
      authentication-password authentication-password;
    }
    privacy-aes128 {
      privacy-password privacy-password;
    }
    privacy-des {
      privacy-password privacy-password;
    }
    privacy-3des {
      privacy-password privacy-password;
    }
    privacy-none {
      privacy-password privacy-password;
    }
  }
}
```

Hierarchy Level [edit snmp v3 usm]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.

Options *engine-id*—Specify engine identifier in hexadecimal format. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Remote Engine and Remote User*

request-type

Syntax request-type (get-next-request | get-request | walk-request);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Extend monitoring to a specific SNMP object instance (get-request), to all object instances belonging to a MIB branch (walk-request), or to the next object instance after the instance specified in the configuration (get-next-request).

Default **walk-request**

Options **get-next-request**—Perform an SNMP get next request.

get-request—Perform an SNMP get request.

walk-request—Perform an SNMP walk request.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

retry-count (SNMPv3)

Syntax retry-count *number*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced in Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the retry count for SNMP informs.

Options *number*—Maximum number of times the inform is transmitted if no acknowledgment is received. If no acknowledgment is received after the inform is transmitted the maximum number of times, the inform message is discarded.

Default: 3 times

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

- *timeout*

rising-event-index

Syntax rising-event-index *index*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the index of the event entry that is used when a rising alarm threshold is exceeded. The rising-event index is specified when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.

Options *index*—Index of the event entry that is used when a rising threshold is exceeded.

Range: 0 through 65,535

Default: 0

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

rising-threshold (Health Monitor)

Syntax rising-threshold *percentage*;

Hierarchy Level [edit snmp health-monitor]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options ***percentage***—Upper threshold for the alarm entry.

Range: **1** through **100**

Default: **80** percent of the maximum possible value

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring Health Monitoring on page 6119
- **falling-threshold on page 1296**

rising-threshold (RMON)

Syntax rising-threshold *integer*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the upper threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options *integer*—Upper threshold for the alarm entry.

Range: –2,147,483,648 through 2,147,483,647

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

rmon

Syntax

```
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type (RMON Notification) type;
  }
  history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Provide comprehensive network fault diagnosis, planning, and performance tuning information. RMON delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports the RMON statistics, history, alarm, and event groups.

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

sample-type

Syntax sample-type (absolute-value | delta-value);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the method of sampling the selected variable (monitored object). When you configure an SNMP RMON alarm, you can specify the sample type.

Options **absolute-value**—Actual value of the selected variable is used when comparing against the thresholds.

delta-value—Difference between samples of the selected variable is used when comparing against the thresholds.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

security-level (Defining Access Privileges)

Syntax

```
security-level (authentication | none | privacy) {
  notify-view view-name;
  read-view view-name;
  write-view view-name;
}
```

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define the security level used for access privileges.

Default none

Options **authentication**—Provide authentication but no encryption.

none—No authentication and no encryption.

privacy—Provide authentication and encryption.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Level*

security-level (Generating SNMP Notifications)

Syntax security-level (authentication | none | privacy);

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security level to use when generating SNMP notifications.

Default none

Options **authentication**—Provide authentication but no encryption.

none—No authentication and no encryption.

privacy—Provide authentication and encryption.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

security-model (Access Privileges)

Syntax security-model (usm | v1 | v2c);

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security model for an SNMPv3 group. The security model is used to determine access privileges for the group.

Options **usm**—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

security-model (Group)

Syntax

```
security-model (usm | v1 | v2c) {
  security-name security-name {
    group group-name;
  }
}
```

Hierarchy Level

[edit snmp v3 vacm security-to-group]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Define a security model for an SNMPv3 group and associate the security name of a user with the group. All users in the group have the same access privileges.

Options

usm—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Model*

security-model (SNMP Notifications)

Syntax security-model (usm | v1 | v2c);

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security model for an SNMPv3 group. The security model is used for SNMP notifications.

Options **usm**—SNMPv3 security model.

v1—SNMPv1 security model.

v2c—SNMPv2c security model.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Security Model*

security-name (Community String)

Syntax security-name *security-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate a community string with the security name of a user. The community string, which is used for SNMPv1 and SNMPv2c clients in an SNMPv3 system, is configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Options ***security-name***—Name that is used for messaging security and user access control.

NOTE: The security name must match the configured security name at the [edit snmp v3 target-parameters *target-parameters-name* parameters] hierarchy level when you configure traps or informs.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Security Names*

security-name (Security Group)

Syntax

security-name *security-name* {
  group *group-name*;
}

Hierarchy Level [edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate the security name of a user (for SNMPv3 clients) or a community string (for SNMPv1 and SNMPv2c clients) with a configured security group.

Options *security-name*—SNMPv3 secure username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level that is used for messaging security. For SNMPv1 and SNMPv2c, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

security-name (SNMP Notifications)

Syntax security-name *security-name*;

Hierarchy Level [edit snmp v3 target-parameters *target-parameters-name* parameters]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the security name used when generating SNMP notifications.

Options ***security-name***—If the SNMPv3 USM security model is used, identify the user when generating the SNMP notification. If the v1 or v2c security models are used, identify the SNMP community used when generating the notification.

NOTE: The access privileges for the group associated with this security name must allow this notification to be sent.

If you are using the v1 or v2 security models, the security name at the **[edit snmp v3 vacm security-to-group]** hierarchy level must match the security name at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

            group group-name {
              (default-context-prefix | context-prefix context-prefix) {
                security-model (any | usm | v1 | v2c) {
                  security-level (authentication | none | privacy) {
                    notify-view view-name;
                    read-view view-name;
                    write-view view-name;
                  }
                }
              }
            }
          }
          security-to-group {
            security-model (usm | v1 | v2c) {
              security-name security-name {
                group group-name;
              }
            }
          }
        }
      }
      view view-name {
        oid object-identifier (include | exclude);
      }
    }
    }
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure SNMP.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp–control—To add this statement to the configuration.

Related Documentation

- Understanding the Implementation of SNMP on page 6021

snmp-community

Syntax

```
snmp-community community-index {
  community-name community-name;
  security-name security-name;
  tag tag-name;
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the SNMP community which authorizes SNMPv1 or SNMPv2c clients in an SNMPv3 system.

Options ***community-index***—(Optional) String that identifies an SNMP community.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the SNMPv3 Community*

source-address (SNMP)

Syntax source-address *address*;

Hierarchy Level [edit snmp trap-options]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.

Options ***address***—Source address of SNMP traps. You can configure the source address of trap packets two ways: **lo0** or a valid IPv4 address configured on one of the interfaces. The value **lo0** indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface **lo0**.

Default: Disabled. (The source address is the address of the outgoing interface.)

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the Source Address for SNMP Traps*

startup-alarm

Syntax startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set an initial alarm that is sent after the configured SNMP RMON alarm becomes active.

Default **rising-or-falling-alarm**

Options **falling-alarm**—Generated if the first sample after the alarm becomes active is equal to or greater than the falling threshold.

rising-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the rising threshold.

rising-or-falling-alarm—Generated if the first sample after the alarm entry becomes active is equal to or greater than either the rising threshold or the falling threshold.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

- *Junos OS Network Management Configuration Guide*

syslog-subtag

Syntax syslog-subtag *syslog-subtag*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Add the **syslog-subtag** tag to the system log message. The tag should not exceed 80 uppercase characters.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

tag (Configuring Notification Targets)

Syntax tag *tag-name*;

Hierarchy Level [edit snmp v3 notify *name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).

Options ***tag-name***—Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The ***tag-name*** is not included in the notification.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

tag (Configuring the SNMP Community)

Syntax tag *tag-name*;

Hierarchy Level [edit snmp v3 snmp-community *community-index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure a set of SNMP managers that are authorized to use a community string.

Options ***tag-name***—Identify the set of addresses for the SNMP managers authorized to use the community string.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

tag-list

Syntax tag-list *tag-list*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure an SNMP tag list used to select target addresses.

Options ***tag-list***—Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the Trap Target Address*

target-address

Syntax

```
target-address target-address-name {
  address address;
  address-mask address-mask;
  port port-number;
  retry-count number;
  tag-list tag-list;
  target-parameters target-parameters-name;
  timeout seconds;
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the address of an SNMP management application and the parameters to be used in sending notifications.

Options ***target-address-name***—String that identifies the target address.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

target-parameters

Syntax

At the **[edit snmp v3]** hierarchy level:

```
target-parameters target-parameters-name {
  profile-name;
  parameters {
    message-processing-model (v1 | v2c | V3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
```

At the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
target-parameters target-parameters-name;
```

Hierarchy Level

[edit snmp v3]
[edit snmp v3 target-address *target-address-name*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the **[edit snmp v3]** hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the **[edit snmp v3 target-parameters *target-parameters-name*]** hierarchy level to the target address configuration at the **[edit snmp v3]** hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Defining and Configuring the Trap Target Parameters*
- *Applying Target Parameters*

targets

Syntax

```
targets {
  address;
}
```

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure one or more systems to receive SNMP traps.

Options ***address***—IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6114

timeout

Syntax timeout *seconds*;

Hierarchy Level [edit snmp v3 target-address *target-address-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the timeout period (in seconds) for SNMP informs.

Default 15 seconds

Options ***seconds***—Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

traceoptions (SNMP)

Syntax

```
traceoptions {
  file filename <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Track the activities of SNMP agents on the switch and record the information in log files.

NOTE: **The traceoptions statement is not supported on the QFabric system.**

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options **file *filename***—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.

files *number*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match ***regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

size ***size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

Range: 10 KB through 1 GB

Default: 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

Required Privilege Level

snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

trap-group

Syntax

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for QFX Series switches.

Description Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

Options *group-name*—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6114

trap-options

Syntax

```
trap-options {
  agent-address outgoing-interface;
  source-address address;
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

The remaining statements are explained separately.

Default Disabled

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring SNMP Trap Options*

type (RMON Notification)

Syntax type *type*;

Hierarchy Level [edit snmp rmon event *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the type of notification generated when a rising or falling threshold is crossed.

Default **log-and-trap**

Options ***type***—Type of notification. It can be one of the following:

- **log**—Add an entry to the **logTable** object.
- **log-and-trap**—Send an SNMP trap and add a log entry.
- **none**—No notifications are sent.
- **snmptrap**—Send an SNMP trap.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

type (SNMPv3)

Syntax type (inform | trap);

Hierarchy Level [edit snmp v3 notify *name*]

Release Information Statement introduced before Junos OS Release 7.4.
inform option added in Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the type of SNMP notification.

Options **inform**—Defines the type of notification as an inform. SNMP informs are confirmed notifications.

trap—Defines the type of notification as a trap. SNMP traps are unconfirmed notifications.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Configuring the SNMPv3 Trap Notification*

user

Syntax user *username*;

Hierarchy Level [edit snmp v3 usm local-engine],
[edit snmp v3 usm remote-engine *engine-id*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a user associated with an SNMPv3 group on a local or remote SNMP engine.

Options ***username***—SNMPv3 user-based security model (USM) username.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

usm

Syntax

```
usm {
  local-engine {
    user username {
      authentication-md5 {
        authentication-password authentication-password;
      }
      authentication-none;
      authentication-sha {
        authentication-password authentication-password;
      }
      privacy-aes128 {
        privacy-password privacy-password;
      }
      privacy-des {
        privacy-password privacy-password;
      }
      privacy-3des {
        privacy-password privacy-password;
      }
      privacy-none {
        privacy-password privacy-password;
      }
    }
    remote-engine engine-id {
      user username {
        authentication-md5 {
          authentication-password authentication-password;
        }
        authentication-none;
        authentication-sha {
          authentication-password authentication-password;
        }
        privacy-aes128 {
          privacy-password privacy-password;
        }
        privacy-des {
          privacy-password privacy-password;
        }
        privacy-3des {
          privacy-password privacy-password;
        }
        privacy-none {
          privacy-password privacy-password;
        }
      }
    }
  }
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure user-based security model (USM) information.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

    }
  }
}
```

Hierarchy Level [edit snmp v3]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure view-based access control model (VACM) information, including access privileges such as security model and security level for a group of users.

The remaining statements are explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- *Defining Access Privileges for an SNMP Group*

variable

Syntax variable *oid-variable*;

Hierarchy Level [edit snmp rmon alarm *index*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Set the object identifier (OID) of the MIB object (also called variable) to be monitored when you configure an SNMP RMON alarm. If the value of the monitored variable exceeds the configured rising threshold or falling threshold, an alarm is triggered and a corresponding event may be generated.

Options ***oid-variable***—OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, **1.3.6.1.2.1.2.1.2.2.1.10.1**) or the name of the MIB object—for example, **ifInOctets.1**.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

version

Syntax version (all | v1 | v2);

Hierarchy Level [edit snmp trap-group *group-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify the version number of SNMP traps.

Default **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

Options **all**—Send an SNMPv1 and SNMPv2 trap for every trap condition.

v1—Send SNMPv1 traps only.

v2—Send SNMPv2 traps only.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

- Configuring SNMP Trap Groups on page 6114

view (Configuring a MIB View)

Syntax

```
view view-name {
  oid object-identifier (include | exclude);
}
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The **view** statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the **view** statement at the **[edit snmp community *community-name*]** hierarchy level.

NOTE: To remove an OID completely, use the **delete view all oid oid-number** command but omit the **include** parameter.

Options *view-name*—Name of the view.

The remaining statement is explained separately.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

- **community on page 1292**

view (Associating MIB View with a Community)

Syntax view *view-name*;

Hierarchy Level [edit snmp community *community-name*]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Associate a view with a community. A view represents a group of MIB objects.

Options *view-name*—Name of the view. You must use a view name already configured in the **view** statement at the **[edit snmp]** hierarchy level.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation
- *Configuring the SNMP Community String*

write-view

Syntax write-view *view-name*;

Hierarchy Level [edit snmp v3 vacm access group *group-name* (default-context-prefix | context-prefix *context-prefix*) security-model (any | usm | v1 | v2c) security-level (authentication | none | privacy)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series switches.

Description Associate the write view with a community (for SNMPv1 or SNMPv2c clients) or a group name (for SNMPv3 clients).

Options *view-name*—Name of the view for which the SNMP user group has write permission.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation

Configuration Statements for System Log Messages

archive (All System Log Files)

Syntax
archive <files *number*> <size *size*> <start-time*time*> <transfer-interval *interval*>
<binary-data | no-binary-data>;
<world-readable | no-world-readable> ;

Hierarchy Level
[edit system syslog]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description
Configure archiving properties for all system log files.

Options

files *number*—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it ***logfile*.0.gz** (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Range: 1 through 1000

Default: 10 files

size *size*—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

Syntax: ***x* k** to specify the number of kilobytes, ***x* m** for the number of megabytes, or ***x* g** for the number of gigabytes

Range: 64 KB through 1 GB

Default:

- 128 KB for EX Series switches and J Series routers
- 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch
- 10 MB for TX Matrix and TX Matrix Plus routers

binary-data | no-binary-data—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..

Default: **no-binary-data**

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default: **no-world-readable**

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Specifying Log File Size, Number, and Archiving Properties on page 6139

archive (Individual System Log File)

Syntax archive <archive-sites (*ftp-url* <password *password*>)> <files *number*> <size *size*> <start-time "*YYYY-MM-DD.hh:mm*"> <transfer-interval *minutes*> <world-readable | no-world-readable>;

Hierarchy Level [edit system syslog file *filename*]

Release Information Statement introduced before Junos OS Release 7.4.
start-time and **transfer-interval** statements introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure archiving properties for a specific system log file.

Options **archive-sites** ***site-name***—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see "Format for Specifying Filenames and URLs in Junos OS CLI Commands" on page 57). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the **[edit system syslog]** hierarchy level.

files ***number***—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it ***logfile*.0.gz** (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Range: 1 through 1000

Default: 10 files

password ***password***—Password for authenticating with the site specified by the **archive-sites** statement.

size ***size***—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

Syntax: ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes

Range: 64 KB through 1 GB

Default: 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers

start-time "*YYYY-MM-DD.hh:mm*"—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval *interval*—Interval at which to transfer the log file to an archive site.

Range: 5 through 2880 minutes

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default: no-world-readable

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Specifying Log File Size, Number, and Archiving Properties on page 6139

archive (QFabric System)

Syntax
```
archive {
  size size;
}
```

Hierarchy Level [edit system syslog file *filename*]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the archiving properties for the system message log file.

Options
size *size*—Maximum amount of system log message data that the QFabric system stores in the log file.

Syntax: *x*k to specify the number of kilobytes, *x*m for the number of megabytes, or *x*g for the number of gigabytes

Range: 65 KB through 1 GB

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- syslog on page 6315

console (System Logging)

Syntax

```
console {
  facility severity;
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the logging of system messages to the system console.

Options ***facility***—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 584 on page 6141.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Table 585 on page 6142.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Directing System Log Messages to the Console on page 6130
- *Junos OS System Log Messages Reference*

explicit-priority

Syntax explicit-priority;

Hierarchy Level [edit logical-systems *logical-system-name* system syslog file *filename*],
[edit logical-systems *logical-system-name* system syslog host],
[edit system syslog file *filename*],
[edit system syslog host]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.

When the **structured-data** statement is also included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including Priority Information in System Log Messages on page 6132
- *Junos OS System Log Messages Reference*
- **structured-data on page 6312**

facility-override

Syntax facility-override *facility*;

Hierarchy Level [edit system syslog host]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.

Options ***facility***—Alternate facility to substitute for the default facilities. For a list of the possible facilities, see Table 587 on page 6143.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Changing the Alternative Facility Name for Remote System Log Messages on page 6144
- *Junos OS System Log Messages Reference*

file (QFabric System)

Syntax

```
file filename {
  archive {
    size maximum-file-size;
  }
  explicit-priority;
  facility severity;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure the logging of system messages to a file.

Options ***facility***—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements.

filename—Filename that you specify with the **show log** command.

Default: Filename **messages**

severity—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities at the specified level and higher are logged.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- syslog on page 6315

file (System Logging)

Syntax

```
file filename {
  facility severity;
  archive {
    files number;
    size size;
    (no-world-readable | world-readable);
  }
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the logging of system messages to a file.

Options *facility*—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 584 on page 6141.

file ***filename***—File in the **severity** directory in which to log messages from the specified facility. To log messages to more than one file, include more than one **file** statement.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Table 585 on page 6142.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

files

Syntax
files *number*;

Hierarchy Level
[edit system syslog archive],
[edit system syslog file *filename* archive]

Release Information
Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for QFX Series switches.

Description
Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it to ***logfile*.0.gz** (for information about the maximum file size, see **size**). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Options
number—Maximum number of archived files.

Range: 1 through 1000

Default: 10 files

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

}
```

TX Matrix Plus Router

```
host (hostname | other-routing-engine | sfc0-master) {
  facility severity;
  allow-duplicates;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
  port;
  source-address source-address;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* system syslog],
[edit system syslog]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Configure the logging of system messages to a remote destination.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 584 on page 6141.

hostname—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

other-routing-engine—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

NOTE: The other-routing-engine option is not applicable to the QFX Series.

port—Port number of the remote syslog server that can be modified.

scc-master—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see Table 585 on page 6142.

sfc0-master—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

log-prefix (System)

Syntax log-prefix *string*;

Hierarchy Level [edit system syslog host]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Include a text string in each message directed to a remote destination.

Options ***string***—Text string to include in each message.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Adding a Text String to System Log Messages on page 6128
- *Junos OS System Log Messages Reference*

match

Syntax match "*regular-expression*";

Hierarchy Level [edit logical-systems *logical-system-name* system syslog file *filename*],
[edit logical-systems *logical-system-name* system syslog user (*username* | *)],
[edit system syslog file *filename*],
[edit system syslog host *hostname* | other-routing-engine| scc-master)],
[edit system syslog user (*username* | *)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Using Regular Expressions to Refine the Set of Logged Messages on page 6146

size (System)

Syntax size *size*;

Hierarchy Level [edit system syslog archive],
[edit system syslog file *filename* archive]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***. For information about the number of archive files that the utility creates in this way, see **files**.

Options ***size***—Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

Syntax: ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes

Range: 64 KB through 1 GB

Default: 1 MB for MX Series routers and the QFX Series

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

structured-data

Syntax

```
structured-data {
  brief;
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* system syslog file *filename*],
[edit system syslog file *filename*]

Release Information

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol* (http://tools.ietf.org/html/draft-ietf-syslog-protocol-23).

NOTE: When this statement is included, other statements that specify the format for messages written to the file are ignored (the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level and the **time-format** statement at the **[edit system syslog]** hierarchy level).

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

    }
    port port number;
  }
  log-rotate-frequency frequency;
  server server name;
  source-address source-address;
  time-format(millisecond | year | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
  }
}
```

Hierarchy Level

[edit logical-systems *logical-system-name* system],
[edit system]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Support at the **[edit logical-systems *logical-system-name* system]** hierarchy level introduced in Junos OS Release 11.4.

Description

Configure the types of system log messages to send to files, to a remote destination, to user terminals, or to the system console.

The remaining statements are explained separately.

Options

archive—Define parameters for archiving log messages.

console—Send log messages of a specified class and severity to the console.

file—Send log messages to a named file.

host —Remote location to be notified of specific log messages.

log-rotate-frequency—Configure the interval for checking logfile size and archiving messages.

server—Name of the system log server in the inet.0 routing instance.

source-address—Include a specified address as the source address for log messages.

time-format—Additional information to include in the system log time stamp.

user—Notify a specific user of the log event.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

time-format

Syntax time-format (year | millisecond | year millisecond);

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a **host** statement.

By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, **Aug 21 12:36:30**. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

NOTE: When the **structured-data** statement is included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Options **millisecond**—Include the millisecond in the timestamp.

year—Include the year in the timestamp.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including the Year or Millisecond in Timestamps on page 157
- *Junos OS System Log Messages Reference*
- **structured-data on page 6312**

user (System Logging)

Syntax

```
user (username | *) {
  facility severity;
  match "regular-expression";
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the logging of system messages to user terminals.

Options ***** (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Table 584 on page 6141.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see Table 585 on page 6142.

username—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one **user** statement.

The remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

CHAPTER 68

Administration

Monitoring Tasks

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

user@switch> **show log** *log-filename*
user@switch> **file show** *log-file-pathname*

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
```

```
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30  switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
 10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30  switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
 AS 100): Can't assign requested address
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6320
2. Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6321

Displaying Real-Time Statistics About All Interfaces on the Router or Switch

Purpose Display real-time statistics about traffic passing through all interfaces on the router or switch.

Action To display real-time statistics about traffic passing through all interfaces on the router or switch:

user@host> **monitor interface traffic**

Sample Output

```
user@host> monitor interface traffic
host name                    Seconds: 15             Time: 12:31:09
Interface     Link  Input packets        (pps)    Output packets        (pps)
 so-1/0/0     Down              0          (0)                 0          (0)
 so-1/1/0     Down              0          (0)                 0          (0)
 so-1/1/1     Down              0          (0)                 0          (0)
 so-1/1/2     Down              0          (0)                 0          (0)
 so-1/1/3     Down              0          (0)                 0          (0)
 t3-1/2/0     Down              0          (0)                 0          (0)
 t3-1/2/1     Down              0          (0)                 0          (0)
 t3-1/2/2     Down              0          (0)                 0          (0)
 t3-1/2/3     Down              0          (0)                 0          (0)
 so-2/0/0       Up         211035          (1)             36778          (0)
 so-2/0/1       Up         192753          (1)             36782          (0)
 so-2/0/2       Up         211020          (1)             36779          (0)
 so-2/0/3       Up         211029          (1)             36776          (0)
 so-2/1/0       Up         189378          (1)             36349          (0)
 so-2/1/1     Down              0          (0)             18747          (0)
 so-2/1/2     Down              0          (0)             16078          (0)
 so-2/1/3       Up              0          (0)             80338          (0)
 at-2/3/0       Up              0          (0)                 0          (0)
 at-2/3/1     Down              0          (0)                 0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

Meaning The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

Displaying Real-Time Statistics About an Interface on the Router or Switch

Purpose Display real-time statistics about traffic passing through an interface on the router or switch.

Action To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

user@host> **monitor interface** ***interface-name***

Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:                  5856541 (88 bps)
  Output bytes:                 6271468 (96 bps)
  Input packets:                 157629 (0 pps)
  Output packets:                157024 (0 pps)
Encapsulation statistics:
```

```
  Input keepalives:                 42353
  Output keepalives:                42320
  LCP state: Opened
Error statistics:
  Input errors:                         0
  Input drops:                          0
  Input framing errors:                 0
  Input runts:                          0
  Input giants:                         0
  Policed discards:                     0
  L3 incompletes:                       0
  L2 channel errors:                    0
  L2 mismatch timeouts:                 0
  Carrier transitions:                  1
  Output errors:                        0
  Output drops:                         0
  Aged packets:                         0
Active alarms : None
Active defects: None
SONET error counts/seconds:
  LOS count                             1
  LOF count                             1
  SEF count                             1
  ES-S                                 77
  SES-S                                77
SONET statistics:
  BIP-B1                                0
  BIP-B2                                0
  REI-L                                 0
  BIP-B3                                0
  REI-P                                 0
Received SONET overhead:  F1       : 0x00  J0        : 0xZ
```

Meaning The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in Table 589 on page 6322.

Table 589: Output Control Keys for the monitor interface Command

Action	Key
Display information about the next interface. The **monitor interface** command scrolls through the physical or logical interfaces in the same order that they are displayed by the **show interfaces terse** command.	**N**
Display information about a different interface. The command prompts you for the name of a specific interface.	**I**
Freeze the display, halting the display of updated statistics.	**F**
Thaw the display, resuming the display of updated statistics.	**T**

Table 589: Output Control Keys for the monitor interface Command *(continued)*

Action	Key
Clear (zero) the current delta counters since **monitor interface** was started. It does not clear the accumulative counter.	**C**
Stop the **monitor interface** command.	**Q**

See the CLI Explorer for details on using match conditions with the **monitor traffic** command.

Monitoring RMON MIB Tables

Purpose Monitor remote monitoring (RMON) alarm, event, and log tables.

Action To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                           Value State

     5 monitor
       jnxOperatingCPU.9.1.0.0                            5 falling threshold

Event
Index  Type                      Last Event
    1  log and trap              2010-07-10 11:34:17 PDT
Event Index: 1
    Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
    Time: 2010-07-10 11:34:07 PDT
    Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
    Time: 2010-07-10 11:34:17 PDT
```

Meaning The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

Related Documentation

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

user@switch> show snmp health-monitor

```
Alarm
Index  Variable description                          Value State

 32768 Health Monitor: root file system utilization
       jnxHrStoragePercentUsed.1                        58 active

 32769 Health Monitor: /config file system utilization
       jnxHrStoragePercentUsed.2                         0 active

 32770 Health Monitor: RE 0 CPU utilization
       jnxOperatingCPU.9.1.0.0                           0 active

 32773 Health Monitor: RE 0 Memory utilization
       jnxOperatingBuffer.9.1.0.0                       35 active

 32775 Health Monitor: jkernel daemon CPU utilization
       Init daemon                                       0 active
       Chassis daemon                                   50 active
       Firewall daemon                                   0 active
       Interface daemon                                  5 active
       SNMP daemon                                      11 active
       MIB2 daemon                                      42 active
       ...
```

The following example provides sample output from the **show snmp mib** command:

user@switch> show snmp mib walk system

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx

Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

user@switch> show snmp statistics

```
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 0, Total set varbinds: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
    Throttle drops: 0, Duplicate request drops: 0
    Output:
    Packets: 0, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0
```

- show snmp mib on page 6392
- show snmp statistics on page 1379

Monitoring System Log Messages

Purpose Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

Action To view system log messages:

user@switch1> **show log messages**

Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
```

```
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

Meaning The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

- **syslog on page 287**

Pinging Hosts

Purpose Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

Action To use the **ping** command to send four requests (ping count) to host3:

ping *host* count *number*

Sample Output

ping host3 count 4

```
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

Meaning

- The **ping** results show the following information:

- Size of the ping response packet (in bytes).
- IP address of the host from which the response was sent.
- Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
- Time-to-live (ttl) hop-count value of the ping response packet.
- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named ***filename*** reaches its maximum size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)

- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

These statements are described in the following sections:

- Configuring the Number and Size of SNMP Log Files on page 6328
- Configuring Access to the Log File on page 6328
- Configuring a Regular Expression for Lines to Be Logged on page 6329
- Configuring the Trace Operations on page 6329

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until there are three trace files. Then the oldest trace file (***filename*.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (***filename***) reaches 2 MB, ***filename*** is renamed ***filename*.0**, and a new file called ***filename*** is created. When the new ***filename*** reaches 2 MB, ***filename*.0** is renamed ***filename*.1** and ***filename*** is renamed ***filename*.0**. This process repeats until there are 20 trace files. Then the oldest file (***filename*.19**) is overwritten by the newest file (***filename*.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

Table 590 on page 6329 describes the meaning of the SNMP tracing flags.

Table 590: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the **[edit snmp]** hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off

Table 590: SNMP Tracing Flags *(continued)*

Flag	Description	Default Setting
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log *agent*d | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where ***agent*** is the name of an SNMP agent.

Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though the Junos OS has built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, the Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**.

You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- **request snmp utility-mib set instance *name* object-type <counter | counter 64 | integer | string | unsigned integer> object-value *value***
- **request snmp utility-mib clear instance *name* object-type <counter | counter 64 | integer | string | unsigned integer>**

The **instance *name*** option of the **request snmp utility-mib <set | clear>** command specifies the name of the data instance and is the main identifier of the data. The **object-type <counter | counter 64 | integer | string | unsigned integer>** option enables you specify the object type, and the **object-value *value*** option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

Event Policy Configuration

To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the [**edit**] hierarchy level:

```
event-options {
   generate-event {
      1-HOUR time-interval 3600;
   }
   policy MBUFS {
      events 1-HOUR;
      then {
         event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
      }
   }
   event-script {
      file check-mbufs.slax;
   }
}
```

check-mbufs.slax Script

The following example shows the **check-mbufs.slax** script that is stored under **/var/db/scripts/event/**:

```
------ script START ------
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
    <op-script-results>{
```

```
 var $cmd = <command> "show system buffers";
        var $out = jcs:invoke($cmd);

     var $lines = jcs:break_lines($out);
     for-each ($lines) {
         if (contains(., "current/peak/max")) {
             var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
             var $split = jcs:regex($pattern, .);
             var $result = $split[2];

             var $rpc = <request-snmp-utility-mib-set> {
                 <object-type> "integer";
                 <instance> "current-mbufs";
                 <object-value> $result;
             }
             var $res = jcs:invoke($rpc);
                }
        }
    }
}
------ script END ------
```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```
user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
regress@caramels>
```

NOTE: The **show snmp mib walk** command is not available on the QFabric system, but you can use external SNMP client applications to perform this operation.

Displaying Commit Script Output

Table 591 on page 6332 summarizes the Junos OS command-line interface (CLI) commands you can use to monitor and troubleshoot commit scripts. For more information about the **cscript.log** file, see *Tracing Commit Script Processing*.

NOTE: Tracing commit script processing, including the **cscript.log** file, is not supported on the QFX3000-G QFabric system.

Table 591: Commit Script Configuration and Operational Mode Commands

Task	Command
Configuration Mode Commands	
Display errors and warnings generated by commit scripts.	**commit** or **commit check**

Table 591: Commit Script Configuration and Operational Mode Commands *(continued)*

Task	Command
Display detailed information.	**commit | display detail**
Display the underlying Extensible Markup Language (XML) data.	**commit | display xml**
Display the postinheritance contents of the configuration database. This view includes transient changes, but does not include changes made in configuration groups.	**show | display commit-scripts**
Display the postinheritance contents of the configuration database. This view excludes transient changes.	**show | display commit-scripts no-transients**
Display the postinheritance configuration in XML format. Viewing the configuration in XML format can be helpful when you are writing XML Path Language (XPath) expressions and configuration element tags.	**show | display commit-scripts view**
Display the postinheritance configuration in XML format, but exclude transient changes.	**show | display commit-scripts view | display commit-scripts no-transients**
Display all configuration groups data, including script-generated changes to the groups.	**show groups | display commit-scripts**
Display a particular configuration group, including script-generated changes to the group.	**show groups *group-name* | display commit-scripts**
Operational Mode Commands	
Display logging data associated with all commit script processing.	**show log cscript.log**
Display processing for only the most recent commit operation.	**show log cscript.log | las**t
Display processing for script errors.	**show log cscript.log | match error**
Display processing for a particular script.	**show log cscript.log | match *filename***

Commands for General Monitoring

- monitor traffic
- ping

monitor traffic

Syntax

monitor traffic
<brief | detail | extensive>
<absolute-sequence>
<count *count*>
<interface *interface-name*>
<layer2-headers>
<matching *matching*>
<no-domain-names>
<no-promiscuous>
<no-resolve>
<no-timestamp>
<print-ascii>
<print-hex>
<resolve-timeout>
<size *size*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

NOTE: This command is not supported on the QFabric system.

Options

none—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

brief | detail | extensive—(Optional) Display the specified level of output.

absolute-sequence—(Optional) Display absolute TCP sequence numbers.

count *count*—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.

interface *interface-name*—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

layer2-headers—(Optional) Display the link-level header on each line.

matching *matching*—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

no-domain-names—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

no-promiscuous—(Optional) Do not put the interface into promiscuous mode.

no-resolve—(Optional) Suppress reverse lookup of the IP addresses.

no-timestamp—(Optional) Suppress timestamps on displayed packets.

print-ascii—(Optional) Display each packet in ASCII format.

print-hex—(Optional) Display each packet, except the link-level header, in hexadecimal format.

resolve-timeout *timeout*—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

size *size*—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

Additional Information

In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace ***expression*** with one or more of the match conditions listed in Table 592 on page 6337.

Table 592: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	**host [*address* | *hostname*]**	Matches packets that contain the specified address or hostname. The protocol match conditions **arp**, **ip**, or **rarp**, or any of the directional match conditions can be prepended to the **host** match condition.
	net *address*	Matches packets with source or destination addresses containing the specified network address.
	net *address* mask *mask*	Matches packets containing the specified network address and subnet mask.
	port (*port-number* | *port-name*)	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as **bgp** (179), **dhcp** (67), or **domain** (53) (the port numbers are also listed).
Directional	**dst**	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	src	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	src and **dst**	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	src or **dst**	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	**less *value***	Matches packets shorter than or equal to the specified value, in bytes.
	greater *value*	Matches packets longer than or equal to the specified value, in bytes.

Table 592: Match Conditions for the monitor traffic Command *(continued)*

Match Type	Condition	Description
Protocol	**amt**	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	arp	Matches all ARP packets.
	ether	Matches all Ethernet packets.
	ether (broadcast | multicast)	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with**src** and **dst**.
	ether ***protocol*** **(*address* | (arp | ip | rarp))**	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The **ether protocol** arguments **arp**, **ip**, and **rarp** are also independent match conditions, so they must be preceded by a backslash (\) when used in the **ether protocol** match condition.
	icmp	Matches all ICMP packets.
	ip	Matches all IP packets.
	ip (broadcast | multicast)	Matches broadcast or multicast IP packets.
	ip protocol (*address* | (icmp | igrp | tcp | udp))	Matches packets with the specified address or protocol type. The **ip protocol** arguments **icmp**, **tcp**, and **udp** are also independent match conditions, so they must be preceded by a backslash (\) when used in the **ip protocol** match condition.
	isis	Matches all IS-IS routing messages.
	rarp	Matches all RARP packets.
	tcp	Matches all TCP datagrams.
	udp	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in Table 593 on page 6338.

Table 593: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.

Table 593: Logical Operators for the monitor traffic Command *(continued)*

Logical Operator (Highest to Lowest Precedence)	Description
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
||	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
( )	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

monitor traffic matching "ether[0] & 1 != 0"*"arithmetic_expression relational_operator arithmetic_expression"*

The packet data accessor uses the following syntax:

protocol [byte-offset <*size*>]

The optional *size* field represents the number of bytes examined in the packet header. The available values are **1**, **2**, or **4** bytes. The following sample command captures all multicast traffic:

user@host> **monitor traffic matching "ether[0] & 1 != 0"**

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in Table 594 on page 6340.

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the **match** pipe option (**| match**) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see Table 592 on page 6337.
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[***x***]** command for aggregated Ethernet interfaces (such as **ae0**) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 594: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
|	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

<wait *seconds*>

Release Information Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options ***host***—IP address or hostname of the remote system to ping.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

count *requests*—(Optional) Number of ping requests to send. The range of values is **1** through **2,000,000,000**. The default value is an unlimited number of requests.

detail—(Optional) Include in the output the interface on which the ping reply was received.

do-not-fragment—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

NOTE: In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.

interface *source-interface*—(Optional) Interface to use to send the ping requests.

interval *seconds*—(Optional) How often to send ping requests. The range of values, in seconds, is **1** through infinity. The default value is **1**.

logical-system *logical-system-name*—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system *logical-system-name*** command and then run the **ping** command. To return to the main router or switch, enter the **clear cli logical-system** command.

loose-source *value*—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address ***mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern ***string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance ***routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

size ***bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source ***source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

strict—(Optional) Use the strict source route option (IPv4).

strict-source ***value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos ***type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

If the device configuration includes the **dscp-code-point** ***value*** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

ttl ***value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

verbose—(Optional) Display detailed output.

vpls ***instance-name***—(Optional) Ping the instance to which this VPLS belongs.

wait ***seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

List of Sample Output

Output Fields
When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

Sample Output

ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes

```

Commands for Network Analytics

- show analytics configuration
- show analytics queue-statistics
- show analytics status
- show analytics streaming-servers
- show analytics traffic-statistics

monitor start (Analytics)

Syntax monitor start *filename*

Release Information Command introduced in Junos OS Release 13.2 for the QFX Series.

Description Start the display of the queue statistics or traffic statistics file if you had enabled queue or traffic monitoring on your device. The output is displayed in the JavaScript Object Notation (JSON) format.

Options *filename*—Name of the queue statistics or traffic statistics file.

Required Privilege Level trace

monitor start Using the Local Analytics File (Junos OS Release 13.2X51-D15 or Later) on page 6351
monitor start Using the Queue Statistics File (Junos OS Release 13.2X51-D10) on page 6351
monitor start Using the Queue Statistics File (Junos OS Release 13.2X50-D15) on page 6351
monitor start Using the Traffic Statistics File (Junos OS Release 13.2X51-D10) on page 6352
monitor start Using the Traffic Statistics File (Junos OS Release 13.2X50-D15) on page 6352

Output Fields Table 595 on page 6350 describes the output fields for the **monitor start** command. Output fields are listed in the approximate order in which they appear.

Table 595: monitor start Command Output Fields

Field	Description
hostname (used in Junos OS Release 13.2X50-D15 only)	Name of the network analytics host device.
record type	Type of statistics. May be queue statistics or traffic statistics.
time	Time at which the statistics were captured.
router-id	ID of the network analytics host device.
latency	For queue statistics only. Traffic queue latency in milliseconds.
port	Name of the physical port configured for network analytics.
queue depth	For queue statistics only. Depth of the traffic queue in bytes.

Table 595: monitor start Command Output Fields *(continued)*

Field	Description
rxpkt	For traffic statistics monitoring only. Total packets received.
rxpps	For traffic statistics monitoring only. Total packets received per second.
rxbyte	For traffic statistics monitoring only. Total bytes received.
rxbps	For traffic statistics monitoring only. Total bytes received per second.
rxdrop	For traffic statistics monitoring only. Total incoming packets dropped.
rxerr	For traffic statistics monitoring only. Total packets with errors.
rxutil (in Junos OS Release 13.2X50-D15 only)	For traffic statistics monitoring only. Total percent of traffic utilization for incoming traffic.
txpkt	For traffic statistics monitoring only. Total packets transmitted.
txpps	For traffic statistics monitoring only. Total packets transmitted per second.
txbyte	For traffic statistics monitoring only. Total bytes transmitted.
txbps	For traffic statistics monitoring only. Total bytes transmitted per second.
txdrop	For traffic statistics monitoring only. Total transmitted bytes dropped.
txerr	For traffic statistics monitoring only. Total transmitted packets with errors (dropped).
txutil (in Junos OS Release 13.2X50-D15 only)	For traffic statistics monitoring only. Total percent of traffic utilization for outgoing traffic.

show analytics collector

Syntax show analytics collector

Release Information Command introduced in Junos OS Release 13.2 for the QFX Series.

Description Show the list of network analytics remote collectors and related information. Remote collectors can be configured to receive streaming output for queue statistics and traffic statistics from the network analytics process (Analyticsd) running on the Routing Engine.

NOTE: **The show analytics collector command is available in Junos OS Release 13.2X51-D15 or later.**

Required Privilege Level interface-control

List of Sample Output show analytics collector on page 6354

Output Fields Table 596 on page 6353 describes the output fields for the **show analytics collector** command.

Table 596: show analytics collector Command Output Fields

Field	Description
Address	IP Address of the collector that is configured for receiving the streaming data.
Port	Port number of the collector receiving the streaming data.
Transport	Transport protocol: • tcp—Transmission Control Protocol • udp—User Datagram Protocol
Stream format	Format of the data that is sent to the server: • csv—Comma-separated values • gpb—Google Protocol Buffers • json—JavaScript Object Notation • tsv—Tab-separated values
State	Connection state of the streaming server.
Sent	Number of bytes sent to the streaming server.

Sample Output

show analytics collector

```
user@host> show analytics collector
Address         Port   Transport  Stream format  State            Sent
10.94.184.25    50013  udp        gpb            n/a              8710

List of Sample Output show analytics configuration on page 6356

Output Fields Table 597 on page 6355 describes the output fields for the **show analytics configuration** command.

Table 597: show analytics configuration Command Output Fields

Field	Descriptions
Global Configurations	
Traffic statistics	Settings are Auto, Enabled, or Disabled. If **Auto** is displayed, traffic statistics monitoring is not enabled.
Poll interval (traffic statististics)	Interval for traffic statistics polling in seconds. If the output displays a setting of 0 seconds, the polling interval was not configured, and the default interval applies. NOTE: The default interval is 1 second in Junos OS Release 13.2X50-D15, and 2 seconds in Junos OS Release 13.2X51-D10 or later. NOTE: Due to limitations and variations in hardware capability in different devices, there might be a difference in value between the actual interval and configured interval.
Queue statistics	Settings are Auto, Enabled, or Disabled. If **Auto** is displayed, queue statistics monitoring is not enabled.
Poll interval (queue statististics)	Interval for queue statistics polling in milliseconds. NOTE: The default interval is 8 milliseconds in Junos OS Release 13.2X50-D15, and 10 milliseconds in Junos OS Release 13.2X51-D10 or later. NOTE: Due to limitations and variations in hardware capability in different devices, there might be a difference in value between the actual interval and configured interval.

Table 597: show analytics configuration Command Output Fields *(continued)*

Field	Descriptions
Depth threshold high	Upper limit of the depth threshold configuration in number of bytes. If **0** is displayed, depth threshold is not enabled.
Depth threshold low	Lower limit of the depth threshold configuration in number of bytes. If **0** is displayed, depth threshold is not enabled.
Latency threshold high	Upper limit of the latency threshold configuration in microseconds. If **0** is displayed, latency threshold is not enabled.
Latency threshold low	Lower limit of the latency threshold configuration in microseconds. If **0** is displayed, latency threshold is not enabled.
Interface Configurations	
Interface	Name of interface that is configured for network analytics. The interface configuration overrides the global network analytics configuration.
Traffic Statistics	Settings are Enabled or Disabled for the interface.
Queue Statistics	Settings are Enabled or Disabled for the interface.
Depth-threshold High	Upper limit of the depth threshold configuration in number of bytes. If **0** is displayed, depth threshold is not enabled.
Depth-threshold Low	Lower limit of the depth threshold configuration in number of bytes. If **0** is displayed, depth threshold is not enabled.
Latency-threshold High	Upper limit of the latency threshold configuration in microseconds. If **0** is displayed, latency threshold is not enabled.
Latency-threshold Low	Lower limit of the latency threshold configuration in microseconds. If **0** is displayed, latency threshold is not enabled.

Sample Output

show analytics configuration

```
user@host> show analytics configuration
Global configurations:
   Traffic statistics: Enabled, Poll interval: 2 seconds
   Queue statistics: Auto, Poll interval: 10 milliseconds
   Depth threshold high: 0 bytes, low: 0 bytes
   Latency threshold high: 0 microseconds, low: 0 microseconds
Interface     Traffic       Queue        Depth-threshold      Latency-threshold
```

```
                  Statistics    Statistics      High      Low           High      Low
                                                   (bytes)              (microseconds)
      xe-0/0/0     Auto          Auto           204800    10            0         0
```

show analytics queue-statistics

Syntax

show analytics queue-statistics
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 13.2 for the QFX Series.

Description

Show the queue statistics (queue length and latency) that are collected for all interfaces that are enabled for network analytics on a device. Optionally, if you wish to see the queue statistics for one interface only, you may specify the interface.

Options

interface ***interface-name***—(Optional) Display the queue statistics for the specified interface only.

Required Privilege Level

interface-control

List of Sample Output

Output Fields

Table 598 on page 6358 describes the output fields for the **show analytics queue-statistics** command.

Table 598: show analytics queue-statistics Command Output Fields

Field	Description
Time	Date and time at which the queue statistics are collected.
Interface	Name of the interface at which the queue statistics are collected.
Queue-length (bytes)	Queue length in number of bytes.
Latency (μs)	Queue depth in microseconds.

Sample Output

show analytics queue-statistics (Junos OS Release 13.2X51-D15 or later)

```
user@host> show analytics queue-statistics

show analytics status

Syntax

show analytics status
<global>

Release Information Command introduced in Junos OS Release 13.2 for the QFX Series.

Description Show the status of the network analytics components that are configured on a device.

Options **none**—Show the global and interface status for network analytics.

global—Show the global status only for network analytics.

NOTE: The **global** option is available in Junos OS Release 13.2X51-D15 or later.

Required Privilege Level interface-control

List of Sample Output

show analytics status (Junos OS Release 13.2X51-D15 or Later) on page 6361
show analytics status global (Junos OS Release 13.2X51-D15 or Later) on page 6362
show analytics status (Junos OS Release 13.2X50-D15 and 13.2X51-D10) on page 6362

Output Fields Table 599 on page 6360 describes the output fields for the **show analytics status** command.

Table 599: show analytics status Command Output Fields

Field	Descriptions
Global Configurations	
Traffic statistics or Traffic monitoring status	Settings are Auto, Enabled, or Disabled. If **Auto** is displayed, traffic statistics monitoring is not enabled. NOTE: The Disabled setting always supersedes the Enabled setting.
Poll interval or Traffic monitoring polling interval	Interval for traffic statistics polling in seconds. NOTE: Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.
Queue statistics or Queue monitoring status	Can be Auto, Enabled, or Disabled. If **Auto** is displayed, queue statistics monitoring is not enabled. NOTE: The Disabled setting always supersedes the Enabled setting.

Table 599: show analytics status Command Output Fields *(continued)*

Field	Descriptions
Poll interval or Queue monitoring polling interval	Interval for queue statistics polling in milliseconds. NOTE: Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.
Depth threshold high or Queue depth high threshold	Upper limit of the depth threshold configuration in number of bytes. If **0** is displayed, depth threshold is not configured.
Depth threshold low or Queue depth low threshold	Lower limit of the depth threshold configuration in number of bytes. If **0** is displayed, depth threshold is not configured.
Latency threshold high	Upper limit of the latency threshold configuration in microseconds. If **0** is displayed, latency threshold is not configured.
Latency threshold low	Lower limit of the latency threshold configuration in microseconds. If **0** is displayed, latency threshold is not configured.
Interface Configurations	
Interface	Name of an interface that is configured for network analytics. The interface configuration overrides the global network analytics configuration.
Traffic Statistics	Settings are Enabled or Disabled for the interface. NOTE: The Disabled setting always supersedes the Enabled setting.
Queue Statistics	Settings are Enabled or Disabled for the interface. NOTE: The Disabled setting always supersedes the Enabled setting.
Depth-threshold High	Upper limit of the depth threshold configuration in number of bytes.
Depth-threshold Low	Lower limit of the depth threshold configuration in number of bytes.
Latency-threshold High	Upper limit of the latency threshold configuration in microseconds.
Latency-threshold Low	Lower limit of the latency threshold configuration in microseconds.

Sample Output

show analytics status (Junos OS Release 13.2X51-D15 or Later)

```
user@host> show analytics status
Traffic monitoring status is auto
Traffic monitoring polling interval : 5 seconds
Queue monitoring status is enabled
Queue monitoring status polling interval : 1000 milliseconds
Queue depth high threshold : 1000000000 bytes
```

```
Queue depth low threshold : 99 bytes

```

show analytics streaming-servers

Syntax show analytics streaming-servers

Release Information Command introduced in Junos OS Release 13.2 for the QFX Series.

Description Show the list of streaming servers that are configured for network analytics. Streaming servers receive streaming output for queue statistics and traffic statistics from the network analytics process (Analyticsd) running on the Routing Engine.

NOTE: The **show analytics streaming-servers** command is available in Junos OS Release 13.2X50-D15 and 13.2X51-D10 only.

Required Privilege Level interface-control

List of Sample Output **show analytics streaming-servers on page 6364**

Output Fields Table 600 on page 6363 describes the output fields for the **show analytics streaming-servers** command.

Table 600: show analytics streaming-servers Command Output Fields

Field	Description
Address	IP Address of the streaming server that is configured for receiving the streaming data.
Port	Port number of the streaming server receiving the streaming data.
Stream-Format	Format of the data that is sent to the server. Values are: • csv—Comma-separated values. • json—JavaScript Object Notification. • tsv—Tab-separated values.
Stream-Type	Type of data that is sent to the a port on the streaming server: • QS—Queue statistics. • TS—Traffic statistics.
State	Connection state of the streaming server.
Sent	Number of bytes sent to the streaming server.

Sample Output

show analytics streaming-servers

```
user@host> show analytics streaming-servers
Address         Port     Stream-Format     Stream-Type   State         Sent
10.94.198.14    50001    json              QS            Established   0
10.94.198.14    50005    csv               TS            Established   1185

clear sflow collector statistics

The following example shows two output examples for the **show sflow collector** command, one before and one after the **clear sflow collector statistics** command was issued.

```
user@host> show sflow collector
Collector         Udp-port     No. of samples
   address
   10.1.1.1             6343        3174
   10.1.2.1             6343        3562

user@host> clear sflow collector statistics

user@host> show sflow collector
Collector         Udp-port     No. of samples
   address
   10.1.1.1              6343        0
   10.1.2.1              6343        0
```

show sflow

Syntax

show sflow
<collector>
<interface>

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Display sFlow configuration information.

Options

none—Display all sFlow configuration information.

collector—(Optional) Display a list of configured sFlow collectors and their properties.

interface—(Optional) Display the interfaces on which sFlow technology is enabled and the sampling parameters.

Required Privilege Level view

List of Sample Output show sflow on page 6370

Output Fields Table 602 on page 6369 lists the output fields for the **show sflow** command. Output fields are listed in the approximate order in which they appear.

Table 602: show sflow Output Fields

Field Name	Field Description	Level of Output
sFlow	Status of the feature: **Enabled** or **Disabled**.	All levels
Sample limit	Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second.	All levels
Polling interval	Interval at which the sFlow agent polls the interface.	All levels
Sample rate egress	Rate at which egress packets are sampled.	All levels
Sample rate ingress	Rate at which ingress packets are sampled.	All levels
Agent ID	IP address assigned to the sFlow agent.	All levels
Source IP address	Source IP address for the sFlow packets.	All levels

Sample Output

show sflow

```
user@host> show sflow

sFlow                     : Enabled
Sample limit              : 300 packets/second
Polling interval          : 20 second
Sample rate egress        : 1:2048: Disabled
Sample rate ingress       : 1:1000: Enabled
Agent ID                  : 10.93.54.7
Source IP address         : 10.93.54.7
```

show sflow collector

Syntax show sflow collector

Release Information Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Display a list of configured sFlow collectors and their properties.

Required Privilege Level view

- show snmp mib
- show snmp rmon
- show snmp rmon history
- show snmp statistics
- show snmp v3

clear snmp history

Syntax clear snmp history (*index* | all)

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Delete the samples of Ethernet statistics collected for a history group.

Options **all**—Clear all the entries in the history index.

index—Clear the contents of the specified entry in the history index.

Required Privilege Level clear

Related Documentation

- clear snmp statistics on page 6375

clear snmp statistics

Syntax clear snmp statistics

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Clear Simple Network Management Protocol (SNMP) statistics.

Options This command has no options.

Required Privilege Level clear

Related Documentation

- show snmp statistics on page 1379

List of Sample Output clear snmp statistics on page 6375

Output Fields See show snmp statistics for an explanation of output fields.

Sample Output

clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
```

```
  Total request varbinds: 0, Total set varbinds: 0,
  Get requests: 0, Get nexts: 0, Set requests: 0,
  Get responses: 0, Traps: 0,
  Silent drops: 0, Proxy drops 0
Output:
  Packets: 0, Too bigs: 0, No such names: 0,
  Bad values: 0, General errors: 0,
  Get requests: 0, Get nexts: 0, Set requests: 0,
  Get responses: 0, Traps: 0
```

request snmp spoof-trap

Syntax

request snmp spoof-trap
<*trap*> variable-bindings <*object*> <*instance*> <*value*>

Release Information

Command introduced in Junos OS Release 8.2.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.

Options

<*trap*>—Name of the trap to spoof.

variable-bindings <*object*> <*instance*> <*value*>—(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, **ifIndex[14] = 14**). Enclose the list of variable bindings in quotation marks (“ “) and use a comma to separate each object name, instance, and value definition (for example, **variable-bindings “ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2”**). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.

<*dummy name*>—A dummy trap name to display the list of available traps.

Question mark (?)—Question mark **?** to display possible completions.

Required Privilege Level

request

List of Sample Output

request snmp spoof-trap (with Variable Bindings) on page 6377
request snmp spoof-trap (Illegal Trap Name) on page 6377
request snmp spoof-trap (Question Mark ?) on page 6381

Sample Output

request snmp spoof-trap (with Variable Bindings)

```
user@host> request snmp spoof-trap linkUp variable-bindings “ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2”
Spoof trap request result: trap sent successfully
```

request snmp spoof-trap (Illegal Trap Name)

```
user@host> request snmp spoof-trap xx
Spoof trap request result: trap not found

request snmp utility-mib clear instance

Syntax

request snmp utility-mib clear instance *name*
object-type *type*

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Clear the data stored in the specified container object in the SNMP Utility MIB.

Options

name—Name of the SNMP instance that is used to identify the data stored in the container object.

object-type *type*—Type of container object in which the data is stored. The following container object types are supported:

- **counter**—Stores a 32-bit counter value.
- **counter64**—Stores a 64-bit counter value.
- **integer**—Stores a 32-bit signed integer value.
- **unsigned-integer**—Stores a 32-bit unsigned integer value.

Required Privilege Level

clear

request snmp utility-mib set instance

Syntax

request snmp utility-mib set instance *name*
object-type *type*
object-value *value*

Release Information

Command introduced in Junos OS Release 12.2 for the QFX Series.

Description

Store data in the specified container object in the SNMP Utility MIB. The data may be retrieved by SNMP operations.

Options

name—Name of the SNMP instance that is used to identify the data stored in the container object.

object-type ***type***—Type of container object in which to store data. The following container object types are supported:

- **counter**—Stores a 32-bit counter value.
- **counter64**—Stores a 64-bit counter value.
- **integer**—Stores a 32-bit signed integer value.
- **unsigned-integer**—Stores a 32-bit unsigned integer value.
- **string**—Stores an octet string value.

object-value ***value***—Data that is stored in the container object.

show snmp health-monitor

Syntax

show snmp health-monitor
<alarms (brief | detail) | logs>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.

Options

none—Display information about all health monitor alarms and logs.

alarms (brief | detail)—(Optional) Display information about health monitor alarms. Optionally, specify brief or detailed information about the alarms.

logs—(Optional) Display information about health monitor logs.

Required Privilege Level

Output Fields

Table 605 on page 6385 describes the output fields for the **show snmp health-monitor** command. Output fields are listed in the approximate order in which they appear.

Table 605: show snmp health-monitor Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 605: show snmp health-monitor Output Fields *(continued)*

Field Name	Field Description	Level of Output

State	State of the alarm or event entry:
	• Alarms:
	  ◦ active—Entry is fully configured and activated.
	  ◦ falling threshold crossed—Value of the variable has crossed the lower threshold limit.
	  ◦ rising threshold crossed—Value of the variable has crossed the upper threshold limit.
	  ◦ under creation—Entry is being configured and is not yet activated.
	  ◦ startup—Alarm is waiting for the first sample of the monitored variable.
	  ◦ object not available—Monitored variable of that type is not available to the health monitor agent.
	  ◦ instance not available—Monitored variable's instance is not available to the health monitor agent.
	  ◦ object type invalid—Monitored variable is not a numeric value.
	  ◦ object processing errored—An error occurred when the monitored variable was processed.
	  ◦ unknown—State is not one of the above.
		All levels

Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.	detail
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value *absolute value* or *delta value*.	detail

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  ◦ Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. *falling alarm*
	  ◦ Value of the alarm is below or equal to the falling threshold and the startup type is either *falling alarm* or *rising or falling alarm*.
	• Alarm is *not* sent when one of the following situations exists:
	  ◦ Value of the alarm is above or equal to the rising threshold and the startup type is *falling alarm*.
	  ◦ Value of the alarm is below or equal to the falling threshold and the startup type is *rising alarm*.
	  ◦ Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	detail
Creator	Mechanism by which the entry was configured (Health Monitor).	detail
Sample interval	Time period between samples (in seconds).	detail
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.	detail

Table 605: show snmp health-monitor Output Fields *(continued)*

Field Name	Field Description	Level of Output
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.	detail
Rising event index	Index number of the event triggered when the rising threshold is crossed.	detail
Falling event index	Index number of the event triggered when the falling threshold is crossed. Details include the value of the falling event instance and the state of the falling event instance.	detail

Sample Output

show snmp health-monitor

```
user@switch> show snmp health-monitor

Alarm
Index  Variable description                                 Value State

```

show snmp inform-statistics

Syntax show snmp inform-statistics

Release Information Command introduced in Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about Simple Network Management Protocol (SNMP) inform requests.

Options This command has no options.

Required Privilege Level view

List of Sample Output show snmp inform-statistics on page 6390

Output Fields Table 606 on page 6390 describes the output fields for the **show snmp inform-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 606: show snmp inform-statistics Output Fields

Field Name	Field Description
Target Name	Name of the device configured to receive and respond to SNMP informs.
Address	IP address of the target device.
Sent	Number of informs sent to the target device and acknowledged by the target device.
Pending	Number of informs held in memory pending a response from the target device.
Discarded	Number of informs discarded after the specified number of retransmissions to the target device were attempted.
Timeouts	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
Probe Failures	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

Sample Output

show snmp inform-statistics

```
user@host> show snmp inform-statistics
Inform Request Statistics:
 Target Name: TA1_v3_md5_none Address: 172.17.20.184
  Sent: 176, Pending: 0
  Discarded: 0, Timeouts: 0, Probe Failures: 0
 Target Name: TA2_v3_sha_none Address: 192.168.110.59
```

```
 Sent: 0, Pending: 4
 Discarded: 84, Timeouts: 0, Probe Failures: 258
Target Name: TA5_v2_none Address: 172.17.20.184
 Sent: 0, Pending: 0
 Discarded: 2, Timeouts: 10, Probe Failures: 0
```

show snmp mib

Syntax show snmp mib (get | get-next | walk) (ascii | decimal) *object-id*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
ascii and **decimal** options introduced in Junos OS Release 9.6.
ascii and **decimal** options introduced in Junos OS Release 9.6 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.

Options **get**—Retrieve and display one or more SNMP object values.

get-next—Retrieve and display the next SNMP object values.

walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.

ascii—Display the SNMP object's string indices as an ASCII-key representation.

decimal—Display the SNMP object values in the decimal (default) format. The **decimal** option is the default option for this command. Therefore, issuing the **show snmp mib (get | get-next | walk) decimal object-id** and the **show snmp mib (get | get-next | walk) object-id** commands display the same output.

object-id—The object can be represented by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). When entering multiple objects, enclose the objects in quotation marks.

Required Privilege Level snmp—To view this statement in the configuration.

List of Sample Output
show snmp mib get on page 6393
show snmp mib get (Multiple Objects) on page 6393
show snmp mib get (Layer 2 Policer) on page 6393
show snmp mib get-next on page 6393
show snmp mib get-next (Specify an OID) on page 6393
show snmp mib walk on page 6393
show snmp mib walk (QFX Series) on page 6393
show snmp mib walk decimal on page 6394
show snmp mib walk (ASCII) on page 6394
show snmp mib walk (Multiple Indices) on page 6394
show snmp mib walk decimal (Multiple Indices) on page 6394

Output Fields Table 607 on page 6393 describes the output fields for the **show snmp mib** command. Output fields are listed in the approximate order in which they appear.

Table 607: show snmp mib Output Fields

Field Name	Field Description
name	Object name and numeric instance value.
object value	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output

show snmp mib get

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

show snmp mib get (Multiple Objects)

```
user@host> show snmp mib get ?sysObjectID.0 sysUpTime.0?
sysObjectID.0 = jnxProductNameM20
sysUpTime.0 = 1640992
```

show snmp mib get (Layer 2 Policer)

```
user@host> show snmp mib get ifInOctets.25970
ifInOctets.25970 = 7545720
```

show snmp mib get-next

```
user@host> show snmp mib get-next jnxMibs
jnxBoxClass.0 = jnxProductLineM20.0
```

show snmp mib get-next (Specify an OID)

```
user@host> show snmp mib get-next 1.3.6.1

.......
```

show snmp rmon

Syntax

show snmp rmon
<alarms (brief | detail)>
<events (brief | detail)>
<logs>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about Simple Network Management Protocol (SNMP) Remote Monitoring (RMON) alarms, events, and logs.

Options

none—Display information about all RMON alarms and events.

brief | detail—(Optional) Display brief or detailed information about RMON alarms or events.

alarms—(Optional) Display information about RMON alarms.

events—(Optional) Display information about RMON events.

logs—(Optional) Display information about RMON monitoring logs.

Required Privilege Level view

Output Fields Table 608 on page 6395 describes the output fields for the **show snmp rmon** command. Output fields are listed in the approximate order in which they appear.

Table 608: show snmp rmon Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels

Table 608: show snmp rmon Output Fields *(continued)*

Field Name	Field Description	Level of Output
State	State of the alarm or event entry: Alarms: • **active**—Entry is fully configured and activated. • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit. • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit. • **under creation**—Entry is being configured and is not yet activated. • **startup**—Alarm is waiting for the first sample of the monitored variable. • **object not available**—Monitored variable of that type is not available to the SNMP agent. • **instance not available**—Monitored variable's instance is not available to the SNMP agent. • **object type invalid**—Monitored variable is not a numeric value. • **object processing errored**—An error occurred when the monitored variable was processed. • **unknown**—State is not one of the above. Events: • **active**—Entry has been fully configured and activated. • **under creation**—Entry is being configured and is not yet activated. • **unknown**—State is not one of the above.	All levels
Variable name	Name of the SNMP object instance being monitored.	All levels
Event Index	Event identifier.	All levels
Type	Type of notification made when an event is triggered. It can be one of the following: • **log**—A system log message is generated and an entry is made to the log table. • **snmptrap**—An SNMP trap is sent to the configured destination. • **log and trap**—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination. • **none**—Neither log nor trap will be sent.	**detail**
Last Event	Date and time of the last event. It has the format *yyyy-mm-dd hh:mm:ss timezone*.	**brief**
Community	Trap group used for sending the SNMP trap.	**detail**
Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of **absolute value** or **delta value**.	**detail**

Table 608: show snmp rmon Output Fields *(continued)*

Field Name	Field Description	Level of Output

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  • Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  • Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  • Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	**detail**
Creator	Mechanism by which the entry was configured (**CLI** or **SNMP**).	**detail**
Sample interval	Time period between samples (in seconds).	**detail**
Rising threshold	Upper limit threshold value configured by the user.	**detail**
Falling threshold	Lower limit threshold value configured by the user.	**detail**
Rising event index	Event triggered when the rising threshold is crossed.	**detail**
Falling event index	Event triggered when the falling threshold is crossed.	**detail**
Current value	Current value of the monitored variable in the most recent sample interval.	**detail**

Sample Output

show snmp rmon

show snmp rmon history

Syntax

show snmp rmon history
<*history-index*>
sample-index <*sample-index*>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of the RMON history group.

Options

none—Display all the entries in the RMON history group.

history-index—(Optional) Display the contents of the specified entry in the RMON history group.

sample-index *sample-index*—(Optional) Display the statistics collected for the specified sample within the specified entry in the RMON history group.

Output Fields Table 117 on page 1379 describes the output fields for the **show snmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 609: show snmp statistics Output Fields

Field Name	Field Description
Input	Information about received packets: • **Packets(snmpInPkts)**—Total number of messages delivered to the SNMP entity from the transport service. • **Bad versions—(snmpInBadVersions**) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • **Bad community names—(snmpInBadCommunityNames)** Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • **Bad community uses—(snmpInBadCommunityUses)** Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • **ASN parse errors—(snmpInASNParseErrs)** Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • **Too bigs—(snmpInTooBigs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpInNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpInBadValues)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **badValue**. • **Read onlys—(snmpInReadOnlys)** Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of **readOnly**. Only incorrect implementations of SNMP generate this error.

Table 609: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
Input (continued)	• **General errors—(snmpInGenErrs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **genErr**. • **Total requests varbinds—(snmpInTotalReqVars)** Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP **GetRequest** and **GetNext** PDUs. • **Total set varbinds—(snmpInSetVars)** Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP **SetRequest** PDUs. • **Get requests—(snmpInGetRequests)** Total number of SNMP **GetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get nexts—(snmpInGetNexts)** Total number of SNMP **GetNext** PDUs that have been accepted and processed by the SNMP entity. • **Set requests—(snmpInSetRequests)** Total number of SNMP **SetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get responses—(snmpInGetResponses)** Total number of SNMP **GetResponse** PDUs that have been accepted and processed by the SNMP entity. • **Traps—(snmpInTraps)** Total number of SNMP traps generated by the SNMP entity. • **Silent drops—(snmpSilentDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • **Proxy drops—(snmpProxyDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned. • **Commit pending drops**—Number of SNMP packets for **Set** requests dropped because of a previous pending SNMP **Set** request on the committed configuration. • **Throttle drops**—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 609: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
V3 Input	Information about SNMP version 3 packets: • **Unknown security models—(snmpUnknownSecurityModels)** Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • **Invalid messages—(snmpInvalidMsgs)** Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • **Unknown pdu handlers—(snmpUnknownPDUHandlers)** Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • **Unavailable contexts—(snmpUnavailableContexts)** Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • **Unknown contexts—(snmpUnknownContexts)** Total number of requests received for a context that is unknown to the SNMP engine. • **Unsupported security levels—(usmStatsUnsupportedSecLevels)** Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • **Not in time windows—(usmStatsNotInTimeWindows)** Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • **Unknown user names—(usmStatsUnknownUserNames)** Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • **Unknown engine ids—(usmStatsUnknownEngineIDs)** Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine. • **Wrong digests—(usmStatsWrongDigests)** Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • **Decryption errors—(usmStatsDecryptionErrors)** Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.

Table 609: show snmp statistics Output Fields *(continued)*

Field Name	Field Description
Output	Information about transmitted packets: • **Packets—(snmpOutPkts)** Total number of messages passed from the SNMP entity to the transport service. • **Too bigs—(snmpOutTooBigs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpOutNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpOutBadValues)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **badValue**. • **General errors—(snmpOutGenErrs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **genErr**. • **Get requests—(snmpOutGetRequests)** Total number of SNMP **GetRequest** PDUs generated by the SNMP entity. • **Get nexts—(snmpOutGetNexts)** Total number of SNMP **GetNext** PDUs generated by the SNMP entity. • **Set requests—(snmpOutSetRequests)** Total number of SNMP **SetRequest** PDUs generated by the SNMP entity. • **Get responses—(snmpOutGetResponses)** Total number of SNMP **GetResponse** PDUs generated by the SNMP entity. • **Traps—(snmpOutTraps)** Total number of SNMP traps generated by the SNMP entity.

Sample Output

show snmp statistics

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 246213, Bad versions: 12, Bad community names: 12,
    Bad community uses: 0, ASN parse errors: 96,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 227084, Total set varbinds: 67,

```

show snmp v3

Syntax

show snmp v3
<access <brief | detail> | community | general | groups | notify <filter> | target <address | parameters> | users>

Release Information

Command introduced in Junos OS Release 11.1 for the QFX Series.

Description

Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.

Options

none—Display all of the SNMPv3 operating configuration.

access—(Optional) Display SNMPv3 access information.

brief | detail—(Optional) Display brief or detailed information about SNMPv3 access information.

community—(Optional) Display SNMPv3 community information.

general—(Optional) Display SNMPv3 general information.

groups—(Optional) Display SNMPv3 security-to-group information.

notify <filter>—(Optional) Display SNMPv3 notify information and, optionally, notify filter information.

target <address | parameters>—(Optional) Display SNMPv3 target information and, optionally, either target address or target parameter information.

users—(Optional) Display SNMPv3 user information.

Additional Information

To edit the default display of the **show snmp v3** command, specify options in the **show** statement at the **[edit snmp v3]** hierarchy level.

List of Sample Output

show snmp v3 on page 6405

Output Fields

Table 610 on page 6405 describes the output fields for the **show snmp v3** command. Output fields are listed in the approximate order in which they appear.

Table 610: show snmp v3 Output Fields

Field Name	Field Description
Local engine	Information about the local SNMP engine configuration: • **Local engine ID**—Unique Identifier of the local SNMPv3 engine. • **Engine boots**—Number of times the local SNMPv3 engine has rebooted or reinitialized since this engine ID was configured. • **Engine time**—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • **Max msg size**—Maximum message size the sender can accommodate.
Engine ID (local engine)	Information about the local SNMP engine ID and the associated users: • **User**—SNMPv3 username. • **Auth/Priv**—Authentication and encryption algorithm that is configured for the user. • **Storage**—Indicates whether a username is saved to the configuration file (nonvolatile) or not saved (volatile). Applies only to users with active status. • **Status**—Status of the user as listed in the SNMPv3 user table. Only rows with an active status in the table are used by the SNMPv3 engine.
Engine ID (remote engine)	Information about a remote SNMP engine, associated users, user groups, and user access policies: • **User**—SNMPv3 username. • **Auth/Priv**—Authentication and encryption algorithm that is configured for the user. • **Storage**—Indicates whether a username is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status. • **Status**—Status of a new user that has been activated. Only users with an active status can use SNMPv3. • **Group name**—Name of a group of users for which the configured access privileges apply. • **Security model**—Security model (such as **usm**, **v1**, **v2c**, or **any**) that is configured for the group. The security model is used with the security name to ensure messaging security. • **Security name**—Security name that is associated with a user, and which is used with the security model to ensure messaging security. • **Storage type**—Indicates whether a username is saved to the configuration file (nonvolatile) or not saved (volatile). Applies only to users with active status. • **Status**—Status of a user in a group. Only users with an active status can use SNMPv3.
Access control	Information about access control: • **Group name**—Name of a group of users for which the configured access privileges apply. • **Context prefix**—SNMPv3 context for which the configured access privileges apply. • **Security model/level**—Security model and security level combination that is configured for user access privileges. • **Read view**—Identifies the MIB view used for SNMPv3 read operations. • **Write view**—Identifies the MIB view used for SNMPv3 write operations. • **Notify view**—Identifies the MIB view used for outbound SNMP notifications.

Commands for Syslog

- show log

show log

Syntax

show log
<*filename* | user <*username*>>

Syntax (QFabric System)

show log *filename*
<*device-type (device-id* | *device-alias*)>

Syntax (TX Matrix Routers)

show log
<all-lcc | lcc *number* | scc>
<*filename* | user <*username*>>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option *device-type (device-id* | *device-alias*) is introduced in Junos OS Release 13.1 for the QFX Series.

Description

List log files, display log file contents, or display information about users who have logged in to the router or switch.

Options

none—List all log files.

<all-lcc | lcc *number* | scc>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace ***number*** with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(*device-id* | *device-alias*)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

user <***username***>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include ***username***, display logging information about the specified user.

Required Privilege Level trace

CHAPTER 69

Troubleshooting

Troubleshooting Overview

Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 611 on page 6411 provides a list of some of the troubleshooting resources.

Table 611: Troubleshooting Resources on the QFX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	"Chassis Alarm Messages on a QFX3500 Device" on page 6430
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	*Chassis Status LEDs on a QFX3500 Device*
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	"Interface Alarm Messages" on page 6433
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	"Understanding Alarms" on page 6429

Table 611: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	• Overview of Single-Chassis System Logging Configuration on page 6069 • Junos OS System Log Configuration Statements on page 6127
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the **traceroute monitor** command to locate points of failure in a network.	• Monitoring System Process Information on page 307 • Monitoring System Properties on page 308 • **traceroute monitor**
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	*Junos OS Automation Library*
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	*Junos XML API Operational Developer Reference*
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as **show**, **set**, and **commit** to perform those operations.	*NETCONF XML Management Protocol Developer Guide*
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	• SNMP MIBs Support on page 6038 • SNMP Traps Support on page 6054 • *Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS*
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	*Advanced Insight Scripts (AI-Scripts) Release Notes*
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	*Service Automation*

Table 611: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	*Service Automation*
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	http://kb.juniper.net

Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

Table 612 on page 6413 provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 612: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See "Chassis Alarm Messages on a QFX3500 Device" on page 6430.
	Fan tray LED is blinking amber.	See *Fan Tray LED on a QFX3500 Device*.
	Chassis status LED for the power is blinking amber.	See *Chassis Status LEDs on a QFX3500 Device*.
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See *Chassis Status LEDs on a QFX3500 Device*.

Table 612: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	Check whether the port is a valid Gigabit Ethernet port (6 through 41). See *QFX3500 Device Overview*.
	Cannot configure a port as a Fibre Channel port.	Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47). See *QFX3500 Device Overview*.
	Cannot configure a port as a 10-Gigabit Ethernet port.	If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports. If the port is a 40-Gbps QSFP+ interface. make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See *QFX3500 Device Overview*.
	Cannot configure a 40-Gbps QSFP+ interface.	The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See *QFX3500 Device Overview*.
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them. NOTE: The management ports are on the front panel of the QFX3500 switch. They are labeled **C0** and **C1** on the front panel. In the CLI they are referred to as **me0** and **me1**. See "Configuring a QFX3500 Device as a Standalone Switch" on page 151.

Table 612: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See "Recovering from a Failed Software Installation" on page 108.
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: • Loading a Previous Configuration File on page 1136 • Reverting to the Default Factory Configuration on page 163 • Reverting to the Rescue Configuration on page 165 • Performing a Recovery Installation on a QFX Series Device on page 103
	Root password is lost or forgotten.	Recover the root password. See "Recovering the Root Password" on page 1117.
Network interfaces	An aggregated Ethernet interface is down.	See "Troubleshooting an Aggregated Ethernet Interface" on page 1119.
	Interface on built-in network port is down.	See "Troubleshooting Network Interfaces" on page 1118.
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See "Troubleshooting Ethernet Switching" on page 1731.
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See "Troubleshooting Firewall Filter Configuration" on page 4699.

QFX5100 Switch with Automation Enhancements Frequently Asked Questions

This FAQ addresses questions regarding using QFX5100 switches with automation enhancements, which were introduced at Junos OS Release 13.2X51-D15 .

This FAQ covers the following questions:

Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries?

Contact Customer Support at http://www.juniper.net/support.

Who Should You Contact If You Have Problems with Puppet for Junos OS?

You can obtain support for Puppet for Junos OS through the J-Net Forum for Puppet at http://forums.juniper.net/t5/Puppet-for-Junos-OS/bd-p/puppet_junos .

Who Should You Contact If You Have Problems with Chef for Junos OS?

You can obtain support for Chef for Junos OS through the J-Net Forum for Chef at http://forums.juniper.net/t5/Chef-for-Junos-OS/bd-p/chef_junos.

What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle?

In this case, the user partition remains intact.

NOTE: If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

How Do You Recover Junos OS Binaries That You Have Deleted?

You must reinstall the software package.

How Do You Recover from a System Crash?

You must reinstall the software package.

How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?

You cannot use the **show version** command to verify that a QFX5100 switch is running the jinstall-qfx-5-flex-x.tgz software bundle. However, there are two other ways to verify this.

- Use the **show configuration** command to check that you are running a Layer 3 configuration. See *Installing Junos OS Software with QFX5100 Switch Automation Enhancements*.
- Go to the shell and confirm that you can invoke Python. See “Invoking the Python Interpreter” on page 6104.

Troubleshooting Procedures

Recovering from a Failed Software Installation

Problem If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

   Hit [Enter] to boot immediately, or space bar for command prompt.

   Press the Spacebar to enter the manual loader. The **loader>** prompt appears.
3. Enter the following command:

   `loader>` **install [– –format] [– –external]** ***source***
   where:

   - **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
   - **external**—Installs the installation package onto external media (a USB stick, for example).

- ***source***—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**).

The installation now proceeds normally and ends with a login prompt.

Loading a Previous Configuration File

You can use the **rollback** <***number*** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <*number*>

Options

- **none**— Return to the most recently saved configuration.
- *number*—Configuration to return to.
  - **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

Related Documentation

- Configuration File Terms on page 26

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings.

This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. [edit]
   user@switch# **load factory-default**
   [edit]
   user@switch# **delete system commit factory-settings**
   [edit]
   user@switch# **commit**

Related Documentation

- Understanding Configuration Files on page 1126
- Loading a Previous Configuration File on page 1136
- Reverting to the Rescue Configuration on page 165

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   [edit]
   user@switch# **load override** *filename*

2. Commit your changes.

   [edit]
   user@switch# **commit** *filename*

Related Documentation

- Setting or Deleting the Rescue Configuration on page 1145
- Reverting to the Default Factory Configuration on page 163
- Configuration File Terms on page 26

Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45–to–DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45–to–DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

   The terminal emulation screen on your management device displays the switch's boot sequence.
10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

    ```
    Hit [Enter] to boot immediately, or space bar for command prompt.
    Booting [kernel] in 9 seconds...
    ```
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

    ok **boot -s**
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.
14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

Troubleshooting a Deprecated Network Analytics Configuration

Problem

After a software upgrade to Junos OS Release 13.2X51-D15 from an earlier release, the network analytics configuration is no longer valid and the feature is disabled.

The network analytics configuration used in Junos OS Release 13.2X51-D10 has been deprecated in Release 13.2X51-D15. Issuing the **show services analytics** command results in the following output:

```
root@qfx5100# show services analytics

queue-statistics { ## Warning: 'queue-statistics' is deprecated
    interval 1;
}
```

Cause

Junos OS Release 13.2X51-D15 added enhancements to the network analytics feature, resulting in significant changes in the CLI. The updated **[edit services analytics]** hierarchy level contains some statements that have replaced those that were previously released. As a result, the earlier configuration does not work in the new release.

Solution

Use the new CLI statements to reconfigure the network analytics feature.

PART 21

Troubleshooting

CHAPTER 70

Overview

General Troubleshooting

Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 611 on page 6411 provides a list of some of the troubleshooting resources.

Table 613: Troubleshooting Resources on the QFX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	"Chassis Alarm Messages on a QFX3500 Device" on page 6430
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	*Chassis Status LEDs on a QFX3500 Device*
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	"Interface Alarm Messages" on page 6433
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	"Understanding Alarms" on page 6429

Table 613: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	• Overview of Single-Chassis System Logging Configuration on page 6069 • Junos OS System Log Configuration Statements on page 6127
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the **traceroute monitor** command to locate points of failure in a network.	• Monitoring System Process Information on page 307 • Monitoring System Properties on page 308 • **traceroute monitor**
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	*Junos OS Automation Library*
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	*Junos XML API Operational Developer Reference*
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as **show**, **set**, and **commit** to perform those operations.	*NETCONF XML Management Protocol Developer Guide*
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	• SNMP MIBs Support on page 6038 • SNMP Traps Support on page 6054 • *Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS*
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	*Advanced Insight Scripts (AI-Scripts) Release Notes*
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	*Service Automation*

Table 613: Troubleshooting Resources on the QFX Series *(continued)*

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	*Service Automation*
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	http://kb.juniper.net

Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

Table 612 on page 6413 provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 614: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	See “Chassis Alarm Messages on a QFX3500 Device” on page 6430.
	Fan tray LED is blinking amber.	See *Fan Tray LED on a QFX3500 Device*.
	Chassis status LED for the power is blinking amber.	See *Chassis Status LEDs on a QFX3500 Device*.
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. See *Chassis Status LEDs on a QFX3500 Device*.

Table 614: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	Check whether the port is a valid Gigabit Ethernet port (6 through 41). See *QFX3500 Device Overview*.
	Cannot configure a port as a Fibre Channel port.	Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47). See *QFX3500 Device Overview*.
	Cannot configure a port as a 10-Gigabit Ethernet port.	If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports. If the port is a 40-Gbps QSFP+ interface. make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See *QFX3500 Device Overview*.
	Cannot configure a 40-Gbps QSFP+ interface.	The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces. See *QFX3500 Device Overview*.
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them. NOTE: The management ports are on the front panel of the QFX3500 switch. They are labeled **C0** and **C1** on the front panel. In the CLI they are referred to as **me0** and **me1**. See "Configuring a QFX3500 Device as a Standalone Switch" on page 151.

Table 614: Troubleshooting on the QFX Series *(continued)*

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See "Recovering from a Failed Software Installation" on page 108.
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: • Loading a Previous Configuration File on page 1136 • Reverting to the Default Factory Configuration on page 163 • Reverting to the Rescue Configuration on page 165 • Performing a Recovery Installation on a QFX Series Device on page 103
	Root password is lost or forgotten.	Recover the root password. See "Recovering the Root Password" on page 1117.
Network interfaces	An aggregated Ethernet interface is down.	See "Troubleshooting an Aggregated Ethernet Interface" on page 1119.
	Interface on built-in network port is down.	See "Troubleshooting Network Interfaces" on page 1118.
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See "Troubleshooting Ethernet Switching" on page 1731.
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See "Troubleshooting Firewall Filter Configuration" on page 4699.

Alarms

Understanding Alarms

The QFX Series support different alarm types and severity levels. Table 615 on page 6430 provides a list of alarm terms and definitions that may help you in monitoring the device.

Table 615: Alarm Terms and Definitions

Term	Definition
Alarm	Signal alerting you to conditions that might prevent normal operation. On the device, alarm indicators might include the LCD panel and LEDs on the device. The LCD panel (if present on the device) displays the chassis alarm message count. Blinking amber LEDs indicate yellow alarm conditions for chassis components.
Alarm condition	Failure event that triggers an alarm.

Alarm severity levels	Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).
	• Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action.
	  ◦ One or more hardware components have failed.
	  ◦ One or more hardware components have exceeded temperature thresholds.
	  ◦ An alarm condition configured on an interface has triggered a critical warning.
	• Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance. For example, a missing rescue configuration generates a yellow system alarm.

Alarm types	Alarms include the following types: • Chassis alarm—Predefined alarm triggered by a physical condition on the device such as a power supply failure or excessive component temperature. • Interface alarm—Alarm you configure to alert you when an interface link is down. Applies to **ethernet**, **fibre-channel**, and **management-ethernet** interfaces. You can configure a red (major) or yellow (minor) alarm for the link-down condition, or have the condition ignored. • System alarm—Predefined alarm that might be triggered by a missing rescue configuration, failure to install a license for a licensed software feature, or high disk usage.

Related Documentation

- *Chassis Alarm Messages on a QFX3008-I Interconnect Device*
- Chassis Alarm Messages on a QFX3500 Device on page 6430
- Interface Alarm Messages on page 6433
- **show chassis alarms on page 466**
- **show system alarms on page 872**

Chassis Alarm Messages on a QFX3500 Device

Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.

The chassis alarm message count is displayed on the LCD panel on the front of the device. To view the chassis alarm message text remotely, use the **show chassis lcd** CLI command.

Chassis alarms on QFX3500 devices have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the conditions described in Table 616 on page 6431. A red alarm condition requires immediate action.

- Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

Table 616 on page 6431 describes the chassis alarm messages on QFX3500 devices.

Table 616: QFX3500 Chassis Alarm Messages

Component	Alarm Type	CLI Message	Recommended Action
Fans	Major (red)	**Fan/Blower Absent**	The fan is missing. Install a fan.
		Fan Failure	Replace the fan and report the failure to customer support.
		Fan I2C Failure	Check the system log for one of the following messages and report the error message to customer support: • **CM ENV Monitor: Get fan speed failed**. • **CM ENV Monitor: Get fan speed failed *Fan-number* is NOT spinning @ correct speed**, where ***fan-number*** may be 1, 2, or 3.
		fan-number **Not Spinning** Fan	Remove and check the fan for obstructions, and then reinsert the fan. If the problem persists, replace the fan.
Power Supplies	Major (red)	**PEM *pem-number* Airflow not matching Chassis Airflow**	The power supply airflow direction is the opposite of the chassis airflow direction. Replace the power supply with a power supply that supports the same airflow direction as the chassis.
		PEM *pem-number* I2C Failure	Check the system log for one of the following messages and report the error message to customer support: • **I2C Read failed for device *number***, where ***number*** may be from 123 to 125. • **PS *number*: Transitioning from online to offline**, where power supply (PS) ***number***may be 1 or 2.
		PEM *pem-number* is not supported	Indicates a power supply problem, or the power supply is not supported on the device. Report the problem to customer support.
		PEM *pem-number* Not OK	Indicates a problem with the incoming AC or outgoing DC power. Replace the power supply.

Table 616: QFX3500 Chassis Alarm Messages *(continued)*

Component	Alarm Type	CLI Message	Recommended Action
	Minor (yellow)	**PEM *pem-number* Absent**	For information only. Indicates the device was powered on with two power supplies installed, but now one is missing. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.
		PEM *pem-number* is not powered	For information only. Check the power cord connection and reconnect it if necessary.
		PEM *pem-number* Power Supply Type Mismatch	For information only. Indicates that an AC power supply and DC power supply have been installed in the same chassis. If you wish to remove this alarm message, reboot the device with two AC power supplies or two DC power supplies.
		PEM *pem-number* Removed	For information only. Indicates the device was powered on with two power supplies installed, but one has been removed. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.
Temperature Sensors	Major (red)	***sensor-location* Temp Sensor Fail**	Check the system log for the following message and report it to customer support: **Temp sensor *sensor-number* failed**, where *sensor-number* may range from 1 through 10.
		***sensor-location* Temp Sensor Too Hot**	Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor. If the condition persists, the device may shut down.
	Minor (yellow)	***sensor-location* Temp Sensor Too Warm**	For information only. Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor.

Related Documentation

- *Front Panel of a QFX3500 Device*

- Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types on page 138
- alarm on page 2043

Interface Alarm Messages

Interface alarms are alarms that you configure to alert you when an interface is down.

To configure an interface link-down condition to trigger a red or yellow alarm, or to configure the link-down condition to be ignored, use the alarm statement at the [**edit chassis**] hierarchy level. You can specify the **ethernet**, **fibre-channel**, or **management-ethernet** interface type.

NOTE: Fibre Channel alarms are only valid on QFX3500 devices.

By default, major alarms are configured for interface link-down conditions on the control plane and management network interfaces in a QFabric system. The link-down alarms indicate that connectivity to the control plane network is down. You can configure these alarms to be ignored using the alarm statement at the [**edit chassis**] hierarchy level.

NOTE: If you configure a yellow alarm on the QFX3008-I Interconnect device, it will be handled as a red alarm.

Related Documentation

- Understanding Alarms on page 6429

System Utilization Alarms

QFX Series devices provide system alarms that alert you when disk usage in the **/var** partition exceeds acceptable levels.

You can display the messages for these alarms by issuing the **show system alarms** operational mode command if the **/var** partition usage exceeds 75 percent. A usage level between 76 and 90 percent indicates high usage and raises a minor alarm condition, whereas a usage level above 90 percent indicates that the partition is full and raises a major alarm condition.

The following sample output from the **show system alarms** command shows system alarm messages that are displayed when disk usage is exceeded on the switch.

```
user@host> show system alarms
4 alarms currently active
Alarm time               Class  Description
2013-10-08 20:08:20 UTC  Minor  RE 0 /var partition usage is high
2013-10-08 20:08:20 UTC  Major  RE 0 /var partition is full
2013-10-08 20:08:08 UTC  Minor  FPC 1 /var partition usage is high
2013-10-08 20:08:08 UTC  Major  FPC 1 /var partition is full
```

BEST PRACTICE: We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch and prevent generating system alarms.

Automation

QFX5100 Switch with Automation Enhancements Frequently Asked Questions

This FAQ addresses questions regarding using QFX5100 switches with automation enhancements, which were introduced at Junos OS Release 13.2X51-D15 .

This FAQ covers the following questions:

Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries?

Contact Customer Support at http://www.juniper.net/support.

Who Should You Contact If You Have Problems with Puppet for Junos OS?

You can obtain support for Puppet for Junos OS through the J-Net Forum for Puppet at http://forums.juniper.net/t5/Puppet-for-Junos-OS/bd-p/puppet_junos .

Who Should You Contact If You Have Problems with Chef for Junos OS?

You can obtain support for Chef for Junos OS through the J-Net Forum for Chef at http://forums.juniper.net/t5/Chef-for-Junos-OS/bd-p/chef_junos.

What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle?

In this case, the user partition remains intact.

NOTE: If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

How Do You Recover Junos OS Binaries That You Have Deleted?

You must reinstall the software package.

How Do You Recover from a System Crash?

You must reinstall the software package.

How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?

You cannot use the **show version** command to verify that a QFX5100 switch is running the jinstall-qfx-5-flex-x.tgz software bundle. However, there are two other ways to verify this.

- Use the **show configuration** command to check that you are running a Layer 3 configuration. See *Installing Junos OS Software with QFX5100 Switch Automation Enhancements*.
- Go to the shell and confirm that you can invoke Python. See "Invoking the Python Interpreter" on page 6104.

CHAPTER 71

Administration

Routine Monitoring Using the CLI

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

user@switch> show snmp health-monitor

```
Alarm
Index  Variable description                          Value State

 32768 Health Monitor: root file system utilization
       jnxHrStoragePercentUsed.1                        58 active

 32769 Health Monitor: /config file system utilization
       jnxHrStoragePercentUsed.2                         0 active
```

```
32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                            0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0                        35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                                        0 active
      Chassis daemon                                    50 active
      Firewall daemon                                    0 active
      Interface daemon                                   5 active
      SNMP daemon                                       11 active
      MIB2 daemon                                       42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

user@switch> show snmp mib walk system

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx

Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

user@switch> show snmp statistics

```
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 0, Total set varbinds: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
    Throttle drops: 0, Duplicate request drops: 0
    Output:
    Packets: 0, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0
```

Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named ***filename*** reaches its maximum size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

These statements are described in the following sections:

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed ***filename*.0**, then ***filename*.1**, and so on, until there are three trace files. Then the oldest trace file (***filename*.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (***filename***) reaches 2 MB, ***filename*** is renamed ***filename*.0**, and a new file called ***filename*** is created. When the new ***filename*** reaches 2 MB, ***filename*.0** is renamed ***filename*.1** and ***filename*** is renamed ***filename*.0**. This process repeats until there are 20 trace files. Then the oldest file (***filename*.19**) is overwritten by the newest file (***filename*.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
```

```
    configuration;
    database;
    events;
    general;
    interface-stats;
    nonvolatile-sets;
    pdu;
    policy;
    protocol-timeouts;
    routing-socket;
    server;
    subagent;
    timer;
    varbind-error;
  }
```

Table 590 on page 6329 describes the meaning of the SNMP tracing flags.

Table 617: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the **[edit snmp]** hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off

Table 617: SNMP Tracing Flags *(continued)*

Flag	Description	Default Setting
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log *agent*d | last** operational mode command:

[edit]
user@host# **run show log *agent*d | last**

where ***agent*** is the name of an SNMP agent.

Monitoring RMON MIB Tables

Purpose Monitor remote monitoring (RMON) alarm, event, and log tables.

Action To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                            Value State

     5 monitor
       jnxOperatingCPU.9.1.0.0                             5 falling threshold

Event
Index  Type                        Last Event
    1  log and trap                2010-07-10 11:34:17 PDT
Event Index: 1
    Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
    Time: 2010-07-10 11:34:07 PDT
    Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
    Time: 2010-07-10 11:34:17 PDT
```

Meaning The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

Related Documentation

- clear snmp history on page 6374

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

user@switch> **show log** *log-filename*
user@switch> **file show** *log-file-pathname*

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30  switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
 10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30  switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
 AS 100): Can't assign requested address
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start

Monitoring System Log Messages

Purpose Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

Action To view system log messages:

user@switch1> **show log messages**

Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
 for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
 configuration mode
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
 'show log messages
```

Meaning The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6445
2. Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6446

Displaying Real-Time Statistics About All Interfaces on the Router or Switch

Purpose Display real-time statistics about traffic passing through all interfaces on the router or switch.

Action To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

Sample Output

```
user@host> monitor interface traffic
host name                    Seconds: 15               Time: 12:31:09
Interface     Link  Input packets       (pps)     Output packets       (pps)
 so-1/0/0     Down              0         (0)                  0         (0)
 so-1/1/0     Down              0         (0)                  0         (0)
 so-1/1/1     Down              0         (0)                  0         (0)
 so-1/1/2     Down              0         (0)                  0         (0)
 so-1/1/3     Down              0         (0)                  0         (0)
 t3-1/2/0     Down              0         (0)                  0         (0)
 t3-1/2/1     Down              0         (0)                  0         (0)
 t3-1/2/2     Down              0         (0)                  0         (0)
 t3-1/2/3     Down              0         (0)                  0         (0)
 so-2/0/0       Up         211035         (1)              36778         (0)
 so-2/0/1       Up         192753         (1)              36782         (0)
 so-2/0/2       Up         211020         (1)              36779         (0)
 so-2/0/3       Up         211029         (1)              36776         (0)
 so-2/1/0       Up         189378         (1)              36349         (0)
 so-2/1/1     Down              0         (0)              18747         (0)
 so-2/1/2     Down              0         (0)              16078         (0)
 so-2/1/3       Up              0         (0)              80338         (0)
 at-2/3/0       Up              0         (0)                  0         (0)
```

```
 at-2/3/1     Down              0          (0)                  0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

Meaning The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

Displaying Real-Time Statistics About an Interface on the Router or Switch

Purpose Display real-time statistics about traffic passing through an interface on the router or switch.

Action To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

user@host> **monitor interface** *interface-name*

Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up

```

```
  REI-L                              0
  BIP-B3                             0
  REI-P                              0
Received SONET overhead:   F1         : 0x00   J0         : 0xZ
```

Meaning The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in Table 589 on page 6322.

Table 618: Output Control Keys for the monitor interface Command

Action	Key
Display information about the next interface. The **monitor interface** command scrolls through the physical or logical interfaces in the same order that they are displayed by the **show interfaces terse** command.	N
Display information about a different interface. The command prompts you for the name of a specific interface.	I
Freeze the display, halting the display of updated statistics.	F
Thaw the display, resuming the display of updated statistics.	T
Clear (zero) the current delta counters since **monitor interface** was started. It does not clear the accumulative counter.	C
Stop the **monitor interface** command.	Q

See the CLI Explorer for details on using match conditions with the **monitor traffic** command.

Pinging Hosts

Purpose Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

Action To use the **ping** command to send four requests (ping count) to host3:

ping ***host*** **count** ***number***

Sample Output

ping host3 count 4

```
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
```

```
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

Meaning

- The **ping** results show the following information:
  - Size of the ping response packet (in bytes).
  - IP address of the host from which the response was sent.
  - Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
  - Time-to-live (ttl) hop-count value of the ping response packet.
  - Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
  - Number of ping requests (probes) sent to the host.
  - Number of ping responses received from the host.
  - Packet loss percentage.
  - Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

CHAPTER 72

Troubleshooting

Configuration and File Management

Loading a Previous Configuration File

You can use the **rollback** <*number* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <*number*>

Options

- **none**— Return to the most recently saved configuration.
- *number*—Configuration to return to.

- **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
- **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

   ```
   [edit]
   user@switch# rollback 1
   load complete
   ```

2. Activate the configuration you have loaded:

   ```
   [edit]
   user@switch# commit
   ```

Related Documentation

- Configuration File Terms on page 26

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. ```
   [edit]
   user@switch# load factory-default
   [edit]
   user@switch# delete system commit factory-settings
   [edit]
   user@switch# commit
   ```

Related Documentation

- Reverting to the Rescue Configuration on page 165

   ```

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

   [edit]
   user@switch# **load override** *filename*

2. Commit your changes.

   [edit]
   user@switch# **commit** *filename*

## Cleaning Up the System File Storage Space

**Problem** The system file storage space on the switch is full. Rebooting the switch does not solve the problem.

The following error message is displayed during a typical operation on the switch after the file storage space is full.

user@switch% **cli**
user@switch> **configure**
**/var: write failed, filesystem is full**

**Solution** Clean up the file storage on the switch by deleting system files.

1. Request to delete system files on the switch.

   user@switch> **request system storage cleanup**

   The list of files to be deleted is displayed.

```
List of files to delete:

         Size Date   Name
   11B Jul 26 20:55 /var/jail/tmp/alarmd.ts
  124B Aug 4 18:05 /var/log/default-log-messages.0.gz
 1301B Jul 26 20:42 /var/log/install.0.gz
  387B Jun 3 14:37 /var/log/install.1.gz
 4920B Aug 4 18:05 /var/log/messages.0.gz
 20.0K Jul 26 21:00 /var/log/messages.1.gz
 16.3K Jun 25 13:45 /var/log/messages.2.gz
  804B Aug 4 18:05 /var/log/security.0.gz
 16.8K Aug 3 11:15 /var/log/security.1.gz
```

```
      487B Aug  4 18:04 /var/log/wtmp.0.gz
      855B Jul 29 22:54 /var/log/wtmp.1.gz
      920B Jun 30 16:32 /var/log/wtmp.2.gz
       94B Jun  3 14:36 /var/log/wtmp.3.gz
   353.2K Jun  3 14:37 /var/sw/pkg/jloader-qfx-11.2I20110303_1117_dc-builder.tgz

   124.0K Jun  3 14:30 /var/tmp/gres-tp/env.dat
       0B Apr 14 16:20 /var/tmp/gres-tp/lock
       0B Apr 14 17:37 /var/tmp/if-rtsdb/env.lck
    12.0K Jul 26 20:55 /var/tmp/if-rtsdb/env.mem
  2688.0K Jul 26 20:55 /var/tmp/if-rtsdb/shm_usr1.mem
   132.0K Jul 26 20:55 /var/tmp/if-rtsdb/shm_usr2.mem
  2048.0K Jul 26 20:55 /var/tmp/if-rtsdb/trace.mem
     155B Jul 26 20:55 /var/tmp/krt_gencfg_filter.txt
       0B Jul 26 20:55 /var/tmp/rtsdb/if-rtsdb
  1400.6K Aug  3 10:13 /var/tmp/sfid.core.0.gz
  1398.9K Aug  3 17:01 /var/tmp/sfid.core.1.gz
  Delete these files ? [yes,no] (no)
```

2. Enter **yes** to delete the files.

3. Reboot the switch.

BEST PRACTICE: We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch.

Ethernet Switching

Troubleshooting Ethernet Switching

Problem Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

Solution Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

Troubleshooting Layer 2 Protocol Tunneling

Drop Threshold Statistics Might Be Incorrect

Problem L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets will not be reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit are not reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

Solution This is expected behavior.

Egress Filtering of L2PT Traffic Not Supported

Problem Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

Solution This is expected behavior.

- *Configuring Layer 2 Protocol Tunneling*

Troubleshooting Private VLANs

Use the following information to troubleshoot a private VLAN configuration.

Limitations of Private VLANs

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

Forwarding with Private VLANs

Problem

- When isolated VLAN or community VLAN tagged traffic is received on a PVLAN trunk port, MAC addresses are learned from the primary VLAN. This means that output from the **show ethernet-switching table** command shows that MAC addresses are learned from the primary VLAN and replicated to secondary VLANs. This behavior has no effect on forwarding decisions.
- If a packet with a secondary VLAN tag is received on a promiscuous port, it is accepted and forwarded.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
  - The packet has a community VLAN tag.
  - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on an isolated VLAN.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
  - The packet has an isolated VLAN tag.

- The packet is destined to a unicast MAC address or multicast group MAC address that was learned on a community VLAN.

- If a packet with a primary VLAN tag is received by a secondary (isolated or community) VLAN port, the secondary port forwards the packet.
- If you configure a community VLAN on one device and configure another community VLAN on a second device and both community VLANs use the same VLAN ID, traffic for one of the VLANs can be forwarded to the other VLAN. For example, assume the following configuration:
  - Community VLAN comm1 on switch 1 has VLAN ID 50 and is a member of primary VLAN pvlan100.
  - Community VLAN comm2 on switch 2 also has VLAN ID 50 and is a member of primary VLAN pvlan200.
  - Primary VLAN pvlan100 exists on both switches.

  If traffic for comm1 is sent from switch 1 to switch 2, it will be sent to the ports participating in comm2. (The traffic will also be forwarded to the ports in comm1, as you would expect.)

Solution These are expected behaviors.

Egress Firewall Filters with Private VLANs

Problem If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

Solution These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

Egress Port Mirroring with Private VLANs

Problem If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

Solution This is expected behavior.

Troubleshooting Q-in-Q and VLAN Translation Configuration

Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

Problem If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

Solution This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statemen at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same Ethertype.

Egress Port Mirroring with VLAN Translation

Problem If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

Solution This is expected behavior.

Related Documentation

- *Example: Setting Up Q-in-Q Tunneling*

High Availability

Troubleshooting VRRP

Problem If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

Solution Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

Related Documentation

- failover-delay on page 1783

Interfaces

Troubleshooting an Aggregated Ethernet Interface

Problem The **show interfaces terse** command shows that the LAG is down.

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

Related Documentation

- Verifying the Status of a LAG Interface on page 2148
- Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 1896

Troubleshooting Network Interfaces

The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

Problem The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

When you check the status with the CLI command **show interfaces *interface-name*** , the disabled port is not listed.

Cause By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

Solution Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

Troubleshooting Multichassis Link Aggregation

Use the following information to troubleshoot multichassis link aggregation configuration.

MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

Problem When both of the mulitchassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table.

For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
  VLAN              MAC address       Type         Age Interfaces
  v10                *                 Flood          - All-members
  v10                00:10:94:00:00:01 Learn(L)     3:55 ae0.0 (MCAE)
  v10                00:10:94:00:00:02 Learn(R)        0 xe-0/0/9.0
  v20                *                 Flood          - All-members
  v30                *                 Flood          - All-members
  v30                84:18:88:de:b1:2e Static         - Router
```

```
user@switchB> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
  VLAN              MAC address       Type         Age Interfaces
  v10                *                 Flood          - All-members
  v10                00:10:94:00:00:01 Learn(R)        0 ae0.0 (MCAE)
  v10                00:10:94:00:00:02 Learn         40 xe-0/0/10.0
  v20                *                 Flood          - All-members
  v30                *                 Flood          - All-members
  v30                84:18:88:df:83:0a Static         - Router
```

Solution This is expected behavior.

MC-LAG Peer Does Not Go into Standby Mode

Problem A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

Solution To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

Problem When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

Solution This is expected behavior.

Redirect Filters Take Priority over User-Defined Filters

Problem Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

Solution This is expected behavior.

Operational Command Output Is Wrong

Problem After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
  Redundancy Group IDs Joined: None

Client Application: lacpd
  Redundancy Group IDs Joined: 1

Client Application: eswd
  Redundancy Group IDs Joined: 1
```

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

Solution This is expected behavior.

ICCP Connection Might Take Up to 60 Seconds to Become Active

Problem When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

Solution This is expected behavior.

MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

Problem When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
  VLAN              MAC address       Type         Age Interfaces
  v100              *                 Flood          - All-members
  v100              00:10:00:00:00:01 Learn(L)     0 ae0.0 (MCAE)
  v100              00:10:00:00:00:02 Learn(L)     0 ae0.0 (MCAE)
```

Solution This is expected behavior.

MAC Address Is Not Learned Remotely in a Default VLAN

Problem If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

Solution This is expected behavior.

Snooping Entries Learned on MC-AE Interfaces Are Not Removed

Problem When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down. This is done to speed up convergence time when the interfaces come up, or come up and go down.

Solution This is expected behavior.

ICCP Does Not Come Up After You Add or Delete an Authentication Key

Problem The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

Solution Delete the ICCP configuration , and then add the ICCP configuration.

Local Status Is Standby When It Should Be Active

Problem If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

Solution This is expected behavior.

Packets Loop on the Server When ICCP Fails

Problem When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

Solution This is expected behavior.

Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

Problem After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

Solution This is expected behavior.

No Commit Checks Are Done for ICL-PL Interfaces

Problem There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

Solution This is expected behavior.

Double Failover Scenario

Problem If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

Solution This is expected behavior.

Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

Problem When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag Ip4McastFloodMode for the VLAN is changed to MCAST_FLOOD_ALL. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

Solution This is expected behavior.

Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

Problem When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

Solution This is expected behavior.

AE Interfaces Go Down

Problem When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

Solution Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

Flooding of Upstream Traffic

Problem When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

Solution Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

Junos OS Basics

Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
  <[Enter]>             Execute this command
  at                    Time at which to perform the operation
  in                    Number of minutes to delay before operation
  media                 Boot media for next boot
```

```
  message               Message to display to all users
  |                     Pipe through a command
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
  <[Enter]>             Execute this command
  at                    Time at which to perform the operation
  in                    Number of minutes to delay before operation
  media                 Boot media for next boot
  message               Message to display to all users
  |                     Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says "Hardware-based members will halt, Virtual Junos Routing Engines will reboot." If you want to halt only one member, use the **member** option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Recovering from a Failed Software Installation

Problem If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

   Hit [Enter] to boot immediately, or space bar for command prompt.

   Press the Spacebar to enter the manual loader. The **loader>** prompt appears.
3. Enter the following command:

   `loader>` **install [– –format] [– –external]** ***source***
   where:

   - **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
   - **external**—Installs the installation package onto external media (a USB stick, for example).
   - ***source***—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
     - Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
     - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**).

   The installation now proceeds normally and ends with a login prompt.

Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.

3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45–to–DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45–to–DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

   The terminal emulation screen on your management device displays the switch's boot sequence.
10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

    ```
    Hit [Enter] to boot immediately, or space bar for command prompt.
    Booting [kernel] in 9 seconds...
    ```
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

    ```
    ok boot -s
    ```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

    ```
    Enter full pathname of shell or 'recovery' for root password recovery or RETURN
    for /bin/sh: recovery
    ```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

    ```
    user@switch# set system root-authentication plain-text-password
    ```
15. At the following prompt, enter the new root password. For example:

    ```
    New password: juniper1
    Retype new password:
    ```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

    ```
    root@host# commit
    commit complete
    ```

18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from http://www.juniper.net/customers/support/ .

> NOTE: In the following procedure, we assume that you are creating the emergency boot device on a QFX device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the QFX device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

   ```
   user@device> start shell
   %
   ```
4. Switch to the root account using the **su** command:

   ```
   % su
   Password: password
   ```

   > NOTE: The password is the root password for the QFX device. If you logged in to the device as root, you do not need to perform this step.
5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

   ```
   root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
   ```

   The device writes the installation media image to the USB device:

   ```
   root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
   11006+1 records in
   ```

```
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 device:

   `root@device%` **dd if=/var/tmp/*filename* of=/dev/da0 bs=1048576**

   The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Performing a Recovery Installation on a QFX Series Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See "Creating an Emergency Boot Device for a QFX Series Device" on page 153 for information on how to create an emergency boot device.
2. Copy the existing configuration in the file **/config/juniper.conf.gz** from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named **/config/juniper.conf.*n***, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

   WARNING: **The recovery installation process completely overwrites the entire contents of the internal flash storage.**

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

   NOTE: **Do not power off the device if it is already on.**

   [edit system]
   user@device> **request system reboot**

   If you do not have access to the CLI, power cycle the QFX Series device.

   The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

   If you do no want to format the internal flash storage, type **y**.

   The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G

Processing format options
Fri September  4 01:18:44 UTC 2012

-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.

Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins

Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

   When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media .............. 2
Exit to installer debug shell ..................................... 3
Install Junos to alternate slice .................................. 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

   You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

   Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

   `user@switch>` **request system software configuration-backup** ***path***

NOTE: To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 6472
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 6474

(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the http://www.juniper.net/support .
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.

5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install media you want to download in the **QFabric System Install Media** section.

   A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.

    ftp ftp://*hostname/pathname install-media-qfabric-<version>*.img.tgz
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.

    binary
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

    get *install-media-qfabric-<version>*.img.tgz
14. Close the FTP session:

    bye
15. Untar the *install-media-qfabric-<version>* .img.tgz file on your UNIX workstation.

```
tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
```
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

    dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k

```
250880+0 records in
250880+0 records out
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
```
18. Perform the steps in "Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software" on page 6474 to continue with the recovery installation.

Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

NOTE: Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
   - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
   - If you do not have access to the default partition, power cycle the Director device.

   The following menu appears on the Director device console when the Director device boots up:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```
3. Type **install** and then press **Enter** to install the software on the Director device.

   Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

   ```
   Juniper Networks QFabric Director Install/Recovery Media
   -  To boot from the local disk, wait 10 seconds or press the Enter key.
   -  To reinstall the QFabric software on this Director device, type: install
   ```
4. Press **Enter**.

   The Director device reboots from the local disk on which the software was just installed.
5. Log in as root on the Director device.

   The following menu appears on the Director device console:

   ```
   Before you can access the QFabric system, you must complete the initial setup
    of the Director group by using the steps that follow.
   If the initial setup procedure does not complete successfully, log out of the
    Director device and then log back in to restart
    this setup menu.

   Continue?[y/n]
   ```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the **mount** directory.

   `root@dg0 ~]#` **ls /mnt**

8. Issue the **mkdir** command to create a directory within the mount directory.

   `root@dg0 ~]#` **mkdir /mnt/myusb**

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

   `root@dg0 ~]#` **mount /dev/sdb2 /mnt/myusb/**

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root       4096 Sep  7 05:16 .
drwxr-xr-x 3 root root       4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root       4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

    The following menu appears:

```
Before you can access the QFabric system, you must complete the initial setup
 of the Director group by using the steps that follow.
If the initial setup procedure does not complete successfully, log out of the
 Director device and then log back in to restart
 this setup menu.

Continue?[y/n] y
Initial Configuration

You may enter the configuration manually or restore from a backup.

Specify a backup file? [y/n] : y
Please specify the full path of the configuration backup file. :
/mnt/myusb/mybackup-20110907
```

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

    `/mnt/myusb/mybackup-20110907`

    The following messages appear:

```

Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

    `user@switch>` **request system reboot node-group all**

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

    `user@switch>` **request system reboot fabric**

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

Layer 3 Protocols

Troubleshooting Virtual Routing Instances

Direct Routes Not Leaked Between Routing Instances

Problem Direct routes are not exported (leaked) between virtual routing instances For example, consider the following scenario:

- QFX switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the QFX switch connects to the upstream device over a direct route and these routes are not leaked between instances.

NOTE: You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the QFX switch over indirect routes.

Solution This is expected behavior.

Network Management

Troubleshooting a Deprecated Network Analytics Configuration

Problem After a software upgrade to Junos OS Release 13.2X51-D15 from an earlier release, the network analytics configuration is no longer valid and the feature is disabled.

The network analytics configuration used in Junos OS Release 13.2X51-D10 has been deprecated in Release 13.2X51-D15. Issuing the **show services analytics** command results in the following output:

```
root@qfx5100# show services analytics

queue-statistics { ## Warning: 'queue-statistics' is deprecated
    interval 1;
}
```

Cause Junos OS Release 13.2X51-D15 added enhancements to the network analytics feature, resulting in significant changes in the CLI. The updated **[edit services analytics]** hierarchy level contains some statements that have replaced those that were previously released. As a result, the earlier configuration does not work in the new release.

Solution Use the new CLI statements to reconfigure the network analytics feature.

Security

Troubleshooting Firewall Filter Configuration

Use the following information to troubleshoot your firewall filter configuration.

Firewall Filter Configuration Returns a No Space Available in TCAM Message

Problem When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

Solution When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

   ```
   [edit]
   user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
   user@switch# delete vlans employee-vlan description "filter to block rogue devices on
   employee-vlan"
   user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
   ```
2. Commit the changes:

   ```
   [edit]
   user@switch# commit
   ```
3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

   ```
   [edit]
   user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
   ```
4. Apply (bind) the new firewall filter to a port, VLAN , or Layer 3 interface. For example:

   ```
   [edit]
   user@switch# set vlans employee-vlan description "filter to block rogue devices on
   employee-vlan"
   user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
   ```
5. Commit the changes:

   ```
   [edit]
   ```

```
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

NOTE: **The original filter is not deleted and is still available in the configuration.**

Filter Counts Previously Dropped Packet

Problem If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:

- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
- You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

Solution This is expected behavior.

Matching Packets Not Counted

Problem If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet.

For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **admin**VLAN, and interface xe-0/0/1 is a member of that VLAN.
- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

Solution This is expected behavior.

Counter Reset When Editing Filter

Problem If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

Solution This is expected behavior.

Cannot Include loss-priority and policer Actions in Same Term

Problem You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: “cannot support policer action if loss-priority is configured.”

Solution This is expected behavior.

Cannot Egress Filter Certain Traffic Originating on QFX Switch

Problem On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

Solution This is expected behavior.

Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

Problem If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

Solution This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statemen at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same Ethertype.

Egress Firewall Filters with Private VLANs

Problem If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port

- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

Solution These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

Egress Filtering of L2PT Traffic Not Supported

Problem Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

Solution This is expected behavior.

Cannot Drop BGP Packets in Certain Circumstances

Problem BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

Solution This is expected behavior.

Invalid Statistics for Policer

Problem If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

Solution This is expected behavior.

Policers can Limit Egress Filters

Problem The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

Solution You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

Troubleshooting Policer Configuration

Incomplete Count of Packet Drops

Problem Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

Solution This is expected behavior.

Counter Reset When Editing Filter

Problem If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000

matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

Solution This is expected behavior.

Invalid Statistics for Policer

Problem If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

Solution This is expected behavior.

Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

Problem If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.

- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/2 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

Solution This is expected behavior.

Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

Problem You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

Solution To prevent this unexpected behavior, use the information about TCAM slices presented in "Planning the Number of Firewall Filters to Create" on page 4435 to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

Policers Can Limit Egress Filters

Problem The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.

- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

Solution You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

Troubleshooting Port Mirroring

Port Mirroring Constraints and Limitations

Local and Remote Port Mirroring

The following constraints and limitations apply to local and remote port mirroring with the QFX Series:

- You can create a total of four port-mirroring configurations on a QFX Series standalone switch.

- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

NOTE: **On QFabric systems, there is no system-wide limit on the total number of mirror sessions.**

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer *name* output** statement:
  - **interface**
  - **ip-address**
  - **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a QFX3500 device or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface.

- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

Remote Port Mirroring Only

The following constraints and limitations apply to remote port mirroring with the QFX Series:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch’s management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

Egress Port Mirroring with VLAN Translation

Problem If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

Solution This is expected behavior.

Egress Port Mirroring with Private VLANs

Problem If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

Solution This is expected behavior.

Storage

Troubleshooting Dropped FCoE Traffic

Problem Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

Cause There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.
5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

   NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

Solution The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

   If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

   If you explicitly configured a forwarding class for FCoE traffic, ensure that:

   - You specified the **no-loss** packet drop attribute in the forwarding class configuration
   - The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
   - The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

   For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

   ```
   Name: fcoe_p5_cnp, Index: 12183
   Type: Input
   Cable Length: 100 m
     Priority     PFC          MRU
     000          Disabled
     001          Disabled
     010          Disabled
     011          Disabled
     100          Disabled
     101          Enabled      2500
     110          Disabled
     111          Disabled
   Type: Output
     Priority     Flow-Control-Queues
     101
                  5
   ```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.

3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces *interface-name***.

4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the ***scheduler-name***) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

   Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the ***traffic-control-profile***) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.

7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “Example: Configuring CoS PFC for FCoE Traffic” on page 4921 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

Troubleshooting Fibre Channel Interface Deletion

Problem You deleted a Fibre Channel (FC) interface at the **[edit interfaces]** hierarchy level, but the commit check fails so the interface is not deleted.

Cause You must first delete the FC interface from the FC fabric on the QFX Series before you can delete the FC interface at the **[edit interfaces]** hierarchy level. You must perform both operations to delete a FC interface.

Solution First delete the interface from the FC fabric and then delete the interface from the QFX Series:

1. Delete the FC interface from the FC fabric to which it belongs:

   ```
   [edit]
   user@switch# delete fc-fabrics fabric-name interface interface-name
   ```

   For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

   ```
   [edit]
   user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
   ```
2. Delete the FC interface at the **[edit interfaces]** hierarchy level:

   ```
   [edit]
   user@switch: delete interfaces interface-name
   ```

   For example, to delete the interface **fc-0/0/3.0** from the switch:

   ```
   [edit]
   user@switch: delete interfaces fc-0/0/3.0
   ```

Troubleshooting Dropped FIP Traffic

Problem Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) traffic such as FIP VLAN discovery and notification frames is dropped on the QFX Series.

Cause The interface on which the FIP traffic is dropped does not have a native VLAN configured. FIP VLAN discovery and notification messages are exchanged as untagged packets on the native VLAN. (After the FCoE session with the Fibre Channel switch is established, FCoE traffic uses the FCoE VLAN.)

Solution Check to ensure that every 10-Gigabit Ethernet interface that connects to an FCoE device includes a native VLAN. Configure a native VLAN on all 10-Gigabit Ethernet interfaces that connect to FCoE devices.

NOTE: **Make sure that the native VLAN you are using on the QFX Series is the same native VLAN that the FCoE devices use for Ethernet traffic.**

The procedure for configuring a native VLAN on an interface is different on switches that use the original CLI than on switches that use the Enhanced Layer 2 Software (ELS) CLI. This topic provides the configuration procedure for each CLI.

Configuring a Native VLAN on Switches Using the Original CLI

To configure a native VLAN on an interface:

1. Set the interface port mode to **tagged-access** if you have not already done so:

   [edit]
   user@switch# **set interfaces *interface* unit *unit* family ethernet-switching port-mode tagged-access**

   For example, to set the port mode to **tagged-access** for interface **xe-0/0/6.0**:

   [edit]
   user@switch# **set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode tagged-access**

2. Configure the native VLAN if it does not already exist:

   [edit]
   user@switch# **set vlans *vlan-name* vlan-id *vlan-id***

   For example, to name the native VLAN **native** and use the VLAN ID **1**:

   [edit]
   user@switch# **set vlans native vlan-id 1**

3. Configure the native VLAN on the interface:

   [edit]
   user@switch# **set interfaces *interface* unit *unit* family ethernet-switching native-vlan-id *vlan-id***

   For example, to configure a native VLAN with the VLAN ID **1** on interface **xe-0/0/6.0**:

   [edit]
   user@switch# **set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1**

Configuring a Native VLAN on Switches Using the ELS CLI

To configure a native VLAN on an interface:

1. Set the interface mode to **trunk** if you have not already done so:

   [edit]
   user@switch# **set interfaces *interface* unit *unit* family ethernet-switching interface-mode trunk**

   For example, to set the interface mode to **trunk** for interface **xe-0/0/6.0**:

   [edit]
   user@switch# **set interfaces xe-0/0/6 unit 0 family ethernet-switching interface-mode trunk**

2. Configure the native VLAN if it does not already exist:

   [edit]
   user@switch# **set vlans *vlan-name* vlan-id *vlan-id***

   For example, to name the native VLAN **native** and use the VLAN ID **1**:

   [edit]
   user@switch# **set vlans native vlan-id 1**

3. Configure the native VLAN on the physical Ethernet interface:

```
[edit]
user@switch# set interfaces interface native-vlan-id vlan-id
```

For example, to configure a native VLAN with the VLAN ID **1** on interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 native-vlan-id 1
```

4. Configure the Ethernet interface as a member of the native VLAN:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching vlan members
vlan-name
```

For example, to configure an Ethernet interface as a member of a native VLAN with the VLAN ID **1** on interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members native
```

Traffic Management

Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

Problem The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

Solution When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

Related Documentation

- Example: Configuring Maximum Output Bandwidth on page 5526
- Example: Configuring Queue Schedulers on page 5511
- Understanding CoS Output Queue Schedulers on page 5371

Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

Problem The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

Cause When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

NOTE: **The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)**

Solution When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

- Understanding CoS Output Queue Schedulers on page 5371

Troubleshooting Egress Queue Bandwidth Impacted by Congestion

Problem Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

Cause Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

Solution The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

  `[edit class-of-service]`
  `user@switch#` **set drop-profile** ***drop-profile-name*** **interpolate fill-level** ***percentage*** **fill-level** ***percentage*** **drop-probability 0 drop-probability** ***percentage***

Related Documentation

Troubleshooting an Unexpected Rewrite Value

Problem Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

NOTE: **For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.**

Cause If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

Solution If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

TIP: **If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.**

NOTE: **There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.**

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

```
[edit class-of-service rewrite-rules]
```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point 011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp | ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1 custom-rw
```

Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

Problem In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

Cause Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

Solution If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

   ```
   [edit class-of-service]
   user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
   ```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

   ```
   [edit class-of-service]
   user@switch# set scheduler-maps scheduler-map-name forwarding-class
   forwarding-class-name scheduler scheduler-name
   ```

3. Associate the scheduler map with a traffic control profile:

   ```
   [edit class-of-service]
   user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
   scheduler-map-name
   ```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

   ```
   [edit class-of-service]
   user@switch# set interfaces interface-name forwarding-class-set fc-set-name
   output-traffic-control-profile traffic-control-profile-name
   ```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues. Table 553 on page 5971 shows the topology for this example:

Table 619: Components of the Rate Shaping Troubleshooting Example

Component	Settings
Affected interface	**shpnode:xe-0/0/10**
Scheduler (strict-high priority scheduler)	Name: **shp-sched** Shaping rate: **7g** Priority: **strict-high** NOTE: This example assumes that the scheduler already exists and has been configured as **strict-high** priority, but that rate shaping to prevent the strict-high priority traffic from using all of the port bandwidth has not been applied.
Scheduler map	Name: **shp-map** Forwarding class to associate with the **shp-sched** scheduler: **strict-high** NOTE: This example assumes that a strict-high priority forwarding class has been configured and assigned the name **strict-high**.
Traffic control profile	Name: **shp-tcp** NOTE: This example does not describe how to define a complete traffic control profile.

Table 619: Components of the Rate Shaping Troubleshooting Example *(continued)*

Component	Settings
Forwarding class set	Name: **shp-pg**

To configure the scheduler, map it to the strict-high priority forwarding class, and apply it to interface **shpnode:xe-0/0/10** using the CLI:

1. Specify the scheduler for the strict-high priority queue (**shp-sched**) with a maximum bandwidth of 7 Gbps:

```
[edit class-of-service schedulers]
user@switch# set shp-sched shaping-rate 7g
```

2. Configure a scheduler map (**shp-map**) that associates the scheduler (**shp-sched**) with the forwarding class (**strict-high**):

```
[edit class-of-service scheduler-maps]
user@switch# set shp-map forwarding-class strict-high scheduler shp-sched
```

3. Associate the scheduler map **shp-map** with a traffic control profile (**shp-tcp**):

```
[edit class-of-service traffic-control-profiles]
user@switch# set shp-tcp scheduler-map shp-map
```

4. Associate the traffic control profile **shp-tcp** with a forwarding class set (**shp-pg**) and the affected interface (**shpnode:xe-0/0/10**):

```
[edit class-of-service]
user@switch# set interfaces shpnode:xe-0/0/10 forwarding-class-set shp-pg
output-traffic-control-profile shp-tcp
```
