We recommend that you use the VLAN ID as the logical interface number when you configure the logical interface. QFX Series systems support a maximum of 4089 VLANs, which includes the default VLAN. You can, however, assign a VLAN ID in the range of 1 to 4094, but five of these VLAN IDs are reserved for internal use.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. Double-tagging, which is assigning more than one VLAN ID in the frame header, is not supported. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces.

Understanding Management Interfaces

You use management interfaces to access devices remotely. Typically, a management interface is not connected to the in-band network, but is connected to a device in the internal network. Through a management interface, you can access the device over the network using utilities such as **ssh** and **telnet** and configure it from anywhere, regardless of its physical location. As a security feature, users cannot log in as **root** through a management interface. To access the device as **root**, you must use the console port.

Management interface port ranges vary based on device type:

- QFX3500 devices:

The valid port range for a management interface (**me**) on a QFX3500 device is between 0 and 6, with a total of seven available ports. However, you can only configure **me0** and **me1** as management interfaces. The management interfaces are labeled **C0** and **C1**, and they correspond to **me0** and **me1**.

- QFX3600 devices:

There are two RJ-45 management interfaces (labeled **C0** and **C1**) and two SFP management interfaces (labeled **C0s** and **C1s**). On a QFX3600 standalone switch, the RJ-45 management interfaces and SFP management interfaces correspond to **me5** and **me6**. On a QFX3600 Node device, the RJ-45 management interfaces and SFP management interfaces correspond to **me0** and **me1**.

NOTE: On a QFX3600 device, you can use either the RJ-45 or the SFP management interfaces, but not both at the same time.

NOTE: Before you can use the management interfaces on either the QFX3500 device or QFX3600 device, you must configure the logical interfaces with valid IP addresses. Juniper Networks does not support configuring two management interfaces in the same subnet.

- QFabric system:

On a QFabric system, there are management interfaces on the Node devices, Interconnect devices, and Director devices. However, you cannot access the management interfaces on the Node devices or Interconnect devices directly. You can only manage and configure these devices using the Director device. You can connect to the management interface over the network using utilities such as SSH.

- On the QFX3500 standalone switch and QFX3500 Node device, the management interfaces are labeled **C0** and **C1**, and they correspond to **me0** and **me1**. You can use both management interfaces simultaneously.
- On the QFX3600 switch, there are two RJ-45 management interfaces (labeled **C0** and **C1**) and two SFP management interfaces (labeled **C0s** and **C1s**), resulting in four management interfaces. Each pair of management interfaces correspond to one

Ethernet interface—for example, both RJ-45 management interfaces (labeled **C0** and **C1**) can correspond to me0, and both SFP management interfaces (labeled **C0S** and **C1S**) can correspond to me1. By default, both RJ-45 management interfaces are active. If you insert an SFP interface into the SFP management port (**C0S**, for example), the SFP interface would become the active management interface, and the corresponding RJ-45 management interface (**C0**) is disabled.

- On QFX5100 switches, there is one RJ-45 management interface (labeled **C0** and one SFP management interface (labeled **C1**), and they correspond to em0 and em1. You can use both management interfaces simultaneously.

Understanding Multichassis Link Aggregation

NOTE: Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software.

Layer 2 networks are increasing in scale mainly because of technologies such as virtualization. Protocol and control mechanisms that limit the disastrous effects of a topology loop in the network are necessary. Spanning Tree Protocol (STP) is the primary solution to this problem because it provides a loop-free Layer 2 environment. STP has gone through a number of enhancements and extensions, and although it scales to very large network environments, it still only provides one active path from one device to another, regardless of how many actual connections might exist in the network. Although STP is a robust and scalable solution to redundancy in a Layer 2 network, the single logical link creates two problems: At least half of the available system bandwidth is off-limits to data traffic, and network topology changes occur. The Rapid Spanning Tree Protocol (RSTP) reduces the overhead of the rediscovery process and allows a Layer 2 network to reconverge faster, but the delay is still high.

Link aggregation (IEEE 802.3ad) solves some of these problems by enabling users to use more than one link connection between switches. All physical connections are considered one logical connection. The problem with standard link aggregation is that the connections are point to point.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two MC-LAG peers (QFX3500 and QFX3600 devices). An MC-LAG provides redundancy and load balancing between the two MC-LAG peers, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

On one end of an MC-LAG, there is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to have an MC-LAG configured. On the other side of the MC-LAG, there are two MC-LAG peers. Each of the MC-LAG peers has one or more physical links connected to a single client device.

The MC-LAG peers use Interchassis Control Protocol (ICCP) to exchange control information and coordinate with each other to ensure that data traffic is forwarded properly.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard. LACP is used to discover multiple links from a client device connected to an MC-LAG peer. LACP must be configured on all member links for an MC-LAG to work correctly.

NOTE: You must specify a service identifier (service-id) for each multichassis aggregated Ethernet interface that belongs to a link aggregation group (LAG), otherwise multichassis link aggregation will not work.

See [Table 159 on page 1855](#) for information about ICCP failure scenarios.

The following sections provide an overview of the terms and features associated with MC-LAG:

Active-Active Mode

In active-active mode, all member links are active on the MC-LAG. In this mode, MAC addresses learned on one MC-LAG peer are propagated to the other MC-LAG peer. Active-active mode is the only mode supported at this time.

ICCP and ICL-PL

ICCP replicates control traffic and forwarding states across the MC-LAG peers and communicates the operational state of the MC-LAG members. Because ICCP uses TCP/IP to communicate between the peers, the two peers must be connected to each other. ICCP messages exchange MC-LAG configuration parameters and ensure that both peers use the correct LACP parameters.

The interchassis link-protection link (ICL-PL) provides redundancy when a link failure (for example, an MC-LAG trunk failure) occurs on one of the active links. The ICL-PL can be either a 10-Gigabit Ethernet interface or an aggregated Ethernet interface. You can configure only one ICL-PL between the two peers, although you can configure multiple MC-LAGs between them.

Failure Handling

Configuring ICCP adjacency over aggregated links mitigates the possibility of a split-brain state. A split brain state occurs when the ICL-PL configured between the MC-LAG peers goes down. To work around this problem, enable backup liveness detection. With backup liveness enabled, the MC-LAG peers can communicate through the keepalive link.

During a split-brain state, the standby peer brings down local members in the MC-LAG links by changing the LACP system ID. When the ICCP connection is active, both of the MC-LAG peers use the configured LACP system ID. If the LACP system ID is changed during failures, the server that is connected over the MC-LAG removes these links from the aggregated Ethernet bundle.

When the ICL-PL is operationally down and the ICCP connection is active, the LACP state of the links with status control configured as standby is set to the standby state. When the LACP state of the links is changed to standby, the server that is connected over the MC-LAG makes these links inactive and does not use them for sending data.

Table 159 on page 1855 describes the different ICCP failure scenarios. The dash means that the item is not applicable.

Table 159: ICCP Failure Scenarios

| ICCP Connection Status | ICL-PL Status | Backup Liveness Peer Status | Action on Multichassis Aggregated Ethernet (MC-AE) Interface with Status Set to Standby |
|------------------------|---------------|-----------------------------|---|
| Down | Down or Up | Not configured | LACP system ID is changed to default value. |
| Down | Down or Up | Active | LACP system ID is changed to default value. |
| Down | Down or Up | Inactive | No change in LACP system ID. |
| Up | Down | – | LACP state is set to standby. MUX state moves to waiting state. |

Split-brain states bring down the MC-LAG link completely if the primary peer members are also down for other reasons. Recovery from the split-brain state occurs automatically when the ICCP adjacency comes up between the MC-LAG peers.

Multichassis Link Protection

Multichassis link protection provides link protection between the two MC-LAG peers hosting an MC-LAG. If the ICCP connection is up and the ICL-PL comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on each MC-LAG peer that is hosting an MC-LAG.

MC-LAG Packet Forwarding

To prevent the server from receiving multiple copies from both of the MC-LAG peers, a block mask is used to prevent forwarding of traffic received on the ICL-PL toward the MC-AE interface. Preventing forwarding of traffic received on the ICL-PL interface toward the MC-AE interface ensures that traffic received on MC-LAG links is not forwarded back to the same link on the other peer. The forwarding block mask for a given MC-LAG link is cleared if all of the local members of the MC-LAG link go down on the peer. To achieve faster convergence, if all local members of the MC-LAG link are down, outbound traffic on the MC-LAG is redirected to the ICL-PL interface on the data plane.

Layer 3 Routing

To provide Layer 3 routing functions to downstream clients, configure the same gateway address on both MC-LAG network peers. To upstream routers, the MC-LAG network peers could be viewed as either equal-cost multipath (ECMP) or two routes with different preference values.

Junos OS supports active-active MC-LAGs by using Virtual Router Redundancy Protocol (VRRP) over routed VLAN interfaces (RVIs). Junos OS also supports active-active MC-LAGs by using RVI MAC address synchronization. You must configure the RVI using the same IP address across MC-LAG peers.

Spanning Tree Protocol (STP) Guidelines

- Enable STP globally.

STP might detect local miswiring loops within the peer or across MC-LAG peers.

STP might not detect network loops introduced by MC-LAG peers.

- Disable STP on ICL-PL links; otherwise, it might block ICL-PL ports and disable protection.
- Disable STP on interfaces that are connected to aggregation switches.
- Do not enable bridge protocol data unit (BPDU) block on interfaces connected to aggregation switches.

For more information about BPDU block, see [“Understanding BPDU Protection for STP, RSTP, and MSTP” on page 1423](#).

MC-LAG Upgrade Guidelines

Upgrade the MC-LAG peers according to the following guidelines. See [“Upgrading Software on QFX3500, QFX3600, and QFX5100 Switches” on page 121](#) for exact details about how to perform a software upgrade.

NOTE: After a reboot, the MC-AE interfaces come up immediately and might start receiving packets from the server. If routing protocols are enabled, and the routing adjacencies have not been formed, packets might be dropped.

To prevent this scenario, issue the `set interfaces interface-name aggregated-ether-options mc-ae init-delay-time time` to set a time by which the routing adjacencies are formed.

1. Make sure that both of the MC-LAG peers (node1 and node2) are in the active-active state using the following command on any one of the MC-LAG peers:

```
user@switch> show interfaces mc-ae id 1
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active<<<<<<<
Local State           : up
Peer Status           : active<<<<<<<
Peer State            : up
  Logical Interface    : ae0.0
  Topology Type        : bridge
  Local State          : up
  Peer State           : up
  Peer Ip/MCP/State    : 20.1.1.2 ae2.0 up
```

2. Upgrade node1 of the MC-LAG.

When node1 is upgraded it is rebooted, and all traffic is sent across the available LAG interfaces of node2, which is still up. The amount of traffic lost depends on how quickly the neighbor devices detect the link loss and rehash the flows of the LAG.

3. Verify that node1 is running the software you just installed. Issue the `show version` command.
4. Make sure that both nodes of the MC-LAG (node1 and node2) are in the active-active state after the reboot of node1.
5. Upgrade node2 of the MC-LAG.

Repeat step 1 through step 3 to upgrade node2.

Layer 2 Unicast Features Supported

The following Layer 2 unicast features are supported:

- L2 unicast: learning and aging

- Learned MAC addresses are propagated across MC-LAG peers for all of the VLANs that are spawned across the peers.
- Aging of MAC addresses occurs when the MAC address is not seen on both of the peers.
- MAC learning is disabled on the ICL-PL automatically.
- MAC addresses learned on single-homed links are propagated across all of the VLANs that have MC-LAG links as members.

Layer 2 Multicast Features Supported

The following Layer 2 multicast features are supported:

- L2 multicast: unknown unicast and IGMP snooping
 - Flooding happens on all links across peers if both peers have virtual LAN membership. Only one of the peers forwards traffic on a given MC-LAG link.
 - Known and unknown multicast packets are forwarded across the peers by adding the ICL-PL port as a multicast router port.
 - IGMP membership learned on MC-LAG links is propagated across peers.
 - During an MC-LAG peer reboot, known multicast traffic is flooded until the IGMP snooping state is synced with the peer.

IGMP Snooping on an Active-Active MC-LAG

IGMP snooping controls multicast traffic in a switched network. When IGMP snooping is not enabled, the Layer 2 device broadcasts multicast traffic out of all of its ports, even if the hosts on the network do not want the multicast traffic. With IGMP snooping enabled, a Layer 2 device monitors the IGMP join and leave messages sent from each connected host to a multicast router. This enables the Layer 2 device to keep track of the multicast groups and associated member ports. The Layer 2 device uses this information to make intelligent decisions and to forward multicast traffic to only the intended destination hosts. IGMP uses Protocol Independent Multicast (PIM) to route the multicast traffic. PIM uses distribution trees to determine which traffic is forwarded.

In an active-active MC-LAG configuration, IGMP snooping replicates the Layer 2 multicast routes so that each MC-LAG peer has the same routes. If a device is connected to an MC-LAG peer by way of a single-homed interface, IGMP snooping replicates join message to its IGMP snooping peer. If a multicast source is connected to an MC-LAG by way of a Layer 3 device, the Layer 3 device passes this information to the RVI that is configured on the MC-LAG. The first hop DR is responsible for sending the register and register-stop messages for the multicast group. The last hop DR is responsible for sending PIM join and leave messages toward the rendezvous point and source for the multicast group. The routing device with the smallest preference metric forwards traffic on transit LANs.

Configure the ICL-PL interface as a router-facing interface. For the scenario in which traffic arrives by way of a Layer 3 interface, PIM and IGMP must be enabled on the RVI interface configured on the MC-LAG peers.

Layer 3 Unicast Features Supported

The following Layer 3 unicast features are supported:

- VRRP active-standby support enables Layer 3 routing over MC-AE interfaces.
- Routed VLAN interface (RVI) MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own RVI MAC address or its peer's RVI MAC address.
- Address Resolution Protocol (ARP) synchronization enables ARP resolution on both of the MC-LAG peers.
- DHCP Relay with option 82 enables option 82 on the MC-LAG peers. Option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client.

VRRP Active-Standby Support

VRRP in active-standby mode enables Layer 3 routing over the MC-AE interfaces on the MC-LAG peers. In this mode, the MC-LAG peers act as virtual routers. The virtual routers share the virtual IP address that corresponds to the default route configured on the host or server connected to the MC-LAG. This virtual IP address, known as a routed VLAN interface (RVI), maps to either of the VRRP MAC addresses or the logical interfaces of the MC-LAG peers. The host or server uses the VRRP MAC address to send any Layer 3 upstream packets. At any time, one of the VRRP routers is the master (active), and the other is a backup (standby). Both VRRP active and VRRP backup routers forward Layer 3 traffic arriving on the MC-AE interface. If the master router fails, all the traffic shifts to the MC-AE link on the backup router.

NOTE: You must configure VRRP on both MC-LAG peers in order for both the active and standby members to accept and route packets. Additionally, configure the VRRP backup router to send and receive ARP requests.

Routing protocols run on the primary IP address of the RVI, and both of the MC-LAG peers run routing protocols independently. The routing protocols use the primary IP address of the RVI and the RVI MAC address to communicate with the MC-LAG peers. The RVI MAC address of each MC-LAG peer is replicated on the other MC-LAG peer and is installed as a MAC address that has been learned on the ICL-PL.

Routed VLAN Interface (RVI) MAC Address Synchronization

Routed VLAN interface (RVI) MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own RVI MAC address or its peer's RVI MAC address. Each MC-LAG peer installs its own RVI MAC address as well as the peer's RVI MAC address in the hardware. Each MC-LAG peer treats the packet as if it were its own packet. If RVI MAC address synchronization is not enabled, the RVI MAC address is installed on the MC-LAG peer as if it was learned on the ICL-PL.

NOTE: If you need routing capability, configure both VRRP and routing protocols on each MC-LAG peer.

Control packets destined for a particular MC-LAG peer that arrive on an MC-AE interface of its MC-LAG peer are not forwarded on the ICL-PL interface. Additionally, using the gateway IP address as a source address when you issue either a ping, traceroute, telnet, or FTP request is not supported.

To enable RVI MAC address synchronization, issue the **set vlan *vlan-name* l3_interface *rvi-name* mcae-mac-synchronize** on each MC-LAG peer. Configure the same IP address on both MC-LAG peers. This IP address is used as the default gateway for the MC-LAG servers or hosts.

Address Resolution Protocol (ARP)

Address Resolution Protocol (ARP) maps IP addresses to MAC addresses. Without synchronization, if one MC-LAG peer sends an ARP request, and the other MC-LAG peer receives the response, ARP resolution is not successful. With synchronization, the MC-LAG peers synchronize the ARP resolutions by sniffing the packet at the MC-LAG peer receiving the ARP response and replicating this to the other MC-LAG peer. This ensures that the entries in ARP tables on the MC-LAG peers are consistent.

When one of the MC-LAG peers restarts, the ARP destinations on its MC-LAG peer are synchronized. Because the ARP destinations are already resolved, its MC-LAG peer can forward Layer 3 packets out of the MC-AE interface.

DHCP Relay with Option 82

DHCP relay with option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client. With DHCP relay enabled, DHCP request packets might take the path to the DHCP server through either of the MC-LAG peers. Because the MC-LAG peers have different host names, chassis MAC addresses, and interface names, you need to observe these requirements when you configure DHCP relay with option 82:

- Use the interface description instead of the interface name.
- Do not use the hostname as part of the circuit ID or remote ID strings.
- Do not use the chassis MAC address as part of the remote ID string.
- Do not enable the vendor ID.
- If the ICL-PL interface receives DHCP request packets, the packets are dropped to avoid duplicate packets in the network.

A counter called *Due to received on ICL interface* has been added to the **show helper statistics** command, which tracks the packets that the ICL-PL interface drops.

An example of the CLI output follows:

```
user@switch> show helper statistics
BOOTP:
  Received packets: 6
```

```

Forwarded packets: 0
Dropped packets: 6
  Due to no interface in DHCP Relay database: 0
  Due to no matching routing instance: 0
  Due to an error during packet read: 0
  Due to an error during packet send: 0
  Due to invalid server address: 0
  Due to no valid local address: 0
  Due to no route to server/client: 0
  Due to received on ICL interface: 6

```

The output shows that six packets received on the ICL-PL interface have been dropped.

Private VLAN (PVLAN)

Private VLANs allow you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside of a VLAN. A PVLAN can span multiple peers on an MC-LAG.

When configuring a PVLAN, you must configure the ICL-PL interface as the PVLAN trunk interface for the PVLAN. This is essential for traffic to be switched to the required primary and secondary ports of the PVLAN across the MC-LAG peers.

Layer 3 Multicast

- [PIM Operation With Normal Mode DR Election on page 1861](#)
- [PIM Operation with Dual-DR Mode on page 1862](#)
- [Configuration Guidelines and Caveats on page 1862](#)

Protocol Independent Multicast (PIM) and Internet Group Management Protocol (IGMP) provide support for Layer 3 multicast. In addition to the standard mode of PIM operation, there is a special mode called PIM dual DR (designated router). PIM dual DR minimizes traffic loss in case of failures.

PIM Operation With Normal Mode DR Election

In normal mode DR election, the RVI interfaces on both of the MC-LAG peers are configured with PIM enabled. In this mode, one of the MC-LAG peers becomes the DR through the PIM DR election mechanism. The elected DR maintains the rendezvous-point tree (RPT) and shortest-path tree (SPT) so it can receive data from the source device. The elected DR participates in periodic PIM join and prune activities toward the rendezvous point (RP) or the source.

The trigger for initiating these join and prune activities is the IGMP membership reports that are received from interested receivers. IGMP reports received over MC-AE interfaces (potentially hashing on either of the MC-LAG peers) and single-homed links are synchronized to the MC-LAG peer through ICCP.

Both MC-LAG peers receive traffic on their incoming interface (IIF). The non-DR receives traffic by way of the ICL-PL interface, which acts as a multicast router (mrouter) interface.

If the DR fails, the non-DR has to build the entire forwarding tree (RPT and SPT), which can cause multicast traffic loss.

PIM Operation with Dual-DR Mode

In this mode, both of MC-LAG peers act as DRs (active and backup) and send periodic join and prune messages upstream towards the RP, or source, and eventually join the RPT or SPT.

The primary MC-LAG peer forwards the multicast traffic to the receiver devices even if the standby MC-LAG peer has a smaller preference metric.

The standby MC-LAG peer also joins the forwarding tree and receives the multicast data. The standby MC-LAG peer drops the data because it has an empty outgoing interface list (OIL). When the standby MC-LAG peer detects the primary MC-LAG peer failure, it adds the receiver VLAN to the OIL, and starts to forward the multicast traffic

To enable a multicast dual DR, issue the **set protocols pim interface interface-name dual-dr** command on the VLAN interfaces of each MC-LAG peer.

Configuration Guidelines and Caveats

- Configure the IP address on the active MC-LAG peer with a high IP address or a high DR priority. To ensure that the active MC-LAG peer retains the DR membership designation if PIM neighborship with the peer goes down.
- Using Bidirectional Forwarding Detection (BFD) and RVI MAC synchronization together is not supported because ARP fails.
- When using RVI MAC synchronization, make sure that you configure the primary IP address on both MC-LAG peers. Doing this ensures that both MC-LAG peers cannot become assert winners.
- The number of BFD sessions on RVIs with PIM enabled is restricted to 100. Also, If you have more than 100 RVIs configured, do not configure BFD, and make sure that the hello interval is 2 seconds.

Understanding Port Ranges and System Modes

QFX Series devices can support different port ranges depending on the device, media type of the interface, the software that is running on the device, and the system mode.

This topic describes:

- [Port Ranges for Different Media Types on page 1863](#)
- [Supported System Modes on page 1883](#)

Port Ranges for Different Media Types

The following media types support the following port ranges:

- The valid port range for a Fibre Channel (fc) interface is **0** through **5** and **42** through **47** on PIC **0**, with a total of 12 available Fibre Channel ports.

NOTE: Fibre Channel ports are not supported on QFX3500, QFX3600, and QFX5100 switches running Enhanced Layer 2 software.

- The valid port range for a Gigabit Ethernet (ge) interface is **6** through **41** on PIC **0** because the ports between **0** and **5** and **42** and **47** are reserved as Fibre Channel ports. The total number of available Gigabit Ethernet ports is 36, because 12 of the remaining 48 ports are reserved for Fibre Channel and 10-Gigabit Ethernet interfaces. Fibre Channel ports cannot be configured as Gigabit Ethernet ports.
- The valid port range for a 10-Gigabit Ethernet (xe) interface is **0** through **47** on PIC **0**. The valid port range for a 10-Gigabit Ethernet (xe) interface is **0** through **15** on PIC **1**. The total number of available 10-Gigabit Ethernet ports is 64.
- The valid port range for a 40-Gigabit Ethernet is **0** through **3** on PIC **2**. There are four available ports.

NOTE: This port range is available on a QFX3500 standalone switch only.

- On a QFX3500 device, see [Table 160 on page 1864](#) and [Table 161 on page 1868](#) for physical port to logical port mappings:
- On a QFX3600 Node device:
 - The valid port range for a 10-Gigabit Ethernet interface is **8** through **63** on PIC **0**. There are 56 available ports.
 - The valid port range for a 40-Gigabit Ethernet interface is **2** through **15** on PIC **1**. There are 14 available ports.
 - The valid port range for a 40-Gigabit data plane uplink interface is **0** through **7** on PIC **1**. There are eight available ports.

See for [Table 162 on page 1871](#) for physical port to logical port mappings.

- On a QFX3600 switch running Enhanced Layer 2 Software:
 - The valid port range for a 10-Gigabit Ethernet interface is **0** through **63** on PIC **0**. There are 64 available ports.
 - The valid port range for a 40-Gigabit Ethernet interface is **0** through **15** on PIC **0**. There are 16 available ports.

See for [Table 163 on page 1874](#) for physical port to logical port mappings.

- On a QFX5100-48S switch running Enhanced Layer 2 Software:
 - The valid port range for a 10-Gigabit Ethernet interface is **0** through **47** on PIC **0**. There are 48 available ports. When you channelize the 6 40-Gbps QSFP+ ports on **48** through **53** on PIC **0**, there are 72 available ports.
 - The valid port range for a 40-Gbps QSFP+ port is **48** through **53** on PIC **0**. There are six available ports.

See for [Table 165 on page 1879](#) for physical port to logical port mappings.

- For QFX5100-24Q and QFX5100-96S switches running Enhanced Layer 2 Software, see for physical port to logical port mappings for different system modes.

Table 160: Valid Port Ranges on QFX3500 Switches Running QFabric Software Package

| Port Number | Fibre Channel Interfaces
(On PIC 0) | Gigabit Ethernet Interfaces
(On PIC 0) | 10-Gigabit Ethernet Interfaces
(On PIC 0 and 1) | 40-Gigabit Ethernet Interfaces
(On PIC 2) |
|-------------|--|---|--|--|

Supported System Modes

NOTE: There are restrictions on the ports you can channelize on the QFX5100-24Q and QFX5100-96S switches depending on the system mode you configure. If you try to channelize ports that are restricted, the configuration is ignored.

The following system modes are available on the QFX5100-24Q switch:

- Default mode
- Mode-104-port
- Flexi-PIC mode
- Non-oversubscribed mode

See [Table 166 on page 1883](#) for more information regarding the supported system modes for your switch.

The following system modes are available on the QFX5100-96S switch:

- Default-mode
- Non-oversubscribed mode

See [Table 166 on page 1883](#) for more information regarding the supported system modes for your switch.

Table 166: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software

| | Default-mode | Mode-104port | Flexi-pic-mode | Non-oversubscribed-mode |
|-------------|--|--|---|---|
| QFX5100-48S | Not supported | Not supported | Not supported | Not supported |
| QFX5100-24Q | Supported

You do not need to configure the switch to be in this mode. On PIC 0, you can channelize all 24 40-Gbps QSFP+ ports. On PIC 1 and PIC 2, the 40-Gbps QSFP+ ports in the expansion modules are supported but cannot be channelized. In this mode, you can have one of two port combinations: 32 40-Gbps QSFP+ ports, or 96 10-Gigabit Ethernet ports plus 8 40-Gbps QSFP+ ports. | Supported

On PIC 0, all 24 40-Gbps QSFP+ ports are channelized by default, which provides 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in an expansion module on PIC 1 are supported. On PIC 1, ports 0 and 2 are channelized by default, and ports 1 and 3 are disabled. If 40-Gbps QSFP+ ports contained in an expansion module are detected on PIC 2, they are ignored. | Supported

On PIC 0, the first four ports (ports 0 through 3) cannot be channelized. 40-Gbps QSFP+ ports contained in expansion modules on PIC 1 and PIC 2 are supported but cannot be channelized. | Supported

All 24 40-Gbps QSFP+ ports on PIC 0 can be channelized to 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in the expansion modules on PIC 1 and PIC 2 are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode. |

Table 166: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software (continued)

| | Default-mode | Mode-104port | Flexi-pic-mode | Non-oversubscribed-mode |
|-------------|---|---------------|----------------|--|
| QFX5100-96S | Supported

You do not need to configure the switch to be in this mode. On PIC 0, all 96 10-Gigabit Ethernet ports are supported. You can only channelize the 40-Gbps QSFP+ interfaces to 10-Gigabit Ethernet interfaces on ports 96 and 100. When you channelize the interfaces on ports 96 and 100, ports 97, 98, 99, 101, 102 and 103 are disabled. | Not supported | Not supported | Supported

On PIC 0, all 96 10-Gigabit Ethernet ports are supported. However, the eight 40-Gbps QSFP+ ports are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode. |

Understanding Redundant Trunk Links

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk port on a switch goes down. In that case, traffic is routed to another trunk port, keeping network convergence time to a minimum.

To configure a redundant trunk link, create a redundant trunk group. The redundant trunk group is configured on the access switch and contains two links: a primary or active link, and a secondary link. If the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal spanning-tree protocol convergence.

Data traffic is forwarded only on the active link. Data traffic on the secondary link is dropped and shown as dropped packets when you issue the operational mode command **show interfaces *interface-name* extensive**.

While data traffic is blocked on the secondary link, Layer 2 control traffic is still permitted. For example, an LLDP session can be run between two switches on the secondary link.

Rapid Spanning Tree Protocol (RSTP) is enabled by default on the switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You must disable RSTP on an interface if a redundant trunk group is configured on that interface. For example, in [Figure 25 on page 1886](#), in addition to disabling RSTP on the Switch 3 interfaces, you must also disable RSTP on the Switch 1 and Switch 2 interfaces connected to Switch 3. Spanning-tree protocols can, however, continue operating on other interfaces on those switches—for example on the link between Switch 1 and Switch 2.

[Figure 25 on page 1886](#) shows three switches in a basic topology for redundant trunk links. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2). Link 1 and Link 2 are in a redundant trunk group called group1. Link 1 is designated as the primary link. Traffic flows between Switch 3 in the access layer and Switch 1 in the distribution layer through Link 1. While Link 1 is active, Link 2 blocks traffic.

Figure 25: Redundant Trunk Group, Link 1 Active

Figure 26 on page 1886 illustrates how the redundant trunk link topology works when the primary link goes down.

Figure 26: Redundant Trunk Group, Link 2 Active

When Link 1 between Switch 1 and Switch 3 goes down, Link 2 takes over as the active link. Traffic between the access layer and the distribution layer is then automatically switched to Link 2 between Switch 1 and Switch 2.

Understanding Generic Routing Encapsulation

Generic routing encapsulation (GRE) provides a private, secure path for transporting packets through an otherwise public network by encapsulating (or tunneling) the packets.

This topic describes:

- [Overview of GRE on page 1887](#)
- [GRE Tunneling on page 1887](#)
- [Configuration Limitations on page 1890](#)

Overview of GRE

GRE encapsulates data packets and redirects them to a device that de-encapsulates them and routes them to their final destination. This allows the source and destination switches to operate as if they have a virtual point-to-point connection with each other (because the outer header applied by GRE is transparent to the encapsulated payload packet). For example, GRE tunnels allow routing protocols such as RIP and OSPF to forward data packets from one switch to another switch across the Internet. In addition, GRE tunnels can encapsulate multicast data streams for transmission over the Internet.

GRE is described in RFC 2784 (obsoletes earlier RFCs 1701 and 1702). The switches support RFC 2784, but not completely. (For a list of limitations, see [“Configuration Limitations” on page 1890](#).)

As a *tunnel source router*, the switch encapsulates a payload packet for transport through the tunnel to a destination network. The payload packet is first encapsulated in a GRE packet, and then the GRE packet is encapsulated in a delivery protocol. The switch performing the role of a *tunnel remote router* extracts the tunneled packet and forwards the packet to its destination.

GRE Tunneling

Data is routed by the system to the GRE endpoint over routes established in the route table. (These routes can be statically configured or dynamically learned by routing protocols such as RIP or OSPF.) When a data packet is received by the GRE endpoint, it is de-encapsulated and routed again to its destination address.

GRE tunnels are *stateless*—that is, the endpoint of the tunnel contains no information about the state or availability of the remote tunnel endpoint. Therefore, the switch operating as a tunnel source router cannot change the state of the GRE tunnel interface to down if the remote endpoint is unreachable.

For details about GRE tunneling, see:

- [Encapsulation and De-Encapsulation on the Switch on page 1888](#)
- [Number of Source and Destination Tunnels Allowed on a Switch on page 1888](#)
- [Class of Service on GRE Tunnels on page 1888](#)
- [Firewall Filters and GRE Tunnels on page 1889](#)

Encapsulation and De-Encapsulation on the Switch

Encapsulation—A switch operating as a tunnel source router encapsulates and forwards GRE packets as follows:

1. When a switch receives a data packet (payload) to be tunneled, it sends the packet to the tunnel interface.
2. The tunnel interface encapsulates the data in a GRE packet and adds an outer IP header.
3. The IP packet is forwarded on the basis of the destination address in the outer IP header.

De-encapsulation—A switch operating as a tunnel remote router handles GRE packets as follows:

1. When the destination switch receives the IP packet from the tunnel interface, the outer IP header and GRE header are removed.
2. The packet is routed based on the inner IP header.

Number of Source and Destination Tunnels Allowed on a Switch

QFX5100 switches support as many as 512 GRE tunnels.

EX switches support as many as 500 GRE tunnels between switches transmitting IPv4 or IPv6 payload packets over GRE. If a passenger protocol in addition to IPv4 and IPv6 is used, you can configure up to 333 GRE tunnels between the switches.

An EX switch can have a maximum of 20 tunnel source IP addresses configured, and each tunnel source IP can be configured with up to 20 destination IP addresses on a second switch. As a result, the two connected switches can have a maximum of 400 GRE tunnels. If the first switch is also connected to a third switch, the possible maximum number of tunnels is 500.

Class of Service on GRE Tunnels

When a network experiences congestion and delay, some packets might be dropped. Junos OS class of service (CoS) divides traffic into classes to which you can apply different levels of throughput and packet loss when congestion occurs and thereby set rules for packet loss. For details about CoS, see [Junos OS CoS for EX Series Switches Overview](#).

The following CoS components are available on a switch operating as a GRE tunnel source router or GRE tunnel remote router:

- At the GRE tunnel source—On a switch operating as a tunnel source router, you can apply CoS classifiers on an *ingress port* or on a *GRE port*, with the following results on CoS component support on tunneled packets:
 - Schedulers only—Based on the CoS classification on the ingress port, you can apply CoS schedulers on a GRE port of the switch to define output queues and control the transmission of packets through the tunnel after GRE encapsulation. However, you cannot apply CoS rewrite rules to these packets.
 - Schedulers and rewrite rules—Depending on the CoS classification on the GRE port, you can apply both schedulers and rewrite rules to the encapsulated packets transmitted through the tunnel.
- At the GRE tunnel endpoint—When the switch is a tunnel remote router, you can apply CoS classifiers on the GRE port and schedulers and rewrite rules on the egress port to control the transmission of a de-encapsulated GRE packet out from the egress port.

Firewall Filters and GRE Tunnels

Firewall filters provide rules that define whether to permit, deny, or forward packets that are transiting an interface on a switch. (For details, see [Firewall Filters for EX Series Switches Overview](#).) Because of the encapsulation and de-encapsulation performed by GRE, you are constrained as to where you can apply a firewall filter to filter tunneled packets and which header will be affected. [Table 167 on page 1889](#) identifies these constraints.

Table 167: Firewall Filter Application Points for Tunneled Packets

| Endpoint Type | Ingress Interface | Egress Interface |
|---------------------------|--|------------------|
| Source (encapsulating) | inner header | outer header |
| Remote (de-encapsulating) | Cannot filter packets on ingress interface | inner header |

Configuration Limitations

Table 168 on page 1890 lists features that are not supported with GRE.

Table 168: Features Not Supported with GRE

| EX Switches | QFX Switches |
|---|---|
| MPLS over GRE tunnels | MPLS over GRE tunnels |
| GRE keepalives | GRE keepalives |
| GRE keys, payload packet fragmentation, and sequence numbers for fragmented packets | GRE keys, payload packet fragmentation, and sequence numbers for fragmented packets |
| BGP dynamic tunnels | BGP dynamic tunnels |
| Outer IP address must be IPv4 | Outer IP address must be IPv4 |
| Virtual routing instances | |
| Bidirectional Forwarding Detection (BFD) protocol over GRE distributed mode | |
| <p>OSPF limitation—Enabling OSPF on a GRE interface creates two equal-cost routes to the destination: one through the Ethernet network or uplink interface and the other through the tunnel interface. If data is routed through the tunnel interface, the tunnel might fail. To keep the interface operational, we recommend that you use a static route, disable OSPF on the tunnel interface, or configure the peer not to advertise the tunnel destination over the tunnel interface.</p> | |

Example: Configuring Interfaces for Uplink Failure Detection

Uplink failure detection allows a switch to detect link failure on uplink interfaces and to propagate the failure information to the downlink interfaces. All of the network interface cards (NICs) on a server are configured as being either the primary link or the secondary link and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link to ensure that the traffic on the failed link is not dropped.

This example describes:

- [Requirements on page 1892](#)
- [Overview and Topology on page 1892](#)
- [Configuring Uplink Failure Detection on Both Switches on page 1893](#)
- [Verification on page 1894](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 12.1 or later for the QFX Series
- Two QFX3500 switches
- Two aggregation switches
- One dual-homed server

Overview and Topology

The topology in this example illustrates how to configure uplink failure detection on Switch A and Switch B. Switch A and Switch B are both configured with a link-to-monitor interface (the uplink interface to the aggregation switch) and a link-to-disable interface (the downlink interface to the server). For simplicity, only one group of link-to-monitor interfaces and link-to-disable interfaces is configured for each switch. The server is dual-homed to both Switch A and Switch B. In this scenario, if the link-to-monitor interface to Switch A is disabled, the server uses the link-to-monitor interface to Switch B instead.

NOTE: This example does not describe how to configure the dual-homed server or the aggregation switches. Please refer to the documentation for each of these devices for more information.

[Figure 24 on page 1842](#) illustrates a typical setup for uplink failure detection.

Figure 27: Uplink Failure Detection Configuration on Switches

Table 169 on page 1893 lists uplink failure settings for each QFX3500 switch.

Table 169: Settings for Uplink Failure Protection Example

| Switch A | Switch B |
|--|--|
| <ul style="list-style-type: none"> Group name: Group1 Link-to-monitor interface: xe-0/0/0 Link-to-disable interface: xe-0/0/1 | <ul style="list-style-type: none"> Group name: Group2 Link-to-monitor interface: xe-0/0/0 Link-to-disable interface: xe-0/0/1 |

Configuring Uplink Failure Detection on Both Switches

To configure uplink failure detection on both switches, perform these tasks:

CLI Quick Configuration

To quickly configure uplink failure protection on Switch A and Switch B, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set uplink-failure-detection group group1
set uplink-failure-detection group group2
set uplink-failure-detection group group1 link-to-monitor xe-0/0/0
set uplink-failure-detection group group2 link-to-monitor xe-0/0/0
set uplink-failure-detection group group1 link-to-disable xe-0/0/1
set uplink-failure-detection group group2 link-to-disable xe-0/0/1
```

Step-by-Step Procedure

To configure uplink failure protection on both switches:

- Specify a name for the uplink failure detection group on Switch A:

```
[edit protocols]
user@switch# set uplink-failure-detection group group1
```
- Add an uplink interface to the group on Switch A:

```
[edit protocols]
user@switch# set uplink-failure-detection group group1 link-to-monitor xe-0/0/0
```

3. Add a downlink interface to the group on Switch A:

```
[edit protocols]
user@switch# set uplink-failure-detection group group1 link-to-disable xe-0/0/1
```
4. Specify a name for the uplink failure detection group on Switch B:

```
[edit protocols]
user@switch# set uplink-failure-detection group group2
```
5. Add an uplink interface to the group on Switch B:

```
[edit protocols]
user@switch# set uplink-failure-detection group group2 link-to-monitor xe-0/0/0
```
6. Add a downlink interface to the group on Switch B:

```
[edit protocols]
user@switch# set uplink-failure-detection group group2 link-to-disable xe-0/0/1
```

Results Display the results of the configuration:

```
uplink-failure-detection {
  group {
    group1 {
      link-to-monitor {
        xe-0/0/0;
      }
      link-to-disable {
        xe-0/0/1;
      }
    }
    group2 {
      link-to-monitor {
        xe-0/0/0;
      }
      link-to-disable {
        xe-0/0/1;
      }
    }
  }
}
```

Verification

To verify that uplink failure detection is working correctly, perform the following tasks on Switch A and Switch B:

- [Verifying That Uplink Failure Detection is Working Correctly on page 1894](#)

Verifying That Uplink Failure Detection is Working Correctly

Purpose Verify that the switch disables the downlink interface when it detects an uplink failure.

- Action** 1. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection
Group                : group1
Uplink               : xe-0/0/0*
Downlink             : xe-0/0/1*
Failure Action       : Inactive
```

NOTE: The asterisk (*) indicates that the link is up.

2. Disable the uplink interface:

```
[edit]
user@switch# set interface xe-0/0/0 disable
```

3. Save the configuration on the switch.

4. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection
Group                : group1
Uplink               : xe-0/0/0
Downlink             : xe-0/0/1
Failure Action       : Active
```

Meaning The output in Step 1 shows that the uplink interface is up, and hence that the downlink interface is also up, and that the status of **Failure Action** is **Inactive**.

The output in Step 4 shows that both the uplink and downlink interfaces are down (there are no asterisks after the interface name) and that the status of **Failure Action** is changed to **Active**. This output shows that uplink failure detection is working.

Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch

A QFX Series product allows you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your QFX Series product model. You can configure LAGs to connect a QFX Series product to other switches, like aggregation switches, servers, or routers. This example describes how to configure LAGs to connect a QFX3500, QFX3600, or QFX5100 switch to an aggregation switch.

- [Requirements on page 1896](#)
- [Overview and Topology on page 1896](#)
- [Configuration on page 1897](#)
- [Verification on page 1899](#)
- [Troubleshooting on page 1900](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX3500 and QFX3600 switches, and Junos OS 13.2 or later for the QFX5100 switch.
- One QFX3500, QFX3600, or QFX5100 switch.

Overview and Topology

In this example, the switch has one LAG comprising two 10-Gigabit Ethernet interfaces. This LAG is configured in port mode trunk so that the switch and the VLAN to which it has been assigned can send and receive traffic.

Configuring the Ethernet interfaces as LAGs has the following advantages:

- If one physical port is lost for any reason (a cable is unplugged or a switch port fails), the logical port transparently continues to function over the remaining physical port.
- Link Aggregation Control Protocol (LACP) can optionally be configured for link monitoring and automatic addition and deletion of individual links without user intervention.

NOTE: If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

The topology used in this example consists of one switch with a LAG configured between two of its 10-Gigabit Ethernet interfaces. The switch is connected to an aggregation switch.

Table 170 on page 1897 details the topology used in this configuration example.

Table 170: Components of the Topology for Configuring a LAG Between a QFX3500 Switch and Aggregation Switch

| Hostname | Base Hardware | Trunk Port |
|----------|-------------------------------------|--|
| switch | QFX3500, QFX3600, or QFX5100 switch | ae0 is configured as a trunk port and combines the following two interfaces:
xe-0/0/2 and
xe-0/0/3 |

Configuration

To configure a LAG between two 10-Gigabit Ethernet interfaces:

CLI Quick Configuration

To quickly configure a LAG between two 10-Gigabit Ethernet interfaces on a switch, copy the following commands and paste them into the switch terminal window:

NOTE: If you are configuring a LAG on the QFX5100 switch, use the interface-mode statement instead of the port-mode statement. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 58.

```

[edit]
set chassis aggregated-devices ethernet device-count 1
set interfaces ae0 aggregated-ether-options minimum-links 1
set interfaces ae0 aggregated-ether-options link-speed 10g
set interfaces ae0 unit 0 family ethernet-switching vlan members green
set interfaces xe-0/0/2 ether-options 802.ad ae0
set interfaces xe-0/0/3 ether-options 802.ad ae0
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 aggregated-ether-options lacp active
set interfaces ae0 aggregated-ether-options lacp periodic fast
  
```

Step-by-Step Procedure

To configure a LAG between a QFX Series switch and an aggregation switch:

- Specify the number of LAGs to be created on the switch:

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 1
      
```
- Specify the number of links that need to be present for the ae0 LAG interface to be up:

- ```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options minimum-links 1
```
3. Specify the media speed of the **ae0** link:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options link-speed 10g
```
  4. Specify the members to be included within the aggregated Ethernet bundle:
 

```
[edit interfaces]
user@switch# set interfaces xe-0/0/2 ether-options 802.ad ae0
[edit interfaces]
user@switch# set interfaces xe-0/0/3 ether-options 802.ad ae0
```
  5. Assign a port mode of trunk to the **ae0** link:

**NOTE:** If you are configuring a LAG on the QFX5100 switch, use the **interface-mode** statement instead of the **port-mode** statement. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

- ```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
or
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
6. Assign the LAG to a VLAN:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching vlan members green vlan-id 200
```
 7. (Optional): Designate one side of the LAG as active for LACP:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp active
```
 8. (Optional): Designate the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp periodic fast
```

Results

Display the results of the configuration on a QFX3500 or QFX3600 switch:

```
[edit]
chassis {
  aggregated-devices {
    ethernet {
      device-count 1;
    }
  }
}
green {
  vlan-id 200;
}
}
interfaces {
```

```

ae0 {
  aggregated-ether-options {
    link-speed 10g;
    minimum-links 1;
  }
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members green;
      }
    }
  }
  xe-0/0/2 {
    ether-options {
      802.ad ae0;
    }
  }
  xe-0/0/3 {
    ether-options {
      802.ad ae0;
    }
  }
}

```

Verification

To verify that switching is operational and one LAG has been created, perform these tasks:

- [Verifying That LAG ae0.0 Has Been Created on page 1899](#)
- [Verifying That LAG ae0 Has Been Created on page 1899](#)

Verifying That LAG ae0.0 Has Been Created

Purpose Verify that LAG ae0.0 has been created on the switch.

Action show interfaces ae0 terse

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|------------|-------|--------|
| ae0 | up | up | | | |
| ae0.0 | up | up | eth-switch | | |

Meaning The output confirms that the ae0.0 link is up and shows the **family** and IP address assigned to this link.

Verifying That LAG ae0 Has Been Created

Purpose Verify that LAG ae0 has been created on the switch

Action show interfaces ae0 terse

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|------------|-------|--------|
| ae0 | up | down | | | |
| ae0.0 | up | down | eth-switch | | |

Meaning The output shows that the **ae0.0** link is down.

[Troubleshooting](#)

Troubleshooting a LAG That Is Down

Problem The **show interfaces terse** command shows that the LAG is **down**.

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.

Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch

QFX Series products allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your QFX Series product model. On a standalone switch, you can group up to 32 Ethernet interfaces to form a LAG. On a QFabric system, you can group up to 8 Ethernet interfaces to form a LAG. QFX Series products allow you to further enhance these links by configuring Link Aggregation Control Protocol (LACP).

This example describes how to overlay LACP on the LAG configurations that were created in [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 1896](#):

- [Requirements on page 1901](#)
- [Overview and Topology on page 1901](#)
- [Configuring LACP for the LAG on the QFX Series on page 1901](#)
- [Verification on page 1902](#)
- [Troubleshooting on page 1903](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX3500 switch, Junos OS Release 12.1 or later for the QFX3600 switch, and Junos OS 13.2 or later for the QFX5100 switch.
- One QFX3500, QFX3600, or QFX5100 switch.

Before you configure LACP, be sure you have:

- Configured the ports on the switches as trunk ports.
- Configured the LAG.

Overview and Topology

The topology in this example is exactly the same as the topology used in the Configuring a LAG Between a QFX Switch and an Aggregation Switch example. This example shows how to use LACP to enhance the LAG functionality.

LACP exchanges are made between *actors* (the transmitting link) and *partners* (the receiving link). The LACP mode can be either active or passive.

NOTE: If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. By default, LACP is in passive mode. To initiate transmission of LACP packets and responses to LACP packets, you must enable LACP in active mode.

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the **periodic** statement at the **[edit interfaces *interface-name* aggregated-ether-options lacp]** hierarchy level.

The interval can be fast (every second) or slow (every 30 seconds).

Configuring LACP for the LAG on the QFX Series

To configure LACP for a QFX Series LAG, perform these tasks:

CLI Quick Configuration

To quickly configure LACP for the access switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ae0 aggregated-ether-options lacp active periodic fast
```

Step-by-Step Procedure

To configure LACP for LAG **ae0** :

1. Specify the aggregated Ethernet options for the LAG:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp active periodic fast
```

Results Display the results of the configuration:

```
[edit interfaces]
user@switch# show
ae0 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
```

Verification

To verify that LACP packets are being exchanged, perform the following tasks:

- [Verifying the LACP Settings on page 1902](#)
- [Verifying That the LACP Packets Are Being Exchanged on page 1902](#)

Verifying the LACP Settings

Purpose Verify that LACP has been set up correctly.

Action Use the **show lacp interfaces *interface-name*** command to check that LACP has been enabled as active on one end.

```
user@switch> show lacp interfaces xe-0/0/2
```

Aggregated interface: ae0

| | | | | | | | | | |
|----------------|---------------|-----|----------------|------|-----------|-----|------|---------|----------|
| LACP state: | Role | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
| xe-0/0/2 | Actor | No | Yes | No | No | No | Yes | Fast | Active |
| xe-0/0/2 | Partner | No | Yes | No | No | No | Yes | Fast | Passive |
| LACP protocol: | Receive State | | Transmit State | | Mux State | | | | |
| xe-0/0/2 | Defaulted | | Fast periodic | | Detached | | | | |

Meaning The output indicates that LACP has been set up correctly and is active at one end.

Verifying That the LACP Packets Are Being Exchanged

Purpose Verify that LACP packets are being exchanged.

Action Use the **show interfaces *aex* statistics** command to display LACP information.

```
user@switch> show interfaces ae0 statistics
```

```
Physical interface: ae0, Enabled, Physical link is Down
Interface index: 153, SNMP ifIndex: 30
Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
Minimum bandwidth needed: 0
Device flags : Present Running
```

```

Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
Current address: 02:19:e2:50:45:e0, Hardware address: 02:19:e2:50:45:e0
Last flapped : Never
Statistics last cleared: Never
  Input packets : 0
  Output packets: 0
Input errors: 0, Output errors: 0

Logical interface ae0.0 (Index 71) (SNMP ifIndex 34)
Flags: Hardware-Down Device-Down SNMP-Traps Encapsulation: ENET2
Statistics      Packets      pps      Bytes      bps
Bundle:
  Input :          0          0          0          0
  Output:          0          0          0          0
Protocol inet
Flags: None
Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255

```

Meaning The output here shows that the link is down and that no PDUs are being exchanged.

Troubleshooting

To troubleshoot a nonworking LACP link, perform these tasks:

- [Troubleshooting a Nonworking LACP Link on page 1903](#)

Troubleshooting a Nonworking LACP Link

Problem The LACP link is not working.

Solution Check the following:

- Remove the LACP configuration and verify whether the static LAG is up.
- Verify that LACP is configured at both ends.
- Verify that LACP is not passive at both ends.
- Verify whether LACP protocol data units (PDUs) are being exchanged by running the **monitor traffic-interface lag-member detail** command.

Example: Configuring Multichassis Link Aggregation

NOTE: Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two switches. An MC-LAG provides redundancy and load balancing between the two switches, multihoming support, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

The peers in an MC-LAG use an interchassis control link-protection link (ICL-PL) to replicate forwarding information across the peers. The Interchassis Control Protocol (ICCP) exchanges the control information between two MC-LAG switches. Additionally, ICCP propagates the operational state of MC-LAG members through the ICL-PL.

On one end of an MC-LAG is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to detect the MC-LAG. On the other side of an MC-LAG are two MC-LAG switches. Each of the switches has one or more physical links connected to a single client device. The switches coordinate with each other to ensure that data traffic is forwarded properly.

- [Requirements on page 1904](#)
- [Overview on page 1905](#)
- [Configuration on page 1906](#)
- [Verification on page 1923](#)
- [Troubleshooting on page 1925](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 1896](#).
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch” on page 1900](#).

Overview

In this example, you configure an MC-LAG across two switches, consisting of two aggregated Ethernet interfaces, an interchassis control link-protection link (ICL-PL), multichassis protection link for the ICL-PL, ICCP for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers. Layer 3 connectivity is required for ICCP.

Topology

The topology used in this example consists of two switches hosting an MC-LAG. The two switches are connected to a server. [Figure 28 on page 1905](#) shows the topology of this example.

Figure 28: Configuring a Multichassis LAG Between Switch A and Switch B

[Table 170 on page 1897](#) details the topology used in this configuration example.

Table 171: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

| Hostname | Base Hardware | Multichassis Link Aggregation Group |
|----------|--|---|
| Switch A | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | ae0 is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of ae0 : xe-0/0/12 and xe-0/0/13 on Switch A and xe-0/0/12 and xe-0/0/13 on Switch B.

ae1 is configured as an MC-LAG, and the following two interfaces are part of ae1 : xe-0/0/44 on Switch A and xe-0/0/46 on Switch B. |
| Switch B | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | |

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

NOTE: This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

Original CLI

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active

Configuring MC-LAG on Two Switches

Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2

```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

```

[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1

```
3. Configure a trunk interface between Switch A and Switch B.

NOTE: The `port-mode` statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the `interface-mode` statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
or
```

ELS:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```

4. Configure a multichassis protection link between Switch A and Switch B.

Switch A:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

Step-by-Step Procedure

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 60
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 60
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval
60
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval
60
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

NOTE: Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

NOTE: By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit vlans]
user@switch# set v500 l3-interface irb.500
```

NOTE: The `port-mode` statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the `interface-mode` statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members
v500
```

or

ELS:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members
v500
```

Step-by-Step Procedure

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

NOTE: At least one end needs to be active. The other end can be either active or passive.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp active
```

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

3. Specify the same service ID on Switch A and Switch B.

ELS:

```
[edit]
user@switch# set switch-options service-id 10
```

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

Switch B:

```
[edit interfaces]
```

- ```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1
```
5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```
6. Specify the status control for MC-LAG on Switch A and Switch B.

NOTE: You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

Switch B:

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
```
7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 240
```
8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
```
9. Specify the same LACP administration key on both Switch A and Switch B.

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```
10. Enable a VLAN on the MC-LAG on Switch A and Switch B.

NOTE: The port-mode statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the interface-mode statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
or
```

ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. (Optional) Enable a private VLAN on the MC-LAG on Switch A and Switch B.

```
[edit]
user@switch# set vlans vlan100 pvlan isolation-vlan-id 200
extend-secondary-vlan-id
[edit]
user@switch# set vlans vlan100 interface ae0.0 pvlan-trunk
```

Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

NOTE: The ae1 interface is a downstream interface. This is why RSTP and bpdv-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

NOTE: The ae1 interface is a downstream interface. This is why RSTP and bpdv-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp bpdv-block-on-edge
```

Results

Display the results of the configuration on Switch A using the original CLI.

Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 1923](#)
- [Verifying That ICCP Is Working on Switch B on page 1923](#)
- [Verifying That LACP Is Active on Switch A on page 1924](#)
- [Verifying That LACP Is Active on Switch B on page 1924](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 1924](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 1924](#)
- [Verifying that MAC Learning Is Occurring on Switch A on page 1925](#)
- [Verifying that MAC Learning Is Occurring on Switch B on page 1925](#)

Verifying That ICCP Is Working on Switch A

Purpose Verify that ICCP is running on Switch A.

Action [edit]
 user@switch# **show iccp**

 TCP Connection : Established
 Liveliness Detection : Up

 Client Application: MCSNOOPD

 Client Application: eswd

Meaning This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

Verifying That ICCP Is Working on Switch B

Purpose Verify that ICCP is running on Switch B.

Action **show iccp**

 [edit]
 user@switch# **show iccp**
 Redundancy Group Information for peer 3.3.3.2
 TCP Connection : Established
 Liveliness Detection : Up

 Client Application: MCSNOOPD

 Client Application: eswd

Meaning This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

Verifying That LACP Is Active on Switch A

Purpose Verify that LACP is active on Switch A.

Action [edit]
user@switch# show lacp interfaces
Aggregated interface: ae1

| LACP state: | Role | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| xe-0/0/46 | Actor | No | No | Yes | Yes | Yes | Yes | Fast | Active |
| xe-0/0/46 | Partner | No | No | Yes | Yes | Yes | Yes | Fast | Active |

LACP protocol: Receive State Transmit State Mux State
xe-0/0/46 Current Fast periodic Collecting distributing

Meaning This output shows that Switch A is participating in LACP negotiation.

Verifying That LACP Is Active on Switch B

Purpose Verify that LACP is active on Switch B

Action [edit]
user@switch# show lacp interfaces
Aggregated interface: ae1

| LACP state: | Role | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| xe-0/0/44 | Actor | No | No | Yes | Yes | Yes | Yes | Fast | Active |
| xe-0/0/44 | Partner | No | No | Yes | Yes | Yes | Yes | Fast | Active |

LACP protocol: Receive State Transmit State Mux State
xe-0/0/44 Current Fast periodic Collecting distributing

Meaning This output shows that Switch B is participating in LACP negotiation.

Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A

Purpose Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

Action [edit]
user@switch# show interfaces mc-ae

```
Member Link                : ae1
Current State Machine's State: mcae active state
Local Status                : active
Local State                 : up
Peer Status                 : active
Peer State                  : up
  Logical Interface         : ae1.0
  Topology Type             : bridge
  Local State               : up
  Peer State                : up
  Peer Ip/MCP/State         : 3.3.3.1 ae0.0 up
```

Meaning This output shows that the MC-AE interface on Switch A is up and active.

Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B

Purpose Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

Action [edit]
 user@switch# **show interfaces mc-ae**
 Member Link : ae1
 Current State Machine's State: mcae active state
 Local Status : active
 Local State : up
 Peer Status : active
 Peer State : up
 Logical Interface : ae1.0
 Topology Type : bridge
 Local State : up
 Peer State : up
 Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

Meaning This output shows that the MC-AE interface on Switch B is up and active.

Verifying that MAC Learning Is Occurring on Switch A

Purpose Verify that MAC learning is working on Switch A.

Action [edit]
 user@switch# **show ethernet-switching table**
 Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

| VLAN | MAC address | Type | Age | Interfaces |
|------|-------------------|----------|-----|--------------|
| V100 | * | Flood | - | All-members |
| V100 | 00:10:94:00:00:05 | Learn(L) | 33 | ae0.0 (MCAE) |

Meaning The output shows four learned MAC addresses entries.

Verifying that MAC Learning Is Occurring on Switch B

Purpose Verify that MAC learning is working on Switch B.

Action [edit]
 user@switch# **show ethernet-switching table**
 Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

| VLAN | MAC address | Type | Age | Interfaces |
|------|-------------------|----------|-----|--------------|
| V100 | * | Flood | - | All-members |
| V100 | 00:10:94:00:00:05 | Learn(L) | 33 | ae0.0 (MCAE) |

Meaning The output shows four learned MAC addresses entries.

Troubleshooting

Troubleshooting a LAG That Is Down

Problem The **show interfaces terse** command shows that the MC-LAG is **down**

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.

- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

**Related
Documentation**

- [Understanding Multichassis Link Aggregation on page 1853](#)
- [Configuring Multichassis Link Aggregation on page 2022](#)

Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP

NOTE: Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software (ELS).

There are two methods for enabling Layer 3 multicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to configure Virtual Router Redundancy Protocol (VRRP) or synchronize the MAC addresses for the Layer 3 interfaces of the switches participating in the MC-LAG. The procedure to configure VRRP for use in a Layer 3 multicast MC-LAG is included in this example.

- [Requirements on page 1926](#)
- [Overview on page 1926](#)
- [Configuration on page 1929](#)
- [Verification on page 1962](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG for Layer 3 multicast using VRRP, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 1896](#).
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch” on page 1900](#).

Overview

In this example, you configure two MC-LAGs across two switches, consisting of two aggregated Ethernet interfaces (ae1 and ae2). To support the MC-LAG, create a third aggregated Ethernet interface (ae0) for the interchassis control link-protection link

(ICL-PL). Configure a multichassis protection link for the ICL-PL, Interchassis Control Protocol (ICCP) for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers.

NOTE: Layer 3 connectivity is required for ICCP.

To complete the configuration, enable VRRP by completing the following steps for each MC-LAG:

- Create a routed VLAN interface (RVI)
- Create a VRRP group and assign a virtual IP address that is shared between each switch in the VRRP group
- Enable a member of a VRRP group to accept all packets destined for the virtual IP address if it is the master in the VRRP group
- Configure Layer 3 connectivity between the VRRP groups

Topology

The topology used in this example consists of two switches hosting two MC-LAGs—ae1 and ae2. The two switches are connected to a multicast source (Server 1) over the MC-LAG ae1, and a multicast receiver (Server 2) over the MC-LAG ae2. [Figure 29 on page 1928](#) shows the topology of this example.

Figure 29: Configuring a Multichassis LAG for Layer 3 Multicast Using VRRP

g041361

Table 172 on page 1928 details the topology used in this configuration example.

Table 172: Components of the Topology for Configuring a Multichassis LAG for Layer 3 Multicast Using VRRP

| Hostname | Base Hardware | Multichassis Link Aggregation Group |
|----------|--|---|
| Switch A | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | <ul style="list-style-type: none"> ae0 is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following two interfaces are part of ae0: <code>xe-0/0/12</code> and <code>xe-0/0/13</code> on Switch A and <code>xe-0/0/12</code> and <code>xe-0/0/13</code> on Switch B. ae1 is configured as an MC-LAG for the multicast source (Server 1), and the following two interfaces are part of ae1: <code>xe-0/0/44</code> on Switch A and <code>xe-0/0/46</code> on Switch B. ae2 is configured as an MC-LAG for the multicast receiver (Server 2), and the following two interfaces are part of ae2: <code>xe-0/0/45</code> on Switch A and <code>xe-0/0/47</code> on Switch B. |
| Switch B | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | |

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

NOTE: This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

Original CLI:

```
set chassis aggregated-devices ethernet device-count 3
set interfaces xe-0/0/12 ether-options 802.3ad ae0

Configuring MC-LAG for Layer 3 Multicast Using VRRP on Two Switches

Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 3

```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

Switch A and Switch B

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
```

Switch A

```
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
user@switch# set xe-0/0/45 ether-options 802.3ad ae2
```

Switch B

```
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
user@switch# set xe-0/0/47 ether-options 802.3ad ae2
```

3. Configure ae0 as the trunk interface between Switch A and Switch B.

Switch A and Switch B

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
```

Switch A and Switch B Using ELS

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```

4. Configure ae0 as the multichassis protection link between Switch A and Switch B.

Switch A

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

Switch B

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

**Step-by-Step
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address, minimum receive interval, and minimum transmit interval for a Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 60
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval
minimum-interval 60
```

Switch B

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval
60
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval
minimum-interval 60
```

3. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

NOTE: Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

Switch A

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

4. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

NOTE: By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip
10.207.64.233
```

Switch B

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip
10.207.64.232
```

5. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B.

NOTE: In ELS, use the *irb.logical-interface-number* instead.

Switch A and Switch B

```
[edit vlans]
user@switch# set v500 vlan-id 500
user@switch# set v500 l3-interface vlan.500
```

Switch A and Switch B Using ELS

```
[edit vlans]
user@switch# set v500 vlan-id 500
user@switch# set v500 l3-interface irb.500
```

Switch A and Switch B

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching vlan members v500
```

Switch A

```
[edit interfaces]
user@switch# set vlan unit 500 family inet address 3.3.3.2/24
```

Switch A Using ELS

```
[edit interfaces]
user@switch# set irbunit 500 family inet address 3.3.3.2/24
```

Switch B

```
[edit interfaces]
user@switch# set vlan unit 500 family inet address 3.3.3.1/24
```

Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 500 family inet address 3.3.3.1/24
```

**Step-by-Step
Procedure**

To enable the ae1 and ae2 MC-LAG interfaces:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interfaces on Switch A and Switch B.

NOTE: At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

user@switch# set ae1 aggregated-ether-options lacp active

user@switch# set ae2 aggregated-ether-options lacp active

2. Specify the same multichassis aggregated Ethernet (MC-AE) identification number for each MC-LAG peer on Switch A and Switch B.

[edit interfaces]

user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3

user@switch# set ae2 aggregated-ether-options mc-ae mc-ae-id 4

3. Specify the same service ID on Switch A and Switch B.

ELS:

[edit]

set switch-options service-id 10

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A

[edit interfaces]

user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0

user@switch# set ae2 aggregated-ether-options mc-ae chassis-id 0

Switch B

[edit interfaces]

user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1

user@switch# set ae2 aggregated-ether-options mc-ae chassis-id 1

5. Specify the operating mode of the MC-LAGs on both Switch A and Switch B.

NOTE: Only active-active mode is supported at this time.

[edit interfaces]

user@switch# set ae1 aggregated-ether-options mc-ae mode active-active

user@switch# set ae2 aggregated-ether-options mc-ae mode active-active

6. Specify the status control for the MC-LAGs on Switch A and Switch B.

NOTE: You must configure status control on both Switch A and Switch B hosting the MC-LAGs. If one peer is in active mode, the other must be in standby mode.

Switch A

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
user@switch# set ae2 aggregated-ether-options mc-ae status-control active
```

Switch B

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
user@switch# set ae2 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-LAG interfaces should be deferred after you reboot Switch A or Switch B.

NOTE: The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 420
user@switch# set ae2 aggregated-ether-options mc-ae init-delay-time 420
```

8. Specify the same LACP system ID for each MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
user@switch# set ae2 aggregated-ether-options lacp system-ID 00:01:02:03:04:06
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
user@switch# set ae2 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN for each MC-LAG on Switch A and Switch B.

```
[edit vlans]
user@switch# set v100 vlan-id 100
user@switch# set v200 vlan-id 200
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
user@switch# set ae2 unit 0 family ethernet-switching vlan members v200
```

11. Configure ae1 and ae2 as trunk interfaces between Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
user@switch# set ae2 unit 0 family ethernet-switching port-mode trunk
```

ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ae2 unit 0 family ethernet-switching interface-mode trunk
```

**Step-by-Step
Procedure**

To enable VRRP on the MC-LAGs on Switch A and Switch B:

1. Create a routed VLAN interface (RVI) for each MC-LAG, assign a virtual IP address that is shared between each switch in the VRRP groups, and assign an individual IP address for each switch in the VRRP groups.

Switch A

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2
virtual-address 10.1.1.2
```

Switch A Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2
virtual-address 10.1.1.2
```

Switch B

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2
virtual-address 10.1.1.2
```

Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2
virtual-address 10.1.1.2
```

2. Assign the priority for each switch in the VRRP groups:

NOTE: The switch configured with the highest priority is the master.

Switch A

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1 priority
200
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2 priority
200
```

Switch A Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1 priority
200
```

```
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2 priority 200
```

Switch B

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1 priority 150
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2 priority 150
```

Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1 priority 150
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2 priority 150
```

3. Enable the switch to accept all packets destined for the virtual IP address if it is the master in a VRRP group:

Switch A

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1 accept-data
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2 accept-data
```

Switch A Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1 accept-data
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2 accept-data
```

Switch B

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1 accept-data
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2 accept-data
```

Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1 accept-data
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2 accept-data
```

4. Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set v100 l3-interface vlan.100
user@switch# set v200 l3-interface vlan.200
```

ELS:

```
[edit interfaces]
user@switch# set v100 l3-interface irb.100
user@switch# set v200 l3-interface irb.200
```

Step-by-Step Procedure

To enable IGMP snooping:

1. Enable IGMP snooping for all VLANs on Switch A and Switch B.

```
[edit protocols]
user@switch# set igmp-snooping vlan all
```

Step-by-Step Procedure

To configure OSPF as the Layer 3 protocol:

1. Configure an OSPF area on Switch A and Switch B.

```
[edit protocols ospf]
user@switch# set area 0.0.0.0
```

2. Assign the VLAN interfaces for the MC-LAGs as interfaces to the OSPF area on Switch A and Switch B.

```
[edit protocols ospf area 0.0.0.0]
user@switch# set interface vlan.100
user@switch# set interface vlan.200
```

3. Configure the minimum receive interval, minimum transmit interval, and transmit interval threshold for a Bidirectional Forwarding Detection (BFD) session for the OSPF interfaces on Switch A and Switch B.

NOTE: On a QFX5100 switch, the minimum transmit interval must be 1000 milliseconds or greater. Sub-second timers are not supported in Junos OS 13.2X51-D10 and later. If you configure the minimum transmit interval timer lower than 1000 milliseconds, the state of the MC-LAG can be affected.

```
[edit protocols ospf area 0.0.0.0]
user@switch# set interface vlan.100 bfd-liveness-detection
  minimum-receive-interval 700
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
  minimum-interval 350
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
  threshold 500
user@switch# set interface vlan.200 bfd-liveness-detection
  minimum-receive-interval 700
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
  minimum-interval 350
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
  threshold 500
```

**Step-by-Step
Procedure**

To configure PIM as the multicast protocol:

1. Configure a static rendezvous point (RP) address on Switch A and Switch B.

```
[edit protocols pim]  
user@switch# set rp static address 1.0.0.3
```
2. Configure the address ranges of the multicast groups for which Switch A and Switch B can be a rendezvous point (RP).

```
[edit protocols pim rp static address 1.0.0.3]  
user@switch# set group-ranges 239.0.0.0/8
```
3. Enable PIM on the VLAN interfaces for the MC-LAGs on Switch A and Switch B.

```
[edit protocols pim]  
user@switch# set interface vlan.100 dual-dr  
user@switch# set interface vlan.200 dual-dr
```
4. Configure each PIM interface's priority for being selected as the designated router (DR).

An interface with a higher priority value has a higher probability of being selected as the DR.

Switch A

```
[edit protocols pim]  
user@switch# set interface vlan.100 priority 200  
user@switch# set interface vlan.200 priority 600
```

Switch B

```
[edit protocols pim]  
user@switch# set interface vlan.100 priority 100  
user@switch# set interface vlan.200 priority 500
```

5. Configure the minimum receive interval, minimum transmit interval, and transmit interval threshold for a Bidirectional Forwarding Detection (BFD) session for the PIM interfaces on Switch A and Switch B.

```
[edit protocols pim]  
user@switch# set interface vlan.100 bfd-liveness-detection  
minimum-receive-interval 700  
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval  
minimum-interval 350  
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval  
threshold 500  
user@switch# set interface vlan.200 bfd-liveness-detection  
minimum-receive-interval 700  
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval  
minimum-interval 350  
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval  
threshold 500
```

**Step-by-Step
Procedure**

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit protocols rstp]
user@switch# set interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B.

```
[edit protocols rstp]
user@switch# set interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

NOTE: The ae1 and ae2 interfaces are downstream interfaces. This is why RSTP and bpd-block-on-edge need to be configured.

```
[edit protocols rstp]
user@switch# set interface ae1.0 edge
user@switch# set interface ae2.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

NOTE: The ae1 and ae2 interfaces are downstream interfaces. This is why RSTP and bpd-block-on-edge need to be configured.

```
[edit protocols rstp]
user@switch# set bpd-block-on-edge
```

Results

From configuration mode on Switch A, confirm your configuration by entering the **show chassis**, **show interfaces**, **show multi-chassis**, **show protocols**, and **show vlans** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Original CLI:

```
chassis {
  aggregated-devices {
    ethernet {
      device-count 3;
    }
  }
}
interfaces {
  xe-0/0/12 {
    ether-options {
```

```
        802.3ad ae0;
    }
}
xe-0/0/13 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/44 {
    ether-options {
        802.3ad ae1;
    }
}

From configuration mode on Switch B, confirm your configuration by entering the **show chassis**, **show interfaces**, **show multi-chassis**, **show protocols**, and **show vlans** commands.

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Original CLI:

```

Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That Switch A is the Master Designated Router on page 1962](#)
- [Verifying That Switch B is the Backup Designated Router on page 1962](#)

Verifying That Switch A is the Master Designated Router

Purpose Verify that Switch A is the master designated router (DR).

Action From operational mode, enter the `show pim interfaces` command.

```

user@switch> show pim interfaces
Stat = Status, V = Version, NbrCnt = Neighbor Count,
S = Sparse, D = Dense, B = Bidirectional,
DR = Designated Router, P2P = Point-to-point link,
Active = Bidirectional is active, NotCap = Not Bidirectional Capable

```

| Name | Stat | Mode | IP | V | State | NbrCnt | JoinCnt(sg/*g) | DR address |
|------------|------|------|----|---|---------------|--------|----------------|------------|
| pime.32769 | Down | S | 4 | 2 | P2P,NotCap | 0 | 0/0 | |
| vlan.100 | Up | S | 4 | 2 | DDR-DR,NotCap | 1 | 0/0 | 10.1.1.11 |
| vlan.200 | Up | S | 4 | 2 | DDR-DR,NotCap | 2 | 0/0 | 10.1.1.21 |

Meaning The DDR-DR state of the VLAN interfaces in the output shows that Switch A is the master designated router.

Verifying That Switch B is the Backup Designated Router

Purpose Verify that Switch B is the backup designated router (BDR).

Action From operational mode, enter the `show pim interfaces` command.

```

user@switch> show pim interfaces
Stat = Status, V = Version, NbrCnt = Neighbor Count,
S = Sparse, D = Dense, B = Bidirectional,
DR = Designated Router, P2P = Point-to-point link,
Active = Bidirectional is active, NotCap = Not Bidirectional Capable

```

| Name | Stat | Mode | IP | V | State | NbrCnt | JoinCnt(sg/*g) | DR address |
|------------|------|------|----|---|----------------|--------|----------------|------------|
| pime.32769 | Down | S | 4 | 2 | P2P,NotCap | 0 | 0/0 | |
| vlan.100 | Up | S | 4 | 2 | DDR-BDR,NotCap | 1 | 0/0 | 10.1.1.11 |
| vlan.200 | Up | S | 4 | 2 | DDR-BDR,NotCap | 2 | 0/0 | 10.1.1.21 |

Meaning The DDR-BDR state of the VLAN interfaces in the output shows that Switch B is the backup designated router.

- [Understanding Multichassis Link Aggregation on page 1853](#)
 - [Configuring Multichassis Link Aggregation on page 2022](#)

Example: Configuring Multichassis Link Aggregation with Layer 3 MAC Address Synchronization

NOTE: Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software.

There are 2 methods for enabling Layer 3 unicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to synchronize the MAC addresses between the switches for the participating MC-LAG interfaces, or you can configure Virtual Router Redundancy Protocol (VRRP). The procedure to configure MAC address synchronization is included in this example. For more information on configuring VRRP for use in a Layer 3 unicast MC-LAG, see “[Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol \(VRRP\)](#)” on page 1983.

- [Requirements on page 1963](#)
- [Overview on page 1963](#)
- [Configuration on page 1964](#)
- [Verification on page 1980](#)
- [Troubleshooting on page 1983](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG for Layer 3 unicast, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See “[Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch](#)” on page 1896.
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See “[Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch](#)” on page 1900.

Overview

In this example, you configure an MC-LAG across two switches, consisting of two aggregated Ethernet interfaces, an interchassis control link-protection link (ICL-PL),

multichassis protection link for the ICL-PL, ICCP for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers. Layer 3 connectivity is required for ICCP.

Topology

The topology used in this example consists of two switches hosting an MC-LAG. The two switches are connected to a server. [Figure 28 on page 1905](#) shows the topology of this example.

Figure 30: Configuring a Multichassis LAG Between Switch A and Switch B

[Table 170 on page 1897](#) details the topology used in this configuration example.

Table 173: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

| Hostname | Base Hardware | Multichassis Link Aggregation Group |
|----------|--|--|
| Switch A | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | ae0 is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of ae0 : xe-0/0/12 and xe-0/0/13 Switch A and xe-0/0/12 and xe-0/0/13 on Switch B.

ae1 is configured as an MC-LAG, and the following two interfaces are part of ae1 : xe-0/0/44 on Switch A and xe-0/0/46 on Switch B. |
| Switch B | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | |

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network

configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

NOTE: This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

Original CLI on Switch A:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0

```

Configuring MC-LAG on Two Switches

Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2

```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

- ```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
```
3. Configure a trunk interface between Switch A and Switch B.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
  4. Configure a multichassis protection link between Switch A and Switch B.  
Switch A:  

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:  

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

**Step-by-Step  
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 60
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 60
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval
60
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval
60
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using the original CLI:

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members
v500
```

7. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using ELS:

```
[edit vlans]
```

```
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface irb.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members
v500
```

**Step-by-Step  
Procedure**

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options lacp active
```

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

3. Specify the same service ID on Switch A and Switch B.

ELS:

[edit]

```
user@switch# set switch-options service-id 10
```

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

Switch B:

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1
```

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

Switch B:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B using the original CLI:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
```

11. Enable a VLAN on the MC-LAG on Switch A and Switch B using ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

**Step-by-Step  
Procedure**

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

**Results**

Display the results of the configuration on Switch A using the original CLI.

## Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 1980](#)
- [Verifying That ICCP Is Working on Switch B on page 1981](#)
- [Verifying That LACP Is Active on Switch A on page 1981](#)
- [Verifying That LACP Is Active on Switch B on page 1981](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 1982](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 1982](#)
- [Verifying that MAC Learning Is Occurring on Switch A and Switch B on page 1982](#)

### ***Verifying That ICCP Is Working on Switch A***

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
 user@switch# show iccp  
 Redundancy Group Information for peer 3.3.3.1  
   TCP Connection : Established  
   Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That ICCP Is Working on Switch B*

**Purpose** Verify that ICCP is running on Switch B.

**Action** show iccp  
  
 [edit]  
 user@switch# show iccp  
 Redundancy Group Information for peer 3.3.3.2  
   TCP Connection : Established  
   Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That LACP Is Active on Switch A*

**Purpose** Verify that LACP is active on Switch A.

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1  

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/46	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/46	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active

LACP protocol:	Receive State	Transmit State	Mux State
xe-0/0/46	Current	Fast periodic	Collecting distributing

**Meaning** This output shows that Switch A is participating in LACP negotiation.

#### *Verifying That LACP Is Active on Switch B*

**Purpose** Verify that LACP is active on Switch B

**Action** [edit]  
user@switch# show lacp interfaces

Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/44	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/44	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active

LACP protocol:

	Receive State	Transmit State	Mux State
xe-0/0/44	Current	Fast periodic	Collecting distributing

**Meaning** This output shows that Switch B is participating in LACP negotiation.

#### *Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A*

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# show interfaces mc-ae

Member Link : ae1

Current State Machine's State: mcae active state

Local Status : active

Local State : up

Peer Status : active

Peer State : up

Logical Interface : ae1.0

Topology Type : bridge

Local State : up

Peer State : up

Peer Ip/MCP/State : 3.3.3.1 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

#### *Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B*

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
user@switch# show interfaces mc-ae

Member Link : ae1

Current State Machine's State: mcae active state

Local Status : active

Local State : up

Peer Status : active

Peer State : up

Logical Interface : ae1.0

Topology Type : bridge

Local State : up

Peer State : up

Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

#### *Verifying that MAC Learning Is Occurring on Switch A and Switch B*

**Purpose** Verify that MAC learning is working on Switch A and B.

**Action** [edit]  
 user@switch# **show ethernet-switching table**  
 Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

VLAN	MAC address	Type	Age	Interfaces
v222	*	Flood		- All-members
v222	00:00:5e:00:01:01	Static		- Router
v222	00:10:94:00:00:05	Learn(L)	33	ae0.0 (MCAE)
v222	84:18:88:df:ac:ae	Learn(R)	0	ae2.0

**Meaning** The output shows four learned MAC addresses entries.

## Troubleshooting

### *Troubleshooting a LAG That Is Down*

**Problem** The **show interfaces terse** command shows that the MC-LAG is **down**

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

- Related Documentation**
- [Understanding Multichassis Link Aggregation on page 1853](#)
  - [Configuring Multichassis Link Aggregation on page 2022](#)
  - [Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP on page 1926](#)

## Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol (VRRP)

There are two methods for enabling Layer 3 unicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to configure Virtual Router Redundancy Protocol (VRRP) or synchronize the MAC addresses for the Layer 3 interfaces of the switches participating in the MC-LAG. The procedure to configure VRRP for use in a Layer 3 unicast MC-LAG is included in this example. For more information on configuring MAC address synchronization, see *Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast using MAC Address Synchronization*.

- [Requirements on page 1984](#)
- [Overview on page 1984](#)
- [Configuration on page 1985](#)
- [Verification on page 2004](#)
- [Troubleshooting on page 2009](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX Series
- Two QFX3500 or QFX3600 or QFX5100 switches

Before you configure an MC-LAG, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch”](#) on page 1896.
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch”](#) on page 1900.
- Configure Virtual Router Redundancy Protocol (VRRP) on a switch. See [“Configuring Basic VRRP Support”](#) on page 1752.

## Overview

---

In this example, you configure an MC-LAG across two switches by including interfaces from both switches in an aggregated Ethernet interface (ae1). To support the MC-LAG, create a second aggregated Ethernet interface (ae0) for the interchassis control link-protection link (ICL-PL). Configure a multichassis protection link for the ICL-PL, Interchassis Control Protocol (ICCP) for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers.

**NOTE:** Layer 3 connectivity is required for ICCP.

---

To complete the configuration, enable VRRP by completing the following steps:

- Create a routed VLAN interface (RVI)
- Create a VRRP group and assign a virtual IP address that is shared between each switch in the VRRP group
- Enable a member of a VRRP group to accept all packets destined for the virtual IP address if it is the master in the VRRP group
- Configure Layer 3 connectivity between the VRRP groups

## Topology

The topology used in this example consists of two switches hosting an MC-LAGs. The two switches are connected to a server. [Figure 31 on page 1985](#) shows the topology of this example.

Figure 31: Configuring a Multichassis LAG Between Switch A and Switch B

Table 170 on page 1897 details the topology used in this configuration example.

Table 174: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

Hostname	Base Hardware	Multichassis Link Aggregation Group
Switch A	QFX3500, QFX3600, or QFX5100 switch	<b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B.  <b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B.
Switch B		

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The port-mode statement in the [edit interfaces *interface-name* unit *number* family ethernet-switching] hierarchy is not supported. Use the interface-mode statement instead.
- The vlan statement in the [edit interfaces *interface-name*] hierarchy is not supported. Use the irb statement instead.
- The vlan.logical-interface-number option in the [edit vlans *vlan-name* l3-interface] option is not supported. Use the irb.logical-interface-number option instead.
- The service-id statement in the [edit switch-options] hierarchy is required in the ELS CLI.

#### Original CLI:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk

### Configuring MC-LAG on Two Switches

#### Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.  

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2
```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.  

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
```
3. Configure a trunk interface between Switch A and Switch B using the original CLI.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
```
4. Configure a trunk interface between Switch A and Switch B using ELS.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
5. Configure a multichassis protection link between Switch A and Switch B.  

Switch A:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

**Step-by-Step  
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 60
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 60
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 60
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 60
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

---

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

- user@switch# **set iccp peer 3.3.3.2 session-establishment-hold-time 50**
5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using the original CLI.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members v500
```

7. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using ELS.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface irb.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members v500
```

**Step-by-Step Procedure**

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options lacp active**

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mc-ae-id 3**

3. Specify the same service ID on Switch A and Switch B.

ELS:

[edit]

user@switch# **set switch-options service-id 10**

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 0**

Switch B:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 1**

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mode active-active**

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

Switch B:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B using the original CLI.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. Enable a VLAN on the MC-LAG on Switch A and Switch B using ELS.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

12. Enable VRRP on the MC-LAG on Switch A and Switch B:

- Create a routed VLAN interface (RVI), assign a virtual IP address that is shared between each switch in the VRRP group, and assign an individual IP address for each switch in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.1/24 vrrp-group 1
virtual-address 100.1.1.1
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1
virtual-address 100.1.1.1
```

- Assign the priority for each switch in the VRRP group:

**NOTE:** The switch configured with the highest priority is the master.

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.11/24 vrrp-group 1 priority 200
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1 priority 150
```

- Enable the switch to accept all packets destined for the virtual IP address if it is the master in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.11/24 vrrp-group 1 accept-data
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1 accept-data
```

- Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set vlans v100 l3-interface vlan.100
```

13. Enable VRRP on the MC-LAG on Switch A and Switch B using ELS:

- Create a routed VLAN interface (RVI), assign a virtual IP address that is shared between each switch in the VRRP group, and assign an individual IP address for each switch in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 virtual-address 100.1.1.1
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 virtual-address 100.1.1.1
```

- Assign the priority for each switch in the VRRP group:

**NOTE:** The switch configured with the highest priority is the master.

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 priority 200
```

Switch B:

```
[edit interfaces]
```

```
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 priority 150
```

- Enable the switch to accept all packets destined for the virtual IP address if it is the master in the VRRP group:

Switch A:

```
[edit interfaces]
```

```
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 accept-data
```

Switch B:

```
[edit interfaces]
```

```
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 accept-data
```

- Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
```

```
user@switch# set irb v100 l3-interface irb.100
```

### Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
```

```
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
```

```
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
```

```
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
```

```
user@switch# set protocols rstp bpdu-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

## Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2005](#)
- [Verifying That ICCP Is Working on Switch B on page 2005](#)

- [Verifying That LACP Is Active on Switch A on page 2006](#)
- [Verifying That LACP Is Active on Switch B on page 2006](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2006](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2006](#)
- [Verifying that MAC Learning Is Occurring on Switch A on page 2007](#)
- [Verifying that MAC Learning Is Occurring on Switch B on page 2007](#)
- [Verifying that Switch A is the Master in the VRRP Group on page 2008](#)
- [Verifying that Switch B is the Backup Member in the VRRP Group on page 2008](#)
- [Verifying that the Virtual IP Address is Attached to an Individual Address on Switch A on page 2009](#)
- [Verifying that the Virtual IP Address is Attached to an Individual Address on Switch B on page 2009](#)

### ***Verifying That ICCP Is Working on Switch A***

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
 user@switch# **show iccp**  
 Redundancy Group Information for peer 3.3.3.1  
     TCP Connection : Established  
     Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

### ***Verifying That ICCP Is Working on Switch B***

**Purpose** Verify that ICCP is running on Switch B.

**Action** **show iccp**  
  
 [edit]  
 user@switch# **show iccp**  
 Redundancy Group Information for peer 3.3.3.2  
     TCP Connection : Established  
     Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

**Verifying That LACP Is Active on Switch A**

**Purpose** Verify that LACP is active on Switch A.

**Action** [edit]  
user@switch# show lacp interfaces  
Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/46	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/46	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active

LACP protocol:                      Receive State      Transmit State                      Mux State  
xe-0/0/46                                      Current      Fast periodic      Collecting      distributing

**Meaning** This output shows that Switch A is participating in LACP negotiation.

**Verifying That LACP Is Active on Switch B**

**Purpose** Verify that LACP is active on Switch B

**Action** [edit]  
user@switch# show lacp interfaces  
Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/44	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/44	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active

LACP protocol:                      Receive State      Transmit State                      Mux State  
xe-0/0/44                                      Current      Fast periodic      Collecting      distributing

**Meaning** This output shows that Switch B is participating in LACP negotiation.

**Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A**

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# show interfaces mc-ae

```
Member Link : ae1
Current State Machine's State: mcae active state
Local Status : active
Local State : up
Peer Status : active
Peer State : up
 Logical Interface : ae1.0
 Topology Type : bridge
 Local State : up
 Peer State : up
 Peer Ip/MCP/State : 3.3.3.1 ae0.0 up
```

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

**Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B**

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

#### *Verifying that MAC Learning Is Occurring on Switch A*

**Purpose** Verify that MAC learning is working on Switch A.

**Action** [edit]  
user@switch# **show ethernet-switching table**  
Ethernet-switching table: 6 entries, 1 learned, 0 persistent entriesC

VLAN	MAC address	Type	Age	Interfaces
v100	*	Flood		- All-members
v100	00:00:5e:00:01:01	Static		- Router
v100	78:fe:3d:5a:07:42	Static		- Router
v100	78:fe:3d:5b:ad:c2	Learn(R)	0	ae0.0
v500	*	Flood		- All-members
v500	78:fe:3d:5a:07:42	Static		- Router

**Meaning** The output shows two static MAC address in VLAN v100 and one static MAC address in VLAN v500. These addresses belong to the Layer 3 RVI addresses on both Switch A and Switch B that you configured in the MC-LAG. The ICL-PL interface configured on the VRRP master member learned the VLAN v100 Learn (R) MAC address of the VRRP backup member.

#### *Verifying that MAC Learning Is Occurring on Switch B*

**Purpose** Verify that MAC learning is working on Switch B.

**Action** [edit]user@switch# **show ethernet-switching table**

Ethernet-switching table: 7 entries, 1 learned, 0 persistent entries

VLAN	MAC address	Type	Age	Interfaces
v100	*	Flood		- All-members
v100	00:00:5e:00:01:01	Static		- Router
v100	78:fe:3d:5a:07:42	Learn(R)	0	ae0.0
v100	78:fe:3d:5b:ad:c2	Static		- Router
v200	78:fe:3d:5b:ad:c2	Static		- Router
v500	*	Flood		- All-members
v500	78:fe:3d:5b:ad:c2	Static		- Router

**Meaning** The output shows two static MAC address in VLAN v100 and one static MAC address in VLAN v500. These addresses belong to the Layer 3 RVI addresses on both Switch A and Switch B that you configured in the MC-LAG. The ICL-PL interface configured on the VRRP backup member learned the VLAN v100 Learn (R) MAC address of the VRRP master member.

**Verifying that Switch A is the Master in the VRRP Group**

**Purpose** Verify that Switch A is the master member in the VRRP group.

**Action** [edit]user@switch# **show vrrp**

Interface	State	Group	VR state	VR Mode	Timer	Type	Address
vlan.100	up	1	master	Active	A 0.605	lcl	100.1.1.11
						vip	100.1.1.1

**Meaning** The output shows that Switch A is the master member in the VRRP group.

**Verifying that Switch B is the Backup Member in the VRRP Group**

**Purpose** Verify that Switch B is the backup member in the VRRP group.

**Action** [edit]user@switch# **show vrrp**

Interface	State	Group	VR state	VR Mode	Timer	Type	Address
vlan.100	up	1	backup	Active	A 0.605	lcl	100.1.1.10
						vip	100.1.1.1

**Meaning** The output shows that Switch B is the backup member in the VRRP group.

*Verifying that the Virtual IP Address is Attached to an Individual Address on Switch A*

**Action** [edit]  
 user@switch# run show interfaces terse vlan

Interface	Admin	Link	Proto	Local	Remote
vlan	up	up			
vlan.100	up	up	inet	100.1.1.1/24	100.1.1.11/24
vlan.500	up	up	inet	3.3.3.2/24	

**Meaning** The output shows that the virtual IP address (100.1.1.1/24) is bound to the individual IP address (100.1.1.11/24) on Switch A.

*Verifying that the Virtual IP Address is Attached to an Individual Address on Switch B*

**Action** [edit]  
 user@switch# run show interfaces terse vlan

Interface	Admin	Link	Proto	Local	Remote
vlan	up	up			
vlan.100	up	up	inet	100.1.1.1/24	100.1.1.10/24
vlan.500	up	up	inet	3.3.3.1/24	

**Meaning** The output shows that the virtual IP address (100.1.1.1/24) is bound to the individual IP address (100.1.1.10/24) on Switch B.

**Troubleshooting***Troubleshooting a LAG That Is Down*

**Problem** The show interfaces terse command shows that the MC-LAG is down

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

## Example: Configuring Redundant Trunk Links for Faster Recovery

**NOTE:** This example uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Example: Configuring Redundant Trunk Links for Faster Recovery*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 58.

You can manage network convergence by configuring both a primary link and a secondary link on a switch; this is called a redundant trunk group (RTG). If the primary link in a redundant trunk group fails, it passes its known MAC address locations to the secondary link, which automatically takes over after one minute.

This example describes how to create a redundant trunk group with a primary and a secondary link:

- [Requirements on page 2010](#)
- [Overview and Topology on page 2010](#)
- [Disabling RSTP on Switches 1 and 2 on page 2013](#)
- [Configuring Redundant Trunk Links on Switch 3 on page 2013](#)
- [Verification on page 2014](#)

### Requirements

---

This example uses the following hardware and software components:

- Two EX Series or QFX Series distribution switches
- One EX Series or QFX Series access switch
- The appropriate software release for your platform:
  - For EX Series switches: Junos OS Release 13.2X50-D10 or later
  - For the QFX Series: Junos OS Release 13.2X50-D15 or later

Before you configure the redundant trunk links network on the access and distribution switches, be sure you have:

- Configured interfaces ge-0/0/9 and ge-0/0/10 on the access switch, Switch 3, as trunk interfaces. .
- Configured one trunk interface on each distribution switch, Switch 1 and Switch 2.
- Connected the three switches as shown in the topology for this example (see [Figure 32 on page 2012](#)).

### Overview and Topology

---

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for trunk interface network recovery. When a trunk

interface fails, data traffic is routed to another trunk interface after one minute, thereby keeping network convergence time to a minimum.

This example shows the configuration of a redundant trunk group that includes one primary link (and its interface) and one unspecified link (and its interface) that serves as the secondary link.

A second type of redundant trunk group, not illustrated in the example, consists of two unspecified links (and their interfaces); in this case, neither of the links is primary. The software selects an active link by comparing the port numbers of the two links and activating the link with the higher port number. For example, if the two link interfaces use interfaces ge-0/1/0 and ge-0/1/1, the software activates ge-0/1/1. (In the interface names, the final number is the port number.)

The two links in a redundant trunk group generally operate the same way, whether they are configured as primary/unspecified or unspecified/unspecified. Data traffic initially passes through the active link but is blocked on the inactive link. While data traffic is blocked on the secondary link, note that Layer 2 control traffic is still permitted if the link is active. For example, an LLDP session can be run between two switches on the secondary link. If the active link either goes down or is disabled administratively, it broadcasts a list of its known MAC addresses for data traffic; the other link immediately picks up and adds the MAC addresses to its address table, becomes active, and begins forwarding traffic.

The one difference in operation between the two types of redundant trunk groups occurs when a primary link is active, goes down, is replaced by the secondary link, and then reactivates. When a primary link is re-enabled like this while the secondary link is active, the primary link waits 2 minutes (you can change the time interval by using the preempt cutover timer to accommodate your network) and then takes over as the active link. In other words, the primary link has priority and is always activated if it is available. This differs from the behavior of two unspecified links, both of which act as equals. Because the unspecified links are equal, the active link remains active until it either goes down or is disabled administratively; this is the only time that the other unspecified link learns the MAC addresses and immediately becomes active.

The example given here illustrates a primary/unspecified configuration for a redundant trunk group because that configuration gives you more control and is more commonly used.

**NOTE:** Rapid Spanning Tree Protocol (RSTP) is enabled by default on the switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You will need to disable RSTP on the two distribution switches in the example, Switch 1 and Switch 2. Spanning-tree protocols can, however, continue operating in other parts of the network—for example, between the distribution switches and also in links between distribution switches and the enterprise core.

Figure 32 on page 2012 displays an example topology containing three switches. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer.

Switch 3 is connected to the distribution layer through trunk interfaces ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2).

Table 175 on page 2012 lists the components used in this redundant trunk group.

Because RSTP and RTGs cannot operate simultaneously on a switch, you disable RSTP on Switch 1 and Switch 2 in the first configuration task, and you disable RSTP on Switch 3 in the second task.

The second configuration task creates a redundant trunk group called example 1 on Switch 3. The trunk interfaces ge-0/0/9.0 and ge-0/0/10.0 are the two links configured in the second configuration task. You configure the trunk interface ge-0/0/9.0 as the primary link. You configure the trunk interface ge-0/0/10.0 as an unspecified link, which becomes the secondary link by default.

Figure 32: Topology for Configuring the Redundant Trunk Links

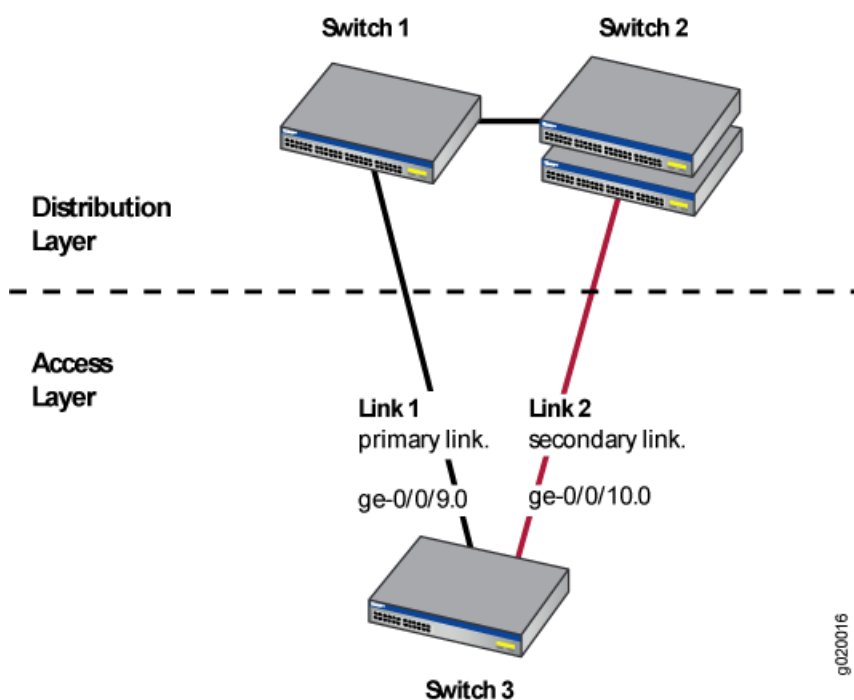

Table 175: Components of the Redundant Trunk Link Topology

Property	Settings
Switch hardware	<ul style="list-style-type: none"> <li>Switch 1—1 EX Series or QFX Series distribution switch</li> <li>Switch 2—1 EX Series or QFX Series distribution switch</li> <li>Switch 3—1 EX Series or QFX Series access switch</li> </ul>
Trunk interfaces	On Switch 3 (access switch): ge-0/0/9.0 and ge-0/0/10.0
Redundant trunk group	example1

### Disabling RSTP on Switches 1 and 2

To disable RSTP on Switch 1 and Switch 2, perform this task on each switch:

**CLI Quick Configuration** To quickly disable RSTP on Switch 1 and Switch 2, copy the following command and paste it into each switch terminal window:

```
[edit]
set protocols rstp disable
```

**Step-by-Step Procedure** To disable RSTP on Switch 1 and Switch 2:

1. Disable RSTP on Switch 1 and Switch 2:
- ```
[edit]
user@switch# set protocols rstp disable
```

Results Check the results of the configuration:

```
[edit]
user@switch# show
protocols {
  rstp {
    disable;
  }
}
```

Configuring Redundant Trunk Links on Switch 3

To configure redundant trunk links on Switch 3, perform this task:

CLI Quick Configuration To quickly configure the redundant trunk group example1 on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp disable
set switch-options redundant-trunk-group group example1 interface ge-0/0/9.0 primary
set switch-options redundant-trunk-group group example1 interface ge-0/0/10.0
set redundant-trunk-group group example1 preempt-cutover-timer 60
```

Step-by-Step Procedure Configure the redundant trunk group example1 on Switch 3.

1. Turn off RSTP:

```
[edit]
user@switch# set protocols rstp disable
```
2. Name the redundant trunk group example1 while configuring trunk interface ge-0/0/9.0 as the primary link and ge-0/0/10 as an unspecified link to serve as the secondary link:

```
[edit switch-options]
user@switch# set redundant-trunk-group group example1 interface ge-0/0/9.0 primary
user@switch# set redundant-trunk-group group example1 interface ge-0/0/10.0
```
3. (Optional) Change the time interval (from the default 120 seconds) that a re-enabled primary link waits to take over for an active secondary link:

```
[edit switch-options]
user@switch# set redundant-trunk-group group example1 preempt-cutover-timer 60
```

Results Check the results of the configuration:

```
[edit]
user@switch# show
switch-options
  redundant-trunk-group {
    group example1 {
      preempt-cutover-timer 60;
      interface ge-0/0/9.0 {
        primary;
      }
      interface ge-0/0/10.0;
    }
  }
protocols {
  rstp {
    disable;
  }
}
```

Verification

To confirm that the configuration is set up correctly, perform this task:

- [Verifying That a Redundant Trunk Group Was Created on page 2014](#)

Verifying That a Redundant Trunk Group Was Created

Purpose Verify that the redundant trunk group example1 has been created on Switch 1 and that trunk interfaces are members of the redundant trunk group.

Action List all redundant trunk groups configured on the switch:

```
user@switch> show redundant-trunk-group
```

| Group name | Interface | State | Time of last flap | Flap count |
|------------|-------------|--------|-------------------|------------|
| example1 | ge-0/0/9.0 | Up/Pri | Never | 0 |
| | ge-0/0/10.0 | Up | Never | 0 |

Meaning The **show redundant-trunk-group** command lists all redundant trunk groups configured on the switch as well as the interface names and their current states (up or down for an unspecified link, and up or down and primary for a primary link). For this configuration example, the output shows that the redundant trunk group example1 is configured on the switch. The **Up** beside the interfaces indicates that both link cables are physically connected. The **Pri** beside trunk interface ge-0/0/9.0 indicates that it is configured as the primary link.

Configuring Gigabit and 10-Gigabit Ethernet Interfaces

QFX Series products include a factory default configuration that:

- Enables all 10-Gigabit Ethernet network interfaces on the switch
- Sets a default port mode (access)
- Sets default link settings
- Specifies a logical unit (**unit 0**) and assigns it to **family ethernet-switching**
- Configures Storm Control on all 10-Gigabit Ethernet network interfaces
- Provides basic Rapid Spanning Tree Protocol (RSTP) and Link Layer Discovery Protocol (LLDP) configuration

This topic describes:

- [Configuring Port Mode on page 2015](#)
- [Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces on page 2016](#)
- [Configuring the IP Options on page 2016](#)

Configuring Port Mode

If you are connecting a switch to other switches and to routers on the LAN, you need to assign the interface to a logical port and you need to configure the logical port as a trunk port.

To configure a Gigabit Ethernet or 10-Gigabit interface for trunk port mode:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
port-mode trunk
```

Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces

QFX Series products include a factory default configuration that enables Gigabit Ethernet and 10-Gigabit Ethernet and interfaces with applicable link settings.

The following default configurations are available on Gigabit Ethernet interfaces:

- The speed for Gigabit Ethernet interfaces is set to 1000 Mbps by default.
- Gigabit Ethernet interfaces operate in full-duplex mode by default, and autonegotiation is supported. If you want to disable autonegotiation, you need to manually set the speed to 1g.

The following default configurations are available on 10-Gigabit Ethernet interfaces:

- The speed for 10-Gigabit Ethernet interfaces is set to 10 Gbps by default. The speed cannot be configured.
- 10-Gigabit Ethernet interfaces operate in full-duplex mode by default. Autonegotiation is not supported.

The **ether-options** statement enables you to modify the following options:

- **802.3ad**—Specify an aggregated Ethernet bundle for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces.
- **autonegotiation**—Enable or disable autonegotiation of flow control, link mode, and speed for Gigabit Ethernet interfaces.
- **link-mode**—Specify **full-duplex**, **half-duplex**, or **automatic** for Gigabit Ethernet interfaces.
- **loopback**—Enable or disable a loopback interface for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces.

To set **ether-options** for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces:

```
[edit]
user@switch# set interfaces interface-name ether-options
```

Configuring the IP Options

To specify an IP address for the logical unit:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

Configuring Aggregated Ethernet LACP

For aggregated Ethernet interfaces on the QFX Series, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs).

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

NOTE: Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable the LACP mode:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp mode
```

For example, to specify the mode as active, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic interval
```

For example, to specify the interval as fast, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic fast
```

Related Documentation

- [Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets on page 2149](#)
- [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 1896](#)
- [Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch on page 1900](#)
- [show lacp statistics interfaces \(View\) on page 2261](#)

Configuring Ethernet Loopback Capability

To place an interface in loopback mode, include the **loopback** statement:

```
loopback;
```

To return to the default—that is, to disable loopback mode—delete the **loopback** statement from the configuration:

```
[edit]
user@switch# delete interfaces interface-name ether-options loopback
```

To explicitly disable loopback mode, include the **no-loopback** statement:

```
no-loopback;
```

You can include the **loopback** and **no-loopback** statements at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* ether-options]

Related Documentation

- [Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2015](#)

Configuring Interfaces for Uplink Failure Detection

You can configure uplink failure detection on the QFX Series to help ensure balanced traffic flow. Using this feature, switches can monitor and detect link failure on uplink interfaces and can propagate the failure information to downlink interfaces, so that servers connected to those downlinks can switch over to secondary interfaces.

Follow these configuration guidelines:

- Configure an interface in only one group.
- Configure a maximum of eight groups for each switch.
- Configure a maximum of eight uplinks to monitor and a maximum of 48 downlinks to disable in each group.
- Configure physical links and logical links in separate groups.

To configure uplink failure detection on a switch:

1. Specify a name for an uplink failure detection group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name
```

2. Add an uplink interface to the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name link-to-monitor interface-name
```

3. Repeat Step 2 for each uplink interface you add to the group.

4. Add a downlink interface to the group:

```
[edit protocols]
```

```
user@switch# set uplink-failure-detection group group-name link-to-disable interface-name
```

5. Repeat Step 4 for each downlink interface you add to the group.

NOTE: After you have configured an uplink failure detection group, use the `show uplink-failure-detection group (Uplink Failure Detection) group-name` command to verify that all interfaces in the group are up. If the interfaces are down, uplink failure detection does not work.

Related Documentation

Configuring a Layer 3 Logical Interface

QFX Series systems use Layer 3 logical interfaces to divide a physical interface into multiple logical interfaces, each corresponding to a VLAN. Layer 3 logical interfaces route traffic between subnets.

To configure Layer 3 logical interfaces, enable VLAN tagging and partition one or more physical ports into multiple logical interfaces, each corresponding to a VLAN ID.

Before you begin, make sure you set up your VLANs. See [“Configuring VLANs” on page 1534](#).

To configure Layer 3 logical interfaces:

1. Enable VLAN tagging:

```
[edit interfaces interface-name]
```

```
user@switch# set vlan-tagging
```

2. Bind each VLAN ID to a logical interface:

```
[edit interfaces interface-name]
```

```
user@switch# set unit logical-unit-number vlan-id vlan-id-number
```

Related Documentation

- [Understanding Layer 3 Logical Interfaces on page 1851](#)
- [Verifying That Layer 3 Logical Interfaces Are Working on page 2148](#)

Configuring Link Aggregation

Use the link aggregation feature to aggregate one or more links to form a virtual link or aggregation group. The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases link availability.

NOTE: An interface with an already configured IP address cannot form part of the aggregation group.

1. [Creating an Aggregated Ethernet Interface on page 2020](#)
2. [Configuring the VLAN Name and VLAN ID Number on page 2020](#)
3. [Configuring Aggregated Ethernet LACP on page 2021](#)

Creating an Aggregated Ethernet Interface

To create an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@switch# set aggregated-devices interfaces device-count device-count
```

For example, to specify 5:

```
[edit chassis]
user@switch# set aggregated-devices interfaces device-count
```

2. Specify the minimum number of links for the aggregated Ethernet interface (aex), that is, the defined bundle, to be labeled “up”:

NOTE: By default only one link must be up for the bundle to be labeled “up”.

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options minimum-links minimum-links
```

For example, to specify 5:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options minimum-links 5
```

3. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options link-speed link-speed
```

For example, to specify 10g:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options link-speed 10g
```

4. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set interface-name ether-options 802.3ad aex
user@switch# set interface-name ether-options 802.3ad aex
```

Configuring the VLAN Name and VLAN ID Number

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

For example, 100.

Configuring Aggregated Ethernet LACP

For aggregated Ethernet interfaces on the QFX Series, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs).

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

NOTE: Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable the LACP mode:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp mode
```

For example, to specify the mode as active, execute the following command:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp periodic interval
```

For example, to specify the interval as fast, execute the following command:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp periodic fast
```

Related Documentation

Configuring Multichassis Link Aggregation

NOTE: Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two switches. An MC-LAG provides redundancy and load balancing between the two switches, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

The MC-LAG switches use the Interchassis Control Protocol (ICCP) to exchange the control information between two MC-LAG switches.

On one end of an MC-LAG is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to detect the MC-LAG. On the other side of MC-LAG are two MC-LAG switches. Each of the switches has one or more physical links connected to a single client device. The switches coordinate with each other to ensure that data traffic is forwarded properly.

NOTE: An interface with an already configured IP address cannot form part of the aggregated Ethernet interface or multichassis aggregated Ethernet interface group.

Perform the following steps on each switch that is hosting an MC-LAG:

1. Specify the same multichassis aggregated Ethernet identification number for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options mc-ae mc-ae-id number
```

For example:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

2. Specify a unique chassis ID for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options mc-ae chassis-id number
```

For example:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

3. Specify the mode of the MC-LAG the aggregated Ethernet interface belongs to.

NOTE: Only active-active mode is supported at this time.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options mc-ae mode mode
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

4. Specify whether the aggregated Ethernet interface participating in the MC-LAG is primary or secondary. Primary is **active**, and secondary is **standby**.

NOTE: You must configure status control on both switches hosting the MC-LAG. If one switch is in active mode, the other must be in standby mode.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options mc-ae status-control (active | standby)
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

5. Specify the same LACP system ID on each switch.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options lacp system-id mac-address
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
```

6. Specify the same LACP administration key on each switch.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options lacp admin-key number
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

7. Configure ICCP by doing the following on each switch hosting the MC-LAG:

- a. Configure the local IP address to be used by all switches hosting the MC-LAG.

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr local-ip-address
```

For example:

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr 3.3.3.1
```

- b. (Optional) Configure the IP address of the switch and the time during which an ICCP connection must succeed between the switches hosting the MC-LAG.

Configured session establishment hold time results in faster ICCP connection establishment. The recommended value is 50 seconds.

```
[edit protocols]
```

```
user@switch# set iccp peer peer-ip-address session-establishment-hold-time seconds
```

For example:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

- c. (Optional) Configure the IP address to be used for backup liveness detection:

NOTE: By default, backup liveness detection is not enabled. Configure backup liveness detection if you require minimal traffic loss during a reboot. Backup liveness detection helps achieve sub-second traffic loss during an MC-LAG reboot.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address backup-liveness-detection backup-peer-ip
ip-address
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip
10.207.64.232
```

- d. Configure the minimum interval at which the switch must receive a reply from the other switch with which it has established a Bidirectional Forwarding Detection (BFD) session.

NOTE: Configuring the minimum receive interval is required to enable BFD.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection minimum-receive-interval
seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 60
```

- e. Configure the minimum transmit interval during which a switch must receive a reply from a switch with which it has established a BFD session.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection transmit-interval
minimum-interval seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval
60
```

8. Configure a multichassis protection link between the switches.

```
[edit]
user@switch# set multi-chassis multi-chassis-protection peer-ip-address interface
interface-name
```

For example:

```
[edit protocols]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

9. If you are using ELS, configure the **service-id** on both switches.

The **service-id** must be the same number on both switches.

```
[edit]
user@switch# set switch-options service-id number
```

For example:

```
[edit]
user@switch# set switch-options service-id 10
```

10. Enable RSTP globally on all interfaces.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

11. Disable RSTP on the ICL-PL interfaces on both switches.

```
[edit]
user@switch# set protocols rstp interface interface-name disable
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

12. Configure the MC-LAG interfaces as edge ports on both switches.

```
set protocols rstp interface interface-name
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae1.0
```

13. Enable BPDU block on all interfaces except for the ICL-PL interfaces on both switches.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

For example:

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

Configuring Generic Routing Encapsulation Tunneling

Generic routing encapsulation (GRE) provides a private, secure path for transporting packets through an otherwise public network by encapsulating (or tunneling) the packets. GRE tunneling is accomplished through tunnel endpoints that encapsulate or de-encapsulate traffic.

This topic describes:

1. [Configuring a GRE Tunnel on page 2026](#)

Configuring a GRE Tunnel

To configure a GRE tunnel interface:

1. Create a GRE interface with a unit number and address:

[edit interfaces]

user@switch# set gr-0/0/0 unit *number* family inet *address*

NOTE: The base name of the interface must be gr-0/0/0.

This is a pseudo interface, and the address you specify can be any IP address. The routing table must specify gr-0/0/0.x as the outgoing interface for any packets that will be tunneled.

2. Specify the tunnel source address for the logical interface:

[edit interfaces]

user@switch# set gr-0/0/0 unit *number* tunnel source *source-address*

3. Specify the destination address:

[edit interfaces]

user@switch# set gr-0/0/0 unit *number* tunnel destination *destination-address*

The destination address must be reachable through static or dynamic routing. If you use static routing, you must get the destination MAC address (for example, by using ping) before user traffic can be forwarded through the tunnel.

Configuring IPv6 Addresses with /65 to /127 Prefix Lengths

If you want to use more than 16 IPv6 addresses with prefixes in the range /65 through /127 you must enter and commit the following statement:

```
[edit]
user@switch# set chassis forwarding-options profile-name num-65-127-prefix value
```

in which *value* can be a value in the range 1 through 128. Each increment adds support for 16 IPv6 addresses with prefixes between /65 and /127, for a maximum of 2048 such addresses (16 x 128 = 2048). The system supports 16 of these addresses by default, so to increase the number of supported addresses, you must enter a value of 2 or greater. For example, if you enter 2, the system will support 32 IPv6 addresses with prefixes in the range /65 through /127.

Each increment that you add for IPv6 addresses with prefixes in the range /65 through /127 reduces the number of forwarding table entries that are available for IPv4 addresses and IPv6 addresses with prefixes outside this range. If you enter 128 to configure support for the maximum number of IPv6 addresses with prefixes in the range /65 through /127, the portion of the longest prefix match section of the forwarding table available to IPv4 addresses and IPv6 addresses with prefixes outside the /65 through /127 range is reduced by 8K.

NOTE: When you configure the num-65-127-prefix value, all the data interfaces on the switch restart. The management interfaces are unaffected.

Configuration Tasks (ELS Only)

- [Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches on page 2028](#)
- [Configuring the System Mode on QFX5100 Switches on page 2030](#)

Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches

The QFX3500, QFX3600, and QFX5100 switches provide 40-Gbps QSFP+ ports that can be channelized. Channelization allows you to configure 40-Gbps QSFP+ ports to operate as four 10-Gigabit Ethernet (xe) interfaces. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. By default, the four 40-Gbps QSFP+ ports operate as 40-Gigabit Ethernet (et) ports. When an et port is channelized to four xe ports, a colon is used to signify the four separate channels. For example, on a QFX3500 standalone switch with port 2 on PIC 1 configured as four 10-Gigabit Ethernet ports, the interface names are *xe-0/1/2:0*, *xe-0/1/2:1*, *xe-0/1/2:2*, and *xe-0/1/2:3*.

By default, the 40-Gbps QSFP+ ports on QFX5100 switches are channelized automatically (auto-channelized) if any of the four channels on a 40-Gbps QSFP+ port receive data, unless you have configured channelization either at the chassis level or at the port level. Auto-channelization is not supported on interfaces contained in expansion modules or on Virtual Chassis ports.

You can disable auto-channelization by including the **disable-auto-speed-detection** statement at the **[edit chassis fpc slot-number pic pic-number (port port-number | port-range port-range-low port-range-high) channel-speed]** hierarchy.

There are restrictions on the ports you can channelize on the QFX5100-24Q and QFX5100-96S switches, depending on the system mode you enable. If you try to channelize ports that are restricted, the configuration is ignored. See [“Configuring the System Mode on QFX5100 Switches” on page 2030](#) for more information.

CAUTION: The Packet Forwarding Engine on the switch is restarted when you configure or delete a port. As a result, you might experience packet loss on the device. When you channelize a 40-Gbps QSFP+ port on the master of a Virtual Chassis, traffic might be disrupted on the master as well as on the line card members, and a mastership switchover occurs.

The following steps describe how to configure a block of ports or an individual port to operate as 10-Gigabit Ethernet ports.

1. To configure a block of 40-Gigabit Ethernet (et) ports to operate as 10-Gigabit Ethernet ports, specify a port range and channel speed:

```
[edit chassis fpc fpc-slot pic pic-slot]
user@switch# set port-range port-range-low port-range-high channel-speed speed
```

For example, to configure ports 0 through 3 on PIC 1 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 1]
user@switch# set port-range 0 3 channel-speed 10g
```

2. To configure an individual 40-Gigabit Ethernet (et) port to operate as 10-Gigabit Ethernet (xe) ports, specify a port number and channel speed:

```
[edit chassis fpc 0 pic 0]
user@switch# set port port-number channel-speed speed
```

For example, to configure port 2 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@switch# set port 2 channel-speed 10g
```

3. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

4. To return a range of ports to the default 40-Gigabit Ethernet configuration, delete the 10g statement:

```
[edit chassis fpc 0 pic 1]
user@switch# delete port-range port-range-low port-range-high channel-speed speed
```

For example, to return ports 0 through 3 to the default 40-Gigabit Ethernet configuration:

```
[edit chassis fpc 0 pic 1]
user@switch# delete port-range 0 3 channel-speed 10g
```

5. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

6. To return a port to the default 40-Gigabit Ethernet configuration, delete the 10g statement:

```
[edit chassis fpc 0 pic 0]
user@switch# delete port port-number channel-speed speed
```

For example, to return port 2 to the default 40-Gigabit Ethernet configuration:

```
[edit chassis fpc 0 pic 0]
user@switch# delete port 2 channel-speed 10g
```

7. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

The following steps describe how to disable auto-channelization at the the port level.

1. To disable auto-channelization at the port level, include the **disable** statement:

```
[edit]
user@switch# set chassis fpc slot-number pic pic-number (port port-number |
  port-range port-range-low port-range-high) channel-speed
  disable-auto-speed-detection
```

For example, to disable auto-channelization for one port:

```
[edit]
```

```
user@switch# set chassis fpc 0 pic 0 port 2 channel-speed  
disable-auto-speed-detection
```

For example, to disable auto-channelization for a range of ports:

```
[edit]  
user@switch# set chassis fpc 0 pic 0 port-range 2 4 channel-speed  
disable-auto-speed-detection
```

2. Review your configuration and issue the **commit** command.

```
[edit]  
user@switch# commit  
commit complete
```

- [pic on page 2133](#)

Configuring the System Mode on QFX5100 Switches

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. By default, all QSFP+ interfaces are auto-channelized. Auto-channelization is not supported on interfaces contained in expansion modules or on Virtual Chassis ports. To disable auto-channelization, see [“Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches” on page 2028](#) for more information.

NOTE: When you request the system mode change, you must reboot for the system mode to take effect.

CAUTION: The Packet Forwarding Engine on the switch is restarted when you issue system mode changes. As a result, you might experience packet loss on the switch.

The following system modes are available on the QFX5100-24Q switch:

- Default-mode
- Mode-104-port
- Flexi-PIC mode
- Non-oversubscribed mode

The following system modes are available on the QFX5100-96S switch:

- Default-mode
- Non-oversubscribed mode

See [Table 176 on page 2031](#) for more information regarding the supported system modes for your switch.

Table 176: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software

| | Default-mode | Mode-104port | Flexi-pic-mode | Non-oversubscribed-mode |
|-------------|--|--|---|---|
| QFX5100-48S | Not supported | Not supported | Not supported | Not supported |
| QFX5100-24Q | Supported

You do not need to configure the switch to be in this mode. On PIC 0, you can channelize all 24 40-Gbps QSFP+ ports. On PIC 1 and PIC 2, the 40-Gbps QSFP+ ports in the expansion modules are supported but cannot be channelized. In this mode, you can have one of two port combinations: 32 40-Gbps QSFP+ ports, or 96 10-Gigabit Ethernet ports plus 8 40-Gbps QSFP+ ports. | Supported

On PIC 0, all 24 40-Gbps QSFP+ ports are channelized by default, which provides 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in an expansion module on PIC 1 are supported. On PIC 1, ports 0 and 2 are channelized by default, and ports 1 and 3 are disabled. If 40-Gbps QSFP+ ports contained in an expansion module are detected on PIC 2, they are ignored. | Supported

On PIC 0, the first four ports (ports 0 through 3) cannot be channelized. 40-Gbps QSFP+ ports contained in expansion modules on PIC 1 and PIC 2 are supported but cannot be channelized. | Supported

All 24 40-Gbps QSFP+ ports on PIC 0 can be channelized to 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in the expansion modules on PIC 1 and PIC 2 are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode. |
| QFX5100-96S | Supported

You do not need to configure the switch to be in this mode. On PIC 0, all 96 10-Gigabit Ethernet ports are supported. You can only channelize the 40-Gbps QSFP+ interfaces to 10-Gigabit Ethernet interfaces on ports 96 and 100. When you channelize the interfaces on ports 96 and 100, ports 97, 98, 99, 101, 102 and 103 are disabled. | Not supported | Not supported | Supported

On PIC 0, all 96 10-Gigabit Ethernet ports are supported. However, the eight 40-Gbps QSFP+ ports are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode. |

The following steps describe how to change the system mode.

1. To change the system mode, issue the following operational command:

```
{master:0}  
root> request chassis system-mode mode
```

For example:

```
{master:0}  
root> request chassis system-mode non-oversubscribed-mode
```

2. To return to the default mode (default-mode), issue the following operational command:

```
{master:0}  
root> request chassis system-mode default-mode
```

3. To see which system mode is configured, issue the following operational command:

```
{master:0}  
root> show chassis system-mode
```

Configuration Tasks (Original CLI Only)

- [Configuring the Port Type on QFX3600 Standalone Switches on page 2032](#)
- [Configuring the QSFP+ Port Type on QFX3500 Standalone Switches on page 2034](#)

Configuring the Port Type on QFX3600 Standalone Switches

The QFX3600 standalone switch provides 16 40-Gbps QSFP+ ports. By default, all 16 ports operate as 40-Gigabit Ethernet (xle) ports. Optionally, you can choose to configure the 40-Gbps ports to operate as four 10-Gigabit Ethernet (xe) ports. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. You can configure up to 64 10-Gigabit Ethernet ports on ports Q0 through Q15.

This topic explains how to configure the port type on QFX3600 standalone switches.

CAUTION: The Packet Forwarding Engine on the QFX3600 standalone switch is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the switch.

The following message may be displayed in the system log file when the Packet Forwarding Engine is restarted. You can ignore this message.

Pipe write error: Broken pipe

flush operation failed

The following steps describe how to configure either a block of ports or an individual port to operate as 10-Gigabit Ethernet (xe) ports, as well as how to delete a 10-Gigabit Ethernet (xe) port configuration.

NOTE: When you delete the xe port type configuration for an individual port or a block of ports, the ports return to operating as 40-Gigabit Ethernet (xle) ports.

1. To configure a block of ports to operate as 10-Gigabit Ethernet (xe) ports, specify a port range:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q7 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port-range 4 7
```

2. To configure an individual port to operate as a 10-Gigabit Ethernet (xe) port, specify a port number:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port port-number
```

For example, to configure port Q4 to operate as a 10-Gigabit Ethernet port:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port 4
```

3. Review your configuration and issue the **commit** command.

```
[edit chassis fpc 0 pic 0]
user@switch# commit
commit complete
```

4. To delete the 10-Gigabit Ethernet (xe) port configuration for a block of ports (and return to the default 40-Gigabit Ethernet configuration), specify a port range:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port-range port-range-low port-range-high
```

For example, to delete the 10-Gigabit Ethernet port configuration for ports Q4 through Q7:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port-range 4 7
```

5. To delete the 10-Gigabit Ethernet (xe) port configuration for an individual port (and return to the default 40-Gigabit Ethernet configuration), specify a port number:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port port-number
```

For example, to delete the 10-Gigabit Ethernet port configuration for port Q4:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port 4
```

Configuring the QSFP+ Port Type on QFX3500 Standalone Switches

By default, the four 40-Gbps QSFP+ ports are configured to operate as 10-Gigabit Ethernet (xe) ports. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. You can, however, configure the four 40-Gbps QSFP+ ports to operate as 40-Gigabit Ethernet (xle) ports.

NOTE: Port Q0 supports only three (not the typical four) 10-Gigabit Ethernet ports, because one port is reserved.

CAUTION: The Packet Forwarding Engine on the QFX3500 standalone switch is restarted when you commit port type configuration changes (for example, configuring or deleting an xle port). As a result, you might experience packet loss on the device.

The following steps describe how to configure either a block of ports or an individual port to operate as 40-Gigabit Ethernet (xle) ports, as well as how to delete a 40-Gigabit Ethernet (xle) configuration.

NOTE: When you delete an xle block of ports or individual port, the ports return to operating as 10-Gigabit Ethernet ports.

1. To configure a block of ports to operate as 40-Gigabit Ethernet (xle) ports, specify a port range:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port-range port-range-low port-range-high
```

For example, to configure ports Q0 through Q3 to operate as 40-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port-range 0 3
```

2. To configure an individual port to operate as a 40-Gigabit Ethernet (xle) port, specify a port number:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port port-number
```

For example, to configure port Q2 to operate as a 40-Gigabit Ethernet port:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port 2
```

- Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

- To delete a block of ports configured as 40-Gigabit Ethernet (xle) ports (and return to the default 10-Gigabit Ethernet configuration), specify a port range:

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port-range port-range-low port-range-high
```

For example, to delete the 40-Gigabit Ethernet (xle) port configuration for ports Q0 through Q3 (and return to the default 10-Gigabit Ethernet configuration):

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port-range 0 3
```

- To delete an individual port configured as a 40-Gigabit Ethernet (xle) port (and return to the default 10-Gigabit Ethernet configuration), specify an individual port:

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port port-number
```

For example, to delete the 40-Gigabit Ethernet (xle) port configuration for port Q2 (and return to the default 10-Gigabit Ethernet configuration):

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port 2
```

- Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

backup-liveness-detection

| | |
|---------------------------------|--|
| Syntax | <code>backup-liveness-detection {
 backup-peer-ip ip4-address</code> |
| Hierarchy Level | [edit protocols iccp peer] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 13.2R1 for EX Series switches. |
| Description | Backup liveness detection determines the peer status (whether it is up or down) by exchanging keep alive messages (UDP-based packets) over the management link between the two Interchassis Control Protocol (ICCP) peers. When an ICCP connection is operationally down, the status of the peers hosting a multichassis link aggregation group (MC-LAG) is detected by sending liveness detection requests to each other. Peers must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, the liveness detection check fails, and a failure action is implemented. Backup liveness detection must be configured on both peers hosting the MC-LAG. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

backup-peer-ip

| | |
|---------------------------------|--|
| Syntax | <code>backup-peer-ip <i>ip4-address</i>;</code> |
| Hierarchy Level | [edit protocols iccp peer backup-liveness-detection] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 13.2R1 for EX Series switches. |
| Description | Specify the IP address of the peer being used as a backup peer in the Bidirectional Forwarding Detection (BFD) configuration. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

chassis

```
Syntax  chassis {
        routing-engine {

chassis-id

| | |
|---------------------------------|---|
| Syntax | <code>chassis-id <i>chassis-id</i>;</code> |
| Hierarchy Level | [edit interfaces aggregated-ether-options mc-ae] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Specify the chassis ID of the multichassis aggregated Ethernet interface device. LACP uses the chassis ID to calculate the port number of the multichassis link aggregation group (MC-LAG) physical member links. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

configured-flow-control

| | |
|---------------------------------|---|
| Syntax | <pre>configured-flow-control {
 rx-buffers (on off);
 tx-buffers (on off);
}</pre> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> ether-options] |
| Description | <p>Configure Ethernet PAUSE asymmetric flow control on an interface. You can set an interface to generate and send PAUSE messages, and you can set an interface to respond to PAUSE messages sent by the connected peer. You must set both the rx-buffers and the tx-buffers values when you configure asymmetric flow control.</p> <p>Use the flow-control and no-flow-control statements to enable and disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> <div> NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC) by applying a congestion notification profile to the interface.</div> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> |
| Default | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces. |
| Options | The statements are explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

hold-time (Physical Interface)

| | |
|---|---|
| Syntax | <code>hold-time up <i>milliseconds</i> down <i>milliseconds</i>;</code> |
| Hierarchy Level | <code>[edit interfaces <i>interface-name</i>],</code>
<code>[edit interfaces interface-range <i>interface-range-name</i>]</code> |
| Release Information | Statement introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 10.4R5 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. |
| Description | Specify the hold-time value to use to damp interface transitions. When an interface goes from up to down, it is not advertised to the rest of the system as being down until it has remained down for the hold-time period. Similarly, an interface is not advertised as being up until it has remained up for the hold-time period. |
| <div>  NOTE: <ul style="list-style-type: none"> We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment. The hold-time option is not available for controller interfaces. </div> | |
| Default | Interface transitions are not damped. |
| Options | <p>down <i>milliseconds</i>—Hold time to use when an interface transitions from up to down. Junos OS advertises the transition within 100 milliseconds of the time value you specify.</p> <p>Range: 0 through 4,294,967,295 milliseconds</p> <p>Default: 0 milliseconds (interface transitions are not damped)</p> <p>up <i>milliseconds</i>—Hold time to use when an interface transitions from down to up. Junos OS advertises the transition within 100 milliseconds of the time value you specify.</p> <p>Range: 0 through 4,294,967,295 milliseconds</p> <p>Default: 0 milliseconds (interface transitions are not damped)</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

    }
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

The remaining statement are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface (Multichassis Protection)

| | |
|---------------------------------|---|
| Syntax | interface <i>interface-name</i> ; |
| Hierarchy Level | [edit multi-chassis multi-chassis-protection peer] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Specify the name of the interface that is being used as an interchassis link-protection link (ICL-PL). The two switches hosting a multichassis link aggregation group (MC-LAG) use this link to pass Interchassis Control Protocol (ICCP) and data traffic. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

interface (Redundant Trunk Groups)

| | |
|---------------------------------|--|
| Syntax | <code>interface <i>interface-name</i> <primary>;</code>
<code>interface <i>interface-name</i>;</code> |
| Hierarchy Level | For platforms with ELS:

[edit switch-options redundant-trunk-group <i>group name</i>]

For platforms without ELS:

[edit ethernet-switching-options redundant-trunk-group <i>group name</i>] |
| Release Information | Statement introduced in Junos OS Release 9.0 for EX Series switches.
Hierarchy level [edit switch-options] introduced in Junos OS Release 13.2X50-D10 (ELS). (See “Getting Started with Enhanced Layer 2 Software” on page 58 for information about ELS.)
Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series. |
| Description | Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over as the primary link without waiting for normal STP convergence. |
| Options | interface <i>interface-name</i> —A logical interface or an aggregated interface containing multiple ports.

primary —(Optional) Specify one of the interfaces in the redundant group as the primary link. The interface without this option is the secondary link in the redundant group. If a link is not specified as primary , the software compares the two links and selects the link with the highest port number as the active link. For example, if the two interfaces are ge-0/1/0 and ge-0/1/1 , the software assigns ge-0/1/1 as the active link. |
| Required Privilege Level | system—To view this statement in the configuration.
system—control—To add this statement to the configuration. |

Hierarchy Level [edit [interfaces](#)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX series.

Description Group interfaces that share a common configuration profile.

NOTE: The interface range definition is supported only for Gigabit Ethernet, 10-Gigabit Ethernet, and Fibre Channel interfaces.

Options `interface-range-name`—Name of the interface range.

NOTE: You can use regular expressions and wildcards to specify the interfaces in the member range configuration. Do not use wildcards for interface types.

The remaining statements are explained separately.

Required Privilege Level `interface`—To view this statement in the configuration.
 `interface-control`—To add this statement to the configuration.

Hierarchy Level [\[edit\]](#)

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interfaces on the QFX Series.

Most standard Junos OS configuration statements are available in the Junos OS for a switch. This topic lists Junos OS statements that you commonly use when configuring a switch as well as statements added to support switches only.

Options **aex**—Configure an aggregated Ethernet interface.

xe-0/0/*port***/**—Configure a 10-Gigabit Ethernet interface.

ge-0/0/*port***/**—Configure a Gigabit Ethernet interface.

fc-0/0/*port***/**—Configure a Fibre Channel interface.

meX/—Configure a management interface.

mc-ae—Configure a multichassis aggregated Ethernet (MC-AE) interface.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

Related Documentation

lcp (802.3ad)

Syntax **lcp** {
 force-up;
 (primary | backup);
 port-priority;
 }

Hierarchy Level [edit [interfaces](#) *interface-name* [ether-options](#) 802.3ad]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

NOTE: The port-priority statement is not supported on QFabric systems.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

lacp (Aggregated Ethernet)

| | |
|---------------------------------|--|
| Syntax | lacp (active passive) {
admin-key <i>key</i> ;
periodic (fast slow);
system-ID <i>mac-address</i> ;
} |
| Hierarchy Level | [edit interfaces interface-name aggregated-ether-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Link Aggregation on page 2019• Configuring Aggregated Ethernet LACP on page 2017• Understanding Aggregated Ethernet Interfaces and LACP on page 1843 |

link-to-disable

| | |
|---------------------------------|--|
| Syntax | link-to-disable <i>interface-name</i> ; |
| Hierarchy Level | [edit protocols uplink-failure-detection group <i>group-name</i>] |
| Release Information | Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Configure the downlink interfaces to be disabled when the switch detects an uplink failure. The switch can monitor a maximum of eight downlink interfaces in a group. |
| Options | <i>interface-name</i> —Name of the downlink interface in an uplink failure detection group. The interface can be a physical interface or a logical interface. |
| Required Privilege Level | admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Overview of Uplink Failure Detection on page 1841• Configuring Interfaces for Uplink Failure Detection on page 2018• Example: Configuring Interfaces for Uplink Failure Detection on page 1891 |

link-to-monitor

| | |
|---------------------------------|--|
| Syntax | <code>link-to-monitor <i>interface-name</i>;</code> |
| Hierarchy Level | <code>[edit protocols uplink-failure-detection group <i>group-name</i>]</code> |
| Release Information | Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Configure the uplink interfaces to be monitored for uplink failure detection. The switch can monitor a maximum of eight uplink interfaces in a group. |
| Options | <i>interface-name</i> —Name of the uplink interface in an uplink failure detection group. The interface can be a physical interface or a logical interface. |
| Required Privilege Level | admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Overview of Uplink Failure Detection on page 1841• Configuring Interfaces for Uplink Failure Detection on page 2018• Example: Configuring Interfaces for Uplink Failure Detection on page 1891 |

link-down

| | |
|---------------------------------|--|
| Syntax | link-down (red yellow ignore); |
| Hierarchy Level | [edit chassis alarm ethernet],
[edit chassis alarm fibre-channel],
[edit chassis interconnect-device <i>name</i> alarm ethernet],
[edit chassis node-group <i>name</i> alarm fibre-channel] |
| Release Information | Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Specify either red, yellow, or ignore to display when the link is down. |
| Options | <p>red—Indicates that one or more hardware components have failed or exceeded temperature thresholds, or an alarm condition configured on an interface has triggered a critical warning.</p> <p>yellow—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.</p> <p>ignore—Suppresses or ignores the alarm.</p> |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | |

link-mode

| | |
|---------------------------------|---|
| Syntax | <code>link-mode mode;</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> ether-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Set the device's link-connection characteristic. |
| Default | The full-duplex mode is enabled. |
| Options | <p>mode —Link characteristic:</p> <ul style="list-style-type: none"> • full-duplex—Connection is full duplex. • half-duplex—Connection is half duplex. • automatic—Link mode is negotiated. <p>If no-auto-negotiation is specified in the ether-options option, you can select only full-duplex or half-duplex. If auto-negotiation is specified in the ether-options option, you can select any mode.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2015 • <i>Junos OS Network Interfaces Library for Routing Devices</i> |

link-speed

| | |
|---------------------------------|--|
| Syntax | link-speed <i>speed</i> ; |
| Hierarchy Level | [edit interfaces aex aggregated-ether-options] |
| Release Information | Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For aggregated Ethernet interfaces only, set the required link speed. |
| Options | <p>speed—For aggregated Ethernet links, you can specify the speed in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).</p> <p>Aggregated Ethernet links on the QFX Series can have one of the following speed values:</p> <ul style="list-style-type: none">• 1g—Links are 1 Gbps.• 10g—Links are 10 Gbps. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Link Aggregation on page 2019 |

liveness-detection

| | |
|---------------------------------|---|
| Syntax | <pre> liveness-detection { detection-time { threshold <i>milliseconds</i>; } minimum-interval <i>milliseconds</i>; minimum-receive-interval <i>milliseconds</i>; multiplier <i>number</i>; no-adaptation; transmit-interval { minimum-interval <i>milliseconds</i>; threshold <i>milliseconds</i>; } version (1 automatic); }</pre> |
| Hierarchy Level | [edit protocols iccp peer] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | <p>Enable Bidirectional Forwarding Detection (BFD). BFD enables rapid detection of communication failures between peers.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

local-ip-addr (ICCP)

| | |
|---------------------------------|--|
| Syntax | local-ip-addr <i>local-ip-address</i> ; |
| Hierarchy Level | [edit protocols iccp],
[edit protocols iccp peer <i>peer-IP-address</i>] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Specify the local IP address of the interchassis link (ICL) interface that Interchassis Control Protocol (ICCP) uses to communicate to the peers that host a multichassis link aggregation group (MC-LAG). |
| Options | local-ip-address —Default local IP address to be used by all peers. |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

loopback (Aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet)

| | |
|---------------------------------|--|
| Syntax | (loopback no-loopback); |
| Hierarchy Level | [edit interfaces <i>interface-name</i> aggregated-ether-options],
[edit interfaces <i>interface-name</i> ether-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Ethernet Loopback Capability on page 2018 |

management-ethernet (Alarm)

| | |
|----------------------------|---|
| Syntax | management-ethernet {
link-down (red yellow ignore);
} |
| Hierarchy Level | [edit chassis alarm],
[edit chassis interconnect-device <i>name</i> alarm],
[edit chassis node-group <i>name</i> alarm] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Configure alarms for a management Ethernet interface. |

NOTE: If you configure a yellow alarm on the Interconnect device, it will be handled as a red alarm.

| | |
|---------------------------------|---|
| Options | The remaining statement is explained separately.— |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Understanding Alarms on page 6429• Interface Alarm Messages on page 6433 |

member

| | |
|---------------------------------|--|
| Syntax | <code>member interface-name;</code> |
| Hierarchy Level | [edit interfaces interface-range interface-range-name] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Specify the name of the member interface belonging to an interface range on the QFX Series switch. |
| Options | <i>interface-name</i> —Name of the interface. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2015 • Interfaces Overview on page 1839 • Junos OS Network Interfaces Library for Routing Devices |

member-range

| | |
|---------------------------------|---|
| Syntax | <code>member-range starting-interface-name ending-interface-name;</code> |
| Hierarchy Level | [edit interfaces interface-range interface-range-name] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Specify the names of the first and last members of a sequence of interfaces belonging to an interface range. |
| Options | <i>starting interface-name ending interface-name</i> —Name of the first member and the name of the last member in the interface sequence. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Understanding Interface Ranges on the QFX Series on page 1850 • Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2015 • Interfaces Overview on page 1839 • Junos OS Network Interfaces Library for Routing Devices |

mc-ae

| | |
|--|--|
| Syntax | <pre>mc-ae { chassis-id chassis-id; mc-ae-id mc-ae-id; mode (active-active); status-control (active standby); }</pre> |
| Hierarchy Level | [edit interfaces aggregated-ether-options] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Specify the multichassis aggregated Ethernet interface configuration. |
| Options | <p>chassis-id—Specify the chassis ID for LACP to calculate the port number of the MC-LAG physical member links.</p> <p>mc-ae-id—Specify the identification number of MC-LAG device. The two MC-LAG QFX3500 devices that manage a given MC-LAG must have the same mc-lag-id.</p> <p>mode (active active)—Specify that the MC-LAG is in active-active mode. In this mode, if a member interface of the MC-LAG goes down, traffic can still be forwarded to the QFX3500 devices hosting the MC-LAG using the interchassis link-protection link (ICL-PL). The links from the client-device connected to both of the QFX3500 devices will remain active. Only active-active mode is supported at this time.</p> <p>status-control (active standby)—Specify if a peer is in active or standby mode. In active mode, the peer is considered the primary device, and in standby mode it is considered the secondary device. If the ICL-PL goes down, the peer in standby mode will bring its member links to standby state. If the Interchassis Control Protocol (ICCP) connection goes down, the peer in standby mode will change the LACP system ID to the default value on its member links.</p> |
| <div style="display: flex; align-items: center;">  <p>NOTE: You cannot have both peers hosting an MC-LAG be in active or standby mode. One peer must be in active mode, and the other peer must be in standby mode.</p> </div> | |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

mc-ae-id

| | |
|---------------------------------|---|
| Syntax | <code>mc-ae-id <i>mc-ae-id</i>;</code> |
| Hierarchy Level | [edit interfaces aggregated-ether-options mc-ae] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Specify the multichassis aggregated Ethernet (MC-AE) identification number of the MC-AE that a given aggregated Ethernet interface belongs to. The two peers that host a given multichassis link aggregation group (MC-LAG) must have the same multichassis aggregated Ethernet ID. |
| Options | Range: 1 through 65535. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

minimum-interval (Liveness Detection)

| | |
|---------------------------------|--|
| Syntax | <code>minimum-interval <i>milliseconds</i>;</code> |
| Hierarchy Level | [edit protocols iccp peer liveness-detection] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Configure simultaneously the minimum interval at which the peer transmits liveness detection requests and the minimum interval at which the peer expects to receive a reply from a peer with which it has established a Bidirectional Forwarding Detection (BFD) session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately by using the transmit-interval minimal-interval and minimum-receive-interval statements, respectively. |
| Options | milliseconds —Specify the minimum interval value for Bidirectional Forwarding Detection (BFD).
Range: 1 through 255,000 |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

minimum-links

| | |
|---------------------------------|---|
| Syntax | <code>minimum-links <i>number</i>;</code> |
| Hierarchy Level | [edit interfaces <code>aex</code> aggregated-ether-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For an aggregated Ethernet interface, set the minimum number of links that must be up for the bundle to be labeled up. |
| Options | <i>number</i> —Number of links.
Range: 1 through 8
Default: 1 |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Link Aggregation on page 2019 |

minimum-receive-interval (Liveness Detection)

| | |
|---------------------------------|---|
| Syntax | <code>minimum-receive-interval <i>milliseconds</i>;</code> |
| Hierarchy Level | [edit protocols <code>iccp</code> <code>peer</code> liveness-detection] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Configure the minimum interval at which the peer must receive a reply from a peer with which it has established a Bidirectional Forwarding Detection (BFD) session. |
| Options | <i>milliseconds</i> —Specify the minimum interval value.
Range: 1 through 255,000 |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

mode (QFX Series)

| | |
|---------------------------------|---|
| Syntax | <code>mode active-active ;</code> |
| Hierarchy Level | [edit interfaces aggregated-ether-options mc-ae] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Configure the multichassis link aggregation group (MC-LAG) to be in active-active mode. In active-active mode, all of the members of the MC-LAG will be active on both routing or switching devices. Only active-active mode is supported at this time. |
| Options | active-active —Specify that all of the members of the MC-LAG will be active on both routing or switching devices. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | |

multi-chassis

| | |
|---------------------------------|---|
| Syntax | <pre>multi-chassis { multi-chassis-protection peer-ip-address { interface interface-name; } }</pre> |
| Hierarchy Level | [edit] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Configure an interchassis link-protection link (ICL-PL) between the two peers that host a multichassis link aggregation group (MC-LAG). You can configure either an aggregated Ethernet interface or a 10-Gigabit Ethernet interface to be an ICL-PL. |
| Options | interface <i>interface-name</i> —Specify the logical interface name of the peer.

The remaining statements are explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

multi-chassis-protection

| | |
|---------------------------------|---|
| Syntax | <code>multi-chassis-protection <i>peer-ip-address</i> {
 interface <i>interface-name</i>;
}</code> |
| Hierarchy Level | [edit multi-chassis] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Configure multichassis link protection between the two peers that host a multichassis link aggregation group (MC-LAG). If the Interchassis Control Protocol (ICCP) connection is up and the interchassis link (ICL) comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on one interface for each peer.

The remaining statements are explained separately. |
| Options | interface <i>interface-name</i> —Specify the logical interface name of the peer.

The remaining statements are explained separately. |
| Required Privilege Level | interface —To view this statement in the configuration.
interface-control —To add this statement to the configuration. |

multiplier (Liveness Detection)

| | |
|---------------------------------|---|
| Syntax | <code>multiplier <i>number</i>;</code> |
| Hierarchy Level | [edit protocols iccp peer liveness-detection] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Configure the number of liveness detection requests not received by the peer before Bidirectional Forwarding Detection (BFD) declares the peer is down. |
| Options | number —Maximum allowable number of liveness detection requests missed by the peer.
Range: 1 through 255
Default: 3 |
| Required Privilege Level | routing —To view this statement in the configuration.
routing-control —To add this statement to the configuration. |
| Related Documentation | |

mtu

| | |
|---------------------------------|---|
| Syntax | <code>mtu bytes;</code> |
| Hierarchy Level | [edit interfaces interface-name],
[edit interfaces interface-range interface-name] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Specify the maximum transmission unit (MTU) size for the media. Changing the media MTU size causes an interface to be deleted and added again. On a QFX3500 switch, either standalone or as part of the QFabric system, the maximum MTU value on an untagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus four, whereas the maximum MTU value on a tagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight. The maximum MTU value on an untagged or tagged packet transiting through an ingress 10-Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight. |
| Options | bytes —MTU size.
Range: 64 through 9216 bytes
Default: 1514 bytes |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2015 • <i>Junos OS Network Interfaces Library for Routing Devices</i> |

no-adaptation (Liveness Detection)

| | |
|---------------------------------|---|
| Syntax | <code>no-adaptation;</code> |
| Hierarchy Level | [edit protocols iccp peer liveness-detection] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Configure Bidirectional Forwarding Detection (BFD) sessions to not adapt to changing network conditions. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | |

no-gratuitous-arp-request

| | |
|---------------------------------|---|
| Syntax | no-gratuitous-arp-request; |
| Hierarchy Level | [edit interfaces <i>interface-name</i>],
[edit interfaces <i>interface-range</i> <i>interface-name</i>] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure the switch not to respond to gratuitous ARP requests. You can disable responses to gratuitous ARP requests on both Layer 2 Ethernet switching interfaces and routed VLAN interfaces (RVIs). |
| Default | Gratuitous ARP responses are enabled on all Ethernet switching interfaces and RVIs. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring Routed VLAN Interfaces on page 1532 |

on-disk-failure

| | |
|---------------------------------|--|
| Syntax | on-disk-failure {
disk-failure-action (halt reboot);
} |
| Hierarchy Level | [edit chassis redundancy]
[edit chassis routing-engine] |
| Release Information | Statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Instruct the router to halt or reboot if it detects hard disk errors on the Routing Engine. |
| Options | The remaining statement is explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• graceful-switchover on page 1775• <i>Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors</i>• <i>Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)</i>• <i>High Availability Features for EX Series Switches Overview</i> |

on-loss-of-keepalives

| | |
|---------------------------------|--|
| Syntax | on-loss-of-keepalives; |
| Hierarchy Level | [edit chassis redundancy failover] |
| Release Information | Statement introduced in Junos OS Release 9.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Instruct the backup router to take mastership if it detects a loss of keepalive signal from the master Routing Engine. |
| Default | <p>The on-loss-of-keepalives statement must be included at the [edit chassis redundancy failover] hierarchy level for failover to occur.</p> <p>When the on-loss-of-keepalives statement is included but graceful Routing Engine switchover <i>is not</i> configured, failover occurs after 300 seconds (5 minutes).</p> <p>When the on-loss-of-keepalives statement is included and graceful Routing Engine switchover <i>is</i> configured, the keepalive signal is automatically enabled and the failover time is set to 2 seconds.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • graceful-switchover on page 1775 • <i>keepalive-time</i> • <i>Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)</i> • <i>High Availability Features for EX Series Switches Overview</i> |

peer (ICCP)

Syntax `peer ip-address {
 authentication-key string;
 backup-liveness-detection {
 backup-peer-ip ip-address;
 }
 liveness-detection {
 detection-time {
 threshold milliseconds;
 }
 minimum-interval milliseconds;
 minimum-receive-interval milliseconds;
 multiplier number;
 no-adaptation;
 transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }
 version (1 | automatic);
 }
 local-ip-addr ipv4-address;
 session-establishment-hold-time seconds;
 }`

Hierarchy Level [edit protocols [iccp](#)]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Configure the peers that host a multichassis link aggregation group (MC-LAG). You must configure Interchassis Control Protocol (ICCP) for both peers that host the MC-LAG.

The remaining statements are explained separately.

Required Privilege routing—To view this statement in the configuration.
 Level routing-control—To add this statement to the configuration.

peer (Multichassis)

| | |
|---------------------------------|--|
| Syntax | <code>peer ip-address {
 interface interface-name;
}</code> |
| Hierarchy Level | [edit multi-chassis] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Configure the IP address of the peer that is part of the interchassis link-protection link (ICL-PL). If the Interchassis Control Connection Protocol (ICCP) is up and the interchassis link (ICL) comes up, the peer configured as standby will bring up the MC-AE interfaces shared with the active peer specified by the peer statement. You must specify the physical interface of the peer. |
| Options | interface interface-name —Specify the logical interface name of the peer. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

periodic

| | |
|---------------------------------|---|
| Syntax | <code>periodic (fast slow);</code> |
| Hierarchy Level | [edit interfaces aex aggregated-ether-options lacp] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure the interval for periodic transmission of LACP packets. |
| Default | fast |
| Options | interval —Interval at which to periodically transmit LACP packets: <ul style="list-style-type: none"> fast—Receive packets every second. This is the default. slow—Receive packets every 30 seconds. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> Understanding Aggregated Ethernet Interfaces and LACP on page 1843 <i>Junos OS Network Interfaces Library for Routing Devices</i> |

preempt-cutover-timer

| | |
|---------------------------------|--|
| Syntax | <code>preempt-cutover-timer seconds;</code> |
| Hierarchy Level | <ul style="list-style-type: none">For platforms with ELS:
[edit switch-options redundant-trunk-group group name]For platforms without ELS:
[edit ethernet-switching-options redundant-trunk-group group name] |
| Release Information | <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Hierarchy level [edit switch-options] introduced in Junos OS Release 13.2X50-D10 (ELS). (See “Getting Started with Enhanced Layer 2 Software” on page 58 for information about ELS.)</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> |
| Description | Change the length of time that a re-enabled primary link waits to take over from an active secondary link in a redundant trunk group. |
| Default | If you do not change the time with the preempt-cutover-timer statement, a re-enabled primary link takes over from the active secondary link after 120 seconds. |
| Options | <p>seconds—Number of seconds that the primary link waits to take over from the active secondary link.</p> <p>Range: 1 through 600 seconds</p> |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"><i>Example: Configuring Redundant Trunk Links for Faster Recovery</i>Example: Configuring Redundant Trunk Links for Faster Recovery on page 2010Understanding Redundant Trunk Links on page 1885 |

redundancy (Graceful Switchover)

| | |
|---------------------------------|---|
| Syntax | <pre> redundancy { failover { on-disk-failure; on-loss-of-keepalives; } graceful-switchover; } </pre> |
| Hierarchy Level | [edit chassis] |
| Release Information | <p>Statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> |
| Description | <p>Enable redundant Routing Engines on a Virtual Chassis with two or more member switches or on a standalone EX6200 or EX8200 switch with more than one Routing Engine.</p> <p>The remaining statements are explained separately.</p> |
| Default | Redundancy is enabled for the Routing Engines. |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • graceful-switchover on page 1775 • Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure) on page 1746 • Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure) • High Availability Features for EX Series Switches Overview |

redundant-trunk-group

| | |
|---------------------------------|--|
| Syntax | <pre>redundant-trunk-group {
 group name {
 interface interface-name <primary>;
 interface interface-name;
 preempt-cutover-timer seconds;
 }
}</pre> |
| Hierarchy Level | <ul style="list-style-type: none">• For platforms with ELS:
[edit switch-options]• For platforms without ELS:
[edit ethernet-switching-options] |
| Release Information | <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Hierarchy level [edit switch-options] introduced in Junos OS Release 13.2X50-D10 (ELS). (See “Getting Started with Enhanced Layer 2 Software” on page 58 for information about ELS.)</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> |
| Description | <p>Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over without waiting for normal spanning-tree protocol convergence.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | <p>system—To view this statement in the configuration.</p> <p>system—control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none">• <i>Example: Configuring Redundant Trunk Links for Faster Recovery</i>• Example: Configuring Redundant Trunk Links for Faster Recovery on page 2010• Understanding Redundant Trunk Links on page 1885 |

rx-buffers

| | |
|---------------------------------|---|
| Syntax | rx-buffers (on off); |
| Hierarchy Level | [edit interfaces <i>interface-name</i> ether-options configured-flow-control] |
| Release Information | Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | <p>Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the rx-buffers statement with the tx-buffers statement to configure asymmetric Ethernet PAUSE on an interface. (Use the flow-control statement to enable symmetric PAUSE and the no-flow-control statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> |
| | <div>  <p>NOTE: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> |
| Default | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces. |
| Options | on off —Enable or disable an interface to generate and send Ethernet PAUSE messages. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • flow-control on page 2060 • tx-buffers on page 2113 |

routing-engine

| | |
|---------------------------------|--|
| Syntax | <pre>routing-engine {
 on-disk-failure {
 disk-failure-action (halt reboot);
 }
}</pre> |
| Hierarchy Level | [edit chassis]
[edit chassis interconnect-device <i>name</i>],
[edit chassis node-group <i>name</i>] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure a Routing Engine to halt or reboot automatically when a hard disk error occurs. A hard disk error may cause a Routing Engine to enter a state in which it responds to local pings and interfaces remain up, but no other processes are responding. Rebooting or halting prevents this. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors• Junos OS High Availability Library for Routing Devices |

session-establishment-hold-time

| | |
|---------------------------------|--|
| Syntax | <pre>session-establishment-hold-time <i>seconds</i>;</pre> |
| Hierarchy Level | [edit protocols iccp peer],
[edit protocols iccp] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Specify the time during which an Interchassis Control Protocol (ICCP) connection must be established between peers. |
| Options | seconds —Time (in seconds) within which a successful ICCP connection must be established. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

source

| | |
|---------------------------------|---|
| Syntax | <code>source <i>source-address</i>;</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> tunnel] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series. |
| Description | Specify the source address of the tunnel. |
| Default | If you do not specify a source address, the tunnel uses the unit's primary address as the source address of the tunnel. |
| Options | <i>source-address</i> —Address of the local side of the tunnel. This is the address that is placed in the outer IP header's source field. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • <i>Configuring Generic Routing Encapsulation Tunneling (CLI Procedure)</i> |

speed

| | |
|--------------------------|--|
| Syntax | speed (auto-negotiation <i>speed</i>); |
| Hierarchy Level | [edit interfaces interface-name ether-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure the speed of the interface. |
| Default | Autonegotiation is automatically enabled for Gigabit Ethernet interfaces. Autonegotiation is not an option for 10-Gigabit Ethernet interfaces. No explicit action is taken after the autonegotiation is complete or if the negotiation fails. If the autonegotiation statement at the [edit interfaces interface-name ether-options] hierarchy level is enabled, the auto-negotiation option is enabled by default. |
| Options | <ul style="list-style-type: none">• auto-negotiation—Automatically negotiate the speed based on the speed of the other end of the link. Autonegotiation is automatically enabled for Gigabit Ethernet interfaces. Autonegotiation is not an option for 10-Gigabit Ethernet interfaces. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.• speed—Specify the interface speed. This value sets the speed that is used on the link. If the auto-negotiation statement is enabled on a Gigabit Ethernet interface, configure the value to advertise to the interface at the other end of the link. If you disable autonegotiation on a Gigabit Ethernet interface, you must explicitly configure the speed to 1g. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• auto-negotiation on page 2044• Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2015• <i>Junos OS Network Interfaces Library for Routing Devices</i> |

status-control

| | |
|--------------------------|---|
| Syntax | status-control (active standby); |
| Hierarchy Level | [edit interfaces aggregated-ether-options mc-ae] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | Specify whether a peer hosting a multichassis link aggregation group (MC-LAG) is primary or secondary. Primary is considered active, and secondary is considered standby. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

targeted-broadcast

| | |
|---------------------------------|---|
| Syntax | targeted-broadcast; |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet],
[edit interfaces <i>interface-range</i> <i>interface-range-name</i> unit <i>logical-unit-number</i> family inet] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Specify whether the IP packets destined for a Layer 3 broadcast need to be forwarded to both an egress interface and the Routing Engine, or to an egress interface only. The packets are broadcast only if the egress interface is a LAN interface. |
| Default | When this statement is not included, broadcast packets are sent to the Routing Engine only. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • <i>Example: Configuring IP Directed Broadcast on an EX Series Switch</i> • <i>Configuring IP Directed Broadcast (CLI Procedure)</i> • <i>Understanding IP Directed Broadcast for EX Series Switches</i> |

threshold (Detection Time)

| | |
|---|--|
| Syntax | threshold <i>milliseconds</i> ; |
| Hierarchy Level | [edit protocols iccp <i>peer</i> liveness-detection <i>detection-time</i>] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Specify the threshold for the adaptation of the detection time for a Bidirectional Forwarding Detection (BFD) session. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent. |
| <div style="display: flex; align-items: center;">  <div> <p>NOTE: The threshold time must be greater than or equal to the minimum-interval or the minimum-receive-interval. values.</p> </div> </div> | |
| Options | <i>milliseconds</i> — Value for the detection time adaptation threshold.
Range: 1 through 255,000 |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

traceoptions (ICCP)

| | |
|----------------------------|--|
| Syntax | <pre>traceoptions {
 file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>;
 flag <i>flag</i> <disable>;
}</pre> |
| Hierarchy Level | [edit protocols iccp] |
| Release Information | Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Set Interchassis Control Protocol (ICCP) tracing options. |
| Default | Tracing operations are disabled. |
| Options | <p>disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>name</i>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. By default, the log file is stored in /var/log/.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed <i>trace-file.0</i>, then <i>trace-file.1</i>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 1 trace file only</p> <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.</p> <p>The following are the tracing options:</p> <ul style="list-style-type: none">• all—All tracing operations• config-internal—Trace configuration internals.• general—Trace general events.• normal—All normal events. <p>Default: If you do not specify this option, only unusual or abnormal operations are traced.</p> <ul style="list-style-type: none">• parse—Trace configuration parsing.• policy—Trace policy operations and actions. |

- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

| | |
|---------------------------------|---|
| Required Privilege Level | routing—To view this statement in the configuration. |
| | routing-control—To add this statement to the configuration. |

transmit-interval (Liveness Detection)

Syntax `transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }`

Hierarchy Level [edit protocols **iccp peer liveness-detection**]

Release Information Statement introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Configure the Bidirectional Forwarding Detection (BFD) transmit interval. The negotiated transmit interval for a peer is the interval between the sending of BFD liveness detection requests to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

The remaining statements are explained separately.

| | |
|---------------------------------|---|
| Required Privilege Level | routing—To view this statement in the configuration. |
| | routing-control—To add this statement to the configuration. |

traceoptions (Individual Interfaces)

| | |
|---------------------------------|---|
| Syntax | <pre>traceoptions {
 flag <i>flag</i>;
}</pre> |
| Hierarchy Level | [edit interfaces <i>interface-name</i>] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | <p>Define tracing operations for individual interfaces.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p> <p>The traceoptions statement for interfaces does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system syslog file in the directory /var/log.</p> |
| | <div> NOTE: The traceoptions statement is not supported on the QFX3000 QFabric system.</div> |
| Default | If you do not include this statement, no interface-specific tracing operations are performed. |
| Options | <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the interface-specific tracing options.</p> <ul style="list-style-type: none">• all—All interface tracing operations• event—Interface events• ipc—Interface interprocess communication (IPC) messages• media—Interface media changes• q921—ISDN Q.921 frames• q931—ISDN Q.931 frames |

[edit interfaces et] Configuration Statement Hierarchy on the QFX Series

This topic lists supported and unsupported configuration statements in the **[edit interfaces et]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific QFX Series platforms, see *QFX Series Virtual Chassis Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit interfaces et\] Hierarchy Level on page 2118](#)
- [Unsupported Statements in the \[edit interfaces et\] Hierarchy Level on page 2122](#)

Supported Statements in the [edit interfaces et] Hierarchy Level

The following hierarchy shows the **[edit interfaces et]** configuration statements supported on EX Series switches.

```
interfaces {
  et-fpc/pic/port {
    accounting-profile name;
    description text;
    disable;
    encapsulation type;
    ether-options {
      802.3ad {

Hierarchy Level [edit [interfaces interface-name unit logical-unit-number](#)],
[edit [interfaces interface-range interface-name unit logical-unit-number family](#)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure protocol family information for the logical interface on the QFX Series product.

Default Access interfaces on the QFX Series are set to **family ethernet-switching** by default. If you are going to change the family setting for an interface, you might have to delete this default setting or any user-configured family setting first.

You must configure a logical interface to be able to use the physical device.

Options Interface types on the switch are:

- Aggregated Ethernet (**ae**)
- Gigabit Ethernet (**ge**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Routed VLAN interface (RVI) (**vlan**)
- 10-Gigabit Ethernet (**xe**)

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge] |
| Release Information | Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series. |
| Description | <p> NOTE: This statement supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see port-mode. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 58.</p> <p>(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the trunk option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the vlan-id or vlan-id-list statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the access option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the vlan-id statement.</p> <p> NOTE: On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure interface-mode and irb for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see <i>Configuring a Trunk Interface on a Bridge Network</i>.</p> |
| Options | <p>access—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the vlan-id statement.</p> <p>trunk—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the vlan-id or vlan-id-list statement.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> Configuring a Logical Interface for Access Mode Configuring a Logical Interface for Trunk Mode |

ethernet-switch-profile

Syntax

```

ethernet-switch-profile {
  ethernet-policer-profile {
    input-priority-map {
      ieee802.1p premium [values];
    }
    output-priority-map {
      classifier {
        premium {
          forwarding-class class-name {
            loss-priority (high | low);
          }
        }
      }
    }
  }
  policer cos-policer-name {
    aggregate {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    premium {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
  }
  tag-protocol-id tpid;
}
(mac-learn-enable | no-mac-learn-enable);

```

Hierarchy Level [edit interfaces *interface-name* gigether-options],
 [edit interfaces *interface-name* aggregated-ether-options],
 [edit interfaces *interface-name* aggregated-ether-options],
 [edit interfaces *interface-name* ether-options]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
 Statement introduced in Junos OS Release 13.2 for the QFX Series.
 Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

Description

NOTE: On QFX Series standalone switches, the `ethernet-policer-profile` CLI hierarchy and the `mac-learn-enable` statement are supported only on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit

Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately.

.....

NOTE: When you gather interfaces into a bridge domain, the `no-mac-learn-enable` statement at the `[edit interfaces interface-name together-options ethernet-switch-profile]` hierarchy level is not supported. You must use the `no-mac-learning` statement at the `[edit bridge-domains bridge-domain-name bridge-options interface interface-name]` hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the *MX Series Layer 2 Configuration Guide*.

.....

| | |
|---------------------------------|---|
| Default | If the ethernet-switch-profile statement is not configured, Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) behave like Gigabit Ethernet interfaces. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

        }
    }
```

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number*],
[edit **interfaces** **interface-range** *interface-name* **unit** *logical-unit-number* family]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure protocol family information for the logical interface on the QFX Series product.

Default Access interfaces on the QFX Series are set to **family ethernet-switching** by default. If you are going to change the family setting for an interface, you might have to delete this default setting or any user-configured family setting first.

You must configure a logical interface to be able to use the physical device.

Options See [Table 178 on page 2139](#) for protocol families available on the QFX Series interfaces. Different protocol families support different subsets of the interface types on the QFX Series.

Interface types on the switch are:

- Aggregated Ethernet (**ae**)

- Gigabit Ethernet (**ge**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Routed VLAN interface (RVI) (**vlan**)
- 10-Gigabit Ethernet (**xe**)

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

Table 178: Protocol Families and Supported Interface Types

| Family | Description | Supported Interface Types | | | | | |
|--------------------|------------------------------------|---------------------------|-----|-----|------|----|----|
| | | ae | lo0 | me0 | vlan | ge | xe |
| ethernet-switching | Ethernet switching protocol family | ✓ | | ✓ | ✓ | ✓ | ✓ |
| fibre-channel | Fibre Channel protocol family | ✓ | | | ✓ | | ✓ |
| inet | IPv4 protocol family | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |

The remaining statements are explained separately.

pic

Syntax `pic pic-number {
 fib-re-channel {
 port-range {
 port-range-low port-range-high;
 }
 }
 xe {
 (port port-number | port-range port-range-low port-range-high);
 }
 xle {
 (port port-number | port-range port-range-low port-range-high);
 }`

Hierarchy Level [edit [chassis fpc slot](#)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Options **xe** and **xle** introduced in Junos OS 12.2X50-D20 for the QFX Series.

Description (QFX3500 and QFX3600 standalone switches only) Enable the specified port on the Physical Interface Card (PIC) to perform in the specified operating mode.

Options *pic-number*—Number of the PIC.

- On a QFX3500 standalone switch, specify **0** if the port type is **fiber-channel**, and **2** if the port type is **xle**.
- On a QFX3600 standalone switch, specify **0** if the port type is **xe**, and **1** if the port type is **xle**.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

port-mode

| | |
|---------------------------------|--|
| Syntax | port-mode (access tagged-access trunk); |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | <div>  <p>NOTE: This statement does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see interface-mode. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 58.</p> </div> <p>Configure whether an interface on the switch operates in access, tagged access, or trunk mode.</p> |
| Default | All switch interfaces are in access mode. |
| Options | <p>access—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.</p> <p>tagged-access—Have the interface operate in access mode. In this mode, the interface can be in multiple VLANs. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.</p> <p>trunk—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

Monitoring System Process Information

| | |
|----------------|---|
| Purpose | View the processes running on the QFX Series. |
| Action | To view the software processes running on the QFX Series:
[edit system]

user@switch> show system processes |
| Meaning | Table 49 on page 307 summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization. |

Table 179: Summary of System Process Information Output Fields

| Field | Values |
|-------|----------------------------|
| PID | Identifier of the process. |

Table 179: Summary of System Process Information Output Fields (*continued*)

| Field | Values |
|--------------------|--|
| Name | Owner of the process. |
| State | Current state of the process. |
| CPU Load | Percentage of the CPU that is being used by the process. |
| Memory Utilization | Amount of memory that is being used by the process. |
| Start Time | Time of day when the process started. |

- Related Documentation**
- [Monitoring System Properties on page 308](#)
 - [show system uptime on page 1025](#)

Monitoring System Properties

Purpose View system properties such as the name and IP address of a QFX Series product and resource usage.

Action To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

Meaning [Table 50 on page 308](#) summarizes key output fields in the system properties display.

Table 180: Summary of Key System Properties Output Fields

| Field | Values | Additional Information |
|----------------------------|---|--|
| General Information | | |
| Serial Number | Serial number for a QFX Series product. | |
| Junos OS Version | Version of Junos OS active on the switch, including whether the software is for domestic or export use. | Export software is for use outside the USA and Canada. |
| Hostname | Name of the QFX Series product. | |
| IP Address | IP address of the QFX Series product. | |
| Loopback Address | Loopback address. | |

Table 180: Summary of Key System Properties Output Fields (*continued*)

| Field | Values | Additional Information |
|--------------------------------|--|--|
| Domain Name Server | Address of the domain name server. | |
| Time Zone | Time zone on the QFX Series product. | |
| Time | | |
| Current Time | Current system time, in Coordinated Universal Time (UTC). | |
| System Booted Time | Date and time when the QFX Series product was last booted and how long it has been running. | |
| Protocol Started Time | Date and time when the protocols were last started and how long they have been running. | |
| Last Configured Time | Date and time when a configuration was last committed. This field also shows the name of the user who issued the last commit command. | |
| Load Average | CPU load average for 1, 5, and 15 minutes. | |
| Storage Media | | |
| Internal Flash Memory | Usage details of internal flash memory. | |
| External Flash Memory | Usage details of external USB flash memory. | |
| Logged in Users Details | | |
| User | Username of any user logged in to the switch. | |
| Terminal | Terminal through which the user is logged in. | |
| From | System from which the user has logged in. A hyphen indicates that the user is logged in through the console. | |
| Login Time | Time when the user logged in. | This is the user@switch field in show system users command output. |
| Idle Time | How long the user has been idle. | |

Related Documentation

- [show system processes on page 941](#)

Monitoring Interface Status and Traffic

Purpose View interface status to monitor interface bandwidth utilization and traffic statistics on the QFX Series product.

- Action**
- To view interface status for all the interfaces, enter [show interfaces xe](#).
 - To view status and statistics for a specific interface, enter [show interfaces xe interface-name](#).
 - To view status and traffic statistics for all interfaces, enter either [show interfaces xe detail](#) or [show interfaces xe extensive](#).

Meaning For details about output from the CLI commands, see [show interfaces xe](#).

Verifying That Layer 3 Logical Interfaces Are Working

Purpose After configuring Layer 3 logical interfaces, verify that they are set up properly and transmitting data.

- Action**
1. To determine if you have successfully created the logical interfaces and the links are up:

```
[edit interfaces]
user@switch> show interfaces interface-name terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|----------------|-------|------|-------|------------|--------|
| ge-0/0/0 | up | up | | | |
| ge-0/0/0.0 | up | up | inet | 1.1.1.1/24 | |
| ge-0/0/0.1 | up | up | inet | 2.1.1.1/24 | |
| ge-0/0/0.2 | up | up | inet | 3.1.1.1/24 | |
| ge-0/0/0.3 | up | up | inet | 4.1.1.1/24 | |
| ge-0/0/0.4 | up | up | inet | 5.1.1.1/24 | |
| ge-0/0/0.32767 | up | up | | | |

2. Use the **ping** command from a device on one subnet to an address on another subnet to determine if packets were transmitted correctly on the logical interface VLANs:

```
user@switch> ping ip-address
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=64 time=0.157 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=64 time=0.238 ms
64 bytes from 1.1.1.1: icmp_seq=2 ttl=64 time=0.255 ms
64 bytes from 1.1.1.1: icmp_seq=3 ttl=64 time=0.128 ms
--- 1.1.1.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
```

Meaning The output confirms that the logical interfaces have been created and the links are up.

Related Documentation

- [Configuring a Layer 3 Logical Interface on page 2019](#)

Verifying the Status of a LAG Interface

Purpose Verify that a link aggregation group (LAG) (**ae0**) has been created on the switch.

Action To verify that the **ae0** LAG has been created:

```
[edit interfaces]
show interfaces ae0 terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|---------------|--------|
| ae0 | up | up | | | |
| ae0.0 | up | up | inet | 10.10.10.2/24 | |

Meaning The output confirms that the **ae0** link is up and shows the family and IP address assigned to this link.

Related Documentation

- [Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets on page 2149](#)
- [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 1896](#)
- [Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch on page 1900](#)
- [show lacp statistics interfaces \(View\) on page 2261](#)

Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets

Verify that LACP has been set up correctly and that the bundle members are transmitting LACP protocol packets.

1. [Verifying the LACP Setup on page 2149](#)
2. [Verifying That LACP Packets Are Being Exchanged on page 2150](#)

Verifying the LACP Setup

Purpose Verify that the LACP has been set up correctly.

Action To verify that LACP has been enabled as active on one end:

```
user@switch>show lacp interfaces xe-0/0/0
```

```
Aggregated interface: ae0
```

| LACP state: | Role | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|----------------|-----------|-------|---------------|-------|----------|-------|------|---------|----------|
| xe-0/1/0 | Actor | No | Yes | No | No | No | Yes | Fast | Active |
| xe-0/1/0 | Partner | No | Yes | No | No | No | Yes | Fast | Passive |
| LACP protocol: | Receive | State | Transmit | State | Mux | State | | | |
| xe-0/1/0 | Defaulted | | Fast periodic | | Detached | | | | |

Meaning This example shows that LACP has been configured with one side as active and the other as passive. When LACP is enabled, one side must be set as active in order for the bundled link to be up.

Verifying That LACP Packets Are Being Exchanged

Purpose Verify that LACP packets are being exchanged between interfaces.

Action Use the **show lacp statistics interfaces *interface-name*** command to display LACP BPDU exchange information.

```
show lacp statistics interfaces ae0
```

```
Aggregated interface: ae0
```

| LACP Statistics: | LACP Rx | LACP Tx | Unknown Rx | Illegal Rx |
|------------------|---------|---------|------------|------------|
| xe-0/0/2 | 1352 | 2035 | 0 | 0 |
| xe-0/0/3 | 1352 | 2056 | 0 | 0 |

Meaning The output here shows that the link is up and that PDUs are being exchanged.

Verifying That Generic Routing Encapsulation Tunneling Is Working Correctly

Purpose Verify that the generic routing encapsulation (GRE) interface is sending tunneled traffic.

Action Display status information about the specified GRE interface by using the command **show interfaces**.

```
user@switch> show interfaces gr-0/0/0.0
```

```
Physical interface: gr-0/0/0, Enabled, Physical link is Up
```

```
Interface index: 132, SNMP ifIndex: 26
```

```
Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
```

```
Device flags : Present Running
```

```
Interface flags: Point-To-Point SNMP-Traps
```

```
Input rate : 0 bps (0 pps)
```

```
Output rate : 0 bps (0 pps)
```

```
Logical interface gr-0/0/0.0 (Index 68) (SNMP ifIndex 47)
```

```
Flags: Point-To-Point SNMP-Traps 16384
```

```
IP-Header 1.1.1.2:1.1.1.1:47:df:64:0000000000000000 Encapsulation: GRE-NULL
```

```
Input packets : 0
```

```
Output packets: 0
```

```
Protocol inet, MTU: 1476
```

```
Flags: None
```

```
Addresses, Flags: Is-Primary
```

```
Local: 1.10.1.1
```

Meaning The output indicates that the GRE interface gr-0/0/0 is up. The output displays the name of the physical interface and the traffic statistics for this interface---the number of and

the rate at which input and output bytes and packets are received and transmitted on the physical interface.

monitor interface

Syntax `monitor interface`
`<interface-name> | traffic <detail>>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

NOTE: This command is not supported on the QFX3000 QFabric system.

Options **none**—Display real-time statistics for all interfaces.

detail—(Optional) With traffic option only, display detailed output.

interface-name—(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

traffic—(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

Additional Information The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the c key. For a description of the statistical information provided in the output of this command, see the **show interfaces extensive** command for a particular interface type in the [CLI Explorer](#). To control the output of the **monitor interface** command while it is running, use the keys listed in [Table 181 on page 2152](#). The keys are not case-sensitive.

Table 181: Output Control Keys for the monitor interface Command

| Key | Action |
|-----|--|
| c | Clears (returns to zero) the delta counters since monitor interface was started. This does not clear the accumulative counter. To clear the accumulative counter, use the clear interfaces interval command. |
| f | Freezes the display, halting the display of updated statistics and delta counters. |
| i | Displays information about a different interface. The command prompts you for the name of a specific interface. |

Table 181: Output Control Keys for the monitor interface Command *(continued)*

| Key | Action |
|----------|--|
| n | Displays information about the next interface. The monitor interface command displays the physical or logical interfaces in the same order as the show interfaces terse command. |
| q or Esc | Quits the command and returns to the command prompt. |
| t | Thaws the display, resuming the update of the statistics and delta counters. |

To control the output of the **monitor interface traffic** command while it is running, use the keys listed in [Table 182 on page 2153](#). The keys are not case-sensitive.

Table 182: Output Control Keys for the monitor interface traffic Command

| Key | Action |
|----------|--|
| b | Displays the statistics in units of bytes and bits per second (bps). |
| c | Clears (return to 0) the delta counters in the Current Delta column. The statistics counters are not cleared. |
| d | Displays the Current Delta column (instead of the rate column) in Bps or packets per second (pps). |
| p | Displays the statistics in units of packets and packets per second (pps). |
| q or Esc | Quits the command and returns to the command prompt. |
| r | Displays the rate column (instead of the Current Delta column) in Bps and pps. |

Output Fields [Table 183 on page 2154](#) describes the output fields for the **monitor interface** command. Output fields are listed in the approximate order in which they appear.

Table 183: monitor interface Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------|--|-----------------|
| routerl | Hostname of the router. | All levels |
| Seconds | How long the monitor interface command has been running or how long since you last cleared the counters. | All levels |
| Time | Current time (UTC). | All levels |
| Delay x/y/z | Time difference between when the statistics were displayed and the actual clock time. <ul style="list-style-type: none"> • x—Time taken for the last polling (in milliseconds). • y—Minimum time taken across all pollings (in milliseconds). • z—Maximum time taken across all pollings (in milliseconds). | All levels |
| Interface | Short description of the interface, including its name, status, and encapsulation. | All levels |
| Link | State of the link: Up , Down , or Test . | All levels |
| Current delta | Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters. | All levels |
| Local Statistics | (Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | All levels |
| Remote Statistics | (Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | All levels |

Table 183: monitor interface Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------|--|-----------------|
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | All levels |
| Description | With the traffic option, displays the interface description configured at the [edit interfaces <i>interface-name</i>] hierarchy level. | detail |

Sample Output

monitor interface (Physical)

```

user@host> monitor interface so-0/0/0
router1                               Seconds: 19                      Time: 15:46:29

Interface: so-0/0/0, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C48

show iccp

Syntax `show iccp <brief | detail>`

Release Information Command introduced in Junos OS Release 12.2 for the QFX Series.

Description Display Interchassis Control Protocol (ICCP) information about the multichassis link aggregation group (MC-LAG) peers, including the state of the TCP connection, Bidirectional Forwarding Detection protocol, backup liveness peer status, and MCSNOOPD, LACPD, and ESWD applications.

Options none—Display ICCP information about the MC-LAG peers, including the state of the TCP connection and Bidirectional Forwarding Detection protocol, and MCSNOOPD, LACPD, and ESWD applications.

brief—Display brief ICCP information about the MC-LAG peers, including the state of the TCP connection and Bidirectional Forwarding Detection protocol, and MCSNOOPD, LACPD, and ESWD applications.

detail—Display detailed ICCP information about the MC-LAG peers, including the state of the TCP connection and Bidirectional Forwarding Detection protocol, and MCSNOOPD, LACPD, and ESWD applications.

List of Sample Output [show iccp on page 2161](#)

Output Fields [Table 184 on page 2160](#) lists the output fields for the **show iccp** command. Output fields are listed in the approximate order in which they appear.

Table 184: show iccp

| Field Name | Field Description |
|---------------------------------------|---|
| Redundancy Group Information for peer | Aggregated Ethernet interface name. |
| TCP Connection | Specifies if the TCP connection between the peers hosting the MC-LAG is up or down. |
| Liveness Detection | Specifies if liveness detection, also known as Bidirectional Forwarding Detection (BFD), is up or down. |
| Client Application | Specifies information regarding the state of the MCSNOOPD and ESWD client applications. |

Sample Output

show iccp

```
user@switch> show iccp
Redundancy Group Information for peer 3.3.3.2
  TCP Connection      : Established
  Liveliness Detection : Up

Client Application: MCSN00PD

Client Application: eswd
```

show interfaces diagnostics optics

| | |
|---------------------------------|--|
| Syntax | <code>show interfaces diagnostics optics <i>interface-name</i></code> |
| Release Information | Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. |
| Description | <p>Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP, SFP+, XFP, QSFP+, or CFP) installed in EX Series or QFX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information. For a list of transceivers supported on EX Series switches and their specifications, including DOM support, see <i>Pluggable Transceivers Supported on EX Series Switches</i>.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p> |
| Options | <i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed: <i>ge-fpc/pic/port</i> , <i>xe-fpc/pic/port</i> , or <i>et-fpc/pic/port</i> . |

| Output Fields | Table 76 on page 840 lists the output fields for the show interfaces diagnostics optics command. Output fields are listed in the approximate order in which they appear. |

Table 185: show interfaces diagnostics optics Output Fields

| Field Name | Field Description |
|--------------------|--|
| Physical interface | Displays the name of the physical interface. |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|--|--|
| Laser bias current | Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power
(Not available for QSFP+ transceivers) | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| Laser temperature
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the laser temperature, in Celsius and Fahrenheit. |
| Module temperature | Displays the temperature, in Celsius and Fahrenheit. |
| Module voltage
(Not available for XFP transceivers) | Displays the voltage, in Volts. |
| Laser rx power
(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| Receiver signal average optical power
(Not available for XFP, QSFP+, and CFP transceivers) | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| Laser bias current high alarm | Displays whether the laser bias power setting high alarm is On or Off . |
| Laser bias current low alarm | Displays whether the laser bias power setting low alarm is On or Off . |
| Laser bias current high warning | Displays whether the laser bias power setting high warning is On or Off . |
| Laser bias current low warning | Displays whether the laser bias power setting low warning is On or Off . |
| Laser output power high alarm
(Not available for QSFP+ transceivers) | Displays whether the laser output power high alarm is On or Off . |
| Laser output power low alarm
(Not available for QSFP+ transceivers) | Displays whether the laser output power low alarm is On or Off . |
| Laser output power high warning
(Not available for QSFP+ transceivers) | Displays whether the laser output power high warning is On or Off . |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|---|---|
| Laser output power low warning
(Not available for QSFP+ transceivers) | Displays whether the laser output power low warning is On or Off . |
| Laser temperature high alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the laser temperature high alarm is On or Off . |
| Laser temperature low alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the laser temperature low alarm is On or Off . |
| Laser temperature high warning
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the laser temperature high warning is On or Off . |
| Laser temperature low warning
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the laser temperature low warning is On or Off . |
| Module temperature high alarm
(Not available for QSFP+ transceivers) | Displays whether the module temperature high alarm is On or Off . |
| Module temperature low alarm
(Not available for QSFP+ transceivers) | Displays whether the module temperature low alarm is On or Off . |
| Module temperature high warning
(Not available for QSFP+ transceivers) | Displays whether the module temperature high warning is On or Off . |
| Module temperature low warning
(Not available for QSFP+ transceivers) | Displays whether the module temperature low warning is On or Off . |
| Module voltage high alarm
(Not available for XFP and QSFP+ transceivers) | Displays whether the module voltage high alarm is On or Off . |
| Module voltage low alarm
(Not available for XFP and QSFP+ transceivers) | Displays whether the module voltage low alarm is On or Off . |
| Module voltage high warning
(Not available for XFP and QSFP+ transceivers) | Displays whether the module voltage high warning is On or Off . |
| Module voltage low warning
(Not available for XFP and QSFP+ transceivers) | Displays whether the module voltage low warning is On or Off . |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|---|--|
| Laser rx power high alarm
(Not available for QSFP+ and CFP transceivers) | Displays whether the receive laser power high alarm is On or Off . |
| Laser rx power low alarm
(Not available for QSFP+ and CFP transceivers) | Displays whether the receive laser power low alarm is On or Off . |
| Laser rx power high warning
(Not available for QSFP+ and CFP transceivers) | Displays whether the receive laser power high warning is On or Off . |
| Laser rx power low warning
(Not available for QSFP+ and CFP transceivers) | Displays whether the receive laser power low warning is On or Off . |
| Laser bias current high alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser bias current high alarm. |
| Module not ready alarm
(Not available for SFP, SFP+, and QSFP+ transceivers) | Displays whether the module not ready alarm is On or Off . When the output is On , the module has an operational fault. |
| Module low power alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the module low power alarm is On or Off . |
| Module initialization incomplete alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the module initialization incomplete alarm is On or Off . |
| Module fault alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the module fault alarm is On or Off . |
| PLD Flash initialization fault alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the PLD Flash initialization fault alarm is On or Off . |
| Power supply fault alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the power supply fault alarm is On or Off . |
| Checksum fault alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the checksum fault alarm is On or Off . |
| Tx laser disabled alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the Tx laser disabled alarm is On or Off . |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|--|--|
| Module power down alarm
(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Displays whether the module power down alarm is On or Off . When the output is On , module is in a limited power mode, low for normal operation. |
| Tx data not ready alarm
(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is On or Off . |
| Tx not ready alarm
(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is On or Off . |
| Tx laser fault alarm
(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Laser fault condition. Displays whether the Tx laser fault alarm is On or Off . |
| Tx CDR loss of lock alarm
(Not available for SFP, SFP+, and QSFP+ transceivers) | Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is On or Off . |
| Rx not ready alarm
(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is On or Off . |
| Rx loss of signal alarm
(Not available for SFP and SFP+ transceivers) | Receive loss of signal alarm. When the output is On , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is On or Off . |
| Rx CDR loss of lock alarm
(Not available for SFP, SFP+, and QSFP+ transceivers) | Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is On or Off . |
| Laser bias current low alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser bias current low alarm. |
| Laser bias current high warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser bias current high warning. |
| Laser bias current low warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser bias current low warning. |
| Laser output power high alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser output power high alarm. |
| Laser output power low alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser output power low alarm. |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|--|--|
| Laser output power high warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser output power high warning. |
| Laser output power low warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser output power low warning. |
| Module temperature high alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the module temperature high alarm. |
| Module temperature low alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the module temperature low alarm. |
| Module temperature high warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the module temperature high warning. |
| Module temperature low warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the module temperature low warning. |
| Module voltage high alarm threshold
(Not available for XFP and QSFP+ transceivers) | Displays the vendor-specified threshold for the module voltage high alarm. |
| Module voltage low alarm threshold
(Not available for XFP and QSFP+ transceivers) | Displays the vendor-specified threshold for the module voltage low alarm. |
| Module voltage high warning threshold
(Not available for XFP and QSFP+ transceivers) | Displays the vendor-specified threshold for the module voltage high warning. |
| Module voltage low warning threshold
(Not available for XFP and QSFP+ transceivers) | Displays the vendor-specified threshold for the module voltage low warning. |
| Laser rx power high alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser rx power high alarm. |
| Laser rx power low alarm threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser rx power low alarm. |
| Laser rx power high warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser rx power high warning. |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|---|--|
| Laser rx power low warning threshold
(Not available for QSFP+ transceivers) | Displays the vendor-specified threshold for the laser rx power low warning. |
| Laser temperature high alarm threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for the laser temperature high alarm, in Celsius and Fahrenheit. |
| Laser temperature low alarm threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for the laser temperature low alarm, in Celsius and Fahrenheit. |
| Laser temperature high warning threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for the laser temperature high warning, in Celsius and Fahrenheit. |
| Laser temperature low warning threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for the laser temperature low warning, in Celsius and Fahrenheit. |
| SOA bias current high alarm threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for SOA bias current high alarm. |
| SOA bias current low alarm threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for SOA bias current low alarm. |
| SOA bias current high warning threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for SOA bias current high warning. |
| SOA bias current low warning threshold
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for SOA bias current low warning. |
| Laser receiver power high alarm
(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the laser receiver power high alarm is On or Off . |
| Laser receiver power low alarm
(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the laser receiver power low alarm is On or Off . |
| Laser receiver power high warning
(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the laser receiver power high warning is On or Off . |
| Laser receiver power low warning
(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the laser receiver power low warning is On or Off . |

Table 185: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name | Field Description |
|---|--|
| Laser receiver power
(Not available for SFP, SFP+, and XFP transceivers) | Displays the laser receiver power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| Tx loss of signal functionality alarm
(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the Tx loss of signal functionality alarm is On or Off . |
| APD supply fault alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the APD supply fault alarm is On or Off . |
| TEC fault alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the TEC fault alarm is On or Off . |
| Wavelength unlocked alarm
(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the Wavelength unlocked alarm is On or Off . |

show interfaces ge

| | |
|---------------------------------|---|
| Syntax | <code>show interfaces <i>device-name:type-fpc/pic/port</i></code>
<code><brief detail extensive terse></code>
<code><descriptions></code>
<code><media></code>
<code><routing-instance (all <i>instance-name</i>)></code>
<code><snmp-index <i>snmp-index</i>></code>
<code><statistics></code> |
| Release Information | Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display status information about the specified Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces. |
| Options | <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p><i>device-name:type-fpc/pic/port</i>—The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>routing instance (all <i>instance-name</i>)—(Optional) Display the name of an individual routing-instance or display all routing-instances.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |

Output Fields [Table 186 on page 2177](#) lists the output fields for the **show interfaces ge** command. Output fields are listed in the approximate order in which they appear.

Table 186: show interfaces ge Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------------|--|-------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface: Enabled or Disabled . | All levels |
| Interface index | Index number of the physical interface, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Description | Optional user-specified description. | brief detail extensive |
| Link-level type | Encapsulation being used on the physical interface. | All levels |
| MTU | Maximum transmission unit size on the physical interface. The default is 1514. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Loopback | Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote . | All levels |
| Source filtering | Source filtering status: Enabled or Disabled . | All levels |
| Flow control | Flow control status: Enabled or Disabled .

<i>NOTE:</i> This field is only displayed if asymmetric flow control is not configured. | detail extensive |
| Configured-flow-control | Configured flow control for the interface transmit buffers (tx-buffers) and receive buffers (rx-buffers):

<ul style="list-style-type: none"> tx-buffers—On if the interface is configured to respond to Ethernet PAUSE messages received from the connected peer.
 Off if the interface is not configured to respond to received PAUSE messages. rx-buffers—On if the interface is configured to generate and send Ethernet PAUSE messages to the connected peer.
 Off if the interface is not configured to generate and send PAUSE messages.
<i>NOTE:</i> This field is only displayed if asymmetric flow control is configured. | detail extensive |

Table 186: show interfaces ge Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Auto-negotiation | Autonegotiation status: Enabled or Disabled . | All levels |
| Remote-fault | Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. | All levels |
| Device flags | Information about the physical device. | All levels |
| Interface flags | Information about the interface. | All levels |
| Link flags | Information about the link. | All levels |
| CoS queues | Number of CoS queues configured. | detail extensive none |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | MAC address of the hardware. | detail extensive none |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago) . | detail extensive none |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. <p>NOTE: The bandwidth bps counter is not enabled on the switch.</p> | detail extensive |

Table 186: show interfaces ge Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------|---|------------------|
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the headers. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. | extensive |

Table 186: show interfaces ge Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. | extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive |
| Queue counters (Egress) | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive |
| Queue Number | The CoS queue number and the forwarding classes mapped to the queue number. The Mapped forwarding class column lists the forwarding classes mapped to each CoS queue. | detail extensive |
| Active alarms and Active defects | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. | detail extensive none |

Table 186: show interfaces ge Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------|--|-----------------|
| MAC statistics | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of packets that exceeds the configured MTU. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." | extensive |
| Filter Statistics | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. | extensive |

Table 186: show interfaces ge Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|---|------------------------------|
| Autonegotiation information | <p>Information about link autonegotiation:</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports PAUSE on both receive and transmit or PAUSE only on receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Link partner speed—Speed of the link partner. • Local resolution: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports PAUSE on both receive and transmit or PAUSE only on receive). For asymmetric PAUSE, shows if the PAUSE transmit and PAUSE receive states on the interface are enable or disable. • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). | extensive |
| Packet Forwarding Engine configuration | <p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Index number of the logical interface, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP interface index number for the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. | All levels |

Table 186: show interfaces ge Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Protocol | Protocol family. | detail extensive none |
| Traffic statistics | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface. | detail extensive |
| IPv6 transit statistics | If IPv6 statistics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface. | extensive |
| Local statistics | Number and rate of bytes and packets destined to and from the switch. | extensive |
| Transit statistics | Number and rate of bytes and packets transiting the switch. | extensive |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route Table | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 . | detail extensive none |
| Input Filters | Names of any input filters applied to this interface. | detail extensive |
| Output Filters | Names of any output filters applied to this interface. | detail extensive |
| Flags | Information about protocol family flags.

If unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is displayed. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled. | detail extensive |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| Flags | Information about the address flags. | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interlace. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Sample Output

| Output Fields | <p>Table 187 on page 2192 lists the output fields for the show interfaces (GRE) command. Output fields are listed in the approximate order in which they appear.</p> |

Table 187: GRE show interfaces Output Fields

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |
| Interface index | Physical interface's index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Type | Type of interface. | All levels |
| Link-level type | Encapsulation used on the physical interface. | All levels |
| MTU | MTU size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Device Flags | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Interface Flags | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> . | All levels |
| Input rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |
| Traffic statistics | <p>The number of and the rate at which input and output bytes and packets are received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Logical interface index number, which reflects its initialization sequence. | detail extensive none |

Table 187: GRE show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|-----------------------|
| SNMP ifIndex | Logical interface SNMP interface index number. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |
| Flags | <p>Information about the logical interface. Possible values listed in the “Logical Interface Flags” section under <i>Common Output Fields Description</i>. describe general information about the logical interface.</p> <p>GRE-specific information about the logical interface is indicated by the presence or absence of the following value in this field:</p> <ul style="list-style-type: none"> • Reassemble-Pkts—If the Flags field includes this string, the GRE tunnel is configured to reassemble tunnel packets that were fragmented after tunnel encapsulation. | All levels |
| IP-Header | <p>IP header of the logical interface. If the tunnel key statement is configured, this information is included in the IP Header entry.</p> <p>GRE-specific information about the logical interface is indicated by the presence or absence of the following value in this field:</p> <ul style="list-style-type: none"> • df—If the IP-Header field includes this string immediately following the 16 bits of identification information (that is, if :df: displays after the twelfth byte), the GRE tunnel is configured to allow fragmentation of GRE packets after encapsulation. | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Copy-tos-to-outer-ip-header | <p>Status of type of service (ToS) bits in the GRE packet header:</p> <ul style="list-style-type: none"> • On—ToS bits were copied from the payload packet header into the header of the IP packet sent through the GRE tunnel. • Off—ToS bits were not copied from the payload packet header and are set to 0 in the GRE packet header. <p>NOTE: EX Series switches do not support copying ToS bits to the encapsulated packet, so the value of this field is always Off in switch output.</p> | detail extensive |
| Gre keepalives configured | <p>Indicates whether a GRE keepalive time and hold time are configured for the GRE tunnel.</p> <p>NOTE: EX Series switches do not support configuration of GRE tunnel keepalive times and hold times, so the value of this field is always Off in switch output.</p> | detail extensive |
| Gre keepalives adjacency state | Status of the other end of the GRE tunnel: Up or Down . If keepalive messages are not received by either end of the GRE tunnel within the hold-time period, the GRE keepalive adjacency state is down even when the GRE tunnel is up. | detail extensive |
| Input packets | Number of packets received on the logical interface. | None specified |
| Output packets | Number of packets transmitted on the logical interface. | None specified |

Table 187: GRE show interfaces Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------|---|------------------------------|
| Traffic statistics | <p>Rate of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input rate—Rate of bits and packets received on the interface. • Output rate—Rate of bits and packets transmitted on the interface. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. | detail extensive none |
| Protocol | Protocol family configured on the logical interface, such as iso , inet6 , or mpls . | detail extensive none |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| MTU | MTU size on the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 . | detail extensive |
| Flags | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Addresses, Flags | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

Sample Output

show interfaces (GRE)

```

show interfaces extensive (GRE)

The output for the **show interfaces extensive** command is identical to that for the **show interfaces detail** command. For sample output, see [show interfaces detail \(GRE\) on page 2195](#) and [show interfaces detail \(GRE\) on an EX4200 Virtual Chassis Member Switch on page 2196](#).

show interfaces mc-ae

| | |
|---------------------------------|--|
| Syntax | show interfaces mc-ae id <i>identifier</i> unit <i>number</i> |
| Release Information | Command introduced in Junos OS Release 12.2 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| Description | On peers with multi-chassis aggregated Ethernet (mc-aeX) interfaces, use this command to display information about the mc-aeX interfaces. |
| Options | identifier —(Optional) Name of the multichassis aggregated Ethernet interface.

number —(Optional) Specify the logical interface by unit number. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • Understanding Multichassis Link Aggregation on page 1853 (QFX Series Switches) • Understanding Multichassis Link Aggregation (EX Series Switches) • Configuring Multichassis Link Aggregation on page 2022 (QFX Series Switches) • Configuring Multichassis Link Aggregation (EX Series Switches) • Example: Configuring Multichassis Link Aggregation on page 1904 (QFX Series Switches) • Example: Configuring Multichassis Link Aggregation with Layer 3 MAC Address Synchronization on page 1963 (QFX Series Switches) • Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast using MAC Address Synchronization (QFX Series Switches) • Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol (VRRP) on page 1983 (QFX Series Switches) • Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using VRRP (EX Series Switches) • Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP on page 1926 (QFX Series Switches) • Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP (EX Series Switches) |
| List of Sample Output | show interfaces mc-ae on page 2199 |
| Output Fields | Table 188 on page 2198 lists the output fields for the show interfaces mc-ae command. Output fields are listed in the approximate order in which they appear. |

Table 188: show interfaces mc-ae Output Fields

| Output Field Name | Field Description |
|--------------------------------------|---|
| Current State Machine's State | Specifies the state of the MC-LAG initialization state machine. |

Table 188: show interfaces mc-ae Output Fields (*continued*)

| Output Field Name | Field Description |
|--------------------------|--|
| Member Link | Specifies the identifiers of the configured multichassis link aggregated interface members. |
| Local Status | Specifies the status of the local link: active or standby . |
| Peer Status | Specifies the status of the peer link: active or standby . |
| Peer State | Specifies the status of the local and peer links in an active/active MC-LAG configuration |
| Logical Interface | Specifies the identifier and unit of the AE interface. |
| Topology Type | Specifies the bridge configured on the AE. |
| Local State | Specifies if the local device is up or down. |
| Peer State | Specifies if the peer device is up or down. |
| Peer Ip/MCP/State | Specifies the multichassis protection (MCP) link or the interchassis link-protection link (ICL-PL) for all of the multichassis aggregated Ethernet (MC-AE) interfaces that are part of the peer. |

Sample Output

show interfaces queue

Syntax show interfaces queue
 <aggregate | remaining-traffic>
 <both-ingress-egress>
 <egress>
 <forwarding-class *forwarding-class*>
 <ingress>
 <interface-name *interface-name*>
 <l2-statistics>

Release Information Command introduced before Junos OS Release 7.4.
 both-ingress-egress, **egress**, and **ingress** options introduced in Junos OS Release 7.6.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 l2-statistics option introduced in Junos OS Release 12.1.

Description Display class-of-service (CoS) queue information for physical interfaces.

Options **none**—Show detailed CoS queue statistics for all physical interfaces.

aggregate—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

both-ingress-egress—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

egress—(Optional) Display egress queue statistics.

forwarding-class *forwarding-class*—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

ingress—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

interface-name *interface-name*—(Optional) Show detailed CoS queue statistics for the specified interface.

l2-statistics—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

remaining-traffic—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.

Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 189 on page 2201](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in [Table 189 on page 2201](#).

Table 189: Layer 2 Overhead, Transmitted Packets/Bytes

| Protocol | Fragmentation | | LFI |
|----------------|---------------------|----------------------------|-----|
| | First fragmentation | Second to n fragmentations | |
| | Bytes | Bytes | |
| MLPPP (Long) | 13 | 12 | 8 |
| MLPPP (short) | 11 | 10 | 8 |
| MLFR (FRF15) | 12 | 10 | 8 |
| MFR (FRF16) | 10 | 8 | - |
| MCMLPPP(Long) | 13 | 12 | - |
| MCMLPPP(Short) | 11 | 10 | - |

Layer 2 Statistics - Fragmentation Overhead Calculation

MLPPP/MC-MLPPP Overhead details:

=====

Fragment 1:

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
Inner PPP header           : 1 byte
HDLC flag and FCS bytes    : 4 bytes

```

Fragments 2 .. n :

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
HDLC flag and FCS bytes    : 4 bytes

```

MLFR (FRF15) Overhead details:

=====

Fragment 1:

```

Framereley header         : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
Inner proto               : 2 bytes
HDLC flag and FCS         : 4 bytes

```

Fragments 2 ...n :

```

Framereley header         : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
HDLC flag and FCS         : 4 bytes

```

MFR (FRF16) Overhead details:

=====

Fragment 1:
Fragmentation header : 2 bytes
Framereplay header : 2 bytes
Inner proto : 2 bytes
HDLC flag and FCS : 4 bytes

Fragments 2 ...n :
Fragmentation header : 2 bytes
Framereplay header : 2 bytes
HDLC flag and FCS : 4 bytes

Overhead with LFI

MLPPP(Long & short sequence):
=====

| | |
|-------------------|-----------|
| Outer PPP header | : 4 bytes |
| HDLC flag and FCS | : 4 bytes |

MLFR (FRF15):
=====

| | |
|--------------------|-----------|
| Framereplay header | : 2 bytes |
| Control,NLPID | : 2 bytes |
| HDLC flag and FCS | : 4 bytes |

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

remaining-traffic—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs), rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

NOTE: For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the [CLI Explorer](#).

| Output Fields | Table 190 on page 2204 lists the output fields for the show interfaces queue command. Output fields are listed in the approximate order in which they appear. |

Table 190: show interfaces queue Output Fields

| Field Name | Field Description |
|---|---|
| Physical interface | Name of the physical interface. |
| Enabled | State of the interface. Possible values are described in the "Enabled Field" section under <i>Common Output Fields Description</i> . |
| Interface index | Physical interface's index number, which reflects its initialization sequence. |
| SNMP ifIndex | SNMP index number for the interface. |
| Forwarding classes supported | Total number of forwarding classes supported on the specified interface. |
| Forwarding classes in use | Total number of forwarding classes in use on the specified interface. |
| Ingress queues supported | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface. |
| Ingress queues in use | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface. |
| Output queues supported | Total number of output queues supported on the specified interface. |
| Output queues in use | Total number of output queues in use on the specified interface. |
| Egress queues supported | Total number of egress queues supported on the specified interface. |
| Egress queues in use | Total number of egress queues in use on the specified interface. |
| Queue counters (Ingress) | CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. |
| Burst size | (Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface. |
| The following output fields are applicable to both interface component and Packet Forwarding component in the show interfaces queue command: | |
| Queue | Queue number. |
| Forwarding classes | Forwarding class name. |

Table 190: show interfaces queue Output Fields (*continued*)

| Field Name | Field Description |
|-----------------------------|---|
| Queued Packets | <p>Number of packets queued to this queue.</p> <p>NOTE: For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see “Additional Information” on page 2202.</p> |
| Queued Bytes | <p>Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see Table 191 on page 2207.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see “Additional Information” on page 2202.</p> |
| Transmitted Packets | <p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the Packet Forwarding Engine Chassis Queues field) shows the prefragmentation values.</p> <p>NOTE: For Layer 2 statistics, see “Overhead for Layer 2 Statistics” on page 2200</p> |
| Transmitted Bytes | <p>Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see Table 191 on page 2207.</p> <p>NOTE: On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p>NOTE: For Layer 2 statistics, see “Overhead for Layer 2 Statistics” on page 2200</p> |
| Tail-dropped packets | Number of packets dropped because of tail drop. |
| RL-dropped packets | <p>Number of packets dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic is not included in the queued traffic statistics. For more information, see “Additional Information” on page 2202.</p> |
| RL-dropped bytes | <p>Number of bytes dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic is not included in the queued traffic statistics. For more information, see “Additional Information” on page 2202.</p> |

Table 190: show interfaces queue Output Fields (*continued*)

| Field Name | Field Description |
|---------------------|---|
| RED-dropped packets | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> Low, non-TCP—Number of low-loss priority non-TCP packets dropped because of RED. Low, TCP—Number of low-loss priority TCP packets dropped because of RED. High, non-TCP—Number of high-loss priority non-TCP packets dropped because of RED. High, TCP—Number of high-loss priority TCP packets dropped because of RED. (J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> Low—Number of low-loss priority packets dropped because of RED. Medium-low—Number of medium-low loss priority packets dropped because of RED. Medium-high—Number of medium-high loss priority packets dropped because of RED. High—Number of high-loss priority packets dropped because of RED. <p>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| RED-dropped bytes | <p>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see Table 191 on page 2207.</p> <ul style="list-style-type: none"> (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> Low, non-TCP—Number of low-loss priority non-TCP bytes dropped because of RED. Low, TCP—Number of low-loss priority TCP bytes dropped because of RED. High, non-TCP—Number of high-loss priority non-TCP bytes dropped because of RED. High, TCP—Number of high-loss priority TCP bytes dropped because of RED. (J Series routers only) The output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> Low—Number of low-loss priority bytes dropped because of RED. Medium-low—Number of medium-low loss priority bytes dropped because of RED. Medium-high—Number of medium-high loss priority bytes dropped because of RED. High—Number of high-loss priority bytes dropped because of RED. <p>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |

Byte counts vary by interface hardware. [Table 191 on page 2207](#) shows how the byte counts on the outbound interfaces vary depending on the interface hardware.

[Table 191 on page 2207](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 191: Byte Count by Interface Hardware

| Interface Hardware | Output Level | Byte Count Includes | Comments |
|----------------------------------|-----------------------------|--|--|
| Gigabit Ethernet IQ and IQE PICs | Interface | <p>Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes</p> | <p>The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type.</p> <p>For RED dropped, 6 bytes are added for the source MAC address.</p> |
| | Packet forwarding component | <p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> | — |
| Non-IQ PIC | Interface | <p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet. <p>T4000 routers with Type 5 FPCs :</p> <ul style="list-style-type: none"> • Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Inter frame Gap. • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead 8 bytes preamble + 12 bytes Interframe Gap. <p>M Series routers:</p> <ul style="list-style-type: none"> • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead. <p>PTX Series Packet Transport Routers:</p> <ul style="list-style-type: none"> • Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes FCS + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). • Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including 4 bytes CRC + the full Layer 1 overhead of the MAC header DA + SA + EtherType (non-VLAN). • RED dropped: 478 bytes of Layer 3 packet + 22 bytes special header. To the TQ, this packet has 4 bytes more than queued or transmitted. | <p>The Layer 2 overhead is 14 bytes for non-VLAN traffic and 18 bytes for VLAN traffic.</p> |

Table 191: Byte Count by Interface Hardware (*continued*)

| Interface Hardware | Output Level | Byte Count Includes | Comments |
|--|-----------------------------|---|--|
| IQ and IQE PICs with a SONET/SDH interface | Interface | Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes

Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes

RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes | The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header. |
| | Packet forwarding component | Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet

Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes | For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie. |
| Non-IQ PIC with a SONET/SDH interface | Interface | T Series, TX Series, T1600, and MX Series routers: <ul style="list-style-type: none"> • Queued: 478 bytes of Layer 3 packet. • Transmitted: 478 bytes of Layer 3 packet. M Series routers: <ul style="list-style-type: none"> • Queued: 478 bytes of Layer 3 packet. • Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes • RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet | For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP). |
| Interfaces configured with Frame Relay Encapsulation | Interface | The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes. | |
| 1-port 10-Gigabit Ethernet IQ2 and IQ2-E PICs | Interface | Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.

Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC. | The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic. |
| 4-port 1G IQ2 and IQ2-E PICs | Packet forwarding component | Queued: 478 bytes of Layer 3 packet. | — |
| 8-port 1G IQ2 and IQ2-E PICs | | Transmitted: 478 bytes of Layer 3 packet. | |

Sample Output

show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the

command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

```
user@host> show interfaces queue ge-4/2/0
Physical interface: ge-4/2/0, Enabled, Physical link is Up
  Interface index: 203, SNMP ifIndex: 1054
Forwarding classes: 16 supported, 4 in use
Egress queues: 8 supported, 4 in use
Queue: 0, Forwarding classes: best-effort
  Queued:

show interfaces xe

| | |
|---------------------------------|--|
| Syntax | <code>show interfaces <i>device-name:type-fpc/pic/port</i></code>
<code><brief detail extensive terse></code>
<code><descriptions></code>
<code><media></code>
<code><routing-instance (all <i>instance-name</i>)></code>
<code><snmp-index <i>snmp-index</i>></code>
<code><statistics></code> |
| Release Information | Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display status information about the specified 10-Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces. |
| Options | <p><i>device-name:type-fpc/pic/port</i>—(QFabric systems only) The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name must contain a maximum of 128 characters and not contain any colons.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>routing-instance (all <i>instance-name</i>)—(Optional) Display the name of an individual routing instance or display all routing instances.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |

Output Fields Table 192 on page 2239 lists the output fields for the **show interfaces xe** command. Output fields are listed in the approximate order in which they appear.

Table 192: show interfaces xe Output Fields

| Field Name | Field Description | Level of Output |
|---|---|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. | All levels |
| Interface index | Index number of the physical interface, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Link-level type | Encapsulation being used on the physical interface. | All levels |
| MTU | Maximum transmission unit size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Duplex | Duplex mode of the interface, either Full-Duplex or Half-Duplex . | All levels |
| Loopback | Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote . | All levels |
| Source filtering | Source filtering status: Enabled or Disabled . | All levels |
| LAN-PHY mode | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications. | All levels |
| Unidirectional | Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces. | All levels |
| Flow control | Flow control status: Enabled or Disabled . | All levels |
| NOTE: This field is only displayed if asymmetric flow control is not configured. | | |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Configured-flow-control | Configured flow control for the interface transmit buffers (tx-buffers) and receive buffers (rx-buffers): <ul style="list-style-type: none"> tx-buffers—On if the interface is configured to respond to Ethernet PAUSE messages received from the connected peer.
Off if the interface is not configured to respond to received PAUSE messages. rx-buffers—On if the interface is configured to generate and send Ethernet PAUSE messages to the connected peer.
Off if the interface is not configured to generate and send PAUSE messages. <p>NOTE: This field is only displayed if asymmetric flow control is configured.</p> | All levels |
| Auto-negotiation | Autonegotiation status: Enabled or Disabled . | All levels |
| Remote-fault | Remote fault status: <ul style="list-style-type: none"> Online—Autonegotiation is manually configured as online. Offline—Autonegotiation is manually configured as offline. | All levels |
| Device flags | Information about the physical device. | All levels |
| Interface flags | Information about the interface. | All levels |
| Link flags | Information about the link. | All levels |
| Wavelength | Configured wavelength, in nanometers (nm). | All levels |
| Frequency | Frequency associated with the configured wavelength, in terahertz (THz). | All levels |
| CoS queues | Number of CoS queues configured. | detail extensive none |
| Schedulers | Number of CoS schedulers configured. | extensive |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | Hardware MAC address. | detail extensive none |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago) . | detail extensive none |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|---|-------------------------|
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>NOTE: The bandwidth bps counter is not enabled.</p> | detail extensive |
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. | extensive |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|--|-------------------------|
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. | extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive |
| Queue counters (Egress) | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive |
| Queue Number | The CoS queue number and the forwarding classes mapped to the queue number. The Mapped forwarding class column lists the forwarding classes mapped to each CoS queue. | detail extensive |
| Ingress queues | Total number of ingress queues supported on the specified interface. | extensive |
| Queue counters (Ingress) | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | extensive |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Active alarms and Active defects | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. | detail extensive none |
| PCS statistics | Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device. | detail extensive |
| MAC statistics | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of packets that exceeds the configured MTU. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." | extensive |
| Filter statistics | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. | extensive |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------------|--|-----------------|
| Autonegotiation information | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). For asymmetric PAUSE, shows if the PAUSE transmit and PAUSE receive states on the interface are enable or disable. • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). | extensive |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Packet Forwarding Engine configuration | Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Index number of the logical interface, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP interface index number for the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Protocol | Protocol family. | detail extensive none |
| Traffic statistics | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface. | detail extensive |
| IPv6 transit statistics | If IPv6 statics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface. | extensive |
| Local statistics | Number and rate of bytes and packets destined to and from the switch. | extensive |
| Transit statistics | Number and rate of bytes and packets transiting the switch. | extensive |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route Table | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail extensive none |

Table 192: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--|------------------------------|
| Input Filters | Names of any input filters applied to this interface. | detail extensive |
| Output Filters | Names of any output filters applied to this interface. | detail extensive |
| Flags | Information about protocol family flags.

If unicast Reverse Path Forwarding (uRPF) is explicitly configured on the specified interface, the uRPF flag appears. If uRPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag does not appear even though uRPF is enabled. | detail extensive |
| Addresses, Flags | Information about the address flags. | detail extensive none |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| Flags | Information about the address flag. | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interlace. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

show lacp interfaces

| | |
|---------------------------------|---|
| Syntax | <code>show lacp interfaces</code>
<code><interface-name></code> |
| Release Information | Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet or Gigabit Ethernet interface. |
| Options | <code>none</code> —Display LACP information for all interfaces.

<code>interface-name</code> —(Optional) Display LACP information for the specified interface: <ul style="list-style-type: none">• Aggregated Ethernet—<code>aex</code>• Gigabit Ethernet—<code>ge-fpc/pic/port</code>• 10-Gigabit Ethernet—<code>xe-fpc/pic/port</code> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• <i>Example: Configuring Aggregated Ethernet High-Speed Uplinks Between an EX4200 Virtual Chassis Access Switch and an EX4200 Virtual Chassis Distribution Switch</i>• <i>Example: Configuring Aggregated Ethernet High-Speed Uplinks with LACP Between an EX4200 Virtual Chassis Access Switch and an EX4200 Virtual Chassis Distribution Switch</i>• Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 1896• Configuring Aggregated Ethernet Links (CLI Procedure)• Configuring Link Aggregation on page 2019• Configuring Aggregated Ethernet LACP (CLI Procedure)• Configuring Aggregated Ethernet LACP on page 2017• Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)• Understanding Aggregated Ethernet Interfaces and LACP• Understanding Aggregated Ethernet Interfaces and LACP on page 1843• Junos OS Interfaces Fundamentals Configuration Guide |
| List of Sample Output | show lacp interfaces (EX Series Switches) on page 2258
show lacp interfaces (QFX Series) on page 2259 |
| Output Fields | Table 184 on page 2160 lists the output fields for the <code>show lacp interfaces</code> command. Output fields are listed in the approximate order in which they appear. |

Table 193: show lacp interfaces Output Fields

| Field Name | Field Description |
|----------------------|--|
| Aggregated interface | Aggregated Ethernet interface name. |
| LACP State | <p>LACP state information for each aggregated Ethernet interface:</p> <ul style="list-style-type: none"> For a child interface configured with the force-up statement, LACP state displays FUP along with the interface name. Role—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> Actor—Local device participating in the LACP negotiation. Partner—Remote device participating in the LACP negotiation. Exp—Expired state. Yes indicates that the actor or partner is in an expired state. No indicates that the actor or partner is not in an expired state. Def—Default. Yes indicates that the actor's receive machine is using the default operational partner information, which is administratively configured for the partner. No indicates that the operational partner information in use has been received in an LACP PDU. Dist—Distribution of outgoing frames. No indicates that the distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is Yes. Col—Collection of incoming frames. Yes indicates that the collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is No. Syn—Synchronization. If the value is Yes, the link is considered to be synchronized. The link has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is No, the link is not synchronized. The link is currently not in the right aggregation. Aggr—Ability of the aggregation port to aggregate (Yes) or to operate only as an individual link (No). Timeout—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or a fast transmission rate, depending upon the expressed LACP timeout preference (Long Timeout or Short Timeout). Activity—Actor's or partner's port activity. Passive indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is Active. Active indicates the port's preference to participate in the protocol regardless of the partner's control value. |

Table 193: show lacp interfaces Output Fields (*continued*)

| Field Name | Field Description |
|---------------|--|
| LACP Protocol | <p>LACP protocol information for each aggregated interface:</p> <ul style="list-style-type: none"> Link state (active or standby) indicated in parentheses next to the interface when link protection is configured. Receive State—One of the following values: <ul style="list-style-type: none"> Current—The state machine receives an LACP PDU and enters the Current state. Defaulted—If no LACP PDU is received before the timer for the Current state expires a second time, the state machine enters the Defaulted state. Expired—If no LACP PDU is received before the timer for the Current state expires once, the state machine enters the Expired state. Initialize—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the Initialize state. LACP Disabled—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to LACP Disabled. This state is similar to the Defaulted state, except that the port is forced to operate as an individual port. Port Disabled—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the Port Disabled state. Transmit State—Transmit state of the state machine. The transmit state is one of the following values: <ul style="list-style-type: none"> Fast periodic—Periodic transmissions are enabled at a fast transmission rate. No periodic—Periodic transmissions are disabled. Periodic timer—Transitory state entered when the periodic timer expires. Slow periodic—Periodic transmissions are enabled at a slow transmission rate. Mux State—State of the multiplexer state machine for the aggregation port. The state is one of the following values: <ul style="list-style-type: none"> Attached—The multiplexer state machine initiates the process of attaching the port to the selected aggregator. Collecting—Yes indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. No indicates the receive function of this link is not enabled. Collecting distributing—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution. Detached—Process of detaching the port from the aggregator is in progress. Distributing—Yes indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames can be passed down from the aggregator's distribution function for transmission. No indicates the transmit function of this link is not enabled. Waiting—The multiplexer state machine is in a holding process, awaiting an outcome. |

Sample Output

show lacp interfaces (EX Series Switches)

```

show redundant-trunk-group

| | |
|---------------------------------|---|
| Syntax | <code>show redundant-trunk-group <group-name group-name></code> |
| Release Information | Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series. |
| Description | Display information about redundant trunk groups. |
| Options | <code>group-name group-name</code> —Display information about the specified redundant trunk group. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • Example: Configuring Redundant Trunk Links for Faster Recovery • Example: Configuring Redundant Trunk Links for Faster Recovery on page 2010 • Understanding Redundant Trunk Links on page 1885 |
| List of Sample Output | show redundant-trunk-group group-name Group1 on page 2263 |
| Output Fields | Table 195 on page 2263 lists the output fields for the <code>show redundant-trunk-group</code> command. Output fields are listed in the approximate order in which they appear. |

Table 195: show redundant-trunk-group Output Fields

| Field Name | Field Description |
|-------------------|--|
| Group name | Name of the redundant trunk port group. |
| Interface | Name of an interface belonging to the trunk port group. |
| State | Operating state of the interface. <ul style="list-style-type: none"> • Up denotes the interface is up. • Down denotes the interface is down. • Pri denotes a primary interface. • Act denotes an active interface. |
| Time of last flap | Date and time at which the advertised link became unavailable, and then, available again. |
| Flap count | Total number of flaps since the last switch reboot. |

Sample Output

show redundant-trunk-group group-name Group1

```
user@switch> show redundant-trunk-group group-name Group1
```

| Group name | Interface | State | Time of last flap | Flap Count |
|------------|-----------|-------|-------------------|------------|
|------------|-----------|-------|-------------------|------------|

| | | | | |
|--------|-------------|------------|-------|---|
| Group1 | ge-0/0/45.0 | UP/Pri/Act | Never | 0 |
| | ge-0/0/47.0 | UP | Never | 0 |

show uplink-failure-detection

| | |
|---------------------------------|--|
| Syntax | <code>show uplink-failure-detection</code>
<code><group group-name></code> |
| Release Information | Command introduced in Junos OS Release 11.1 for EX Series switches. |
| Description | Display information about the uplink-failure-detection group, the member interfaces, and their status. |
| Options | none —Display information about all groups configured for uplink failure detection.
group group-name —(Optional) Display information about the specified group only. |

Table 196: show uplink-failure-detection Output Fields

| Field Name | Field Description |
|----------------|---|
| Group | Name of the group. |
| Uplink | The uplink interface or interfaces configured as link-to-monitor.
NOTE: The asterisk (*) indicates that the link is up. |
| Downlink | The downlink interface or interfaces configured as link-to-disable.
NOTE: The asterisk (*) indicates that the link is up. |
| Failure Action | Status of uplink failure detection: <ul style="list-style-type: none"> • Active—The switch has detected an uplink failure and has brought the downlink down. • Inactive—The uplink or uplinks are up. |

Sample Output

show uplink-failure-detection

```
user@switch> show uplink-failure-detection
```

```
Group          : group1
Uplink         : ge-0/0/0*
Downlink       : ge-0/0/1*
Failure Action : Inactive

Group          : group2
Uplink         : ge-0/0/3.0
Downlink       : ge-0/0/4.0
Failure Action : Active
```

Monitoring Commands (ELS CLI Only)

- `show interfaces irb`

show interfaces irb

| | |
|---------------------------------|---|
| Syntax | <pre>show interfaces irb <brief detail extensive terse> <descriptions> <media> <routing-instance <i>instance-name</i>> <snmp-index <i>snmp-index</i>> <statistics></pre> |
| Release Information | <p>Command introduced in Junos OS Release 12.3R2.</p> <p>Command introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2 for the QFX Series</p> |
| Description | Display integrated routing and bridging interfaces information. |
| Options | <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>routing-instance <i>instance-name</i>—(Optional) Display information for the interface with the specified SNMP index.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the interface with the specified SNMP index.</p> <p>statistics—(Optional) Display static interface statistics.</p> |
| Additional Information | Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. |
| Required Privilege Level | view |

| Output Fields | Table 197 on page 2267 lists the output fields for the show interfaces irb command. Output fields are listed in the approximate order in which they appear. |

Table 197: show interfaces irb Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|---|-----------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels |

Table 197: show interfaces irb Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|------------------------------------|
| Proto | Protocol configured on the interface. | terse |
| Interface index | Physical interface index number, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Type | Physical interface type. | detail extensive none |
| Link-level type | Encapsulation being used on the physical interface. | detail extensive brief none |
| MTU | MTU size on the physical interface. | detail extensive brief none |
| Clocking | Reference clock source: Internal or External . Always unspecified on IRB interfaces. | detail extensive brief |
| Speed | Speed at which the interface is running. Always unspecified on IRB interfaces. | detail extensive brief |
| Device flags | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | detail extensive brief none |
| Interface flags | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> . | detail extensive brief none |
| Link type | Physical interface link type: full duplex or half duplex . | detail extensive none |
| Link flags | Information about the link. Possible values are described in the "Links Flags" section under <i>Common Output Fields Description</i> . | detail extensive none |
| Physical Info | Physical interface information. | All levels |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | MAC address of the hardware. | detail extensive none |
| Alternate link address | Backup address of the link. | detail extensive |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) . | detail extensive none |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |

Table 197: show interfaces irb Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|-------------------------|
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. | detail extensive |
| IPv6 transit statistics | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. | detail extensive |
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. | detail extensive |

Logical Interface

Table 197: show interfaces irb Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|--|---------------------------------|
| Logical interface | Name of the logical interface. | All levels |
| Index | Index number of the logical interface (which reflects its initialization sequence). | detail extensive
none |
| SNMP ifIndex | SNMP interface index number of the logical interface. | detail extensive
none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> . | detail extensive |
| Encapsulation | Encapsulation on the logical interface. | detail extensive |
| Bandwidth | Speed at which the interface is running. | detail extensive |
| Routing Instance | Routing instance IRB is configured under. | detail extensive |
| Bridging Domain | Bridging domain IRB is participating in. | detail extensive |
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. | detail extensive |
| IPv6 transit statistics | <p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. | detail extensive |
| Local statistics | Statistics for traffic received from and transmitted to the Routing Engine. | detail extensive |
| Transit statistics | Statistics for traffic transiting the router. | detail extensive |
| Protocol | Protocol family configured on the local interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> . | detail extensive |
| MTU | Maximum transmission unit size on the logical interface. | detail extensive |
| Maximum labels | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface. | detail extensive
none |

Table 197: show interfaces irb Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|-------------------------|
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route table | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail extensive |
| Addresses, Flags | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | detail extensive |
| Policer | The policer that is to be evaluated when packets are received or transmitted on the interface. | detail extensive |
| Flags | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | detail extensive |

Sample Output

show interfaces irb extensive

```

user@host> show interfaces irb extensive
Physical interface: irb, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 23, Generation: 130
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: Unspecified

Monitoring Commands (Original CLI Only)

- `show interfaces xle`

show interfaces xle

| | |
|---------------------------------|--|
| Syntax | <code>show interfaces <i>device-name:type-fpc/pic/port</i></code>
<code><brief detail extensive terse></code>
<code><descriptions></code>
<code><media></code>
<code><routing-instance (all <i>instance-name</i>)></code>
<code><snmp-index <i>snmp-index</i>></code>
<code><statistics></code> |
| Release Information | Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display status information about the specified 10-Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces. |
| Options | <p><i>device-name:type-fpc/pic/port</i>—(QFabric systems only) The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name must contain a maximum of 128 characters and not contain any colons.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>routing-instance (all <i>instance-name</i>)—(Optional) Display the name of an individual routing instance or display all routing instances.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p> |

Output Fields Table 192 on page 2239 lists the output fields for the **show interfaces xe** command. Output fields are listed in the approximate order in which they appear.

Table 198: show interfaces xe Output Fields

| Field Name | Field Description | Level of Output |
|---|---|------------------------------|
| Physical Interface | | |
| Physical interface | Name of the physical interface. | All levels |
| Enabled | State of the interface. | All levels |
| Interface index | Index number of the physical interface, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP index number for the physical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Link-level type | Encapsulation being used on the physical interface. | All levels |
| MTU | Maximum transmission unit size on the physical interface. | All levels |
| Speed | Speed at which the interface is running. | All levels |
| Duplex | Duplex mode of the interface, either Full-Duplex or Half-Duplex . | All levels |
| Loopback | Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote . | All levels |
| Source filtering | Source filtering status: Enabled or Disabled . | All levels |
| LAN-PHY mode | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications. | All levels |
| Unidirectional | Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces. | All levels |
| Flow control | Flow control status: Enabled or Disabled . | All levels |
| NOTE: This field is only displayed if asymmetric flow control is not configured. | | |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------------------|---|------------------------------|
| Configured-flow-control | Configured flow control for the interface transmit buffers (tx-buffers) and receive buffers (rx-buffers): <ul style="list-style-type: none"> tx-buffers—On if the interface is configured to respond to Ethernet PAUSE messages received from the connected peer.
Off if the interface is not configured to respond to received PAUSE messages. rx-buffers—On if the interface is configured to generate and send Ethernet PAUSE messages to the connected peer.
Off if the interface is not configured to generate and send PAUSE messages. <p>NOTE: This field is only displayed if asymmetric flow control is configured.</p> | All levels |
| Auto-negotiation | Autonegotiation status: Enabled or Disabled . | All levels |
| Remote-fault | Remote fault status: <ul style="list-style-type: none"> Online—Autonegotiation is manually configured as online. Offline—Autonegotiation is manually configured as offline. | All levels |
| Device flags | Information about the physical device. | All levels |
| Interface flags | Information about the interface. | All levels |
| Link flags | Information about the link. | All levels |
| Wavelength | Configured wavelength, in nanometers (nm). | All levels |
| Frequency | Frequency associated with the configured wavelength, in terahertz (THz). | All levels |
| CoS queues | Number of CoS queues configured. | detail extensive none |
| Schedulers | Number of CoS schedulers configured. | extensive |
| Hold-times | Current interface hold-time up and hold-time down, in milliseconds. | detail extensive |
| Current address | Configured MAC address. | detail extensive none |
| Hardware address | Hardware MAC address. | detail extensive none |
| Last flapped | Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago) . | detail extensive none |
| Input Rate | Input rate in bits per second (bps) and packets per second (pps). | None specified |
| Output Rate | Output rate in bps and pps. | None specified |
| Statistics last cleared | Time when the statistics for the interface were last set to zero. | detail extensive |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|---|-------------------------|
| Traffic statistics | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>NOTE: The bandwidth bps counter is not enabled.</p> | detail extensive |
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. | extensive |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------------|--|-------------------------|
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. | extensive |
| Egress queues | Total number of egress queues supported on the specified interface. | detail extensive |
| Queue counters (Egress) | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | detail extensive |
| Queue Number | The CoS queue number and the forwarding classes mapped to the queue number. The Mapped forwarding class column lists the forwarding classes mapped to each CoS queue. | detail extensive |
| Ingress queues | Total number of ingress queues supported on the specified interface. | extensive |
| Queue counters (Ingress) | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. | extensive |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Active alarms and Active defects | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. | detail extensive none |
| PCS statistics | Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device. | detail extensive |
| MAC statistics | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of packets that exceeds the configured MTU. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." | extensive |
| Filter statistics | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. | extensive |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------------|--|-----------------|
| Autonegotiation information | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). For asymmetric PAUSE, shows if the PAUSE transmit and PAUSE receive states on the interface are enable or disable. • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). | extensive |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|------------------------------|
| Packet Forwarding Engine configuration | Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> Destination slot—FPC slot number. CoS transmit queue—Queue number and its associated user-configured forwarding class name. Bandwidth %—Percentage of bandwidth allocated to the queue. Bandwidth bps—Bandwidth allocated to the queue (in bps). Buffer %—Percentage of buffer space allocated to the queue. Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. Priority—Queue priority: low or high. Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. | extensive |
| Logical Interface | | |
| Logical interface | Name of the logical interface. | All levels |
| Index | Index number of the logical interface, which reflects its initialization sequence. | detail extensive none |
| SNMP ifIndex | SNMP interface index number for the logical interface. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Flags | Information about the logical interface. | All levels |
| Encapsulation | Encapsulation on the logical interface. | All levels |
| Protocol | Protocol family. | detail extensive none |
| Traffic statistics | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface. | detail extensive |
| IPv6 transit statistics | If IPv6 statics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface. | extensive |
| Local statistics | Number and rate of bytes and packets destined to and from the switch. | extensive |
| Transit statistics | Number and rate of bytes and packets transiting the switch. | extensive |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |
| Route Table | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail extensive none |

Table 198: show interfaces xe Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|--|------------------------------|
| Input Filters | Names of any input filters applied to this interface. | detail extensive |
| Output Filters | Names of any output filters applied to this interface. | detail extensive |
| Flags | Information about protocol family flags.

If unicast Reverse Path Forwarding (uRPF) is explicitly configured on the specified interface, the uRPF flag appears. If uRPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag does not appear even though uRPF is enabled. | detail extensive |
| Addresses, Flags | Information about the address flags. | detail extensive none |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed. | brief |
| Flags | Information about the address flag. | detail extensive none |
| Destination | IP address of the remote side of the connection. | detail extensive none |
| Local | IP address of the logical interface. | detail extensive none |
| Broadcast | Broadcast address of the logical interlace. | detail extensive none |
| Generation | Unique number for use by Juniper Networks technical support only. | detail extensive |

- [Troubleshooting Multichassis Link Aggregation on page 2293](#)
- [Troubleshooting Network Interfaces on page 2299](#)

Troubleshooting an Aggregated Ethernet Interface

Problem The `show interfaces terse` command shows that the LAG is down.

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

Problem When both of the multichassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table.

For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v10        *                Flood     - All-members
v10        00:10:94:00:00:01 Learn(L)    3:55 ae0.0 (MCAE)
v10        00:10:94:00:00:02 Learn(R)    0 xe-0/0/9.0
v20        *                Flood     - All-members
v30        *                Flood     - All-members
v30        84:18:88:de:b1:2e Static      - Router
```

```
user@switchB> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
```

| | | | |
|-----|-------------------|----------|----------------|
| v10 | * | Flood | - All-members |
| v10 | 00:10:94:00:00:01 | Learn(R) | 0 ae0.0 (MCAE) |
| v10 | 00:10:94:00:00:02 | Learn | 40 xe-0/0/10.0 |
| v20 | * | Flood | - All-members |
| v30 | * | Flood | - All-members |
| v30 | 84:18:88:df:83:0a | Static | - Router |

Solution This is expected behavior.

MC-LAG Peer Does Not Go into Standby Mode

Problem A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

Solution To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

Problem When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

Solution This is expected behavior.

Redirect Filters Take Priority over User-Defined Filters

Problem Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

Solution This is expected behavior.

Operational Command Output Is Wrong

Problem After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
Redundancy Group IDs Joined: None

Client Application: lacpd
Redundancy Group IDs Joined: 1
```

```
Client Application: eswd
Redundancy Group IDs Joined: 1
```

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

Solution This is expected behavior.

ICCP Connection Might Take Up to 60 Seconds to Become Active

Problem When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

Solution This is expected behavior.

MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

Problem When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v100      *                Flood     - All-members
v100      00:10:00:00:00:01 Learn(L)    0 ae0.0 (MCAE)
v100      00:10:00:00:00:02 Learn(L)    0 ae0.0 (MCAE)
```

Solution This is expected behavior.

MAC Address Is Not Learned Remotely in a Default VLAN

Problem If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

Solution This is expected behavior.

Snooping Entries Learned on MC-AE Interfaces Are Not Removed

Problem When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down. This is done to speed up convergence time when the interfaces come up, or come up and go down.

Solution This is expected behavior.

ICCP Does Not Come Up After You Add or Delete an Authentication Key

Problem The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

Solution Delete the ICCP configuration , and then add the ICCP configuration.

Local Status Is Standby When It Should Be Active

Problem If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

Solution This is expected behavior.

Packets Loop on the Server When ICCP Fails

Problem When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

Solution This is expected behavior.

Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

Problem After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

Solution This is expected behavior.

No Commit Checks Are Done for ICL-PL Interfaces

Problem There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

Solution This is expected behavior.

Double Failover Scenario

Problem If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

Solution This is expected behavior.

Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

Problem When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag `Ip4McastFloodMode` for the VLAN is changed to `MCAST_FLOOD_ALL`. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

Solution This is expected behavior.

Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

Problem When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

Solution This is expected behavior.

AE Interfaces Go Down

Problem When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

Solution Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

Flooding of Upstream Traffic

Problem When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with

a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

Solution Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

Troubleshooting Network Interfaces

The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

Problem The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

When you check the status with the CLI command **show interfaces *interface-name*** , the disabled port is not listed.

Cause By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

Solution Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

Overview of Routing Options

In addition to dynamic routing protocols, you can configure static routing on QFX Series switches. You can also configure a variety of protocol-independent routing properties, such as

- Per-packet load balancing (equal cost multipath routing)
- Autonomous system numbers
- Autonomous system confederation members
- Router identifiers
- Routing table groups
- Multicast scoping

Related Documentation

- [Understanding Distributed Periodic Packet Management on page 2304](#)
- [Understanding Virtual Router Routing Instances on page 2304](#)

Understanding Virtual Router Routing Instances

Virtual router routing instances allow administrators to divide a QFX Series switch into multiple independent virtual routers, each with its own routing table. Virtual router routing instances enable you to isolate traffic without using multiple devices to segment your network. You can create routing instances for unicast routing protocols and PIM sparse mode.

Each virtual router routing instance consists of sets of the following:

- Routing tables
- Interfaces that belong to these routing tables
- Routing protocol configurations
- Routing option configurations

You can use virtual router routing instances to isolate customer traffic on a network and to bind customer-specific routing instances to customer-owned interfaces. Each interface can belong to only one routing instance. QFX 3500 and QFX3600 switches and QFabric systems support as many as 256 virtual router routing instances. QFX 5100 switches support as many as 512 virtual router routing instances.

Related Documentation

- [Configuring Virtual Router Routing Instances on page 2313](#)

Understanding Distributed Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the QFX Series can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocol, and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and the access interfaces for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

BEST PRACTICE: We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

- Related Documentation**
- [Configuring Distributed Periodic Packet Management on page 2312](#)

Understanding Bidirectional Forwarding Detection (BFD)

The Bidirectional Forwarding Detection (BFD) protocol is a simple mechanism that detects failures in a network and works in a wide variety of network environments and topologies. In BFD operation, switches exchange BFD hello packets at a specified interval and detect a neighbor failure if they do not receive a reply after a specified interval. The BFD failure detection timers support shorter time limits than the static route failure detection mechanisms, so they can provide faster detection of failures.

To configure faster failure detection, use lower BFD timer values. The timers can automatically adapt to a higher value if an adjacency fails, and they also adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. In this case, a back-off algorithm increases the receive interval by two if the local BFD instance is the reason for the session flap and increases the transmission interval by two if the remote BFD instance is the reason for the session flap.

You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. This command is hitless, meaning that it does not affect traffic flow.

NOTE: QFX switches do not support BFD timer values of less than 1 second.

- Related Documentation**
- [Examples: Configuring BFD for Static Routes on page 2315](#)
 - [Example: Configuring BFD Authentication for Static Routes on page 2330](#)

Understanding the Unified Forwarding Table

On the QFX5100 switch, you can control the allocation of forwarding table memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

This feature gives you the flexibility to configure your QFX5100 to match the needs of your particular network environment.

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 122 on page 1416](#) lists the profiles you can choose and the associated maximum values for each type of table entry.

Table 199: Unified Forwarding Table Profiles

| Profile Name | MAC Table | Host Table (unicast and multicast addresses) | | | | | | LPM Table | |
|---|---------------|--|--------------|-------------|-------------|-------------|-------------|--------------|-----------------------------|
| | MAC Addresses | IPv4 unicast | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) | IPv4 Entries | IPv6 Entries (prefix <= 64) |
| l2-profile-one | 288K | 16K | 8K | 8K | 8K | 4K | 4K | 16K | 8K |
| l2-profile-two | 224K | 80K | 40K | 40K | 40K | 20K | 20K | 16K | 8K |
| l2-profile-three
(default) | 160K | 144K | 72K | 72K | 72K | 36K | 36K | 16K | 8K |
| l3-profile | 96K | 208K | 104K | 104K | 104K | 52K | 52K | 16K | 8K |
| lpm-profile
(Do not use for IPv6) | 32K | 16K | 8K | 8K | 8K | 4K | 4K | 128K | 64K |

Note that if the host or LPM table stores the maximum number of entries for any given type, the entire shared table is full and is unable to accommodate *any* entries of any other type. As you can see, different entry types occupy different amounts of memory. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address. [Table 123 on page 1416](#) lists various valid combinations that the host table can store if you use the **l2-profile-one** profile. Each row in the table represents a case in which the host table is full and cannot accommodate any more entries.

Table 200: Example Host Table Combinations Using l2-profile-one

| IPv4 unicast | IPv6 unicast | IPv4 multicast (*, G) | IPv4 multicast (S, G) | IPv6 multicast (*, G) | IPv6 multicast (S, G) |
|--------------|--------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 16K | 0 | 0 | 0 | 0 | 0 |
| 12K | 2K | 0 | 0 | 0 | 0 |
| 12K | 0 | 2 | 2 | 0 | 0 |
| 8K | 4K | 0 | 0 | 0 | 0 |
| 4K | 2K | 2 | 2 | 0 | 0 |
| 0 | 4K | 0 | 0 | 1K | 1K |

The LPM table is also shared and the same principles apply. [Table 124 on page 1417](#) provides examples of valid combinations that the LPM table can store, also using the **l2-profile-one** profile. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

Table 201: Example LPM Table Combinations Using l2-profile-one

| IPv4 entries | IPv6 Entries (prefix <= 64) |
|--------------|-----------------------------|
| 16K | 0 |
| 0 | 8K |
| 8K | 4K |
| 4K | 6K |

NOTE: If you want to use more than 16 IPv6 addresses with prefix lengths greater than 64, you must follow the instructions at [“Configuring the Unified Forwarding Table” on page 1548](#). As that topic explains, if you increase the number of addresses with prefix lengths greater than 64, you reduce the amount of LPM-table memory available to store IPv6 addresses with prefixes less than or equal to 64.

Configuring Static Routing

Static routes are routes that are manually configured and entered into the routing table.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) *preference* value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, **0** is the lowest and **255** is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:

```
[edit]  
user@switch# set routing-options static route 0.0.0.0/0 next-hop 10.0.1.1
```
- To configure a static route and specify the next address to be used when routing traffic to the static route:

```
[edit]  
user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
```
- To always keep the static route in the forwarding table:

```
[edit]  
user@switch# set routing-options static route 20.0.0.0/24 retain
```
- To prevent the static route from being readvertised:

```
[edit]  
user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
```
- To remove inactive routes from the forwarding table:

```
[edit]  
user@switch# set routing-options static route 20.0.0.0/24 active
```

Configuring Per-Packet Load Balancing

When there are multiple equal-cost paths to the same destination for the active route, Junos OS chooses one of the next-hop addresses to install into the forwarding table in a random fashion by default. Whenever the set of next hops for a destination changes in any way, the next-hop address is chosen again, also in a random fashion.

You can configure Junos OS so that, for the active route, all next-hop addresses for a destination are installed in the forwarding table. This is called per-packet load balancing. You can use this feature to spread traffic across multiple paths.

When per-packet load balancing is configured, traffic is divided into individual flows (up to a maximum of 16). Packets for an individual flow are sent out a single interface. To determine flows, the switch examines each of the following packet fields:

- Source IP address
- Destination IP address
- Protocol
- Source port number
- Destination port number
- Source interface index
- Type of service (ToS)

The switch recognizes packets in which all of these parameters are identical and ensures that these packets are sent out through the same interface. This prevents problems that might otherwise occur with packets arriving at their destination out of their original sequence.

NOTE: Load balancing is not supported on management interfaces.

The following steps show how to configure per-packet load balancing:

1. Define a load-balancing routing policy by including one or more **policy-statement** statements at the **[edit policy-options]** hierarchy level, defining an action of **load-balance per-packet**:

```
policy-statement policy-name {
  from {
    match-conditions;
    route-filter destination-prefix match-type <actions>;
    prefix-list name;
  }
  then {
    load-balance per-packet;
  }
}
```

2. Apply the policy to routes exported from the routing table to the forwarding table. To do this, include the **forwarding-table** and **export** statements:

```
forwarding-table {
  export policy-name;
}
```

When you enable per-packet load balancing on a QFabric system, packets might be switched across the fabric even though there is a local port with a same-cost route to the destination. For example, if per-packet load balancing is enabled and a packet arrives at network Node device A, it might be switched to network Node device B and forwarded from there even if there is a same-cost route through a port on Node device A to the destination. In this case, traffic transits the fabric needlessly. You can configure a QFabric

system to choose a locally switched route if one is available. To enable this feature, include the **ecmp-do-local-lookup** statement at the **[edit forwarding-options]** hierarchy level.

Related Documentation • [Examples: Configuring Per-Packet Load Balancing on page 2315](#)

Configuring Distributed Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes on the QFX Series can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and the access interfaces for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for Link Aggregation Control Protocol (LACP) packets only.

BEST PRACTICE: We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

This topic describes:

- [Disabling or Enabling Distributed Periodic Packet Management Globally on page 2312](#)
- [Disabling or Enabling Distributed Periodic Packet Management for LACP Packets on page 2312](#)

Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:

```
[edit routing-options]  
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:

```
[edit routing-options]  
user@switch# delete ppm no-delegate-processing
```

Disabling or Enabling Distributed Periodic Packet Management for LACP Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:

```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:

```
[edit protocols]
user@switch# delete lacp ppm centralized
```

Configuring Virtual Router Routing Instances

Use virtual router routing instances to divide a QFX Series switch into multiple independent virtual routers, each with its own routing table. Virtual router routing instances enable you to isolate traffic without using multiple devices to segment your network. You can create routing instances for unicast routing protocols and PIM sparse mode.

To configure virtual router routing instances:

1. Create a routing instance:

```
[edit routing-instances]user@switch# set routing-instance-name instance-type virtual-router
```

NOTE: The default routing instance, master, refers to the main inet.0 routing table. The master routing instance is reserved and cannot be specified as a routing instance.

2. Bind each routing instance to the corresponding interfaces:

```
[edit routing-instances]user@switch# set routing-instance-name interface
device-name:type-fpc/pic/port.logical-unit-number
```

NOTE:

- You must bind routing instances to interfaces from the Node devices assigned to the network Node group only. If you try to bind routing instances to interfaces from the Node devices assigned to server Node groups, the configuration does not commit.
- You can bind an interface to one routing instance only.

3. Create each of the logical interfaces bound to each routing instance:

```
[edit interfaces]user@switch# set device-name:type-fpc/pic/port unit logical-unit-number
family inet address ip-address
```

NOTE: Do not create a logical interface using the family ethernet-switching option in this step. Binding an interface using the family ethernet-switching option to a routing instance can cause the interface to shut down.

4. (Optional) Configure routing protocols for the routing instance at the **[edit routing-instances *routing-instance-name* protocols]** hierarchy level.
5. (Optional) Configure routing options for the routing instance at the **[edit routing-instances *routing-instance-name* routing-options]** hierarchy level.

Configuring the Unified Forwarding Table

On the QFX5100 switch, you can control the allocation of memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 135 on page 1548](#) lists the profiles you can choose and the associated values for each type of entry.

Table 202: Unified Forwarding Table Profiles

| Profile Name | Maximum Number of MAC Addresses | Maximum Number of Layer 3 Hosts | Maximum Number of LPM Table Entries |
|-------------------------|---------------------------------|---------------------------------|-------------------------------------|
| l2-profile-one | 288K | 16K | 16K |
| l2-profile-two | 224K | 80K | 16K |
| l2-profile-three | 160K | 144K | 16K |
| l3-profile | 96K | 120K | 16K |
| lpm-profile | 32K | 208K | 128K |

To configure the profile that you want, enter and commit the following statement:

```
[edit]
user@switch# set forwarding-options chassis profile-name
```

The settings for **l2-profile-three** are configured by default. That is, if you do not enter a **set forwarding-options chassis *profile-name*** statement, these settings are configured.

Configuration Examples

- [Examples: Configuring Per-Packet Load Balancing on page 2315](#)
- [Examples: Configuring BFD for Static Routes on page 2315](#)
- [Example: Configuring BFD Authentication for Static Routes on page 2330](#)

Examples: Configuring Per-Packet Load Balancing

Perform per-packet load balancing for all routes:

```
[edit]
policy-options {
  policy-statement load-balancing-policy {
    then {
      load-balance per-packet;
    }
  }
}
routing-options {
  forwarding-table {
    export load-balancing-policy;
  }
}
```

Perform per-packet load balancing for a limited set of routes:

```
[edit]
policy-options {
  policy-statement load-balancing-policy {
    from {
      route-filter 192.168.10/24 orlonger;
      route-filter 9.114/16 orlonger;
    }
    then {
      load-balance per-packet;
    }
  }
}
routing-options {
  forwarding-table {
    export load-balancing-policy;
  }
}
```

Understanding BFD for Static Routes

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the static route failure detection mechanisms, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

By default, BFD is supported on single-hop static routes. In Junos OS Release 8.2 and later, BFD also supports multihop static routes.

To enable failure detection, include the **bfd-liveness-detection** statement in the static route configuration.

In Junos OS Release 9.1 and later, the BFD protocol is supported for IPv6 static routes. Global unicast and link-local IPv6 addresses are supported for static routes. The BFD protocol is not supported on multicast or anycast IPv6 addresses. For IPv6, the BFD protocol supports only static routes and only in Junos OS Release 9.3 and later. IPv6 for BFD is not supported for any other protocol.

To configure the BFD protocol for IPv6 static routes, include the **bfd-liveness-detection** statement at the **[edit routing-options rib inet6.0 static route destination-prefix]** hierarchy level.

In Junos OS Release 8.5 and later, you can configure a hold-down interval to specify how long the BFD session must remain up before a state change notification is sent.

To specify the hold-down interval, include the **holddown-interval** statement in the BFD configuration.

You can configure a number in the range from 0 through 255,000 milliseconds. The default is 0. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

NOTE: If a single BFD session includes multiple static routes, the hold-down interval with the highest value is used.

To specify the minimum transmit and receive intervals for failure detection, include the **minimum-interval** statement in the BFD configuration.

This value represents both the minimum interval after which the local routing device transmits hello packets and the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

NOTE: BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

NOTE: SRX Series devices do not support distributed BFD.

To specify the minimum receive interval for failure detection, include the **minimum-receive-interval** statement in the BFD configuration. This value represents the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the number of hello packets not received by the neighbor that causes the originating interface to be declared down, include the **multiplier** statement in the BFD configuration.

The default value is 3. You can configure a number in the range from 1 through 255.

To specify a threshold for detecting the adaptation of the detection time, include the **threshold** statement in the BFD configuration.

When the BFD session detection time adapts to a value equal to or higher than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the **minimum-interval** or the **minimum-receive-interval** value. The threshold must be a higher value than the multiplier for either of these configured values. For example if the **minimum-receive-interval** is 300 ms and the **multiplier** is 3, the total detection time is 900 ms. Therefore, the detection time threshold must have a value higher than 900.

To specify the minimum transmit interval for failure detection, include the **transmit-interval** **minimum-interval** statement in the BFD configuration.

This value represents the minimum interval after which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the threshold for the adaptation of the transmit interval, include the **transmit-interval threshold** statement in the BFD configuration.

The threshold value must be greater than the transmit interval. When the BFD session transmit time adapts to a value greater than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the value for the **minimum-interval** or the **minimum-receive-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level. The threshold must be a higher value than the multiplier for either of these configured values.

To specify the BFD version, include the **version** statement in the BFD configuration. The default is to have the version detected automatically.

To include an IP address for the next hop of the BFD session, include the **neighbor** statement in the BFD configuration.

NOTE: You must configure the **neighbor** statement if the next hop specified is an interface name. If you specify an IP address as the next hop, that address is used as the neighbor address for the BFD session.

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions.

To disable BFD adaptation, include the **no-adaptation** statement in the BFD configuration.

NOTE: We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation in your network.

NOTE: If BFD is configured only on one end of a static route, the route is removed from the routing table. BFD establishes a session when BFD is configured on both ends of the static route.

BFD is not supported on ISO address families in static routes. BFD does support IS-IS.

If you configure graceful Routing Engine switchover (GRES) at the same time as BFD, GRES does not preserve the BFD state information during a failover.

Junos OS also supports BFD over multihop static routes. For example, you can configure BFD over a Layer 3 path to provide path integrity over that path. You can limit the number of hops by specifying the time to live (TTL).

To configure BFD over multihop static routes, include the following statements:

```
static route destination-prefix {
  bfd-liveness-detection {
    local-address ip-address;
    minimum-receive-ttl number;
  }
}
```

To specify the source address for the multihop static route and to enable multihop BFD support, include the **local-address** statement.

To specify the number of hops, include the **minimum-receive-ttl** statement. You must configure this statement for a multihop BFD session. You can configure a value in the range from 1 through 255. It is optional for a single-hop BFD session. If you configure the **minimum-receive-ttl** statement for a single-hop session, the value must be 255.

On M Series and T Series platforms only, starting in Junos OS Release 12.3, multihop BFD runs on the CPU in the FPC, DPC, or MPC. This is referred to as *distributed BFD*. Previously, multihop BFD ran from the Routing Engine.

Example: Configuring BFD for Static Routes

This example shows how to configure Bidirectional Forwarding Detection (BFD) for static routes.

- [Requirements on page 2319](#)
- [Overview on page 2320](#)
- [Configuration on page 2320](#)
- [Verification on page 2323](#)

Requirements

In this example, no special configuration beyond device initialization is required.

Overview

There are many practical applications for static routes. Static routing is often used at the network edge to support attachment to stub networks, which, given their single point of entry and egress, are well suited to the simplicity of a static route. In Junos OS, static routes have a global preference of 5. Static routes are activated if the specified next hop is reachable.

In this example, you configure the static route 192.168.47.0/24 from the provider network to the customer network, using the next-hop address of 172.16.1.2. You also configure a static default route of 0.0.0.0/0 from the customer network to the provider network, using a next-hop address of 172.16.1.1.

For demonstration purposes, some loopback interfaces are configured on Device B and Device D. These loopback interfaces provide addresses to ping and thus verify that the static routes are working.

Figure 33 on page 2320 shows the sample network.

Figure 33: Customer Routes Connected to a Service Provider

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device B

```
set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
```

```

set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

Device D

```

set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.

```

[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24
user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32

```
2. On Device B, create a static route and set the next-hop address.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2

```
3. On Device B, configure BFD for the static route.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000

```
4. On Device B, configure tracing operations for BFD.

```

[edit protocols]
user@B# set bfd traceoptions file bfd-trace
user@B# set bfd traceoptions flag all

```
5. If you are done configuring Device B, commit the configuration.

```

[edit]
user@B# commit

```
6. On Device D, configure the interfaces.

```

[edit interfaces]
user@D# set ge-1/2/0 unit 1 description D->B
user@D# set ge-1/2/0 unit 1 family inet address 172.16.1.2/24
user@D# set lo0 unit 2 family inet address 192.168.47.5/32
user@D# set lo0 unit 2 family inet address 192.168.47.6/32

```
7. On Device D, create a static route and set the next-hop address.

```
[edit routing-options]
user@D# set static route 0.0.0.0/0 next-hop 172.16.1.1
```

8. On Device D, configure BFD for the static route.

```
[edit routing-options]
user@D# set static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
```

9. On Device D, configure tracing operations for BFD.

```
[edit protocols]
user@D# set bfd traceoptions file bfd-trace
user@D# set bfd traceoptions flag all
```

10. If you are done configuring Device D, commit the configuration.

```
[edit]
user@D# commit
```

Results

Confirm your configuration by issuing the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}
lo0 {
  unit 57 {
    family inet {
      address 10.0.0.1/32;
      address 10.0.0.2/32;
    }
  }
}

user@D# show protocols
bfd {
  traceoptions {
    file bfd-trace;
    flag all;
  }
}

user@B# show routing-options
static {
  route 192.168.47.0/24 {
    next-hop 172.16.1.2;
    bfd-liveness-detection {
      minimum-interval 1000;
    }
  }
}
```

```

    }
  }
}

Device D user@D# show interfaces
ge-1/2/0 {
  unit 1 {
    description D->B;
    family inet {
      address 172.16.1.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.47.5/32;
      address 192.168.47.6/32;
    }
  }
}

user@D# show routing-options
static {
  route 0.0.0.0/0 {
    next-hop 172.16.1.1;
    bfd-liveness-detection {
      minimum-interval 1000;
    }
  }
}
}

```

Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 2323](#)
- [Viewing Detailed BFD Events on page 2324](#)

Verifying That BFD Sessions Are Up

Purpose Verify that the BFD sessions are up, and view details about the BFD sessions.

Action From operational mode, enter the **show bfd session extensive** command.

```

user@B> show bfd session extensive

```

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up | lt-1/2/0.0 | 3.000 | 1.000 | 3 |

```

Client Static, TX interval 1.000, RX interval 1.000
Session up time 00:14:30
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Replicated, routing table index 172
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3

```

Local discriminator 2, remote discriminator 1
Echo mode disabled/inactive

1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

user@D> show bfd session extensive

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.1 | Up | lt-1/2/0.1 | 3.000 | 1.000 | 3 |

Client Static, TX interval 1.000, RX interval 1.000
Session up time 00:14:35
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Replicated, routing table index 170
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 1, remote discriminator 2
Echo mode disabled/inactive

1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

Meaning The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

Viewing Detailed BFD Events

Purpose View the contents of the BFD trace file to assist in troubleshooting, if needed.

Action From operational mode, enter the **file show /var/log/bfd-trace** command.

```
user@B> file show /var/log/bfd-trace

Meaning BFD messages are being written to the trace file.

Example: Enabling BFD on Qualified Next Hops in Static Routes

This example shows how to configure a static route with multiple possible next hops. Each next hop has Bidirectional Forwarding Detection (BFD) enabled.

- [Requirements on page 2325](#)
- [Overview on page 2325](#)
- [Configuration on page 2325](#)
- [Verification on page 2328](#)

Requirements

In this example, no special configuration beyond device initialization is required.

Overview

In this example, Device B has the static route **192.168.47.0/24** with two possible next hops. The two next hops are defined using two **qualified-next-hop** statements. Each next hop has BFD enabled.

BFD is also enabled on Device D because BFD must be enabled on both ends of the connection.

A next hop is included in the routing table if the BFD session is up. The next hop is removed from the routing table if the BFD session is down.

See [Figure 34 on page 2325](#).

Figure 34: BFD Enabled on Qualified Next Hops

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device B `set interfaces fe-0/1/0 unit 2 description secondary-B->D`
 `set interfaces fe-0/1/0 unit 2 family inet address 192.168.2.1/24`
 `set interfaces ge-1/2/0 unit 0 description B->D`
 `set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24`
 `set routing-options static route 192.168.47.0/24 qualified-next-hop 192.168.2.2`
 `bfd-liveness-detection minimum-interval 60`
 `set routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2`
 `bfd-liveness-detection minimum-interval 60`

Device D `set interfaces fe-0/1/0 unit 3 description secondary-D->B`
 `set interfaces fe-0/1/0 unit 3 family inet address 192.168.2.2/24`
 `set interfaces ge-1/2/0 unit 1 description D->B`
 `set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24`
 `set routing-options static route 0.0.0.0/0 qualified-next-hop 192.168.2.1`
 `set routing-options static route 0.0.0.0/0 qualified-next-hop 172.16.1.1`
 `set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 60`

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a static route with two possible next hops, both with BFD enabled:

1. On Device B, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@B# set unit 2 description secondary-B->D
user@B# set unit 2 family inet address 192.168.2.1/24

[edit interfaces ge-1/2/0]
user@B# set unit 0 description B->D
user@B# set unit 0 family inet address 172.16.1.1/24
```
2. On Device B, configure the static route with two next hops, both with BFD enabled.

```
[edit routing-options static route 192.168.47.0/24]
user@B# set qualified-next-hop 192.168.2.2 bfd-liveness-detection minimum-interval
60
user@B# set qualified-next-hop 172.16.1.2 bfd-liveness-detection minimum-interval
60
```
3. On Device D, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@D# set unit 3 description secondary-D->B
user@D# set unit 3 family inet address 192.168.2.2/24

[edit interfaces ge-1/2/0]
user@D# set unit 1 description D->B
user@D# set unit 1 family inet address 172.16.1.2/24
```
4. On Device D, configure a BFD-enabled default static route with two next hops to the provider network.

In this case, BFD is enabled on the route, not on the next hops.

```
[edit routing-options static route 0.0.0.0/0]
user@D# set qualified-next-hop 192.168.2.1
user@D# set qualified-next-hop 172.16.1.1
user@D# set bfd-liveness-detection minimum-interval 60
```

Results Confirm your configuration by issuing the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/1/0 {
  unit 2 {
    description secondary-B->D;
    family inet {
      address 192.168.2.1/24;
    }
  }
}
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}

user@B# show routing-options
static {
  route 192.168.47.0/24 {
    qualified-next-hop 192.168.2.2 {
      bfd-liveness-detection {
        minimum-interval 60;
      }
    }
    qualified-next-hop 172.16.1.2 {
      bfd-liveness-detection {
        minimum-interval 60;
      }
    }
  }
}

user@D# show interfaces
fe-0/1/0 {
  unit 3 {
    description secondary-D->B;
    family inet {
      address 192.168.2.2/24;
    }
  }
}
ge-1/2/0 {
  unit 1 {
```

```
description D->B;
family inet {
    address 172.16.1.2/24;
}
}
}

user@D# show routing-options
static {
    route 0.0.0.0/0 {
        qualified-next-hop 192.168.2.1;
        qualified-next-hop 172.16.1.1;
        bfd-liveness-detection {
            minimum-interval 60;
        }
    }
}
```

If you are done configuring the devices, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the Routing Tables on page 2328](#)
- [Verifying the BFD Sessions on page 2329](#)
- [Removing BFD from Device D on page 2329](#)
- [Removing BFD from One Next Hop on page 2329](#)

Checking the Routing Tables

Purpose Make sure that the static route appears in the routing table on Device B with two possible next hops.

Action

```
user@B> show route 192.168.47.0 extensive
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
192.168.47.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 192.168.47.0/24 -> {192.168.2.2}
    *Static Preference: 5
        Next hop type: Router
        Address: 0x9334010
        Next-hop reference count: 1
        Next hop: 172.16.1.2 via ge-1/2/0.0
        Next hop: 192.168.2.2 via fe-0/1/0.2, selected
        State: <Active Int Ext>
        Age: 9
        Task: RT
        Announcement bits (1): 3-KRT
        AS path: I
```

Meaning Both next hops are listed. The next hop 192.168.2.2 is the selected route.

Verifying the BFD Sessions

Purpose Make sure that the BFD sessions are up.

Action user@B> show bfd session

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up | ge-1/2/0.0 | 0.720 | 0.240 | 3 |
| 192.168.2.2 | Up | fe-0/1/0.2 | 0.720 | 0.240 | 3 |

2 sessions, 2 clients

Cumulative transmit rate 8.3 pps, cumulative receive rate 8.3 pps

Meaning The output shows that the BFD sessions are up.

Removing BFD from Device D

Purpose Demonstrate what happens when the BFD session is down for both next hops.

Action 1. Deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Rerun the **show bfd session** command on Device B.

user@B> show bfd session

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Down | ge-1/2/0.0 | 3.000 | 1.000 | 3 |
| 192.168.2.2 | Down | fe-0/1/0.2 | 3.000 | 1.000 | 3 |

2 sessions, 2 clients

Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

3. Rerun the **show route 192.168.47.0** command on Device B.

user@B> show route 192.168.47.0

Meaning As expected, when the BFD sessions are down, the static route is removed from the routing table.

Removing BFD from One Next Hop

Purpose Demonstrate what happens when only one next hop has BFD enabled.

Action 1. If it is not already deactivated, deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Deactivate BFD on one of the next hops on Device B.

```
[edit routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2]
user@B# deactivate bfd-liveness-detection
user@B# commit
```

3. Rerun the **show bfd session** command on Device B.

```
user@B> show bfd session
```

| Address | State | Interface | Detect
Time | Transmit
Interval | Multiplier |
|-------------|-------|------------|----------------|----------------------|------------|
| 192.168.2.2 | Down | fe-0/1/0.2 | 3.000 | 1.000 | 3 |

4. Rerun the **show route 192.168.47.0 extensive** command on Device B.

```
user@B> show route 192.168.47.0 extensive
```

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
192.168.47.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 192.168.47.0/24 -> {172.16.1.2}
  *Static Preference: 5
    Next hop type: Router, Next hop index: 624
    Address: 0x92f0178
    Next-hop reference count: 3
    Next hop: 172.16.1.2 via ge-1/2/0.0, selected
    State: <Active Int Ext>
    Age: 2:36
    Task: RT
    Announcement bits (1): 3-KRT
    AS path: I
```

Meaning As expected, the BFD session is down for the 192.168.2.2 next hop. The 172.16.1.2 next hop remains in the routing table, and the route remains active, because BFD is not a condition for this next hop to remain valid.

Understanding BFD Authentication for Static Routes

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant.

NOTE: We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels.

Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over IPv4 and IPv6 static routes. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 2331](#)
- [Security Authentication Keychains on page 2332](#)
- [Strict Versus Loose Authentication on page 2332](#)

BFD Authentication Algorithms

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with

every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

NOTE: Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

Security Authentication Keychains

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

Strict Versus Loose Authentication

By default, strict authentication is enabled, and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

Example: Configuring BFD Authentication for Static Routes

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for static routes.

- [Requirements on page 2332](#)
- [Overview on page 2333](#)
- [Configuration on page 2333](#)
- [Verification on page 2337](#)

Requirements

Junos OS Release 9.6 or later (Canda and United States version).

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

Overview

You can configure authentication for BFD sessions running over IPv4 and IPv6 static routes. Routing instances and logical systems are also supported.

The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the static route.
2. Associate the authentication keychain with the static route.
3. Configure the related security authentication keychain. This must be configured on the main router.

TIP: We recommend that you specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

[edit]

```
user@host> set routing-options static route ipv4 bfd-liveness-detection
authentication loose-check
```

Figure 35 on page 2333 shows the sample network.

Figure 35: Customer Routes Connected to a Service Provider

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device B set interfaces ge-1/2/0 unit 0 description B->D
Device B set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
```

```
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication
  key-chain bfd-kc4
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication
  algorithm keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
  "$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
  DkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
  "2011-1-1.12:00:00 -0800"
```

Device D

```
set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication key-chain
  bfd-kc4
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication algorithm
  keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
  "$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
  DkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
  "2011-1-1.12:00:00 -0800"
```

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.

```
[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24

user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32
```

2. On Device B, create a static route and set the next-hop address.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2
```

3. On Device B, configure BFD for the static route.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000
```

4. On Device B, specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on the static route.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
algorithm keyed-sha-1
```

NOTE: Nonstop active routing (NSR) is not supported with the **meticulous-keyed-md5** and **meticulous-keyed-sha-1** authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

5. On Device B, specify the keychain to be used to associate BFD sessions on the specified route with the unique security authentication keychain attributes.

This should match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
key-chain bfd-kc4
```

6. On Device B, specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 5.
- At least one key, a unique integer between **0** and **63**. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-kc4]
user@B# set key 5 secret
"$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
DkP5Ft0IQFclev7N"
user@B# set key 5 start-time "2011-1-1.12:00:00 -0800"
```

7. If you are done configuring Device B, commit the configuration.

```
[edit]
user@B# commit
```

8. Repeat the configuration on Device D.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

Results

Confirm your configuration by issuing the **show interfaces**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}
lo0 {
  unit 57 {
    family inet {
      address 10.0.0.1/32;
      address 10.0.0.2/32;
    }
  }
}

user@B# show routing-options
static {
  route 192.168.47.0/24 {
    next-hop 172.16.1.2;
    bfd-liveness-detection {
      minimum-interval 1000;
      authentication {
        key-chain bfd-kc4;
        algorithm keyed-sha-1;
      }
    }
  }
}

user@B# show security
authentication-key-chains {
  key-chain bfd-kc4 {
    key 5 {
      secret
        "$9$JhZHmn6Ap0ln/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIeyMWxSrlKvM-dbs2a
        DkP5FtOIQFclev7N"; ## SECRET-DATA
      start-time "2011-1-1.12:00:00 -0800";
    }
  }
}
```

Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 2337](#)
- [Viewing Details About the BFD Session on page 2337](#)
- [Viewing Extensive BFD Session Information on page 2337](#)

Verifying That BFD Sessions Are Up

Purpose Verify that the BFD sessions are up.

Action From operational mode, enter the **show bfd session** command.

```
user@B> show bfd session
```

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up | ge-1/2/0.0 | 3.000 | 1.000 | 3 |

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

Meaning The command output shows that the BFD session is up.

Viewing Details About the BFD Session

Purpose View details about the BFD sessions and make sure that authentication is configured.

Action From operational mode, enter the **show bfd session detail** command.

```
user@B> show bfd session detail
```

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up | ge-1/2/0.0 | 3.000 | 1.000 | 3 |

```
Client Static, TX interval 1.000, RX interval 1.000, Authenticate
```

```
Session up time 00:53:58
```

```
Local diagnostic NbrSignal, remote diagnostic None
```

```
Remote state Up, version 1
```

```
Logical system 9, routing table index 22
```

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

Meaning In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured.

Viewing Extensive BFD Session Information

Purpose View more detailed information about the BFD sessions.

Action From operational mode, enter the **show bfd session extensive** command.

```
user@B> show bfd session extensive
```

| Address | State | Interface | Time | Interval | Multiplier |
|------------|-------|------------|-------|----------|------------|
| 172.16.1.2 | Up | ge-1/2/0.0 | 3.000 | 1.000 | 3 |

```
Client Static, TX interval 1.000, RX interval 1.000, Authenticate
```

```
keychain bfd-kc4, algo keyed-sha-1, mode strict
Session up time 01:39:45
Local diagnostic NbrSignal, remote diagnostic None
Remote state Up, version 1
Logical system 9, routing table index 22
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 3, remote discriminator 4
Echo mode disabled/inactive
Authentication enabled/active, keychain bfd-kc4, algo keyed-sha-1, mode strict

1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

Meaning In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured. The output for the **extensive** command provides the keychain name, the authentication algorithm, and the mode for each client in the session.

| Description | <p>Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.</p> <p>In Junos OS Release 9.1 and later, the numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i><16-bit high-order value in decimal>.<16-bit low-order value in decimal></i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.</p> |
| Default | No AS path information is associated with static routes. |
| Options | <p>aggregator—(Optional) Attach the BGP aggregator path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for as-number, followed by the IP address of the BGP system that formed the aggregate route for ip-address.</p> |

as-path—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ([]). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for **as-path**. You must use a complete, valid AS path.

atomic-aggregate—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

origin egp—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

origin igp—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

origin incomplete—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

asdot-notation option introduced in Junos OS Release 9.3 for EX Series switches.
no-attrset option introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers. |
| Description | Specify the routing device's AS number. |

An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (<http://www.isi.edu>).

If you are using BGP on the routing device, you must configure an AS number.

The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.

In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options ***autonomous-system***—AS number. Use a number assigned to you by the NIC.

Range: 1 through 4,294,967,295 ($2^{32} - 1$) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 65546;
}
```

Range: 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
  autonomous-system 1.10;
}
```

Range: 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 60000;
}
```

asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

Default: Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

loops number—(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

Range: 1 through 10

Default: 1

NOTE: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the loops statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.

```

[edit routing-options static route *destination-prefix* qualified-next-hop (*interface-name* | *address*)]

- Release Information** Statement introduced before Junos OS Release 7.4.
detection-time threshold and **transmit-interval threshold** options introduced in Junos OS Release 8.2.
local-address statement introduced in Junos OS Release 8.2.
minimum-receive-ttl statement introduced in Junos OS Release 8.2.
Support for logical routers introduced in Junos OS Release 8.3.
holddown-interval statement introduced in Junos OS Release 8.5.
no-adaptation statement introduced in Junos OS Release 9.0.
Support for IPv6 static routes introduced in Junos OS Release 9.1.
authentication algorithm, **authentication key-chain**, and **authentication loose-check** statements introduced in Junos OS Release 9.6.
Statement introduced in Junos OS Release 12.1 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
- Description** Configure bidirectional failure detection timers and authentication criteria for static routes.

- Options** **authentication algorithm *algorithm-name***—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.
- authentication key-chain *key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.
- authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.
- detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.
- holddown-interval *milliseconds***—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.
Range: 0 through 255,000
Default: 0
- local-address *ip-address***—Enable a multihop BFD session and configure the source address for the BFD session.
- minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.
Range: 1 through 255,000
- minimum-receive-interval *milliseconds***—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route *destination-prefix* bfd-liveness-detection]** hierarchy level.
Range: 1 through 255,000
- minimum-receive-ttl *number***—Configure the time to live (TTL) for the multihop BFD session.
Range: 1 through 255
Default: 255
- multiplier *number***—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.
Range: 1 through 255
Default: 3

neighbor *address*—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

no-adaptation—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold *milliseconds*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

Range: 0 through 4,294,967,295

transmit-interval minimum-interval *milliseconds*—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route *destination-prefix* bfd-liveness-detection]** hierarchy level.

Range: 1 through 255,000

version—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

Default: automatic

confederation

| | |
|---------------------------------|---|
| Syntax | <code>confederation <i>confederation-autonomous-system</i> members [<i>autonomous-systems</i>];</code> |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> routing-options],
[edit routing-options] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers. |
| Description | <p>Specify the routing device's confederation AS number.</p> <p>If you administer multiple ASs that contain a very large number of BGP systems, you can group them into one or more <i>confederations</i>. Each confederation is identified by its own AS number, which is called a <i>confederation AS number</i>. To external ASs, a confederation appears to be a single AS. Thus, the internal topology of the ASs making up the confederation is hidden.</p> <p>The BGP path attributes NEXT_HOP, LOCAL_PREF, and MULTI_EXIT_DISC, which normally are restricted to a single AS, are allowed to be propagated throughout the ASs that are members of the same confederation.</p> <p>Because each confederation is treated as if it were a single AS, you can apply the same routing policy to all the ASs that make up the confederation.</p> <p>Grouping ASs into confederations reduces the number of BGP connections required to interconnect ASs.</p> <p>If you are using BGP, you can enable the local routing device to participate as a member of an AS confederation. To do this, include the confederation statement.</p> <p>Specify the AS confederation identifier, along with the peer AS numbers that are members of the confederation.</p> <p>Note that peer adjacencies do not form if two BGP neighbors disagree about whether an adjacency falls within a particular confederation.</p> |
| Options | <p><i>autonomous-systems</i>—AS numbers of the confederation members.
Range: 1 through 65,535</p> <p><i>confederation-autonomous-system</i>—Confederation AS number. Use one of the numbers assigned to you by the NIC.
Range: 1 through 65,535</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

| Description | <p>Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.</p> <p>To propagate static routes into the routing protocols, include the discard statement when you define the route, along with a routing policy.</p> |
| | <p> NOTE: In other vendors' software, a common way to propagate static routes into routing protocols is to configure the routes so that the next-hop routing device is the loopback address (commonly, 127.0.0.1). However, configuring static routes in this way (by including a statement such as <code>route <i>address/mask-length</i> next-hop 127.0.0.1</code>) does not propagate the static routes, because the forwarding table ignores static routes whose next-hop routing device is the loopback address.</p> |
| Default | When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent. |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | <p>Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits, the threshold at which a warning message is logged, and timeout values.</p> <p>Specify a value for the threshold at which to suppress new multicast forwarding cache entries and an optional reuse value for the threshold at which the router begins to create new multicast forwarding cache entries. The range for both is from 1 through 200,000. If configured, the reuse value should be less than the suppression threshold value. The suppression value is mandatory. If you do not specify the optional reuse value, then the number of multicast forwarding cache entries is limited to the suppression value. A new entry is created as soon as the number of multicast forwarding cache entries falls below the suppression value.</p> <p>You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the threshold statement globally for the multicast forwarding cache or including the family statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> |
| Default | By default, there are no limits on the number of multicast forwarding cache entries. |
| Options | <p>family (inet inet6)—(Optional) Apply the configured thresholds to either IPv4 or IPv6 multicast forwarding cache entries.</p> <p>Default: By default, the configured thresholds are applied to both IPv4 and IPv6 multicast forwarding cache entries.</p> |

import-rib

| | |
|---|--|
| Syntax | <code>import-rib [<i>routing-table-names</i>];</code> |
| Hierarchy Level | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options rib-groups <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options rib-groups <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options rib-groups <i>group-name</i>],</p> <p>[edit routing-options rib-groups <i>group-name</i>]</p> |
| Release Information | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> |
| Description | <p>Specify the name of the routing table into which Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be inet.0 or routing-instance-name.inet.0. For IPv6 import routing tables, the primary routing table must be inet6.0.</p> <p>In Junos OS Release 9.5 and later, you can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4. In releases prior to Junos OS Release 9.5, you could configure an import routing table with only either IPv4 or IPv6 routing tables.</p> |
| <div>  NOTE: On EX Series switches, only dynamically learned routes can be imported from one routing table group to another. </div> | |
| Options | <i>routing-table-names</i> —Name of one or more routing tables. |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

indirect-next-hop

| | |
|--|--|
| Syntax | (indirect-next-hop no-indirect-next-hop); |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> routing-options forwarding-table],
[edit routing-options forwarding-table] |
| Release Information | Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Enable indirectly connected next hops for route convergence. This statement is implemented on the Packet Forward Engine to speed up forwarding information base (FIB) updates. Configuring this statement significantly speeds convergence times. The only downside of configuring this statement is that some additional FIB memory overhead is required. Unless routes have an extremely high number of next hops, this increased memory usage should not be noticeable. |
| <div> NOTE:<ul style="list-style-type: none">When virtual private LAN service (VPLS) is configured on the routing device, the indirect-next-hop statement is configurable at the [edit routing-options forwarding-table] hierarchy level. However, this configuration is not applicable to indirect nexthops specific to VPLS routing instances.By default, the Junos Trio Modular Port Concentrator (MPC) chipset on MX Series routers is enabled with indirectly connected next hops, and this cannot be disabled using the no-indirect-next-hop statement.</div> | |
| Default | Disabled. |
| Options | indirect-next-hop —Enable indirectly connected next hops.
no-indirect-next-hop —Explicitly disable indirect next hops. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"><i>Example: Optimizing Route Reconvergence by Enabling Indirect Next Hops on the Packet Forwarding Engine</i> |

install (Routing Options)

| | |
|---------------------------------|---|

interface (Multicast Static Routes)

| | |
|---------------------------------|---|
| Syntax | <pre> interface <i>interface-names</i> { disable; maximum-bandwidth <i>bps</i>; no-qos-adjust; reverse-oif-mapping { no-qos-adjust; } subscriber-leave-timer <i>seconds</i>; } </pre> |
| Hierarchy Level | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit routing-options multicast]</p> |
| Release Information | <p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> |
| Description | <p>Enable multicast traffic on an interface.</p> <p>By default, multicast packets are forwarded by enabling Protocol Independent Multicast (PIM) on an interface. PIM adds multicast routes into the routing table.</p> <p>You can also configure multicast packets to be forwarded over a static route, such as a static route associated with an LSP next hop. Multicast packets are accepted on an interface and forwarded over a static route in the forwarding table. This is useful when you want to enable multicast traffic on a specific interface without configuring PIM on the interface.</p> <p>You cannot enable multicast traffic on an interface and configure PIM on the same interface simultaneously.</p> <p>Static routes must be configured before you can enable multicast on an interface. Configuring the interface statement alone does not install any routes into the routing table. This feature relies on the static route configuration.</p> |
| Options | <p><i>interface-names</i>—Name of one or more interfaces on which to enable multicast traffic.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

interface-routes {  
    family (inet | inet6) {  
        export {  
            lan;  
            point-to-point;  
        }  
    }  
    rib-group group-name;  
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

NOTE: On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

Description Associate a routing table group with the routing device's interfaces, and specify routing table groups into which interface routes are imported.

By default, IPv4 interface routes (also called direct routes) are imported into routing table **inet.0**, and IPv6 interface routes are imported into routing table **inet6.0**. If you are configuring alternate routing tables for use by some routing protocols, it might be necessary to import the interface routes into the alternate routing tables. To define the routing tables into which interface routes are imported, you create a routing table group and associate it with the routing device's interfaces.

To create the routing table groups, include the **passive** statement at the **[edit routing-options]** hierarchy level.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group.

To export local routes, include the **export** statement.

To export LAN routes, include the **lan** option. To export point-to-point routes, include the **point-to-point** option.

Only local routes on point-to-point interfaces configured with a destination address are exportable.

Options **inet**—Specify the IPv4 address family.

inet6—Specify the IPv6 address family.

lan—Export LAN routes.

point-to-point—Export point-to-point routes.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

maximum-paths

| | |
|----------------------------|---|
| Syntax | <code>maximum-paths <i>path-limit</i> <log-interval <i>seconds</i>> <log-only threshold <i>value</i>>;</code> |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],
[edit logical-systems <i>logical-system-name</i> routing-options],
[edit routing-instances <i>routing-instance-name</i> routing-options],
[edit routing-options] |
| Release Information | Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Configure a limit for the number of routes installed in a routing table based upon the route path. |

NOTE: The `maximum-paths` statement is similar to the `maximum-prefixes` statement. The `maximum-prefixes` statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

```
OSPF 10.10.10.0/24
ISIS 10.10.10.0/24
```

These are two routes, but only one destination (prefix). The `maximum-paths` limit applies the total number of routes (two). The `maximum-prefixes` limit applies to the total number of unique prefixes (one).

| | |
|----------------|---|
| Options | <p><code>log-interval <i>seconds</i></code>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p>Range: 5 through 86,400</p> <p><code>log-only</code>—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><code><i>path-limit</i></code>—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.</p> <p>Range: 1 through 4,294,967,295 ($2^{32} - 1$)</p> <p>Default: No default</p> <p><code>threshold <i>value</i></code>—(Optional) Percentage of the maximum number of routes that starts triggering a warning. You can configure a percentage of the <code><i>path-limit</i></code> value that starts triggering the warnings.</p> <p>Range: 1 through 100</p> |
|----------------|---|

NOTE: When the number of routes reaches the **threshold** value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *path-limit* value, then additional routes are rejected.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

maximum-prefixes

| | |
|----------------------------|--|
| Syntax | <code>maximum-prefixes <i>prefix-limit</i> <log-interval <i>seconds</i>> <log-only threshold <i>percentage</i>>;</code> |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],
[edit logical-systems <i>logical-system-name</i> routing-options],
[edit routing-instances <i>routing-instance-name</i> routing-options],
[edit routing-options] |
| Release Information | Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Configure a limit for the number of routes installed in a routing table based upon the route prefix.

Using a prefix limit, you can curtail the number of prefixes received from a CE router in a VPN. Prefix limits apply only to dynamic routing protocols and are not applicable to static or interface routes. |

NOTE: The `maximum-prefixes` statement is similar to the `maximum-paths` statement. The `maximum-prefixes` statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

```
OSPF 10.10.10.0/24
ISIS 10.10.10.0/24
```

These are two routes, but only one destination (prefix). The `maximum-paths` limit applies the total number of routes (two). The `maximum-prefixes` limit applies to the total number of unique prefixes (one).

| | |
|----------------|---|
| Options | <p><code>log-interval <i>seconds</i></code>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p>Range: 5 through 86,400</p> <p><code>log-only</code>—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><code>prefix-limit</code>—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.</p> <p>Range: 1 through 4,294,967,295</p> <p>Default: No default</p> <p><code>threshold <i>value</i></code>—(Optional) Percentage of the maximum number of prefixes that starts triggering a warning. You can configure a percentage of the <code>prefix-limit</code> value that starts triggering the warnings.</p> |
|----------------|---|

Range: 1 through 100

NOTE: When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *prefix-limit* value, then additional routes are rejected.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

med-igp-update-interval

Syntax med-igp-update-interval *minutes*;

Hierarchy Level [edit routing-options]

Release Information Statement introduced in Junos OS Release 9.0
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure a timer for how long to delay updates for the multiple exit discriminator (MED) path attribute for BGP groups and peers configured with the **metric-out igp offset delay-med-update** statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

Options *minutes*—Interval to delay MED updates.
Range: 10 through 600
Default: 10 minutes

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

metric (Aggregate, Generated, or Static Route)

| | |
|---------------------------------|---|
| Syntax | (metric metric2 metric3 metric4) <i>metric</i> <type <i>type</i> >; |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> routing-options (aggregate generate static) (defaults route)],
[edit routing-options (aggregate generate static) (defaults route)] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers. |
| Description | Specify the metric value for an aggregate, generated, or static route. You can specify up to four metric values, starting with metric (for the first metric value) and continuing with metric2 , metric3 , and metric4 . |
| Options | metric —Metric value.
Range: 0 through 4,294,967,295 ($2^{32} - 1$)

type <i>type</i> —(Optional) Type of route.

When routes are exported to OSPF, type 1 routes are advertised in type 1 externals, and routes of any other type are advertised in type 2 externals. Note that if a qualified-next-hop metric value is configured, this value overrides the route metric.
Range: 1 through 16 |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |

multicast (Routing Options)

Syntax

```
multicast {
  forwarding-cache {
    threshold suppress value <reuse value>;
  }
  interface interface-name {
    enable;
  }
  scope scope-name {
    interface [ interface-names ];
    prefix destination-prefix;
  }
  ssm-groups {
    address;
  }
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description Configure generic multicast properties.

NOTE: You cannot apply a scoping policy to a specific routing instance. All scoping policies are applied to all routing instances. However, you can apply the `scope` statement to a specific routing instance.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

| Hierarchy Level | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options (aggregate generate) (defaults route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (aggregate generate) (defaults route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options (aggregate generate) (defaults route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options rib <i>routing-table-name</i> (aggregate generate) (defaults route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options (aggregate generate) (defaults route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (aggregate generate) (defaults route)],</p> <p>[edit routing-options (aggregate generate) (defaults route)],</p> <p>[edit routing-options rib <i>routing-table-name</i> (aggregate generate) (defaults route)]</p> |
| Release Information | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> |
| Description | <p>Associate a routing policy when configuring an aggregate or generated route's destination prefix in the routes part of the aggregate or generate statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route.</p> <p>If the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or <i>primary</i>, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.</p> <p>The following algorithm is used to compare two generated contributing routes in order to determine which one is the primary or preferred contributor:</p> <ol style="list-style-type: none"> 1. Compare the protocol's preference of the contributing routes. The lower the preference, the better the route. This is similar to the comparison that is done while determining the best route for the routing table. 2. Compare the protocol's preference2 of the contributing routes. The lower preference2 value is better. If only one route has preference2, then this route is preferred. 3. The preference values are the same. Proceed with a numerical comparison of the prefixes' values. <ol style="list-style-type: none"> a. The primary contributor is the numerically smallest prefix value. b. If the two prefixes are numerically equal, the primary contributor is the route that has the smallest prefix length value. |

At this point, the two routes are the same. The primary contributor does not change. An additional next hop is available for the existing primary contributor.

A rejected contributor still can contribute to less specific generated route. If you do not specify a policy filter, all candidate routes contribute to a generated route.

|----------------------------|--|
| Syntax | <pre> policy-statement <i>policy-name</i> { term <i>term-name</i> { from { family <i>family-name</i>; match-conditions; policy <i>subroutine-policy-name</i>; prefix-list <i>prefix-list-name</i>; prefix-list-filter <i>prefix-list-name</i> match-type <actions>; route-filter <i>destination-prefix</i> match-type <actions>; source-address-filter <i>source-prefix</i> match-type <actions>; } to { match-conditions; policy <i>subroutine-policy-name</i>; } then <i>actions</i>; } } </pre> |
| Hierarchy Level | <p>[edit dynamic policy-options],</p> <p>[edit logical-systems <i>logical-system-name</i> policy-options],</p> <p>[edit policy-options]</p> |
| Release Information | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>inet-mdt option introduced in Junos OS Release 10.0R2.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>route-target option introduced in Junos OS Release 12.2.</p> |
| Description | <p>Define a routing policy, including subroutine policies.</p> <p>A <i>term</i> is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.</p> <p>Each term contains a set of match conditions and a set of actions:</p> <ul style="list-style-type: none"> • Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route. • Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route. <p>Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of</p> |

accept or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement *policy-name*** in alphabetical order, enter the **show policy-options** configuration command.

Options *actions*—(Optional) One or more actions to take if the conditions match. The actions are described in *Configuring Flow Control Actions*.

family *family-name*—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**.

NOTE: When family is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the **family** statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

from—(Optional) Match a route based on its source address.

match-conditions—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in *Routing Policy Match Conditions*.

policy *subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form **__.*-internal__**, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

policy-name—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

prefix-list *prefix-list-name* —Name of a list of IPv4 or IPv6 prefixes.

prefix-list-filter *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match (see *Configuring Prefix List Filters*), and *actions* is the action to take if the prefixes match.

route-filter *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *destination-prefix* matches.

source-address-filter *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is

the IPv4 or IPv6 route prefix to match, **match-type** is the type of match (see *Configuring Route Lists*), and **actions** is the action to take if the **source-prefix** matches.

term term-name—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

to—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

then—(Optional) Actions to take on matching routes. The actions are described in *Configuring Flow Control Actions* and *Configuring Actions That Manipulate Route Characteristics*.

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],
[edit routing-instances *routing-instance-name*]

Release Information Statement introduced before Junos OS Release 7.4.

Support for RIPv6 introduced in Junos OS Release 9.0.
 Statement introduced in Junos OS Release 11.1 for EX Series switches.
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Specify the protocol for a routing instance. You can configure multiple instances of many protocol types. Not all protocols are supported on the switches. See the switch CLI.

Options **bgp**—Specify BGP as the protocol for a routing instance.
isis—Specify IS-IS as the protocol for a routing instance.
ldp—Specify LDP as the protocol for a routing instance.
l2vpn—Specify Layer 2 VPN as the protocol for a routing instance.
msdp—Specify the Multicast Source Discovery Protocol (MSDP) for a routing instance.
mstp—Specify the Multiple Spanning Tree Protocol (MSTP) for a virtual switch routing instance.
ospf—Specify OSPF as the protocol for a routing instance.
ospf3—Specify OSPF version 3 (OSPFv3) as the protocol for a routing instance.

NOTE: OSPFv3 supports the **no-forwarding**, **virtual-router**, and **vrf** routing instance types only.

pim—Specify the Protocol Independent Multicast (PIM) protocol for a routing instance.
rip—Specify RIP as the protocol for a routing instance.
ripng—Specify RIP next generation (RIPv6) as the protocol for a routing instance.
rstp—Specify the Rapid Spanning Tree Protocol (RSTP) for a virtual switch routing instance.
vstp—Specify the VLAN Spanning Tree Protocol (VSTP) for a virtual switch routing instance.
vpls—Specify VPLS as the protocol for a routing instance.

Required Privilege Level **routing**—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 11.3 for the QFX Series.
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.

Description Configure a static route with multiple possible next hops, each of which can have its own preference value, IGP metric that is used when the route is exported into an IGP, and Bidirectional Forwarding Detection (BFD) settings. If multiple links are operational, the one with the most preferred next hop is used. The most preferred next hop is the one with the lowest preference value.

Options *address*—IPv4, IPv6, or ISO network address of the next hop.

interface-name—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered interface as the next-hop

interface for a static route, specify **qualified-next-hop *interface-name***, where *interface-name* is the name of the IPv4 or IPv6 unnumbered interface.

NOTE: For an Ethernet interface to be configured as the qualified next hop for a static route, it must be an unnumbered interface.

To configure an Ethernet interface as an unnumbered interface, configure the `unnumbered-address <interface-name>` statement at the [edit interfaces <interface-name> unit <logical-unit-number> family <family-name>] hierarchy level as described in *Configuring an Unnumbered Interface*.

The remaining statements are explained separately.

resolution

| | |
|---------------------------------|--|
| Syntax | <pre> resolution { rib <i>routing-table-name</i> { import [<i>policy-names</i>]; resolution-ribs [<i>routing-table-names</i>]; } } </pre> |
| Hierarchy Level | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-options]</p> |
| Release Information | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> |
| Description | <p>Configure the router to perform custom route resolution on protocol next hops of routes in a certain routing table. The protocol next hop is used to determine the forwarding next-hop.</p> <p>For example, you might want to direct inet.2 route resolution to use topology routing tables :red.inet.0 and :blue.inet.0 for protocol next-hop IP address lookups. Or you might want to direct bgp.l3vpn.0 to use the information in inet.0 to resolve routes, thus overriding the default behavior, which is to use inet.3.</p> <p>You can specify up to two routing tables in the resolution-ribs statement. The route resolution scheme first checks the first-listed routing table for the protocol next-hop address. If the address is found, it uses this entry. If it is not found, the resolution scheme checks second-listed routing table. Hence, only one routing table is used for each protocol nexthop address. For example, if you configure resolution rib bgp.l3vpn.0 resolution-ribs [inet.0 inet.3], inet.0 is checked first and then inet.3 is checked.</p> |
| | <p> NOTE: Customizing route resolution might cause the routing protocol process (rpd) to consume more memory resources than it ordinarily would. When you customize route resolution, we recommend that you check the memory resources by running the show system processes and the show task memory commands. For more information, see <i>Routing Protocol Process Memory FAQs</i>.</p> |
| | <p>The remaining statements are explained separately.</p> |

    }  
}
```

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],
[edit logical-systems *logical-system-name* routing-options],
[edit routing-instances *routing-instance-name* routing-options],
[edit routing-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Create a routing table.

Explicitly creating a routing table with ***routing-table-name*** is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group.

NOTE: The IPv4 multicast routing table (`inet.1`) and the IPv6 multicast routing table (`inet6.1`) are not supported for this statement.

Default If you do not specify a routing table name with the ***routing-table-name*** option, the software uses the default routing tables, which are `inet.0` for unicast routes and `inet.1` for the multicast cache.

Options ***routing-table-name***—Name of the routing table, in the following format:
protocol [.identifier].

In a routing instance, the routing table name must include the routing instance name.

For example, if the routing instance name is `link0`, the routing table name might be `link0.inet6.0`.

- ***protocol*** is the protocol family. It can be `inet6` for the IPv6 family, `inet` for the IPv4 family, `iso` for the ISO protocol family, or ***instance-name.iso.0*** for an ISO routing instance.
- ***identifier*** is a positive integer that specifies the instance of the routing table.

Default: `inet.0`

The remaining statements are explained separately.

Required Privilege Level `routing`—To view this statement in the configuration.
`routing-control`—To add this statement to the configuration.

rib-groups

| | |
|---------------------|--|
| Syntax | <pre>rib-groups {
 group-name {
 export-rib group-name;
 import-policy [policy-names];
 import-rib [group-names];
 }
}</pre> |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> routing-options],
[edit routing-options] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | <p>Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.</p> <p>Each routing table group must contain one or more routing tables that Junos OS uses when importing routes (specified in the import-rib statement) and optionally can contain one routing table group that Junos OS uses when exporting routes to the routing protocols (specified in the export-rib statement).</p> <p>The first routing table you specify is the <i>primary routing table</i>, and any additional routing tables are the <i>secondary routing tables</i>.</p> <p>The primary routing table determines the address family of the routing table group. To configure an IP version 4 (IPv4) routing table group, specify inet.0 as the primary routing table. To configure an IP version 6 (IPv6) routing table group, specify inet6.0 as the primary routing table. If you configure an IPv6 routing table group, the primary and all secondary routing tables must be IPv6 routing tables (inet6.x).</p> <p>In Junos OS Release 9.5 and later, you can include both IPv4 and IPv6 routing tables in an IPv4 import routing table group using the import-rib statement. In releases prior to Junos OS Release 9.5, you can only include either IPv4 or IPv6 routing tables in the same import-rib statement. The ability to configure an import routing table group with both IPv4 and IPv6 routing tables enables you, for example, to populate the inet6.3 routing table with IPv6 addresses that are compatible with IPv4. Specify inet.0 as the primary routing table, and specify inet6.3 as a secondary routing table.</p> |

NOTE: On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

NOTE: If you configure an import routing table group that includes both IPv4 and IPv6 routing tables, any corresponding export routing table group must include only IPv4 routing tables.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group. For more information, see *Example: Configuring Multiple Routing Instances of OSPF*.

After specifying the routing table from which to import routes, you can apply one or more policies to control which routes are installed in the routing table group. To apply a policy to routes being imported into the routing table group, include the **import-policy** statement.

Options *group-name*—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

router-id

| | |
|--|---|
| Syntax | <code>router-id address;</code> |
| Hierarchy Level | <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</code>
<code>[edit logical-systems <i>logical-system-name</i> routing-options],</code>
<code>[edit routing-instances <i>routing-instance-name</i> routing-options],</code>
<code>[edit routing-options]</code> |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.3 for ACX Series routers. |
| Description | <p>Specify the routing device's IP address.</p> <p>The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier usually is the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.</p> |
| <div> NOTE: We strongly recommend that you configure the router identifier under the <code>[edit routing-options]</code> hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.</div> | |
| <p>For more information about the router identifier in OSPF, see “Example: Configuring an OSPF Router Identifier” on page 3380.</p> | |
| Options | address —IP address of the routing device.
Default: Address of the first interface encountered by Junos OS |
| Required Privilege Level | routing —To view this statement in the configuration.
routing-control —To add this statement to the configuration. |

| Description | <p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p> |
| Default | If you do not include this statement, no global tracing operations are performed. |
| Options | <p>Values:</p> <p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place global routing protocol tracing output in the file routing-log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and</p> |

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

upstream-interface

| | |
|---------------------------------|--|
| Syntax | <code>upstream-interface [<i>interface-names</i>];</code> |
| Hierarchy Level | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast pim-to-igmp-proxy],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast pim-to-mld-proxy],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast pim-to-igmp-proxy],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast pim-to-mld-proxy],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast pim-to-igmp-proxy],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast pim-to-mld-proxy],</p> <p>[edit routing-options multicast pim-to-igmp-proxy],</p> <p>[edit routing-options multicast pim-to-mld-proxy]</p> |
| Release Information | <p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> |
| Description | <p>Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the pim-to-igmp-proxy statement), or into corresponding MLD report or leave messages (if you include the pim-to-mld-proxy statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.</p> |
| Options | <p><i>interface-names</i>—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ([]).</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

Routine Monitoring

- [Monitoring Routing Information on page 2441](#)
- [Verifying That Virtual Router Routing Instances Are Working on page 2442](#)

Monitoring Routing Information

- Purpose** Use the monitoring functionality to view the `inet.0` routing table on the routing device.
- Action** To view the routing table, enter the following commands in the CLI interface:
- `show route terse`
 - `show route detail`
- Meaning** [Table 203 on page 2441](#) describes the different filters, their functions, and the associated actions.
- [Table 204 on page 2442](#) summarizes key output fields in the routing information display.

Table 203: Filtering Route Messages

| Field | Function | Your Action |
|---------------------|--|---|
| Destination Address | Specifies the destination address of the route. | Enter the destination address. |
| Next hop address | Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | Enter the next hop address. |
| Best route | Specifies only the best route available. | Select the view details of the best route. |
| Inactive routes | Specifies the inactive routes. | Select the view details of inactive routes. |
| Exact route | Specifies the exact route. | Select the view details of the exact route. |

Table 203: Filtering Route Messages (*continued*)

| Field | Function | Your Action |
|---------------|--|---|
| Hidden routes | Specifies the hidden routes. | Select the view details of hidden routes. |
| Search | Applies the specified filter and displays the matching messages. | To apply the filter and display messages, click Search . |

Table 204: Summary of Key Routing Information Output Fields

| Field | Values | Additional Information |
|------------------------|--|---|
| Static Route Addresses | The list of static route addresses. | |
| Protocol | Protocol from which the route was learned: Static , Direct , Local . | |
| Preference | The preference is the individual preference value for the route. | The route preference is used as one of the route selection criteria. |
| Next-Hop | Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | <p>If a next hop is listed as Discard, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the discard attribute has been set.</p> <p>If a next hop is listed as Reject, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected.</p> <p>If a next hop is listed as Local, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</p> |
| Age | How long the route has been active. | |
| State | Flags for this route. | There are many possible flags. |

Verifying That Virtual Router Routing Instances Are Working

Purpose After creating a virtual router routing instance, verify that it has been set up properly.

Action 1. Use the **show route instance** command to list all the routing instances and their properties:

```
user@switch> show route instance
```

| Instance | Type | Active/holddown/hidden |
|-----------------------------|----------------|------------------------|
| Primary RIB | | |
| master | forwarding | |
| inet.0 | | 4/0/1 |
| __juniper_private1__ | forwarding | |
| __juniper_private1__.inet.0 | | 1/0/3 |
| __juniper_private2__ | forwarding | |
| __juniper_private2__.inet.0 | | 0/0/1 |
| __juniper_private3__ | forwarding | |
| __juniper_private3__.inet.0 | | 1/0/2 |
| __juniper_private4__ | forwarding | |
| __juniper_private4__.inet.0 | | 4/0/2 |
| __master.anon__ | forwarding | |
| r1 | virtual-router | |
| r2 | virtual-router | |

- Use the **show route forwarding-table** command to view the forwarding table information for each routing instance:

```
user@switch> show route forwarding-table
Routing table: r1---qfabric.inet
Internet:
Destination      Type RtRef Next hop      Type Index NhRef Netif
default          perm  0          Type Index NhRef Netif
0.0.0.0/32       perm  0          dscd  1626  1
224.0.0.0/4      perm  0          mdsc  1627  1
224.0.0.1/32     perm  0 224.0.0.1    mcst  1623  1
255.255.255.255/32 perm  0          bcst  1624  1
```

Meaning The output displays the routing table information and confirms that the virtual router routing instances have been created and the links are up.

```

show as-path

| | |
|------------------------------------|---|
| Syntax | show as-path
<brief detail>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show as-path
<brief detail> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | <p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the as-path-prepend action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| Options | <p>none—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Required Privilege Level | view |

show as-path domain

| | |
|------------------------------------|--|
| Syntax | show as-path domain
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show as-path domain |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display autonomous system (AS) path domain information. |
| Options | none —(Optional) Display AS path domain information for all routing instances.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level | view |
| List of Sample Output | show as-path domain on page 2451 |
| Output Fields | Table 206 on page 2450 lists the output fields for the show as-path domain command. Output fields are listed in the approximate order in which they appear |

Table 206: show as-path domain Output Fields

| Field Name | Field Description |
|---------------------|---|
| Domain | Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain. |
| Primary | Primary AS number. |
| References | Path reference count. |
| Number Paths | Number of known AS paths. |
| Flags | Information about the AS path: <ul style="list-style-type: none"> • ASLoop—Path contains an AS loop. • Atomic—Path includes the ATOMIC_AGGREGATE path attribute. • Local—Path was created by local aggregation. • Master—Path was created by the master routing instance. |
| Local AS | AS number of the local routing device. |
| Loops | How many times this AS number can appear in an AS path. |

Sample Output

show as-path domain

```
user@host> show as-path domain
Domain: 1          Primary: 10458
References:        3 Paths:      30383
Flags: Master
Local AS: 10458   Loops: 1
```

show as-path summary

| | |
|------------------------------------|--|
| Syntax | show as-path summary
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show as-path summary |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display autonomous system (AS) path summary information.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table. |
| Options | none —(Optional) Display AS path summary information for all routing instances.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> show as-path on page 2446 |
| List of Sample Output | show as-path summary on page 2453 |
| Output Fields | Table 207 on page 2452 lists the output fields for the show as-path summary command. Output fields are listed in the approximate order in which they appear. |

Table 207: show as-path summary Output Fields

| Field Name | Field Description |
|---------------|---|
| AS Paths | Number of AS paths. |
| Buckets | Number of hash buckets in use. |
| Max | Maximum number of AS path entries per bucket. |
| Min | Minimum number of AS path entries per bucket. |
| Avg | Average number of AS path entries per bucket. |
| Std deviation | Standard deviation of AS path entries per bucket. |

Sample Output

show as-path summary

```
user@host> show as-path summary
AS Paths Buckets Max Min Avg Std deviation
30425    1024    95  12  29  6.481419
```

show ipv6 neighbors

| | |
|---------------------------------|--|
| Syntax | show ipv6 neighbors |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.3 for EX Series switches.
Command introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | Display information about the IPv6 neighbor cache. |
| Options | This command has no options. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • clear ipv6 neighbors on page 2445 |
| List of Sample Output | show ipv6 neighbors on page 2454 |
| Output Fields | Table 208 on page 2454 describes the output fields for the show ipv6 neighbors command. Output fields are listed in the approximate order in which they appear. |

Table 208: show ipv6 neighbors Output Fields

| Field Name | Field Description |
|-------------------|--|
| IPv6 Address | Name of the IPv6 interface. |
| Linklayer Address | Link-layer address. |
| State | State of the link: up , down , incomplete , reachable , stale , or unreachable . |
| Exp | Number of seconds until the entry expires. |
| Rtr | Whether the neighbor is a routing device: yes or no . |
| Secure | Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: yes or no . |
| Interface | Name of the interface. |

Sample Output

show ipv6 neighbors

```

user@host> show ipv6 neighbors
IPv6 Address          Linklayer Address  State      Exp Rtr Secure
Interface
2001:db8:0:1:2a0:a514:0:24c  00:05:85:8f:c8:bd  stale      546 yes no
fe-1/2/0.1

```

| | | | | | |
|------------------------------------|-------------------|-------|-----|-----|----|
| fe80::2a0:a514:0:24c
fe-1/2/0.1 | 00:05:85:8f:c8:bd | stale | 258 | yes | no |
| fe80::2a0:a514:0:64c
fe-1/2/1.5 | 00:05:85:8f:c8:bd | stale | 111 | yes | no |

show ipv6 router-advertisement

| | |
|---------------------------------|--|
| Syntax | <pre>show ipv6 router-advertisement <conflicts> <interface <i>interface</i>> <logical-system (all <i>logical-system-name</i>)> <prefix <i>prefix/prefix length</i>></pre> |
| Release Information | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.2 for the QFX Series.</p> |
| Description | Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers. |
| Options | <p>none—Display all IPv6 router advertisement information for all interfaces.</p> <p>conflicts—(Optional) Display only the IPv6 router advertisement information that is conflicting.</p> <p>interface <i>interface</i>—(Optional) Display IPv6 router advertisement information for the specified interface.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>prefix <i>prefix/prefix length</i>—(Optional) Display IPv6 router advertisement information for the specified prefix.</p> |
| Additional Information | The display identifies conflicting information by enclosing the value the router is advertising in brackets. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> clear ipv6 router-advertisement |
| List of Sample Output | <p>show ipv6 router-advertisement on page 2457</p> <p>show ipv6 router-advertisement conflicts on page 2458</p> <p>show ipv6 router-advertisement prefix on page 2458</p> |
| Output Fields | Table 209 on page 2456 describes the output fields for the show ipv6 router-advertisement command. Output fields are listed in the approximate order in which they appear. |

Table 209: show ipv6 router-advertisement Output Fields

| Field Name | Field Description |
|---------------------|---|
| Interface | Name of the interface. |
| Advertisements sent | Number of router advertisements sent and the elapsed time since they were sent. |

Table 209: show ipv6 router-advertisement Output Fields (*continued*)

| Field Name | Field Description |
|-------------------------|---|
| Solicits received | Number of solicitation messages received. |
| Advertisements received | Number of router advertisements received. |
| Advertisements from | Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received. |
| Managed | Managed address configuration flag: 0 (stateless) or 1 (stateful). |
| Other configuration | Other stateful configuration flag: 0 (stateless) or 1 (stateful). |
| Reachable time | Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds. |
| Default lifetime | Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router. |
| Retransmit timer | Time between retransmitted Neighbor Solicitation messages, in milliseconds. |
| Current hop limit | Configured current hop limit. |
| Prefix | Name and length of the prefix. |
| Valid lifetime | How long the prefix remains valid for onlink determination. |
| Preferred lifetime | How long the prefix generated by stateless autoconfiguration remains preferred. |
| On link | Onlink flag: 0 (not onlink) or 1 (onlink). |
| Autonomous | Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous). |

Sample Output

show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 1
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
  Managed: 0
  Other configuration: 0 [1]
  Reachable time: 0 ms
  Default lifetime: 1800 sec

```

Retransmit timer: 0 ms
Current hop limit: 64

show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
  Other configuration: 0 [1]
```

show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
  Managed: 0
  Other configuration: 0
  Reachable time: 0 ms
  Default lifetime: 180 sec [1800 sec]
  Retransmit timer: 0 ms
  Current hop limit: 64
  Prefix: 8040:1::/64
    Valid lifetime: 2592000 sec
    Preferred lifetime: 604800 sec
    On link: 1
    Autonomous: 1
```

Output Fields Table 210 on page 2460 describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

Table 210: show route Output Fields

| Field Name | Field Description |
|---------------------------------|--|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |
| <i>number routes</i> | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> • active (routes that are active). • holddown (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly. <p>However, if you have configured advertisement of multiple routes (with the add-path or advertise-inactive statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> • hidden (routes that are not used because of a routing policy). |
| <i>destination-prefix</i> | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote. |
| [protocol, preference] | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p> |

Table 210: show route Output Fields (*continued*)

| Field Name | Field Description |
|---|---|
| <i>weeks:days</i>
<i>hours:minutes:seconds</i> | How long the route been known (for example, 2w4d 13:11:14 , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds). |
| metric | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value. |
| localpref | Local preference value included in the route. |
| from | Interface from which the route was received. |
| AS path | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| validation-state | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> • Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • Valid—Indicates that the prefix and autonomous system pair are found in the database. |
| to | <p>Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.</p> <p>If the destination is Discard, traffic is dropped.</p> |

Table 210: show route Output Fields (*continued*)

| Field Name | Field Description |
|------------|--|
| via | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. • lsp-path-name—Name of the LSP used to reach the next hop. • label-action—MPLS label and operation occurring at the next hop. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). For VPNs, expect to see multiple push operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only). |

Sample Output

show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    *[MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
    [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
    [BGP/170] 19:53:25, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```

user@host> show route 70.0.0.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)

```

+ = Active Route, - = Last Active, * = Both

```

show route all

| | |
|------------------------------------|---|
| Syntax | <code>show route all</code>
<code><logical-system (all <i>logical-system-name</i>)></code> |
| Syntax (EX Series Switches) | <code>show route all</code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display information about all routes in all routing tables, including private, or internal, tables. |
| Options | none —Display information about all routes in all routing tables, including private, or internal, tables.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level | view |
| List of Sample Output | show route all on page 2469 |
| Output Fields | In Junos OS Release 9.5 and later, only the output fields for the show route all command display all routing tables, including private, or hidden, routing tables. The output field table of the show route command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

Sample Output

show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route

```

show route aspath-regex

| | |
|------------------------------------|---|
| Syntax | show route aspath-regex <i>regular-expression</i>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show route aspath-regex <i>regular-expression</i> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression. |
| Options | <p><i>regular-expression</i>—Regular expression that matches an entire AS path.</p> <p><i>logical-system</i> (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"> • An individual AS number • A period wildcard used in place of an AS number • An AS path regular expression that is enclosed in parentheses <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"> • <i>{m,n}</i>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term. • <i>{m}</i>—Exactly <i>m</i> repetitions of the AS path term. • <i>{m,}</i>—<i>m</i> or more repetitions of the AS path term. • <i>*</i>—Zero or more repetitions of an AS path term. • <i>+</i>—One or more repetitions of an AS path term. • <i>?</i>—Zero or one repetition of an AS path term. • <i>aspath_term</i> <i>aspath_term</i>—Match one of the two AS path terms. <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> <pre>show route aspath-regex ".* 234 .*"</pre> |
| Required Privilege Level | view |

| | |
|-----------------------|--|
| Related Documentation | <ul style="list-style-type: none">• <i>Example: Using AS Path Regular Expressions</i> |
| List of Sample Output | show route aspath-regex (Matching a Specific AS Number) on page 2472
show route aspath-regex (Matching Any Path with Two AS Numbers) on page 2472 |
| Output Fields | For information about output fields, see the output field table for the show route command. |

| Description | Display brief information about the active entries in the routing tables. |
| Options | none —Display all active entries in the routing table.

destination-prefix —(Optional) Display active entries for the specified address or range of addresses.

logical-system (all logical-system-name) —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level | view |
| List of Sample Output | show route brief on page 2476 |
| Output Fields | For information about output fields, see the Output Field table of the show route command. |

Sample Output

show route brief

```
user@host> show route brief

show route community

| | |
|-----------------------------|--|
| Syntax | <code>show route community <i>as-number:community-value</i></code>
<brief detail extensive terse>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | <code>show route community <i>as-number:community-value</i></code>
<brief detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community. |
| Options | <p><i>as-number:community-value</i>—One or more community identifiers. <i>as-number</i> is the AS number, and <i>community-value</i> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information | Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">• show route detail on page 2487 |
| List of Sample Output | show route community on page 2478 |
| Output Fields | For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command. |

Sample Output

show route community

```
user@host> show route community 234:80

show route damping

| | |
|---|---|
| Syntax | show route damping (decayed history suppressed)
<brief detail extensive terse>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switch and QFX Series) | show route damping (decayed history suppressed)
<brief detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Display the BGP routes for which updates might have been reduced because of route flap damping. |
| Options | <p>brief detail extensive terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>decayed—Display route damping entries that might no longer be valid, but are not suppressed.</p> <p>history—Display entries that have already been withdrawn, but have been logged.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>suppressed—Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • clear bgp damping on page 3130 • show policy damping on page 3163 |
| List of Sample Output | show route damping decayed detail on page 2485
show route damping history on page 2486
show route damping history detail on page 2486 |
| Output Fields | Table 211 on page 2482 lists the output fields for the show route damping command. Output fields are listed in the approximate order in which they appear. |

Table 211: show route damping Output Fields

| Field Name | Field Description | Level of Output |
|---------------------------|---|-----------------|
| <i>routing-table-name</i> | Name of the routing table—for example, inet.0 . | All levels |
| destinations | Number of destinations for which there are routes in the routing table. | All levels |

Table 211: show route damping Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|---|-------------------------|
| <i>number routes</i> | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> • active • holdddown (routes that are in a pending state before being declared inactive) • hidden (the routes are not used because of a routing policy) | All levels |
| <i>destination-prefix (entry, announced)</i> | Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. | detail extensive |
| <i>[protocol, preference]</i> | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p> | All levels |
| Next-hop reference count | Number of references made to the next hop. | detail extensive |
| Source | IP address of the route source. | detail extensive |
| Next hop | Network layer address of the directly reachable neighboring system. | detail extensive |
| via | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected . | detail extensive |
| Protocol next hop | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop. | detail extensive |
| Indirect next hop | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops. | detail extensive |
| State | Flags for this route. For a description of possible values for this field, see the output field table for the show route detail command. | detail extensive |
| Local AS | AS number of the local routing device. | detail extensive |
| Peer AS | AS number of the peer routing device. | detail extensive |

Table 211: show route damping Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|------------------|
| Age | How long the route has been known. | detail extensive |
| Metric | Metric for the route. | detail extensive |
| Task | Name of the protocol that has added the route. | detail extensive |
| Announcement bits | List of protocols that announce this route. n-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. n is an index used by Juniper Networks customer support only. | detail extensive |
| AS path | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels |
| to | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route. | brief none |
| via | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected . | brief none |
| Communities | Community path attribute for the route. See the output field table for the show route detail command. | detail extensive |
| Localpref | Local preference value included in the route. | All levels |
| Router ID | BGP router ID as advertised by the neighbor in the open message. | detail extensive |
| Merit (last update/now) | Last updated and current figure-of-merit value. | detail extensive |

Table 211: show route damping Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------------|--|-------------------------|
| damping-parameters | Name that identifies the damping parameters used, which is defined in the damping statement at the [edit policy-options] hierarchy level. | detail extensive |
| Last update | Time of most recent change in path attributes. | detail extensive |
| First update | Time of first change in path attributes, which started the route damping process. | detail extensive |
| Flaps | Number of times the route has gone up or down or its path attributes have changed. | detail extensive |
| Suppressed | (suppressed keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels |
| Reusable in | (suppressed keyword only) Time when a suppressed route will again be available. | All levels |
| Preference will be | (suppressed keyword only) Preference value that will be applied to the route when it is again active. | All levels |

| List of Sample Output | show route detail on page 2496
show route detail (with BGP Multipath) on page 2501
show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 2502 |
| Output Fields | Table 212 on page 2487 describes the output fields for the show route detail command. Output fields are listed in the approximate order in which they appear. |

Table 212: show route detail Output Fields

| Field Name | Field Description |
|----------------------------|---|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |
| <i>number routes</i> | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> active (routes that are active) holddown (routes that are in the pending state before being declared inactive) hidden (routes that are not used because of a routing policy) |

Table 212: show route detail Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| <i>route-destination</i>
(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote. |
| label stacking | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> • S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed). |
| [protocol, preference] | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • —A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p> |
| Level | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p> |
| Route Distinguisher | IP subnet augmented with a 64-bit prefix. |
| PMSI | Provider multicast service interface (MVPN routing table). |
| Next-hop type | Type of next hop. For a description of possible values for this field, see Table 213 on page 2491 . |

Table 212: show route detail Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Next-hop reference count | Number of references made to the next hop. |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel. |
| Source | IP address of the route source. |
| Next hop | Network layer address of the directly reachable neighboring system. |
| via | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. |
| Label-switched-path
lsp-path-name | Name of the LSP used to reach the next hop. |
| Label operation | MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). |
| Interface | (Local only) Local interface name. |
| Protocol next hop | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop. |
| Indirect next hop | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops. |
| State | State of the route (a route can be in more than one state). See Table 214 on page 2493 . |
| Local AS | AS number of the local routing device. |
| Age | How long the route has been known. |
| AIGP | Accumulated interior gateway protocol (AIGP) BGP attribute. |
| Metricn | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value. |

Table 212: show route detail Output Fields (*continued*)

| Field Name | Field Description |
|----------------------------|---|
| MED-plus-IGP | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added. |
| TTL-Action | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see show route table.</p> |
| Task | Name of the protocol that has added the route. |
| Announcement bits | List of protocols that announce this route. n-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. n is an index used by Juniper Networks customer support only. |
| AS path | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> I—IGP. E—EGP. Recorded—The AS path is recorded by the sample process (sampled). ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. []—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. ()—Parentheses enclose a confederation. ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| validation-state | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. Valid—Indicates that the prefix and autonomous system pair are found in the database. |
| FECs bound to route | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured. |

Table 212: show route detail Output Fields (*continued*)

| Field Name | Field Description |
|----------------------------------|--|
| VC Label | MPLS label assigned to the Layer 2 circuit virtual connection. |
| MTU | Maximum transmission unit (MTU) of the Layer 2 circuit. |
| VLAN ID | VLAN identifier of the Layer 2 circuit. |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP. |
| Communities | Community path attribute for the route. See Table 215 on page 2495 for all possible values for this field. |
| Layer2-info: encaps | Layer 2 encapsulation (for example, VPLS). |
| control flags | Control flags: none or Site Down . |
| mtu | Maximum transmission unit (MTU) information. |
| Label-Base, range | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device. |
| status vector | Layer 2 VPN and VPLS network layer reachability information (NLRI). |
| Accepted Multipath | Current active path when BGP multipath is configured. |
| Accepted MultipathContrib | Path currently contributing to BGP multipath. |
| Localpref | Local preference value included in the route. |
| Router ID | BGP router ID as advertised by the neighbor in the open message. |
| Primary Routing Table | In a routing table group, the name of the primary routing table in which the route resides. |
| Secondary Tables | In a routing table group, the name of one or more secondary tables in which the route resides. |

[Table 213 on page 2491](#) describes all possible values for the Next-hop Types output field.

Table 213: Next-hop Types Output Field Values

| Next-Hop Type | Description |
|--------------------------|---------------------|
| Broadcast (bcast) | Broadcast next hop. |
| Deny | Deny next hop. |
| Discard | Discard next hop. |

Table 213: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type | Description |
|---------------------------------|--|
| Flood | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| Hold | Next hop is waiting to be resolved into a unicast or multicast type. |
| Indexed (idxd) | Indexed next hop. |
| Indirect (indr) | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected. |
| Interface | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network. |
| Local (locl) | Local address on an interface. This next-hop type causes packets with this destination address to be received locally. |
| Multicast (mcst) | Wire multicast next hop (limited to the LAN). |
| Multicast discard (mdsc) | Multicast discard. |
| Multicast group (mgrp) | Multicast group member. |
| Receive (recv) | Receive. |
| Reject (rjct) | Discard. An ICMP unreachable message was sent. |
| Resolve (rslv) | Resolving next hop. |
| Routed multicast (mcrt) | Regular multicast next hop. |
| Router | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> • Must not be a direct or local subnet for the routing device. • Must have a next hop that is directly connected to the routing device. |
| Table | Routing table next hop. |

Table 213: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type | Description |
|----------------|---|
| Unicast (ucst) | Unicast. |
| Unilist (ulst) | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. |

Table 214 on page 2493 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 214: State Output Field Values

| Value | Description |
|---------------------------------------|--|
| Accounting | Route needs accounting. |
| Active | Route is active. |
| Always Compare MED | Path with a lower multiple exit discriminator (MED) is available. |
| AS path | Shorter AS path is available. |
| Cisco Non-deterministic MED selection | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| Clone | Route is a clone. |
| Cluster list length | Length of cluster list sent by the route reflector. |
| Delete | Route has been deleted. |
| Ex | Exterior route. |
| Ext | BGP route received from an external BGP neighbor. |
| FlashAll | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden | Route not used because of routing policy. |
| IfCheck | Route needs forwarding RPF check. |
| IGP metric | Path through next hop with lower IGP metric is available. |
| Inactive reason | Flags for this route, which was not selected as best for a particular destination. |
| Initial | Route being added. |

Table 214: State Output Field Values (*continued*)

| Value | Description |
|--|---|
| Int | Interior route. |
| Int Ext | BGP route received from an internal BGP peer or a BGP confederation peer. |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGP path is available. |
| Local Preference | Path with a higher local preference value is available. |
| Martian | Route is a martian (ignored because it is obviously invalid). |
| MartianOK | Route exempt from martian filtering. |
| Next hop address | Path with lower metric next hop is available. |
| No difference | Path from neighbor with lower IP address is available. |
| NoReadvrt | Route not to be advertised. |
| NotBest | Route not chosen because it does not have the lowest MED. |
| Not Best in its group | Incoming BGP AS is not the best of a group (only one AS can be the best). |
| NotInstall | Route not to be installed in the forwarding table. |
| Number of gateways | Path with a greater number of next hops is available. |
| Origin | Path with a lower origin code is available. |
| Pending | Route pending because of a hold-down configured on another route. |
| Release | Route scheduled for release. |
| RIB preference | Route from a higher-numbered routing table is available. |
| Route Distinguisher | 64-bit prefix added to IP subnets to make them unique. |
| Route Metric or MED comparison | Route with a lower metric or MED is available. |
| Route Preference | Route with lower preference value is available |
| Router ID | Path through a neighbor with lower ID is available. |
| Secondary | Route not a primary route. |

Table 214: State Output Field Values (*continued*)

| Value | Description |
|----------------------|---|
| Unusable path | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> • The route is damped. • The route is rejected by an import policy. • The route is unresolved. |
| Update source | Last tiebreaker is the lowest IP address value. |

Table 215 on page 2495 describes the possible values for the Communities output field.

Table 215: Communities Output Field Values

| Value | Description |
|---|---|
| <i>area-number</i> | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0 . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain. |
| bandwidth: local AS number:link-bandwidth-number | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| domain-id | Unique configurable number that identifies the OSPF domain. |
| domain-id-vendor | Unique configurable number that further identifies the OSPF domain. |
| <i>link-bandwidth-number</i> | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second). |
| <i>local AS number</i> | Local AS number: from 1 through 65,535 . |
| <i>options</i> | 1 byte. Currently this is only used if the route type is 5 or 7 . Setting the least significant bit in the field indicates that the route carries a type 2 metric. |
| origin | (Used with VPNs) Identifies where the route came from. |
| <i>ospf-route-type</i> | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses. |
| route-type-vendor | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000 . The format is area-number:ospf-route-type:options . |
| rte-type | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306 . The format is area-number:ospf-route-type:options . |
| target | Defines which VPN the route participates in; target has the format 32-bit IP address:16-bit number . For example, 10.19.0.0:100. |

Table 215: Communities Output Field Values (*continued*)

| Value | Description |
|-------------------------------|---|
| unknown IANA | Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized. |
| unknown OSPF vendor community | Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized. |

show route export

| | |
|------------------------------------|---|
| Syntax | show route export
<brief detail>
<instance <instance-name> routing-table-name>
<logical-system (all logical-system-name)> |
| Syntax (EX Series Switches) | show route export
<brief detail>
<instance <instance-name> routing-table-name> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances. |
| Options | <p>none—(Same as brief.) Display standard information about policy-based export for all instances and routing tables on all systems.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>instance <instance-name>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>routing-table-name—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route export inet command).</p> |
| Required Privilege Level | view |
| List of Sample Output | show route export on page 2506
show route export detail on page 2506
show route export instance detail on page 2506 |
| Output Fields | Table 216 on page 2505 lists the output fields for the show route export command. Output fields are listed in the approximate order in which they appear. |

Table 216: show route export Output Fields

| Field Name | Field Description | Level of Output |
|----------------------------|---|-------------------|
| Table or <i>table-name</i> | Name of the routing tables that either import or export routes. | All levels |
| Routes | Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one. | brief none |
| Export | Whether the table is currently exporting routes to other tables: Y or N (Yes or No). | brief none |

Table 216: show route export Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------|---|-----------------|
| Import | Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.) | detail |
| Flags | (instance keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> config auto-policy—The policy was deduced from the configured IGP export policies. cleanup—Configuration information for this instance is no longer valid. config—The instance was explicitly configured. | detail |
| Options | (instance keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> unicast—Indicates <i>instance.inet.0</i>. multicast—Indicates <i>instance.inet.2</i>. unicast multicast—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>. | detail |
| Import policy | (instance keyword only) Policy that route export uses to construct the import-export matrix. Not displayed if the instance type is vrf . | detail |
| Instance | (instance keyword only) Name of the routing instance. | detail |
| Type | (instance keyword only) Type of routing instance: forwarding , non-forwarding , or vrf . | detail |

Sample Output

show route export

```

user@host> show route export
Table      Export      Routes
inet.0     N            0
black.inet.0 Y           3
red.inet.0 Y            4

```

show route export detail

```

user@host> show route export detail
inet.0                                Routes:      0
black.inet.0                          Routes:      3
  Import: [ inet.0 ]
red.inet.0                            Routes:      4
  Import: [ inet.0 ]

```

show route export instance detail

```

user@host> show route export instance detail
Instance: master                      Type: forwarding
  Flags: <config auto-policy> Options: <unicast multicast>
  Import policy: [ (ospf-master-from-red || isis-master-from-black) ]
Instance: black                       Type: non-forwarding
Instance: red                         Type: non-forwarding

```

show route extensive

| | |
|------------------------------------|--|
| Syntax | show route extensive
<destination-prefix>
<logical-system (all logical-system-name)> |
| Syntax (EX Series Switches) | show route extensive
<destination-prefix> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display extensive information about the active entries in the routing tables. |
| Options | <p>none—Display all active entries in the routing table.</p> <p>destination-prefix—(Optional) Display active entries for the specified address or range of addresses.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Required Privilege Level | view |
| List of Sample Output | show route extensive on page 2514
show route extensive (Access Route) on page 2520
show route extensive (BGP PIC Edge) on page 2521
show route extensive (FRR and LFA) on page 2521
show route extensive (Route Reflector) on page 2522
show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 2522 |
| Output Fields | Table 217 on page 2508 describes the output fields for the show route extensive command. Output fields are listed in the approximate order in which they appear. |

Table 217: show route extensive Output Fields

| Field Name | Field Description |
|----------------------------|--|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |
| <i>number routes</i> | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> active (routes that are active). holddown (routes that are in the pending state before being declared inactive). hidden (routes that are not used because of a routing policy). |

Table 217: show route extensive Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| <i>route-destination</i>
(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The entry value is the number of route for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote. |
| TSI | Protocol header information. |
| label stacking | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> • S=0 route indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed). • If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed). |
| [<i>protocol, preference</i>] | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p> |
| Level | <p>(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p> |
| Route Distinguisher | IP subnet augmented with a 64-bit prefix. |

Table 217: show route extensive Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Next-hop type | Type of next hop. For a description of possible values for this field, see the Output Field table in the show route detail command. |
| Next-hop reference count | Number of references made to the next hop. |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel. |
| Source | IP address of the route source. |
| Next hop | Network layer address of the directly reachable neighboring system. |
| via | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. |
| Label-switched-path <i>lsp-path-name</i> | Name of the LSP used to reach the next hop. |
| Label operation | MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). |
| Offset | Whether the metric has been increased or decreased by an offset value. |
| Interface | (Local only) Local interface name. |
| Protocol next hop | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop. |
| <i>label-operation</i> | MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). |

Table 217: show route extensive Output Fields (*continued*)

| Field Name | Field Description |
|---------------------------|---|
| Indirect next hops | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain Indirect next hop: weight follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none">• 0x1 indicates active next hops.• 0x4000 indicates passive next hops. |
| State | State of the route (a route can be in more than one state). See the Output Field table in the show route detail command. |
| Session ID | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA). |
| Weight | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see show route table.</p> |

Table 217: show route extensive Output Fields (*continued*)

| Field Name | Field Description |
|-----------------|---|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> • Active preferred—Currently active route was selected over this route. • Always compare MED—Path with a lower multiple exit discriminator (MED) is available. • AS path—Shorter AS path is available. • Cisco Non-deterministic MED selection—Cisco nondeterministic MED is enabled and a path with a lower MED is available. • Cluster list length—Path with a shorter cluster list length is available. • Forwarding use only—Path is only available for forwarding purposes. • IGP metric—Path through the next hop with a lower IGP metric is available. • IGP metric type—Path with a lower OSPF link-state advertisement type is available. • Interior > Exterior > Exterior via Interior—Direct, static, IGP, or EBGP path is available. • Local preference—Path with a higher local preference value is available. • Next hop address—Path with a lower metric next hop is available. • No difference—Path from a neighbor with a lower IP address is available. • Not Best in its group—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed). • Number of gateways—Path with a higher number of next hops is available. • Origin—Path with a lower origin code is available. • OSPF version—Path does not support the indicated OSPF version. • RIB preference—Route from a higher-numbered routing table is available. • Route distinguisher—64-bit prefix added to IP subnets to make them unique. • Route metric or MED comparison—Route with a lower metric or MED is available. • Route preference—Route with a lower preference value is available. • Router ID—Path through a neighbor with a lower ID is available. • Unusable path—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved. • Update source—Last tiebreaker is the lowest IP address value. |
| Local AS | Autonomous system (AS) number of the local routing device. |
| Age | How long the route has been known. |
| AIGP | Accumulated interior gateway protocol (AIGP) BGP attribute. |
| Metric | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value. |
| MED-plus-IGP | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added. |
| TTL-Action | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see show route table.</p> |

Table 217: show route extensive Output Fields (*continued*)

| Field Name | Field Description |
|--------------------------------------|---|
| Task | Name of the protocol that has added the route. |
| Announcement bits | List of protocols that announce this route. n-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. n is an index used by Juniper Networks customer support only. |
| AS path | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • Recorded—The AS path is recorded by the sample process (sampled). • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| FECs bound to route | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured. |
| AS path: I <Originator> | (For route reflected output only) Originator ID attribute set by the route reflector. |
| VC Label | MPLS label assigned to the Layer 2 circuit virtual connection. |
| MTU | Maximum transmission unit (MTU) of the Layer 2 circuit. |
| VLAN ID | VLAN identifier of the Layer 2 circuit. |
| Cluster list | (For route reflected output only) Cluster ID sent by the route reflector. |
| Originator ID | (For route reflected output only) Address of router that originally sent the route to the route reflector. |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP. |
| Communities | Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field. |
| Layer2-info: encaps | Layer 2 encapsulation (for example, VPLS). |

Table 217: show route extensive Output Fields (*continued*)

| Field Name | Field Description |
|------------------------------|--|
| control flags | Control flags: none or Site Down. |
| mtu | Maximum transmission unit (MTU) information. |
| Label-Base, range | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device. |
| status vector | Layer 2 VPN and VPLS network layer reachability information (NLRI). |
| Localpref | Local preference value included in the route. |
| Router ID | BGP router ID as advertised by the neighbor in the open message. |
| Primary Routing Table | In a routing table group, the name of the primary routing table in which the route resides. |
| Secondary Tables | In a routing table group, the name of one or more secondary tables in which the route resides. |
| Originating RIB | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| Node path count | Number of nodes in the path. |
| Forwarding nexthops | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. |

show route flow validation

| | |
|------------------------------------|--|
| Syntax | show route flow validation
<brief detail>
<ip-prefix>
<table table-name>
<logical-system (all logical-system-name)> |
| Syntax (EX Series Switches) | show route flow validation
<brief detail>
<ip-prefix>
<table table-name> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display flow route information. |
| Options | <p>none—Display flow route information.</p> <p>brief detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>ip-prefix—(Optional) IP address for the flow route.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>table table-name—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route flow validation inet command).</p> |
| Required Privilege Level | view |
| List of Sample Output | show route flow validation on page 2525 |
| Output Fields | Table 218 on page 2524 lists the output fields for the show route flow validation command. Output fields are listed in the approximate order in which they appear. |

Table 218: show route flow validation Output Fields

| Field Name | Field Description | Level of Output |
|-----------------------------|--|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels |
| <i>prefix</i> | Route address. | All levels |
| Active unicast route | Active route in the routing table. | All levels |
| Dependent flow destinations | Number of flows for which there are routes in the routing table. | All levels |

Table 218: show route flow validation Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------|---|-----------------|
| Origin | Source of the route flow. | All levels |
| Neighbor AS | Autonomous system identifier of the neighbor. | All levels |
| Flow destination | Number of entries and number of destinations that match the route flow. | All levels |
| Unicast best match | Destination that is the best match for the route flow. | All levels |
| Flags | Information about the route flow. | All levels |

Sample Output

show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```

Description Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

NOTE: The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the [show pfe route](#) command.

Options **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

detail | extensive | summary—(Optional) Display the specified level of output.

all—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

bridge-domain (all | bridge-domain-name)—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

ccc interface-name—(Optional) Display route entries for the specified circuit cross-connect interface.

destination destination-prefix—(Optional) Destination prefix.

family family—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

interface-name interface-name—(Optional) Display routing table entries for the specified interface.

label name—(Optional) Display route entries for the specified label.

lcc number—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

learning-vlan-id *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

matching *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

multicast—(Optional) Display routing table entries for multicast routes.

table (default | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

vlan (all | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

vpn *vpn*—(Optional) Display routing table entries for a specified VPN.

Output Fields

[Table 219 on page 2529](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

Table 219: show route forwarding-table Output Fields

| Field Name | Field Description | Level of Output |
|-------------------------|---|-------------------------|
| Logical system | Name of the logical system. This field is displayed if you specify the table <i>logical-system-name/routing-instance-name</i> option on a device that is configured for and supports logical systems. | All levels |
| Routing table | Name of the routing table (for example, inet, inet6, mpls). | All levels |
| Address family | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS). | All levels |
| Destination | Destination of the route. | detail extensive |
| Route Type (Type) | <p>How the route was placed into the forwarding table. When the detail keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> • cloned (clon)—(TCP or multicast only) Cloned route. • destination (dest)—Remote addresses directly reachable through an interface. • destination down (iddn)—Destination route for which the interface is unreachable. • interface cloned (ifcl)—Cloned route for which the interface is unreachable. • route down (ifdn)—Interface route for which the interface is unreachable. • ignore (ignr)—Ignore this route. • interface (intf)—Installed as a result of configuring an interface. • permanent (perm)—Routes installed by the kernel when the routing table is initialized. • user—Routes installed by the routing protocol process or as a result of the configuration. | All levels |
| Route Reference (RtRef) | Number of routes to reference. | detail extensive |
| Flags | <p>Route type flags:</p> <ul style="list-style-type: none"> • none—No flags are enabled. • accounting—Route has accounting enabled. • cached—Cache route. • incoming-iface interface-number—Check against incoming interface. • prefix load balance—Load balancing is enabled for this prefix. • rt nh decoupled—Route has been decoupled from the next hop to the destination. • sent to PFE—Route has been sent to the Packet Forwarding Engine. • static—Static route. | extensive |
| Next hop | IP address of the next hop to the destination. | detail extensive |

Table 219: show route forwarding-table Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|----------------------------|--|------------------------------|
| Next hop Type (Type) | <p>Next-hop type. When the detail keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> • broadcast (bcst)—Broadcast. • deny—Deny. • discard (dscd)—Discard. • hold—Next hop is waiting to be resolved into a unicast or multicast type. • indexed (idxd)—Indexed next hop. • indirect (indr)—Indirect next hop. • local (locl)—Local address on an interface. • routed multicast (mcrst)—Regular multicast next hop. • multicast (mcst)—Wire multicast next hop (limited to the LAN). • multicast discard (mdsc)—Multicast discard. • multicast group (mgrp)—Multicast group member. • receive (rcv)—Receive. • reject (rjct)—Discard. An ICMP unreachable message was sent. • resolve (rslv)—Resolving the next hop. • unicast (ucst)—Unicast. • unilist (ulst)—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. | detail extensive |
| Index | Software index of the next hop that is used to route the traffic for a given prefix. | detail extensive none |
| Route interface-index | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned. | extensive |
| Reference (NhRef) | Number of routes that refer to this next hop. | detail extensive none |
| Next-hop interface (Netif) | Interface used to reach the next hop. | detail extensive none |
| Weight | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the Balance field description). | extensive |
| Balance | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. | extensive |
| RPF interface | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when rpf-check is configured on the interface. | extensive |

show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 15.95.1.2/30;
    }
  }
}
```

```
user@host> show route forwarding-table extensive
```

```
Routing table: inet [Index 0]
Internet:
...
...
Destination: 15.95.1.3/32
Route type: destination
Route reference: 0                               Route interface-index: 67
```

```

Flags: sent to PFE

| Syntax | show route inactive-path
<brief detail extensive terse>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show route inactive-path
<brief detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path. |
| Options | <p>none—Display all inactive routes.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Required Privilege Level | view |
| List of Sample Output | show route inactive-path on page 2539
show route inactive-path detail on page 2540
show route inactive-path extensive on page 2541
show route inactive-path terse on page 2541 |
| Output Fields | For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command. |

Sample Output

show route inactive-path

```

user@host> show route inactive-path

inet.0: 25 destinations, 26 routes (24 active, 0 holddown, 1 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

10.12.100.12/30      [OSPF/10] 03:57:28, metric 1
> via so-0/3/0.0

private1__inet.0: 2 destinations, 3 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

127.0.0.1/32 (1 entry, 0 announced)
    Direct Preference: 0
    Next hop type: Interface
```

```

Next-hop reference count: 1
Next hop: via lo0.0, selected
State: <Hidden Martian Int>
Age: 4:51
Task: IF
AS path: I00:04:54
> via lo0.0

```

show route inactive-prefix extensive

The output for the **show route inactive-prefix extensive** command is identical to that of the **show route inactive-path detail** command. For sample output, see [show route inactive-prefix detail on page 2542](#).

show route inactive-prefix terse

```
user@host> show route inactive-prefix terse
```

```
inet.0: 18 destinations, 18 routes (17 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both
```

| A | Destination | P | Prf | Metric 1 | Metric 2 | Next hop | AS path |
|---|--------------|---|-----|----------|----------|----------|---------|
| | 127.0.0.1/32 | D | 0 | | | >lo0.0 | |

show route instance

| | |
|---|---|
| Syntax | <code>show route instance</code>
<code><brief detail summary></code>
<code><instance-name></code>
<code><logical-system (all <i>logical-system-name</i>)></code>
<code><operational></code> |
| Syntax (EX Series Switches and QFX Series) | <code>show route instance</code>
<code><brief detail summary></code>
<code><instance-name></code>
<code><operational></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Display routing instance information. |
| Options | <p>none—(Same as brief) Display standard information about all routing instances.</p> <p>brief detail summary—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief. (These options are not available with the operational keyword.)</p> <p>instance-name—(Optional) Display information for all routing instances whose name begins with this string (for example, cust1, cust11, and cust111 are all displayed when you run the show route instance cust1 command).</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>operational—(Optional) Display operational routing instances.</p> |
| Required Privilege Level | view |

| Output Fields | Table 116 on page 1375 lists the output fields for the show route instance command. Output fields are listed in the approximate order in which they appear. |

Table 220: show route instance Output Fields

| Field Name | Field Description | Level of Output |
|----------------------------------|--|----------------------------------|
| Instance or <i>instance-name</i> | Name of the routing instance. | All levels |
| Operational Routing Instances | (operational keyword only) Names of all operational routing instances. | — |
| Type | Type of routing instance: forwarding , l2vpn , no-forwarding , vpls , virtual-router , or vrf . | All levels |
| State | State of the routing instance: active or inactive . | brief detail none |
| Interfaces | Name of interfaces belonging to this routing instance. | brief detail none |
| Restart State | Status of graceful restart for this instance: Pending or Complete . | detail |
| Path selection timeout | Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is 300 . | detail |
| Tables | Tables (and number of routes) associated with this routing instance. | brief detail none |
| Route-distinguisher | Unique route distinguisher associated with this routing instance. | detail |
| Vrf-import | VPN routing and forwarding instance import policy name. | detail |
| Vrf-export | VPN routing and forwarding instance export policy name. | detail |
| Vrf-import-target | VPN routing and forwarding instance import target community name. | detail |
| Vrf-export-target | VPN routing and forwarding instance export target community name. | detail |
| Fast-reroute-priority | Fast reroute priority setting for a VPLS routing instance: high , medium , or low . The default is low . | detail |
| Restart State | Restart state: <ul style="list-style-type: none"> Pending;protocol-name—List of protocols that have not yet completed graceful restart for this routing table. Complete—All protocols have restarted for this routing table. | detail |
| Primary rib | Primary table for this routing instance. | brief none summary |
| Active/holddown/hidden | Number of active, hold-down, and hidden routes. | All levels |

show route label

| | |
|------------------------------------|--|
| Syntax | <code>show route label <i>label</i></code>
<brief detail extensive terse>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | <code>show route label <i>label</i></code>
<brief detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches. |
| Description | Display the routes based on a specified Multiprotocol Label Switching (MPLS) label value. |
| Options | <p><i>label</i>—Value of the MPLS label.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Required Privilege Level | view |
| List of Sample Output | show route label on page 2551
show route label detail on page 2551
show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 2552
show route label extensive on page 2552
show route label terse on page 2552 |
| Output Fields | For information about output fields, see the output field table for the show route command, the show route detail command, the show route extensive command, or the show route terse command. |

Sample Output

show route label

```

user@host> show route label 100016

mpls.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
100016          * [VPN/170] 03:25:41
                  > to 10.12.80.1 via ge-6/3/2.0, Pop

```

show route label detail

```

user@host> show route label 100016 detail

show route range

| | |
|------------------------------------|---|
| Syntax | <code>show route range</code>
<code><brief detail extensive terse></code>
<code><destination-prefix></code>
<code><logical-system (all <i>logical-system-name</i>)></code> |
| Syntax (EX Series Switches) | <code>show route range</code>
<code><brief detail extensive terse></code>
<code><destination-prefix></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display routing table entries using a prefix range. |
| Options | none —Display standard information about all routing table entries using a prefix range.

brief detail extensive terse —(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief .

destination-prefix —(Optional) Destination and prefix mask for the range.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level | view |
| List of Sample Output | show route range on page 2578
show route range destination-prefix on page 2579
show route range detail on page 2579
show route range extensive on page 2580
show route range terse on page 2581 |
| Output Fields | For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command. |

Sample Output

show route range

```
user@host> show route range

inet.0: 11 destinations, 11 routes (10 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

<brief detail extensive terse>
<logical-system (all <i>logical-system-name</i>)> | |
| Syntax (EX Series Switches) | show route receive-protocol <i>protocol neighbor-address</i>
<brief detail extensive terse> | |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. | |
| Description | Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol. | |
| Options | brief detail extensive terse —(Optional) Display the specified level of output.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.

<i>protocol neighbor-address</i> —Protocol transmitting the route (bgp , dvmrp , msdp , pim , rip , or ripng) and address of the neighboring router from which the route entry was received. | |
| Additional Information | The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes. | |
| Required Privilege Level | view | |
| List of Sample Output | show route receive-protocol bgp on page 2585
show route receive-protocol bgp extensive on page 2585
show route receive-protocol bgp table extensive on page 2585
show route receive-protocol bgp logical-system extensive on page 2586

show route receive-protocol bgp detail (Layer 3 VPN) on page 2588
show route receive-protocol bgp extensive (Layer 3 VPN) on page 2589 | |
| Output Fields | Table 222 on page 2582 describes the output fields for the show route receive-protocol command. Output fields are listed in the approximate order in which they appear. | |

Table 222: show route receive-protocol Output Fields

| Field Name | Field Description | Level of Output |
|----------------------------|---|-----------------|
| <i>routing-table-name</i> | Name of the routing table—for example, inet.0. | All levels |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. | All levels |

Table 222: show route receive-protocol Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---|--|-------------------------|
| <i>number routes</i> | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> • active • holddown (routes that are in pending state before being declared inactive) • hidden (routes that are not used because of a routing policy) | All levels |
| Prefix | Destination prefix. | none brief |
| MED | Multiple exit discriminator value included in the route. | none brief |
| <i>destination-prefix</i>
(entry, announced) | Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. | detail extensive |
| Route Distinguisher | 64-bit prefix added to IP subnets to make them unique. | detail extensive |
| Label-Base, range | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device. | detail extensive |
| VPN Label | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel. | detail extensive |
| Next hop | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route. | All levels |
| Localpref or Lclpref | Local preference value included in the route. | All levels |

Table 222: show route receive-protocol Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|---------------------|--|------------------|
| AS path | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893. • []—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels |
| Cluster list | (For route reflected output only) Cluster ID sent by the route reflector. | detail extensive |
| Originator ID | (For route reflected output only) Address of routing device that originally sent the route to the route reflector. | detail extensive |
| Communities | Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field. | detail extensive |
| AIGP | Accumulated interior gateway protocol (AIGP) BGP attribute. | detail extensive |
| Attrset AS | Number, local preference, and path of the AS that originated the route. These values are stored in the Attrset attribute at the originating routing device. | detail extensive |
| Layer2-info: encaps | Layer 2 encapsulation (for example, VPLS). | detail extensive |
| control flags | Control flags: none or Site Down . | detail extensive |
| mtu | Maximum transmission unit (MTU) of the Layer 2 circuit. | detail extensive |

show route resolution

| | |
|------------------------------------|---|
| Syntax | <code>show route resolution</code>
<code><brief detail extensive summary></code>
<code><index <i>index</i>></code>
<code><logical-system (all <i>logical-system-name</i>)></code>
<code><prefix></code>
<code><table <i>routing-table-name</i>></code>
<code><unresolved></code> |
| Syntax (EX Series Switches) | <code>show route resolution</code>
<code><brief detail extensive summary></code>
<code><index <i>index</i>></code>
<code><prefix></code>
<code><table <i>routing-table-name</i>></code>
<code><unresolved></code> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table. |
| Options | none —Display standard information about all entries in the next-hop resolution database.

brief detail extensive summary —(Optional) Display the specified level of output.

index <i>index</i> —(Optional) Show the index of the resolution tree.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix <i>network/destination-prefix</i> —(Optional) Display database entries for the specified address.

table <i>routing-table-name</i> —(Optional) Display information about a particular routing table (for example, inet.0) where policy-based export is currently enabled.

unresolved —(Optional) Display routes that could not be resolved. |

show route resolution summary on page 2592
show route resolution unresolved on page 2592 |

Output Fields Table 223 on page 2591 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

Table 223: show route resolution Output Fields

| Field Name | Field Description |
|------------------------------------|---|
| <i>routing-table-name</i> | Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database. |
| Tree index | Tree index identifier. |
| Nodes | Number of nodes in the tree. |
| Reference count | Number of references made to the next hop. |
| Contributing routing tables | Routing tables used for next-hop resolution. |
| Originating RIB | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3 , this field indicates which routing table, inet.0 or inet.3 , provided the best path for a particular prefix. |
| Metric | Metric associated with the forwarding next hop. |
| Node path count | Number of nodes in the path. |
| Forwarding next hops | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. |

Sample Output

show route resolution detail

```

user@host> show route resolution detail
Tree Index: 1, Nodes 0, Reference Count 1

show route source-gateway

| | |
|------------------------------------|---|
| Syntax | show route source-gateway <i>address</i>
<brief detail extensive terse>
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show route source-gateway <i>address</i>
<brief detail extensive terse> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display the entries in the routing table that were learned from a particular address. The Source field in the show route detail command output lists the source for each route, if known. |
| Options | brief detail extensive terse —(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief .

address —IP address of the system.

logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level | view |
| List of Sample Output | show route source-gateway on page 2601
show route source-gateway detail on page 2602
show route source-gateway extensive on page 2604 |
| Output Fields | For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command. |

Sample Output

show route source-gateway

```

show route summary

| | |
|------------------------------------|--|
| Syntax | show route summary
<logical-system (all <i>logical-system-name</i>)>
<table <i>routing-table-name</i> > |
| Syntax (EX Series Switches) | show route summary |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | <p>Display summary statistics about the entries in the routing table.</p> <p>CPU utilization might increase while the device learns routes. We recommend that you use the show route summary command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the show route summary command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).</p> |
| Options | <p>none—Display summary statistics about the entries in the routing table.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>table <i>routing-table-name</i>—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route summary table inet command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.</p> |
| Required Privilege Level | view |
| List of Sample Output | show route summary on page 2608
show route summary table on page 2609
show route summary table (with Route Limits Configured for the Routing Table) on page 2609 |
| Output Fields | Table 224 on page 2607 lists the output fields for the show route summary command. Output fields are listed in the approximate order in which they appear. |

Table 224: show route summary Output Fields

| Field Name | Field Description |
|----------------------------------|--|
| Router ID | Address of the local routing device. |
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). |

Table 224: show route summary Output Fields (*continued*)

| Field Name | Field Description |
|------------------------|---|
| destinations | Number of destinations for which there are routes in the routing table. |
| routes | Number of routes in the routing table: <ul style="list-style-type: none"> • active—Number of routes that are active. • holddown—Number of routes that are in the hold-down state before being declared inactive. • hidden—Number of routes that are not used because of routing policy. |
| Limit/Threshold | Displays the configured route limits for the routing table set with the maximum-prefixes and the maximum-paths statements. If you do not configure route limits for the routing table, the show output does not display this information. <ul style="list-style-type: none"> • destinations—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message. • routes—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message. |
| Direct | Routes on the directly connected network. |
| Local | Local routes. |
| protocol-name | Name of the protocol from which the route was learned. For example, OSPF, RSVP, and Static. |

Sample Output

show route summary

```

user@host> show route summary
Autonomous system number: 69
Router ID: 10.255.71.52
Maximum-ECMP: 32
inet.0: 24 destinations, 25 routes (23 active, 0 holddown, 1 hidden)
Restart Complete
      Direct:      6 routes,      5 active
      Local:       4 routes,      4 active
      OSPF:        5 routes,      4 active
      Static:      7 routes,      7 active
      IGMP:        1 routes,      1 active
      PIM:         2 routes,      2 active

inet.3: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
Restart Complete
      RSVP:        2 routes,      2 active

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
Restart Complete
      Direct:      1 routes,      1 active

```

```

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
      MPLS:      3 routes,      3 active
      VPLS:      4 routes,      2 active

inet6.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
Restart Complete
      Direct:     2 routes,      2 active
      PIM:        2 routes,      2 active
      MLD:        1 routes,      1 active

green.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
      BGP:        2 routes,      2 active
      L2VPN:      2 routes,      2 active

red.l2vpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Restart Complete
      BGP:        2 routes,      2 active
      L2VPN:      1 routes,      1 active

bgp.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
      BGP:        4 routes,      4 active

```

show route summary table

```

user@host> show route summary table inet
Router ID: 192.168.0.1

inet.0: 32 destinations, 34 routes (31 active, 0 holddown, 1 hidden)

|---|---|
| Syntax | show route terse
<logical-system (all <i>logical-system-name</i>)> |
| Syntax (EX Series Switches) | show route terse |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches. |
| Description | Display a high-level summary of the routes in the routing table. |
| <div>  <p>NOTE: For BGP routes, the show route terse command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.</p> <p>To display the metric1 and metric2 value of a BGP route, use the show route extensive command.</p> </div> | |
| Options | <p>none—Display a high-level summary of the routes in the routing table.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Required Privilege Level | view |
| List of Sample Output | show route terse on page 2626 |
| Output Fields | Table 225 on page 2624 describes the output fields for the show route terse command. Output fields are listed in the approximate order in which they appear. |

Table 225: show route terse Output Fields

| Field Name | Field Description |
|----------------------------|---|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |
| <i>number routes</i> | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> active (routes that are active) holddown (routes that are in the pending state before being declared inactive) hidden (routes that are not used because of a routing policy) |

Table 225: show route terse Output Fields (*continued*)

| Field Name | Field Description |
|------------------|--|
| <i>route key</i> | Key for the state of the route: <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. |
| A | Active route. An asterisk (*) indicates this is the active route. |
| V | Validation status of the route: <ul style="list-style-type: none"> • ?—Not evaluated. Indicates that the route was not learned through BGP. • I—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • N—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database. • V—Valid. Indicates that the prefix and autonomous system pair are found in the database. |
| Destination | Destination of the route. |
| P | Protocol through which the route was learned: <ul style="list-style-type: none"> • A—Aggregate • B—BGP • C—CCC • D—Direct • G—GMPLS • I—IS-IS • L—L2CKT, L2VPN, LDP, Local • K—Kernel • M—MPLS, MSDP • O—OSPF • P—PIM • R—RIP, RIPng • S—Static • T—Tunnel |
| Prf | Preference value of the route. In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value. |
| Metric 1 | First metric value in the route. For routes learned from BGP, this is the MED metric. |
| Metric 2 | Second metric value in the route. For routes learned from BGP, this is the IGP metric. |

Table 225: show route terse Output Fields (*continued*)

| Field Name | Field Description |
|------------|--|
| Next hop | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route. |
| AS path | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> I—IGP. E—EGP. ?—Incomplete; typically, the AS path was aggregated. |

Sample Output

Troubleshooting Virtual Routing Instances

- [Direct Routes Not Leaked Between Routing Instances on page 2627](#)

Direct Routes Not Leaked Between Routing Instances

Problem Direct routes are not exported (leaked) between virtual routing instances. For example, consider the following scenario:

- QFX switch with two virtual routing instances:
 - Routing instance 1 connects to downstream device through interface xe-0/0/1.
 - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the QFX switch connects to the upstream device over a direct route and these routes are not leaked between instances.

NOTE: You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the QFX switch over indirect routes.

Solution This is expected behavior.

Understanding BGP

BGP is an exterior gateway protocol (EGP) that is used to exchange routing information among routers in different autonomous systems (ASs). BGP routing information includes the complete route to each destination. BGP uses the routing information to maintain a database of network reachability information, which it exchanges with other BGP systems. BGP uses the network reachability information to construct a graph of AS connectivity, which enables BGP to remove routing loops and enforce policy decisions at the AS level.

Multiprotocol BGP (MBGP) extensions enable BGP to support IP version 6 (IPv6). MBGP defines the attributes MP_REACH_NLRI and MP_UNREACH_NLRI, which are used to carry IPv6 reachability information. Network layer reachability information (NLRI) update messages carry IPv6 address prefixes of feasible routes.

BGP allows for policy-based routing. You can use routing policies to choose among multiple paths to a destination and to control the redistribution of routing information.

BGP uses TCP as its transport protocol, using port 179 for establishing connections. Running over a reliable transport protocol eliminates the need for BGP to implement update fragmentation, retransmission, acknowledgment, and sequencing.

The Junos OS routing protocol software supports BGP version 4. This version of BGP adds support for Classless Interdomain Routing (CIDR), which eliminates the concept of network classes. Instead of assuming which bits of an address represent the network by looking at the first octet, CIDR allows you to explicitly specify the number of bits in the network address, thus providing a means to decrease the size of the routing tables. BGP version 4 also supports aggregation of routes, including the aggregation of AS paths.

This section discusses the following topics:

- [Autonomous Systems on page 2632](#)
- [AS Paths and Attributes on page 2632](#)
- [External and Internal BGP on page 2633](#)
- [Multiple Instances of BGP on page 2633](#)

Autonomous Systems

An *autonomous system* (AS) is a set of routers that are under a single technical administration and normally use a single interior gateway protocol and a common set of metrics to propagate routing information within the set of routers. To other ASs, an AS appears to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it.

AS Paths and Attributes

The routing information that BGP systems exchange includes the complete route to each destination, as well as additional information about the route. The route to each destination is called the *AS path*, and the additional route information is included in *path attributes*. BGP uses the AS path and the path attributes to completely determine the network topology. Once BGP understands the topology, it can detect and eliminate

routing loops and select among groups of routes to enforce administrative preferences and routing policy decisions.

External and Internal BGP

BGP supports two types of exchanges of routing information: exchanges among different ASs and exchanges within a single AS. When used among ASs, BGP is called *external BGP* (EBGP) and BGP sessions perform *inter-AS routing*. When used within an AS, BGP is called *internal BGP* (IBGP) and BGP sessions perform *intra-AS routing*.

Figure 36 on page 2633 illustrates ASs, IBGP, and EBGP.

Figure 36: ASs, EBGP, and IBGP

A BGP system shares network reachability information with adjacent BGP systems, which are referred to as *neighbors* or *peers*.

BGP systems are arranged into *groups*. In an IBGP group, all peers in the group—called *internal peers*—are in the same AS. Internal peers can be anywhere in the local AS and do not have to be directly connected to one another. Internal groups use routes from an IGP to resolve forwarding addresses. They also propagate external routes among all other internal routers running IBGP, computing the next hop by taking the BGP next hop received with the route and resolving it using information from one of the interior gateway protocols.

In an EBGP group, the peers in the group—called *external peers*—are in different ASs and normally share a subnet. In an external group, the next hop is computed with respect to the interface that is shared between the external peer and the local router.

Multiple Instances of BGP

You can configure multiple instances of BGP at the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

Multiple instances of BGP are primarily used for Layer 3 VPN support.

IGP peers and external BGP (EBGP) peers (both nonmultihop and multihop) are all supported for routing instances. BGP peering is established over one of the interfaces configured under the **routing-instances** hierarchy.

NOTE: When a BGP neighbor sends BGP messages to the local routing device, the incoming interface on which these messages are received must be configured in the same routing instance that the BGP neighbor configuration exists in. This is true for neighbors that are a single hop away or multiple hops away.

Routes learned from the BGP peer are added to the **instance-name.inet.0** table by default. You can configure import and export policies to control the flow of information into and out of the instance routing table.

For Layer 3 VPN support, configure BGP on the provider edge (PE) router to receive routes from the customer edge (CE) router and to send the instances' routes to the CE router if necessary. You can use multiple instances of BGP to maintain separate per-site forwarding tables for keeping VPN traffic separate on the PE router.

You can configure import and export policies that allow the service provider to control and rate-limit traffic to and from the customer.

You can configure an EBGP multihop session for a VRF routing instance. Also, you can set up the EBGP peer between the PE and CE routers by using the loopback address of the CE router instead of the interface addresses.

BGP Routes Overview

A BGP route is a destination, described as an IP address prefix, and information that describes the path to the destination.

The following information describes the path:

- AS path, which is a list of numbers of the ASs that a route passes through to reach the local router. The first number in the path is that of the last AS in the path—the AS closest to the local router. The last number in the path is the AS farthest from the local router, which is generally the origin of the path.
- Path attributes, which contain additional information about the AS path that is used in routing policy.

BGP peers advertise routes to each other in update messages.

BGP stores its routes in the Junos OS routing table (**inet.0**). The routing table stores the following information about BGP routes:

- Routing information learned from update messages received from peers

- Local routing information that BGP applies to routes because of local policies
- Information that BGP advertises to BGP peers in update messages

For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

The BGP router that first advertises a route assigns it one of the following values to identify its origin. During route selection, the lowest origin value is preferred.

- **0**—The router originally learned the route through an IGP (OSPF, IS-IS, or a static route).
- **1**—The router originally learned the route through an EGP (most likely BGP).
- **2**—The route's origin is unknown.

- [Example: Advertising Multiple Paths in BGP on page 2876](#)

BGP Messages Overview

All BGP messages have the same fixed-size header, which contains a marker field that is used for both synchronization and authentication, a length field that indicates the length of the packet, and a type field that indicates the message type (for example, open, update, notification, keepalive, and so on).

This section discusses the following topics:

- [Open Messages on page 2635](#)
- [Update Messages on page 2636](#)
- [Keepalive Messages on page 2636](#)
- [Notification Messages on page 2636](#)

Open Messages

After a TCP connection is established between two BGP systems, they exchange BGP open messages to create a BGP connection between them. Once the connection is established, the two systems can exchange BGP messages and data traffic.

Open messages consist of the BGP header plus the following fields:

- **Version**—The current BGP version number is 4.
- **Local AS number**—You configure this by including the **autonomous-system** statement at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level.
- **Hold time**—Proposed hold-time value. You configure the local hold time with the BGP **hold-time** statement.
- **BGP identifier**—IP address of the BGP system. This address is determined when the system starts and is the same for every local interface and every BGP peer. You can

configure the BGP identifier by including the **router-id** statement at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level. By default, BGP uses the IP address of the first interface it finds in the router.

- Parameter field length and the parameter itself—These are optional fields.

Update Messages

BGP systems send update messages to exchange network reachability information. BGP systems use this information to construct a graph that describes the relationships among all known ASs.

Update messages consist of the BGP header plus the following optional fields:

- Unfeasible routes length—Length of the withdrawn routes field
- Withdrawn routes—IP address prefixes for the routes being withdrawn from service because they are no longer deemed reachable
- Total path attribute length—Length of the path attributes field; it lists the path attributes for a feasible route to a destination
- Path attributes—Properties of the routes, including the path origin, the multiple exit discriminator (MED), the originating system's preference for the route, and information about aggregation, communities, confederations, and route reflection
- Network layer reachability information (NLRI)—IP address prefixes of feasible routes being advertised in the update message

Keepalive Messages

BGP systems exchange keepalive messages to determine whether a link or host has failed or is no longer available. Keepalive messages are exchanged often enough so that the hold timer does not expire. These messages consist only of the BGP header.

Notification Messages

BGP systems send notification messages when an error condition is detected. After the message is sent, the BGP session and the TCP connection between the BGP systems are closed. Notification messages consist of the BGP header plus the error code and subcode, and data that describes the error.

Understanding the Advertisement of Multiple Paths to a Single Destination in BGP

BGP peers advertise routes to each other in update messages. BGP stores its routes in the Junos OS routing table (**inet.0**). For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

Instead of advertising only the active path to a destination, you can configure BGP to advertise multiple paths to the destination. Within an autonomous system (AS), the availability of multiple exit points to reach a destination provides the following benefits:

- **Fault tolerance**—Path diversity leads to reduction in restoration time after failure. For instance, a border after receiving multiple paths to the same destination can precompute a backup path and have it ready so that when the primary path becomes invalid, the border routing device can use the backup to quickly restore connectivity. Without a backup path, the restoration time depends on BGP reconvergence, which includes withdraw and advertisement messages in the network before a new best path can be learned.
- **Load balancing**—The availability of multiple paths to reach the same destination enables load balancing of traffic, if the routing within the AS meets certain constraints.
- **Maintenance**—The availability of alternate exit points allows for graceful maintenance operation of routers.

The following limitations apply to advertising multiple routes in BGP:

- Address families supported:
 - IPv4 unicast (**family inet unicast**)
 - IPv6 unicast (**family inet6 unicast**)
 - IPv4 labeled unicast (**family inet labeled-unicast**)
 - IPv6 labeled unicast (**family inet6 labeled-unicast**)
- Internal BGP (IBGP) peers only. No support on external BGP (EBGP) peers.
- Master instance only. No support for routing instances.
- Graceful restart supported, but not nonstop active routing (NSR).
- No BGP Monitoring Protocol (BMP) support.
- No support for EBGP sessions between confederations.
- Prefix policies enable you to filter routes on a router that is configured to advertise multiple paths to a destination. Prefix policies can only match prefixes. They cannot match route attributes, and they cannot change the attributes of routes.

- [Example: Configuring External BGP Point-to-Point Peer Sessions on page 2640](#)
- [Example: Configuring External BGP on Logical Systems with IPv6 Interfaces on page 2647](#)

Understanding External BGP Peering Sessions

To establish point-to-point connections between peer autonomous systems (ASs), you configure a BGP session on each interface of a point-to-point link. Generally, such sessions are made at network exit points with neighboring hosts outside the AS.

[Figure 37 on page 2640](#) shows an example of a BGP peering session.

Figure 37: BGP Peering Session

In [Figure 37 on page 2640](#), Router A is a gateway router for AS 3, and Router B is a gateway router for AS 10. For traffic internal to either AS, an interior gateway protocol (IGP) is used (OSPF, for instance). To route traffic between peer ASs, a BGP session is used.

You arrange BGP routing devices into groups of peers. Different peer groups can have different group types, AS numbers, and route reflector cluster identifiers.

To define a BGP group that recognizes only the specified BGP systems as peers, statically configure all the system's peers by including one or more **neighbor** statements. The peer neighbor's address can be either an IPv6 or IPv4 address.

As the number of external BGP (EBGP) groups increases, the ability to support a large number of BGP sessions might become a scaling issue. The preferred way to configure a large number of BGP neighbors is to configure a few groups consisting of multiple neighbors per group. Supporting fewer EBGP groups generally scales better than supporting a large number of EBGP groups. This becomes more evident in the case of hundreds of EBGP groups when compared with a few EBGP groups with multiple peers in each group.

After the BGP peers are established, BGP routes are not automatically advertised by the BGP peers. At each BGP-enabled device, policy configuration is required to export the local, static, or IGP-learned routes into the BGP RIB and then advertise them as BGP routes to the other peers. BGP's advertisement policy, by default, does not advertise any non-BGP routes (such as local routes) to peers.

Example: Configuring External BGP Point-to-Point Peer Sessions

This example shows how to configure BGP point-to-point peer sessions.

- [Verification on page 2643](#)

Requirements

Before you begin, if the default BGP policy is not adequate for your network, configure routing policies to filter incoming BGP routes and to advertise BGP routes.

Overview

Figure 38 on page 2641 shows a network with BGP peer sessions. In the sample network, Device E in AS 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22 and have IP addresses 10.10.10.2, 10.10.10.6, and 10.10.10.10. Peer D resides in AS 79, at IP address 10.21.7.2. This example shows the configuration on Device E.

Figure 38: Typical Network with BGP Peer Sessions

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/2/0 unit 0 description to-A
set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
set interfaces ge-0/0/1 unit 5 description to-B
set interfaces ge-0/0/1 unit 5 family inet address 10.10.10.5/30
set interfaces ge-0/1/0 unit 9 description to-C
set interfaces ge-0/1/0 unit 9 family inet address 10.10.10.9/30
set interfaces ge-1/2/1 unit 21 description to-D
set interfaces ge-1/2/1 unit 21 family inet address 10.21.7.1/30
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 22
set protocols bgp group external-peers neighbor 10.10.10.2
set protocols bgp group external-peers neighbor 10.10.10.6
set protocols bgp group external-peers neighbor 10.10.10.10
set protocols bgp group external-peers neighbor 10.21.7.2 peer-as 79
set routing-options autonomous-system 17
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Configure the interfaces to Peers A, B, C, and D.

```
[edit interfaces]
user@E# set ge-1/2/0 unit 0 description to-A
user@E# set ge-1/2/0 unit 0 family inet address 10.10.10.1/30
user@E# set ge-0/0/1 unit 5 description to-B
user@E# set ge-0/0/1 unit 5 family inet address 10.10.10.5/30
user@E# set ge-0/1/0 unit 9 description to-C
user@E# set ge-0/1/0 unit 9 family inet address 10.10.10.9/30
user@E# set ge-1/2/1 unit 21 description to-D
user@E# set ge-1/2/1 unit 21 family inet address 10.21.7.1/30
```

2. Set the autonomous system (AS) number.

```
[edit routing-options]
user@E# set autonomous-system 17
```

3. Create the BGP group, and add the external neighbor addresses.

```
[edit protocols bgp group external-peers]
user@E# set neighbor 10.10.10.2
user@E# set neighbor 10.10.10.6
user@E# set neighbor 10.10.10.10
```

4. Specify the autonomous system (AS) number of the external AS.

```
[edit protocols bgp group external-peers]
user@E# set peer-as 22
```

5. Add Peer D, and set the AS number at the individual neighbor level.

The neighbor configuration overrides the group configuration. So, while **peer-as 22** is set for all the other neighbors in the group, **peer-as 79** is set for neighbor 10.21.7.2.

```
[edit protocols bgp group external-peers]
user@E# set neighbor 10.21.7.2 peer-as 79
```

6. Set the peer type to external BGP (EBGP).

```
[edit protocols bgp group external-peers]
user@E# set type external
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@E# show interfaces
ge-1/2/0 {
  unit 0 {
    description to-A;
    family inet {
      address 10.10.10.1/30;
```

```

    }
  }
}
ge-0/0/1 {
  unit 5 {
    description to-B;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
ge-0/1/0 {
  unit 9 {
    description to-C;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
ge-1/2/1 {
  unit 21 {
    description to-D;
    family inet {
      address 10.21.7.1/30;
    }
  }
}

[edit]
user@E# show protocols
bgp {
  group external-peers {
    type external;
    peer-as 22;
    neighbor 10.10.10.2;
    neighbor 10.10.10.6;
    neighbor 10.10.10.10;
    neighbor 10.21.7.2 {
      peer-as 79;
    }
  }
}

[edit]
user@E# show routing-options
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 2644](#)

Example: Configuring External BGP on Logical Systems with IPv6 Interfaces

This example shows how to configure external BGP (EBGP) point-to-point peer sessions on logical systems with IPv6 interfaces.

- [Requirements on page 2647](#)
- [Overview on page 2647](#)
- [Configuration on page 2648](#)
- [Verification on page 2657](#)

Requirements

In this example, no special configuration beyond device initialization is required.

Overview

Junos OS supports EBGP peer sessions by means of IPv6 addresses. An IPv6 peer session can be configured when an IPv6 address is specified in the **neighbor** statement. This example uses EUI-64 to generate IPv6 addresses that are automatically applied to the interfaces. An EUI-64 address is an IPv6 address that uses the IEEE EUI-64 format for the interface identifier portion of the address (the last 64 bits).

NOTE: Alternatively, you can configure EBGP sessions using manually assigned 128-bit IPv6 addresses.

If you use 128-bit link-local addresses for the interfaces, you must include the **local-interface** statement. This statement is valid only for 128-bit IPv6 link-local addresses and is mandatory for configuring an IPv6 EBGP link-local peer session.

Configuring EBGP peering using link-local addresses is only applicable for directly connected interfaces. There is no support for multihop peering.

After your interfaces are up, you can use the **show interfaces terse** command to view the EUI-64-generated IPv6 addresses on the interfaces. You must use these generated

addresses in the BGP **neighbor** statements. This example demonstrates the full end-to-end procedure.

In this example, Frame Relay interface encapsulation is applied to the logical tunnel (lt) interfaces. This is a requirement because only Frame Relay encapsulation is supported when IPv6 addresses are configured on the lt interfaces.

Figure 39 on page 2648 shows a network with BGP peer sessions. In the sample network, Router R1 has five logical systems configured. Device E in autonomous system (AS) 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22. This example shows the step-by-step configuration on Logical System A and Logical System E.

Figure 39: Typical Network with BGP Peer Sessions

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device A

```
set logical-systems A interfaces lt-0/1/0 unit 1 description to-E
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation frame-relay
set logical-systems A interfaces lt-0/1/0 unit 1 dlci 1
```

```

set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 25
set logical-systems A interfaces lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64
  eui-64
set logical-systems A interfaces lo0 unit 1 family inet6 address 2001:db8::1/128
set logical-systems A protocols bgp group external-peers type external
set logical-systems A protocols bgp group external-peers peer-as 17
set logical-systems A protocols bgp group external-peers neighbor
  2001:db8:0:1:2a0:a502:0:19da
set logical-systems A routing-options router-id 1.1.1.1
set logical-systems A routing-options autonomous-system 22

```

Device B

```

set logical-systems B interfaces lt-0/1/0 unit 6 description to-E
set logical-systems B interfaces lt-0/1/0 unit 6 encapsulation frame-relay
set logical-systems B interfaces lt-0/1/0 unit 6 dlci 6
set logical-systems B interfaces lt-0/1/0 unit 6 peer-unit 5
set logical-systems B interfaces lt-0/1/0 unit 6 family inet6 address 2001:db8:0:2::/64
  eui-64
set logical-systems B interfaces lo0 unit 2 family inet6 address 2001:db8::2/128
set logical-systems B protocols bgp group external-peers type external
set logical-systems B protocols bgp group external-peers peer-as 17
set logical-systems B protocols bgp group external-peers neighbor
  2001:db8:0:2:2a0:a502:0:5da
set logical-systems B routing-options router-id 2.2.2.2
set logical-systems B routing-options autonomous-system 22

```

Device C

```

set logical-systems C interfaces lt-0/1/0 unit 10 description to-E
set logical-systems C interfaces lt-0/1/0 unit 10 encapsulation frame-relay
set logical-systems C interfaces lt-0/1/0 unit 10 dlci 10
set logical-systems C interfaces lt-0/1/0 unit 10 peer-unit 9
set logical-systems C interfaces lt-0/1/0 unit 10 family inet6 address 2001:db8:0:3::/64
  eui-64
set logical-systems C interfaces lo0 unit 3 family inet6 address 2001:db8::3/128
set logical-systems C protocols bgp group external-peers type external
set logical-systems C protocols bgp group external-peers peer-as 17
set logical-systems C protocols bgp group external-peers neighbor
  2001:db8:0:3:2a0:a502:0:9da
set logical-systems C routing-options router-id 3.3.3.3
set logical-systems C routing-options autonomous-system 22

```

Device D

```

set logical-systems D interfaces lt-0/1/0 unit 7 description to-E
set logical-systems D interfaces lt-0/1/0 unit 7 encapsulation frame-relay
set logical-systems D interfaces lt-0/1/0 unit 7 dlci 7
set logical-systems D interfaces lt-0/1/0 unit 7 peer-unit 21
set logical-systems D interfaces lt-0/1/0 unit 7 family inet6 address 2001:db8:0:4::/64
  eui-64
set logical-systems D interfaces lo0 unit 4 family inet6 address 2001:db8::4/128
set logical-systems D protocols bgp group external-peers type external
set logical-systems D protocols bgp group external-peers peer-as 17
set logical-systems D protocols bgp group external-peers neighbor
  2001:db8:0:4:2a0:a502:0:15da
set logical-systems D routing-options router-id 4.4.4.4
set logical-systems D routing-options autonomous-system 79

```

Device E

```

set logical-systems E interfaces lt-0/1/0 unit 5 description to-B
set logical-systems E interfaces lt-0/1/0 unit 5 encapsulation frame-relay

```

```

set logical-systems E interfaces lt-0/1/0 unit 5 dlci 6

set logical-systems E interfaces lt-0/1/0 unit 25 encapsulation frame-relay
set logical-systems E interfaces lt-0/1/0 unit 25 dlci 1
set logical-systems E interfaces lt-0/1/0 unit 25 peer-unit 1
set logical-systems E interfaces lt-0/1/0 unit 25 family inet6 address 2001:db8:0:1::/64
    eui-64
set logical-systems E interfaces lo0 unit 5 family inet6 address 2001:db8::5/128
set logical-systems E protocols bgp group external-peers type external
set logical-systems E protocols bgp group external-peers peer-as 22
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:1:2a0:a502:0:1da
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:2:2a0:a502:0:6da
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:3:2a0:a502:0:ada
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:4:2a0:a502:0:7da peer-as 79
set logical-systems E routing-options router-id 5.5.5.5
set logical-systems E routing-options autonomous-system 17

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Run the **show interfaces terse** command to verify that the physical router has a logical tunnel (lt) interface.

```

user@R1> show interfaces terse
Interface           Admin Link Proto  Local           Remote
...
lt-0/1/0             up    up
...

```

2. On Logical System A, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System E.

```

user@R1> set cli logical-system A
Logical system: A
[edit]

```

```

user@R1:A> edit
Entering configuration mode
[edit]
user@R1:A# edit interfaces
[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 encapsulation frame-relay
user@R1:A# set lt-0/1/0 unit 1 dlci 1
user@R1:A# set lt-0/1/0 unit 1 peer-unit 25

```

3. On Logical System A, configure the network address for the link to Peer E, and configure a loopback interface.

```

[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 description to-E
user@R1:A# set lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:A# set lo0 unit 1 family inet6 address 2001:db8::1/128

```

4. On Logical System E, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System A.

```

user@R1> set cli logical-system E
Logical system: E
[edit]
user@R1:E> edit
Entering configuration mode
[edit]
user@R1:E# edit interfaces
[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 encapsulation frame-relay
user@R1:E# set lt-0/1/0 unit 25 dlci 1
user@R1:E# set lt-0/1/0 unit 25 peer-unit 1

```

5. On Logical System E, configure the network address for the link to Peer A, and configure a loopback interface.

```

[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 description to-A
user@R1:E# set lt-0/1/0 unit 25 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:E# set lo0 unit 5 family inet6 address 2001:db8::5/128

```

6. Run the **show interfaces terse** command to see the IPv6 addresses that are generated by EUI-64.

The 2001 addresses are used in this example in the BGP **neighbor** statements.

NOTE: The fe80 addresses are link-local addresses and are not used in this example.

```

user@R1:A> show interfaces terse
Interface          Admin Link Proto  Local              Remote
Logical system: A

betsy@tp8:A> show interfaces terse
Interface          Admin Link Proto  Local              Remote
lt-0/1/0
lt-0/1/0.1         up    up    inet6    2001:db8:0:1:2a0:a502:0:1da/64

```

```

fe80::2a0:a502:0:1da/64
lo0
lo0.1                up    up    inet6  2001:db8::1
                    fe80::2a0:a50f:fc56:1da

user@R1:E> show interfaces terse
Interface           Admin Link Proto  Local              Remote
lt-0/1/0
lt-0/1/0.25         up    up    inet6  2001:db8:0:1:2a0:a502:0:19da/64

fe80::2a0:a502:0:19da/64
lo0
lo0.5                up    up    inet6  2001:db8::5
                    fe80::2a0:a50f:fc56:1da

```

7. Repeat the interface configuration on the other logical systems.

Configuring the External BGP Sessions

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. On Logical System A, create the BGP group, and add the external neighbor address.

```
[edit protocols bgp group external-peers]
user@R1:A# set neighbor 2001:db8:0:1:2a0:a502:0:19da
```
2. On Logical System E, create the BGP group, and add the external neighbor address.

```
[edit protocols bgp group external-peers]
user@R1:E# set neighbor 2001:db8:0:1:2a0:a502:0:1da
```
3. On Logical System A, specify the autonomous system (AS) number of the external AS.

```
[edit protocols bgp group external-peers]
user@R1:A# set peer-as 17
```
4. On Logical System E, specify the autonomous system (AS) number of the external AS.

```
[edit protocols bgp group external-peers]
user@R1:E# set peer-as 22
```
5. On Logical System A, set the peer type to EBGP.

```
[edit protocols bgp group external-peers]
user@R1:A# set type external
```
6. On Logical System E, set the peer type to EBGP.

```
[edit protocols bgp group external-peers]
user@R1:E# set type external
```
7. On Logical System A, set the autonomous system (AS) number and router ID.

```
[edit routing-options]
user@R1:A# set router-id 1.1.1.1
user@R1:A# set autonomous-system 22
```

8. On Logical System E, set the AS number and router ID.

```
[edit routing-options]
user@R1:E# set router-id 5.5.5.5
user@R1:E# set autonomous-system 17
```

9. Repeat these steps for Peers A, B, C, and D.

Results From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show logical-systems

}

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 2657](#)
- [Verifying BGP Groups on page 2660](#)
- [Verifying BGP Summary Information on page 2660](#)
- [Checking the Routing Table on page 2660](#)

Verifying BGP Neighbors

Purpose Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

Action From operational mode, run the **show bgp neighbor** command.

```

user@R1:E> show bgp neighbor
Peer: 2001:db8:0:1:2a0:a502:0:1da+54987 AS 22 Local:

```

Meaning IPv6 unicast network layer reachability information (NLRI) is being exchanged between the neighbors.

Verifying BGP Groups

Purpose Verify that the BGP groups are configured correctly.

Action From operational mode, run the **show bgp group** command.

```
user@R1:~> show bgp group
Group Type: External                               Local AS: 17
  Name: external-peers  Index: 0                   Flags: <>
  Holdtime: 0
  Total peers: 4      Established: 4
  2001:db8:0:1:2a0:a502:0:1da+54987
  2001:db8:0:2:2a0:a502:0:6da+179
  2001:db8:0:3:2a0:a502:0:ada+55983
  2001:db8:0:4:2a0:a502:0:7da+49255
  inet6.0: 0/0/0/0

Groups: 1  Peers: 4   External: 4   Internal: 0   Down peers: 0   Flaps: 0
Table      Tot Paths  Act Paths  Suppressed  History  Damp State  Pending
inet6.0           0         0           0         0         0         0
inet6.2           0         0           0         0         0         0
```

Meaning The group type is external, and the group has four peers.

Verifying BGP Summary Information

Purpose Verify that the BGP that the peer relationships are established.

Action From operational mode, run the **show bgp summary** command.

```
user@R1:~> show bgp summary
Groups: 1 Peers: 4 Down peers: 0
Table      Tot Paths  Act Paths  Suppressed  History  Damp State  Pending

Meaning The Down peers: 0 output shows that the BGP peers are in the established state.

Checking the Routing Table

Purpose Verify that the inet6.0 routing table is populated with local and direct routes.

Action From operational mode, run the **show route** command.

```

user@R1:E> show route
inet6.0: 15 destinations, 18 routes (15 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

2001:db8::5/128    *[Direct/0] 12:41:18
                  > via lo0.5

Understanding Internal BGP Peering Sessions

When two BGP-enabled devices are in the same autonomous system (AS), the BGP session is called an *internal* BGP session, or IBGP session. BGP uses the same message types on IBGP and external BGP (EBGP) sessions, but the rules for when to send each message and how to interpret each message differ slightly. For this reason, some people refer to IBGP and EBGP as two separate protocols.

Figure 40: Internal and External BGP

In [Figure 40 on page 2662](#), Device Jackson, Device Memphis, and Device Biloxi have IBGP peer sessions with each other. Likewise, Device Miami and Device Atlanta have IBGP peer sessions between each other.

The purpose of IBGP is to provide a means by which EBGP route advertisements can be forwarded throughout the network. In theory, to accomplish this task you could redistribute all of your EBGP routes into an interior gateway protocol (IGP), such as OSPF or IS-IS. This, however, is not recommended in a production environment because of the large number of EBGP routes in the Internet and because of the way that IGPs operate. In short, with that many routes the IGP churns or crashes.

Generally, the loopback interface (lo0) is used to establish connections between IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.

While IBGP neighbors do not need to be directly connected, they do need to be fully meshed. In this case, fully meshed means that each device is logically connected to every

other device through neighbor peer relationships. The **neighbor** statement creates the mesh. Because of the full mesh requirement of IBGP, you must configure individual peering sessions between all IBGP devices in the AS. The full mesh need not be physical links. Rather, the configuration on each routing device must create a full mesh of peer sessions (using multiple **neighbor** statements).

NOTE: The requirement for a full mesh is waived if you configure a confederation or route reflection.

To understand the full-mesh requirement, consider that an IBGP-learned route cannot be readvertised to another IBGP peer. The reason for preventing the readvertisement of IBGP routes and requiring the full mesh is to avoid routing loops within an AS. The AS path attribute is the means by which BGP routing devices avoid loops. The path information is examined for the local AS number only when the route is received from an EBGP peer. Because the attribute is only modified across AS boundaries, this system works well. However, the fact that the attribute is only modified across AS boundaries presents an issue inside the AS. For example, suppose that routing devices A, B, and C are all in the same AS. Device A receives a route from an EBGP peer and sends the route to Device B, which installs it as the active route. The route is then sent to Device C, which installs it locally and sends it back to Device A. If Device A installs the route, a loop is formed within the AS. The routing devices are not able to detect the loop because the AS path attribute is not modified during these advertisements. Therefore, the BGP protocol designers decided that the only assurance of never forming a routing loop was to prevent an IBGP peer from advertising an IBGP-learned route within the AS. For route reachability, the IBGP peers are fully meshed.

IBGP supports multihop connections, so IBGP neighbors can be located anywhere within the AS and often do not share a link. A recursive route lookup resolves the loopback peering address to an IP forwarding next hop. The lookup service is provided by static routes or an IGP, such as OSPF.

Example: Configuring Internal BGP Peer Sessions

This example shows how to configure internal BGP peer sessions.

- [Requirements on page 2663](#)
- [Overview on page 2663](#)
- [Configuration on page 2665](#)
- [Verification on page 2672](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

In this example, you configure internal BGP (IBGP) peer sessions. The loopback interface (lo0) is used to establish connections between IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address,

the IBGP peer session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peer session also goes up and down. Thus, if the device has link redundancy, the loopback interface provides fault tolerance in case the physical interface or one of the links goes down.

When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The **local-address** statement enables you to specify the source information in BGP update messages. If you omit the **local-address** statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally results in the egress interface address being the expected source of update messages. When this happens, the peer session is not established because a mismatch exists between the expected source address (the egress interface of the peer) and the actual source (the loopback interface of the peer). To make sure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

Because IBGP supports multihop connections, IBGP neighbors can be located anywhere within the autonomous system (AS) and often do not share a link. A recursive route lookup resolves the loopback peer address to an IP forwarding next hop. In this example, this service is provided by OSPF. Although interior gateway protocol (IGP) neighbors do not need to be directly connected, they do need to be fully meshed. In this case, fully meshed means that each device is logically connected to every other device through neighbor peer relationships. The **neighbor** statement creates the mesh.

NOTE: The requirement for a full mesh is waived if you configure a confederation or route reflection.

After the BGP peers are established, BGP routes are not automatically advertised by the BGP peers. At each BGP-enabled device, policy configuration is required to export the local, static, or IGP-learned routes into the BGP routing information base (RIB) and then advertise them as BGP routes to the other peers. BGP's advertisement policy, by default, does not advertise any non-BGP routes (such as local routes) to peers.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

Figure 41 on page 2665 shows a typical network with internal peer sessions.

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device A

```

set interfaces ge-0/1/0 unit 1 description to-B
set interfaces ge-0/1/0 unit 1 family inet address 10.10.10.1/30
set interfaces lo0 unit 1 family inet address 192.168.6.5/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to B and C"
set protocols bgp group internal-peers local-address 192.168.6.5
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.163.6.4
set protocols bgp group internal-peers neighbor 192.168.40.4
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.1
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.168.6.5
set routing-options autonomous-system 17

```

Device B

```

set interfaces ge-0/1/0 unit 2 description to-A
set interfaces ge-0/1/0 unit 2 family inet address 10.10.10.2/30
set interfaces ge-0/1/1 unit 5 description to-C
set interfaces ge-0/1/1 unit 5 family inet address 10.10.10.5/30
set interfaces lo0 unit 2 family inet address 192.163.6.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to A and C"
set protocols bgp group internal-peers local-address 192.163.6.4
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.168.40.4
set protocols bgp group internal-peers neighbor 192.168.6.5

```

```
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.2
set protocols ospf area 0.0.0.0 interface ge-0/1/1.5
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.163.6.4
set routing-options autonomous-system 17
```

Device C

```
set interfaces ge-0/1/0 unit 6 description to-B
set interfaces ge-0/1/0 unit 6 family inet address 10.10.10.6/30
set interfaces lo0 unit 3 family inet address 192.168.40.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to A and B"
set protocols bgp group internal-peers local-address 192.168.40.4
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.163.6.4
set protocols bgp group internal-peers neighbor 192.168.6.5
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.6
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.168.40.4
set routing-options autonomous-system 17
```

Configuring Device A

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 1]
user@A# set description to-B
user@A# set family inet address 10.10.10.1/30
```

```
[edit interfaces]
user@A# set lo0 unit 1 family inet address 192.168.6.5/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@A# set type internal
user@A# set description "connections to B and C"
user@A# set local-address 192.168.6.5
user@A# set export send-direct
user@A# set neighbor 192.163.6.4
user@A# set neighbor 192.168.40.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```

user@A# set interface lo0.1 passive
user@A# set interface ge-0/1/0.1

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 2]
user@A# set from protocol direct
user@A# set then accept

```

5. Configure the router ID and the AS number.

```

[edit routing-options]
user@A# set router-id 192.168.6.5
user@A# set autonomous-system 17

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@A# show interfaces
ge-0/1/0 {
  unit 1 {
    description to-B;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@A# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@A# show protocols
bgp {
  group internal-peers {
    type internal;
    description "connections to B and C";
    local-address 192.168.6.5;
    export send-direct;
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
  }
}

```

```
}  
}  
ospf {  
  area 0.0.0.0 {  
    interface lo0.1 {  
      passive;  
    }  
    interface ge-0/1/0.1;  
  }  
}  
  
user@A# show routing-options  
router-id 192.168.6.5;  
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device B

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure internal BGP peer sessions on Device B:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 2]  
user@B# set description to-A  
user@B# set family inet address 10.10.10.2/30
```

```
[edit interfaces ge-0/1/1]  
user@B# set unit 5 description to-C  
user@B# set unit 5 family inet address 10.10.10.5/30
```

```
[edit interfaces]  
user@B# set lo0 unit 2 family inet address 192.163.6.4/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]  
user@B# set type internal  
user@B# set description "connections to A and C"  
user@B# set local-address 192.163.6.4  
user@B# set export send-direct  
user@B# set neighbor 192.168.40.4  
user@B# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]  
user@B# set interface lo0.2 passive  
user@B# set interface ge-0/1/0.2  
user@B# set interface ge-0/1/1.5
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@B# set from protocol direct
user@B# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@B# set router-id 192.163.6.4
user@B# set autonomous-system 17
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
ge-0/1/0 {
  unit 2 {
    description to-A;
    family inet {
      address 10.10.10.2/30;
    }
  }
}
ge-0/1/1 {
  unit 5 {
    description to-C;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.163.6.4/32;
    }
  }
}

user@B# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@B# show protocols
bgp {
  group internal-peers {
    type internal;
```

```
        description "connections to A and C";
        local-address 192.163.6.4;
        export send-direct;
        neighbor 192.168.40.4;
        neighbor 192.168.6.5;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.2 {
            passive;
        }
        interface ge-0/1/0.2;
        interface ge-0/1/1.5;
    }
}
```

```
user@B# show routing-options
router-id 192.163.6.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device C

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device C:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 6]
user@C# set description to-B
user@C# set family inet address 10.10.10.6/30

[edit interfaces]
user@C# set lo0 unit 3 family inet address 192.168.40.4/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@C# set type internal
user@C# set description "connections to A and B"
user@C# set local-address 192.168.40.4
user@C# set export send-direct
user@C# set neighbor 192.163.6.4
user@C# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@C# set interface lo0.3 passive
user@C# set interface ge-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@C# set from protocol direct
user@C# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@C# set router-id 192.168.40.4
user@C# set autonomous-system 17
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@C# show interfaces
ge-0/1/0 {
  unit 6 {
    description to-B;
    family inet {
      address 10.10.10.6/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.40.4/32;
    }
  }
}

user@C# show policy-options
policy-statement send-direct {
  term 2 {

Verifying BGP Summary Information

Purpose Verify that the BGP configuration is correct.

Action From operational mode, enter the **show bgp summary** command.

```
user@A> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 5 0 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.163.6.4 17 2441 2432 0 0 18:18:52
0/3/3/0 0/0/0/0
192.168.40.4 17 2432 2430 0 0 18:18:48
0/2/2/0 0/0/0/0
```

Verifying That BGP Routes Are Installed in the Routing Table

Purpose Verify that the export policy configuration is causing the BGP routes to be installed in the routing tables of the peers.

Action From operational mode, enter the **show route protocol bgp** command.

```
user@A> show route protocol bgp
inet.0: 7 destinations, 12 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.0/30 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
10.10.10.4/30 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1

AS path: I
> to 10.10.10.2 via ge-0/1/0.1
192.168.40.4/32 [BGP/170] 07:07:12, localpref 100, from 192.168.40.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
```

Example: Configuring Internal BGP Peering Sessions on Logical Systems

This example shows how to configure internal BGP peer sessions on logical systems.

- [Requirements on page 2675](#)
- [Overview on page 2675](#)

- [Configuration on page 2675](#)
- [Verification on page 2682](#)

Requirements

In this example, no special configuration beyond device initialization is required.

Overview

In this example, you configure internal BGP (IBGP) peering sessions.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

[Figure 42 on page 2675](#) shows a typical network with internal peer sessions.

Figure 42: Typical Network with IBGP Sessions

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems A interfaces lt-0/1/0 unit 1 description to-B
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation ethernet
set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 2
set logical-systems A interfaces lt-0/1/0 unit 1 family inet address 10.10.10.1/30
set logical-systems A interfaces lo0 unit 1 family inet address 192.168.6.5/32
set logical-systems A protocols bgp group internal-peers type internal
set logical-systems A protocols bgp group internal-peers local-address 192.168.6.5
set logical-systems A protocols bgp group internal-peers export send-direct
set logical-systems A protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems A protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems A protocols ospf area 0.0.0.0 interface lo0.1 passive
set logical-systems A protocols ospf area 0.0.0.0 interface lt-0/1/0.1
set logical-systems A policy-options policy-statement send-direct term 2 from protocol
  direct
set logical-systems A policy-options policy-statement send-direct term 2 then accept
set logical-systems A routing-options router-id 192.168.6.5
```

```
set logical-systems A routing-options autonomous-system 17
set logical-systems B interfaces lt-0/1/0 unit 2 description to-A

set logical-systems B routing-options autonomous-system 17
set logical-systems C interfaces lt-0/1/0 unit 6 description to-B
set logical-systems C interfaces lt-0/1/0 unit 6 encapsulation ethernet
set logical-systems C interfaces lt-0/1/0 unit 6 peer-unit 5
set logical-systems C interfaces lt-0/1/0 unit 6 family inet address 10.10.10.6/30
set logical-systems C interfaces lo0 unit 3 family inet address 192.168.40.4/32
set logical-systems C protocols bgp group internal-peers type internal
set logical-systems C protocols bgp group internal-peers local-address 192.168.40.4
set logical-systems C protocols bgp group internal-peers export send-direct
set logical-systems C protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems C protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems C protocols ospf area 0.0.0.0 interface lo0.3 passive
set logical-systems C protocols ospf area 0.0.0.0 interface lt-0/1/0.6
set logical-systems C policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems C policy-options policy-statement send-direct term 2 then accept
set logical-systems C routing-options router-id 192.168.40.4
set logical-systems C routing-options autonomous-system 17
```

Device A

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.

```
[edit logical-systems A interfaces lt-0/1/0 unit 1]
user@R1# set description to-B
user@R1# set encapsulation ethernet
user@R1# set peer-unit 2
user@R1# set family inet address 10.10.10.1/30
```

```

user@R1# set family inet address 192.168.6.5/32
user@R1# up
user@R1# up
[edit logical-systems A interfaces]
user@R1# set lo0 unit 1 family inet address 192.168.6.5/32
user@R1# exit
[edit]
user@R1# edit logical-systems B interfaces lt-0/1/0
[edit logical-systems B interfaces lt-0/1/0]
user@R1# set unit 2 description to-A
user@R1# set unit 2 encapsulation ethernet
user@R1# set unit 2 peer-unit 1
user@R1# set unit 2 family inet address 10.10.10.2/30
user@R1# set unit 5 description to-C
user@R1# set unit 5 encapsulation ethernet
user@R1# set unit 5 peer-unit 6
user@R1# set family inet address 10.10.10.5/30
user@R1# up
[edit logical-systems B interfaces]
user@R1# set lo0 unit 2 family inet address 192.163.6.4/32
user@R1# exit
[edit]
user@R1# edit logical-systems C interfaces lt-0/1/0 unit 6
[edit logical-systems C interfaces lt-0/1/0 unit 6]
set description to-B
set encapsulation ethernet
set peer-unit 5
set family inet address 10.10.10.6/30
user@R1# up
user@R1# up
[edit logical-systems C interfaces]
set lo0 unit 3 family inet address 192.168.40.4/32

```

2. Configure BGP.

On Logical System A, the **neighbor** statements are included for both Device B and Device C, even though Logical System A is not directly connected to Device C.

```

[edit logical-systems A protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.6.5
user@R1# set export send-direct
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.40.4

```

```

[edit logical-systems B protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.163.6.4
user@R1# set export send-direct
user@R1# set neighbor 192.168.40.4
user@R1# set neighbor 192.168.6.5

```

```

[edit logical-systems C protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.40.4
user@R1# set export send-direct

```

```
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface lt-0/1/0.1
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.2 passive
user@R1# set interface lt-0/1/0.2
user@R1# set interface lt-0/1/0.5
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.3 passive
user@R1# set interface lt-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit logical-systems A policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems B policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems C policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit logical-systems A routing-options]
user@R1# set router-id 192.168.6.5
user@R1# set autonomous-system 17
```

```
[edit logical-systems B routing-options]
user@R1# set router-id 192.163.6.4
user@R1# set autonomous-system 17
```

```
[edit logical-systems C routing-options]
user@R1# set router-id 192.168.40.4
user@R1# set autonomous-system 17
```

Results From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show logical-systems
A {
```

```

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 2682](#)
- [Verifying BGP Groups on page 2683](#)
- [Verifying BGP Summary Information on page 2683](#)
- [Verifying That BGP Routes Are Installed in the Routing Table on page 2684](#)

Verifying BGP Neighbors

Purpose Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

Action From the operational mode, enter the **show bgp neighbor** command.

```
user@R1> show bgp neighbor logical-system A

Configuring BGP Monitoring Protocol Version 3

BGP Monitoring Protocol (BMP) allows the Junos OS to send the BGP route information from the router to a monitoring application on a separate device. The monitoring application is called the BMP monitoring station or BMP station. To deploy BMP in your network, you need to configure BMP on each router and you also need to configure at least one BMP station. This procedure describes how to configure BMP on a router.

You can specify these settings for all BMP stations by configuring the statements described here at the **[edit routing-options bmp]** hierarchy level. You can also configure settings for specific BMP stations by configuring these statements at the **[edit routing-options bmp station station-name]** hierarchy level.

The following procedure describes how to configure BMP version 3 on the router:

1. Specify the name or address for the BMP monitoring station by configuring the **station-address** statement. You can specify one or the other but not both. The address must be a valid IPv4 or IPv6 address.

```
station-address (station-address | station-name);
```

2. Specify the authentication algorithm used to encrypt authentication between the BMP-enabled router and the BMP station using the **authentication-algorithm** statement.

```
authentication-algorithm algorithm;
```

You can specify one of the following types of authentication algorithms:

- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
- **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
- **md5**—Message digest 5.

3. Specify an MD5 authentication key (password) using the **authentication-key** statement.

```
authentication-key key;
```

4. Specify the authentication key chain using the **authentication-key-chain** statement.

```
authentication-key-chain key-chain;
```

The authentication key chain itself needs to be configured at the **[edit security authentication-key-chains key-chain]** hierarchy level. For a detailed example, see [“Example: Configuring Route Authentication for BGP” on page 2953](#).

5. Specify how to handle a BMP station flap by configuring the **hold-down** statement. A flap is when the TCP session unexpectedly switches from established to non-established. The BMP station can be prevented from attempting to reconnect to the device for a specified period of time.

```
hold-down {
  seconds;
  flaps number;
  period seconds;
}
```

You can specify the following options for the **hold-down** statement:

- **seconds**—Specify the time in seconds to wait before allowing the BMP station to reconnect to the device.
 - **flaps number**—Specify the number of BMP station flaps allowed before terminating the connection to the BMP station and triggering the hold down timer.
 - **period seconds**—Specify the time in seconds between BMP station flaps before terminating the connection to the BMP station and triggering the hold down timer.
6. (Optional) Specify an initiation message to be sent to the BMP station using the **initiation-message** statement. This statement allows you to provide some information to the BMP station system administrator (for example, a contact phone number).

initiation-message *text*;

7. Specify the connection mode for the connection between the BMP-enabled router and the BMP station using the **connection-mode** statement. The connection mode can be **active** or **passive**:
- **active**—BMP initiates the connection to the BMP station. If you configure active mode, you must also configure a station port using the **station-port** statement. However, you must not configure a local port (active mode).
 - **passive**—BMP does not initiate a connection the BMP station. However, it does listen for a connection request from active BMP stations and will connect if a station is available. If you configure passive mode, you must not configure a station port. However, you must configure a local port using the **local-port** statement (passive mode).

connection-mode (active | passive);

8. Specify the port number for the BMP monitoring station by configuring the **station-port** statement. See also **connection-mode**.

station-port *port*;

9. Specify the listening port for the BMP station connection using the **local-port** statement. See also **connection-mode**.

If you change the local port, the BMP station connection flaps when you commit the configuration.

local-port

10. (Optional) Specify the IPv4 or IPv6 address for the BMP connection on the device using the **local-address** statement. For both active and passive connections, configure a loopback local address. This provides a consistent local endpoint, is useful for debugging, and assures greater reliability for the BMP connection since it is not tied to a single router interface.

For passive mode, specifying a local address is required. It also provides some security against a malicious BMP connection. For active mode, we also recommend configuring a local address to help ensure reliability.

If you change the local address, the BMP station connection flaps when you commit the configuration.

local-address *address*;

11. BMP monitoring is enabled by default. You can explicitly enable BMP monitoring or disable it. You can also selectively enable or disable BMP monitoring at various hierarchy levels (for example, `[edit protocols bgp group group-name]` or `[edit protocols bgp group group-name neighbor address]`). If you disable BMP monitoring, withdrawal messages are sent for any previously advertised routes. These are followed by a down message. If you enable BMP monitoring, an up message is sent first and then the route advertisements follow.

`monitor` (enable | disable);

12. Specify the dispatch priority for BMP by configuring the **priority** statement. The dispatch priority controls the frequency with which the device is able to forward BMP messages to BMP stations. You can configure the dispatch priority as either **high**, **medium**, or **low**.

`priority` (high | medium | low);

13. Specify whether BMP should send pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none at all. The pre-policy can be configured to exclude routes that are non-feasible for the decision process (for example, a route loop) by including the **non-feasible** option for the **pre-policy** statement. This represents the view of the BGP routes before running the import policy.

The post-policy can be configured to exclude routes that are not eligible for the decision process (for example, protocol nexthop not resolved) by including the **exclude-non-eligible** option for the **post-policy** statement. This represents the view of the BGP routes after running the import policy. If the import policy has rejected the BGP route, the route does not exist in the post policy view.

You can explicitly disable route monitoring by specifying the **none** option for the **route-monitoring** statement. This is the default behavior.

```
route-monitoring {
  none;
  post-policy {
    exclude-non-eligible;
  }
  pre-policy {
    exclude-non-feasible;
  }
}
```

14. Configure how often statistics messages are sent to the BMP monitoring station by specifying the number of seconds between message transmissions using **statistics-timeout** statement. If you configure a value of 0, no statistics messages are sent.

`statistics-timeout` *seconds*;

Example: Configuring BGP Local Preference

- [Understanding the BGP Local Preference on page 2688](#)
- [Example: Configuring the Local Preference Value for BGP Routes on page 2688](#)

Understanding the BGP Local Preference

Internal BGP (IBGP) sessions use a metric called the *local preference*, which is carried in IBGP update packets in the path attribute LOCAL_PREF. When an autonomous system (AS) has multiple routes to another AS, the local preference indicates the degree of preference for one route over the other routes. The route with the highest local preference value is preferred.

The LOCAL_PREF path attribute is always advertised to IBGP peers and to neighboring confederations. It is never advertised to external BGP (EBGP) peers. The default behavior is to not modify the LOCAL_PREF path attribute if it is present.

The LOCAL_PREF path attribute applies at export time only, when the routes are exported from the routing table into BGP.

If a BGP route is received without a LOCAL_PREF attribute, the route is stored in the routing table and advertised by BGP as if it were received with a LOCAL_PREF value of 100. A non-BGP route that is advertised by BGP is advertised with a LOCAL_PREF value of 100 by default.

Example: Configuring the Local Preference Value for BGP Routes

This example shows how to configure local preference in internal BGP (IBGP) peer sessions.

- [Requirements on page 2688](#)
- [Overview on page 2688](#)
- [Configuration on page 2689](#)
- [Verification on page 2699](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

To change the local preference metric advertised in the path attribute, you must include the **local-preference** statement, specifying a value from 0 through 4,294,967,295 ($2^{32} - 1$).

There are several reasons you might want to prefer one path over another. For example, compared to other paths, one path might be less expensive to use, might have higher bandwidth, or might be more stable.

Figure 43 on page 2689 shows a typical network with internal peer sessions and multiple exit points to a neighboring AS.

Figure 43: Typical Network with IBGP Sessions and Multiple Exit Points

To reach Device R4, Device R1 can take a path through either Device R2 or Device R3. By default, the local preference is 100 for either route. When the local preferences are equal, Junos OS has rules for breaking the tie and choosing a path. (See [“Understanding BGP Path Selection” on page 2827](#).) In this example, the active route is through Device R2 because the router ID of Device R2 is lower than the router ID of Device R3. The following example shows how to override the default behavior with an explicit setting for the local preference. The example configures a local preference of 300 on Device R3, thereby making Device R3 the preferred path to reach Device R4.

Configuration

set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 34.34.34.4
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.5
set protocols ospf area 0.0.0.0 interface fe-1/2/1.6
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.3.1
```

Device R4

```
set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
```

```

set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3
set protocols bgp group external neighbor 24.24.24.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1

```

Configuring Device R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24

[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24

[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32

```
2. Configure BGP.

```

[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1

```
3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2

```
4. Configure a policy that accepts direct routes.

NOTE: Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct

```

```
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R1# set autonomous-system 123
```

```
user@R1# set router-id 192.168.1.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
```

```
fe-1/2/0 {
```

```
  unit 1 {
```

```
    family inet {
```

```
      address 12.12.12.1/24;
```

```
    }
```

```
  }
```

```
}
```

```
fe-1/2/1 {
```

```
  unit 2 {
```

```
    family inet {
```

```
      address 13.13.13.1/24;
```

```
    }
```

```
  }
```

```
}
```

```
lo0 {
```

```
  unit 1 {
```

```
    family inet {
```

```
      address 192.168.1.1/32;
```

```
    }
```

```
  }
```

```
}
```

```
user@R1# show policy-options
```

```
policy-statement send-direct {
```

```
  term 1 {
```

```
    from protocol direct;
```

```
    then accept;
```

```
  }
```

```
}
```

```
user@R1# show protocols
```

```
bgp {
```

```
  group internal {
```

```
    type internal;
```

```
    local-address 192.168.1.1;
```

```
    export send-direct;
```

```
    neighbor 192.168.2.1;
```

```
    neighbor 192.168.3.1;
```

```
  }
```

```
}
```

```
ospf {
```

```
  area 0.0.0.0 {
```

```

interface lo0.1 {
    passive;
}
interface fe-1/2/0.1;
interface fe-1/2/1.2;
}
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24

[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24

[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32

```
2. Configure BGP.

```

[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1

[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4

```
3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4

```
4. Configure a policy that accepts direct routes.

NOTE: Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
  }
}
```

```

    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R3

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

[edit interfaces fe-1/2/1 unit 6]
user@R3# set family inet address 34.34.34.3/24

[edit interfaces lo0 unit 3]
user@R3# set family inet address 192.168.3.1/32

```
2. Configure BGP.

```

[edit protocols bgp group internal]
user@R3# set type internal
user@R3# set local-address 192.168.3.1
user@R3# set export send-direct
user@R3# set neighbor 192.168.1.1
user@R3# set neighbor 192.168.2.1

```

```
[edit protocols bgp group external]
user@R3# set type external
user@R3# set export send-direct
user@R3# set peer-as 4
user@R3# set neighbor 34.34.34.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0.3 passive
user@R3# set interface fe-1/2/0.5
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

NOTE: Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R3# set from protocol direct
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 123
user@R3# set router-id 192.168.3.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}
```

```

}

user@R3# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R3# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 34.34.34.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.3 {
      passive;
    }
    interface fe-1/2/0.5;
    interface fe-1/2/1.6;
  }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R4

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

```

```
[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
```

2. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
user@R4# set export send-direct
user@R4# set peer-as 123
user@R4# set neighbor 34.34.34.3
user@R4# set neighbor 24.24.24.2
```

3. Configure a policy that accepts direct routes.

NOTE: Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept
```

4. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
    }
  }
}
```

```

user@R4# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 34.34.34.3;
    neighbor 24.24.24.2;
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the Active Path From Device R1 to Device R4 on page 2699](#)
- [Altering the Local Preference to Change the Path Selection on page 2700](#)
- [Rechecking the Active Path From Device R1 to Device R4 on page 2700](#)

Checking the Active Path From Device R1 to Device R4

Purpose Verify that the active path from Device R1 to Device R4 goes through Device R2.

Action From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 11 destinations, 18 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32     [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1

```

```
192.168.3.1/32      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 00:05:14, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
                  [BGP/170] 00:05:14, localpref 100, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
```

Meaning The asterisk (*) shows that the preferred path is through Device R2. In the default configuration, Device R2 has a lower router ID than Device R3. The router ID is controlling the path selection.

Altering the Local Preference to Change the Path Selection

Purpose Change the path so that it goes through Device R3.

Action From configuration mode, enter the **set local-preference 300** command.

```
[edit protocols bgp group internal]
user@R3# set local-preference 300
user@R3# commit
```

Rechecking the Active Path From Device R1 to Device R4

Purpose Verify that the active path from Device R1 to Device R4 goes through Device R3.

Action From operational mode, enter the **show route protocol bgp** command.

```
user@R1> show route protocol bgp
inet.0: 11 destinations, 17 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 00:00:21, localpref 300, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
```

Meaning The asterisk (*) shows that the preferred path is through Device R3. In the altered configuration, Device R3 has a higher local preference than Device R2. The local preference is controlling the path selection.

Understanding the MED Attribute

The BGP multiple exit discriminator (MED, or MULTI_EXIT_DISC) is a non-transitive attribute, meaning that it is not propagated throughout the Internet, but only to adjacent autonomous systems (ASs). The MED attribute is optional, meaning that it is not always sent with the BGP updates. The purpose of MED is to influence how other ASs enter your AS to reach a certain prefix.

The MED attribute has a value that is referred to as a *metric*. If all other factors in determining an exit point are equal, the exit point with the lowest metric is preferred.

If a MED is received over an external BGP link, it is propagated over internal links to other BGP-enabled devices within the AS.

BGP update messages include a MED metric if the route was learned from BGP and already had a MED metric associated with it, or if you configure the MED metric in the configuration file.

A MED metric is advertised with a route according to the following general rules:

- A more specific metric overrides a less specific metric. That is, a group-specific metric overrides a global BGP metric, and a peer-specific metric overrides a global BGP or group-specific metric.
- A metric defined with a routing policy overrides a metric defined with the **metric-out** statement.
- If any metric is defined, it overrides a metric received in a route.
- If the received route does not have an associated MED metric, and if you do not explicitly configure a metric value, no metric is advertised. When you do not explicitly configure a metric value, the MED value is equivalent to zero (0) when advertising an active route.

Because the AS path rather than the number of hops between hosts is the primary criterion for BGP route selection, an AS with multiple connections to a peer AS can have multiple equivalent AS paths. When the routing table contains two routes to the same host in a neighboring AS, an MED metric assigned to each route can determine which to include in the forwarding table. The MED metric you assign can force traffic through a particular exit point in an AS.

Figure 44 on page 2702 illustrates how MED metrics are used to determine route selection.

Figure 44: Default MED Example

Figure 44 on page 2702 shows AS 1 and AS 2 connected by two separate BGP links to Routers C and D. Host E in AS 1 is located nearer to Router C. Host F, also in AS 1, is located nearer to Router D. Because the AS paths are equivalent, two routes exist for each host, one through Router C and one through Router D. To force all traffic destined for Host E through Router C, the network administrator for AS 1 assigns an MED metric for each router to Host E at its exit point. An MED metric of 10 is assigned to the route to Host E through Router C, and an MED metric of 20 is assigned to the route to Host E through Router D. BGP routers in AS 2 then select the route with the lower MED metric for the forwarding table.

By default, only the MEDs of routes that have the same peer ASs are compared. However, you can configure the routing table path selection options listed in Table 226 on page 2703 to compare MEDs in different ways. The MED options are not mutually exclusive and can be configured in combination or independently. For the MED options to take effect, you must configure them uniformly all through your network. The MED option or options you configure determine the route selected. Thus we recommend that you carefully evaluate your network for preferred routes before configuring the MED options.

Table 226: MED Options for Routing Table Path Selection

| Option (Name) | Function | Use |
|---|--|--|
| Always comparing MEDs
(always-compare-med) | Ensures that the MEDs for paths from peers in different ASs are always compared in the route selection process. | Useful when all enterprises participating in a network agree on a uniform policy for setting MEDs. For example, in a network shared by two ISPs, both must agree that a certain path is the better path to configure the MED values correctly. |
| Adding IGP cost to MED (med-plus-igp) | <p>Before comparing MED values for path selection, adds to the MED the cost of the IGP route to the BGP next-hop destination.</p> <p>This option replaces the MED value for the router, but does not affect the IGP metric comparison. As a result, when multiple routes have the same value after the MED-plus-IGP comparison, and route selection continues, the IGP route metric is also compared, even though it was added to the MED value and compared earlier in the selection process.</p> | Useful when the downstream AS requires the complete cost of a certain route that is received across multiple ASs. |
| Applying Cisco IOS nondeterministic behavior (cisco-non-deterministic) | <p>Specifies the nondeterministic behavior of the Cisco IOS software:</p> <ul style="list-style-type: none"> The active path is always first. All nonactive but eligible paths follow the active path and are maintained in the order in which they were received. Ineligible paths remain at the end of the list. When a new path is added to the routing table, path comparisons are made among all routes, including those paths that must never be selected because they lose the MED tie-breaking rule. | We recommend that you do not configure this option, because the nondeterministic behavior sometimes prevents the system from properly comparing the MEDs between paths. |

Example: Configuring the MED Attribute Directly

This example shows how to configure a multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Requirements on page 2703](#)
- [Overview on page 2704](#)
- [Configuration on page 2705](#)
- [Verification on page 2715](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

To directly configure a MED metric to advertise in BGP update messages, include the **metric-out** statement:

metric-out (*metric* | **minimum-igp** *offset* | **igp** **delay-med-update** | *offset*);

metric is the primary metric on all routes sent to peers. It can be a value in the range from 0 through 4,294,967,295 ($2^{32} - 1$).

The following optional settings are also supported:

- **minimum-igp**—Sets the metric to the minimum metric value calculated in the interior gateway protocol (IGP) to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value.
- **igp**—Sets the metric to the most recent metric value calculated in the IGP to get to the BGP next hop.
- **delay-med-update**—Delays sending MED updates when the MED value increases. Include the **delay-med-update** statement when you configure the **igp** statement. The default interval to delay sending updates, unless the MED is lower or another attribute associated with the route has changed is 10 minutes. Include the **med-igp-update-interval** *minutes* statement at the **[edit routing-options]** hierarchy level to modify the default interval.
- **offset**—Specifies a value for **offset** to increase or decrease the metric that is used from the metric value calculated in the IGP. The metric value is offset by the value specified. The metric calculated in the IGP (by specifying either **igp** or **igp-minimum**) is increased if the **offset** value is positive. The metric calculated in the IGP (by specifying either **igp** or **igp-minimum**) is decreased if the **offset** value is negative.

offset can be a value in the range from -2^{31} through $2^{31} - 1$. Note that the adjusted metric can never go below 0 or above $2^{32} - 1$.

Figure 45 on page 2705 shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 45: Typical Network with IBGP Sessions and Multiple Exit Points

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 and a MED value of 20 to Device R2. This causes all of the devices in AS 123 to prefer the path through Device R2 to reach AS 4.

Configuration

- [Configuring Device R1 on page 2707](#)
- [Configuring Device R2 on page 2709](#)
- [Configuring Device R3 on page 2711](#)
- [Configuring Device R4 on page 2713](#)

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct

```

Configuring Device R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24
```

```
[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24
```

```
[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24
```

```
[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1
```

```
[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
  }
}
```

```

    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R3

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

```

```

[edit interfaces fe-1/2/1 unit 6]
user@R3# set family inet address 34.34.34.3/24

```

```

[edit interfaces lo0 unit 3]
user@R3# set family inet address 192.168.3.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R3# set type internal
user@R3# set local-address 192.168.3.1
user@R3# set export send-direct
user@R3# set neighbor 192.168.1.1
user@R3# set neighbor 192.168.2.1

```

```

[edit protocols bgp group external]
user@R3# set type external
user@R3# set export send-direct
user@R3# set peer-as 4
user@R3# set neighbor 34.34.34.4

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0.3 passive
user@R3# set interface fe-1/2/0.5
user@R3# set interface fe-1/2/1.6

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R3# set from protocol direct
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 123
user@R3# set router-id 192.168.3.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}

user@R3# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R3# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
```

```

        type external;
        export send-direct;
        peer-as 4;
        neighbor 34.34.34.4;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.3 {
            passive;
        }
        interface fe-1/2/0.5;
        interface fe-1/2/1.6;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R4

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

```

```

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

```

```

[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32

```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept

```

3. Configure BGP.

```

[edit protocols bgp group external]
user@R4# set type external

```

```
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure a MED value of 30 for neighbor Device R3, and a MED value of 20 for neighbor Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 metric-out 30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

This configuration causes autonomous system (AS) 123 (of which Device R1, Device R2, and Device R3 are members) to prefer the path through Device R2 to reach AS 4.

5. Configure the router ID and AS number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
      address 44.44.44.44/32;
      address 144.144.144.144/32;
    }
  }
}

user@R4# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```

user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 34.34.34.3 {
      metric-out 30;
    }
    neighbor 24.24.24.2 {
      metric-out 20;
    }
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the Active Path From Device R1 to Device R4 on page 2715](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 2716](#)

Checking the Active Path From Device R1 to Device R4

Purpose Verify that the active path goes through Device R2.

Action From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 01:41:11, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:08:13, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.2.1/32     [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1

```

```

192.168.3.1/32      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                   AS path: I
                   > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 01:41:11, MED 20, localpref 100, from 192.168.2.1
                   AS path: 4 I
                   > to 12.12.12.2 via fe-1/2/0.1

```

Meaning The asterisk (*) shows that the preferred path is through Device R2. The reason for the path selection is listed as MED 20.

Verifying That Device R4 Is Sending Its Routes Correctly

Purpose Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

Action From operational mode, enter the **show route advertising-protocol bgp 24.24.24.2** command.

```

user@R4> show route advertising-protocol bgp 24.24.24.2
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lclpref  AS path
* 24.24.24.0/24         Self                20              I
* 34.34.34.0/24         Self                20              I
* 44.44.44.44/32        Self                20              I
* 144.144.144.144/32    Self                20              I
* 192.168.4.1/32        Self                20              I

```

```

user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lclpref  AS path
* 24.24.24.0/24         Self                30              I
* 34.34.34.0/24         Self                30              I
* 44.44.44.44/32        Self                30              I
* 144.144.144.144/32    Self                30              I

```

Meaning The MED column shows that Device R4 is sending the correct MED values to its two external BGP (EBGP) neighbors.

Example: Configuring the MED Using Route Filters

This example shows how to configure a policy that uses route filters to modify the multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Requirements on page 2716](#)
- [Overview on page 2717](#)
- [Configuration on page 2717](#)
- [Verification on page 2728](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

To configure a route-filter policy that modifies the advertised MED metric in BGP update messages, include the **metric** statement in the policy action.

Figure 46 on page 2717 shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 46: Typical Network with IBGP Sessions and Multiple Exit Points

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 for all routes except 144.144.144.144. For 144.144.144.144, a MED value of 10 is advertised to Device 3. A MED value of 20 is advertised to Device R2, regardless of the route prefix.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2

```

```
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1
```

Device R2

```
set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1

set policy-options policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-options policy-statement med-10 then metric 10
set policy-options policy-statement med-10 then accept
set policy-options policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-options policy-statement med-30 then metric 30
set policy-options policy-statement med-30 then accept
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1

```

Configuring Device R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24

```

```

[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24

```

```

[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept

```

5. Configure the router ID and autonomous system (AS) number.

```

[edit routing-options]

```

```
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```

    }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24

```

```

[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24

```

```

[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1

```

```

[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept

```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
```

```

        interface fe-1/2/1.4;
    }
}

user@R2# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R3

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

```

```

[edit interfaces fe-1/2/1 unit 6]
user@R3# set family inet address 34.34.34.3/24

```

```

[edit interfaces lo0 unit 3]
user@R3# set family inet address 192.168.3.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R3# set type internal
user@R3# set local-address 192.168.3.1
user@R3# set export send-direct
user@R3# set neighbor 192.168.1.1
user@R3# set neighbor 192.168.2.1

```

```

[edit protocols bgp group external]
user@R3# set type external
user@R3# set export send-direct
user@R3# set peer-as 4
user@R3# set neighbor 34.34.34.4

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0.3 passive
user@R3# set interface fe-1/2/0.5

```

```
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
```

```
user@R3# set from protocol direct
```

```
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R3# set autonomous-system 123
```

```
user@R3# set router-id 192.168.3.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
```

```
fe-1/2/0 {  
  unit 5 {  
    family inet {  
      address 13.13.13.3/24;  
    }  
  }  
}  
fe-1/2/1 {  
  unit 6 {  
    family inet {  
      address 34.34.34.3/24;  
    }  
  }  
}  
lo0 {  
  unit 3 {  
    family inet {  
      address 192.168.3.1/32;  
    }  
  }  
}
```

```
user@R3# show protocols
```

```
bgp {  
  group internal {  
    type internal;  
    local-address 192.168.3.1;  
    export send-direct;  
    neighbor 192.168.1.1;  
    neighbor 192.168.2.1;  
  }  
  group external {  
    type external;  
    export send-direct;  
  }  
}
```

```

        peer-as 4;
        neighbor 34.34.34.4;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.3 {
            passive;
        }
        interface fe-1/2/0.5;
        interface fe-1/2/1.6;
    }
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R4

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

```

```

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

```

```

[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32

```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]

```

```
user@R4# set from protocol direct
user@R4# set then accept
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure the two MED policies.

```
[edit policy-options]
set policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-statement med-10 then metric 10
set policy-statement med-10 then accept
```

```
set policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-statement med-30 then metric 30
set policy-statement med-30 then accept
```

5. Configure the two EBGP neighbors, applying the two MED policies to Device R3, and a MED value of 20 to Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 export med-10
user@R4# set neighbor 34.34.34.3 export med-30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

6. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
```

```

    family inet {
        address 192.168.4.1/32;
        address 44.44.44.44/32;
        address 144.144.144.144/32;
    }
}

user@R4# show protocols
bgp {
    group external {
        type external;
        export send-direct;
        peer-as 123;
        neighbor 24.24.24.2 {
            metric-out 20;
        }
        neighbor 34.34.34.3 {
            export [ med-10 med-30 ];
        }
    }
}

user@R4# show policy-options
policy-statement med-10 {
    from {
        route-filter 144.144.144.144/32 exact;
    }
    then {
        metric 10;
        accept;
    }
}
policy-statement med-30 {
    from {
        route-filter 0.0.0.0/0 longer;
    }
    then {
        metric 30;
        accept;
    }
}
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the Active Path from Device R1 to Device R4 on page 2728](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 2728](#)

Checking the Active Path from Device R1 to Device R4

Purpose Verify that the active path goes through Device R2.

Action From operational mode, enter the **show route protocol bgp** command.

```
user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:06:03, MED 10, localpref 100, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2

                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
```

Meaning The output shows that the preferred path to the routes advertised by Device R4 is through Device R2 for all routes except 144.144.144.144/32. For 144.144.144.144/32, the preferred path is through Device R3.

Verifying That Device R4 Is Sending Its Routes Correctly

Purpose Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

Action From operational mode, enter the **show route advertising-protocol bgp** command.

```
user@R4> show route advertising-protocol bgp 24.24.24.2
```

```
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 24.24.24.0/24         Self            20                I
* 34.34.34.0/24         Self            20                I
* 44.44.44.44/32        Self            20                I
* 144.144.144.144/32    Self            20                I
* 192.168.4.1/32        Self            20                I
```

```
user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 24.24.24.0/24         Self            30                I
* 34.34.34.0/24         Self            30                I
* 44.44.44.44/32        Self            30                I
* 144.144.144.144/32    Self            10                I
* 192.168.4.1/32        Self            30                I
```

Meaning The MED column shows that Device R4 is sending the correct MED values to its two EBGp neighbors.

Example: Configuring the MED Using Communities

Set the multiple exit discriminator (MED) metric to 20 for all routes from a particular community.

```
[edit]
routing-options {
  router-id 10.0.0.1;
  autonomous-system 23;
}
policy-options {
  policy-statement from-otago {
    from community otago;
    then metric 20;
  }
  community otago members [56:2379 23:46944];
}
protocols {
  bgp {
    import from-otago;
    group 23 {
      type external;
      peer-as 56;
      neighbor 192.168.0.1 {
        traceoptions {
          file bgp-log-peer;
          flag packets;
        }
        log-updown;
      }
    }
  }
}
```

Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates

This example shows how to associate the multiple exit discriminator (MED) path attribute with the interior gateway protocol (IGP) metric, and configure a timer to delay update of the MED attribute.

- [Requirements on page 2730](#)
- [Overview on page 2730](#)
- [Configuration on page 2732](#)
- [Verification on page 2738](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

BGP can be configured to advertise the MED attribute for a route based on the IGP distance of its internal BGP (IBGP) route next-hop. The IGP metric enables internal routing to follow the shortest path according to the administrative setup. In some deployments, it might be ideal to communicate IGP shortest-path knowledge to external BGP (EBGP) peers in a neighboring autonomous system (AS). This allows those EBGP peers to forward traffic into your AS using the shortest paths possible.

Routes learned from an EBGP peer usually have a next hop on a directly connected interface, and thus the IGP value is equal to zero. Zero is the value advertised. The IGP metric is a nonzero value when a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the **multihop** command. In these scenarios, it might make sense to associate the MED value with the IGP metric by including the **metric-out minimum-igp** or **metric-out igp** option.

The drawback of associating the MED with the IGP metric is the risk of excessive route advertisements when there are IGP instabilities in the network. Configuring a delay for the MED update provides a mechanism to reduce route advertisements in such scenarios. The delay works by slowing down MED updates when the IGP metric for the next hop changes. The approach uses a timer to periodically advertise MED updates. When the timer expires, the MED attribute for routes with **metric-out igp delay-updates** configured is updated to the current IGP metric of the next hop. The BGP-enabled device sends out advertisements for routes for which the MED attribute has changed.

The **delay-updates** option identifies the BGP groups (or peers) for which the MED updates must be suppressed. The time for advertising MED updates is set to 10 minutes by default. You can increase the interval up to 600 minutes by including the **med-igp-update-interval** statement in the **routing-options** configuration.

NOTE: If you have nonstop active routing (NSR) enabled and a switchover occurs, the delayed MED updates might be advertised as soon as the switchover occurs.

When you configure the **metric-out igp** option, the IGP metric directly tracks the IGP cost to the IBGP peer. When the IGP cost goes down, so does the advertised MED value. Conversely, when the IGP cost goes up, the MED value goes up as well.

When you configure the **metric-out minimum-igp** option, the advertised MED value changes only when the IGP cost to the IBGP peer goes down. An increase in the IGP cost does not affect the MED value. The router monitors and remembers the lowest IGP cost until the routing process (rpd) is restarted. The BGP peer sends an update only if the MED is lower than the previously advertised value or another attribute associated with the route has changed, or if the BGP peer is responding to a refresh route request.

This example uses the **metric** statement in the OSPF configuration to demonstrate that when the IGP metric changes, the MED also changes after the configured delay interval. The OSPF metric can range from 1 through 65,535.

[Figure 47 on page 2732](#) shows the sample topology.

Figure 47: Topology for Delaying the MED Update

In this example, the MED value advertised by Device R1 is associated with the IGP running in AS 1. The MED value advertised by Device R1 impacts the decisions of the neighboring AS (AS 2) when AS 2 is forwarding traffic into AS 1.

Configuration

- [Configuring Device R1 on page 2736](#)

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device R1
set interfaces fe-1/2/0 unit 2 description R1->R2
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.1/30

```

Configuring Device R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 2]
user@R1# set description R1->R2
user@R1# set family inet address 10.0.0.1/30
```

```
[edit interfaces fe-1/2/1 unit 7]
user@R1# set description R1->R4
user@R1# set family inet address 172.16.0.1/30
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.0.1/32
```

2. Configure IBGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.0.2
user@R1# set neighbor 192.168.0.3
```

3. Configure EBGP.

```
[edit protocols bgp group external]
user@R1# set type external
user@R1# set export send-direct
user@R1# set peer-as 2
user@R1# set neighbor 172.16.0.2
```

4. Associate the MED value with the IGP metric.

```
[edit protocols bgp group external]
user@R1# set metric-out igp delay-med-update
```

The default for the MED update is 10 minutes when you include the **delay-med-update** option. When you exclude the **delay-med-update** option, the MED update occurs immediately after the IGP metric changes.

5. (Optional) Configure the update interval for the MED update.

```
[edit routing-options]
user@R1# set med-igp-update-interval 12
```

You can configure the interval from 10 minutes through 600 minutes.

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.2 metric 600
user@R1# set interface lo0.1 passive
```

The **metric** statement is used here to demonstrate what happens when the IGP metric changes.

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

8. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 2 {
    description R1->R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 7 {
    description R1->R4;
    family inet {
      address 172.16.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
```

```
bgp {
  group internal {
    type internal;
    local-address 192.168.0.1;
    export send-direct;
    neighbor 192.168.0.2;
    neighbor 192.168.0.3;
  }
  group external {
    type external;
    metric-out igp delay-med-update;
    export send-direct;
    peer-as 2;
    neighbor 172.16.0.2;
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.2 {
      metric 600;
    }
    interface lo0.1 {
      passive;
    }
  }
}
```

```
user@R1# show routing-options
med-igp-update-interval 12;
router-id 192.168.0.1;
autonomous-system 1;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration steps on the other devices in the topology, as needed for your network.

Verification

Confirm that the configuration is working properly.

- [Checking the BGP Advertisements on page 2738](#)
- [Verifying That the MED Value Changes When the OSPF Metric Changes on page 2739](#)
- [Testing the minimum-igp Setting on page 2739](#)

Checking the BGP Advertisements

Purpose Verify that Device R1 is advertising to Device R4 a BGP MED value that reflects the IGP metric.

Action From operational mode, enter the **show route advertising-protocol bgp** command.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix                Nexthop        MED      Lc1pref  AS path
* 10.0.0.0/30           Self           0         I         I
* 172.16.0.0/30         Self           0         I         I
```

| | | | |
|------------------|------|-----|---|
| * 172.16.0.4/30 | Self | 601 | I |
| * 192.168.0.1/32 | Self | 0 | I |

Meaning The 601 value in the MED column shows that the MED value has been updated to reflect the configured OSPF metric.

Verifying That the MED Value Changes When the OSPF Metric Changes

Purpose Make sure that when you raise the OSPF metric to 700, the MED value is updated to reflect this change.

Action From configuration mode, enter the **set protocols ospf area 0 interface fe-1/2/0.2 metric 700** command.

```
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 700
user@R1# commit
```

After waiting 12 minutes (the configured delay period), enter the **show route advertising-protocol bgp** command from operational mode.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop      MED      Lclpref  AS path
* 10.0.0.0/30       Self         0         I
* 172.16.0.0/30     Self         0         I
* 172.16.0.4/30     Self         701        I
* 192.168.0.1/32    Self         0         I
```

Meaning The 701 value in the MED column shows that the MED value has been updated to reflect the configured OSPF metric.

Testing the minimum-igp Setting

Purpose Change the configuration to use the **minimum-igp** statement instead of the **igp** statement. When you increase the OSPF metric, the MED value remains unchanged, but when you decrease the OSPF metric, the MED value reflects the new OSPF metric.

Action From configuration mode, delete the **igp** statement, add the **minimum-igp** statement, and increase the OSPF metric.

```
user@R1# delete protocols bgp group external metric-out igp
user@R1# set protocols bgp group external metric-out minimum-igp
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 800
user@R1# commit
```

From operational mode, enter the **show route advertising-protocol bgp** command to make sure that the MED value does not change.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop      MED      Lclpref  AS path
* 10.0.0.0/30       Self         0         I
* 172.16.0.0/30     Self         0         I
* 172.16.0.4/30     Self         701        I
* 192.168.0.1/32    Self         0         I
```

From configuration mode, decrease the OSPF metric.

```
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 20
user@R1# commit
```

From operational mode, enter the **show route advertising-protocol bgp** command to make sure that the MED value does change.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 10.0.0.0/30       Self             0         I          I
* 172.16.0.0/30     Self             0         I          I
* 172.16.0.4/30     Self             21        I          I
* 192.168.0.1/32    Self             0         I          I
```

Meaning When the **minimum-igp** statement is configured, the MED value changes only when a shorter path is available.

Understanding the BGP Local AS Attribute

When an Internet service provider (ISP) acquires a network that belongs to a different autonomous system (AS), there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. Sometimes customers do not want to or are not immediately able to modify their peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a *local AS*.

Using a local AS number permits the routing devices in an acquired network to appear to belong to the former AS.

For example, ISP A, with an AS of 200, acquires ISP B, with an AS of 250. ISP B has a customer, ISP C, that does not want to change its configuration. After ISP B becomes part of ISP A, a local AS number of 250 is configured for use in EBGp peer sessions with ISP C. Consequently, the local AS number of 250 is either prepended before or used instead of the global AS number of 200 in the AS path used to export routes to direct external peers in ISP C.

If the route is received from an internal BGP (IBGP) peer, the AS path includes the local AS number prepended before the global AS number.

The local AS number is used instead of the global AS number if the route is an external route, such as a static route or an interior gateway protocol (IGP) route that is imported into BGP. If the route is external and you want the global AS number to be included in the AS path, you can apply a routing policy that uses **as-path-expand** or **as-path-prepend**. Use the **as-path-expand** policy action to place the global AS number behind the local AS number. Use the **as-path-prepend** policy action to place the global AS number in front of the local AS number.

For example:

```

user@R2# show policy-options
policy-statement prepend-global {
  term 1 {
    from protocol static;
    then {
      as-path-prepend 200; # or use as-path-expand
      accept;
    }
  }
}

user@R2# show protocols bgp
group ext {
  export prepend-global;
  type external;
  local-as 250;
  neighbor 10.0.0.1 {
    peer-as 100;
  }
  neighbor 10.1.0.2 {
    peer-as 300;
  }
}

user@R2# show routing-options
static {
  route 1.1.1.1/32 next-hop 10.0.0.1;
}
autonomous-system 200;

user@R3# run show route 1.1.1.1 protocol bgp
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.1.1/32          *[BGP/170] 00:05:11, localpref 100
                   AS path: 200 250 I, validation-state: unverified
                   > to 10.1.0.1 via lt-1/2/0.4

```

In a Layer 3 VPN scenario, in which a provider edge (PE) device uses external BGP (EBGP) to peer with a customer edge (CE) device, the **local-as** statement behaves differently than in the non-VPN scenario. In the VPN scenario, the global AS number defined in the master instance is prepended to the AS path by default. To override this behavior, you can configure the **no-prepend-global-as** in the routing-instance BGP configuration on the PE device, as shown here:

```

user@R2# show routing-instances

```

```
red {  
  instance-type vrf;  
  interface fe-1/2/0.2;  
  route-distinguisher 2:1;  
  vrf-target target:2:1;  
  protocols {  
    bgp {  
      group toR1 {  
        type external;  
        peer-as 1;  
        local-as 200 no-prepend-global-as;  
        neighbor 10.1.1.1;  
      }  
    }  
  }  
}
```

The Junos operating system (Junos OS) implementation of the local AS attribute supports the following options:

- **Local AS with private option**—When you use the **private** option, the local AS is used during the establishment of the BGP session with an EBGP neighbor but is hidden in the AS path sent to other EBGP peers. Only the global AS is included in the AS path sent to external peers.

The **private** option is useful for establishing local peering with routing devices that remain configured with their former AS or with a specific customer that has not yet modified its peer arrangements. The local AS is used to establish the BGP session with the EBGP neighbor but is hidden in the AS path sent to external peers in another AS.

Include the **private** option so that the local AS is not prepended before the global AS in the AS path sent to external peers. When you specify the **private** option, the local AS is prepended only in the AS path sent to the EBGP neighbor.

For example, in [Figure 48 on page 2743](#), Router 1 and Router 2 are in AS 64496, Router 4 is in AS 64511, and Router 3 is in AS 64510. Router 2 formerly belonged to AS 64497, which has merged with another network and now belongs to AS 64496. Because Router 3 still peers with Router 2 using its former AS (64497), Router 2 needs to be configured with a local AS of 64497 in order to maintain peering with Router 3. Configuring a local AS of 64497 permits Router 2 to add AS 64497 when advertising routes to Router 3. Router 3 sees an AS path of 64497 64496 for the prefix 10/8.

Figure 48: Local AS Configuration

To prevent Router 2 from adding the local AS number in its announcements to other peers, use the **local-as 64497 private** statement. This statement configures Router 2 to not include local AS 64497 when announcing routes to Router 1 and to Router 4. In this case, Router 4 sees an AS path of 64496 64510 for the prefix 10.222/16.

- **Local AS with alias option**—In Junos OS Release 9.5 and later, you can configure a local AS as an alias. During the establishment of the BGP open session, the AS used in the open message alternates between the local AS and the global AS. If the local AS is used to connect with the EBGP neighbor, then only the local AS is prepended to the AS path when the BGP peer session is established. If the global AS is used to connect with the EBGP neighbor, then only the global AS is prepended to the AS path when the BGP peer session is established. The use of the **alias** option also means that

the local AS is not prepended to the AS path for any routes learned from that EBGp neighbor. Therefore, the local AS remains hidden from other external peers.

Configuring a local AS with the **alias** option is especially useful when you are migrating the routing devices in an acquired network to the new AS. During the migration process, some routing devices might be configured with the new AS while others remain configured with the former AS. For example, it is good practice to start by first migrating to the new AS any routing devices that function as route reflectors. However, as you migrate the route reflector clients incrementally, each route reflector has to peer with routing devices configured with the former AS, as well as peer with routing devices configured with the new AS. To establish local peer sessions, it can be useful for the BGP peers in the network to use both the local AS and the global AS. At the same time, you want to hide this local AS from external peers and use only the global AS in the AS path when exporting routes to another AS. In this kind of situation, configure the **alias** option.

Include the **alias** option to configure the local AS as an alias to the global AS configured at the **[edit routing-options]** hierarchy level. When you configure a local AS as an alias, during the establishment of the BGP open session, the AS used in the open message alternates between the local AS and the global AS. The local AS is prepended to the AS path only when the peer session with an EBGp neighbor is established using that local AS. The local AS is hidden in the AS path sent to any other external peers. Only the global AS is prepended to the AS path when the BGP session is established using the global AS.

NOTE: The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

- **Local AS with option not to prepend the global AS**—In Junos OS Release 9.6 and later, you can configure a local AS with the option not to prepend the global AS. Only the local AS is included in the AS path sent to external peers.

Use the **no-prepend-global-as** option when you want to strip the global AS number from outbound BGP updates in a virtual private network (VPN) scenario. This option is useful in a VPN scenario in which you want to hide the global AS from the VPN.

Include the **no-prepend-global-as** option to have the global AS configured at the **[edit routing-options]** hierarchy level removed from the AS path sent to external peers. When you use this option, only the local AS is included in the AS path for the routes sent to a customer edge (CE) device.

- **Number of loops option**—The local AS feature also supports specifying the number of times that detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

For the **loops number** statement, you can configure 1 through 10.

NOTE: If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGP or IBGP peer is the same as the current AS, do not use the `local-as` statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the `local-as` statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

Example: Configuring a Local AS for EBGP Sessions

This example shows how to configure a local autonomous system (AS) for a BGP peer so that both the global AS and the local AS are used in BGP inbound and outbound updates.

- [Overview on page 2745](#)
- [Configuration on page 2746](#)
- [Verification on page 2752](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

Use the `local-as` statement when ISPs merge and want to preserve a customer's configuration, particularly the AS with which the customer is configured to establish a peer relationship. The `local-as` statement simulates the AS number already in place in customer routers, even if the ISP's router has moved to a different AS.

This example shows how to use the `local-as` statement to configure a local AS. The `local-as` statement is supported for BGP at the global, group, and neighbor hierarchy levels.

When you configure the `local-as` statement, you must specify an AS number. You can specify a number from 1 through 4,294,967,295 in plain-number format. In Junos OS Release 9.1 and later, the range for AS numbers is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value from 0.0 through 65535.65535 in AS-dot notation format. Junos

OS continues to support 2-byte AS numbers. The 2-byte AS number range is 1 through 65,535 (this is a subset of the 4-byte range).

Figure 49 on page 2746 shows the sample topology.

Figure 49: Topology for Configuring the Local AS

In this example, Device R2 formerly belonged to AS 250 and now is in AS 200. Device R1 and Device R3 are configured to peer with AS 250 instead of with the new AS number (AS 200). Device R2 has the new AS number configured with the **autonomous-system 200** statement. To enable the peering sessions to work, the **local-as 250** statement is added in the BGP configuration. Because **local-as 250** is configured, Device R2 includes both the global AS (200) and the local AS (250) in its BGP inbound and outbound updates.

Configuration

- [Configuring Device R1 on page 2747](#)
- [Configuring Device R2 on page 2749](#)
- [Configuring Device R3 on page 2751](#)

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 250
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.1.0.0/30 next-hop 10.0.0.2
set routing-options autonomous-system 100

```

Device R2

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 3 family inet address 10.1.0.1/30
set interfaces lo0 unit 2 family inet address 192.168.0.2/32
set protocols bgp group ext type external

```

```

set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext local-as 250
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options autonomous-system 200

```

Device R3

```

set interfaces fe-1/2/0 unit 4 family inet address 10.1.0.2/30
set interfaces lo0 unit 3 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 250
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.0.0.0/30 next-hop 10.1.0.1
set routing-options autonomous-system 300

```

Configuring Device R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set lo0 unit 1 family inet address 192.168.0.1/32

```
2. Configure external BGP (EBGP).

```

[edit protocols bgp group ext]
user@R1# set type external
user@R1# set export send-direct
user@R1# set export send-static
user@R1# set peer-as 250
user@R1# set neighbor 10.0.0.2

```
3. Configure the routing policy.

```

[edit policy-options]
user@R1# set policy-statement send-direct term 1 from protocol direct
user@R1# set policy-statement send-direct term 1 then accept
user@R1# set policy-statement send-static term 1 from protocol static
user@R1# set policy-statement send-static term 1 then accept

```

4. Configure a static route to the remote network between Device R2 and Device R3.

```
[edit routing-options]
user@R1# set static route 10.1.0.0/30 next-hop 10.0.0.2
```

5. Configure the global AS number.

```
[edit routing-options]
user@R1# set autonomous-system 100
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group ext {
    type external;
    export [ send-direct send-static ];
    peer-as 250;
    neighbor 10.0.0.2;
  }
}

user@R1# show routing-options
static {
```

```

    route 10.1.0.0/30 next-hop 10.0.0.2;
}
autonomous-system 100;

```

When you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```

[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 3 family inet address 10.1.0.1/30

user@R2# set lo0 unit 2 family inet address 192.168.0.2/32

```
2. Configure EBGP.

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set export send-static
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300

```
3. Configure the local autonomous system (AS) number.

```

[edit protocols bgp group ext]
user@R2# set local-as 250

```
4. Configure the global AS number.

```

[edit routing-options]
user@R2# set autonomous-system 200

```
5. Configure the routing policy.

```

[edit policy-options]
user@R2# set policy-statement send-direct term 1 from protocol direct
user@R2# set policy-statement send-direct term 1 then accept
user@R2# set policy-statement send-static term 1 from protocol static
user@R2# set policy-statement send-static term 1 then accept

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 2 {

```

```
        family inet {
            address 10.0.0.2/30;
        }
    }
}
fe-1/2/1 {
    unit 3 {
        family inet {
            address 10.1.0.1/30;
        }
    }
}
lo0 {
    unit 2 {
        family inet {
            address 192.168.0.2/32;
        }
    }
}

user@R2# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R2# show protocols
bgp {
    group ext {
        type external;
        export [ send-direct send-static ];
        local-as 250;
        neighbor 10.0.0.1 {
            peer-as 100;
        }
        neighbor 10.1.0.2 {
            peer-as 300;
        }
    }
}

user@R2# show routing-options
autonomous-system 200;
```

When you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R3

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.

```
[edit interfaces]
user@R3# set fe-1/2/0 unit 4 family inet address 10.1.0.2/30

user@R3# set lo0 unit 3 family inet address 192.168.0.3/32
```
2. Configure EBGP.

```
[edit protocols bgp group ext]
user@R3# set type external
user@R3# set export send-direct
user@R3# set export send-static
user@R3# set peer-as 250
user@R3# set neighbor 10.1.0.1
```
3. Configure the global autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 300
```
4. Configure a static route to the remote network between Device R1 and Device R2.

```
[edit routing-options]
user@R3# set static route 10.0.0.0/30 next-hop 10.1.0.1
```
5. Configure the routing policy.

```
[edit policy-options]
user@R3# set policy-statement send-direct term 1 from protocol direct
user@R3# set policy-statement send-direct term 1 then accept
user@R3# set policy-statement send-static term 1 from protocol static
user@R3# set policy-statement send-static term 1 then accept
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 4 {
    family inet {
      address 10.1.0.2/30;
    }
  }
}
lo0 {
  unit 3 {
```

```
family inet {
    address 192.168.0.3/32;
}
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R3# show protocols
bgp {
    group ext {
        type external;
        export [ send-direct send-static ];
        peer-as 250;
        neighbor 10.1.0.1;
    }
}

user@R3# show routing-options
static {
    route 10.0.0.0/30 next-hop 10.1.0.1;
}
autonomous-system 300;
```

When you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Checking the Local and Global AS Settings on page 2752](#)
- [Checking the BGP Peering Sessions on page 2754](#)
- [Verifying the BGP AS Paths on page 2754](#)

Checking the Local and Global AS Settings

Purpose Make sure that Device R2 has the local and global AS settings configured.

Action From operational mode, enter the **show bgp neighbors** command.

```
user@R2> show bgp neighbors
Peer: 10.0.0.1+179 AS 100      Local: 10.0.0.2+61036 AS 250
Type: External    State: Established    Flags: <Sync>
Last State: OpenConfirm    Last Event: RecvKeepAlive
Last Error: None
```

```

Export: [ send-direct send-static ]

Output messages: Total 256   Updates 2     Refreshes 0   Octets 4999
Output Queue[0]: 0

```

Meaning The Local AS: 250 and Local System AS: 200 output shows that Device R2 has the expected settings. Additionally, the output shows that the options list includes LocalAS.

Checking the BGP Peering Sessions

Purpose Ensure that the sessions are established and that the local AS number 250 is displayed.

Action From operational mode, enter the **show bgp summary** command.

```

user@R1> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State   Pending
inet.0      4          2          0          0        0      0        0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.0.0.2      250      232      233       0        4    1:42:37
2/4/4/0      0/0/0/0

```

```

user@R3> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State   Pending
inet.0      4          2          0          0        0      0        0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.1.0.1      250      235      236       0        4    1:44:25
2/4/4/0      0/0/0/0

```

Meaning Device R1 and Device R3 appear to be peering with a device in AS 250, even though Device R2 is actually in AS 200.

Verifying the BGP AS Paths

Purpose Make sure that the routes are in the routing tables and that the AS paths show the local AS number 250.

Action From configuration mode, enter the **set route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30      [BGP/170] 01:46:44, localpref 100
                 AS path: 250 I
                 > to 10.0.0.2 via fe-1/2/0.1
10.1.0.0/30      [BGP/170] 01:46:44, localpref 100
                 AS path: 250 I
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.0.2/32   *[BGP/170] 01:46:44, localpref 100
                 AS path: 250 I
                 > to 10.0.0.2 via fe-1/2/0.1

```

```

192.168.0.3/32      *[BGP/170] 01:46:40, localpref 100
                   AS path: 250 300 I
                   > to 10.0.0.2 via fe-1/2/0.1

user@R3> show route protocol bgp

inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30        [BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4
10.1.0.0/30        [BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4
192.168.0.1/32     *[BGP/170] 01:47:10, localpref 100
                   AS path: 250 100 I
                   > to 10.1.0.1 via fe-1/2/0.4
192.168.0.2/32     *[BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4

```

Meaning The output shows that Device R1 and Device R3 appear to have routes with AS paths that include AS 250, even though Device R2 is actually in AS 200.

Example: Configuring a Private Local AS for EBGp Sessions

This example shows how to configure a private local autonomous system (AS) number. The local AS is considered to be private because it is advertised to peers that use the local AS number for peering, but is hidden in the announcements to peers that can use the global AS number for peering.

- [Requirements on page 2755](#)
- [Overview on page 2755](#)
- [Configuration on page 2756](#)
- [Verification on page 2759](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

Use the **local-as** statement when ISPs merge and want to preserve a customer's configuration, particularly the AS with which the customer is configured to establish a peer relationship. The **local-as** statement simulates the AS number already in place in customer routers, even if the ISP's router has moved to a different AS.

When you use the **private** option, the local AS is used during the establishment of the BGP session with an external BGP (EBGP) neighbor, but is hidden in the AS path sent to other EBGp peers. Only the global AS is included in the AS path sent to external peers.

The **private** option is useful for establishing local peering with routing devices that remain configured with their former AS or with a specific customer that has not yet modified its

peer arrangements. The local AS is used to establish the BGP session with the EBGp neighbor, but is hidden in the AS path sent to external peers in another AS.

Include the **private** option so that the local AS is not prepended before the global AS in the AS path sent to external peers. When you specify the **private** option, the local AS is prepended only in the AS path sent to the EBGp neighbor.

Figure 50 on page 2756 shows the sample topology.

Figure 50: Topology for Configuring a Private Local AS

Device R1 is in AS 64496. Device R2 is in AS 64510. Device R3 is in AS 64511. Device R4 is in AS 64512. Device R1 formerly belonged to AS 64497, which has merged with another network and now belongs to AS 64496. Because Device R3 still peers with Device R1, using its former AS, 64497, Device R1 needs to be configured with a local AS of 64497 in order to maintain peering with Device R3. Configuring a local AS of 64497 permits Device R1 to add AS 64497 when advertising routes to Device R3. Device R3 sees an AS path of 64497 64496 for the prefix 10.1.1.2/32, which is Device R2's loopback interface. Device R4, which is behind Device R3, sees an AS path of 64511 64497 64496 64510 to Device R2's loopback interface. To prevent Device R1 from adding the local AS number in its announcements to other peers, this example includes the **local-as 64497 private** statement. The **private** option configures Device R1 to not include the local AS 64497 when announcing routes to Device R2. Device R2 sees an AS path of 64496 64511 to Device R3 and an AS path of 64496 64511 64512 to Device R4. The **private** option in Device R1's configuration causes the AS number 64497 to be missing from the AS paths that Device R1 readvertises to Device R2.

Device R2 is hiding the private local AS from all the routers, except Device R3. The **private** option applies to the routes that Device R1 receives (learns) from Device R3 and that Device R1, in turn, readvertises to other routers. When these routes learned from Device R3 are readvertised by Device R1 to Device R2, the private local AS is missing from the AS path advertised to Device R2.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

| | |
|-----------|---|
| Device R1 | <pre> set interfaces fe-1/2/0 unit 3 family inet address 192.168.1.1/24 set interfaces fe-1/2/1 unit 5 family inet address 192.168.10.1/24 set interfaces lo0 unit 2 family inet address 10.1.1.1/32 set protocols bgp group external-AS64511 type external set protocols bgp group external-AS64511 peer-as 64511 set protocols bgp group external-AS64511 local-as 64497 set protocols bgp group external-AS64511 local-as private set protocols bgp group external-AS64511 neighbor 192.168.1.2 set protocols bgp group external-AS64510 type external set protocols bgp group external-AS64510 peer-as 64510 set protocols bgp group external-AS64510 neighbor 192.168.10.2 set policy-options policy-statement send-direct term 1 from protocol direct set policy-options policy-statement send-direct term 1 then accept set routing-options autonomous-system 64496 </pre> |

Configuring Device R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 3]
user@R1# set family inet address 192.168.1.1/24

[edit interfaces fe-1/2/1 unit 5]
user@R1# set family inet address 192.168.10.1/24

[edit interfaces lo0 unit 2]
user@R1# set family inet address 10.1.1.1/32
```
2. Configure the EBGP peering session with Device R2.

```
[edit protocols bgp group external-AS64510]
user@R1# set type external
user@R1# set peer-as 64510
user@R1# set neighbor 192.168.10.2
```
3. Configure the EBGP peering session with Device R3.

```
[edit protocols bgp group external-AS64511]
user@R1# set type external
user@R1# set peer-as 64511
user@R1# set local-as 64497
user@R1# set local-as private
user@R1# set neighbor 192.168.1.2
```
4. Configure the routing policy.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```
5. Configure the global autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 64496
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 192.168.1.1/24;
    }
  }
}
```

```

    }
  }
  fe-1/2/1 {
    unit 5 {
      family inet {
        address 192.168.10.1/24;
      }
    }
  }
  lo0 {
    unit 2 {
      family inet {
        address 10.1.1.1/32;
      }
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group external-AS64511 {
    type external;
    peer-as 64511;
    local-as 64497 private;
    neighbor 192.168.1.2;
  }
  group external-AS64510 {
    type external;
    peer-as 64510;
    neighbor 192.168.10.2;
  }
}

user@R1# show routing-options
autonomous-system 64496;

```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the configuration as needed for the other devices in the topology.

Verification

Confirm that the configuration is working properly.

- [Checking Device R2's AS Paths on page 2760](#)
- [Checking Device R3's AS Paths on page 2760](#)

Checking Device R2's AS Paths

Purpose Make sure that Device R2 does not have AS 64497 in its AS paths to Device R3 and Device R4.

Action From operational mode, enter the **show route protocol bgp** command.

```
user@R2> show route protocol bgp
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.3/32      *[BGP/170] 01:33:11, localpref 100
                 AS path: 64496 64511 I
                 > to 192.168.10.1 via fe-1/2/0.6
10.1.1.4/32      *[BGP/170] 01:33:11, localpref 100
                 AS path: 64496 64511 64512 I
                 > to 192.168.10.1 via fe-1/2/0.6
192.168.5.0/24  *[BGP/170] 01:49:15, localpref 100
                 AS path: 64496 64511 I
                 > to 192.168.10.1 via fe-1/2/0.6
```

Meaning Device R2's AS paths do not include AS 64497.

Checking Device R3's AS Paths

Purpose Make sure that Device R3 does not have AS 64497 in its AS path to Device R4.

Action From operational mode, enter the **show route protocol bgp** command.

```
user@R3> show route protocol bgp
inet.0: 7 destinations, 8 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.2/32      *[BGP/170] 01:35:11, localpref 100
                 AS path: 64497 64496 64510 I
                 > to 192.168.1.1 via fe-1/2/0.4
10.1.1.4/32      *[BGP/170] 01:35:11, localpref 100
                 AS path: 64512 I
                 > to 192.168.5.2 via fe-1/2/1.7
192.168.5.0/24  [BGP/170] 01:51:15, localpref 100
                 AS path: 64512 I
                 > to 192.168.5.2 via fe-1/2/1.7
```

Meaning Device R3's route to Device R2 (prefix 10.1.1.2) includes both the local and the global AS configured on Device R1 (64497 and 64496, respectively).

Understanding the Accumulated IGP Attribute for BGP

The interior gateway protocols (IGPs) are designed to handle routing within a single domain or an autonomous system (AS). Each link is assigned a particular value called a metric. The distance between the two nodes is calculated as a sum of all the metric values of links along the path. The IGP selects the shortest path between two nodes based on distance.

BGP is designed to provide routing over a large number of independent ASs with limited or no coordination among respective administrations. BGP does not use metrics in the path selection decisions.

The accumulated IGP (AIGP) metric attribute for BGP enables deployment in which a single administration can run several contiguous BGP ASs. Such deployments allow BGP to make routing decisions based on the IGP metric. In such networks, it is possible for BGP to select paths based on metrics as is done by IGPs. In this case, BGP chooses the shortest path between two nodes, even though the nodes might be in two different ASs.

The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. The Juniper Networks® Junos® operating system (Junos OS) currently supports the AIGP attribute for two BGP address families, **family inet labeled-unicast** and **family inet6 labeled-unicast**.

AIGP impacts the BGP best-route decision process. The AIGP attribute preference rule is applied after the local-preference rule. The AIGP distance is compared to break a tie. The BGP best-route decision process also impacts the way the interior cost rule is applied if the resolving next hop has an AIGP attribute. Without AIGP enabled, the interior cost of a route is based on the calculation of the metric to the next hop for the route. With AIGP enabled, the resolving AIGP distance is added to the interior cost.

The AIGP attribute is an optional non-transitive BGP path attribute and is specified in Internet draft draft-ietf-idr-aigp-06, *The Accumulated IGP Metric Attribute for BGP*.

Example: Configuring the Accumulated IGP Attribute for BGP

This example shows how to configure the accumulated IGP (AIGP) metric attribute for BGP.

Requirements

This example uses the following hardware and software components:

- Seven BGP-speaking devices.
- Junos OS Release 12.1 or later.

Overview

The AIGP attribute enables deployments in which a single administration can run several contiguous BGP autonomous systems (ASs). Such deployments allow BGP to make routing decisions based on the IGP metric. With AIGP enabled, BGP can select paths based on IGP metrics. This enables BGP to choose the shortest path between two nodes, even though the nodes might be in different ASs. The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. This example shows AIGP configured with MPLS label-switched paths.

To enable AIGP, you include the **aigp** statement in the BGP configuration on a protocol family basis. Configuring AIGP on a particular family enables sending and receiving of the AIGP attribute on that family. By default, AIGP is disabled. An AIGP-disabled neighbor does not send an AIGP attribute and silently discards a received AIGP attribute.

Junos OS supports AIGP for **family inet labeled-unicast** and **family inet6 labeled-unicast**. The **aigp** statement can be configured for a given family at the global BGP, group, or neighbor level.

By default, the value of the AIGP attribute for a local prefix is zero. An AIGP-enabled neighbor can originate an AIGP attribute for a given prefix by export policy, using the **aigp-originate** policy action. The value of the AIGP attribute reflects the IGP distance to the prefix. Alternatively, you can specify a value, by using the **aigp-originate distance distance** policy action. The configurable range is 0 through 4,294,967,295. Only one node needs to originate an AIGP attribute. The AIGP attribute is retained and readvertised if the neighbors are AIGP enabled with the **aigp** statement in the BGP configuration.

The policy action to originate the AIGP attribute has the following requirements:

- Neighbor must be AIGP enabled.
- Policy must be applied as an export policy.
- Prefix must have no current AIGP attribute.
- Prefix must export with next-hop self.
- Prefix must reside within the AIGP domain. Typically, a loopback IP address is the prefix to originate.

The policy is ignored if these requirements are not met.

Topology Diagram

[Figure 51 on page 2763](#) shows the topology used in this example. OSPF is used as the interior gateway protocol (IGP). Internal BGP (IBGP) is configured between Device PE1 and Device PE4. External BGP (EBGP) is configured between Device PE7 and Device PE1, between Device PE4 and Device PE3, and between Device PE4 and Device PE2. Devices PE4, PE2, and PE3 are configured for multihop. Device PE4 selects a path based on the AIGP value and then readvertises the AIGP value based on the AIGP and policy configuration. Device PE1 readvertises the AIGP value to Device PE7, which is in another administrative domain. Every device has two loopback interface addresses: 10.9.9.x is used for BGP peering and the router ID, and 10.100.1.x is used for the BGP next hop.

The network between Device PE1 and PE3 has IBGP peering and multiple OSPF areas. The external link to Device PE7 is configured to show that the AIGP attribute is readadvertised to a neighbor outside of the administrative domain, if that neighbor is AIGP enabled.

Figure 51: Advertisement of Multiple Paths in BGP

For origination of an AIGP attribute, the BGP next hop is required to be itself. If the BGP next hop remains unchanged, the received AIGP attribute is readadvertised, as is, to another AIGP neighbor. If the next hop changes, the received AIGP attribute is readadvertised with an increased value to another AIGP neighbor. The increase in value reflects the IGP distance to the previous BGP next hop. To demonstrate, this example uses loopback interface addresses for Device PE4's EBGP peering sessions with Device PE2 and Device PE3. Multihop is enabled on these sessions so that a recursive lookup is performed to determine the point-to-point interface. Because the next hop changes, the IGP distance is added to the AIGP distance.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device P1 set interfaces fe-1/2/0 unit 1 description P1-to-PE1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.2/30
set interfaces fe-1/2/0 unit 1 family mpls
set interfaces fe-1/2/1 unit 4 description P1-to-P2
```

```
set interfaces fe-1/2/1 unit 4 family inet address 10.0.0.29/30
set interfaces fe-1/2/1 unit 4 family mpls
set interfaces fe-1/2/2 unit 8 description P1-to-PE4
set interfaces fe-1/2/2 unit 8 family inet address 10.0.0.17/30
set interfaces fe-1/2/2 unit 8 family mpls
set interfaces lo0 unit 3 family inet address 10.9.9.2/32

Configuring Device P1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device P1:

1. Configure the interfaces.

```

[edit interfaces]
user@P1# set fe-1/2/0 unit 1 description P1-to-PE1
user@P1# set fe-1/2/0 unit 1 family inet address 10.0.0.2/30
user@P1# set fe-1/2/0 unit 1 family mpls
user@P1# set fe-1/2/1 unit 4 description P1-to-P2
user@P1# set fe-1/2/1 unit 4 family inet address 10.0.0.29/30
user@P1# set fe-1/2/1 unit 4 family mpls
user@P1# set fe-1/2/2 unit 8 description P1-to-PE4
user@P1# set fe-1/2/2 unit 8 family inet address 10.0.0.17/30
user@P1# set fe-1/2/2 unit 8 family mpls
user@P1# set lo0 unit 3 family inet address 10.9.9.2/32
user@P1# set lo0 unit 3 family inet address 10.100.1.2/32

```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```

[edit protocols]
user@P1# set rsvp interface fe-1/2/0.1
user@P1# set rsvp interface fe-1/2/2.8
user@P1# set rsvp interface fe-1/2/1.4
user@P1# set mpls label-switched-path P1-to-P2 to 10.9.9.3
user@P1# set mpls label-switched-path P1-to-PE1 to 10.9.9.1
user@P1# set mpls label-switched-path P1-to-PE4 to 10.9.9.4
user@P1# set mpls interface fe-1/2/0.1
user@P1# set mpls interface fe-1/2/2.8
user@P1# set mpls interface fe-1/2/1.4

```

3. Configure BGP.

```

[edit protocols bgp group internal]
user@P1# set type internal
user@P1# set local-address 10.9.9.2
user@P1# set neighbor 10.9.9.1
user@P1# set neighbor 10.9.9.3
user@P1# set neighbor 10.9.9.4

```

4. Enable AIGP.

```

[edit protocols bgp group internal]
user@P1# set family inet labeled-unicast aigp

```

5. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@P1# set area 0.0.0.1 interface fe-1/2/0.1 metric 1
user@P1# set area 0.0.0.1 interface fe-1/2/1.4 metric 1
user@P1# set area 0.0.0.0 interface fe-1/2/2.8 metric 1
user@P1# set area 0.0.0.0 interface 10.9.9.2 passive
user@P1# set area 0.0.0.0 interface 10.9.9.2 metric 1
user@P1# set area 0.0.0.0 interface 10.100.1.2 passive
user@P1# set area 0.0.0.0 interface 10.100.1.2 metric 1
```

6. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@P1# set router-id 10.9.9.2
user@P1# set autonomous-system 13979
```

7. If you are done configuring the device, commit the configuration.

```
user@P1# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

Configuring Device P2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device P2:

1. Configure the interfaces.

```
[edit interfaces]  
user@P2# set fe-1/2/0 unit 3 description P2-to-PE1  
user@P2# set fe-1/2/0 unit 3 family inet address 10.0.0.6/30  
user@P2# set fe-1/2/0 unit 3 family mpls  
user@P2# set fe-1/2/1 unit 5 description P2-to-P1  
user@P2# set fe-1/2/1 unit 5 family inet address 10.0.0.30/30  
user@P2# set fe-1/2/1 unit 5 family mpls  
user@P2# set fe-1/2/2 unit 6 description P2-to-PE4  
user@P2# set fe-1/2/2 unit 6 family inet address 10.0.0.13/30  
user@P2# set fe-1/2/2 unit 6 family mpls  
user@P2# set lo0 unit 5 family inet address 10.9.9.3/32  
user@P2# set lo0 unit 5 family inet address 10.100.1.3/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]  
user@P2# set rsvp interface fe-1/2/1.5  
user@P2# set rsvp interface fe-1/2/2.6  
user@P2# set rsvp interface fe-1/2/0.3  
user@P2# set mpls label-switched-path P2-to-PE1 to 10.9.9.1  
user@P2# set mpls label-switched-path P2-to-P1 to 10.9.9.2  
user@P2# set mpls label-switched-path P2-to-PE4 to 10.9.9.4  
user@P2# set mpls interface fe-1/2/1.5  
user@P2# set mpls interface fe-1/2/2.6  
user@P2# set mpls interface fe-1/2/0.3
```

3. Configure BGP.

```
[edit protocols bgp group internal]  
user@P2# set type internal  
user@P2# set local-address 10.9.9.3  
user@P2# set neighbor 10.9.9.1  
user@P2# set neighbor 10.9.9.2  
user@P2# set neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp group internal]
user@P2# set family inet labeled-unicast aigp
```

5. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@P2# set area 0.0.0.0 interface fe-1/2/2.6 metric 1
user@P2# set area 0.0.0.0 interface 10.9.9.3 passive
user@P2# set area 0.0.0.0 interface 10.9.9.3 metric 1
user@P2# set area 0.0.0.0 interface 10.100.1.3 passive
user@P2# set area 0.0.0.0 interface 10.100.1.3 metric 1
```

6. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@P2# set router-id 10.9.9.3
user@P2# set autonomous-system 13979
```

7. If you are done configuring the device, commit the configuration.

```
user@P2# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

```

Configuring Device PE4

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE4:

1. Configure the interfaces.

```

[edit interfaces]
user@PE4# set fe-1/2/0 unit 7 description PE4-to-P2
user@PE4# set fe-1/2/0 unit 7 family inet address 10.0.0.14/30
user@PE4# set fe-1/2/0 unit 7 family mpls
user@PE4# set fe-1/2/1 unit 9 description PE4-to-P1
user@PE4# set fe-1/2/1 unit 9 family inet address 10.0.0.18/30
user@PE4# set fe-1/2/1 unit 9 family mpls
user@PE4# set fe-1/2/2 unit 10 description PE4-to-PE2
user@PE4# set fe-1/2/2 unit 10 family inet address 10.0.0.21/30
user@PE4# set fe-1/2/2 unit 10 family mpls
user@PE4# set fe-1/0/2 unit 12 description PE4-to-PE3
user@PE4# set fe-1/0/2 unit 12 family inet address 10.0.0.25/30
user@PE4# set fe-1/0/2 unit 12 family mpls
user@PE4# set lo0 unit 7 family inet address 10.9.9.4/32
user@PE4# set lo0 unit 7 family inet address 10.100.1.4/32

```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```

[edit protocols]
user@PE4# set rsvp interface fe-1/2/0.7
user@PE4# set rsvp interface fe-1/2/1.9
user@PE4# set rsvp interface fe-1/2/2.10
user@PE4# set rsvp interface fe-1/0/2.12
user@PE4# set mpls label-switched-path PE4-to-PE2 to 10.9.9.5
user@PE4# set mpls label-switched-path PE4-to-PE3 to 10.9.9.6
user@PE4# set mpls label-switched-path PE4-to-P1 to 10.9.9.2
user@PE4# set mpls label-switched-path PE4-to-P2 to 10.9.9.3
user@PE4# set mpls interface fe-1/2/0.7
user@PE4# set mpls interface fe-1/2/1.9
user@PE4# set mpls interface fe-1/2/2.10
user@PE4# set mpls interface fe-1/0/2.12

```

3. Configure BGP.

```

[edit protocols bgp]
user@PE4# set export next-hop
user@PE4# set export aigp
user@PE4# set group internal type internal
user@PE4# set group internal local-address 10.9.9.4
user@PE4# set group internal neighbor 10.9.9.1
user@PE4# set group internal neighbor 10.9.9.3

```

```
user@PE4# set group internal neighbor 10.9.9.2
user@PE4# set group external type external
user@PE4# set group external multihop ttl 2
user@PE4# set group external local-address 10.9.9.4
user@PE4# set group external peer-as 7018
user@PE4# set group external neighbor 10.9.9.5
user@PE4# set group external neighbor 10.9.9.6
```

4. Enable AIGP.

```
[edit protocols bgp]
user@PE4# set group external family inet labeled-unicast aigp
user@PE4# set group internal family inet labeled-unicast aigp
```

5. Originate a prefix, and configure an AIGP distance.

By default, a prefix is originated using the current IGP distance. Optionally, you can configure a distance for the AIGP attribute, using the **distance** option, as shown here.

```
[edit policy-options policy-statement aigp term 10]
user@PE4# set from protocol static
user@PE4# set from route-filter 44.0.0.0/24 exact
user@PE4# set then aigp-originate distance 200
user@PE4# set then next-hop 10.100.1.4
user@PE4# set then accept
```

6. Enable the policies.

```
[edit policy-options policy-statement next-hop]
user@PE4# set term 10 from protocol bgp
user@PE4# set term 10 then next-hop 10.100.1.4
user@PE4# set term 10 then accept
user@PE4# set term 20 from protocol direct
user@PE4# set term 20 from route-filter 10.9.9.4/32 exact
user@PE4# set term 20 from route-filter 10.100.1.4/32 exact
user@PE4# set term 20 then next-hop 10.100.1.4
user@PE4# set term 20 then accept
```

7. Configure a static route.

```
[edit routing-options]
user@PE4# set static route 44.0.0.0/24 discard
```

8. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@PE4# set area 0.0.0.0 interface fe-1/2/1.9 metric 1
user@PE4# set area 0.0.0.0 interface fe-1/2/0.7 metric 1
user@PE4# set area 0.0.0.0 interface 10.9.9.4 passive
user@PE4# set area 0.0.0.0 interface 10.9.9.4 metric 1
user@PE4# set area 0.0.0.0 interface 10.100.1.4 passive
user@PE4# set area 0.0.0.0 interface 10.100.1.4 metric 1
user@PE4# set area 0.0.0.2 interface fe-1/2/2.10 metric 1
user@PE4# set area 0.0.0.3 interface fe-1/0/2.12 metric 1
```

9. Configure the router ID and the autonomous system number.

```
[edit routing-options]
```

```

user@PE4# set router-id 10.9.9.4
user@PE4# set autonomous-system 13979

```

10. If you are done configuring the device, commit the configuration.

```

user@PE4# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

Configuring Device PE1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE1:

1. Configure the interfaces.

```
[edit interfaces]  
user@PE1# set fe-1/2/0 unit 0 description PE1-to-P1  
user@PE1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30  
user@PE1# set fe-1/2/0 unit 0 family mpls  
user@PE1# set fe-1/2/1 unit 2 description PE1-to-P2  
user@PE1# set fe-1/2/1 unit 2 family inet address 10.0.0.5/30  
user@PE1# set fe-1/2/1 unit 2 family mpls  
user@PE1# set fe-1/2/2 unit 14 description PE1-to-PE7  
user@PE1# set fe-1/2/2 unit 14 family inet address 10.0.0.9/30  
user@PE1# set lo0 unit 1 family inet address 10.9.9.1/32  
user@PE1# set lo0 unit 1 family inet address 10.100.1.1/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]  
user@PE1# set rsvp interface fe-1/2/0.0  
user@PE1# set rsvp interface fe-1/2/1.2  
user@PE1# set rsvp interface fe-1/2/2.14  
user@PE1# set mpls label-switched-path PE1-to-P1 to 10.9.9.2  
user@PE1# set mpls label-switched-path PE1-to-P2 to 10.9.9.3  
user@PE1# set mpls interface fe-1/2/0.0  
user@PE1# set mpls interface fe-1/2/1.2  
user@PE1# set mpls interface fe-1/2/2.14
```

3. Configure BGP.

```
[edit protocols bgp]  
user@PE1# set group internal type internal  
user@PE1# set group internal local-address 10.9.9.1  
user@PE1# set group internal export SET_EXPORT_ROUTES  
user@PE1# set group internal vpn-apply-export
```

```

user@PE1# set group internal neighbor 10.9.9.4
user@PE1# set group internal neighbor 10.9.9.2
user@PE1# set group internal neighbor 10.9.9.3
user@PE1# set group external type external
user@PE1# set group external export SET_EXPORT_ROUTES
user@PE1# set group external peer-as 7019
user@PE1# set group external neighbor 10.0.0.10

```

4. Enable AIGP.

```

[edit protocols bgp]
user@PE1# set group internal family inet labeled-unicast aigp
user@PE1# set group external family inet labeled-unicast aigp

```

5. Enable the policies.

```

[edit policy-options policy-statement SET_EXPORT_ROUTES term 10]
user@PE1# set from protocol direct
user@PE1# set from protocol bgp
user@PE1# set then next-hop 10.100.1.1
user@PE1# set then accept

```

6. Configure an IGP, such as OSPF, RIP, or IS-IS.

```

[edit protocols ospf area 0.0.0.1]
user@PE1# set interface fe-1/2/0.0 metric 1
user@PE1# set interface fe-1/2/1.2 metric 1
user@PE1# set interface 10.9.9.1 passive
user@PE1# set interface 10.9.9.1 metric 1
user@PE1# set interface 10.100.1.1 passive
user@PE1# set interface 10.100.1.1 metric 1

```

7. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@PE1# set router-id 10.9.9.1
user@PE1# set autonomous-system 13979

```

8. If you are done configuring the device, commit the configuration.

```

user@PE1# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE1# show interfaces

Configuring Device PE2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE2:

1. Configure the interfaces.

```
[edit interfaces]
user@PE2# set fe-1/2/0 unit 11 description PE2-to-PE4
user@PE2# set fe-1/2/0 unit 11 family inet address 10.0.0.22/30
user@PE2# set fe-1/2/0 unit 11 family mpls
user@PE2# set lo0 unit 9 family inet address 10.9.9.5/32 primary
user@PE2# set lo0 unit 9 family inet address 10.100.1.5/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]
user@PE2# set rsvp interface fe-1/2/0.11
user@PE2# set mpls label-switched-path PE2-to-PE4 to 10.9.9.4
user@PE2# set mpls interface fe-1/2/0.11
```

3. Configure BGP.

```
[edit protocols bgp]
user@PE2# set group external type external
user@PE2# set group external multihop ttl 2
user@PE2# set group external local-address 10.9.9.5
user@PE2# set group external export next-hop
user@PE2# set group external export aigp
user@PE2# set group external export SET_EXPORT_ROUTES
user@PE2# set group external vpn-apply-export
user@PE2# set group external peer-as 13979
user@PE2# set group external neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp]
user@PE2# set group external family inet labeled-unicast aigp
```

5. Originate a prefix, and configure an AIGP distance.

By default, a prefix is originated using the current IGP distance. Optionally, you can configure a distance for the AIGP attribute, using the **distance** option, as shown here.

```
[edit policy-options policy-statement aigp]
user@PE2# set term 10 from route-filter 55.0.0.0/24 exact
user@PE2# set term 10 then aigp-originate distance 20
user@PE2# set term 10 then next-hop 10.100.1.5
user@PE2# set term 10 then accept
user@PE2# set term 20 from route-filter 99.0.0.0/24 exact
user@PE2# set term 20 then aigp-originate distance 30
user@PE2# set term 20 then next-hop 10.100.1.5
user@PE2# set term 20 then accept
```

6. Enable the policies.

```
[edit policy-options]
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
direct
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
static
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
bgp
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 then next-hop
10.100.1.5
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 then accept
user@PE2# set policy-statement next-hop term 10 from protocol bgp
user@PE2# set policy-statement next-hop term 10 then next-hop 10.100.1.5
user@PE2# set policy-statement next-hop term 10 then accept
user@PE2# set policy-statement next-hop term 20 from protocol direct
user@PE2# set policy-statement next-hop term 20 from route-filter 10.9.9.5/32
exact
user@PE2# set policy-statement next-hop term 20 from route-filter 10.100.1.5/32
exact
user@PE2# set policy-statement next-hop term 20 then next-hop 10.100.1.5
user@PE2# set policy-statement next-hop term 20 then accept
```

7. Enable some static routes.

```
[edit routing-options]
user@PE2# set static route 99.0.0.0/24 discard
user@PE2# set static route 55.0.0.0/24 discard
```

8. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf area 0.0.0.2]
user@PE2# set interface 10.9.9.5 passive
user@PE2# set interface 10.9.9.5 metric 1
user@PE2# set interface 10.100.1.5 passive
user@PE2# set interface 10.100.1.5 metric 1
user@PE2# set interface fe-1/2/0.11 metric 1
```

9. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@PE2# set router-id 10.9.9.5
user@PE2# set autonomous-system 7018
```

10. If you are done configuring the device, commit the configuration.

```
user@PE2# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE2# show interfaces

Configuring Device PE3

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE3:

1. Configure the interfaces.

```
[edit interfaces]
user@PE3# set fe-1/2/0 unit 13 description PE3-to-PE4
user@PE3# set fe-1/2/0 unit 13 family inet address 10.0.0.26/30
user@PE3# set fe-1/2/0 unit 13 family mpls
user@PE3# set lo0 unit 11 family inet address 10.9.9.6/32
user@PE3# set lo0 unit 11 family inet address 10.100.1.6/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]
user@PE3# set rsvp interface fe-1/2/0.13
user@PE3# set mpls label-switched-path PE3-to-PE4 to 10.9.9.4
user@PE3# set mpls interface fe-1/2/0.13
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@PE3# set type external
user@PE3# set multihop ttl 2
user@PE3# set local-address 10.9.9.6
user@PE3# set export next-hop
user@PE3# set export SET_EXPORT_ROUTES
user@PE3# set vpn-apply-export
user@PE3# set peer-as 13979
user@PE3# set neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp group external]
user@PE3# set family inet labeled-unicast aigp
```

5. Enable the policies.

```
[edit policy-options]
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
    direct
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
    static
```

```

user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
bgp
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 then next-hop
10.100.1.6
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 then accept
user@PE3# set policy-statement next-hop term 10 from protocol bgp
user@PE3# set policy-statement next-hop term 10 then next-hop 10.100.1.6
user@PE3# set policy-statement next-hop term 10 then accept
user@PE3# set policy-statement next-hop term 20 from protocol direct
user@PE3# set policy-statement next-hop term 20 from route-filter 10.9.9.6/32
exact
user@PE3# set policy-statement next-hop term 20 from route-filter 10.100.1.6/32
exact
user@PE3# set policy-statement next-hop term 20 then next-hop 10.100.1.6
user@PE3# set policy-statement next-hop term 20 then accept

```

6. Configure an IGP, such as OSPF, RIP, or IS-IS.

```

[edit protocols ospf area 0.0.0.3]
user@PE3# set interface 10.9.9.6 passive
user@PE3# set interface 10.9.9.6 metric 1
user@PE3# set interface 10.100.1.6 passive
user@PE3# set interface 10.100.1.6 metric 1
user@PE3# set interface fe-1/2/0.13 metric 1

```

7. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@PE3# set router-id 10.9.9.6
user@PE3# set autonomous-system 7018

```

8. If you are done configuring the device, commit the configuration.

```

user@PE3# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

            metric 1;
        }
        interface fe-1/2/0.13 {
            metric 1;
        }
    }
}

user@PE3# show routing-options
router-id 10.9.9.6;
autonomous-system 7018;

```

Configuring Device PE7

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE7:

1. Configure the interfaces.

```

[edit interfaces]
user@PE7# set fe-1/2/0 unit 15 description PE7-to-PE1
user@PE7# set fe-1/2/0 unit 15 family inet address 10.0.0.10/30
user@PE7# set lo0 unit 13 family inet address 10.9.9.7/32
user@PE7# set lo0 unit 13 family inet address 10.100.1.7/32

```

2. Configure BGP.

```

[edit protocols bgp group external]
user@PE7# set type external
user@PE7# set export SET_EXPORT_ROUTES
user@PE7# set peer-as 13979
user@PE7# set neighbor 10.0.0.9

```

3. Enable AIGP.

```

[edit protocols bgp group external]
user@PE7# set family inet labeled-unicast aigp

```

4. Configure the routing policy.

```

[edit policy-options policy-statement SET_EXPORT_ROUTES term 10]
user@PE7# set from protocol direct

```

```
user@PE7# set from protocol bgp
user@PE7# set then next-hop 10.100.1.7
user@PE7# set then accept
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@PE7# set router-id 10.9.9.7
user@PE7# set autonomous-system 7019
```

6. If you are done configuring the device, commit the configuration.

```
user@PE7# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE7# show interfaces
interfaces {
  fe-1/2/0 {
    unit 15 {
      description PE7-to-PE1;
      family inet {
        address 10.0.0.10/30;
      }
    }
  }
  lo0 {
    unit 13 {
      family inet {
        address 10.9.9.7/32;
        address 10.100.1.7/32;
      }
    }
  }
}

user@PE7# show policy-options
policy-statement SET_EXPORT_ROUTES {
  term 10 {
    from protocol [ direct bgp ];
    then {
      next-hop 10.100.1.7;
      accept;
    }
  }
}

user@PE7# show protocols
bgp {
  group external {
    type external;
    family inet {
      labeled-unicast {
        aigp;
      }
    }
  }
}
```

```

    }
  }
  export SET_EXPORT_ROUTES;
  peer-as 13979;
  neighbor 10.0.0.9;
}
}

user@PE7# show routing-options
router-id 10.9.9.7;
autonomous-system 7019;

```

Verification

Confirm that the configuration is working properly.

- [Verifying That Device PE4 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE2 on page 2793](#)
- [Checking the IGP Metric on page 2793](#)
- [Verifying That Device PE4 Adds the IGP Metric to the AIGP Attribute on page 2794](#)
- [Verifying That Device PE7 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE1 on page 2794](#)
- [Verifying the Resolving AIGP Metric on page 2795](#)
- [Verifying the Presence of AIGP Attributes in BGP Updates on page 2798](#)

Verifying That Device PE4 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE2

Purpose Make sure that the AIGP policy on Device PE2 is working.

Action

```

user@PE4> show route receive-protocol bgp 10.9.9.5 extensive
* 55.0.0.0/24 (1 entry, 1 announced)
  Accepted
  Route Label: 299888
  Nexthop: 10.100.1.5
  AS path: 7018 I
  AIGP: 20

* 99.0.0.0/24 (1 entry, 1 announced)
  Accepted
  Route Label: 299888
  Nexthop: 10.100.1.5
  AS path: 7018 I
  AIGP: 30

```

Meaning On Device PE2, the **aigp-originate** statement is configured with a distance of 20 (**aigp-originate distance 20**). This statement is applied to route 55.0.0.0/24. Likewise, the **aigp-originate distance 30** statement is applied to route 99.0.0.0/24. Thus, when Device PE4 receives these routes, the AIGP attribute is attached with the configured metrics.

Checking the IGP Metric

Purpose From Device PE4, check the IGP metric to the BGP next hop 10.100.1.5.

Action user@PE4> show route 10.100.1.5
inet.0: 30 destinations, 40 routes (30 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.100.1.5/32 *[OSPF/10] 05:35:50, metric 2
 > to 10.0.0.22 via fe-1/2/2.10
 [BGP/170] 03:45:07, localpref 100, from 10.9.9.5
 AS path: 7018 I
 > to 10.0.0.22 via fe-1/2/2.10

Meaning The IGP metric for this route is 2.

Verifying That Device PE4 Adds the IGP Metric to the AIGP Attribute

Purpose Make sure that Device PE4 adds the IGP metric to the AIGP attribute when it readvertises routes to its IBGP neighbor, Device PE1.

Action user@PE4> show route advertising-protocol bgp 10.9.9.1 extensive

* 55.0.0.0/24 (1 entry, 1 announced)
BGP group internal type Internal
Route Label: 300544
Nexthop: 10.100.1.4
Flags: Nexthop Change
Localpref: 100
AS path: [13979] 7018 I
AIGP: 22

* 99.0.0.0/24 (1 entry, 1 announced)
BGP group internal type Internal
Route Label: 300544
Nexthop: 10.100.1.4
Flags: Nexthop Change
Localpref: 100
AS path: [13979] 7018 I
AIGP: 32

Meaning The IGP metric is added to the AIGP metric ($20 + 2 = 22$ and $30 + 2 = 32$), because the next hop is changed for these routes.

Verifying That Device PE7 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE1

Purpose Make sure that the AIGP policy on Device PE1 is working.

Action user@PE7> show route receive-protocol bgp 10.0.0.9 extensive

* 44.0.0.0/24 (1 entry, 1 announced)

Accepted
Route Label: 300096
Nexthop: 10.0.0.9
AS path: 13979 I
AIGP: 203

* 55.0.0.0/24 (1 entry, 1 announced)

Accepted
Route Label: 300112
Nexthop: 10.0.0.9
AS path: 13979 7018 I
AIGP: 25

* 99.0.0.0/24 (1 entry, 1 announced)

Accepted
Route Label: 300112
Nexthop: 10.0.0.9
AS path: 13979 7018 I
AIGP: 35

Meaning The 44.0.0.0/24 route is originated at Device PE4. The 55.0.0.0/24 and 99.0.0.0/24 routes are originated at Device PE2. The IGP distances are added to the configured AIGP distances.

Verifying the Resolving AIGP Metric

Purpose Confirm that if the prefix is resolved through recursion and the recursive next hops have AIGP metrics, the prefix has the sum of the AIGP values that are on the recursive BGP next hops.

Action 1. Add a static route to 66.0.0.0/24.

```
[edit routing-options]
user@PE2# set static route 66.0.0.0/24 discard
```

2. Delete the existing terms in the **aigp** policy statement on Device PE2.

```
[edit policy-options policy-statement aigp]
user@PE2# delete term 10
user@PE2# delete term 20
```

3. Configure a recursive route lookup for the route to 66.0.0.0.

The policy shows the AIGP metric for prefix 66.0.0.0/24 (none) and its recursive next hop. Prefix 66.0.0.0/24 is resolved by 55.0.0.1. Prefix 66.0.0.0/24 does not have its own AIGP metric being originated, but its recursive next hop, 55.0.0.1, has an AIGP value.

```
[edit policy-options policy-statement aigp]
user@PE2# set term 10 from route-filter 55.0.0.1/24 exact
user@PE2# set term 10 then aigp-originate distance 20
user@PE2# set term 10 then next-hop 10.100.1.5
user@PE2# set term 10 then accept
user@PE2# set term 20 from route-filter 66.0.0.0/24 exact
user@PE2# set term 20 then next-hop 55.0.0.1
```

user@PE2# set term 20 then accept

4. On Device PE4, run the **show route 55.0.0.0 extensive** command.

The value of Metric2 is the IGP metric to the BGP next hop. When Device PE4 readvertises these routes to its IBGP peer, Device PE1, the AIGP metric is the sum of AIGP + its Resolving AIGP metric + Metric2.

Prefix 55.0.0.0 shows its own IGP metric 20, as defined and advertised by Device PE2. It does not show a resolving AIGP value because it does not have a recursive BGP next hop. The value of Metric2 is 2.

```

user@PE4> show route 55.0.0.0 extensive
inet.0: 31 destinations, 41 routes (31 active, 0 holddown, 0 hidden)
55.0.0.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 55.0.0.0/24 -> {indirect(262151)}
Page 0 idx 0 Type 1 val 928d1b8
  Flags: Nexthop Change

```

Forwarding nexthops: 1
Nexthop: 10.0.0.22 via fe-1/2/2.10

Verifying the Presence of AIGP Attributes in BGP Updates

Purpose If the AIGP attribute is not enabled under BGP (or the **group** or **neighbor** hierarchies), the AIGP attribute is silently discarded. Enable **traceoptions** and include the **packets** flag in the **detail** option in the configuration to confirm the presence of the AIGP attribute in transmitted or received BGP updates. This is useful when debugging AIGP issues.

Action 1. Configure Device PE2 and Device PE4 for **traceoptions**.

```
user@host> show protocols bgp
  traceoptions {
    file bgp size 1m files 5;
    flag packets detail;
  }
```

2. Check the **traceoptions** file on Device PE2.

The following sample shows Device PE2 advertising prefix 99.0.0.0/24 to Device PE4 (10.9.9.4) with an AIGP metric of 20:

```
user@PE2> show log bgp
Mar 22 09:27:18.982150 BGP SEND 10.9.9.5+49652 -> 10.9.9.4+179
Mar 22 09:27:18.982178 BGP SEND message type 2 (Update) length 70
Mar 22 09:27:18.982198 BGP SEND Update PDU length 70
Mar 22 09:27:18.982248 BGP SEND flags 0x40 code Origin(1): IGP
Mar 22 09:27:18.982273 BGP SEND flags 0x40 code ASPath(2) length 6: 7018
Mar 22 09:27:18.982295 BGP SEND flags 0x80 code AIGP(26): AIGP: 20
Mar 22 09:27:18.982316 BGP SEND flags 0x90 code MP_reach(14): AFI/SAFI 1/4
Mar 22 09:27:18.982341 BGP SEND      nhop 10.100.1.5 len 4
Mar 22 09:27:18.982372 BGP SEND    99.0.0.0/24 (label 301664)
Mar 22 09:27:33.665412 bgp_send: sending 19 bytes to abcd::10:255:170:84
(External AS 13979)
```

3. Verify that the route was received on Device PE4 using the **show route receive-protocol** command.

AIGP is not enabled on Device PE4, so the AIGP attribute is silently discarded for prefix 99.0.0.0/24 and does not appear in the following output:

```
user@PE4> show route receive-protocol bgp 10.9.9.5 extensive | find 55.0.0.0
* 99.0.0.0/24 (2 entries, 1 announced)
  Accepted
  Route Label: 301728
  Nexthop: 10.100.1.5
  AS path: 7018 I
```

4. Check the **traceoptions** file on Device PE4.

The following output from the **traceoptions** log shows that the 99.0.0.0/24 prefix was received with the AIGP attribute attached:

```
user@PE4> show log bgp
Mar 22 09:41:39.650295 BGP RECV 10.9.9.5+64690 -> 10.9.9.4+179
Mar 22 09:41:39.650331 BGP RECV message type 2 (Update) length 70
Mar 22 09:41:39.650350 BGP RECV Update PDU length 70
Mar 22 09:41:39.650370 BGP RECV flags 0x40 code Origin(1): IGP
Mar 22 09:41:39.650394 BGP RECV flags 0x40 code ASPath(2) length 6: 7018
```

```

Mar 22 09:41:39.650415 BGP RECV flags 0x80 code AIGP(26): AIGP: 20
Mar 22 09:41:39.650436 BGP RECV flags 0x90 code MP_reach(14): AFI/SAFI 1/4
Mar 22 09:41:39.650459 BGP RECV          nhop 10.100.1.5 len 4
Mar 22 09:41:39.650495 BGP RECV    99.0.0.0/24 (label 301728)
Mar 22 09:41:39.650574 bgp_rcv_nlri: 99.0.0.0/24
Mar 22 09:41:39.650607 bgp_rcv_nlri: 99.0.0.0/24 belongs to meshgroup
Mar 22 09:41:39.650629 bgp_rcv_nlri: 99.0.0.0/24 qualified bnp->ribact 0x0
12afcb 0x0

```

Meaning Performing this verification helps with AIGP troubleshooting and debugging issues. It enables you to verify which devices in your network send and receive AIGP attributes.

Understanding Routing Policies

Each routing policy is identified by a policy name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks. Each routing policy name must be unique within a configuration.

Once a policy is created and named, it must be applied before it is active. You apply routing policies using the **import** and **export** statements at the **protocols>protocol-name** level in the configuration hierarchy.

In the **import** statement, you list the name of the routing policy to be evaluated when routes are imported into the routing table from the routing protocol.

In the **export** statement, you list the name of the routing policy to be evaluated when routes are being exported from the routing table into a dynamic routing protocol. Only active routes are exported from the routing table.

To specify more than one policy and create a policy chain, you list the policies using a space as a separator. If multiple policies are specified, the policies are evaluated in the

order in which they are specified. As soon as an accept or reject action is executed, the policy chain evaluation ends.

Example: Injecting OSPF Routes into the BGP Routing Table

This example shows how to create a policy that injects OSPF routes into the BGP routing table.

- [Requirements on page 2800](#)
- [Overview on page 2800](#)
- [Configuration on page 2800](#)
- [Verification on page 2802](#)
- [Troubleshooting on page 2803](#)

Requirements

Before you begin:

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 2640](#).
- Configure interior gateway protocol (IGP) sessions between peers.

Overview

In this example, you create a routing policy called **injectpolicy1** and a routing term called **injectterm1**. The policy injects OSPF routes into the BGP routing table.

Configuration

- [Configuring the Routing Policy on page 2800](#)
- [Configuring Tracing for the Routing Policy on page 2801](#)

Configuring the Routing Policy

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 from protocol ospf
set policy-options policy-statement injectpolicy1 term injectterm1 from area 0.0.0.1
set policy-options policy-statement injectpolicy1 term injectterm1 then accept
set protocols bgp export injectpolicy1
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To inject OSPF routes into a BGP routing table:

1. Create the policy term.

```
[edit policy-options policy-statement injectpolicy1]
user@host# set term injectterm1
```

2. Specify OSPF as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from protocol ospf
```

3. Specify the routes from an OSPF area as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from area 0.0.0.1
```

4. Specify that the route is to be accepted if the previous conditions are matched.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set then accept
```

5. Apply the routing policy to BGP.

```
[edit]
user@host# set protocols bgp export injectpolicy1
```

Results Confirm your configuration by entering the **show policy-options** and **show protocols bgp** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    from {
      protocol ospf;
      area 0.0.0.1;
    }
    then accept;
  }
}
```

```
user@host# show protocols bgp
export injectpolicy1;
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Tracing for the Routing Policy

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 then trace
set routing-options traceoptions file ospf-bgp-policy-log
set routing-options traceoptions file size 5m
set routing-options traceoptions file files 5
set routing-options traceoptions flag policy
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Include a trace action in the policy.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# then trace
```

2. Configure the tracing file for the output.

```
[edit routing-options traceoptions]
user@host# set file ospf-bgp-policy-log
user@host# set file size 5m
user@host# set file files 5
user@host# set flag policy
```

Results Confirm your configuration by entering the **show policy-options** and **show routing-options** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    then {
      trace;
    }
  }
}

user@host# show routing-options
traceoptions {
  file ospf-bgp-policy-log size 5m files 5;
  flag policy;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

Verifying That the Expected BGP Routes Are Present

Purpose Verify the effect of the export policy.

Action From operational mode, enter the **show route** command.

Troubleshooting

- [Using the show log Command to Examine the Actions of the Routing Policy on page 2803](#)

Using the show log Command to Examine the Actions of the Routing Policy

Problem The routing table contains unexpected routes, or routes are missing from the routing table.

Solution If you configure policy tracing as shown in this example, you can run the **show log ospf-bgp-policy-log** command to diagnose problems with the routing policy. The **show log ospf-bgp-policy-log** command displays information about the routes that the **injectpolicy1** policy term analyzes and acts upon.

Understanding Route Advertisement

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes they should advertise in their protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table. For information about routing policy, see the *Routing Policy Feature Guide for Routing Devices*.

When configuring BGP routing policy, you can perform the following tasks:

- [Applying Routing Policy on page 2803](#)
- [Setting BGP to Advertise Inactive Routes on page 2804](#)
- [Configuring BGP to Advertise the Best External Route to Internal Peers on page 2805](#)
- [Configuring How Often BGP Exchanges Routes with the Routing Table on page 2806](#)
- [Disabling Suppression of Route Advertisements on page 2807](#)

Applying Routing Policy

You define routing policy at the **[edit policy-options]** hierarchy level. To apply policies you have defined for BGP, include the **import** and **export** statements within the BGP configuration.

You can apply policies as follows:

- BGP global **import** and **export** statements—Include these statements at the **[edit protocols bgp]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp]** hierarchy level).

- Group **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name]** hierarchy level).
- Peer **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name neighbor address]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]** hierarchy level).

A peer-level **import** or **export** statement overrides a group **import** or **export** statement. A group-level **import** or **export** statement overrides a global BGP **import** or **export** statement.

To apply policies, see the following sections:

- [Applying Policies to Routes Being Imported into the Routing Table from BGP on page 2804](#)
- [Applying Policies to Routes Being Exported from the Routing Table into BGP on page 2804](#)

Applying Policies to Routes Being Imported into the Routing Table from BGP

To apply policy to routes being imported into the routing table from BGP, include the **import** statement, listing the names of one or more policies to be evaluated:

```
import [ policy-names ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices.

Applying Policies to Routes Being Exported from the Routing Table into BGP

To apply policy to routes being exported from the routing table into BGP, include the **export** statement, listing the names of one or more policies to be evaluated:

```
export [ policy-names ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP.

Setting BGP to Advertise Inactive Routes

By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. To have the routing table export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route, include the **advertise-inactive** statement:

```
advertise-inactive;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

Configuring BGP to Advertise the Best External Route to Internal Peers

In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.

In Junos OS Release 9.3 and later, you can configure BGP to advertise the best external route into an internal BGP (IBGP) mesh group, a route reflector cluster, or an autonomous system (AS) confederation, even when the best route is an internal route.

NOTE: In order to configure the `advertise-external` statement on a route reflector, you must disable intracluster reflection with the `no-client-reflect` statement.

When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.

In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external.

You can also configure BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. As a result, an external route with an AS path worse (that is, longer) than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes. For more information, see the *Routing Policy Feature Guide for Routing Devices*.

To configure BGP to advertise the best external path to internal peers, include the **`advertise-external`** statement:

```
advertise-external;
```

NOTE: The `advertise-external` statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.

For a complete list of hierarchy levels at which you can configure this statement, see the statement summary section for this statement.

To configure BGP to advertise the best external path only if the route selection process reaches the point where the MED value is evaluated, include the **conditional** statement:

```
advertise-external {  
    conditional;  
}
```

Configuring How Often BGP Exchanges Routes with the Routing Table

BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. To guard against this, you can delay the time between when BGP and the routing table exchange route information.

To configure how often BGP and the routing table exchange route information, include the **out-delay** statement:

```
out-delay seconds;
```

By default, the routing table retains some of the route information learned from BGP. To have the routing table retain all or none of this information, include the **keep** statement:

```
keep (all | none);
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

The routing table can retain the route information learned from BGP in one of the following ways:

- Default (omit the **keep** statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.
- **keep all**—Keep all route information that was learned from BGP.
- **keep none**—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure **keep none** for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.

- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

Disabling Suppression of Route Advertisements

Junos OS does not advertise the routes learned from one EBGp peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGp peers that are in the same AS as the originating peer, regardless of the routing instance. You can modify this behavior by including the **advertise-peer-as** statement in the configuration. To disable the default advertisement suppression, include the **advertise-peer-as** statement:

advertise-peer-as;

NOTE: The route suppression default behavior is disabled if the **as-override** statement is included in the configuration.

If you include the **advertise-peer-as** statement in the configuration, BGP advertises the route regardless of this check.

To restore the default behavior, include the **no-advertise-peer-as** statement in the configuration:

no-advertise-peer-as;

If you include both the **as-override** and **no-advertise-peer-as** statements in the configuration, the **no-advertise-peer-as** statement is ignored. You can include these statements at multiple hierarchy levels.

For a list of hierarchy levels at which you can include these statements, see the statement summary section for these statements.

Example: Configuring BGP Prefix-Based Outbound Route Filtering

This example shows how to configure a Juniper Networks router to accept route filters from remote peers and perform outbound route filtering using the received filters.

- [Requirements on page 2808](#)
- [Overview on page 2808](#)
- [Configuration on page 2808](#)
- [Verification on page 2810](#)

Requirements

Before you begin:

- Configure the router interfaces.
- Configure an interior gateway protocol (IGP).

Overview

You can configure a BGP peer to accept route filters from remote peers and perform outbound route filtering using the received filters. By filtering out unwanted updates, the sending peer saves resources needed to generate and transmit updates, and the receiving peer saves resources needed to process updates. This feature can be useful, for example, in a virtual private network (VPN) in which subsets of customer edge (CE) devices are not capable of processing all the routes in the VPN. The CE devices can use prefix-based outbound route filtering to communicate to the provider edge (PE) routing device to transmit only a subset of routes, such as routes to the main data centers only.

The maximum number of prefix-based outbound route filters that a BGP peer can accept is 5000. If a remote peer sends more than 5000 outbound route filters to a peer address, the additional filters are discarded, and a system log message is generated.

You can configure interoperability for the routing device as a whole or for specific BGP groups or peers only.

Topology

In the sample network, Device CE1 is a router from another vendor. The configuration shown in this example is on Juniper Networks Router PE1.

Figure 52 on page 2808 shows the sample network.

Figure 52: BGP Prefix-Based Outbound Route Filtering

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

PE1  set protocols bgp group cisco-peers type external
      set protocols bgp group cisco-peers description "to CE1"
      set protocols bgp group cisco-peers local-address 192.168.165.58

```

```

set protocols bgp group cisco-peers peer-as 35
set protocols bgp group cisco-peers outbound-route-filter bgp-orf-cisco-mode
set protocols bgp group cisco-peers outbound-route-filter prefix-based accept inet
set protocols bgp group cisco-peers neighbor 192.168.165.56
set routing-options autonomous-system 65500

```

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router PE1 to accept route filters from Device CE1 and perform outbound route filtering using the received filters:

1. Configure the local autonomous system.

```

[edit routing-options]
user@PE1# set autonomous-system 65500

```

2. Configure external peering with Device CE1.

```

[edit protocols bgp group cisco-peers]
user@PE1# set type external
user@PE1# set description "to CE1"
user@PE1# set local-address 192.168.165.58
user@PE1# set peer-as 35
user@PE1# set neighbor 192.168.165.56

```

3. Configure Router PE1 to accept IPv4 route filters from Device CE1 and perform outbound route filtering using the received filters.

```

[edit protocols bgp group cisco-peers]
user@PE1# set outbound-route-filter prefix-based accept inet

```

4. (Optional) Enable interoperability with routing devices that use the vendor-specific compatibility code of 130 for outbound route filters and the code type of 128.

The IANA standard code is 3, and the standard code type is 64.

```

[edit protocols bgp group cisco-peers]
user@PE1# set outbound-route-filter bgp-orf-cisco-mode

```

Results From configuration mode, confirm your configuration by entering the **show protocols** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE1# show protocols
group cisco-peers {
  type external;
  description "to CE1";
  local-address 192.168.165.58;
  peer-as 35;
  outbound-route-filter {
    bgp-orf-cisco-mode;
    prefix-based {
      accept {
        inet;
      }
    }
  }
}

```

```
    }  
  }  
  neighbor 192.168.165.56;  
}  
  
user@PE1# show routing-options  
autonomous-system 65500;
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying the Outbound Route Filter on page 2810](#)
- [Verifying the BGP Neighbor Mode on page 2810](#)

Verifying the Outbound Route Filter

Purpose Display information about the prefix-based outbound route filter received from Device CE1.

Action From operational mode, enter the **show bgp neighbor orf detail** command.

```
user@PE1> show bgp neighbor orf 192.168.165.56 detail  
Peer: 192.168.165.56 Type: External  
Group: cisco-peers  
  
inet-unicast  
Filter updates rcv:          4 Immediate:          0  
Filter: prefix-based         receive  
Updates rcv:                4  
Received filter entries:  
seq 10 2.2.0.0/16 deny minlen 0 maxlen 0  
seq 20 3.3.0.0/16 deny minlen 24 maxlen 0  
seq 30 4.4.0.0/16 deny minlen 0 maxlen 28  
seq 40 5.5.0.0/16 deny minlen 24 maxlen 28
```

Verifying the BGP Neighbor Mode

Purpose Verify that the **bgp-orf-cisco-mode** setting is enabled for the peer by making sure that the **ORFCiscoMode** option is displayed in the **show bgp neighbor** command output.

Action From operational mode, enter the **show bgp neighbor** command.

```
user@PE1> show bgp neighbor  
Peer: 192.168.165.56 AS 35 Local: 192.168.165.58 AS 65500  
Type: External State: Active Flags: <>  
Last State: Idle Last Event: Start  
Last Error: None  
Export: [ adv_stat ]

Options: <ORF ORFCiscoMode>  
Address families configured: inet-unicast  
Local Address: 192.168.165.58 Holdtime: 90 Preference: 170  
Number of flaps: 0  
Trace options: detail open detail refresh  
Trace file: /var/log/orf size 5242880 files 20
```

Related Documentation

- [Understanding External BGP Peering Sessions on page 2639](#)
- [BGP Configuration Overview](#)
- [Example: Configuring BGP to Advertise the Best External Route to Internal Peers](#)
- [Example: Setting BGP to Advertise Inactive Routes](#)

Example: Configuring EBGP Multihop

- [Understanding BGP Multihop on page 2811](#)
- [Example: Configuring EBGP Multihop Sessions on page 2811](#)

Understanding BGP Multihop

When external BGP (EBGP) peers are not directly connected to each other, they must cross one or more non-BGP routers to reach each other. Configuring multihop EBGP enables the peers to pass through the other routers to form peer relationships and exchange update messages. This type of configuration is typically used when a Juniper Networks routing device needs to run EBGP with a third-party router that does not allow direct connection of the two EBGP peers. EBGP multihop enables a neighbor connection between two EBGP peers that do not have a direct connection.

Example: Configuring EBGP Multihop Sessions

This example shows how to configure an external BGP (EBGP) peer that is more than one hop away from the local router. This type of session is called a *multihop* BGP session.

- [Requirements on page 2811](#)
- [Overview on page 2811](#)
- [Configuration on page 2812](#)
- [Verification on page 2818](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

The configuration to enable multihop EBGP sessions requires connectivity between the two EBGP peers. This example uses static routes to provide connectivity between the devices.

Unlike directly connected EBGP sessions in which physical address are typically used in the **neighbor** statements, you must use loopback interface addresses for multihop EBGP by specifying the loopback interface address of the indirectly connected peer. In this way, EBGP multihop is similar to internal BGP (IBGP).

Finally, you must add the **multihop** statement. Optionally, you can set a maximum time-to-live (TTL) value with the **ttl** statement. The TTL is carried in the IP header of BGP packets. If you do not specify a TTL value, the system's default maximum TTL value

is used. The default TTL value is 64 for multihop EBGP sessions. Another option is to retain the BGP next-hop value for route advertisements by including the **no-nexthop-change** statement.

Figure 53 on page 2812 shows a typical EBGP multihop network.

Device C and Device E have an established EBGP session. Device D is not a BGP-enabled device. All of the devices have connectivity via static routes.

Figure 53: Typical Network with EBGP Multihop Sessions

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device C

```
set interfaces fe-1/2/0 unit 9 description to-D
set interfaces fe-1/2/0 unit 9 family inet address 10.10.10.9/30
set interfaces lo0 unit 3 family inet address 192.168.40.4/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers multihop ttl 2
set protocols bgp group external-peers local-address 192.168.40.4
set protocols bgp group external-peers export send-static
set protocols bgp group external-peers peer-as 18
set protocols bgp group external-peers neighbor 192.168.6.7
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.10.10.14/32 next-hop 10.10.10.10
set routing-options static route 192.168.6.7/32 next-hop 10.10.10.10
set routing-options router-id 192.168.40.4
set routing-options autonomous-system 17
```

Device D

```
set interfaces fe-1/2/0 unit 10 description to-C
set interfaces fe-1/2/0 unit 10 family inet address 10.10.10.10/30
set interfaces fe-1/2/1 unit 13 description to-E
set interfaces fe-1/2/1 unit 13 family inet address 10.10.10.13/30
set interfaces lo0 unit 4 family inet address 192.168.6.6/32
set routing-options static route 192.168.40.4/32 next-hop 10.10.10.9
set routing-options static route 192.168.6.7/32 next-hop 10.10.10.14
set routing-options router-id 192.168.6.6
```

Device E

```
set interfaces fe-1/2/0 unit 14 description to-D
```

```

set interfaces fe-1/2/0 unit 14 family inet address 10.10.10.14/30
set interfaces lo0 unit 5 family inet address 192.168.6.7/32
set protocols bgp group external-peers multihop ttl 2
set protocols bgp group external-peers local-address 192.168.6.7
set protocols bgp group external-peers export send-static
set protocols bgp group external-peers peer-as 17
set protocols bgp group external-peers neighbor 192.168.40.4
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.10.10.8/30 next-hop 10.10.10.13
set routing-options static route 192.168.40.4/32 next-hop 10.10.10.13
set routing-options router-id 192.168.6.7
set routing-options autonomous-system 18

```

Device C

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device C:

1. Configure the interface to the directly connected device (to-D), and configure the loopback interface.

```

[edit interfaces fe-1/2/0 unit 9]
user@C# set description to-D
user@C# set family inet address 10.10.10.9/30

```

```

[edit interfaces lo0 unit 3]
user@C# set family inet address 192.168.40.4/32

```

2. Configure an EBGP session with Device E.

The **neighbor** statement points to the loopback interface on Device E.

```

[edit protocols bgp group external-peers]
user@C# set type external
user@C# set local-address 192.168.40.4
user@C# set export send-static
user@C# set peer-as 18
user@C# set neighbor 192.168.6.7

```

3. Configure the multihop statement to enable Device C and Device E to become EBGP peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```

[edit protocols bgp group external-peers]
user@C# set multihop ttl 2

```

4. Configure connectivity to Device E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```

[edit routing-options]

```

```
user@C# set static route 10.10.10.14/32 next-hop 10.10.10.10
user@C# set static route 192.168.6.7/32 next-hop 10.10.10.10
```

5. Configure the local router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@C# set router-id 192.168.40.4
user@C# set autonomous-system 17
```

6. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-static term 1]
user@C# set from protocol static
user@C# set then accept
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@C# show interfaces
fe-1/2/0 {
  unit 9 {
    description to-D;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.40.4/32;
    }
  }
}
```

```
user@C# show protocols
bgp {
  group external-peers {
    type external;
    multihop {
      ttl 2;
    }
    local-address 192.168.40.4;
    export send-static;
    peer-as 18;
    neighbor 192.168.6.7;
  }
}
```

```
user@C# show policy-options
policy-statement send-static {
  term 1 {
```

```

        from protocol static;
        then accept;
    }
}

user@C# show routing-options
static {
    route 10.10.10.14/32 next-hop 10.10.10.10;
    route 192.168.6.7/32 next-hop 10.10.10.10;
}
router-id 192.168.40.4;
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps for all BFD sessions in the topology.

Configuring Device D

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device D:

1. Set the CLI to Device D.

```
user@host> set cli logical-system D
```

2. Configure the interfaces to the directly connected devices, and configure a loopback interface.

```

[edit interfaces fe-1/2/0 unit 10]
user@D# set description to-C
user@D# set family inet address 10.10.10.10/30

```

```

[edit interfaces fe-1/2/1 unit 13]
user@D# set description to-E
user@D# set family inet address 10.10.10.13/30

```

```

[edit interfaces lo0 unit 4]
user@D# set family inet address 192.168.6.6/32

```

3. Configure connectivity to the other devices using static routes to the loopback interface addresses.

On Device D, you do not need static routes to the physical addresses because Device D is directly connected to Device C and Device E.

```

[edit routing-options]
user@D# set static route 192.168.40.4/32 next-hop 10.10.10.9
user@D# set static route 192.168.6.7/32 next-hop 10.10.10.14

```

4. Configure the local router ID.

```

[edit routing-options]
user@D# set router-id 192.168.6.6

```

Results From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@D# show interfaces
fe-1/2/0 {
  unit 10 {
    description to-C;
    family inet {
      address 10.10.10.10/30;
    }
  }
}
fe-1/2/1 {
  unit 13 {
    description to-E;
    family inet {
      address 10.10.10.13/30;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.6.6/32;
    }
  }
}

user@D# show protocols

user@D# show routing-options
static {
  route 192.168.40.4/32 next-hop 10.10.10.9;
  route 192.168.6.7/32 next-hop 10.10.10.14;
}
router-id 192.168.6.6;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps for all BFD sessions in the topology.

Configuring Device E

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device E:

1. Set the CLI to Device E.

```
user@host> set cli logical-system E
```
2. Configure the interface to the directly connected device (to-D), and configure the loopback interface.

```
[edit interfaces fe-1/2/0 unit 14]
```

```
user@E# set description to-D
user@E# set family inet address 10.10.10.14/30
```

```
[edit interfaces lo0 unit 5]
user@E# set family inet address 192.168.6.7/32
```

3. Configure an EBGP session with Device E.

The **neighbor** statement points to the loopback interface on Device C.

```
[edit protocols bgp group external-peers]
user@E# set local-address 192.168.6.7
user@E# set export send-static
user@E# set peer-as 17
user@E# set neighbor 192.168.40.4
```

4. Configure the **multihop** statement to enable Device C and Device E to become EBGP peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```
[edit protocols bgp group external-peers]
user@E# set multihop ttl 2
```

5. Configure connectivity to Device E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```
[edit routing-options]
user@E# set static route 10.10.10.8/30 next-hop 10.10.10.13
user@E# set static route 192.168.40.4/32 next-hop 10.10.10.13
```

6. Configure the local router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@E# set router-id 192.168.6.7
user@E# set autonomous-system 18
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-static term 1]
user@E# set from protocol static
user@E# set then accept
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@E# show interfaces
fe-1/2/0 {
  unit 14 {
    description to-D;
    family inet {
```

```
        address 10.10.10.14/30;
    }
}
lo0 {
    unit 5 {
        family inet {
            address 192.168.6.7/32;
        }
    }
}

user@E# show protocols
bgp {
    group external-peers {
        multihop {
            ttl 2;
        }
        local-address 192.168.6.7;
        export send-static;
        peer-as 17;
        neighbor 192.168.40.4;
    }
}

user@E# show policy-options
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@E# show routing-options
static {
    route 10.10.10.8/30 next-hop 10.10.10.13;
    route 192.168.40.4/32 next-hop 10.10.10.13;
}
router-id 192.168.6.7;
autonomous-system 18;
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying Connectivity on page 2818](#)
- [Verifying That BGP Sessions Are Established on page 2819](#)
- [Viewing Advertised Routes on page 2819](#)

Verifying Connectivity

Purpose Make sure that Device C can ping Device E, specifying the loopback interface address as the source of the ping request.

The loopback interface address is the source address that BGP will use.

Action From operational mode, enter the `ping 10.10.10.14 source 192.168.40.4` command from Device C, and enter the `ping 10.10.10.9 source 192.168.6.7` command from Device E.

```
user@C> ping 10.10.10.14 source 192.168.40.4
```

```
PING 10.10.10.14 (10.10.10.14): 56 data bytes
64 bytes from 10.10.10.14: icmp_seq=0 ttl=63 time=1.262 ms
64 bytes from 10.10.10.14: icmp_seq=1 ttl=63 time=1.202 ms
^C
--- 10.10.10.14 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.202/1.232/1.262/0.030 ms
```

```
user@E> ping 10.10.10.9 source 192.168.6.7
```

```
PING 10.10.10.9 (10.10.10.9): 56 data bytes
64 bytes from 10.10.10.9: icmp_seq=0 ttl=63 time=1.255 ms
64 bytes from 10.10.10.9: icmp_seq=1 ttl=63 time=1.158 ms
^C
--- 10.10.10.9 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.158/1.206/1.255/0.049 ms
```

Meaning The static routes are working if the pings work.

Verifying That BGP Sessions Are Established

Purpose Verify that the BGP sessions are up.

Action From operational mode, enter the `show bgp summary` command.

```
user@C> show bgp summary
```

```
Groups: 1 Peers: 1 Down peers: 0
Table          Tot Paths  Act Paths Suppressed    History  Damp State   Pending
inet.0          2          0          0          0          0          0          0
Peer           AS      InPkt   OutPkt   OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.6.7      18       147     147      0        1    1:04:27
0/2/2/0         0/0/0/0
```

```
user@E> show bgp summary
```

```
Groups: 1 Peers: 1 Down peers: 0
Table          Tot Paths  Act Paths Suppressed    History  Damp State   Pending
inet.0          2          0          0          0          0          0          0
Peer           AS      InPkt   OutPkt   OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.40.4     17       202     202      0        1    1:02:18
0/2/2/0         0/0/0/0
```

Meaning The output shows that both devices have one peer each. No peers are down.

Viewing Advertised Routes

Purpose Check to make sure that routes are being advertised by BGP.

Action From operational mode, enter the `show route advertising-protocol bgp neighbor` command.

```
user@C> show route advertising-protocol bgp 192.168.6.7
```

```
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 10.10.10.14/32    Self
* 192.168.6.7/32    Self            I
```

```
user@E> show route advertising-protocol bgp 192.168.40.4
```

```
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 10.10.10.8/30     Self
* 192.168.40.4/32   Self            I
```

Meaning The `send-static` routing policy is exporting the static routes from the routing table into BGP. BGP is advertising these routes between the peers because the BGP peer session is established.

Understanding Route Preference Values

The Junos OS routing protocol process assigns a default preference value (also known as an *administrative distance*) to each route that the routing table receives. The default value depends on the source of the route. The preference value is a value from 0 through 4,294,967,295 ($2^{32} - 1$), with a lower value indicating a more preferred route.

[Table 227 on page 2820](#) lists the default preference values.

Table 227: Default Route Preference Values

| How Route Is Learned | Default Preference | Statement to Modify Default Preference |
|----------------------------|--------------------|---|
| Directly connected network | 0 | — |
| System routes | 4 | — |
| Static and Static LSPs | 5 | <i>static</i> |
| RSVP-signaled LSPs | 7 | RSVP preference as described in the <i>Junos OS MPLS Applications Library for Routing Devices</i> |
| LDP-signaled LSPs | 9 | LDP preference , as described in the <i>Junos OS MPLS Applications Library for Routing Devices</i> |

Table 227: Default Route Preference Values (*continued*)

| How Route Is Learned | Default Preference | Statement to Modify Default Preference |
|------------------------------|--------------------|--|
| OSPF internal route | 10 | OSPF preference |
| IS-IS Level 1 internal route | 15 | IS-IS preference |
| IS-IS Level 2 internal route | 18 | IS-IS preference |
| Redirects | 30 | – |
| Kernel | 40 | – |
| SNMP | 50 | – |
| Router discovery | 55 | – |
| RIP | 100 | RIP preference |
| RIPng | 100 | RIPng preference |
| PIM | 105 | <i>Multicast Protocols Feature Guide for Routing Devices</i> |
| DVMRP | 110 | <i>Multicast Protocols Feature Guide for Routing Devices</i> |
| Aggregate | 130 | aggregate |
| OSPF AS external routes | 150 | OSPF external-preference |
| IS-IS Level 1 external route | 160 | IS-IS external-preference |
| IS-IS Level 2 external route | 165 | IS-IS external-preference |
| BGP | 170 | BGP preference , export , import |
| MSDP | 175 | <i>Multicast Protocols Feature Guide for Routing Devices</i> |

In general, the narrower the scope of the statement, the higher precedence its preference value is given, but the smaller the set of routes it affects. To modify the default preference value for routes learned by routing protocols, you generally apply routing policy when configuring the individual routing protocols. You also can modify some preferences with other configuration statements, which are indicated in the table.

Example: Configuring the Preference Value for BGP Routes

This example shows how to specify the preference for routes learned from BGP. Routing information can be learned from multiple sources. To break ties among equally specific routes learned from multiple sources, each source has a preference value. Routes that are learned through explicit administrative action, such as static routes, are preferred

over routes learned from a routing protocol, such as BGP or OSPF. This concept is called *administrative distance* by some vendors.

- [Requirements on page 2822](#)
- [Overview on page 2822](#)
- [Configuration on page 2823](#)
- [Verification on page 2825](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

Routing information can be learned from multiple sources, such as through static configuration, BGP, or an interior gateway protocol (IGP). When Junos OS determines a route's preference to become the active route, it selects the route with the lowest preference as the active route and installs this route into the forwarding table. By default, the routing software assigns a preference of 170 to routes that originated from BGP. Of all the routing protocols, BGP has the highest default preference value, which means that routes learned by BGP are the least likely to become the active route.

Some vendors have a preference (distance) of 20 for external BGP (EBGP) and a distance of 200 for internal BGP (IBGP). Junos OS uses the same value (170) for both EBGP and IBGP. However, this difference between vendors has no operational impact because Junos OS always prefers EBGP routes over IBGP routes.

Another area in which vendors differ is in regard to IGP distance compared to BGP distance. For example, some vendors assign a distance of 110 to OSPF routes. This is higher than the EBGP distance of 20, and results in the selection of an EBGP route over an equivalent OSPF route. In the same scenario, Junos OS chooses the OSPF route, because of the default preference 10 for an internal OSPF route and 150 for an external OSPF route, which are both lower than the 170 preference assigned to all BGP routes.

In a multivendor environment, you might want to change the preference value for BGP routes so that Junos OS chooses an EBGP route instead of an OSPF route. To accomplish this goal, one option is to include the [preference](#) statement in the EBGP configuration. To modify the default BGP preference value, include the **preference** statement, specifying a value from 0 through 4,294,967,295 ($2^{32} - 1$).

TIP: Another way to achieve multivendor compatibility is to include the [advertise-inactive](#) statement in the EBGP configuration. This causes the routing table to export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The `advertise-inactive` statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the `advertise-inactive` statement, the Junos OS device uses the OSPF

route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.

Topology

In the sample network, Device R1 and Device R2 have EBGP routes to each other and also OSPF routes to each other.

This example shows the routing tables in the following cases:

- Accept the default preference values of 170 for BGP and 10 for OSPF.
- Change the BGP preference to 8.

Figure 54 on page 2823 shows the sample network.

Figure 54: BGP Preference Value Topology

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```

set interfaces fe-1/2/0 unit 4 family inet address 1.12.0.1/30
set interfaces lo0 unit 2 family inet address 10.255.71.24/32
set protocols bgp export send-direct
set protocols bgp group ext type external

```

```
set protocols bgp group ext preference 8
set protocols bgp group ext peer-as 65000
set protocols bgp group ext neighbor 1.12.0.2
set protocols ospf area 0.0.0.0 interface fe-1/2/0.4
set protocols ospf area 0.0.0.0 interface 10.255.71.24
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 65500
```

Device R2

```
set interfaces fe-1/2/0 unit 6 family inet address 1.12.0.2/30
set interfaces lo0 unit 3 family inet address 10.255.14.177/32
set protocols bgp export send-direct
set protocols bgp group ext type external
set protocols bgp group ext peer-as 65500
set protocols bgp group ext neighbor 1.12.0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/0.6
set protocols ospf area 0.0.0.0 interface 10.255.14.177
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 65000
```

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 4 family inet address 1.12.0.1/30
user@R1# set lo0 unit 2 family inet address 10.255.71.24/32
```
2. Configure the local autonomous system.

```
[edit routing-options]
user@R1# set autonomous-system 65500
```
3. Configure the external peering with Device R2.

```
[edit protocols bgp]
user@R1# set export send-direct
user@R1# set group ext type external
user@R1# set group ext preference 8
user@R1# set group ext peer-as 65000
user@R1# set group ext neighbor 1.12.0.2
```
4. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.4
user@R1# set interface 10.255.71.24
```
5. Configure the routing policy.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 4 {
    family inet {
      address 1.12.0.1/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.255.71.24/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
protocols {
  bgp {
    export send-direct;
    group ext {
      type external;
      preference 8;
      peer-as 65000;
      neighbor 1.12.0.2;
    }
  }
  ospf {
    area 0.0.0.0 {
      interface fe-1/2/0.4;
      interface 10.255.71.24;
    }
  }
}

user@R1# show routing-options
autonomous-system 65500;

```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps on Device R2.

Verification

Confirm that the configuration is working properly.

Verifying the Preference

Purpose Make sure that the routing tables on Device R1 and Device R2 reflect the fact that Device R1 is using the configured EBGp preference of 8, and Device R2 is using the default EBGp preference of 170.

Action From operational mode, enter the **show route** command.

```
user@R1> show route
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.12.0.0/30      *[Direct/0] 3d 07:03:01
                  > via fe-1/2/0.4
                  [BGP/8] 01:04:49, localpref 100
                  AS path: 65000 I
                  > to 1.12.0.2 via fe-1/2/0.4
1.12.0.1/32      *[Local/0] 3d 07:03:01
                  Local via fe-1/2/0.4
10.255.14.177/32 *[BGP/8] 01:04:49, localpref 100
                  AS path: 65000 I
                  > to 1.12.0.2 via fe-1/2/0.4
                  [OSPF/10] 3d 07:02:16, metric 1
                  > to 1.12.0.2 via fe-1/2/0.4
10.255.71.24/32  *[Direct/0] 3d 07:03:01
                  > via lo0.2
224.0.0.5/32     *[OSPF/10] 5d 03:42:16, metric 1
                  MultiRecv
```

```
user@R2> show route
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.12.0.0/30      *[Direct/0] 3d 07:03:30
                  > via fe-1/2/0.6
                  [BGP/170] 00:45:36, localpref 100
                  AS path: 65500 I
                  > to 1.12.0.1 via fe-1/2/0.6
1.12.0.2/32      *[Local/0] 3d 07:03:30
                  Local via fe-1/2/0.6
10.255.14.177/32 *[Direct/0] 3d 07:03:30
                  > via lo0.3
10.255.71.24/32  *[OSPF/10] 3d 07:02:45, metric 1
                  > to 1.12.0.1 via fe-1/2/0.6
                  [BGP/170] 00:45:36, localpref 100
                  AS path: 65500 I
                  > to 1.12.0.1 via fe-1/2/0.6
224.0.0.5/32     *[OSPF/10] 5d 03:42:45, metric 1
                  MultiRecv
```

Meaning The output shows that on Device R1, the active path to Device R2's loopback interface (10.255.14.177/32) is a BGP route. The output also shows that on Device R2, the active path to Device R1's loopback interface (10.255.71.24/32) is an OSPF route.

Understanding BGP Path Selection

For each prefix in the routing table, the routing protocol process selects a single best path. After the best path is selected, the route is installed in the routing table. The best path becomes the active route if the same prefix is not learned by a protocol with a lower (more preferred) global preference value, also known as the administrative distance. The algorithm for determining the active route is as follows:

1. Verify that the next hop can be resolved.
2. Choose the path with the lowest preference value (routing protocol process preference).

Routes that are not eligible to be used for forwarding (for example, because they were rejected by routing policy or because a next hop is inaccessible) have a preference of -1 and are never chosen.

3. Prefer the path with higher local preference.

For non-BGP paths, choose the path with the lowest **preference2** value.

4. If the accumulated interior gateway protocol (AIGP) attribute is enabled, prefer the path with the lower AIGP attribute.
5. Prefer the path with the shortest autonomous system (AS) path value (skipped if the **as-path-ignore** statement is configured).

A confederation segment (sequence or set) has a path length of 0. An AS set has a path length of 1.

6. Prefer the route with the lower origin code.

Routes learned from an IGP have a lower origin code than those learned from an exterior gateway protocol (EGP), and both have lower origin codes than incomplete routes (routes whose origin is unknown).

7. Prefer the path with the lowest multiple exit discriminator (MED) metric.

Depending on whether nondeterministic routing table path selection behavior is configured, there are two possible cases:

- If nondeterministic routing table path selection behavior is not configured (that is, if the **path-selection cisco-nondeterministic** statement is not included in the BGP configuration), for paths with the same neighboring AS numbers at the front of the AS path, prefer the path with the lowest MED metric. To always compare MEDs whether or not the peer ASs of the compared routes are the same, include the **path-selection always-compare-med** statement.

- If nondeterministic routing table path selection behavior is configured (that is, the **path-selection cisco-nondeterministic** statement is included in the BGP configuration), prefer the path with the lowest MED metric.

Confederations are not considered when determining neighboring ASs. A missing MED metric is treated as if a MED were present but zero.

NOTE: MED comparison works for single path selection within an AS (when the route does not include an AS path), though this usage is uncommon.

By default, only the MEDs of routes that have the same peer autonomous systems (ASs) are compared. You can configure routing table path selection options to obtain different behaviors.

8. Prefer strictly internal paths, which include IGP routes and locally generated routes (static, direct, local, and so forth).
9. Prefer strictly external BGP (EBGP) paths over external paths learned through internal BGP (IBGP) sessions.
10. Prefer the path whose next hop is resolved through the IGP route with the lowest metric.

NOTE: A path is considered a BGP equal-cost path (and will be used for forwarding) if a tie-break is performed after the previous step. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor, are considered.

BGP multipath does not apply to paths that share the same MED-plus-IGP cost yet differ in IGP cost. Multipath path selection is based on the IGP cost metric, even if two paths have the same MED-plus-IGP cost.

11. If both paths are external, prefer the currently active path to minimize route-flapping. This rule is not used if any one of the following conditions is true:
 - **path-selection external-router-id** is configured.
 - Both peers have the same router ID.
 - Either peer is a confederation peer.
 - Neither path is the current active path.
12. Prefer a primary route over a secondary route. A primary route is one that belongs to the routing table. A secondary route is one that is added to the routing table through an export policy.
13. Prefer the path from the peer with the lowest router ID. For any path with an originator ID attribute, substitute the originator ID for the router ID during router ID comparison.

14. Prefer the path with the shortest cluster list length. The length is 0 for no list.
15. Prefer the path from the peer with the lowest peer IP address.

Routing Table Path Selection

The shortest AS path step of the algorithm, by default, evaluates the length of the AS path and determines the active path. You can configure an option that enables Junos OS to skip this step of the algorithm by including the **as-path-ignore** option.

NOTE: The **as-path-ignore** option is not supported for routing instances.

To configure routing table path selection behavior, include the **path-selection** statement:

```
path-selection {
  (always-compare-med | cisco-non-deterministic | external-router-id);
  as-path-ignore;
  med-plus-igp {
    igp-multiplier number;
    med-multiplier number;
  }
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

Routing table path selection can be configured in one of the following ways:

- Emulate the Cisco IOS default behavior (**cisco-non-deterministic**). This mode evaluates routes in the order that they are received and does not group them according to their neighboring AS. With **cisco-non-deterministic** mode, the active path is always first. All inactive, but eligible, paths follow the active path and are maintained in the order in which they were received, with the most recent path first. Ineligible paths remain at the end of the list.

As an example, suppose you have three path advertisements for the 192.168.1.0 /24 route:

- Path 1—learned through EBGp; AS Path of 65010; MED of 200
- Path 2—learned through IBGP; AS Path of 65020; MED of 150; IGP cost of 5
- Path 3—learned through IBGP; AS Path of 65010; MED of 100; IGP cost of 10

These advertisements are received in quick succession, within a second, in the order listed. Path 3 is received most recently, so the routing device compares it against path 2, the next most recent advertisement. The cost to the IBGP peer is better for path 2, so the routing device eliminates path 3 from contention. When comparing paths 1 and 2, the routing device prefers path 1 because it is received from an EBGp peer. This allows the routing device to install path 1 as the active path for the route.

NOTE: We do not recommend using this configuration option in your network. It is provided solely for interoperability to allow all routing devices in the network to make consistent route selections.

- Always comparing MEDs whether or not the peer ASs of the compared routes are the same (**always-compare-med**).
- Override the rule that If both paths are external, the currently active path is preferred (**external-router-id**). Continue with the next step (Step 12) in the path-selection process.
- Adding the IGP cost to the next-hop destination to the MED value before comparing MED values for path selection (**med-plus-igp**).

BGP multipath does not apply to paths that share the same MED-plus-IGP cost, yet differ in IGP cost. Multipath path selection is based on the IGP cost metric, even if two paths have the same MED-plus-IGP cost.

Effects of Advertising Multiple Paths to a Destination

BGP advertises only the active path, unless you configure BGP to advertise multiple paths to a destination.

Suppose a routing device has in its routing table four paths to a destination and is configured to advertise up to three paths (**add-path send path-count 3**). The three paths are chosen based on path selection criteria. That is, the three best paths are chosen in path-selection order. The best path is the active path. This path is removed from consideration and a new best path is chosen. This process is repeated until the specified number of paths is reached.

Example: Ignoring the AS Path Attribute When Selecting the Best Path

If multiple BGP routes to the same destination exist, BGP selects the best path based on the route attributes of the paths. One of the route attributes that affects the best-path decision is the length of the AS paths of each route. Routes with shorter AS paths are preferred over those with longer AS paths. Although not typically practical, some scenarios might require that the AS path length be ignored in the route selection process. This example shows how to configure a routing device to ignore the AS path attribute.

- [Verification on page 2837](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

On externally connected routing devices, the purpose of skipping the AS path comparison might be to force an external BGP (EBGP) versus internal BGP (IBGP) decision to remove traffic from your network as soon as possible. On internally connected routing devices, you might want your IBGP-only routers to default to the local externally connected gateway. The local IBGP-only (internal) routers skip the AS path comparison and move down the decision tree to use the closest interior gateway protocol (IGP) gateway (lowest IGP metric). Doing this might be an effective way to force these routers to use a LAN connection instead of their WAN connection.

CAUTION: When you include the `as-path-ignore` statement on a routing device in your network, you might need to include it on all other BGP-enabled devices in your network to prevent routing loops and convergence issues. This is especially true for IBGP path comparisons.

In this example, Device R2 is learning about the loopback interface address on Device R4 (4.4.4.4/32) from Device R1 and Device R3. Device R1 is advertising 4.4.4.4/32 with an AS-path of 1 5 4, and Device R3 is advertising 4.4.4.4/32 with an AS-path of 3 4. Device R2 selects the path for 4.4.4.4/32 from Device R3 as the best path because the AS path is shorter than the AS path from Device R1.

This example modifies the BGP configuration on Device R2 so that the AS-path length is not used in the best-path selection.

Device R1 has a lower router ID (1.1.1.1) than Device R3 (1.1.1.1). If all other path selection criteria are equal (or, as in this case, ignored), the route learned from Device R1 is used. Because the AS-path attribute is being ignored, the best path is toward Device R1 because of its lower router ID value.

Figure 55 on page 2832 shows the sample topology.

Figure 55: Topology for Ignoring the AS-Path Length

**Configuration****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1 set interfaces fe-1/2/0 unit 1 family inet address 192.168.10.1/24
set interfaces fe-1/2/1 unit 10 family inet address 192.168.50.2/24
set interfaces lo0 unit 1 family inet address 1.1.1.1/32
set protocols bgp group ext type external

Configuring Device R2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 192.168.10.2/24
user@R2# set fe-1/2/1 unit 3 family inet address 192.168.20.2/24
user@R2# set lo0 unit 2 family inet address 2.2.2.2/32
```

2. Configure EBGp.

```
[edit protocols bgp group ext]
```

```

user@R2# set type external
user@R2# set export send-direct
user@R2# set export send-static
user@R2# set export send-local
user@R2# set neighbor 192.168.10.1 peer-as 1
user@R2# set neighbor 192.168.20.1 peer-as 3

```

3. Configure the autonomous system (AS) path attribute to be ignored in the Junos OS path selection algorithm.

```

[edit protocols bgp]
user@R2# set path-selection as-path-ignore

```

4. Configure the routing policy.

```

[edit policy-options]
user@R2# set policy-statement send-direct term 1 from protocol direct
user@R2# set policy-statement send-direct term 1 then accept
user@R2# set policy-statement send-local term 1 from protocol local
user@R2# set policy-statement send-local term 1 then accept
user@R2# set policy-statement send-static term 1 from protocol static
user@R2# set policy-statement send-static term 1 then accept

```

5. Configure some static routes.

```

[edit routing-options static]
user@R2# set route 192.168.50.0/24 next-hop 192.168.10.1
user@R2# set route 192.168.40.0/24 next-hop 192.168.10.1
user@R2# set route 192.168.30.0/24 next-hop 192.168.20.1

```

6. Configure the autonomous system (AS) number and the router ID.

```

[edit routing-options]
user@R2# set router-id 2.2.2.2
user@R2# set autonomous-system 2

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 192.168.10.2/24;
    }
  }
}
fe-1/2/1 {
  unit 3 {
    family inet {
      address 192.168.20.2/24;
    }
  }
}
lo0 {
  unit 2 {

```

```
        family inet {
            address 2.2.2.2/32;
        }
    }
}

user@R2# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-local {
    term 1 {
        from protocol local;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R2# show protocols
bgp {
    path-selection as-path-ignore;
    group ext {
        type external;
        export [ send-direct send-static send-local ];
        neighbor 192.168.10.1 {
            peer-as 1;
        }
        neighbor 192.168.20.1 {
            peer-as 3;
        }
    }
}

user@R21# show routing-options
static {
    route 192.168.50.0/24 next-hop 192.168.10.1;
    route 192.168.40.0/24 next-hop 192.168.10.1;
    route 192.168.30.0/24 next-hop 192.168.20.1;
}
router-id 2.2.2.2;
autonomous-system 2;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration on the other devices in the network, changing the interface names and IP addresses, as needed.

Verification

Confirm that the configuration is working properly.

- [Checking the Neighbor Status on page 2837](#)

Checking the Neighbor Status

Purpose Make sure that from Device R2, the active path to get to AS 4 is through AS 1 and AS 5, not through AS 3.

NOTE: To verify the functionality of the `as-path-ignore` statement, you might need to run the `restart routing` command to force reevaluation of the active path. This is because for BGP, if both paths are external, the Junos OS behavior is to prefer the currently active path. This behavior helps to minimize route-flapping. Use caution when restarting the routing protocol process in a production network.

Action From operational mode, enter the `restart routing` command.

```
user@R2> restart routing
Routing protocols process started, pid 49396
```

From operational mode, enter the `show route 4.4.4.4 protocol bgp` command.

```
user@R2> show route 4.4.4.4 protocol bgp
inet.0: 12 destinations, 25 routes (12 active, 0 holddown, 4 hidden)
+ = Active Route, - = Last Active, * = Both

4.4.4.4/32          *[BGP/170] 00:00:12, localpref 100
                    AS path: 1 5 4 I
                    > to 192.168.10.1 via fe-1/2/0.2
                    [BGP/170] 00:00:08, localpref 100
                    AS path: 3 4 I
                    > to 192.168.20.1 via fe-1/2/1.3
```

Meaning The asterisk (*) is next to the path learned from R1, meaning that this is the active path. The AS path for the active path is 1 5 4, which is longer than the AS path (3 4) for the nonactive path learned from Router R3.

Example: Removing Private AS Numbers

- [Understanding Private AS Number Removal from AS Paths on page 2838](#)
- [Example: Removing Private AS Numbers from AS Paths on page 2839](#)

Understanding Private AS Number Removal from AS Paths

By default, when BGP advertises AS paths to remote systems, it includes all AS numbers, including private AS numbers. You can configure the software so that it removes private AS numbers from AS paths. Doing this is useful when any of the following circumstances are true:

- A remote AS for which you provide connectivity is multihomed, but only to the local AS.
- The remote AS does not have an officially allocated AS number.
- It is not appropriate to make the remote AS a confederation member AS of the local AS.

Most companies acquire their own AS number. Some companies also use private AS numbers to connect to their public AS network. These companies might use a different private AS number for each region in which their company does business. In any implementation, announcing a private AS number to the Internet must be avoided. Service providers can use the **remove-private** statement to prevent advertising private AS numbers to the Internet.

In an enterprise scenario, suppose that you have multiple AS numbers in your company, some of which are private AS numbers, and one with a public AS number. The one with a public AS number has a direct connection to the service provider. In the AS that connects directly to the service provider, you can use the **remove-private** statement to filter out any private AS numbers in the advertisements that are sent to the service provider.

CAUTION: Changing configuration statements that affect BGP peers, such as enabling or disabling **remove-private** or renaming a BGP group, resets the BGP sessions. Changes that affect BGP peers should only be made when resetting a BGP session is acceptable.

The AS numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

NOTE: As of Junos OS 10.0R2 and later, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the **as-override** statement instead of the **remove-private** statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The software is preconfigured with knowledge of the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document. The set of AS numbers reserved as private are in the range from 64,512 through 65,534, inclusive.

Example: Removing Private AS Numbers from AS Paths

This example demonstrates the removal of a private AS number from the advertised AS path to avoid announcing the private AS number to the Internet.

- [Requirements on page 2839](#)
- [Overview on page 2839](#)
- [Configuration on page 2839](#)
- [Verification on page 2842](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

Service providers and enterprise networks use the **remove-private** statement to prevent advertising private AS numbers to the Internet. The **remove-private** statement works in the outbound direction. You configure the **remove-private** statement on a device that has a public AS number and that is connected to one or more devices that have private AS numbers. Generally, you would not configure this statement on a device that has a private AS number.

[Figure 56 on page 2839](#) shows the sample topology.

Figure 56: Topology for Removing a Private AS from the Advertised AS Path

In this example, Device R1 is connected to its service provider using private AS number 65535. The example shows the **remove-private** statement configured on Device ISP to prevent Device R1's private AS number from being announced to Device R2. Device R2 sees only the AS number of the service provider.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 192.168.10.1/24
set interfaces lo0 unit 1 family inet address 10.10.10.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 192.168.10.10
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.20.0/24 next-hop 192.168.10.10
set routing-options autonomous-system 65535
```

Device ISP

```
set interfaces fe-1/2/0 unit 2 family inet address 192.168.10.10/24
set interfaces fe-1/2/1 unit 3 family inet address 192.168.20.20/24
set interfaces lo0 unit 2 family inet address 10.10.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext neighbor 192.168.10.1 peer-as 65535
set protocols bgp group ext neighbor 192.168.20.1 remove-private
set protocols bgp group ext neighbor 192.168.20.1 peer-as 200
set routing-options autonomous-system 100
```

Device R2

```
set interfaces fe-1/2/0 unit 4 family inet address 192.168.20.1/24
set interfaces lo0 unit 3 family inet address 10.10.20.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 192.168.20.20
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.10.0/24 next-hop 192.168.20.20
set routing-options autonomous-system 200
```

Device ISP

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device ISP:

1. Configure the interfaces.

```
[edit interfaces]
user@ISP# set fe-1/2/0 unit 2 family inet address 192.168.10.10/24
user@ISP# set fe-1/2/1 unit 3 family inet address 192.168.20.20/24
user@ISP# set lo0 unit 2 family inet address 10.10.0.1/32
```
2. Configure EBGp.

```
[edit protocols bgp group ext]
user@ISP# set type external
user@ISP# set neighbor 192.168.10.1 peer-as 65535
user@ISP# set neighbor 192.168.20.1 peer-as 200
```

3. For the neighbor in autonomous system (AS) 200 (Device R2), remove private AS numbers from the advertised AS paths.

```
[edit protocols bgp group ext]
user@ISP# set neighbor 192.168.20.1 remove-private
```

4. Configure the AS number.

```
[edit routing-options]
user@ISP# set autonomous-system 100
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@ISP# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 192.168.10.10/24;
    }
  }
}
fe-1/2/1 {
  unit 3 {
    family inet {
      address 192.168.20.20/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.10.0.1/32;
    }
  }
}

user@ISP# show protocols
bgp {
  group ext {
    type external;
    neighbor 192.168.10.1 {
      peer-as 65535;
    }
    neighbor 192.168.20.1 {
      remove-private;
      peer-as 200;
    }
  }
}
```

```
user@ISP# show routing-options
autonomous-system 100;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration on Device R1 and Device R2, changing the interface names and IP address, as needed, and adding the routing policy configuration.

Verification

Confirm that the configuration is working properly.

- [Checking the Neighbor Status on page 2842](#)
- [Checking the Routing Tables on page 2843](#)
- [Checking the AS Path When the remove-private Statement Is Deactivated on page 2843](#)

Checking the Neighbor Status

Purpose Make sure that Device ISP has the **remove-private** setting enabled in its neighbor session with Device R2.

Action From operational mode, enter the **show bgp neighbor 192.168.20.1** command.

```
user@ISP> show bgp neighbor 192.168.20.1
Peer: 192.168.20.1+179 AS 200 Local: 192.168.20.20+60216 AS 100
Type: External State: Established Flags: <ImportEval Sync>
Last State: OpenConfirm Last Event: RecvKeepAlive
Last Error: None
Options: <Preference RemovePrivateAS PeerAS Refresh>
Holdtime: 90 Preference: 170
Number of flaps: 0
Peer ID: 10.10.20.1 Local ID: 10.10.0.1 Active Holdtime: 90
Keepalive Interval: 30 Peer index: 0
BFD: disabled, down
Local Interface: fe-1/2/1.3
NLRI for restart configured on peer: inet-unicast
NLRI advertised by peer: inet-unicast
NLRI for this session: inet-unicast
Peer supports Refresh capability (2)
Stale routes from peer are kept for: 300
Peer does not support Restarter functionality
NLRI that restart is negotiated for: inet-unicast
NLRI of received end-of-rib markers: inet-unicast
NLRI of all end-of-rib markers sent: inet-unicast
Peer supports 4 byte AS extension (peer-as 200)
Peer does not support Addpath
Table inet.0 Bit: 10001
RIB State: BGP restart is complete
Send state: in sync
Active prefixes: 1
Received prefixes: 3
Accepted prefixes: 2
Suppressed due to damping: 0
Advertised prefixes: 1
Last traffic (seconds): Received 10 Sent 16 Checked 55
Input messages: Total 54 Updates 3 Refreshes 0 Octets 1091
Output messages: Total 54 Updates 1 Refreshes 0 Octets 1118
Output Queue[0]: 0
```

Meaning The **RemovePrivateAS** option shows that Device ISP has the expected setting.

Checking the Routing Tables

Purpose Make sure that the devices have the expected routes and AS paths.

Action From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.20.1/32      *[BGP/170] 00:28:57, localpref 100
                   AS path: 100 200 I
                   > to 192.168.10.10 via fe-1/2/0.1

user@ISP> show route protocol bgp

inet.0: 7 destinations, 11 routes (7 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32      *[BGP/170] 00:29:40, localpref 100
                   AS path: 65535 I
                   > to 192.168.10.1 via fe-1/2/0.2
10.10.20.1/32      *[BGP/170] 00:29:36, localpref 100
                   AS path: 200 I
                   > to 192.168.20.1 via fe-1/2/1.3
192.168.10.0/24    [BGP/170] 00:29:40, localpref 100
                   AS path: 65535 I
                   > to 192.168.10.1 via fe-1/2/0.2
192.168.20.0/24    [BGP/170] 00:29:36, localpref 100
                   AS path: 200 I
                   > to 192.168.20.1 via fe-1/2/1.3

user@R2> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32      *[BGP/170] 00:29:53, localpref 100
                   AS path: 100 I
                   > to 192.168.20.20 via fe-1/2/0.4

```

Meaning Device ISP has the private AS number 65535 in its AS path to Device R1. However, Device ISP does not advertise this private AS number to Device R2. This is shown in the routing table of Device R2. Device R2's path to Device R1 contains only the AS number for Device ISP.

Checking the AS Path When the remove-private Statement Is Deactivated

Purpose Verify that without the **remove-private** statement, the private AS number appears in Device R2's routing table.

Action From configuration mode on Device ISP, enter the **deactivate remove-private** command and then recheck the routing table on Device R2.

```
[protocols bgp group ext neighbor 192.168.20.1]
```

```
user@ISP# deactivate remove-private
user@ISP# commit

user@R2> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32      *[BGP/170] 00:00:54, localpref 100
                  AS path: 100 65535 I
                  > to 192.168.20.20 via fe-1/2/0.4
```

Meaning Private AS number 65535 appears in Device R2's AS path to Device R1.

Understanding BFD for BGP

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. BFD works with a wide variety of network environments and topologies. The failure detection timers for BFD have shorter time limits than default failure detection mechanisms for BGP, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

In Junos OS Release 8.3 and later, BFD is supported on internal BGP (IBGP) and multihop external BGP (EBGP) sessions as well as on single-hop EBGP sessions. In Junos OS Release 9.1 through Junos OS Release 11.1, BFD supports IPv6 interfaces in static routes only. In Junos OS Release 11.2 and later, BFD supports IPv6 interfaces with BGP.

Example: Configuring BFD on Internal BGP Peer Sessions

This example shows how to configure internal BGP (IBGP) peer sessions with the Bidirectional Forwarding Detection (BFD) protocol to detect failures in a network.

- [Requirements on page 2845](#)
- [Overview on page 2845](#)
- [Configuration on page 2846](#)
- [Verification on page 2850](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

The minimum configuration to enable BFD on IBGP sessions is to include the `bfd-liveness-detection minimum-interval` statement in the BGP configuration of all neighbors participating in the BFD session. The `minimum-interval` statement specifies the minimum transmit and receive intervals for failure detection. Specifically, this value represents the minimum interval after which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value from 1 through 255,000 milliseconds.

Optionally, you can specify the minimum transmit and receive intervals separately using the `transmit-interval minimum-interval` and `minimum-receive-interval` statements. For information about these and other optional BFD configuration statements, see [bfd-liveness-detection](#).

NOTE: BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD less than 100 ms for Routing Engine-based sessions and less than 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

BFD is supported on the default routing instance (the main router), routing instances, and logical systems. This example shows BFD on logical systems.

Figure 57 on page 2846 shows a typical network with internal peer sessions.

Figure 57: Typical Network with IBGP Sessions

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Device A

```
set logical-systems A interfaces lt-1/2/0 unit 1 description to-B
set logical-systems A interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems A interfaces lt-1/2/0 unit 1 peer-unit 2
set logical-systems A interfaces lt-1/2/0 unit 1 family inet address 10.10.10.1/30
set logical-systems A interfaces lo0 unit 1 family inet address 192.168.6.5/32
set logical-systems A protocols bgp group internal-peers type internal
set logical-systems A protocols bgp group internal-peers traceoptions file bgp-bfd

set logical-systems C routing-options autonomous-system 17

```

Configuring Device A

Step-by-Step Procedure The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device A:

1. Set the CLI to Logical System A.

```
user@host> set cli logical-system A
```
2. Configure the interfaces.

```
[edit interfaces lt-1/2/0 unit 1]
user@host:A# set description to-B
user@host:A# set encapsulation ethernet
```

```
user@host:A# set peer-unit 2
user@host:A# set family inet address 10.10.10.1/30
```

```
[edit interfaces lo0 unit 1]
user@host:A# set family inet address 192.168.6.5/32
```

3. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@host:A# set type internal
user@host:A# set local-address 192.168.6.5
user@host:A# set export send-direct
user@host:A# set neighbor 192.163.6.4
user@host:A# set neighbor 192.168.40.4
```

4. Configure BFD.

```
[edit protocols bgp group internal-peers]
user@host:A# set bfd-liveness-detection minimum-interval 1000
```

You must configure the same minimum interval on the connecting peer.

5. (Optional) Configure BFD tracing.

```
[edit protocols bgp group internal-peers]
user@host:A# set traceoptions file bgp-bfd
user@host:A# set traceoptions flag bfd detail
```

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@host:A# set interface lo0.1 passive
user@host:A# set interface lt-1/2/0.1
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@host:A# set from protocol direct
user@host:A# set then accept
```

8. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:A# set router-id 192.168.6.5
user@host:A# set autonomous-system 17
```

9. If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps to configure Device B and Device C.

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:A# show interfaces
lt-1/2/0 {
  unit 1 {
    description to-B;
    encapsulation ethernet;
    peer-unit 2;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@host:A# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@host:A# show protocols
bgp {
  group internal-peers {
    type internal;
    traceoptions {
      file bgp-bfd;
      flag bfd detail;
    }
    local-address 192.168.6.5;
    export send-direct;
    bfd-liveness-detection {
      minimum-interval 1000;
    }
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface lt-1/2/0.1;
  }
}

user@host:A# show routing-options

```

Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Is Enabled on page 2850](#)
- [Verifying That BFD Sessions Are Up on page 2850](#)
- [Viewing Detailed BFD Events on page 2851](#)
- [Viewing Detailed BFD Events After Deactivating and Reactivating a Loopback Interface on page 2852](#)

Verifying That BFD Is Enabled

Purpose Verify that BFD is enabled between the IBGP peers.

Action From operational mode, enter the **show bgp neighbor** command. You can use the **| match bfd** filter to narrow the output.

```
user@host:A> show bgp neighbor | match bfd
Options: <BfdEnabled>
  BFD: enabled, up
  Trace file: /var/log/A/bgp-bfd size 131072 files 10
Options: <BfdEnabled>
  BFD: enabled, up
  Trace file: /var/log/A/bgp-bfd size 131072 files 10
```

Meaning The output shows that Logical System A has two neighbors with BFD enabled. When BFD is not enabled, the output displays **BFD: disabled, down**, and the **<BfdEnabled>** option is absent. If BFD is enabled and the session is down, the output displays **BFD: enabled, down**. The output also shows that BFD-related events are being written to a log file because trace operations are configured.

Verifying That BFD Sessions Are Up

Purpose Verify that the BFD sessions are up, and view details about the BFD sessions.

Action From operational mode, enter the **show bfd session extensive** command.

```
user@host:A> show bfd session extensive
```

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|-----------|-------------|-------------------|------------|
| 192.163.6.4 | Up | | 3.000 | 1.000 | 3 |

```
Client BGP, TX interval 1.000, RX interval 1.000
Session up time 00:54:40
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Logical system 12, routing table index 25
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 10, remote discriminator 9
Echo mode disabled/inactive
Multi-hop route table 25, local-address 192.168.6.5
```

Detect Transmit

```

Address          State    Interface    Time    Interval  Multiplier
192.168.40.4      Up      Up           3.000   1.000     3
Client BGP, TX interval 1.000, RX interval 1.000
Session up time 00:48:03
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Logical system 12, routing table index 25
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 14, remote discriminator 13
Echo mode disabled/inactive
Multi-hop route table 25, local-address 192.168.6.5

2 sessions, 2 clients
Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

```

Meaning The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

Viewing Detailed BFD Events

Purpose View the contents of the BFD trace file to assist in troubleshooting, if needed.

Action From operational mode, enter the **file show /var/log/A/bgp-bfd** command.

```

user@host:A> file show /var/log/A/bgp-bfd
Aug 15 17:07:25 trace_on: Tracing to "/var/log/A/bgp-bfd" started

Understanding BFD Authentication for BGP

Bidirectional Forwarding Detection protocol (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over BGP. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 2853](#)
- [Security Authentication Keychains on page 2854](#)
- [Strict Versus Loose Authentication on page 2854](#)

BFD Authentication Algorithms

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.

- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

NOTE: Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

Security Authentication Keychains

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

Strict Versus Loose Authentication

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

Example: Configuring BFD Authentication for BGP

Beginning with Junos OS Release 9.6, you can configure authentication for BFD sessions running over BGP. Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the BGP protocol.
2. Associate the authentication keychain with the BGP protocol.

3. Configure the related security authentication keychain.

The following sections provide instructions for configuring and viewing BFD authentication on BGP:

- [Configuring BFD Authentication Parameters on page 2855](#)
- [Viewing Authentication Information for BFD Sessions on page 2856](#)

Configuring BFD Authentication Parameters

BFD authentication can be configured for the entire BGP protocol, or a specific BGP group, neighbor, or routing instance.

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use.

```
[edit]
user@host# set protocols bgp bfd-liveness-detection authentication algorithm
keyed-sha-1
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
algorithm keyed-sha-1
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication algorithm keyed-sha-1
```

NOTE: Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on BGP with the unique security authentication keychain attributes.

The keychain name you specify must match a keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit]
user@host# set protocols bgp bfd-liveness-detection authentication keychain bfd-bgp
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
keychain bfd-bgp
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication keychain bfd-bgp
```

NOTE: The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 2.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

[edit security]

```
user@host# set authentication-key-chains key-chain bfd-bgp key 53 secret
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

[edit]

```
user@host# set protocols bgp bfd-liveness-detection authentication loose-check
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
loose-check
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication loose-check
```

5. (Optional) View your configuration using the **show bfd session detail** or **show bfd session extensive** command.

6. Repeat these steps to configure the other end of the BFD session.

NOTE: BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

Viewing Authentication Information for BFD Sessions

You can view the existing BFD authentication configuration using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **bgp-gr1** BGP group. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-bgp**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9L.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols bgp]
group bgp-gr1 {
  bfd-liveness-detection {
    authentication {
      algorithm keyed-sha-1;
      key-chain bfd-bgp;
    }
  }
}
```

```
[edit security]
authentication key-chains {
  key-chain bfd-bgp {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9l.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
```

If you commit these updates to your configuration, you see output similar to the following. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured. For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

show bfd session detail

```
user@host# show bfd session detail
```

| Address | State | Interface | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|

- [Example: Configuring Single-Hop EBGP Peers to Accept Remote Next Hops on page 2863](#)

Understanding BGP Multipath

The Junos OS BGP multipath feature supports the following applications:

- Load balancing across multiple links between two routing devices belonging to different autonomous systems (ASs)
- Load balancing across a common subnet or multiple subnets to different routing devices belonging to the same peer AS
- Load balancing across multiple links between two routing devices belonging to different external confederation peers
- Load balancing across a common subnet or multiple subnets to different routing devices belonging to external confederation peers

In a common scenario for load balancing, a customer is multihomed to multiple routers in a point of presence (POP). The default behavior is to send all traffic across only one of the available links. Load balancing causes traffic to use two or more of the links.

BGP multipath does not apply to paths that share the same MED-plus-IGP cost, yet differ in IGP cost. Multipath path selection is based on the IGP cost metric, even if two paths have the same MED-plus-IGP cost.

Example: Load Balancing BGP Traffic

This example shows how to configure BGP to select multiple equal-cost external BGP (EBGP) or internal BGP (IBGP) paths as active paths.

- [Requirements on page 2859](#)
- [Overview on page 2859](#)
- [Configuration on page 2860](#)
- [Verification on page 2862](#)

Requirements

Before you begin:

- Configure the device interfaces.
- Configure an interior gateway protocol (IGP).
- Configure BGP.
- Configure a routing policy that exports routes (such as direct routes or IGP routes) from the routing table into BGP.

Overview

The following steps show how to configure per-packet load balancing:

1. Define a load-balancing routing policy by including one or more **policy-statement** statements at the **[edit policy-options]** hierarchy level, defining an action of **load-balance per-packet**:

```
policy-statement policy-name {
  from {
    match-conditions;
    route-filter destination-prefix match-type <actions>;
    prefix-list name;
  }
  then {
    load-balance per-packet;
  }
}
```

2. Apply the policy to routes exported from the routing table to the forwarding table. To do this, include the **forwarding-table** and **export** statements:

```
forwarding-table {
  export policy-name;
}
```

You cannot apply the export policy to VRF routing instances.

3. Specify all next hops of that route, if more than one exists, when allocating a label corresponding to a route that is being advertised.
4. Configure the forwarding-options hash key for MPLS to include the IP payload.

NOTE: On some platforms, you can increase the number of paths that are load balanced by using the `chassis maximum-ecmp` statement. With this statement, you can change the maximum number of equal-cost load-balanced paths to 32 or 64.

In this example, Device R1 is in AS 65000 and is connected to both Device R2 and Device R3, which are in AS 65001. This example shows the configuration on Device R1.

Topology

Figure 58 on page 2860 shows the topology used in this example.

Figure 58: BGP Load Balancing

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set protocols bgp group external type external
set protocols bgp group external peer-as 65001
set protocols bgp group external multipath
set protocols bgp group external neighbor 10.0.1.1
set protocols bgp group external neighbor 10.0.0.2
set policy-options policy-statement loadbal from route-filter 10.0.0.0/16 orlonger
set policy-options policy-statement loadbal then load-balance per-packet
set routing-options forwarding-table export loadbal
set routing-options autonomous-system 65000

```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Configure the BGP group.

```

[edit protocols bgp group external]
user@R1# set type external
user@R1# set peer-as 65001
user@R1# set neighbor 10.0.1.1
user@R1# set neighbor 10.0.0.2

```
2. Enable the BGP group to use multiple paths.

NOTE: To disable the default check requiring that paths accepted by BGP multipath must have the same neighboring autonomous system (AS), include the `multiple-as` option.

```
[edit protocols bgp group external]
user@R1# set multipath
```

3. Configure the load-balancing policy.

```
[edit policy-options policy-statement loadbal]
user@R1# set from route-filter 10.0.0.0/16 orlonger
user@R1# set then load-balance per-packet
```

4. Apply the load-balancing policy.

```
[edit routing-options]
user@R1# set forwarding-table export loadbal
```

5. Configure the local autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 65000
```

Results From configuration mode, confirm your configuration by entering the **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show protocols
bgp {
  group external {
    type external;
    peer-as 65001;
    multipath;
    neighbor 10.0.1.1;
    neighbor 10.0.0.2;
  }
}

Verification

Confirm that the configuration is working properly:

- [Verifying Routes on page 2862](#)
- [Verifying Forwarding on page 2863](#)

Verifying Routes

Purpose Verify that routes are learned from both routers in the neighboring AS.

Action From operational mode, run the **show route** command.

```
user@R1> show route 10.0.2.0  
inet.0: 12 destinations, 15 routes (12 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, * = Both  
  
10.0.2.0/30          *[BGP/170] 03:12:32, localpref 100  
                    AS path: 65001 I  
                    to 10.0.1.1 via ge-1/2/0.0  
                    > to 10.0.0.2 via ge-1/2/1.0  
                    [BGP/170] 03:12:32, localpref 100  
                    AS path: 65001 I  
                    > to 10.0.1.1 via ge-1/2/0.0  
  
user@R1> show route 10.0.2.0 detail

```

Meaning The active path, denoted with an asterisk (*), has two next hops: 10.0.1.1 and 10.0.0.2 to the 10.0.2.0 destination. The 10.0.1.1 next hop is copied from the inactive path to the active path.

NOTE: The `show route detail` command output designates one gateway as selected. This output is potentially confusing in the context of load balancing. The selected gateway is used for many purposes in addition to deciding which gateway to install into the kernel when Junos OS is not performing per-packet load-balancing. For instance, the `ping mpls` command uses the selected gateway when sending packets. Multicast protocols use the selected gateway in some cases to determine the upstream interface. Therefore, even when Junos OS is performing per-packet load-balancing by way of a forwarding-table policy, the selected gateway information is still required for other purposes. It is useful to display the selected gateway for troubleshooting purposes. Additionally, it is possible to use forwarding-table policy to override what is installed into the kernel (for example, by using the `install-nexthop` action). In this case, the next-hop gateway installed in the forwarding table might be a subset of the total gateways displayed in the `show route` command.

Verifying Forwarding

Purpose Verify that both next hops are installed in the forwarding table.

Action From operational mode, run the `show route forwarding-table` command.

```
user@R1> show route forwarding-table destination 10.0.2.0
Routing table: default.inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.2.0/30      user  0          10.0.1.1          ucst  602    5 ge-1/2/0.0
                  10.0.0.2          ucst  522    6 ge-1/2/1.0
```

Example: Configuring Single-Hop EBGPeers to Accept Remote Next Hops

This example shows how to configure a single-hop external BGP (EBGP) peer to accept a remote next hop with which it does not share a common subnet.

- [Requirements on page 2864](#)
- [Overview on page 2864](#)
- [Configuration on page 2865](#)
- [Verification on page 2872](#)

Requirements

No special configuration beyond device initialization is required before you configure this example.

Overview

In some situations, it is necessary to configure a single-hop EBGP peer to accept a remote next hop with which it does not share a common subnet. The default behavior is for any next-hop address received from a single-hop EBGP peer that is not recognized as sharing a common subnet to be discarded. The ability to have a single-hop EBGP peer accept a remote next hop to which it is not directly connected also prevents you from having to configure the single-hop EBGP neighbor as a multihop session. When you configure a multihop session in this situation, all next-hop routes learned through this EBGP peer are labeled indirect even when they do share a common subnet. This situation breaks multipath functionality for routes that are recursively resolved over routes that include these next-hop addresses. Configuring the **accept-remote-nexthop** statement allows a single-hop EBGP peer to accept a remote next hop, which restores multipath functionality for routes that are resolved over these next-hop addresses. You can configure this statement at the global, group, and neighbor hierarchy levels for BGP. The statement is also supported on logical systems and the VPN routing and forwarding (VRF) routing instance type. Both the remote next-hop and the EBGP peer must support BGP route refresh as defined in RFC 2918, *Route Refresh Capability in BGP-4*. If the remote peer does not support BGP route refresh, the session is reset.

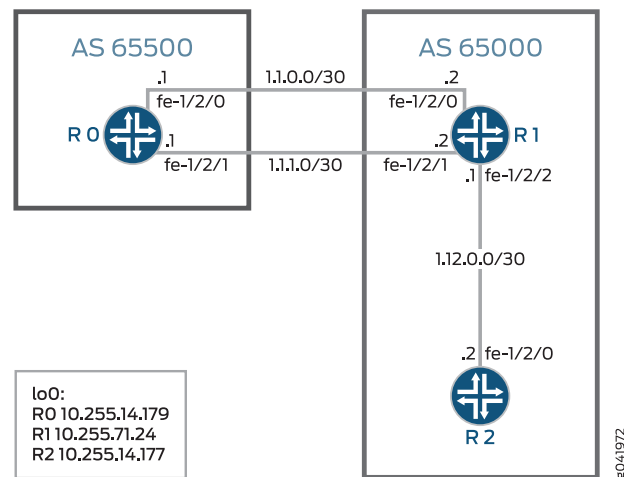

NOTE: You cannot configure both the **multihop** and **accept-remote-nexthop** statements for the same EBGP peer.

When you enable a single-hop EBGP peer to accept a remote next hop, you must also configure an import routing policy on the EBGP peer that specifies the remote next-hop address.

This example includes an import routing policy, **agg_route**, that enables a single-hop external BGP peer (Device R1) to accept the remote next-hop 1.1.10.10 for the route to the 1.1.230.0/23 network. At the **[edit protocols bgp]** hierarchy level, the example includes the **import agg_route** statement to apply the policy to the external BGP peer and includes the **accept-remote-nexthop** statement to enable the single-hop EBGP peer to accept the remote next hop.

Figure 59 on page 2865 shows the sample topology.

```

Device R0

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R0:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 1]
user@R0# set family inet address 1.1.0.1/30

[edit interfaces fe-1/2/1 unit 2]
user@R0# set family inet address 1.1.1.1/30

[edit interfaces lo0 unit 1]
user@R0# set family inet address 10.255.14.179/32
```
2. Configure EBGp.

```
[edit protocols bgp group ext]
user@R0# set type external
user@R0# set peer-as 65000
user@R0# set neighbor 1.1.0.2
user@R0# set neighbor 1.1.1.2
```
3. Enable multipath BGP between Device R0 and Device R1.

```
[edit protocols bgp group ext]
user@R0# set multipath
```

4. Configure static routes to remote networks.
These routes are not part of the topology. The purpose of these routes is to demonstrate the functionality in this example.

```
[edit routing-options]
user@R0# set static route 1.1.10.10/32 reject
user@R0# set static route 1.1.230.0/23 reject
```

5. Configure routing policies that accept the static routes.

```
[edit policy-options policy-statement agg_route term 1]
user@R0# set from protocol static
user@R0# set from route-filter 1.1.230.0/23 exact
user@R0# set then accept
```

```
[edit policy-options policy-statement test_route term 1]
user@R0# set from protocol static
user@R0# set from route-filter 1.1.10.10/32 exact
user@R0# set then accept
```

6. Export the **agg_route** and **test_route** policies from the routing table into BGP.

```
[edit protocols bgp group ext]
user@R0# set export test_route
user@R0# set export agg_route
```

7. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R0# set autonomous-system 65500
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 1.1.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 1.1.1.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 10.255.14.179/32;
    }
  }
}
```

```
}
user@R0# show policy-options
policy-statement agg_route {
  term 1 {
    from {
      protocol static;
      route-filter 1.1.230.0/23 exact;
    }
    then accept;
  }
}
policy-statement test_route {
  term 1 {
    from {
      protocol static;
      route-filter 1.1.10.10/32 exact;
    }
    then accept;
  }
}

user@R0# show protocols
bgp {
  group ext {
    type external;
    export [ test_route agg_route ];
    peer-as 65000;
    multipath;
    neighbor 1.1.0.2;
    neighbor 1.1.1.2;
  }
}

user@R0# show routing-options
static {
  route 1.1.10.10/32 reject;
  route 1.1.230.0/23 reject;
}
autonomous-system 65500;
```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R1

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

[edit interfaces fe-1/2/0 unit 3]
user@R1# set family inet address 1.1.0.2/30

[edit interfaces fe-1/2/1 unit 4]

```
user@R1# set family inet address 1.12.0.1/30
```

```
[edit interfaces fe-1/2/2 unit 5]
user@R1# set family inet address 1.1.1.2/30
```

```
[edit interfaces lo0 unit 2]
user@R1# set family inet address 10.255.71.24/32
```

2. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/1.4
user@R1# set interface 10.255.71.24
```

3. Enable Device R1 to accept the remote next hop.

```
[edit protocols bgp]
user@R1# set accept-remote-nexthop
```

4. Configure IBGP.

```
[edit protocols bgp group int]
user@R1# set type internal
user@R1# set local-address 10.255.71.24
user@R1# set neighbor 10.255.14.177
```

5. Configure EBGP.

```
[edit protocols bgp group ext]
user@R1# set type external
user@R1# set peer-as 65500
user@R1# set neighbor 1.1.0.1
user@R1# set neighbor 1.1.1.1
```

6. Enable multipath BGP between Device R0 and Device R1.

```
[edit protocols bgp group ext]
user@R1# set multipath
```

7. Configure a routing policy that enables a single-hop external BGP peer (Device R1) to accept the remote next-hop 1.1.10.10 for the route to the 1.1.230.0/23 network.

```
[edit policy-options policy-statement agg_route term 1]
user@R1# set from protocol bgp
user@R1# set from route-filter 1.1.230.0/23 exact
user@R1# set then next-hop 1.1.10.10
user@R1# set then accept
```

8. Import the **agg_route** policy into the routing table on Device R1.

```
[edit protocols bgp group ext]
user@R1# set import agg_route
```

9. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 65000
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 1.1.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 1.12.0.1/30;
    }
  }
}
fe-1/2/2 {
  unit 5 {
    family inet {
      address 1.1.1.2/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.255.71.24/32;
    }
  }
}

user@R1# show policy-options
policy-statement agg_route {
  term 1 {
    from {
      protocol bgp;
      route-filter 1.1.230.0/23 exact;
    }
    then {
      next-hop 1.1.10.10;
      accept;
    }
  }
}

user@R1# show protocols
bgp {
  accept-remote-nexthop;
  group ext {
    type external;
    import agg_route;
    peer-as 65500;
    multipath;
    neighbor 1.1.0.1;
```

```

        neighbor 1.1.1.1;
    }
    group int {
        type internal;
        local-address 10.255.71.24;
        neighbor 10.255.14.177;
    }
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/1.4;
        interface 10.255.71.24;
    }
}

```

```

user@R1# show routing-options
autonomous-system 65000;

```

If you are done configuring the device, enter **commit** from configuration mode.

Configuring Device R2

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 6]
user@R2# set family inet address 1.12.0.2/30

[edit interfaces lo0 unit 3]
user@R2# set family inet address 10.255.14.177/32

```
2. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R2# set interface fe-1/2/0.6
user@R2# set interface 10.255.14.177

```
3. Configure IBGP.

```

[edit protocols bgp group int]
user@R2# set type internal
user@R2# set local-address 10.255.14.177
user@R2# set neighbor 10.255.71.24

```
4. Configure the autonomous system (AS) number.

```

[edit routing-options]
user@R1# set autonomous-system 65000

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 6 {
    family inet {
      address 1.12.0.2/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 10.255.14.177/32;
    }
  }
}

user@R2# show protocols
bgp {
  group int {
    type internal;
    local-address 10.255.14.177;
    neighbor 10.255.71.24;
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.6;
    interface 10.255.14.177;
  }
}

user@R2# show routing-options
autonomous-system 65000;
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

Confirm that the configuration is working properly.

- [Verifying That the Multipath Route with the Indirect Next Hop Is in the Routing Table on page 2872](#)
- [Deactivating and Reactivating the accept-remote-nexthop Statement on page 2874](#)

Verifying That the Multipath Route with the Indirect Next Hop Is in the Routing Table

Purpose Verify that Device R1 has a route to the 1.1.230.0/23 network.

Action From operational mode, enter the **show route 1.1.230.0 extensive** command.

```
user@R1> show route 1.1.230.0 extensive
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
Restart Complete

      Next hop: 1.1.1.1 via fe-1/2/2.5
    1.1.10.10/32 Originating RIB: inet.0
    Node path count: 1
    Forwarding nexthops: 2
      Nexthop: 1.1.0.1 via fe-1/2/0.3
      Nexthop: 1.1.1.1 via fe-1/2/2.5
  BGP Preference: 170/-101
    Next hop type: Indirect
    Address: 0x90c44d8
    Next-hop reference count: 4
    Source: 1.1.1.1
    Next hop type: Router, Next hop index: 262143
    Next hop: 1.1.0.1 via fe-1/2/0.3, selected
    Next hop: 1.1.1.1 via fe-1/2/2.5
    Protocol next hop: 1.1.10.10
    Indirect next hop: 91c0000 262142
    State: <NotBest Ext>
    Inactive reason: Not Best in its group - Update source
    Local AS: 65000 Peer AS: 65500
    Age: 2:55:27 Metric2: 0
    Task: BGP_65500.1.1.1.1+53260
    AS path: 65500 I
    Accepted
    Localpref: 100
    Router ID: 10.255.14.179
    Indirect next hops: 1
      Protocol next hop: 1.1.10.10
      Indirect next hop: 91c0000 262142
      Indirect path forwarding next hops: 2
        Next hop type: Router

```

```
Next hop: 1.1.0.1 via fe-1/2/0.3
Next hop: 1.1.1.1 via fe-1/2/2.5
1.1.10.10/32 Originating RIB: inet.0
Node path count: 1
Forwarding nexthops: 2
  Nexthop: 1.1.0.1 via fe-1/2/0.3
  Nexthop: 1.1.1.1 via fe-1/2/2.5
```

Meaning The output shows that Device R1 has a route to the 1.1.230.0 network with the multipath feature enabled (**Accepted Multipath**). The output also shows that the route has an indirect next hop of 1.1.10.10.

Deactivating and Reactivating the accept-remote-nexthop Statement

Purpose Make sure that the multipath route with the indirect next hop is removed from the routing table when you deactivate the **accept-remote-nexthop** statement.

Action 1. From configuration mode, enter the **deactivate protocols bgp accept-remote-nexthop** command.

```
user@R1# deactivate protocols bgp accept-remote-nexthop
user@R1# commit
```

2. From operational mode, enter the **show route 1.1.230.0** command.

```
user@R1> show route 1.1.230.0
```

3. From configuration mode, reactivate the statement by entering the **activate protocols bgp accept-remote-nexthop** command.

```
user@R1# activate protocols bgp accept-remote-nexthop
user@R1# commit
```

4. From operational mode, reenter the **show route 1.1.230.0** command.

```
user@R1> show route 1.1.230.0
```

```
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
```

```
1.1.230.0/23      *[BGP/170] 03:13:19, localpref 100
                  AS path: 65500 I
                  > to 1.1.0.1 via fe-1/2/0.3
                  to 1.1.1.1 via fe-1/2/2.5
                  [BGP/170] 03:13:15, localpref 100, from 1.1.1.1
                  AS path: 65500 I
                  > to 1.1.0.1 via fe-1/2/0.3
                  to 1.1.1.1 via fe-1/2/2.5
```

Meaning When the **accept-remote-nexthop** statement is deactivated, the multipath route to the 1.1.230.0 network is removed from the routing table .

Understanding the Advertisement of Multiple Paths to a Single Destination in BGP

BGP peers advertise routes to each other in update messages. BGP stores its routes in the Junos OS routing table (**inet.0**). For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

Instead of advertising only the active path to a destination, you can configure BGP to advertise multiple paths to the destination. Within an autonomous system (AS), the availability of multiple exit points to reach a destination provides the following benefits:

- **Fault tolerance**—Path diversity leads to reduction in restoration time after failure. For instance, a border after receiving multiple paths to the same destination can precompute a backup path and have it ready so that when the primary path becomes invalid, the border routing device can use the backup to quickly restore connectivity. Without a backup path, the restoration time depends on BGP reconvergence, which includes withdraw and advertisement messages in the network before a new best path can be learned.
- **Load balancing**—The availability of multiple paths to reach the same destination enables load balancing of traffic, if the routing within the AS meets certain constraints.
- **Maintenance**—The availability of alternate exit points allows for graceful maintenance operation of routers.

The following limitations apply to advertising multiple routes in BGP:

- Address families supported:
 - IPv4 unicast (**family inet unicast**)
 - IPv6 unicast (**family inet6 unicast**)
 - IPv4 labeled unicast (**family inet labeled-unicast**)
 - IPv6 labeled unicast (**family inet6 labeled-unicast**)
- Internal BGP (IBGP) peers only. No support on external BGP (EBGP) peers.
- Master instance only. No support for routing instances.
- Graceful restart supported, but not nonstop active routing (NSR).
- No BGP Monitoring Protocol (BMP) support.

- No support for EBGP sessions between confederations.
- Prefix policies enable you to filter routes on a router that is configured to advertise multiple paths to a destination. Prefix policies can only match prefixes. They cannot match route attributes, and they cannot change the attributes of routes.

Example: Advertising Multiple Paths in BGP

In this example, BGP routers are configured to advertise multiple paths instead of advertising only the active path. Advertising multiple paths in BGP is specified in Internet draft draft-ietf-idr-add-paths-04, *Advertisement of Multiple Paths in BGP*.

- [Verification on page 2895](#)

Requirements

This example uses the following hardware and software components:

- Eight BGP-enabled devices.
- Five of the BGP-enabled devices do not necessarily need to be routers. For example, they can be EX Series Ethernet Switches.
- Three of the BGP-enabled devices are configured to send multiple paths or receive multiple paths (or both send and receive multiple paths). These three BGP-enabled devices must be M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers.
- The three routers must be running Junos OS Release 11.4 or later.

Overview

The following statements are used for configuring multiple paths to a destination:

```
[edit protocols bgp group group-name family family]  
add-path {  
  receive;  
  send {  
    path-count number;  
    prefix-policy [ policy-names ];  
  }  
}
```

In this example, Router R5, Router R6, and Router R7 redistribute static routes into BGP. Router R1 and Router R4 are route reflectors. Router R2 and Router R3 are clients to Route Reflector R1. Router R8 is a client to Route Reflector R4.

Route reflection is optional when multiple-path advertisement is enabled in BGP.

With the **add-path send path-count 6** configuration, Router R1 is configured to send up to six paths (per destination) to Router R4.

With the **add-path receive** configuration, Router R4 is configured to receive multiple paths from Router R1.

With the **add-path send path-count 6** configuration, Router R4 is configured to send up to six paths to Router R8.

With the **add-path receive** configuration, Router R8 is configured to receive multiple paths from Router R4.

The **add-path send prefix-policy allow_199** policy configuration (along with the corresponding route filter) limits Router R4 to sending multiple paths for only the 199.1.1.1/32 route.

Topology Diagram

Figure 60 on page 2877 shows the topology used in this example.

Configuring Router R1

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1:

1. Configure the interfaces to Router R2, Router R3, Router R4, and Router R5, and configure the loopback (lo0) interface.

```
[edit interfaces]
user@R1# set fe-0/0/0 unit 12 family inet address 10.0.12.1/24

user@R1# set fe-0/0/1 unit 13 family inet address 10.0.13.1/24

user@R1# set fe-1/0/0 unit 14 family inet address 10.0.14.1/24

user@R1# set fe-1/2/0 unit 15 family inet address 10.0.15.1/24

user@R1# set lo0 unit 10 family inet address 10.0.0.10/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
user@R1# set group rr type internal
user@R1# set group rr local-address 10.0.0.10
user@R1# set group rr cluster 10.0.0.10
user@R1# set group rr neighbor 10.0.0.20
user@R1# set group rr neighbor 10.0.0.30

user@R1# set group rr_rr type internal
user@R1# set group rr_rr local-address 10.0.0.10

user@R1# set group e1 type external
user@R1# set group e1 neighbor 10.0.15.2 local-address 10.0.15.1
user@R1# set group e1 neighbor 10.0.15.2 peer-as 2
```

3. Configure Router R1 to send up to six paths to its neighbor, Router R4.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp]
user@R1# set group rr_rr neighbor 10.0.0.40 family inet unicast add-path send
path-count 6
```

4. Configure OSPF on the interfaces.

```
[edit protocols ospf]
```

```

user@R1# set area 0.0.0.0 interface lo0.10 passive
user@R1# set area 0.0.0.0 interface fe-0/0/0.12
user@R1# set area 0.0.0.0 interface fe-0/0/1.13
user@R1# set area 0.0.0.0 interface fe-1/0/0.14
user@R1# set area 0.0.0.0 interface fe-1/2/0.15

```

5. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@R1# set router-id 10.0.0.10
user@R1# set autonomous-system 1

```

6. If you are done configuring the device, commit the configuration.

```

user@R1# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-0/0/0 {
  unit 12 {
    family inet {
      address 10.0.12.1/24;
    }
  }
}

      passive;  
    }  
    interface fe-0/0/0.12;  
    interface fe-0/0/1.13;  
    interface fe-1/0/0.14;  
    interface fe-1/2/0.15;  
  }  
}  
user@R1# show routing-options  
router-id 10.0.0.10;  
autonomous-system 1;
```

Configuring Router R2**Step-by-Step Procedure**

To configure Router R2:

1. Configure the loopback (lo0) interface and the interfaces to Router R6 and Router R1.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 21 family inet address 10.0.12.2/24
```

```
user@R2# set fe-1/2/1 unit 26 family inet address 10.0.26.1/24
```

```
user@R2# set lo0 unit 20 family inet address 10.0.0.20/32
```

2. Configure BGP and OSPF on Router R2's interfaces.

```
[edit protocols]
```

```
user@R2# set bgp group rr type internal
```

```
user@R2# set bgp group rr local-address 10.0.0.20
```

```
user@R2# set bgp group e1 type external
```

```
user@R2# set bgp group e1 neighbor 10.0.26.2 peer-as 2
```

```
user@R2# set ospf area 0.0.0.0 interface lo0.20 passive
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/0.21
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/1.28
```

3. For routes sent from Router R2 to Router R1, advertise Router R2 as the next hop, because Router R1 does not have a route to Router R6's address on the 10.0.26.0/24 network.

```
[edit]
```

```
user@R2# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R2# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R2# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R2# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 21 {
    family inet {
      address 10.0.12.2/24;
```

```
    }
  }
}
fe-1/2/1 {
  unit 26 {
    family inet {
      address 10.0.26.1/24;
    }
  }
}

```

Configuring Router R3**Step-by-Step Procedure**

To configure Router R3:

1. Configure the loopback (lo0) interface and the interfaces to Router R7 and Router R1.

```
[edit interfaces]
```

```
user@R3# set fe-1/0/1 unit 31 family inet address 10.0.13.2/24
```

```
user@R3# set fe-1/0/2 unit 37 family inet address 10.0.37.1/24
```

```
user@R3# set lo0 unit 30 family inet address 10.0.0.30/32
```

2. Configure BGP and OSPF on Router R3's interfaces.

```
[edit protocols]
```

```
user@R3# set bgp group rr type internal
```

```
user@R3# set bgp group rr local-address 10.0.0.30
```

```
user@R3# set bgp group e1 type external
```

```
user@R3# set bgp group e1 neighbor 10.0.37.2 peer-as 2
```

```
user@R3# set ospf area 0.0.0.0 interface lo0.30 passive
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/1.31
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/2.37
```

3. For routes sent from Router R3 to Router R1, advertise Router R3 as the next hop, because Router R1 does not have a route to Router R7's address on the 10.0.37.0/24 network.

```
[edit]
```

```
user@R3# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R3# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R3# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R3# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/0/1 {
  unit 31 {

```

Configuring Router R4**Step-by-Step
Procedure**

To configure Router R4:

1. Configure the interfaces to Router R1 and Router R8, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R4# set fe-1/2/0 unit 41 family inet address 10.0.14.2/24
```

```
user@R4# set fe-1/2/1 unit 48 family inet address 10.0.48.1/24
```

```
user@R4# set lo0 unit 40 family inet address 10.0.0.40/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R4# set group rr type internal
```

```
user@R4# set group rr local-address 10.0.0.40
```

```
user@R4# set group rr neighbor 10.0.0.10
```

```
user@R4# set group rr_client type internal
```

```
user@R4# set group rr_client local-address 10.0.0.40
```

```
user@R4# set group rr_client cluster 10.0.0.40
```

3. Configure Router R4 to send up to six paths to its neighbor, Router R8.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R4# set group rr_client neighbor 10.0.0.80 family inet unicast add-path send  
path-count 6
```

4. Configure Router R4 to receive multiple paths from its neighbor, Router R1.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp group rr family inet unicast]
```

```
user@R4# set add-path receive
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R4# set interface fe-1/2/0.41
```

```
user@R4# set interface lo0.40 passive
```

```
user@R4# set interface fe-1/2/1.48
```

6. Configure a policy that allows Router R4 to send Router R8 multiple paths to the 199.1.1.1/32 route.

Router R4 receives multiple paths for the 198.1.1.1/32 route and the 199.1.1.1/32 route. However, because of this policy, Router R4 only sends multiple paths for the 199.1.1.1/32 route.

```
[edit protocols bgp group rr_client neighbor 10.0.0.80 family inet unicast]
```

```
user@R4# set add-path send prefix-policy allow_199
```

```
[edit policy-options policy-statement allow_199]
user@R4# set from route-filter 199.1.1/32 exact
user@R4# set then accept
```

7. Configure the autonomous system number.

```
[edit routing-options]
user@R4# set autonomous-system 1
```

8. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 41 {
    family inet {
      address 10.0.14.2/24;
    }
  }
}
fe-1/2/1 {
  unit 48 {
    family inet {
      address 10.0.48.1/24;
    }
  }
}
lo0 {
  unit 40 {
    family inet {
      address 10.0.0.40/32;
    }
  }
}

user@R4# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.40;
    family inet {
      unicast {
        add-path {
          receive;
        }
      }
    }
  }
  neighbor 10.0.0.10;
}
group rr_client {
```

Configuring Router R5

To configure Router R5:

- ```
user@R5# set lo0 unit 50 family inet address 10.0.0.50/32
```

- ```
user@R5# set neighbor 10.0.15.1 peer-as 1
```

- ```
[edit routing-options]
```

```
user@R5# set static route 199.1.1.1/32 reject
user@R5# set static route 198.1.1.1/32 reject
```

4. Redistribute static and direct routes into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.15.1]
user@R5# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R5# set from protocol static
user@R5# set from protocol direct
user@R5# set then as-path-expand 2
user@R5# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R5# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R5# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
 unit 51 {
 family inet {
 address 10.0.15.2/24;
 }
 }
}
lo0 {
 unit 50 {
 family inet {
 address 10.0.0.50/32;
 }
 }
}
```

```
user@R5# show protocols
bgp {
 group e1 {
 type external;
 neighbor 10.0.15.1 {
 export s2b;
 peer-as 1;
 }
 }
}
```

```
user@R5# show policy-options
policy-statement s2b {
```

```

from protocol [static direct];
then {
 as-path-expand 2;
 accept;
}
}

user@R5# show routing-options
static {
 route 198.1.1.1/32 reject;
 route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### Configuring Router R6

#### Step-by-Step Procedure

To configure Router R6:

1. Configure the loopback (lo0) interface and the interface to Router R2.  
  

```

[edit interfaces]
user@R6# set fe-1/2/0 unit 62 family inet address 10.0.26.2/24

user@R6# set lo0 unit 60 family inet address 10.0.0.60/32

```
2. Configure BGP on Router R6's interface.  
  

```

[edit protocols]
user@R6# set bgp group e1 type external
user@R6# set bgp group e1 neighbor 10.0.26.1 peer-as 1

```
3. Create static routes for redistribution into BGP.  
  

```

[edit]
user@R6# set routing-options static route 199.1.1.1/32 reject
user@R6# set routing-options static route 198.1.1.1/32 reject

```
4. Redistribute static and direct routes from Router R6's routing table into BGP.  
  

```

[edit protocols bgp group e1 neighbor 10.0.26.1]
user@R6# set export s2b

[edit policy-options policy-statement s2b]
user@R6# set from protocol static
user@R6# set from protocol direct
user@R6# set then accept

```
5. Configure the autonomous system number.  
  

```

[edit routing-options]
user@R6# set autonomous-system 2

```
6. If you are done configuring the device, commit the configuration.  
  

```

user@R6# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R6# show interfaces
fe-1/2/0 {
 unit 62 {
 family inet {
 address 10.0.26.2/24;
 }
 }
}
lo0 {
 unit 60 {
 family inet {
 address 10.0.0.60/32;
 }
 }
}

user@R6# show protocols
bgp {
 group e1 {
 type external;
 neighbor 10.0.26.1 {
 export s2b;
 peer-as 1;
 }
 }
}

user@R6# show policy-options
policy-statement s2b {
 from protocol [static direct];
 then accept;
}

user@R6# show routing-options
static {
 route 198.1.1.1/32 reject;
 route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### ***Configuring Router R7***

#### **Step-by-Step Procedure**

To configure Router R7:

1. Configure the loopback (lo0) interface and the interface to Router R3.

```
[edit interfaces]
```

```
user@R7# set fe-1/2/0 unit 73 family inet address 10.0.37.2/24
```

```
user@R7# set lo0 unit 70 family inet address 10.0.0.70/32
```

2. Configure BGP on Router R7's interface.

```
[edit protocols bgp group e1]
```

```
user@R7# set type external
```

```
user@R7# set neighbor 10.0.37.1 peer-as 1
```

3. Create a static route for redistribution into BGP.

```
[edit]
user@R7# set routing-options static route 199.1.1.1/32 reject
```

4. Redistribute static and direct routes from Router R7's routing table into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.37.1]
user@R7# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R7# set from protocol static
user@R7# set from protocol direct
user@R7# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R7# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R7# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R7# show interfaces
fe-1/2/0 {
 unit 73 {
 family inet {
 address 10.0.37.2/24;
 }
 }
}
lo0 {
 unit 70 {
 family inet {
 address 10.0.0.70/32;
 }
 }
}

user@R7# show protocols
bgp {
 group e1 {
 type external;
 neighbor 10.0.37.1 {
 export s2b;
 peer-as 1;
 }
 }
}
```

```
user@R7# show policy-options
policy-statement s2b {
 from protocol [static direct];
 then accept;
}

user@R7# show routing-options
static {
 route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### *Configuring Router R8*

#### **Step-by-Step Procedure**

To configure Router R8:

1. Configure the loopback (lo0) interface and the interface to Router R4.  
  
[edit interfaces]  
user@R8# set fe-1/2/0 unit 84 family inet address 10.0.48.2/24  
  
user@R8# set lo0 unit 80 family inet address 10.0.0.80/32
2. Configure BGP and OSPF on Router R8's interface.  
  
[edit protocols]  
user@R8# set bgp group rr type internal  
user@R8# set bgp group rr local-address 10.0.0.80  
  
user@R8# set ospf area 0.0.0.0 interface lo0.80 passive  
user@R8# set ospf area 0.0.0.0 interface fe-1/2/0.84
3. Configure Router R8 to receive multiple paths from its neighbor, Router R4.  
  
The destination of the paths can be any destination that Router R4 can reach through multiple paths.  
  
[edit protocols]  
user@R8# set bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive
4. Configure the autonomous system number.  
  
[edit]  
user@R8# set routing-options autonomous-system 1
5. If you are done configuring the device, commit the configuration.  
  
user@R8# commit

### *Results*

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R8# show interfaces
fe-1/2/0 {
```

```

 unit 84 {
 family inet {
 address 10.0.48.2/24;
 }
 }
 }
 lo0 {
 unit 80 {
 family inet {
 address 10.0.0.80/32;
 }
 }
 }
}

user@R8# show protocols
bgp {
 group rr {
 type internal;
 local-address 10.0.0.80;
 neighbor 10.0.0.40 {
 family inet {
 unicast {
 add-path {
 receive;
 }
 }
 }
 }
 }
}

ospf {
 area 0.0.0.0 {
 interface lo0.80 {
 passive;
 }
 interface fe-1/2/0.84;
 }
}

user@R8# show routing-options
autonomous-system 1;

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths on page 2896](#)
- [Verifying That Router R1 Is Advertising Multiple Paths on page 2896](#)
- [Verifying That Router R4 Is Receiving and Advertising Multiple Paths on page 2897](#)
- [Verifying That Router R8 Is Receiving Multiple Paths on page 2898](#)
- [Checking the Path ID on page 2898](#)

***Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths***

**Purpose** Make sure that one or both of the following strings appear in the output of the **show bgp neighbor** command:

- NLRI's for which peer can receive multiple paths: inet-unicast
- NLRI's for which peer can send multiple paths: inet-unicast

**Action**

```
user@R1> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1 Local: 10.0.0.10+65237 AS 1
 Type: Internal State: Established Flags: <Sync>
... NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.10
Peer: 10.0.0.10+65237 AS 1 Local: 10.0.0.40+179 AS 1
 Type: Internal State: Established Flags: <Sync>
...
 NLRI's for which peer can send multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.80
Peer: 10.0.0.80+55416 AS 1 Local: 10.0.0.40+179 AS 1
 Type: Internal State: Established (route reflector client)Flags: <Sync>
'''
 NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R8> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1 Local: 10.0.0.80+55416 AS 1
 Type: Internal State: Established Flags: <Sync>
...
 NLRI's for which peer can send multiple paths: inet-unicast
...
```

***Verifying That Router R1 Is Advertising Multiple Paths***

**Purpose** Make sure that multiple paths to the 198.1.1.1/32 destination and multiple paths to the 199.1.1.1/32 destination are advertised to Router R4.

**Action** user@R1> show route advertising-protocol bgp 10.0.0.40  
 inet.0: 21 destinations, 25 routes (21 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
	10.0.15.2		100	2 2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

**Meaning** When you see one prefix and more than one next hop, it means that multiple paths are advertised to Router R4.

### *Verifying That Router R4 Is Receiving and Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 199.1.1.1/32 destination are received from Router R1 and advertised to Router R8. Make sure that multiple paths to the 198.1.1.1/32 destination are received from Router R1, but only one path to this destination is advertised to Router R8.

**Action** user@R4> show route receive-protocol bgp 10.0.0.10  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
	10.0.15.2		100	2 2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

user@R4> show route advertising-protocol bgp 10.0.0.80  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

**Meaning** The **show route receive-protocol** command shows that Router R4 receives two paths to the 198.1.1.1/32 destination and three paths to the 199.1.1.1/32 destination. The **show route advertising-protocol** command shows that Router R4 advertises only one path to the 198.1.1.1/32 destination and advertises all three paths to the 199.1.1.1/32 destination.

Because of the prefix policy that is applied to Router R4, Router R4 does not advertise multiple paths to the 198.1.1.1/32 destination. Router R4 advertises only one path to the 198.1.1.1/32 destination even though it receives multiple paths to this destination.

### ***Verifying That Router R8 Is Receiving Multiple Paths***

**Purpose** Make sure that Router R8 receives multiple paths to the 199.1.1.1/32 destination through Router R4. Make sure that Router R8 receives only one path to the 198.1.1.1/32 destination through Router R4.

**Action** user@R8> **show route receive-protocol bgp 10.0.0.40**  
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lclpref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I

* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

### ***Checking the Path ID***

**Purpose** On the downstream devices, Router R4 and Router R8, verify that a path ID uniquely identifies the path. Look for the **Addpath Path ID:** string.

Action user@R4> show route 199.1.1.1/32 detail

## Example: Advertising Multiple Paths in BGP

In this example, BGP routers are configured to advertise multiple paths instead of advertising only the active path. Advertising multiple paths in BGP is specified in Internet draft [draft-ietf-idr-add-paths-04, Advertisement of Multiple Paths in BGP](#).

- [Requirements on page 2901](#)
- [Overview on page 2901](#)
- [Configuration on page 2902](#)
- [Verification on page 2920](#)

### Requirements

This example uses the following hardware and software components:

- Eight BGP-enabled devices.
- Five of the BGP-enabled devices do not necessarily need to be routers. For example, they can be EX Series Ethernet Switches.
- Three of the BGP-enabled devices are configured to send multiple paths or receive multiple paths (or both send and receive multiple paths). These three BGP-enabled devices must be M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers.
- The three routers must be running Junos OS Release 11.4 or later.

### Overview

The following statements are used for configuring multiple paths to a destination:

```
[edit protocols bgp group group-name family family]
add-path {
 receive;
 send {
 path-count number;
 prefix-policy [policy-names];
 }
}
```

In this example, Router R5, Router R6, and Router R7 redistribute static routes into BGP. Router R1 and Router R4 are route reflectors. Router R2 and Router R3 are clients to Route Reflector R1. Router R8 is a client to Route Reflector R4.

Route reflection is optional when multiple-path advertisement is enabled in BGP.

With the **add-path send path-count 6** configuration, Router R1 is configured to send up to six paths (per destination) to Router R4.

With the **add-path receive** configuration, Router R4 is configured to receive multiple paths from Router R1.

With the **add-path send path-count 6** configuration, Router R4 is configured to send up to six paths to Router R8.

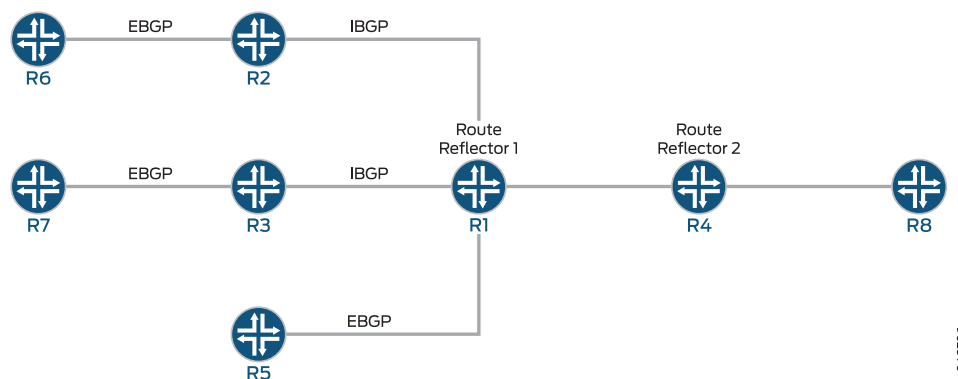

With the **add-path receive** configuration, Router R8 is configured to receive multiple paths from Router R4.

The **add-path send prefix-policy allow\_199** policy configuration (along with the corresponding route filter) limits Router R4 to sending multiple paths for only the 199.1.1.1/32 route.

### Topology Diagram

Figure 60 on page 2877 shows the topology used in this example.

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Router R1

```

### Configuring Router R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1:

1. Configure the interfaces to Router R2, Router R3, Router R4, and Router R5, and configure the loopback (lo0) interface.

```

[edit interfaces]
user@R1# set fe-0/0/0 unit 12 family inet address 10.0.12.1/24

user@R1# set fe-0/0/1 unit 13 family inet address 10.0.13.1/24

user@R1# set fe-1/0/0 unit 14 family inet address 10.0.14.1/24

user@R1# set fe-1/2/0 unit 15 family inet address 10.0.15.1/24

user@R1# set lo0 unit 10 family inet address 10.0.0.10/32

```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```

[edit protocols bgp]
user@R1# set group rr type internal
user@R1# set group rr local-address 10.0.0.10
user@R1# set group rr cluster 10.0.0.10
user@R1# set group rr neighbor 10.0.0.20
user@R1# set group rr neighbor 10.0.0.30

user@R1# set group rr_rr type internal
user@R1# set group rr_rr local-address 10.0.0.10

user@R1# set group e1 type external
user@R1# set group e1 neighbor 10.0.15.2 local-address 10.0.15.1
user@R1# set group e1 neighbor 10.0.15.2 peer-as 2

```

3. Configure Router R1 to send up to six paths to its neighbor, Router R4.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```

[edit protocols bgp]
user@R1# set group rr_rr neighbor 10.0.0.40 family inet unicast add-path send
path-count 6

```

4. Configure OSPF on the interfaces.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface lo0.10 passive
user@R1# set area 0.0.0.0 interface fe-0/0/0.12
user@R1# set area 0.0.0.0 interface fe-0/0/1.13
user@R1# set area 0.0.0.0 interface fe-1/0/0.14
user@R1# set area 0.0.0.0 interface fe-1/2/0.15
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@R1# set router-id 10.0.0.10
user@R1# set autonomous-system 1
```

6. If you are done configuring the device, commit the configuration.

```
user@R1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-0/0/0 {
 unit 12 {
 family inet {
 address 10.0.12.1/24;
 }
 }
}
fe-0/0/1 {
 unit 13 {
 family inet {

 interface fe-1/2/0.15;
 }
}

user@R1# show routing-options
router-id 10.0.0.10;
autonomous-system 1;

```

### *Configuring Router R2*

#### **Step-by-Step Procedure**

To configure Router R2:

1. Configure the loopback (lo0) interface and the interfaces to Router R6 and Router R1.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 21 family inet address 10.0.12.2/24
```

```
user@R2# set fe-1/2/1 unit 26 family inet address 10.0.26.1/24
```

```
user@R2# set lo0 unit 20 family inet address 10.0.0.20/32
```

2. Configure BGP and OSPF on Router R2's interfaces.

```
[edit protocols]
```

```
user@R2# set bgp group rr type internal
```

```
user@R2# set bgp group rr local-address 10.0.0.20
```

```
user@R2# set bgp group e1 type external
```

```
user@R2# set bgp group e1 neighbor 10.0.26.2 peer-as 2
```

```
user@R2# set ospf area 0.0.0.0 interface lo0.20 passive
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/0.21
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/1.28
```

3. For routes sent from Router R2 to Router R1, advertise Router R2 as the next hop, because Router R1 does not have a route to Router R6's address on the 10.0.26.0/24 network.

```
[edit]
```

```
user@R2# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R2# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R2# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
 unit 21 {
 family inet {
 address 10.0.12.2/24;
```

```

 }
 }
}
fe-1/2/1 {
 unit 26 {
 family inet {
 address 10.0.26.1/24;
 }
 }
}
lo0 {
 unit 20 {
 family inet {
 address 10.0.0.20/32;
 }
 }
}
}

user@R2# show protocols

 then {
 next-hop self;
 }
}

user@R2# show routing-options
autonomous-system 1;

```

### Configuring Router R3

#### Step-by-Step Procedure

To configure Router R3:

1. Configure the loopback (lo0) interface and the interfaces to Router R7 and Router R1.

```
[edit interfaces]
```

```
user@R3# set fe-1/0/1 unit 31 family inet address 10.0.13.2/24
```

```
user@R3# set fe-1/0/2 unit 37 family inet address 10.0.37.1/24
```

```
user@R3# set lo0 unit 30 family inet address 10.0.0.30/32
```

2. Configure BGP and OSPF on Router R3's interfaces.

```
[edit protocols]
```

```
user@R3# set bgp group rr type internal
```

```
user@R3# set bgp group rr local-address 10.0.0.30
```

```
user@R3# set bgp group e1 type external
```

```
user@R3# set bgp group e1 neighbor 10.0.37.2 peer-as 2
```

```
user@R3# set ospf area 0.0.0.0 interface lo0.30 passive
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/1.31
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/2.37
```

3. For routes sent from Router R3 to Router R1, advertise Router R3 as the next hop, because Router R1 does not have a route to Router R7's address on the 10.0.37.0/24 network.

```
[edit]
```

```
user@R3# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R3# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R3# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R3# commit
```

#### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/0/1 {
 unit 31 {
 family inet {
 address 10.0.13.2/24;
```

```

 }
 }
}
fe-1/0/2 {
 unit 37 {
 family inet {
 address 10.0.37.1/24;
 }
 }
}
lo0 {
 unit 30 {
 family inet {
 address 10.0.0.30/32;
 }
 }
}
}

user@R3# show protocols
bgp {
 group rr {
 type internal;
 local-address 10.0.0.30;
 neighbor 10.0.0.10 {

 interface fe-1/0/2.37;
 }
}

user@R3# show policy-options
policy-statement set_nh_self {
 then {
 next-hop self;
 }
}

user@R3# show routing-options
autonomous-system 1;

```

### ***Configuring Router R4***

#### **Step-by-Step Procedure**

To configure Router R4:

1. Configure the interfaces to Router R1 and Router R8, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R4# set fe-1/2/0 unit 41 family inet address 10.0.14.2/24
```

```
user@R4# set fe-1/2/1 unit 48 family inet address 10.0.48.1/24
```

```
user@R4# set lo0 unit 40 family inet address 10.0.0.40/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R4# set group rr type internal
```

```
user@R4# set group rr local-address 10.0.0.40
```

```
user@R4# set group rr neighbor 10.0.0.10
```

```
user@R4# set group rr_client type internal
```

```
user@R4# set group rr_client local-address 10.0.0.40
```

```
user@R4# set group rr_client cluster 10.0.0.40
```

3. Configure Router R4 to send up to six paths to its neighbor, Router R8.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R4# set group rr_client neighbor 10.0.0.80 family inet unicast add-path send
path-count 6
```

4. Configure Router R4 to receive multiple paths from its neighbor, Router R1.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp group rr family inet unicast]
```

```
user@R4# set add-path receive
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R4# set interface fe-1/2/0.41
```

```
user@R4# set interface lo0.40 passive
```

```
user@R4# set interface fe-1/2/1.48
```

6. Configure a policy that allows Router R4 to send Router R8 multiple paths to the 199.1.1.1/32 route.

Router R4 receives multiple paths for the 198.1.1.1/32 route and the 199.1.1.1/32 route. However, because of this policy, Router R4 only sends multiple paths for the 199.1.1.1/32 route.

```
[edit protocols bgp group rr_client neighbor 10.0.0.80 family inet unicast]
```

```
user@R4# set add-path send prefix-policy allow_199
```

```
[edit policy-options policy-statement allow_199]
user@R4# set from route-filter 199.1.1/32 exact
user@R4# set then accept
```

7. Configure the autonomous system number.

```
[edit routing-options]
user@R4# set autonomous-system 1
```

8. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
 unit 41 {
 family inet {
 address 10.0.14.2/24;
 }
 }
}
fe-1/2/1 {

```

### Configuring Router R5

## Step-by-Step Procedure

To configure Router R5:

1. Configure the loopback (lo0) interface and the interface to Router R1.

[edit interfaces]

```
user@R5# set fe-1/2/0 unit 51 family inet address 10.0.15.2/24
```

```
user@R5# set lo0 unit 50 family inet address 10.0.0.50/32
```

2. Configure BGP on Router R5's interface.

```
[edit protocols bgp group e1]
```

```
user@R5# set type external
```

```
user@R5# set neighbor 10.0.15.1 peer-as 1
```

3. Create static routes for redistribution into BGP.

[edit routing-options]

```
user@R5# set static route 199.1.1.1/32 reject
user@R5# set static route 198.1.1.1/32 reject
```

4. Redistribute static and direct routes into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.15.1]
user@R5# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R5# set from protocol static
user@R5# set from protocol direct
user@R5# set then as-path-expand 2
user@R5# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R5# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R5# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
 unit 51 {
 family inet {
 address 10.0.15.2/24;
 }
 }
}
lo0 {
 unit 50 {
 family inet {
 address 10.0.0.50/32;
 }
 }
}
```

```
user@R5# show protocols
bgp {
 group e1 {
 type external;
 neighbor 10.0.15.1 {
 export s2b;
 peer-as 1;
 }
 }
}
```

```
user@R5# show policy-options
policy-statement s2b {
```

```
from protocol [static direct];
then {
 as-path-expand 2;
 accept;
}
}

user@R5# show routing-options
static {
 route 198.1.1.1/32 reject;
 route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### *Configuring Router R6*

#### **Step-by-Step Procedure**

To configure Router R6:

1. Configure the loopback (lo0) interface and the interface to Router R2.  
  
[edit interfaces]  
user@R6# set fe-1/2/0 unit 62 family inet address 10.0.26.2/24  
  
user@R6# set lo0 unit 60 family inet address 10.0.0.60/32
2. Configure BGP on Router R6's interface.  
  
[edit protocols]  
user@R6# set bgp group e1 type external  
user@R6# set bgp group e1 neighbor 10.0.26.1 peer-as 1
3. Create static routes for redistribution into BGP.  
  
[edit]  
user@R6# set routing-options static route 199.1.1.1/32 reject  
user@R6# set routing-options static route 198.1.1.1/32 reject
4. Redistribute static and direct routes from Router R6's routing table into BGP.  
  
[edit protocols bgp group e1 neighbor 10.0.26.1]  
user@R6# set export s2b  
  
[edit policy-options policy-statement s2b]  
user@R6# set from protocol static  
user@R6# set from protocol direct  
user@R6# set then accept
5. Configure the autonomous system number.  
  
[edit routing-options]  
user@R6# set autonomous-system 2
6. If you are done configuring the device, commit the configuration.  
  
user@R6# commit

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R6# show interfaces
fe-1/2/0 {
 unit 62 {
 family inet {
 address 10.0.26.2/24;
 }
 }
}
lo0 {
 unit 60 {
 family inet {
 address 10.0.0.60/32;
 }
 }
}

user@R6# show protocols
bgp {
 group e1 {
 type external;
 neighbor 10.0.26.1 {
 export s2b;
 peer-as 1;
 }
 }
}

user@R6# show policy-options
policy-statement s2b {
 from protocol [static direct];
 then accept;
}

user@R6# show routing-options
static {
 route 198.1.1.1/32 reject;
 route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### *Configuring Router R7*

**Step-by-Step Procedure** To configure Router R7:

1. Configure the loopback (lo0) interface and the interface to Router R3.  

```

[edit interfaces]
user@R7# set fe-1/2/0 unit 73 family inet address 10.0.37.2/24

user@R7# set lo0 unit 70 family inet address 10.0.0.70/32

```
2. Configure BGP on Router R7's interface.  

```

[edit protocols bgp group e1]
user@R7# set type external

```

```
user@R7# set neighbor 10.0.37.1 peer-as 1
```

3. Create a static route for redistribution into BGP.

```
[edit]
user@R7# set routing-options static route 199.1.1.1/32 reject
```

4. Redistribute static and direct routes from Router R7's routing table into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.37.1]
user@R7# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R7# set from protocol static
user@R7# set from protocol direct
user@R7# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R7# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R7# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R7# show interfaces
fe-1/2/0 {
 unit 73 {
 family inet {
 address 10.0.37.2/24;
 }
 }
}
lo0 {
 unit 70 {
 family inet {
 address 10.0.0.70/32;
 }
 }
}

user@R7# show protocols
bgp {
 group e1 {
 type external;
 neighbor 10.0.37.1 {
 export s2b;
 peer-as 1;
 }
 }
}
```

```

user@R7# show policy-options
policy-statement s2b {
 from protocol [static direct];
 then accept;
}

user@R7# show routing-options
static {
 route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### Configuring Router R8

#### Step-by-Step Procedure

To configure Router R8:

1. Configure the loopback (lo0) interface and the interface to Router R4.

```

[edit interfaces]
user@R8# set fe-1/2/0 unit 84 family inet address 10.0.48.2/24

user@R8# set lo0 unit 80 family inet address 10.0.0.80/32

```

2. Configure BGP and OSPF on Router R8's interface.

```

[edit protocols]
user@R8# set bgp group rr type internal
user@R8# set bgp group rr local-address 10.0.0.80

user@R8# set ospf area 0.0.0.0 interface lo0.80 passive
user@R8# set ospf area 0.0.0.0 interface fe-1/2/0.84

```

3. Configure Router R8 to receive multiple paths from its neighbor, Router R4.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```

[edit protocols]
user@R8# set bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive

```

4. Configure the autonomous system number.

```

[edit]
user@R8# set routing-options autonomous-system 1

```

5. If you are done configuring the device, commit the configuration.

```

user@R8# commit

```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R8# show interfaces
fe-1/2/0 {

```

```
 unit 84 {
 family inet {
 address 10.0.48.2/24;
 }
 }
 }
lo0 {
 unit 80 {
 family inet {
 address 10.0.0.80/32;
 }
 }
}

user@R8# show protocols
bgp {
 group rr {
 type internal;
 local-address 10.0.0.80;
 neighbor 10.0.0.40 {
 family inet {
 unicast {
 add-path {
 receive;
 }
 }
 }
 }
 }
}

ospf {
 area 0.0.0.0 {
 interface lo0.80 {
 passive;
 }
 interface fe-1/2/0.84;
 }
}

user@R8# show routing-options
autonomous-system 1;
```

---

## Verification

Confirm that the configuration is working properly.

- [Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths on page 2921](#)
- [Verifying That Router R1 Is Advertising Multiple Paths on page 2921](#)
- [Verifying That Router R4 Is Receiving and Advertising Multiple Paths on page 2922](#)
- [Verifying That Router R8 Is Receiving Multiple Paths on page 2923](#)
- [Checking the Path ID on page 2923](#)

*Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths*

**Purpose** Make sure that one or both of the following strings appear in the output of the **show bgp neighbor** command:

- NLRI's for which peer can receive multiple paths: inet-unicast
- NLRI's for which peer can send multiple paths: inet-unicast

**Action**

```

user@R1> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1 Local: 10.0.0.10+65237 AS 1
 Type: Internal State: Established Flags: <Sync>
... NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.10
Peer: 10.0.0.10+65237 AS 1 Local: 10.0.0.40+179 AS 1
 Type: Internal State: Established Flags: <Sync>
...
 NLRI's for which peer can send multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.80
Peer: 10.0.0.80+55416 AS 1 Local: 10.0.0.40+179 AS 1
 Type: Internal State: Established (route reflector client)Flags: <Sync>
...
 NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R8> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1 Local: 10.0.0.80+55416 AS 1
 Type: Internal State: Established Flags: <Sync>
...
 NLRI's for which peer can send multiple paths: inet-unicast
...

```

*Verifying That Router R1 Is Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 198.1.1.1/32 destination and multiple paths to the 199.1.1.1/32 destination are advertised to Router R4.

**Action** user@R1> show route advertising-protocol bgp 10.0.0.40  
 inet.0: 21 destinations, 25 routes (21 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
	10.0.15.2		100	2 2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

**Meaning** When you see one prefix and more than one next hop, it means that multiple paths are advertised to Router R4.

#### *Verifying That Router R4 Is Receiving and Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 199.1.1.1/32 destination are received from Router R1 and advertised to Router R8. Make sure that multiple paths to the 198.1.1.1/32 destination are received from Router R1, but only one path to this destination is advertised to Router R8.

**Action** user@R4> show route receive-protocol bgp 10.0.0.10  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
	10.0.15.2		100	2 2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

user@R4> show route advertising-protocol bgp 10.0.0.80  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

**Meaning** The **show route receive-protocol** command shows that Router R4 receives two paths to the 198.1.1.1/32 destination and three paths to the 199.1.1.1/32 destination. The **show route advertising-protocol** command shows that Router R4 advertises only one path to the 198.1.1.1/32 destination and advertises all three paths to the 199.1.1.1/32 destination.

Because of the prefix policy that is applied to Router R4, Router R4 does not advertise multiple paths to the 198.1.1.1/32 destination. Router R4 advertises only one path to the 198.1.1.1/32 destination even though it receives multiple paths to this destination.

### *Verifying That Router R8 Is Receiving Multiple Paths*

**Purpose** Make sure that Router R8 receives multiple paths to the 199.1.1.1/32 destination through Router R4. Make sure that Router R8 receives only one path to the 198.1.1.1/32 destination through Router R4.

**Action** user@R8> `show route receive-protocol bgp 10.0.0.40`  
 inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

Prefix	Nexthop	MED	Lc1pref	AS path
* 10.0.0.50/32	10.0.15.2		100	2 2 I
* 10.0.0.60/32	10.0.0.20		100	2 I
* 10.0.0.70/32	10.0.0.30		100	2 I
* 198.1.1.1/32	10.0.0.20		100	2 I
* 199.1.1.1/32	10.0.0.20		100	2 I
	10.0.0.30		100	2 I
	10.0.15.2		100	2 2 I
* 200.1.1.0/30	10.0.0.20		100	2 I

### *Checking the Path ID*

**Purpose** On the downstream devices, Router R4 and Router R8, verify that a path ID uniquely identifies the path. Look for the **Addpath Path ID:** string.

**Action** user@R4> show route 199.1.1.1/32 detail

## Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing

The Junos OS supports configurations of 16, 32, or 64 equal-cost multipath (ECMP) next hops for RSVP and LDP LSPs on M10i routers with an Enhanced CFEB, M320, M120, MX Series, and T Series routers, and routing devices. For networks with high-volume traffic, this provides more flexibility to load-balance the traffic over as many as 64 LSPs.

To configure the maximum limit for ECMP next hops, include the **maximum-ecmp next-hops** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
maximum-ecmp next-hops;
```

You can configure a maximum ECMP next-hop limit of 16, 32, or 64 using this statement. The default limit is 16.

**NOTE:** MX Series routers with one or more Modular Port Concentrator (MPC) cards and with Junos OS 11.4 or earlier installed, support the configuration of the **maximum-ecmp** statement with only 16 next hops. You should *not* configure the **maximum-ecmp** statement with 32 or 64 next hops. When you commit the configuration with 32 or 64 next hops, the following warning message appears:

**Error: Number of members in Unilist NH exceeds the maximum supported 16 on Trio.**

The following types of routes support the ECMP maximum next-hop configuration for as many as 64 ECMP gateways:

- Static IPv4 and IPv6 routes with direct and indirect next-hop ECMPs
- LDP ingress and transit routes learned through associated IGP routes
- RSVP ECMP next hops created for LSPs
- OSPF IPv4 and IPv6 route ECMPs
- ISIS IPv4 and IPv6 route ECMPs
- EBGp IPv4 and IPv6 route ECMPs
- IBGP (resolving over IGP routes) IPv4 and IPv6 route ECMPs

The enhanced ECMP limit of up to 64 ECMP next hops is also applicable for Layer 3 VPNs, Layer 2 VPNs, Layer 2 circuits, and VPLS services that resolve over an MPLS route, because the available ECMP paths in the MPLS route can also be used by such traffic.

**NOTE:**

The following FPCs on M320, T640, and T1600 routers only support 16 ECMP next hops:

- (M320, T640, and T1600 routers only) Enhanced II FPC1
- (M320, T640, and T1600 routers only) Enhanced II FPC2
- (M320 and T640 routers only) Enhanced II FPC3
- (T640 and T1600 routers only) FPC2
- (T640 and T1600 routers only) FPC3

If a maximum ECMP next-hop limit of 32 or 64 is configured on an M320, T640, or T1600 router with any of these FPCs installed, the Packet Forwarding Engines on these FPCs use only the first 16 ECMP next hops. For Packet Forwarding Engines on FPCs that support only 16 ECMP next hops, the Junos OS generates a system log message if a maximum ECMP next-hop limit of 32 or 64 is configured. However, for Packet Forwarding Engines on other FPCs installed on the router, a maximum configured ECMP limit of 32 or 64 ECMP next hops is applicable.

**NOTE:** If RSVP LSPs are configured with bandwidth allocation, for ECMP next hops with more than 16 LSPs, traffic is not distributed optimally based on bandwidths configured. Some LSPs with smaller allocated bandwidths receive more traffic than the ones configured with higher bandwidths. Traffic distribution does not strictly comply with the configured bandwidth allocation. This caveat is applicable to the following routers:

- T1600 and T640 routers with Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, Enhanced Scaling FPC 4, and all Type 4 FPCs
- M320 routers with Enhanced III FPC1, Enhanced III FPC2, and Enhanced III FPC3
- MX Series routers with all types of FPCs and DPCs, excluding MPCs. This caveat is not applicable to MX Series routers with line cards based on the Junos Trio chipset.
- M120 routers with Type 1, Type 2, and Type 3 FPCs
- M10i routers with Enhanced CFEB

Next-hop cloning and permutations are disabled on T Series routers with Enhanced Scaling FPCs (Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3,

and Enhanced Scaling FPC 4) that support enhanced load-balancing capability. As a result, memory utilization is reduced for a highly scaled system with a high number of next hops on ECMP or aggregated interfaces. Next-hop cloning and permutations are also disabled on T Series routers with Type-4 FPCs.

To view the details of the ECMP next hops, issue the **show route** command. The **show route summary** command also shows the current configuration for the maximum ECMP limit. To view details of the ECMP LDP paths, issue the **traceroute mpls ldp** command.

#### Understanding BGP Route Reflectors

---

Because of the internal BGP (IBGP) full-mesh requirement, most networks use route reflectors to simplify configuration. The formula to compute the number of sessions required for a full mesh is  $v * (v - 1) / 2$ , where  $v$  is the number of BGP-enabled devices. The full-mesh model does not scale well. Using a route reflector, you group routers into clusters, which are identified by numeric identifiers unique to the autonomous system (AS). Within the cluster, you must configure a BGP session from a single router (the route reflector) to each internal peer. With this configuration, the IBGP full-mesh requirement is met.

To use route reflection in an AS, you designate one or more routers as a route reflector—typically, one per point of presence (POP). Route reflectors have the special BGP ability to readvertise routes learned from an internal peer to other internal peers. So rather than requiring all internal peers to be fully meshed with each other, route reflection requires only that the route reflector be fully meshed with all internal peers. The route reflector and all of its internal peers form a cluster, as shown in [Figure 62 on page 2929](#).

**NOTE:** For some Juniper Networks devices, you must have an Advanced BGP Feature license installed on each device that uses a route reflector. For license details, see the *Junos OS Initial Configuration Guide for Security Devices*.

---

Figure 62: Simple Route Reflector Topology (One Cluster)

Figure 62 on page 2929 shows Router RR configured as the route reflector for Cluster 127. The other routers are designated internal peers within the cluster. BGP routes are advertised to Router RR by any of the internal peers. RR then readvertises those routes to all other peers within the cluster.

You can configure multiple clusters and link them by configuring a full mesh of route reflectors (see Figure 63 on page 2929).

Figure 63: Basic Route Reflection (Multiple Clusters)

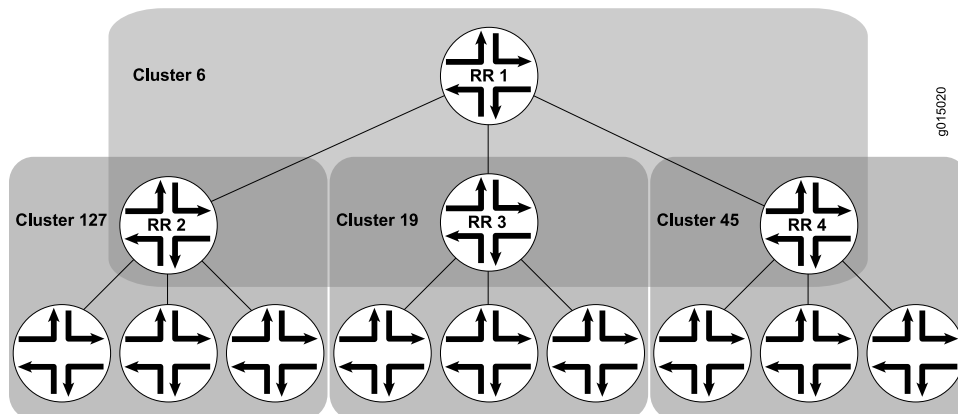

Figure 63 on page 2929 shows Route Reflectors RR 1, RR 2, RR 3, and RR 4 as fully meshed internal peers. When a router advertises a route to RR 1, RR 1 readvertises the route to the other route reflectors, which, in turn, readvertise the route to the remaining routers within the AS. Route reflection allows the route to be propagated throughout the AS without the scaling problems created by the full mesh requirement.

However, as clusters become large, a full mesh with a route reflector becomes difficult to scale, as does a full mesh between route reflectors. To help offset this problem, you can group clusters of routers together into clusters of clusters for hierarchical route reflection (see [Figure 64 on page 2930](#)).

**Figure 64: Hierarchical Route Reflection (Clusters of Clusters)**

[Figure 64 on page 2930](#) shows RR 2, RR 3, and RR 4 as the route reflectors for Clusters 127, 19, and 45, respectively. Rather than fully mesh those route reflectors, the network administrator has configured them as part of another cluster (Cluster 6) for which RR 1 is the route reflector. When a router advertises a route to RR 2, RR 2 readvertises the route to all the routers within its own cluster, and then readvertises the route to RR 1. RR 1 readvertises the route to the routers in its cluster, and those routers propagate the route down through their clusters.

### Example: Configuring a Route Reflector

This example shows how to configure a route reflector.

- [Requirements on page 2930](#)
- [Overview on page 2930](#)
- [Configuration on page 2932](#)
- [Verification on page 2940](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Generally, internal BGP (IBGP)-enabled devices need to be fully meshed, because IBGP does not readvertise updates to other IBGP-enabled devices. The full mesh is a logical mesh achieved through configuration of multiple **neighbor** statements on each IBGP-enabled device. The full mesh is not necessarily a physical full mesh. Maintaining a full mesh (logical or physical) does not scale well in large deployments.

Figure 65 on page 2932 shows an IBGP network with Device A acting as a route reflector. Device B and Device C are clients of the route reflector. Device D and Device E are outside the cluster, so they are nonclients of the route reflector.

On Device A (the route reflector), you must form peer relationships with all of the IBGP-enabled devices by including the **neighbor** statement for the clients (Device B and Device C) and the nonclients (Device D and Device E). You must also include the **cluster** statement and a cluster identifier. The cluster identifier can be any 32-bit value. This example uses the loopback interface IP address of the route reflector.

On Device B and Device C, the route reflector clients, you only need one **neighbor** statement that forms a peer relationship with the route reflector, Device A.

On Device D and Device E, the nonclients, you need a **neighbor** statement for each nonclient device (D-to-E and E-to-D). You also need a **neighbor** statement for the route reflector (D-to-A and E-to-A). Device D and Device E do not need **neighbor** statements for the client devices (Device B and Device C).

**TIP:** Device D and Device E are considered to be nonclients because they have explicitly configured peer relationships with each other. To make them RRroute reflector clients, remove the **neighbor 192.168.5.5** statement from the configuration on Device D, and remove the **neighbor 192.168.0.1** statement from the configuration on Device E.

Figure 65: IBGP Network Using a Route Reflector

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device A**

```

set interfaces fe-0/0/0 unit 1 description to-B

```

### *Configuring the Route Reflector*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IBGP in the network using Juniper Networks Device A as a route reflector:

1. Configure the interfaces.

```
[edit interfaces]
user@A# set fe-0/0/0 unit 1 description to-B
user@A# set fe-0/0/0 unit 1 family inet address 10.10.1/30
user@A# set fe-0/0/1 unit 3 description to-D
user@A# set fe-0/0/1 unit 3 family inet address 10.10.9/30
user@A# set lo0 unit 1 family inet address 192.168.6.5/32
```

2. Configure BGP, including the cluster identifier and neighbor relationships with all IBGP-enabled devices in the autonomous system (AS).

Also apply the policy that redistributes OSPF routes into BGP.

```
[edit protocols bgp group internal-peers]
user@A# set type internal
user@A# set local-address 192.168.6.5
user@A# set export send-ospf
user@A# set cluster 192.168.6.5
user@A# set neighbor 192.163.6.4
user@A# set neighbor 192.168.40.4
user@A# set neighbor 192.168.0.1
user@A# set neighbor 192.168.5.5
```

3. Configure static routing or an interior gateway protocol (IGP).

This example uses OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@A# set interface lo0.1 passive
user@A# set interface fe-0/0/0.1
user@A# set interface fe-0/0/1.3
```

4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@A# set from protocol ospf
user@A# set then accept
```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@A# set router-id 192.168.6.5
user@A# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@A# show interfaces
fe-0/0/0 {
 unit 1 {
 description to-B;
 family inet {
 address 10.10.10.1/30;
 }
 }
}
fe-0/0/1 {
 unit 3 {
 description to-D;
 family inet {
 address 10.10.10.9/30;
 }
 }
}
lo0 {
 unit 1 {
 family inet {
 address 192.168.6.5/32;
 }
 }
}

user@A# show protocols
bgp {
 group internal-peers {
 type internal;
 local-address 192.168.6.5;
 export send-ospf;
 cluster 192.168.6.5;
 neighbor 192.163.6.4;
 neighbor 192.168.40.4;
 neighbor 192.168.0.1;
 neighbor 192.168.5.5;
 }
}
ospf {
 area 0.0.0.0 {
 interface lo0.1 {
 passive;
 }
 interface fe-0/0/0.1;
 interface fe-0/0/1.3;
```

```
}
}

user@A# show policy-options
policy-statement send-ospf {
 term 2 {
 from protocol ospf;
 then accept;
 }
}

user@A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each nonclient BGP peer within the cluster that you are configuring, if the other nonclient devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### *Configuring Client Peers*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure client peers:

1. Configure the interfaces.  

```
[edit interfaces]
user@B# set fe-0/0/0 unit 2 description to-A
user@B# set fe-0/0/0 unit 2 family inet address 10.10.10.2/30
user@B# set fe-0/0/1 unit 5 description to-C
user@B# set fe-0/0/1 unit 5 family inet address 10.10.10.5/30
user@B# set lo0 unit 2 family inet address 192.163.6.4/32
```

2. Configure the BGP neighbor relationship with the route reflector.

Also apply the policy that redistributes OSPF routes into BGP.

```
[edit protocols bgp group internal-peers]
user@B# set type internal
user@B# set local-address 192.163.6.4
user@B# set export send-ospf
user@B# set neighbor 192.168.6.5
```

3. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]
user@B# set interface lo0.2 passive
user@B# set interface fe-0/0/0.2
user@B# set interface fe-0/0/1.5
```
4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@B# set from protocol ospf
user@B# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@B# set router-id 192.163.6.4
user@B# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/0/0 {
 unit 2 {
 description to-A;
 family inet {
 address 10.10.10.2/30;
 }
 }
}
fe-0/0/1 {
 unit 5 {
 description to-C;
 family inet {
 address 10.10.10.5/30;
 }
 }
}
lo0 {
 unit 2 {
 family inet {
 address 192.163.6.4/32;
 }
 }
}

user@B# show protocols
bgp {
 group internal-peers {
 type internal;
 local-address 192.163.6.4;
 export send-ospf;
 neighbor 192.168.6.5;
 }
}
ospf {
 area 0.0.0.0 {
 interface lo0.2 {
 passive;
 }
 interface fe-0/0/0.2;
 interface fe-0/0/1.5;
```

```
}
}

user@B# show policy-options
policy-statement send-ospf {
 term 2 {
 from protocol ospf;
 then accept;
 }
}

user@B# show routing-options
router-id 192.163.6.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each client BGP peer within the cluster that you are configuring if the other client devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### **Configuring Nonclient Peers**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure nonclient peers:

1. Configure the interfaces.

```
[edit interfaces]
user@D# set fe-0/0/0 unit 4 description to-A
user@D# set fe-0/0/0 unit 4 family inet address 10.10.10.10/30
user@D# set fe-0/0/1 unit 7 description to-E
user@D# set fe-0/0/1 unit 7 family inet address 10.10.10.13/30
user@D# set lo0 unit 4 family inet address 192.168.0.1/32
```

2. Configure the BGP neighbor relationships with the RRroute reflector and with the other nonclient peers.

Also apply the policy that redistributes OSPF routes into BGP.

```
[edit protocols bgp group internal-peers]
user@D# set type internal
user@D# set local-address 192.168.0.1
user@D# set export send-ospf
user@D# set neighbor 192.168.6.5
user@D# set neighbor 192.168.5.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@D# set interface lo0.4 passive
user@D# set interface fe-0/0/0.4
```

```
user@D# set interface fe-0/0/1.7
```

4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@D# set from protocol ospf
user@D# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@D# set router-id 192.168.0.1
user@D# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@D# show interfaces
fe-0/0/0 {
 unit 4 {
 description to-A;
 family inet {
 address 10.10.10.10/30;
 }
 }
}
fe-0/0/1 {
 unit 7 {
 description to-E;
 family inet {
 address 10.10.10.13/30;
 }
 }
}
lo0 {
 unit 4 {
 family inet {
 address 192.168.0.1/32;
 }
 }
}
```

```
user@D# show protocols
bgp {
 group internal-peers {
 type internal;
 local-address 192.168.0.1;
 export send-ospf;
 neighbor 192.168.6.5;
 neighbor 192.168.5.5;
 }
}
ospf {
 area 0.0.0.0 {
 interface lo0.4 {
```

```
 passive;
 }
 interface fe-0/0/0.4;
 interface fe-0/0/1.7;
}
}

user@D# show policy-options
policy-statement send-ospf {
 term 2 {
 from protocol ospf;
 then accept;
 }
}

user@D# show routing-options
router-id 192.168.0.1;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each nonclient BGP peer within the cluster that you are configuring if the other nonclient devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 2940](#)
- [Verifying BGP Groups on page 2943](#)
- [Verifying BGP Summary Information on page 2943](#)
- [Verifying Routing Table Information on page 2943](#)

### **Verifying BGP Neighbors**

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is established for each neighbor address.

**Action** From operational mode, enter the **show bgp neighbor** command.

```
user@A> show bgp neighbor
Peer: 192.163.6.4+179 AS 17 Local: 192.168.6.5+62857 AS 17

## Example: Configuring BGP Confederations

- [Understanding BGP Confederations on page 2945](#)
- [Example: Configuring BGP Confederations on page 2946](#)

### Understanding BGP Confederations

BGP confederations are another way to solve the scaling problems created by the BGP full mesh requirement. BGP confederations effectively break up a large autonomous system (AS) into subautonomous systems (sub-ASs). Each sub-AS must be uniquely identified within the confederation AS by a sub-AS number. Typically, sub-AS numbers are taken from the private AS numbers between 64,512 and 65,535.

Within a sub-AS, the same internal BGP (IBGP) full mesh requirement exists. Connections to other confederations are made with standard external BGP (EBGP), and peers outside the sub-AS are treated as external. To avoid routing loops, a sub-AS uses a confederation sequence, which operates like an AS path but uses only the privately assigned sub-AS numbers.

The confederation AS appears whole to other confederation ASs. The AS path received by other ASs shows only the globally assigned AS number. It does not include the confederation sequence or the privately assigned sub-AS numbers. The sub-AS numbers are removed when the route is advertised out of the confederation AS.

[Figure 66 on page 2946](#) shows an AS divided into four confederations.

Figure 66: BGP Confederations

Figure 66 on page 2946 shows AS 3 divided into four sub-ASs, 64517, 64550, 65300, and 65410, which are linked through EBGP sessions. Because the confederations are connected by EBGP, they do not need to be fully meshed. EBGP routes are readvertised to other sub-ASs.

### Example: Configuring BGP Confederations

This example shows how to configure BGP confederations.

- [Requirements on page 2946](#)
- [Overview on page 2946](#)
- [Configuration on page 2947](#)
- [Verification on page 2949](#)

#### Requirements

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 2640](#).
- Configure interior gateway protocol (IGP) sessions between peers.
- Configure a routing policy to advertise the BGP routes.

#### Overview

Within a BGP confederation, the links between the confederation member autonomous systems (ASs) must be external BGP (EBGP) links, not internal BGP (IBGP) links.

Similar to route reflectors, BGP confederations reduce the number of peer sessions and TCP sessions to maintain connections between IBGP routing devices. BGP confederation is one method used to solve the scaling problems created by the IBGP full mesh requirement. BGP confederations effectively break up a large AS into subautonomous

systems. Each sub-AS must be uniquely identified within the confederation AS by a sub-AS number. Typically, sub-AS numbers are taken from the private AS numbers between 64512 and 65535. Within a sub-AS, the same IBGP full mesh requirement exists. Connections to other confederations are made with standard EBGP, and peers outside the sub-AS are treated as external. To avoid routing loops, a sub-AS uses a confederation sequence, which operates like an AS path but uses only the privately assigned sub-AS numbers.

Figure 67 on page 2947 shows a sample network in which AS 17 has two separate confederations: sub-AS 64512 and sub-AS 64513, each of which has multiple routers. Within a sub-AS, an IGP is used to establish network connectivity with internal peers. Between sub-ASs, an EBGP peer session is established.

Figure 67: Typical Network Using BGP Confederations

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

All Devices in Sub-AS 64512	<pre> set routing-options autonomous-system 64512 set routing-options confederation 17 members 64512 set routing-options confederation 17 members 64513 set protocols bgp group sub-AS-64512 type internal set protocols bgp group sub-AS-64512 local-address 192.168.5.1 set protocols bgp group sub-AS-64512 neighbor 192.168.8.1 set protocols bgp group sub-AS-64512 neighbor 192.168.15.1 </pre>
Border Device in Sub-AS 64512	<pre> set protocols bgp group to-sub-AS-64513 type external set protocols bgp group to-sub-AS-64513 peer-as 64513 set protocols bgp group to-sub-AS-64513 neighbor 192.168.5.2 </pre>
All Devices in Sub-AS 64513	<pre> set routing-options autonomous-system 64513 set routing-options confederation 17 members 64512 set routing-options confederation 17 members 64513 set protocols bgp group sub-AS-64513 type internal set protocols bgp group sub-AS-64513 local-address 192.168.5.2 set protocols bgp group sub-AS-64513 neighbor 192.168.9.1 </pre>

```
set protocols bgp group sub-AS-64513 neighbor 192.168.16.1
```

**Border Device in  
Sub-AS 64513**

```
set protocols bgp group to-sub-AS-64512 type external
set protocols bgp group to-sub-AS-64512 peer-as 64512
set protocols bgp group to-sub-AS-64512 neighbor 192.168.5.1
```

**Step-by-Step  
Procedure**

This procedure shows the steps for the devices that are in sub-AS 64512.

The **autonomous-system** statement sets the sub-AS number of the device.

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BGP confederations:

1. Set the sub-AS number for the device.

```
[edit routing-options]
user@host# set autonomous-system 64512
```

2. In the confederation, include all sub-ASs in the main AS.

The number 17 represents the main AS. The **members** statement lists all the sub-ASs in the main AS.

```
[edit routing-options confederation]
user@host# set 17 members 64512
user@host# set 17 members 64513
```

3. On the border device in sub-AS 64512, configure an EBGP connection to the border device in AS 64513.

```
[edit protocols bgp group to-sub-AS-64513]
user@host# set type external
user@host# set neighbor 192.168.5.2
user@host# set peer-as 64513
```

4. Configure an IBGP group for peering with the devices within sub-AS 64512.

```
[edit protocols bgp group sub-AS-64512]
user@host# set type internal
user@host# set local-address 192.168.5.1
user@host# neighbor 192.168.8.1
user@host# neighbor 192.168.15.1
```

**Results** From configuration mode, confirm your configuration by entering the **show routing-options** and **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-options
autonomous-system 64512;
confederation 17 members [64512 64513];

user@host# show protocols
bgp {
 group to-sub-AS-64513 { # On the border devices only
 type external;
```

```

 peer-as 64513;
 neighbor 192.168.5.2;
 }
 group sub-AS-64512 {
 type internal;
 local-address 192.168.5.1;
 neighbor 192.168.8.1;
 neighbor 192.168.15.1;
 }
}

```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps for sSub-AS 64513.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 2949](#)
- [Verifying BGP Groups on page 2950](#)
- [Verifying BGP Summary Information on page 2951](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From the CLI, enter the **show bgp neighbor** command.

### Sample Output

```

user@host> show bgp neighbor
Peer: 10.255.245.12+179 AS 35 Local: 10.255.245.13+2884 AS 35
 Type: Internal State: Established (route reflector client)Flags: Sync
 Last State: OpenConfirm Last Event: RecvKeepAlive
 Last Error: None
 Options: Preference LocalAddress HoldTime Cluster AddressFamily Rib-group Refresh

 Address families configured: inet-vpn-unicast inet-labeled-unicast
 Local Address: 10.255.245.13 Holdtime: 90 Preference: 170
 Flags for NLRI inet-vpn-unicast: AggregateLabel
 Flags for NLRI inet-labeled-unicast: AggregateLabel
 Number of flaps: 0
 Peer ID: 10.255.245.12 Local ID: 10.255.245.13 Active Holdtime: 90
 Keepalive Interval: 30
 NLRI advertised by peer: inet-vpn-unicast inet-labeled-unicast
 NLRI for this session: inet-vpn-unicast inet-labeled-unicast
 Peer supports Refresh capability (2)
 Restart time configured on the peer: 300
 Stale routes from peer are kept for: 60
 Restart time requested by this peer: 300
 NLRI that peer supports restart for: inet-unicast inet6-unicast
 NLRI that restart is negotiated for: inet-unicast inet6-unicast
 NLRI of received end-of-rib markers: inet-unicast inet6-unicast
 NLRI of all end-of-rib markers sent: inet-unicast inet6-unicast
 Table inet.0 Bit: 10000
 RIB State: restart is complete
 Send state: in sync

```

```
Active prefixes: 4

Last traffic (seconds): Received 3 Sent 3 Checked 3
Input messages: Total 9 Updates 6 Refreshes 0 Octets 403
Output messages: Total 7 Updates 3 Refreshes 0 Octets 365
Output Queue[0]: 0
Output Queue[1]: 0
Trace options: detail packets
Trace file: /var/log/bgpr size 131072 files 10
```

**Meaning** The output shows a list of the BGP neighbors with detailed session information. Verify the following information:

- Each configured peering neighbor is listed.
- For **State**, each BGP session is **Established**.
- For **Type**, each peer is configured as the correct type (either internal or external).
- For **AS**, the AS number of the BGP neighbor is correct.

#### *Verifying BGP Groups*

**Purpose** Verify that the BGP groups are configured correctly.

**Action** From the CLI, enter the **show bgp group** command.

### Sample Output

```
user@host> show bgp group
Group Type: Internal AS: 10045 Local AS: 10045
Name: pe-to-asbr2
Export: [match-all]
Total peers: 1 Established: 1
10.0.0.4+179
bgp.13vpn.0: 1/1/0
vpn-green.inet.0: 1/1/0

Groups: 1 Peers: 1 External: 0 Internal: 1 Down peers: 0 Flaps: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
bgp.13vpn.0 1 1 0 0 0 0
```

**Meaning** The output shows a list of the BGP groups with detailed group information. Verify the following information:

- Each configured group is listed.
- For **AS**, each group's remote AS is configured correctly.
- For **Local AS**, each group's local AS is configured correctly.
- For **Group Type**, each group has the correct type (either internal or external).

- For **Total peers**, the expected number of peers within the group is shown.
- For **Established**, the expected number of peers within the group have BGP sessions in the **Established** state.
- The IP addresses of all the peers within the group are present.

### Verifying BGP Summary Information

**Purpose** Verify that the BGP configuration is correct.

**Action** From the CLI, enter the **show bgp summary** command.

### Sample Output

```
user@host> show bgp summary
Groups: 1 Peers: 3 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 6 4 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Damped...
10.0.0.2 65002 88675 88652 0 2 42:38 2/4/0
 0/0/0
10.0.0.3 65002 54528 54532 0 1 2w4d22h 0/0/0
 0/0/0
10.0.0.4 65002 51597 51584 0 0 2w3d22h 2/2/0
 0/0/0
```

**Meaning** The output shows a summary of BGP session information. Verify the following information:

- For **Groups**, the total number of configured groups is shown.
- For **Peers**, the total number of BGP peers is shown.
- For **Down Peers**, the total number of unestablished peers is 0. If this value is not zero, one or more peering sessions are not yet established.
- Under **Peer**, the IP address for each configured peer is shown.
- Under **AS**, the peer AS for each configured peer is correct.
- Under **Up/Dwn State**, the BGP state reflects the number of paths received from the neighbor, the number of these paths that have been accepted, and the number of routes being damped (such as 0/0/0). If the field is **Active**, it indicates a problem in the establishment of the BGP session.

### Understanding Route Authentication

---

The use of router and route authentication and route integrity greatly mitigates the risk of being attacked by a machine or router that has been configured to share incorrect routing information with another router. In this kind of attack, the attacked router can be tricked into creating a routing loop, or the attacked router's routing table can be greatly increased thus impacting performance, or routing information can be redirected to a place in the network for the attacker to analyze it. Bogus route advertisements can be sent out on a segment. These updates can be accepted into the routing tables of neighbor routers unless an authentication mechanism is in place to verify the source of the routes.

Router and route authentication enables routers to share information only if they can verify that they are talking to a trusted source, based on a password (key). In this method, a hashed key is sent along with the route being sent to another router. The receiving router compares the sent key to its own configured key. If they are the same, it accepts the route. By using a hashing algorithm, the key is not sent over the wire in plain text. Instead, a hash is calculated using the configured key. The routing update is used as the input text, along with the key, into the hashing function. This hash is sent along with the route update to the receiving router. The receiving router compares the received hash with a hash it generates on the route update using the preshared key configured on it. If the two hashes are the same, the route is assumed to be from a trusted source. The key is known only to the sending and receiving routers.

To further strengthen security, you can configure a series of authentication keys (a *keychain*). Each key has a unique start time within the keychain. Keychain authentication allows you to change the password information periodically without bringing down peering sessions. This keychain authentication method is referred to as *hitless* because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol.

The sending peer uses the following rules to identify the active authentication key:

- The start time is less than or equal to the current time (in other words, not in the future).
- The start time is greater than that of all other keys in the chain whose start time is less than the current time (in other words, closest to the current time).

The receiving peer determines the key with which it authenticates based on the incoming key identifier.

The sending peer identifies the current authentication key based on a configured start time and then generates a hash value using the current key. The sending peer then inserts a TCP-enhanced authentication option object into the BGP update message. The object contains an object ID (assigned by IANA), the object length, the current key, and a hash value.

The receiving peer examines the incoming TCP-enhanced authentication option, looks up the received authentication key, and determines whether the key is acceptable based on the start time, the system time, and the tolerance parameter. If the key is accepted, the receiving peer calculates a hash and authenticates the update message.

Initial application of a keychain to a TCP session causes the session to reset. However, once the keychain is applied, the addition or removal of a password from the keychain does not cause the TCP session to reset. Also, the TCP session does not reset when the keychain changes from one authentication algorithm to another.

### Example: Configuring Route Authentication for BGP

All BGP protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in autonomous system (AS) routing updates. By default, authentication is disabled.

- [Requirements on page 2953](#)
- [Overview on page 2953](#)
- [Configuration on page 2954](#)
- [Verification on page 2956](#)

#### Requirements

Before you begin:

- Configure the router interfaces.
- Configure an interior gateway protocol (IGP).

#### Overview

When you configure authentication, the algorithm creates an encoded checksum that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet's checksum.

This example includes the following statements for configuring and applying the keychain:

- **key**—A keychain can have multiple keys. Each key within a keychain must be identified by a unique integer value. The range of valid identifier values is from 0 through 63.  
The key can be up to 126 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").
- **tolerance**—(Optional) For each keychain, you can configure a clock-skew tolerance value in seconds. The clock-skew tolerance is applicable to the receiver accepting keys for BGP updates. The configurable range is 0 through 999,999,999 seconds. During the tolerance period, either the current or previous password is acceptable.
- **key-chain**—For each keychain, you must specify a name. This example defines one keychain: **bgp-auth**. You can have multiple keychains on a routing device. For example, you can have a keychain for BGP, a keychain for OSPF, and a keychain for LDP.

- **secret**—For each key in the keychain, you must set a secret password. This password can be entered in either encrypted or plain text format in the **secret** statement. It is always displayed in encrypted format.
- **start-time**—Each key must specify a start time in UTC format. Control gets passed from one key to the next. When a configured start time arrives (based on the routing device's clock), the key with that start time becomes active. Start times are specified in the local time zone for a routing device and must be unique within the keychain.
- **authentication-key-chain**—Enables you to apply a keychain at the global BGP level for all peers, for a group, or for a neighbor. This example applies the keychain to the peers defined in the external BGP (EBGP) group called **ext**.
- **authentication-algorithm**—For each keychain, you can specify a hashing algorithm. The algorithm can be AES-128, MD5, or SHA-1.

You associate a keychain and an authentication algorithm with a BGP neighboring session.
