## show chassis in-service-upgrade

---

<b>Syntax</b>	<b>show chassis in-service-upgrade</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0.</p> <p>Command introduced in Junos OS Release 12.3R2, 13.1R2, and 13.2R1 for TX Matrix Plus routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for PTX5000 routers.</p> <p>Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p>
<b>Description</b>	<p>Display the status of Flexible PIC Concentrators (FPCs) and their corresponding PICs after the most recent unified in-service software upgrade (ISSU). This command must be issued on the master Routing Engine.</p>
	<div> <b>NOTE:</b> Only Intelligent Queuing (IQ) PICs are displayed by this command output. Unified ISSU status for other PIC types is controlled internally by the FPC.</div>
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>request system software abort</i></li><li>• <a href="#">request system software in-service-upgrade on page 406</a></li><li>• <i>Unified ISSU Concepts</i></li><li>• <i>Performing a Unified ISSU</i></li><li>• <a href="#">Understanding In-Service Software Upgrade (ISSU) on page 40</a></li><li>• <a href="#">Performing an In-Service Software Upgrade (ISSU) on page 106</a></li></ul>

## show chassis lcd

show chassis lcd (EX Series)	<pre>show chassis lcd &lt;fpc-slot <i>fpc-slot-number</i>&gt; &lt;menu &lt;(all-members   local   member <i>member-id</i>)&gt;&gt;</pre>
show chassis lcd (QFX Series and QFabric Systems)	<pre>show chassis lcd &lt;fpc-slot <i>fpc-slot-number</i>&gt; &lt;interconnect-device <i>device-id</i>&gt; &lt;node-device <i>device-id</i>&gt;</pre>
Release Information	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>menu</b> option introduced in Junos OS Release 10.2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.1 for QFabric systems.</p>
Description	<p>Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.</p>
Options	<p><b>none</b>—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.</p> <p><b>fpc-slot &lt;fpc-slot-number&gt;</b>—(Optional) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no <b>fpc-slot-number</b> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <b>fpc-slot-number</b>. Output for these options is the same as for the <b>none</b> option.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <b>fpc-slot-number</b> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <b>fpc-slot-number</b> value is specified (it equals the <b>member-id</b> value), display the information for the specified member.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the <b>fpc-slot-number</b> value.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p>

**interconnect-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

**menu**—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

**menu all-members**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

**menu local**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

**menu member *member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

**node-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

**Output Fields**

Table 65 on page 760 lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

Table 65: show chassis lcd Output Fields

Field Name	Field Description
<b>membernumber</b> (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
<b>Front panel contents for slot</b>  <b>Front panel contents</b> (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	<p>FPC slot number of the switch whose content is being displayed. The number is always <b>0</b>, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.</p> <p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the <b>member number</b> field for each member device in the EX8200 Virtual Chassis.</p>
<b>LCD screen</b>	<p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays <b>RE</b> and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet (EX3200 and EX4200 switches only)</li> </ul>
<b>LEDs status</b>	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
<b>Interface</b>	Names of the interfaces on the switch.
<b>LED (ADM/SPD/DPX/POE)</b>	<p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> The XRE200 External Routing Engine always displays the <b>NA</b> parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>NA</b>—Not applicable.</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>fpcx</b>	On standalone EX Series and QFX Series switches, always <b>0</b> . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

## show chassis led

show chassis led (EX Series)	show chassis led <fpc-slot < <i>fpc-slot-number</i> >>
show chassis led (QFX Series)	show chassis led <fpc-slot < <i>fpc-slot-number</i> >> interconnect-device <i>name</i> node-device <i>name</i>
Release Information	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.
Options	<p><b>none</b>—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) (Not on EX2200 switches) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches) Display the status of the chassis status LEDs for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.</li> <li>(EX4200 switches in a Virtual Chassis with two or more members) If no <i>fpc-slot-number</i> value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the status of the chassis status LEDs for the specified member.</li> <li>(EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li> </ul> <p><b>interconnect-device <i>name</i></b>—</p> <p>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.</p> <p><b>node-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.</p>
Required Privilege Level	view

- Output Fields** [Table 54 on page 478](#) lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

Table 66: show chassis led Output Fields

Field Name	Field Description
<b>Front panel contents for slot</b>	FPC slot number of the device whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
<b>Front panel contents</b> (EX8200 Switches)	
<b>Front Panel Module Information</b> (QFabric system QFX3008-I Interconnect device)	On EX8200 switches, no slot number is displayed.
<b>Front panel contents for</b> (QFabric system Node devices and QFX3600-I Interconnect devices)	On QFabric system Node devices, the name of the Node device whose content is being displayed.
<b>Alarms LED</b>	(EX Series switches only) Displays status of the ALM LED: <ul style="list-style-type: none"> <li>• Off—No alarm has been configured.</li> <li>• Green—No alarm has been triggered.</li> <li>• Red—Major alarm.</li> <li>• Yellow—Minor alarm</li> </ul>

Table 66: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>System LED</b>	<p>(EX Series switches only) Displays status of the SYS LED:</p> <ul style="list-style-type: none"> <li>• Off—Switch is powered off.</li> <li>• Green—Switch is operating normally.</li> <li>• Yellow—Switch is booting.</li> </ul>
<b>Master LED:</b>	<p>Displays status of the MST LED (on EX3200, EX4200, and EX8200 switches):</p> <ul style="list-style-type: none"> <li>• Green—On an EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational.</li> <li>• Off <ul style="list-style-type: none"> <li>• On an EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration.</li> <li>• On EX3200, standalone EX4200, and EX8200 switches, indicates that the Routing Engine is not operational.</li> </ul> </li> </ul>
<b>Mode LED:</b>	<p>(EX Series switches only) On an EX2200 switch only, displays the currently selected port parameter of the Status LED:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>Status/Beacon LED</b>	<p>(QFX Series only) Displays the system status as indicated by the Status LED on the chassis. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Chassis Status LEDs on a QFX3500 Device</i></li> <li>• <i>Chassis Status LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>LINK/SPEED LED</b>	<p>(QFX Series only) Displays the link status and speed of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Management Port LEDs on a QFX3500 Device</i></li> <li>• <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>ACTIVITY LED</b>	<p>(QFX Series only) Displays the activity status of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Management Port LEDs on a QFX3500 Device</i></li> <li>• <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>STATUS LED</b>	<p>(QFX Series only) Displays the link status of an interface as indicated by the ST LED. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Control Board LEDs on a QFX3008-I Interconnect Device</i></li> <li>• <i>Access Port and Uplink Port LEDs on a QFX3500 Device</i></li> <li>• <i>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</i></li> </ul>

Table 66: show chassis led Output Fields (*continued*)

Field Name	Field Description
LINK/ACTIVITY LED	<p>(QFX Series only) Displays link activity or faults on an interface as indicated by the LA LED. For more information, see:</p> <ul style="list-style-type: none"> <li>Access Port and Uplink Port LEDs on a QFX3500 Device</li> <li>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</li> </ul>
Status LED	<p>(QFX3008-I Interconnect device only)</p> <ul style="list-style-type: none"> <li>Displays the system status as indicated by the STATUS LED on the front panel of the chassis. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</li> <li>Displays the status of a Control Board as indicated by the STATUS LED on the Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i>.</li> </ul>
Power LED	<p>(QFX3008-I Interconnect device only) Displays the status of system power on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Major Alarm LED	<p>(QFX3008-I Interconnect device only) Displays whether a critical error condition that requires immediate action exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Minor Alarm LED	<p>(QFX3008-I Interconnect device only) Displays whether a noncritical condition that requires monitoring or maintenance exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Fan 0 LED	<p>(QFX3008-I Interconnect device only) Displays the status of fan trays on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Fan 1 LED	
Fan 2 LED	
Fan 3 LED	
Fan 4 LED	
Fan 5 LED	
Fan 6 LED	
Fan 7 LED	
Fan 8 LED	
PEM 0 LED	<p>(QFX3008-I Interconnect device only) Displays the status of power supplies on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
PEM 1 LED	
PEM 2 LED	
PEM 3 LED	
PEM 4 LED	

Table 66: show chassis led Output Fields (*continued*)

Field Name	Field Description
LED info for	(QFX3008-I Interconnect device only) Displays the LED information for a Control Board.
Mastership LED	(QFX3008-I Interconnect device only) Displays status of the MASTER LED on a Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i> .
Interface	Names of the interfaces on the device.
LED (ADM/SPD/DPX/POE)	<p>(EX Series switches only) State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> EX4500 and EX8200 switches do not have the POE port parameter.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>

## show chassis location

<b>Syntax</b>	show chassis location
<b>Syntax (TX Matrix Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc number lcc number)   lcc number   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc number lcc number)   lcc number   sfc number>
<b>Syntax (MX Series Router)</b>	show chassis location <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
<b>Options</b>	<p><b>none</b>—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.</p> <p><b>fpc</b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.</p> <p><b>interface by-name <i>name</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.</p> <p><b>interface by-slot fpc number lcc number</b>—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a</p>

TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace **number** with a value from **0** through **7**.
- For **lcc**, replace **number** with a value from **0** through **7**.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**node-device name**—(QFabric systems only) (Optional) Display the physical location of the Node device.

**scc**—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

view

**List of Sample Output**

[show chassis location on page 783](#)

[show chassis location fpc \(TX Matrix Router\) on page 783](#)

[show chassis location interface by-slot \(TX Matrix Router\) on page 783](#)

[show chassis location fpc \(TX Matrix Plus Router\) on page 784](#)

**Output Fields** Table 67 on page 783 lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

**Table 67: show chassis location Output Fields**

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31. On TX Matrix Plus router with 3D SIBs the value is 0 through 63.
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.

## Sample Output

### show chassis location

```

user@host> show chassis location

<b>Syntax (QFX Series)</b>	show chassis mac-addresses <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Syntax (ACX Series Universal Access Routers)</b>	show chassis mac-addresses
<b>Release Information</b>	<p>Command introduced before JUNOS Release 7.4.</p> <p>Command introduced in JUNOS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.</p>
<b>Description</b>	Display the media access control (MAC) addresses for the router, switch chassis, or switch.
<b>Options</b>	<p><b>none</b>—(TX Matrix, TX Matrix Plus routers, and the QFX Series) Display the MAC addresses for the router chassis or switch. On a TX Matrix router, display MAC addresses on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display MAC addresses on the TX Matrix Plus router and its attached routers.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display the MAC addresses for all the member routers of the Virtual Chassis configuration.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display the MAC addresses for the Interconnect device.</p>

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display MAC addresses for a specified T640 router (line-card chassis) that is connected to the TX Matrix Plus router. On a TX Matrix Plus router, display MAC addresses for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the MAC addresses for the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display the MAC addresses for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-group name**—(QFabric systems only) (Optional) Display the MAC addresses for the specified Node group.

**scc**—(TX Matrix routers only) (Optional) Display MAC addresses for the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display MAC addresses for the TX Matrix Plus router (or switch-fabric chassis).

## show chassis pic

<b>Syntax</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> &lt;lcc <i>number</i>&gt;</code>
<b>Syntax (MX Series Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> &lt;all-members&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt;</code>
<b>Syntax (MX104, MX2010 and MX2020 3D Universal Edge Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (PTX Series Packet Transport Router)</b>	<code>show chassis pic transport fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (QFX Series)</b>	<code>show chassis pic &lt;interconnect-device <i>name</i> (fpc-slot <i>slot-number</i>   pic-slot <i>slot-number</i>)&gt; &lt;node-device <i>name</i> pic-slot <i>slot-number</i>&gt;</code>
<b>Syntax (ACX Series Universal Access Routers)</b>	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.</p>
<b>Description</b>	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
<b>Options</b>	<p><b>fpc-slot <i>slot-number</i></b>—Display information about the PIC in this particular FPC slot:</p> <ul style="list-style-type: none"> <li>On a TX Matrix router, if you specify the number of the T640 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot-number</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot-number</i></b> with a value from 0 through 31.</li> </ul> <p>Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot-number</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot-number</i></b> with a value from 0 through 31. For example, the following commands have the same result:</p>

```

user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1

```

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX104 routers only—Replace **slot-number** with a value from 0 through 2.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2010 routers only—Replace **slot-number** with a value from 0 through 9.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 and QFX5100 standalone switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

**transport**—Display PIC information for optical transport network.

**Required Privilege Level**

**Output Fields** [Table 69 on page 793](#) lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

**Table 69: show chassis pic Output Fields**

Field Name	Field Description
Type	<p>PIC type.</p> <p><b>NOTE:</b> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as <b>MIC-3D-1STM64-XFP</b> and with the SONET framing mode, the type is displayed as <b>MIC-3D-1OC192-XFP</b>. By default, the 1-port OC192/STM64 MICs displays the type as <b>MIC-3D-1OC192-XFP</b>.</p>

Table 69: show chassis pic Output Fields (*continued*)

Field Name	Field Description
<b>Account Layer2 Overhead</b>	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
<b>ASIC type</b>	Type of ASIC on the PIC.
<b>State</b>	Status of the PIC. State is displayed only when a PIC is in the slot. <ul style="list-style-type: none"> <li>• <b>Online</b>— PIC is online and running.</li> <li>• <b>Offline</b>—PIC is powered down.</li> </ul>
<b>PIC version</b>	PIC hardware version.
<b>Uptime</b>	How long the PIC has been online.
<b>Package</b>	(Multiservices PICs only) Services package supported: <b>Layer-2</b> or <b>Layer-3</b> .
<b>Port Number</b>	Port number for the PIC.
<b>Cable Type</b>	Type of cable connected to the port: <b>LH</b> , <b>LX</b> , or <b>SX</b> .
<b>PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)</b>	Port-level information for the PIC. <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of optical transceiver installed.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction</li> </ul>
<b>PIC Port Information (MX960 Router Bidirectional Optics )</b>	Port-level information for the PIC. <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> <li>• BX10-10-km bidirectional optics.</li> <li>• BX40-40-km bidirectional optics.</li> <li>• SFP-LX-40-km SFP optics.</li> </ul> </li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.</li> </ul>

Table 69: show chassis pic Output Fields (*continued*)

Field Name	Field Description
<b>PIC Port Information (Next-Generation SONET/SDH SFP)</b>	Port-level information for the next-generation SONET/SDH SFP PIC. <ul style="list-style-type: none"> <li>• Port—Port number.</li> <li>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed.</li> <li>• Fiber type—Type of fiber: <b>SM</b> (single-mode) or <b>MM</b> (multimode).</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.</li> </ul>
<b>Pic port information (MX104 router)</b>	Port-level information for the PIC. <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of optical transceiver installed.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal.</li> <li>• Xcvr Firmware—Firmware version of the transceiver.</li> </ul>
<b>Multirate Mode</b>	Rate-selectability status for the MIC: <b>Enabled</b> or <b>Disabled</b> .
<b>Channelization</b>	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

## show chassis routing-engine

---

<b>Syntax</b>	show chassis routing-engine <bios   <i>slot</i> >
<b>Syntax (EX Series Switches)</b>	show chassis routing-engine < <i>slot</i> >
<b>Syntax (T Series routers)</b>	show chassis routing-engine <bios   <i>slot</i> >
<b>Syntax (TX Matrix Routers)</b>	show chassis routing-engine <bios   <i>slot</i> > <lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis routing-engine <bios   <i>slot</i> > <lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (QFX Series)</b>	show chassis routing-engine <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Syntax (MX Series Routers)</b>	show chassis routing-engine <bios   <i>slot</i> > <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis routing-engine <bios   <i>slot</i> >
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis routing-engine <bios   <i>slot</i> >
<b>Syntax (ACX Series Universal Access Routers)</b>	show chassis routing-engine
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release in 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	Display the status of the Routing Engine.

**Options** **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

**bios**—(Optional) Display the (BIOS) firmware version.

**interconnect-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

**scc**—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slot**—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace *slot* with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

**Output Fields** [Table 70 on page 806](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 70: show chassis routing-engine Output Fields**

Field Name	Field Description
Slot	(Systems with single and multiple Routing Engines) Slot number.
Current state	(Systems with multiple Routing Engines) Current state of the Routing Engine: <b>Master</b> , <b>Backup</b> , or <b>Disabled</b> .
Election priority	(Systems with multiple Routing Engines) Election priority for the Routing Engine: <b>Master</b> or <b>Backup</b> .
Temperature	Temperature of the air flowing past the Routing Engine.

Table 70: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
<b>CPU Temperature</b>	Temperature of the CPU.
<b>DRAM</b>	Total DRAM available to the Routing Engine's processor.  Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.
<b>Memory utilization</b>	Percentage of Routing Engine memory being used.
<b>CPU utilization</b>	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"> <li>• <b>User</b>—Percentage of CPU time being used by user processes.</li> <li>• <b>Background</b>—Percentage of CPU time being used by background processes.</li> <li>• <b>Kernel</b>—Percentage of CPU time being used by kernel processes.</li> <li>• <b>Interrupt</b>—Percentage of CPU time being used by interrupts.</li> <li>• <b>Idle</b>—Percentage of CPU time that is idle.</li> </ul>
<b>Model</b>	Routing Engine model number.
<b>Serial ID</b>	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
<b>Start time</b>	Time at which the Routing Engine started running.
<b>Uptime</b>	How long the Routing Engine has been running.
Routing Engine BIOS Version	BIOS version being run by the Routing Engine.

Table 70: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Last reboot reason	<p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> <li><b>power cycle/failure</b>—Halt of the Routing Engine using the <b>halt</b> command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the <b>request system halt</b> command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard.</li> <li><b>watchdog</b>—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered.</li> <li><b>reset-button reset</b>—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine.</li> <li><b>power-button hard power off</b>—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the <b>request system power-off</b> command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software.</li> <li><b>misc hardware reason</b>—Reboot due to miscellaneous hardware reasons.</li> <li><b>thermal shutdown</b>—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations.</li> <li><b>hard disk failure</b>—Reboot due to a hard disk or solid-state drive (SSD) failure.</li> <li><b>reset from debugger</b>—Reboot due to reset from the debugger.</li> <li><b>chassis control reset</b>—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the <b>restart chassis-control</b> command.</li> <li><b>bios auto recovery reset</b>—Reboot due to a BIOS auto-recovery reset.</li> <li><b>could not be determined</b>—Reboot due to an undetermined reason.</li> <li><b>Router rebooted after a normal shutdown</b>—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the <b>request system reboot</b> command. You can enter this command to reboot the chassis or specific Routing Engines.</li> </ul>
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

## Sample Output

### show chassis routing-engine (M5 Router)

```

user@host> show chassis routing-engine

## show chassis zones

<b>Syntax</b>	show chassis zones <detail>
<b>Syntax (QFX Series)</b>	show chassis zones <detail> <interconnect-device <i>name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays. On MX2010 and MX2020 routers, display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.
<b>Options</b>	<p><b>detail</b>—(MX2010 and MX2020 routers only) (Optional) Display detailed status of the cooling system zones.</p> <p><b>detail <i>device-name</i></b>— (QFabric systems only) (Optional) Display detailed status of the two cooling systems on the Interconnect device.</p> <p><b>interconnect-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the cooling zones on the Interconnect device.</p>
<b>Required Privilege Level</b>	view

<b>Output Fields</b>	Table 54 on page 478 lists the output fields for the <b>show chassis zones</b> command. Output fields are listed in the approximate order in which they appear.

Table 71: show chassis zones Output Fields

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0.
Beacon State	Status of the beacon state: <ul style="list-style-type: none"> <li>Off—The beacon is <b>OFF</b>.</li> <li>On—The beacon is <b>ON</b>.</li> </ul>
<b>show chassis zones</b> command output fields for MX2020 and MX2010 routers:	
Driving FRU	Field replacable unit (FRU).
Temperature	Temperature of the specified FRU in degrees Celsius and degrees Fahrenheit.
Condition	Condition of the specified FRU. Condition can be <b>HIGH TEMP</b> , <b>WARM TEMP</b> , <b>OK</b> , and <b>Offline</b> .
Num Fans Missing	Number of fans or fan trays missing.
Num Fans Failed	Number of fans or fan trays that have failed.
Fan Duty Cycle	Fan duty cycle value.
<b>show chassis zones detail</b> command output fields for MX2020 and MX2010 routers:	
Item	Chassis component: <ul style="list-style-type: none"> <li>Information about the chassis, Routing Engines, Control Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</li> </ul>
Measurement	Fan tray speed utilization in percentage.
Status	Status of the specified item. Status can be <b>OK</b> , <b>Absent</b> , or <b>Offline</b> .

## Sample Output

### show chassis zones interconnect-device (QFabric System)

```
user@switch> show chassis zones interconnect-device interconnect1

## show cli

<b>Syntax</b>	show cli
<b>Syntax (QFX Series)</b>	show cli <authorization> <directory> <history <i>count</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display configured CLI settings.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli on page 832</a>
<b>Output Fields</b>	<a href="#">Table 72 on page 831</a> lists the output fields for the <b>show cli</b> command. Output fields are listed in the approximate order in which they appear.

**Table 72: show cli Output Fields**

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: <b>on</b> or <b>off</b> .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is <b>disabled</b> .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: <b>on</b> or <b>off</b> .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: <b>enhanced</b> .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is <b>disabled</b> .
CLI working directory	Pathname of the working directory.

## Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

## show cli authorization

<b>Syntax</b>	show cli authorization
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the permissions for the current user.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli authorization on page 835</a>
<b>Output Fields</b>	<a href="#">Table 73 on page 833</a> lists the output fields for the <b>show cli authorization</b> command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

**Table 73: show cli authorization Output Fields**

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 73: show cli authorization Output Fields (*continued*)

Field Name	Field Description
<b>flow-tap-control</b>	Can configure flow-tap configuration information.
<b>idp-profiler-operation</b>	Can configure Profiler data.
<b>interface</b>	Can view interface configuration information.
<b>interface-control</b>	Can modify interface configuration information.
<b>maintenance</b>	Can perform system maintenance.
<b>network</b>	Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>pgcp-session-mirroring</b>	Can view Packet Gateway Control Protocol session mirroring configuration.
<b>pgcp-session-mirroring-control</b>	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
<b>reset</b>	Can reset or restart interfaces and system processes.
<b>rollback</b>	Can roll back to previous configurations.
<b>routing</b>	Can view routing configuration information.
<b>routing-control</b>	Can modify routing configuration information.
<b>secret</b>	Can view passwords and authentication keys in the configuration.
<b>secret-control</b>	Can modify passwords and authentication keys in the configuration.
<b>security</b>	Can view security configuration information.
<b>security-control</b>	Can modify security configuration information.
<b>shell</b>	Can start a local shell.
<b>snmp</b>	Can view SNMP configuration information.
<b>snmp-control</b>	Can modify SNMP configuration information.
<b>system</b>	Can view system configuration information.
<b>system-control</b>	Can modify system configuration information.
<b>trace</b>	Can view trace file settings information.

Table 73: show cli authorization Output Fields (*continued*)

Field Name	Field Description
<b>trace-control</b>	Can modify trace file settings information.
<b>view</b>	Can view current values and statistics.
<b>view-configuration</b>	Can view all configuration information (not including secrets).

## Sample Output

### show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
 admin -- Can view user accounts
 admin-control-- Can modify user accounts
 clear -- Can clear learned network information
 configure -- Can enter configuration mode
 control -- Can modify any configuration
 edit -- Can edit full files
 field -- Special for field (debug) support
 floppy -- Can read and write from the floppy
 interface -- Can view interface configuration
 interface-control-- Can modify interface configuration
 network -- Can access the network
 reset -- Can reset/restart interfaces and daemons
 routing -- Can view routing configuration
 routing-control-- Can modify routing configuration
 shell -- Can start a local shell
 snmp -- Can view SNMP configuration
 snmp-control-- Can modify SNMP configuration
 system -- Can view system configuration
 system-control-- Can modify system configuration
 trace -- Can view trace file settings
 trace-control-- Can modify trace file settings
 view -- Can view current values and statistics
 maintenance -- Can become the super-user
 firewall -- Can view firewall configuration
 firewall-control-- Can modify firewall configuration
 secret -- Can view secret configuration
 secret-control-- Can modify secret configuration
 rollback -- Can rollback to previous configurations
 security -- Can view security configuration
 security-control-- Can modify security configuration
 access -- Can view access configuration
 access-control-- Can modify access configuration
 view-configuration-- Can view all configuration (not including secrets)
 flow-tap -- Can view flow-tap configuration
 flow-tap-control-- Can configure flow-tap service
Individual command authorization:
 Allow regular expression: none
 Deny regular expression: none
 Allow configuration regular expression: none
 Deny configuration regular expression: none

```

## Sample Output

### show cli directory

```
user@host> show cli directory
Current directory: /var/home/regress
```

## show cli history

---

<b>Syntax</b>	<code>show cli history</code> <code>&lt;count&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of previous CLI commands.
<b>Options</b>	<b>none</b> —Display all previous CLI commands.  <b>count</b> —(Optional) Maximum number of commands to display.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli history on page 838</a>
<b>Output Fields</b>	<a href="#">Table 75 on page 838</a> lists the output fields for the <b>show cli history</b> command. Output fields are listed in the approximate order in which they appear.

**Table 75: show cli history Output Fields**

Field Name	Field Description
<i>timestamp</i>	Time at which the command was entered.
<i>command-syntax</i>	Command that was entered.

## Sample Output

### show cli history

```
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history
```

---

## show host

---

<b>Syntax</b>	<code>show host <i>hostname</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Domain Name System (DNS) hostname information.
<b>Options</b>	<i>hostname</i> —Hostname or address.
<b>Additional Information</b>	The <code>show host</code> command displays the raw data received from the DNS server.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show host on page 839</a>

### Sample Output

#### show host

```
user@host> show host snark
snark.boojum.net has address 192.168.1.254

user@host> show host 192.168.1.254
Name: snark.boojum.net
Address: 192.168.1.254
Aliases:
```

## show interfaces diagnostics optics

<b>Syntax</b>	<code>show interfaces diagnostics optics <i>interface-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Display diagnostics data and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, and QSFP+ optical transceivers installed in a QFX Series product. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p>
<b>Options</b>	<i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring Interface Status and Traffic on page 309</a></li> <li>• <a href="#">Installing a Transceiver in a QFX Series Device</a></li> <li>• <a href="#">Removing a Transceiver from a QFX Series Device</a></li> <li>• <a href="#">Junos OS Network Interfaces Library for Routing Devices</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver) on page 844</a> <a href="#">show interfaces diagnostics optics node1:xe-0/0/1 (SFP+ Transceiver) on page 845</a>
<b>Output Fields</b>	lists the output fields for the <code>show interfaces diagnostics optics</code> command. Output fields are listed in the approximate order in which they appear.

**Table 76: show interfaces diagnostics optics Output Fields**

Field Name	Field Description
Physical interface	Displays the name of the physical interface.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage	Displays the voltage, in volts.
(Not available for XFP transceivers)	

Table 76: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
<b>Laser rx power</b> (Not available for SFP and SFP+ transceivers)	Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
<b>Receiver signal average optical power</b> (Not available for XFP transceivers)	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
<b>Laser bias current high alarm</b>	Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .
<b>Laser bias current low alarm</b>	Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .
<b>Laser bias current high warning</b>	Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .
<b>Laser bias current low warning</b>	Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .
<b>Laser output power high alarm</b>	Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .
<b>Laser output power low alarm</b>	Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .
<b>Laser output power high warning</b>	Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .
<b>Laser output power low warning</b>	Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .
<b>Module temperature high alarm</b>	Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .
<b>Module temperature low alarm</b>	Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .
<b>Module temperature high warning</b>	Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> .
<b>Module temperature low warning</b>	Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .
<b>Module voltage high alarm</b> (Not available for XFP transceivers)	Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .
<b>Module voltage low alarm</b> (Not available for XFP transceivers)	Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .
<b>Module voltage high warning</b> (Not available for XFP transceivers)	Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .
<b>Module voltage low warning</b> (Not available for XFP transceivers)	Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .
<b>Laser rx power high alarm</b>	Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .

Table 76: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power low alarm	Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .
Laser rx power high warning	Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .
Laser rx power low warning	Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Module not ready alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault.
Module power down alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module is in a limited power mode, low for normal operation.
Tx data not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .
Tx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .
Tx laser fault alarm (Not available for SFP and SFP+ transceivers)	Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .
Tx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .
Rx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .
Rx loss of signal alarm (Not available for SFP and SFP+ transceivers)	Receive loss of signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> .
Rx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.

Table 76: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high warning.
Module voltage low warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser Rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser Rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser Rx power high warning.

Table 76: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser Rx power low warning.

## Sample Output

### show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver)

```

user@host> show interfaces diagnostics optics xe-0/0/1
Physical interface: xe-0/0/1
 Laser bias current : 4.968 mA
 Laser output power : 0.4940 mW / -3.06 dBm
 Module temperature : 27 degrees C / 81 degrees F
 Module voltage : 3.2310 V
 Receiver signal average optical power : 0.0000

## show log

---

Syntax	show log <filename   user <username>>
Syntax (QFabric System)	show log filename <device-type (device-id   device-alias)>
Syntax (TX Matrix Routers)	show log <all-lcc   lcc number   scc> <filename   user <username>>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <i>device-type (device-id   device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.
Options	<b>none</b> —List all log files.  <all-lcc   lcc number   scc>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <b>number</b> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).  <b>device-type</b> —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none"><li>• <b>director-device</b>—Display logs for Director devices.</li><li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li><li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li><li>• <b>node-device</b>—Display logs for Node devices.</li></ul>

**NOTE:** If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

## show ntp associations

<b>Syntax</b>	<code>show ntp associations</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Network Time Protocol (NTP) peers and their state.
<b>Options</b>	<b>none</b> —Display NTP peers and their state.  <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ntp status on page 851</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp associations on page 850</a>
<b>Output Fields</b>	<a href="#">Table 77 on page 849</a> describes the output fields for the <b>show ntp associations</b> command. Output fields are listed in the approximate order in which they appear.

**Table 77: show ntp associations Output Fields**

Field Name	Field Description
<b>remote</b>	Address or name of the remote NTP peer.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of <b>0.0.0.0</b> .
<b>st</b>	Stratum of the remote peer.
<b>t</b>	Type of peer: <b>b</b> (broadcast), <b>l</b> (local), <b>m</b> (multicast), or <b>u</b> (unicast).
<b>when</b>	When the last packet from the peer was received.
<b>poll</b>	Polling interval, in seconds.
<b>reach</b>	Reachability register, in octal.
<b>delay</b>	Current estimated delay of the peer, in milliseconds.
<b>offset</b>	Current estimated offset of the peer, in milliseconds.
<b>disp</b>	Current estimated dispersion of the peer, in milliseconds.

Table 77: show ntp associations Output Fields (*continued*)

Field Name	Field Description
<i>peer-name</i>	<p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> <li>• space—Discarded because of a high stratum value or failed sanity checks.</li> <li>• x—Designated "falseticker" by the intersection algorithm.</li> <li>• .—Culled from the end of the candidate list.</li> <li>• — —Discarded by the clustering algorithm.</li> <li>• +—Included in the final selection set.</li> <li>• #—Selected for synchronization, but the distance exceeds the maximum.</li> <li>• *—Selected for synchronization.</li> <li>• o—Selected for synchronization, but the packets-per-second (pps) signal is in use.</li> </ul>

## Sample Output

### show ntp associations

## show ntp status

<b>Syntax</b>	<code>show ntp status</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the values of internal variables returned by Network Time Protocol (NTP) peers.
<b>Options</b>	<b>none</b> —Display the values of internal variables returned by NTP peers. <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ntp associations on page 849</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp status on page 852</a>
<b>Output Fields</b>	<a href="#">Table 78 on page 851</a> describes the output fields for the <b>show ntp status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 78: show ntp status Output Fields**

Field Name	Field Description
<b>status</b>	System status word, a code representing the status items listed.
<b>leap_none</b>	Indicates a normal synchronized state with no leap seconds imminent. Other options could be <b>leap_add_sec</b> , <b>leap_del_sec</b> , or <b>leap_alarm</b> , indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
<b>sync_ntp</b>	Indicates the current synchronization source, in this case, an NTP server. Other options include <b>sync_alarm</b> and <b>sync_unspec</b> , both indicating that the router has not been synched.
<b>x events</b>	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
<b>event_peer/strat_chg</b>	Describes the most recent event, in this case, the stratum of the peer server changed.
<b>version</b>	A detailed description of the version of NTP being used.
<b>processor</b>	Indicates the current hardware platform and version of the processor.
<b>system</b>	Detailed description of the name and version of the operating system in use.
<b>leap</b>	The number of leap seconds in use.

Table 78: show ntp status Output Fields (*continued*)

Field Name	Field Description
<b>stratum</b>	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
<b>precision</b>	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
<b>rootdelay</b>	The total roundtrip delay to the primary reference source, in seconds.
<b>rootdispersion</b>	The maximum error relative to the primary reference source, in seconds.
<b>peer</b>	An identification number of the peer in use.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.
<b>reftime</b>	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
<b>poll</b>	The NTP broadcast message polling interval, in seconds.
<b>clock</b>	The current time on the local router clock.
<b>state</b>	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
<b>offset</b>	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
<b>frequency</b>	The frequency of the clock.
<b>jitter</b>	Indicates the magnitude of jitter, in milliseconds, between several time queries.
<b>stability</b>	A measure of how well this clock can maintain a constant frequency.

## Sample Output

### show ntp status

```

## show subscribers

---

**Syntax**    `show subscribers`  
              `<detail | extensive | terse>`  
              `<aci-interface-set-name aci-interface-set-name>`  
              `<address address>`  
              `<agent-circuit-identifier agent-circuit-identifier-substring>`  
              `<client-type client-type>`  
              `<count>`  
              `<interface interface>`  
              `<logical-system logical-system>`  
              `<mac-address mac-address>`  
              `<physical-interface physical-interface-name>`  
              `<profile-name profile-name>`  
              `<routing-instance routing-instance>`  
              `<stacked-vlan-id stacked-vlan-id>`  
              `<subscriber-state subscriber-state>`  
              `<user-name user-name>`  
              `<vci vci-identifier>`  
              `<vpi vpi-identifier>`  
              `<vlan-id vlan-id>`

**Release Information**    Command introduced in Junos OS Release 9.3.  
                              Command introduced in Junos OS Release 9.3 for EX Series switches.  
                              **client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
                              **count** option usage with other options introduced in Junos OS Release 10.2.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
                              The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.  
                              Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
                              Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description**    Display information for active subscribers.

**Options**    **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as `aci-1003-ge-1/0/0.4001`, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, `192.168.17.1`). If you specify the IP address as a prefix with a netmask (for example, `192.168.17.1/32`), the router displays a message that the IP address is invalid, and rejects the command.

***agent-circuit-identifier-substring***—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

***client-type***—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

***count***—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the ***count*** option alone or with the ***address***, ***client-type***, ***interface***, ***logical-system***, ***mac-address***, ***profile-name***, ***routing-instance***, ***stacked-vlan-id***, ***subscriber-state***, or ***vlan-id*** options.

***id***—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the ***show subscribers extensive*** or the ***show subscribers interface extensive*** commands.

***interface***—(Optional) Display subscribers whose interface matches the specified interface.

***logical-system***—(Optional) Display subscribers whose logical system matches the specified logical system.

***mac-address***—(Optional) Display subscribers whose MAC address matches the specified MAC address.

***physical-interface-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

***profile-name***—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

***routing-instance***—(Optional) Display subscribers whose routing instance matches the specified routing instance.

***subscriber-state***—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

***user-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

***vci-identifier***—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is 0 through 255.

***vpi-identifier***—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is 0 through 65535.

***vlan-id***—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

***stacked-vlan-id***—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

**NOTE:** Due to display limitations, logical system and routing instance output values are truncated when necessary.

**Output Fields** [Table 79 on page 857](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

**Table 79: show subscribers Output Fields**

Field Name	Field Description
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>  No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> .
<b>User Name</b>	Name of subscriber.
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.
<b>Type</b>	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
<b>IP Address</b>	Subscriber IPv4 address.
<b>IP Netmask</b>	Subscriber IP netmask.
<b>Primary DNS Address</b>	IP address of primary DNS server.
<b>Secondary DNS Address</b>	IP address of secondary DNS server.
<b>Primary WINS Address</b>	IP address of primary WINS server.
<b>Secondary WINS Address</b>	IP address of secondary WINS server.
<b>IPv6 Address</b>	Subscriber IPv6 address, or multiple addresses.
<b>IPv6 Prefix</b>	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
<b>IPv6 User Prefix</b>	IPv6 prefix obtained through ND/RA.
<b>IPv6 Address Pool</b>	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
<b>IPv6 Network Prefix Length</b>	Length of the network portion of the IPv6 address.
<b>IPv6 Prefix Length</b>	Length of the subscriber IPv6 prefix.

Table 79: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>Logical System</b>	Logical system associated with the subscriber.
<b>Routing Instance</b>	Routing instance associated with the subscriber.
<b>Interface Type</b>	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .
<b>Interface Set</b>	Internally generated name of the dynamic ACI interface set used by the subscriber session.
<b>Interface Set Type</b>	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
<b>Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.
<b>Underlying Interface</b>	Name of the underlying interface for the subscriber session.
<b>Dynamic Profile Name</b>	Dynamic profile used for the subscriber.
<b>Dynamic Profile Version</b>	Version number of the dynamic profile used for the subscriber.
<b>MAC Address</b>	MAC address associated with the subscriber.
<b>State</b>	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).
<b>L2TP State</b>	Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
<b>Tunnel switch Profile Name</b>	Name of the L2TP tunnel switch profile that initiates tunnel switching.
<b>Local IP Address</b>	IP address of the local gateway (LAC).
<b>Remote IP Address</b>	IP address of the remote peer (LNS).
<b>VLAN Id</b>	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
<b>Stacked VLAN Id</b>	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
<b>RADIUS Accounting ID</b>	RADIUS accounting ID associated with the subscriber.
<b>Agent Circuit ID</b>	Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
<b>Agent Remote ID</b>	Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
<b>DHCP Relay IP Address</b>	IP address used by the DHCP relay agent.

Table 79: show subscribers Output Fields (*continued*)

Field Name	Field Description
ATM VPI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
ATM VCI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.
Login Time	Date and time at which the subscriber logged in.
Effective shaping-rate	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.
IPv6 Interface Address	Address assigned by the Framed-Ipv6-Prefix AAA attribute.
IPv6 Framed Interface Id	Interface ID assigned by the Framed-Interface-Id AAA attribute.
ADF IPv4 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.

Table 79: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).

## Sample Output

### show subscribers (IPv4)

```

user@host> show subscribers
Interface IP Address/VLAN ID User Name LS:RI

## show system alarms

---

<b>Syntax</b>	show system alarms
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display active system alarms.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	<p>System alarms are preset. They include a <b>configuration</b> alarm that appears when no rescue configuration alarm is set and a <b>license</b> alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the <i>Junos OS Administration Library for Routing Devices</i>.</p> <p>In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.</p> <p>Starting with Junos OS Release 13.2, you can view degraded fabric alarms on a routing matrix based on TX Matrix Plus router with 3D SIBs. The alarm indicates that the source FPC is running with a degraded fabric condition. This alarm is an early warning of a possible fabric black-hole condition. When the degraded fabric alarm is raised on the source FPC, you can take remedial action to avoid a fabric black-hole condition. The degraded fabric alarm is raised on the source FPC if both the following conditions are met:</p> <ul style="list-style-type: none"><li>• The active Packet Forwarding Engine destinations are reachable on one or no active switching planes.</li><li>• At least one of the inactive switching planes has a fault that causes the destination Packet Forwarding Engine to become unreachable.</li></ul>
<b>Required Privilege Level</b>	admin
<b>List of Sample Output</b>	<a href="#">show system alarms on page 872</a> <a href="#">show system alarms (Fan Tray) on page 873</a> <a href="#">show system alarms (QFX Series) on page 873</a> <a href="#">show system alarms (TX Matrix Plus router with 3D SIBs) on page 873</a>

### Sample Output

#### show system alarms

```
user@host> show system alarms
2 alarms currently active
Alarm time Class Description
2005-02-24 17:29:34 UTC Minor IPsec VPN tunneling usage requires a
license
2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent
```

**show system alarms (Fan Tray)**

```

user@host> show system alarms
4 alarms currently active
Alarm time Class Description
2010-11-11 20:27:38 UTC Major Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC Minor Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC Major Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC Major Side Fan Tray 0 Failure

```

**show system alarms (QFX Series)**

```

user@switches> show system alarms
2 alarms currently active
Alarm time Class Description
2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent

```

**show system alarms (TX Matrix Plus router with 3D SIBs)**

```

user@router> show system alarms

sfc0-re0:

2 alarms currently active
Alarm time Class Description
2013-05-08 18:13:58 UTC Major LCC 0 Major Errors
2013-05-08 17:48:46 UTC Major LCC 7 Major Errors

lcc0-re1:

1 alarm currently active
Alarm time Class Description
2013-05-08 18:19:24 UTC Major FPC 1 degraded fabric condition detected

lcc7-re0:

1 alarm currently active
Alarm time Class Description
2013-05-08 18:19:24 UTC Major FPC 7 degraded fabric condition detected

```

## show system audit

---

<b>Syntax</b>	show system audit <root-only>
<b>Syntax (EX Series Switch and MX Series Router)</b>	show system audit <all-members> <local> <member <i>member-id</i> > <root-only>
<b>Syntax (TX Matrix Router)</b>	show system audit <all-lcc   lcc <i>number</i>   scc> <root-only>
<b>Syntax (TX Matrix Plus Router)</b>	show system audit <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <root-only>
<b>Syntax (QFX Series)</b>	show system audit <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the state and checksum values for file systems.
<b>Options</b>	<b>none</b> —Display the state and checksum values for all file systems.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.  <b>all-members</b> —(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.  <b>lcc <i>number</i></b> —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**infrastructure *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

**local**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

**member *member-id***—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

**root-only**—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

**scc**—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** To redirect the output to a file, issue the following command:

```
ssh device-name 'show system audit root-only' > output-file
```

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Required Privilege Level** admin

**List of Sample Output** [show system audit root-only on page 876](#)  
[show system audit lcc \(TX Matrix Router\) on page 876](#)  
[show system audit lcc \(TX Matrix Plus Router\) on page 878](#)  
[show system audit root-only \(QFX3500 Switch\) on page 880](#)

## show system boot-messages

---

<b>Syntax</b>	show system boot-messages
<b>Syntax (EX Series Switches)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system boot-messages infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
<b>Options</b>	<b>none</b> —Display all boot time messages.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.  <b>infrastructure <i>name</i></b> —(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.  <b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.  <b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to

a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display boot time messages on the Node group.

**scc**—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

## show system buffers

<b>Syntax</b>	show system buffers
<b>Syntax (EX Series)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system buffers <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only (infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
<b>Options</b>	<p><b>none</b>—Show all buffer statistics.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.</p> <p><b>infrastructure <i>name</i></b>—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.</p>

**interconnect-device *name***—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show buffer statistics for the Node group

**sfc**—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

**Output Fields** [Table 80 on page 892](#) describes the output fields for the **show system buffers** command. Output fields are listed in the approximate order in which they appear.

Table 80: show system buffers Output Fields

Field Name	Field Description
<b>mbufs in use</b>	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
<b>mbufs allocated to packet headers</b>	Number of memory buffers currently holding packet headers
<b>mbufs allocated to control blocks</b>	Number of memory buffers currently holding the state for sockets.
<b>mbufs allocated to send data</b>	Number of memory buffers currently holding socket send data.
<b>mbufs allocated to pfe refill data</b>	Number of memory buffers currently holding Packet Forwarding Engine refill data.
<b>mbufs allocated to fxp data</b>	Number of memory buffers currently holding fxp data.
<b>mbufs allocated to socket names and addresses</b>	Number of memory buffers currently holding addresses for sockets.
<b>mbuf clusters in use</b>	Allocation statistics for memory buffer clusters.
<b>allocated to network</b>	Total amount of memory in use by the networking and interprocess communication (IPC) code.
<b>requests for memory denied</b>	Number of times a memory allocation request within the IPC and networking code failed.
<b>requests for memory delayed</b>	Number of times a memory allocation request within the IPC and networking code was postponed.
<b>calls to protocol drain routines</b>	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

## Sample Output

### show system buffers

```

user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)
395/331/726/30000 mbuf clusters in use (current/cache/total/max)
384/256 mbuf+clusters out of packet secondary zone in use (current/cache)
0/0/0/0 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/0 9k jumbo clusters in use (current/cache/total/max)
0/0/0/0 16k jumbo clusters in use (current/cache/total/max)
889K/885K/1774K bytes allocated to network (current/cache/total)
0/0/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
0/5/1024 sfbufs in use (current/peak/max)

```

```

0 requests for sbufs denied
0 requests for sbufs delayed
0 requests for I/O initiated by sendfile

## show system certificate

<b>Syntax</b>	show system certificate <certificate-id>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series, T Series routers, and QFX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority.
<b>Options</b>	<b>none</b> —Display all installed certificates signed by the Juniper Networks certificate authority. <b>certificate-id</b> —(Optional) Display the details of a particular certificate.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system certificate on page 897</a> <a href="#">show system certificate (QFX Series) on page 897</a>
<b>Output Fields</b>	<a href="#">Table 81 on page 896</a> lists the output fields for the <b>show system certificate</b> command. Output fields are listed in the approximate order in which they appear.

**Table 81: show system certificate Output Fields**

Field Name	Field Description
<b>Certificate identifier</b>	Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.
<b>Issuer</b> <b>Subject</b>	Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> <li>• <b>Organization</b>—Name of the owner's organization.</li> <li>• <b>Organizational unit</b>—Name of the owner's department.</li> <li>• <b>Country</b>—Two-character country code in which the owner's system is located.</li> <li>• <b>State</b>—State in the USA in which the owner is using the certificate.</li> <li>• <b>Locality</b>—City in which the owner's system is located.</li> <li>• <b>Common name</b>—Name of the owner of the certificate.</li> <li>• <b>E-mail address</b>—E-mail address of the owner of the certificate.</li> </ul>
<b>Validity</b>	When a certificate is valid.
<b>Signature algorithm</b>	Encryption algorithm applied to the installed certificate.
<b>Public key algorithm</b>	Encryption algorithm applied to the public key.

## Sample Output

### show system certificate

<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear system commit on page 328</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system commit on page 899</a> <a href="#">show system commit (At a Particular Time) on page 899</a> <a href="#">show system commit (At the Next Reboot) on page 899</a> <a href="#">show system commit (Rollback Pending) on page 899</a> <a href="#">show system commit (QFX Series) on page 899</a>
<b>Output Fields</b>	<a href="#">Table 82 on page 898</a> describes the output fields for the <b>show system commit</b> command. Output fields are listed in the approximate order in which they appear.

**Table 82: show system commit Output Fields**

Field Name	Field Description
Junos XML protocol	Displays the last 50 commit operations listed, most recent to first. The identifier <b>Junos XML protocol</b> designates a configuration created for recovery using the <b>request system configuration rescue save</b> command.
Junos XML protocol	Date and time of the commit operation.
Junos XML protocol	User who executed the commit operation.
Junos XML protocol	Method used to execute the commit operation: <ul style="list-style-type: none"> <li>• <b>Junos XML protocol</b>—CLI interactive user performed the commit operation.</li> <li>• <b>Junos XML protocol</b>—Junos XML protocol client performed the commit operation.</li> <li>• <b>synchronize</b>—The <b>commit synchronize</b> command was performed on the other Routing Engine.</li> <li>• <b>snmp</b>—An SNMP <b>set</b> request caused the commit operation.</li> <li>• <b>button</b>—A button on the router or switch was pressed to commit a rescue configuration for recovery.</li> <li>• <b>autoinstall</b>—A configuration obtained through autoinstallation was committed.</li> <li>• <b>other</b>—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.</li> </ul>

## Sample Output

### show system commit

```
user@host> show system commit
0 2003-07-28 19:14:04 PDT by root via other
1 2003-07-25 22:01:36 PDT by regress via cli
2 2003-07-25 22:01:32 PDT by regress via cli
3 2003-07-25 21:30:13 PDT by root via button
4 2003-07-25 13:46:48 PDT by regress via cli
5 2003-07-25 05:33:21 PDT by root via autoinstall
...
rescue 2002-05-10 15:32:03 PDT by root via other
```

### show system commit (At a Particular Time)

```
user@host> show system commit
commit requested by root via cli at Tue May 7 15:59:00 2002
```

### show system commit (At the Next Reboot)

```
user@host> show system commit
commit requested by root via cli at reboot
```

### show system commit (Rollback Pending)

```
user@host> show system commit
0 2005-01-05 15:00:37 PST by root via cli commit confirmed, rollback in 3mins
```

### show system commit (QFX Series)

```
user@switch> show system commit
0 2011-11-25 19:17:49 PST by root via cli
```

## show system configuration archival

---

**Syntax**    show system configuration archival

**Release Information**    Introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display directory and number of files queued for archival transfer.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

---

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**List of Sample Output**    [show system configuration archival on page 900](#)

### Sample Output

show system configuration archival

```
user@host> show system configuration archival

/var/transfer/config/:
total 8
```

## show system configuration rescue

<b>Syntax</b>	show system configuration rescue
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a rescue configuration, if one exists.
<div>  <b>NOTE:</b> The [edit system configuration] hierarchy is not available on QFabric systems. </div>	
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system configuration archival on page 900</a></li> </ul>

## show system connections

<b>Syntax</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   scc&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (EX Series)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-members&gt; &lt;inet   inet6&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (TX Matrix Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   scc&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (TX Matrix Plus Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i>&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-members&gt; &lt;inet   inet6&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>show system connections &lt;extensive&gt; &lt;inet&gt; &lt;infrastructure <i>name</i>&gt; &lt;interconnect-device <i>name</i>&gt; &lt;node-group <i>name</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.</p>

- Options** **none**—Display information about all active IP sockets on the Routing Engine.
- extensive**—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.
- all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.
- all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs
- all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.
- inet | inet6**—(Optional) Display IPv4 connections or IPv6 connections, respectively.
- infrastructure *name***—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.
- interconnect-device *name***—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.
- lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:
- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- local**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.
- member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.
- node-group *name***—(QFabric systems only) (Optional) Display system connection activity for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

**show-routing-instances**—(Optional) Display routing instances.

**Additional Information** By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 83 on page 905](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

**Table 83: show system connections Output Fields**

Field Name	Field Description
<b>Proto</b>	Protocol of the socket: <b>IP</b> , <b>TCP</b> , or <b>UDP</b> for IPv4 or IPv6.
<b>Recv-Q</b>	Number of input packets received by the protocol and waiting to be processed by the application.
<b>Send-Q</b>	Number of output packets sent by the application and waiting to be processed by the protocol.
<b>Local Address</b>	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
<b>Foreign Address</b>	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.

Table 83: show system connections Output Fields (*continued*)

Field Name	Field Description
<b>Routing Instance</b>	(Displayed only when the <b>show-routing-instance</b> option is used.) Routing instances associated with active IP sockets on the Routing Engine.
<b>(state)</b>	For TCP, the protocol state of the socket.

## show system core-dumps

---

<b>Syntax</b>	show system core-dumps <brief   detail> <core-filename> <core-file-info>
<b>Syntax (EX Series Switches)</b>	show system core-dumps <all-members> <brief   detail> <core-filename> <core-file-info> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system core-dumps <all-chassis   all-lcc   lcc <i>number</i>   scc> <brief   detail> <core-filename> <core-file-info>
<b>Syntax (TX Matrix Plus Router)</b>	show system core-dumps <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <brief   detail> <core-filename> <core-file-info>
<b>Syntax (QFX Series)</b>	show system core-dumps <brief   detail> <component ( <i>UUID</i>   <i>serial number</i>   all)> <core-file-info component ( <i>UUID</i>   <i>serial number</i> ) core-file-name> <display-period ( <i>hours</i>   <i>minutes</i>   <i>seconds</i> )> <display-order> <kernel-crashinfo component ( <i>UUID</i>   <i>serial number</i> )> <repository (core   log)>
<b>Release Information</b>	Command introduced before Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Show core files on all routers or switches running Junos OS. You can use the <b>show system core-dumps</b> command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.  You can use the option <b>core-filename</b> and its options <b>core-file-info</b> , <b>brief</b> , and <b>detail</b> to display more information about the specified core-dump files.
<b>Options</b>	<b>none</b> —Display a list of all existing core-dump files.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

**<all-lcc | lcc number>**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc number** option, replace **number** with a value from 0 through 3.

**NOTE:** The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

**all-members**—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

**brief**—(Optional) View details of a binary file.

**component (UUID | serial number | all)**—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

**core-file-info**—(Optional) Display the stack trace of a core file.

**core-filename**—(Optional) Name of a specific core file to display.

**detail**—(Optional) View stack trace with details of the binary file.

**display-order (timestamp-sort | alphanumeric-sort)**—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

**display-period (hours | minutes | seconds)**—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

**kernel-crashinfo component (UUID | serial number)**—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

**local**—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**repository (core | log)**—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

**scc**—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

**Output Fields**

[Table 84 on page 924](#) describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

**Table 84: show system core-dumps Output Fields**

Field Name	Field Description
<i>Permissions</i>	Read/write permissions for the file named.
<i>Links</i>	Number of links to the file.
<i>Owner</i>	Name of the file owner.
<i>Group</i>	Name of the group with file access.
<i>File size</i>	File size in bytes.
<i>Modified</i>	Last file modification date and time.

Table 84: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
<i>Path/filename</i>	File path where the file resides and the filename.
<b>Repository scope:</b>	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
<b>Repository head:</b>	Path to the top-level repository location.
<b>Repository name:</b>	Name of the repository: <b>core</b> or <b>log</b> .
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>Node Group</b>	Name of the QFabric system device.
<b>Node Identifier</b>	UUID or serial number of the QFabric system device.
<b>Num</b>	Number of core-dump and log files.
<b>Model</b>	Model number of the QFabric system device.
<b>Usage</b>	Usage of the repository in megabytes.
<b>Total usage of core repository:</b>	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
<b>Total usage of log repository:</b>	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>List of nodes for log repository:</b>	List of log files associated with a particular QFabric system device located in the log repository.
<b>Filename</b>	Name of the core-dump file.
<b>Date</b>	Last core-dump file modification date and time.
<b>Size</b>	Size of the core-dump file.
<b>Core filename</b>	Filename of the core-dump file.
<b>Process name</b>	Name of the process that is generating a core-dump file or log file.

Table 84: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
<b>Release</b>	Junos OS release.
<b>Build server</b>	Junos OS build server.
<b>Build date</b>	Junos OS build date.
<b>Stack trace</b>	Stack trace of the core-dump file.

## Sample Output

### show system core-dumps

This example shows the command output if core files exist.

```
user@switcht> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

### show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

### show system core-dumps (TX Matrix Plus Router)

## show system directory-usage

---

<b>Syntax</b>	show system directory-usage <depth <i>number</i> > <path>
<b>Syntax (EX Series)</b>	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
<b>Syntax (TX Matrix Router)</b>	show system directory-usage <all-chassis   all-lcc   lcc <i>number</i>   scc> <depth <i>number</i> > <path>
<b>Syntax (TX Matrix Plus Router)</b>	show system directory-usage <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <depth <i>number</i> > <path>
<b>Syntax (MX Series Router)</b>	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
<b>Syntax (QFX Series)</b>	show system directory-usage <depth <i>number</i> > <path> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display directory usage information.
<b>Options</b>	<b>none</b> —Display all directory usage information.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

**depth *number***—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

**infrastructure *name***— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

**interconnect-device *name***— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

**node-group *name***— (QFabric systems only) (Optional) Display directory information for the Node group.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

***path***—(Optional) Path or root directory to traverse.

**scc**—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level** view

**Output Fields** [Table 85 on page 936](#) describes the output fields for the **show system directory-usage** command. Output fields are listed in the approximate order in which they appear.

**Table 85: show system directory-usage Output Fields**

Field Name	Field Description
<i>bytes</i>	Number of bytes used by files in a directory.
<i>directory-name</i>	Name of the directory.

## Sample Output

### show system directory-usage scc (TX Matrix Router)

```

user@host> show system directory-usage /var/tmp scc
/var/tmp
1.0K /var/tmp/vi.recover
2.0K /var/tmp/instmp.tPMk8u
1.0K /var/tmp/install
 /var/tmp/instmp.GUMpur
4.8M /var/tmp/instmp.GUMpur/packages
6.4M /var/tmp/troy1
297M /var/tmp/dsw
 /var/tmp/pkg_tmp.2073

```

## show system license

<b>Syntax</b>	show system license <installed   keys   usage>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display licenses and information about how they are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system license on page 939</a> <a href="#">show system license installed on page 939</a> <a href="#">show system license keys on page 940</a> <a href="#">show system license usage on page 940</a> <a href="#">show system license (QFX Series) on page 940</a>
<b>Output Fields</b>	<a href="#">Table 86 on page 938</a> lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

**Table 86: show system license Output Fields**

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
<b>Licenses used</b>	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p><b>NOTE:</b> In Junos OS Release 10.1 and later, the <b>Licenses used</b> column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (<b>scale-subscriber</b>), L2TP (<b>scale-l2tp</b>), Mobile IP (<b>scale-mobile-ip</b>), and so on.</p>

Table 86: show system license Output Fields (*continued*)

Field Name	Field Description
Licenses installed	<p>Information about the installed license key:</p> <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>State</b>—State of the license key: <b>valid</b> or <b>invalid</b>. An <b>invalid</b> state indicates that the key was entered incorrectly or is not valid for the specific device.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Group defined</b>—Group membership of a device.</li> <li>• <b>Features</b>—Feature associated with a license, such as data link switching (DLSw).</li> </ul>
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

## Sample Output

### show system license

```
user@host> show system license
```

License usage:

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

Licenses installed:

License identifier: XXXXXXXXXX

License version: 2

Features:

```
subscriber-accounting - Per Subscriber Radius Accounting
permanent
subscriber-authentication - Per Subscriber Radius Authentication
permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
permanent
subscriber-ip - Dynamic and Static IP
permanent
```

### show system license installed

```
user@host> show system license installed
```

License identifier: XXXXXXXXXX

License version: 2

**Features:**

```

subscriber-accounting - Per Subscriber Radius Accounting
 permanent
subscriber-authentication - Per Subscriber Radius Authentication
 permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
 permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
 permanent
subscriber-ip - Dynamic and Static IP
 permanent

```

**show system license keys**

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>

- Description** Display information about software processes that are running on the router or switch and that have controlling terminals.
- Options** **none**—Display standard information about system processes.
- brief | detail | extensive | summary**—(Optional) Display the specified level of detail.
- adaptive-services**—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- alarm-control**—(Optional) Display the process to configure the system alarm.
- all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.
- all-lcc**—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.
- all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.
- ancpd-service**—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- application-identification**—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- audit-process**—(Optional) Display the RADIUS accounting process.
- auto-configuration**—Display the Interface Auto-Configuration process.
- bootp**—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.
- captive-portal-content-delivery**—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- ce-l2tp-service**—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**cfm**—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

**chassis-control**—(Optional) Display the chassis management process.

**class-of-service**—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**craft-control**—Display the process for the I/O of the craft interface.

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

**datapath-trace-service**—Display the packet path tracing process.

**dhcp-service**—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

**diameter-service**—(Optional) Display the diameter process.

**disk-monitoring**—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

**dynamic-flow-capture**—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**— Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**event-processing**—(Optional) Display the event process (eventd).

**firewall**—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Display the general authentication process.

**health** (*pid process-identifier* | *process-name process-name*)—(Optional) Display process health information, either by process id (PID) or by process name.

**iccp-service**—Display the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—Display the intrusion detection and prevention (IDP) protocol process.

**ilmi**—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

**inet-process**—Display the IP multicast family process.

**init**—Display the process that initializes the USB modem.

**interface-control**—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**kernel-replication**—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Display the Layer 2 address flooding and learning process.

**l2cpd-service**—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**lACP**—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

**local-policy-decision-function**—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**logical-system-mux**—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

**mac-validation**—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**mib-process**—(Optional) Display the MIB II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

**mpls-traceroute**—(Optional) Display the MPLS Periodic Traceroute process.

**mspd**—(Optional) Display the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**neighbor-liveness**—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

**nfsd-service**—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**ntp**—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

**packet-triggered-subscribers**—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Display the Peer Selection Service process.

**periodic-packet-services**—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

**pfe**—Display the Packet Forwarding Engine management process.

**pgcp-service**—(Optional) Display the pgcpd service process running on the Routing Engine.

**pgm**—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

**pic-services-logging**—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**ppp**—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**process-monitor**—Display the process health monitor process (pmond).

**providers**—(Optional) Display provider processes.

**redundancy-interface-process**—(Optional) Display the ASP redundancy process.

**remote-operations**—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

**resource-cleanup**—Display the resource cleanup process.

**resource-limits (brief | detail) process-name**—(Optional) Display process resource limits.

**routing**—(Optional) Display the routing protocol process.

**sampling**—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—Display the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

**sdk-service**—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**send**—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

**service-deployment**—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace *number* with 0.

**snmp**—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**sonet-aps**—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

**static-subscribers**—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**tunnel-oamd**—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**vrrp**—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**watchdog**—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

**wide**—(Optional) Display process information that might be wider than 80 columns.

**Additional Information** By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 87 on page 948](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

**Table 87: show system processes Output Fields**

Field Name	Field Description	Level of Output
last pid	Last process identifier assigned to the process.	brief extensive summary
load averages	Three load averages followed by the current time.	brief extensive summary
processes	Number of existing processes and the number of processes in each state (sleeping, running, starting, zombies, and stopped).	brief extensive summary
Mem	Information about physical and virtual memory allocation.	brief extensive summary
Swap	Information about physical and virtual memory allocation.	brief extensive summary
PID	Process identifier.	detail extensive summary
TT	Control terminal name.	none detail

Table 87: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>STAT</b>	<p>Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process:</p> <ul style="list-style-type: none"> <li>• <b>D</b>—In disk or other short-term, uninterruptible wait</li> <li>• <b>I</b>—Idle (sleeping longer than about 20 seconds)</li> <li>• <b>R</b>—Runnable</li> <li>• <b>S</b>—Sleeping for less than 20 seconds</li> <li>• <b>T</b>—Stopped</li> <li>• <b>Z</b>—Dead (zombie)</li> <li>• <b>+</b> —The process is in the foreground process group of its control terminal.</li> <li>• <b>&lt;</b>—The process has raised CPU scheduling priority.</li> <li>• <b>&gt;</b>—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped.</li> <li>• <b>A</b>—The process requested random page replacement.</li> <li>• <b>E</b>—The process is trying to exit.</li> <li>• <b>L</b>—The process has pages locked in core.</li> <li>• <b>N</b>—The process has reduced CPU scheduling priority.</li> <li>• <b>S</b>—The process requested first-in, first-out (FIFO) page replacement.</li> <li>• <b>s</b>—The process is a session leader.</li> <li>• <b>V</b>—The process is temporarily suspended.</li> <li>• <b>W</b>—The process is swapped out.</li> <li>• <b>X</b>—The process is being traced or debugged.</li> </ul>	none <b>detail</b>
<b>UID</b>	User identifier.	<b>detail</b>
<b>USERNAME</b>	Process owner.	<b>extensive summary</b>
<b>PPID</b>	Parent process identifier.	<b>detail</b>
<b>CPU</b>	<p>(D)—Short-term CPU usage.</p> <p>(E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.</p>	<b>detail extensive summary</b>
<b>RSS</b>	Resident set size.	<b>detail</b>
<b>WCHAN</b>	Symbolic name of the wait channel.	<b>detail</b>
<b>STARTED</b>	Local time when the process started running.	<b>detail</b>
<b>PRI</b>	Current priority of the process. A lower number indicates a higher priority.	<b>detail extensive summary</b>
<b>NI or NICE</b>	UNIX "niceness" value. A lower number indicates a higher priority.	<b>detail extensive summary</b>
<b>SIZE</b>	Total size of the process (text, data, and stack), in kilobytes.	<b>extensive summary</b>

Table 87: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, <b>sleep</b> , <b>wait</b> , <b>run</b> , <b>idle</b> , <b>zombie</b> , or <b>stop</b> ).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used.  (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary
THR	Number of threads in the process	extensive

## show system reboot

---

<b>Syntax</b>	show system reboot <both-routing-engines>
<b>Syntax (EX Series Switches)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   scc> <both-routing-engines>
<b>Syntax (TX Matrix Plus Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <both-routing-engines>
<b>Syntax (MX Series Router)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system reboot <both-routing-engines> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display pending system reboots or halts.
<b>Options</b>	<b>none</b> —Display pending reboots or halts on the active Routing Engine.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers

connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

**infrastructure *name***—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display reboot request information on the Node group.

**scc**—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

**Additional Information** By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the

same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** maintenance

- [Routing Matrix with a TX Matrix Plus Router Solutions Page](#)

**List of Sample Output** [show system reboot on page 970](#)  
[show system reboot all-lcc \(TX Matrix Router\) on page 970](#)  
[show system reboot sfc \(TX Matrix Plus Router\) on page 970](#)  
[show system reboot \(QFX3500 Switch\) on page 970](#)

## Sample Output

### show system reboot

```
user@host> show system reboot
reboot requested by root at Wed Feb 10 17:40:46 1999
[process id 17885]
```

### show system reboot all-lcc (TX Matrix Router)

```
user@host> show system reboot all-lcc
lcc0-re0:

No shutdown/reboot scheduled.

lcc2-re0:

No shutdown/reboot scheduled.
```

### show system reboot sfc (TX Matrix Plus Router)

```
user@host> show system sfc 0
No shutdown/reboot scheduled.
```

### show system reboot (QFX3500 Switch)

```
user@switch> show system reboot
No shutdown/reboot scheduled.
```

## show system resource-cleanup processes

<b>Syntax</b>	show system resource-cleanup processes <detail> <pid <i>number</i> > <process-name <i>name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.3. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the list of processes that have been registered for resource cleanup services.
<b>Options</b>	<p><b>detail</b>—(Optional) Display the list of processes that have been registered for resource cleanup services, along with the resources that have been requested for cleanup.</p> <p><b>pid <i>number</i></b>—(Optional) Display a process that has been registered for resource cleanup services by specifying the Process Identifier number.</p> <p><b>process-name <i>name</i></b>—(Optional) Display a process that has been registered for resource cleanup services by name of the process.</p>
<b>Required Privilege Level</b>	view

**Table 88: show system resource-cleanup processes Output Fields**

Field Name	Field Description
<b>PID</b>	Process ID, a number that identifies a process.
<b>Process name</b>	String that identifies the process.
<b>Resources to clean</b>	Resources that have been registered to be cleaned up.

## Sample Output

### show system resource-cleanup processes

```

user@host> show system resource-cleanup processes
PID Process name Resources to clean
420 jnx-exampld GENCFG, SYSV shared memory

```

### show system resource-cleanup processes detail

```
user@host> show system resource-cleanup processes detail
PID Process name Resources to clean
420 jnx-exampld GENCFG blob major ID 0x8000, minor ID 0x0000
 SYSV shared memory ID 65536, key 1108955839
 SYSV shared memory ID 65537, key 1108955837
```

## show system rollback

<b>Syntax</b>	<code>show system rollback <i>number</i></code> <code>&lt;compare <i>number</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a previously committed configuration, or the differences between two previously committed configurations.
<div>  <b>NOTE:</b> The <code>show system rollback</code> command is a purely operational mode command and cannot be issued with <code>run</code> from the configuration mode.         </div>	
<b>Options</b>	<p><b><i>number</i></b>—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.</p> <p><b><code>compare <i>number</i></code></b>—(Optional) Number of another previously committed (rollback) configuration to compare to rollback <b><i>number</i></b>. The output displays the differences between the two configurations. The range of values is 0 through 49.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show system rollback compare on page 973</a>

## Sample Output

### show system rollback compare

```

user@host> show system rollback 3 compare 1
[edit]
+ interfaces {
+ ge-1/1/1 {
+ unit 0 {
+ family inet {
+ filter {

## show system services service-deployment

<b>Syntax</b>	show system services service-deployment
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about a Session and Resource Control (SRC) client.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	system view
<b>List of Sample Output</b>	<a href="#">show system services service-deployment on page 975</a>
<b>Output Fields</b>	<a href="#">Table 89 on page 975</a> lists the output fields for the <b>show system services service-deployment</b> command. Output fields are listed in the approximate order in which they appear.

**Table 89: show system services service-deployment Output Fields**

Field Name	Field Description
PDT Keepalive settings	Configured PDT keepalive interval, in seconds.
Keepalives sent	Number of keepalives sent.
Notifications sent	Number of notifications sent.
Last update from peer	Time at which the last update from a peer was received.

## Sample Output

### show system services service-deployment

```
user@host> show system services service-deployment
Connected to 192.4.4.4 port 10288 since 2004-05-03 11:04:34 PDT Keepalive settings:
Interval 15 seconds Keepalives sent: 750 Notifications sent: 0 Last update from
peer: 00:00:06 ago
```

## show system software

---

<b>Syntax</b>	show system software <detail>
<b>Syntax (EX Series Switches)</b>	show system software <all-members> <detail> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system software <all-chassis   all-lcc   lcc <i>number</i>   scc> <detail>
<b>Syntax (TX Matrix Plus Router)</b>	show system software <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <detail>
<b>Syntax (J Series Routers)</b>	show system software <backup> <detail>
<b>Syntax (QFX Series)</b>	show system software <detail> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the Junos OS extensions loaded on your router or switch.
<b>Options</b>	<b>none</b> —Display standard information about all loaded Junos OS extensions.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the routers (TX Matrix Plus Router) in the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for all connected T1600 or T4000 LCCs.  <b>all-members</b> —(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.  <b>backup</b> —(J Series routers only) (Optional) Display the status of old system software packages only.

**detail**—(Optional) Display detailed information about available Junos OS extensions.

**infrastructure *name***—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group *name***—(QFabric systems only) (Optional) Display the system software running on the Node group.

**scc**—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router.

**Required Privilege Level**

maintenance

## show system statistics

---

<b>Syntax</b>	show system statistics
<b>Syntax (EX Series Switches)</b>	show system statistics <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system statistics <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system statistics <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system statistics <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system statistics
<b>Release Information</b>	Command introduced before JUNOS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display system-wide protocol-related statistics.
<b>Options</b>	<b>none</b> —Display system statistics for all the following protocols: <ul style="list-style-type: none"><li>• <b>arp</b>—Address Resolution Protocol</li><li>• <b>bridge</b>—IEEE 802.1 Bridging</li><li>• <b>clns</b>—Connectionless Network Service</li><li>• <b>esis</b>—End System-to-Intermediate System</li><li>• <b>ethoamcfm</b>—Ethernet OAM protocol for connectivity fault management</li><li>• <b>ethoamlfm</b>—Ethernet OAM protocol for link fault management</li><li>• <b>icmp</b>—Internet Control Message Protocol</li><li>• <b>icmp6</b>—Internet Control Message Protocol version 6</li><li>• <b>igmp</b>—Internet Group Management Protocol</li><li>• <b>ip</b>—Internet Protocol version 4</li><li>• <b>ip6</b>—Internet Protocol version 6</li><li>• <b>mpls</b>—Multiprotocol Label Switching</li><li>• <b>rdp</b>—Reliable Datagram Protocol</li></ul>

- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all routers (line-card chassis) connected to the TX Matrix Plus router

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

**Additional Information** By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** view

## Sample Output

### show system statistics

```
user@host> show system statistics
ip:
 3682087 total packets received
 0 bad header checksums
 0 with size smaller than minimum
 0 with data size < data length
 0 with header length < data size
 0 with data length < header length
 0 with incorrect version number
 0 packets destined to dead next hop
 0 fragments received
 0 fragments dropped (dup or out of space)
 0 fragments dropped (queue overflow)
 0 fragments dropped after timeout
 0 fragments dropped due to over limit
 0 packets reassembled ok
 3664774 packets for this host
 17316 packets for unknown/unsupported protocol
 0 packets forwarded
 0 packets not forwardable
 0 redirects sent
 6528 packets sent from this host
 0 packets sent with fabricated ip header
 0 output packets dropped due to no bufs
 0 output packets discarded due to no route
 0 output datagrams fragmented
 0 fragments created
 0 datagrams that can't be fragmented
 0 packets with bad options
 1123 packets with options handled without error
 0 strict source and record route options
 0 loose source and record route options
```

```

0 record route options
0 timestamp options
0 timestamp and address options
0 timestamp and prespecified address options
0 option packets dropped due to rate limit
1123 router alert options
0 multicast packets dropped (no iflist)
0 packets dropped (src and int don't match)
icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
 echo reply: 75
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
0 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
 echo: 75
 router advertisement: 130
75 message responses generated
tcp:
3844 packets sent
 3618 data packets (1055596 bytes)
 0 data packets (0 bytes) retransmitted
 0 resends initiated by MTU discovery
 205 ack-only packets (148 packets delayed)
 0 URG only packets
 0 window probe packets
 0 window update packets
 1079 control packets
5815 packets received
 3377 acks (for 1055657 bytes)
 24 duplicate acks
 0 acks for unsent data
 2655 packets (15004 bytes) received in-sequence
 1 completely duplicate packet (0 bytes)
 0 old duplicate packets
 0 packets with some dup. data (0 bytes duped)
 0 out-of-order packets (0 bytes)
 0 packets (0 bytes) of data after window
 0 window probes
 7 window update packets
 0 packets received after close
 0 discarded for bad checksums
 0 discarded for bad header offset fields
 0 discarded because packet too short
1 connection request
32 connection accepts
0 bad connection attempts
0 listen queue overflows
33 connections established (including accepts)
30 connections closed (including 0 drops)
 27 connections updated cached RTT on close
 27 connections updated cached RTT variance on close
 0 connections updated cached ssthresh on close
0 embryonic connections dropped

```

```
3374 segments updated rtt (of 3220 attempts)
0 retransmit timeouts
 0 connections dropped by retransmit timeout
0 persist timeouts
 0 connections dropped by persist timeout
344 keepalive timeouts
 0 keepalive probes sent
 0 connections dropped by keepalive
1096 correct ACK header predictions
1314 correct data packet header predictions
32 syncache entries added
 0 retransmitted
 0 dupsyn
 0 dropped
 32 completed
 0 bucket overflow
 0 cache overflow
 0 reset
 0 stale
 0 aborted
 0 badack
 0 unreach
 0 zone failures
0 cookies sent
0 cookies received
0 ACKs sent in response to in-window but not exact RSTs
0 ACKs sent in response to in-window SYNs on established connections
0 rcv packets dropped by TCP due to bad address
0 out-of-sequence segment drops due to insufficient memory
1058 RST packets
0 ICMP packets ignored by TCP
0 send packets dropped by TCP due to auth errors
0 rcv packets dropped by TCP due to auth errors
udp:
3658884 datagrams received
0 with incomplete header
0 with bad data length field
0 with bad checksum
3657342 dropped due to no socket
3657342 broadcast/multicast datagrams dropped due to no socket
0 dropped due to full socket buffers
0 not for hashed pcb
4291311496 delivered
1551 datagrams output
ipsec:
0 inbound packets processed successfully
0 inbound packets violated process security policy
0 inbound packets with no SA available
0 invalid inbound packets
0 inbound packets failed due to insufficient memory
0 inbound packets failed getting SPI
0 inbound packets failed on AH replay check
0 inbound packets failed on ESP replay check
0 inbound AH packets considered authentic
0 inbound AH packets failed on authentication
0 inbound ESP packets considered authentic
0 inbound ESP packets failed on authentication
0 outbound packets processed successfully
0 outbound packets violated process security policy
0 outbound packets with no SA available
0 invalid outbound packets
```

```
0 outbound packets failed due to insufficient memory
0 outbound packets with no route

igmp:
17186 messages received
0 messages received with too few bytes
0 messages received with bad checksum
0 membership queries received
0 membership queries received with invalid field(s)
0 membership reports received
0 membership reports received with invalid field(s)
0 membership reports received for groups to which we belong
0 membership reports sent

arp:
44181302 datagrams received
2 ARP requests received
2028 ARP replies received
3156 resolution requests received
0 unrestricted proxy requests
0 received proxy requests
0 proxy requests not proxied
0 with bogus interface
787 with incorrect length
712 for non-IP protocol
0 with unsupported op code
0 with bad protocol address length
0 with bad hardware address length
0 with multicast source address
7611 with multicast target address
0 with my own hardware address
14241699 for an address not on the interface
0 with a broadcast source address
0 with source address duplicate to mine
29929250 which were not for me
0 packets discarded waiting for resolution
6 packets sent after waiting for resolution
17812 ARP requests sent
2 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry

ip6:
0 total packets received
0 with size smaller than minimum
0 with data size < data length
0 with bad options
0 with incorrect version number
0 fragments received
0 fragments dropped (dup or out of space)
0 fragments dropped after timeout
0 fragments that exceeded limit
0 packets reassembled ok
0 packets for this host
0 packets forwarded
0 packets not forwardable
0 redirects sent
0 packets sent from this host
0 packets sent with fabricated ip header
0 output packets dropped due to no bufs, etc.
0 output packets discarded due to no route
0 output datagrams fragmented
0 fragments created
```

```
0 datagrams that can't be fragmented
0 packets that violated scope rules
0 multicast packets which we don't join
Mbuf statistics:
0 packets whose headers are not continuous
0 tunneling packets that can't find gif
0 packets discarded due to too many headers
0 failures of source address selection
0 forward cache hit
0 forward cache miss
0 packets destined to dead next hop
0 option packets dropped due to rate limit
0 packets dropped (src and int don't match)
0 packets dropped due to bad protocol

icmp6:
0 calls to icmp_error
0 errors not generated because old message was icmp error or so
0 errors not generated because rate limitation
0 messages with bad code fields
0 messages < minimum length
0 bad checksums
0 messages with bad length
Histogram of error messages to be generated:
 0 no route
 0 administratively prohibited
 0 beyond scope
 0 address unreachable
 0 port unreachable
 0 packet too big
 0 time exceed transit
 0 time exceed reassembly
 0 erroneous header field

<b>Syntax (MX Series Router)</b>	show system storage <detail> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system storage <detail> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Syntax (SRX Series)</b>	show system storage <detail> <partitions>  For more information, see <b>show system storage partitions (View SRX Series)</b> .
<b>Syntax (TX Matrix Router)</b>	show system storage <detail> <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router and TX Matrix Plus Router with 3D SIBs)</b>	show system storage <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display statistics about the amount of free disk space in the router's or switch's file systems.
<b>Options</b>	<b>none</b> —Display standard information about the amount of free disk space in the router's or switch's file systems.  <b>detail</b> —(Optional) Display detailed output.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 90 on page 1021](#) describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

**Table 90: show system storage Output Fields**

Field Name	Field Description
<b>Filesystem</b>	Name of the filesystem.
<b>Size</b>	Size of the filesystem.
<b>Used</b>	Amount of space used in the filesystem.
<b>Avail</b>	Amount of space available in the filesystem.
<b>Capacity</b>	Percentage of the filesystem space that is being used.
<b>Mounted on</b>	Directory in which the filesystem is mounted.

## Sample Output

## show system uptime

<b>Syntax</b>	show system uptime
<b>Syntax (EX Series Switches)</b>	show system uptime <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system uptime <director-group <i>name</i> > <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Syntax (TX Matrix Router)</b>	show system uptime <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system uptime <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system uptime <all-members> <invoke-on> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
<b>Options</b>	<p><b>none</b>—Show time since the system rebooted and processes started.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.</p>

**director-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

**infrastructure *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

**invoke-on**—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

**scc**—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

<b>Additional Information</b>	By default, when you issue the <b>show system uptime</b> command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

<b>Output Fields</b>	<a href="#">Table 91 on page 1027</a> describes the output fields for the <b>show system uptime</b> command. Output fields are listed in the approximate order in which they appear.

Table 91: show system uptime Output Fields

Field Name	Field Description
<b>Current time</b>	Current system time in UTC.
<b>System booted</b>	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
<b>Protocols started</b>	Date and time when the routing protocols were last started and how long they have been running.
<b>Last configured</b>	Date and time when a configuration was last committed. Also shows the name of the user who issued the last <b>commit</b> command.
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

## Sample Output

### show system uptime

```

user@host> show system uptime
Current time: 1998-10-13 19:45:47 UTC
System booted: 1998-10-12 20:51:41 UTC (22:54:06 ago)

```

## show system users

<b>Syntax</b>	show system users <no-resolve>
<b>Syntax (TX Matrix Router)</b>	show system users <all-chassis   all-lcc   lcc <i>number</i>   scc> <no-resolve>
<b>Syntax (TX Matrix Plus Router)</b>	show system users <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <no-resolve>
<b>Syntax (MX Series Router)</b>	show system users <all-members> <local> <member <i>member-id</i> > <no-resolve>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	List information about the users who are currently logged in to the router or switch.

**NOTE:** The `show system users` command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

<b>Options</b>	<p><b>none</b>—List information about the users who are currently logged in to the router or switch.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.</p> <p><b>lcc <i>number</i></b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is</p>
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace ***number*** with 0.

**Additional Information** By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 92 on page 1032](#) describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

Table 92: show system users Output Fields

Field Name	Field Description
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
<b>USER</b>	Username.
<b>TTY</b>	Terminal through which the user is logged in.
<b>FROM</b>	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
<b>LOGIN@</b>	Time when the user logged in.
<b>IDLE</b>	How long the user has been idle.
<b>WHAT</b>	Processes that the user is running.

## Sample Output

## show system virtual-memory

---

<b>Syntax</b>	show system virtual-memory
<b>Syntax (EX Series)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system virtual-memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the <b>show system virtual-memory</b> command for troubleshooting with Juniper Networks Customer Support.
<b>Options</b>	<b>none</b> —Display kernel dynamic memory usage information.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.  <b>infrastructure <i>name</i></b> —(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**NOTE:** The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

Output Fields	<a href="#">Table 93 on page 1037</a> lists the output fields for the <code>show system virtual-memory</code> command. Output fields are listed in the approximate order in which they appear.

Table 93: show system virtual-memory Output Fields

Field Name	Field Description
<b>Memory statistics by bucket size</b>	
<b>Size</b>	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
<b>In Use</b>	Number of memory blocks of this size that are in use (bytes).
<b>Free</b>	Number of memory blocks of this size that are free (bytes).
<b>Requests</b>	Number of memory allocation requests made.
<b>HighWater</b>	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
<b>Couldfree</b>	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
<b>Memory usage type by bucket size</b>	
<b>Size</b>	Memory block size (bytes).
<b>Type(s)</b>	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
<b>Memory statistics by type</b>	
<b>Type</b>	Kernel module that is using dynamic memory.
<b>InUse</b>	Number of memory blocks used by this type. The number is rounded up.
<b>MemUse</b>	Amount of memory in use, in kilobytes (KB).
<b>HighUse</b>	Maximum memory ever used by this type.
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Requests</b>	Total number of dynamic memory allocation requests this type has made.
<b>Type Limit</b>	Number of times requests were blocked for reaching the maximum limit.
<b>Kern Limit</b>	Number of times requests were blocked for the kernel map.
<b>Size(s)</b>	Memory block sizes this type is using.
<b>Memory Totals</b>	
<b>In Use</b>	Total kernel dynamic memory in use (bytes, rounded up).
<b>Free</b>	Total kernel dynamic memory free (bytes, rounded up).

Table 93: show system virtual-memory Output Fields (*continued*)

Field Name	Field Description
<b>Requests</b>	Total number of memory allocation requests.
<b>ITEM</b>	Kernel module that is using memory.
<b>Size</b>	Memory block size (bytes).
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Used</b>	Number of memory blocks used by this type. The number is rounded up.
<b>Free</b>	Number of memory blocks available to this type.
<b>Requests</b>	Total number of memory allocation requests this type has made.
<b>interrupt</b>	Timer events and scheduling interruptions.
<b>total</b>	Total number of interruptions for each type.
<b>rate</b>	Interruption rate.
<b>Total</b>	Total for all interruptions.

<b>Syntax</b>	show version <brief   detail>
<b>Syntax (EX Series Switches)</b>	show version <all-members> <brief   detail> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show version <brief   detail> <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show version <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <brief   detail>
<b>Syntax (MX Series Router)</b>	show version <brief   detail> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show version <brief   detail> <component <i>component-name</i>   all>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the hostname and version information about the software running on the router or switch.
<b>Options</b>	<b>none</b> —Display standard information about the hostname and version of the software running on the router or switch.  <b>brief   detail</b> —(Optional) Display the specified level of output.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.  <b>component all</b> —(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.  <b>component <i>component-name</i></b> —(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace <i>component-name</i> with the name of the QFabric system

component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

#### Additional Information

By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

## start shell

<b>Syntax</b>	start shell (csh   sh) <user <i>username</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type <b>exit</b> from the shell.
<div>  <b>NOTE:</b> <ul style="list-style-type: none"> <li>To issue this command, the user must have the required login access privileges configured by including the <b>permissions</b> statement at the [edit system login class <i>class-name</i>] hierarchy level.</li> <li>UNIX wheel group membership or permissions are no longer required to issue this command.</li> </ul> </div>	
<b>Options</b>	<b>csh</b> —Create a UNIX C shell.  <b>sh</b> —Create a UNIX Bourne shell.  <b>user <i>username</i></b> —(Optional) Start the shell as another user.
<b>Additional Information</b>	When you are in the shell, the shell prompt has the following format:  <i>username@hostname%</i>  An example of the prompt is:  root@host%
<b>Required Privilege Level</b>	shell and maintenance
<b>List of Sample Output</b>	<a href="#">start shell csh on page 1105</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### start shell csh

```

user@host> start shell csh
%

exit
%
```

```
username@hostname% start shell sh
%

exit
user@host>
```

## test configuration

<b>Syntax</b>	<code>test configuration <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found.
<b>Options</b>	<b><i>filename</i></b> —Name of the configuration file.  <b>syntax-only</b> —Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">test configuration on page 1107</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### test configuration

```

user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
[edit system]
 'paris-23;'
 syntax error
terminal:4:(11) statement must contain additional statements: ;
[edit system login]
 'login ;'
 statement must contain additional statements
configuration syntax failed

```

## traceroute

---

<b>Syntax</b>	<pre>traceroute <i>host</i> &lt;as-number-lookup&gt; &lt;bypass-routing&gt; &lt;clns&gt; &lt;gateway <i>address</i>&gt; &lt;inet   inet6&gt; &lt;interface <i>interface-name</i>&gt; &lt;logical system <i>logical-system-name</i>&gt; &lt;monitor <i>host</i>&gt; &lt;mpls (<i>ldp FEC address</i>   <i>rsvp label-switched-path-name</i>)&gt; &lt;no-resolve&gt; &lt;propagate-ttl&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;source <i>source-address</i>&gt; &lt;tos <i>value</i>&gt; &lt;ttl <i>value</i>&gt; &lt;wait <i>seconds</i>&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>traceroute <i>host</i> &lt;as-number-lookup&gt; &lt;bypass-routing&gt; &lt;gateway <i>address</i>&gt; &lt;inet&gt; &lt;interface <i>interface-name</i>&gt; &lt;monitor <i>host</i>&gt; &lt;no-resolve&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;source <i>source-address</i>&gt; &lt;tos <i>value</i>&gt; &lt;ttl <i>value</i>&gt; &lt;wait <i>seconds</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>mpls</b> option introduced in Junos OS Release 9.2.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>propagate-ttl</b> option introduced in Junos OS Release 12.1.</p>
<b>Description</b>	Display the route that packets take to a specified network host. Use <b>traceroute</b> as a debugging tool to locate points of failure in a network.
<b>Options</b>	<p><b>host</b>—IP address or name of remote host.</p> <p><b>as-number-lookup</b>—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.</p>

**clns**—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

**gateway address**—(Optional) Address of a router or switch through which the route transits.

**inet | inet6**—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

**interface *interface-name***—(Optional) Name of the interface over which to send packets.

**logical-system *logical-system-name***—(Optional) Perform this operation on all logical systems or on a particular logical system.

**monitor *host***—(Optional) Display real-time monitoring information for the specified host.

**mpls (*ldp FEC address | rsvp label-switched-path name*)**—(Optional) See [traceroute mpls ldp](#) and [traceroute mpls rsvp](#).

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**propagate-ttl**—(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

**NOTE:** Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the traceroute attempt.

**source *source-address***—(Optional) Source address of the outgoing traceroute packets.

**tos *value***—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

**ttl *value***—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

**wait *seconds***—(Optional) Maximum time to wait for a response to the traceroute request.

**Required Privilege Level** network

**Related Documentation** • [traceroute monitor on page 1112](#)

**List of Sample Output** [traceroute on page 1110](#)

[traceroute as-number-lookup host on page 1110](#)

[traceroute no-resolve on page 1110](#)

[traceroute propagate-ttl on page 1111](#)

**Output Fields** Table 94 on page 1110 describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

**Table 94: traceroute Output Fields**

Field Name	Field Description
<b>traceroute to</b>	IP address of the receiver.
<b>hops max</b>	Maximum number of hops allowed.
<b>byte packets</b>	Size of packets being sent.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
<b>Round trip time</b>	Average round-trip time, in milliseconds (ms).

## Sample Output

### traceroute

```
user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254) 2.370 ms 2.853 ms 0.367 ms
 2 red14 (10.168.255.250) 0.778 ms 2.937 ms 0.446 ms
 3 yellow (10.156.169.254) 7.737 ms 89.905 ms 0.834 ms
```

### traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1 10.39.1.1 (10.39.1.1) 0.779 ms 0.728 ms 0.562 ms
 2 10.39.1.6 (10.39.1.6) [AS 32] 0.657 ms 0.611 ms 0.617 ms
 3 10.100.1.1 (10.100.1.1) [AS 10, 40, 50] 0.880 ms 0.808 ms 0.774 ms
```

### traceroute no-resolve

```
user@host> traceroute santacruz no-resolve
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 10.168.1.254 0.458 ms 0.370 ms 0.365 ms
 2 10.168.255.250 0.474 ms 0.450 ms 0.444 ms
 3 10.156.169.254 0.931 ms 0.876 ms 0.862 ms
```

### traceroute propagate-ttl

```

user@host> traceroute propagate-ttl 100.200.2.2 routing-instance VPN-A
traceroute to 100.200.2.2 (100.200.2.2) from 1.1.0.2, 30 hops max, 40 byte packets

 1 1.2.0.2 (1.2.0.2) 2.456 ms 1.753 ms 1.672 ms
 MPLS Label=299776 CoS=0 TTL=1 S=0
 MPLS Label=299792 CoS=0 TTL=1 S=1
 2 1.3.0.2 (1.3.0.2) 1.213 ms 1.225 ms 1.166 ms
 MPLS Label=299792 CoS=0 TTL=1 S=1
 3 100.200.2.2 (100.200.2.2) 1.422 ms 1.521 ms 1.443 ms

```

### traceroute (Between CE Routers, Layer 3 VPN)

```

user@host> traceroute vpn09
traceroute to vpn09.skybank.net (10.255.14.179), 30 hops max, 40
byte packets
 1 10.39.10.21 (10.39.10.21) 0.598 ms 0.500 ms 0.461 ms
 2 10.39.1.13 (10.39.1.13) 0.796 ms 0.775 ms 0.806 ms
 MPLS Label=100006 CoS=0 TTL=1 S=1
 3 vpn09.skybank.net (10.255.14.179) 0.783 ms 0.716 ms 0.686

```

### traceroute (Through an MPLS LSP)

```

user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1 mpls1-sr0.company.net (10.168.200.101) 0.555 ms 0.393 ms 0.367 ms
 MPLS Label=1024 CoS=0 TTL=1

```

## traceroute monitor

<b>Syntax</b>	<pre>traceroute monitor <i>host</i> &lt;count <i>value</i>&gt; &lt;inet   inet 6&gt; &lt;interval <i>seconds</i>&gt; &lt;no resolve&gt; &lt;size <i>value</i>&gt; &lt;source <i>source-address</i>&gt; &lt;summary&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>traceroute monitor <i>host</i> &lt;count <i>value</i>&gt; &lt;inet&gt; &lt;interval <i>seconds</i>&gt; &lt;no resolve&gt; &lt;size <i>value</i>&gt; &lt;source <i>source-address</i>&gt; &lt;summary&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.0</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.
<b>Options</b>	<p><b><i>host</i></b>—IP address or name of remote host.</p> <p><b><i>count value</i></b>—Number of ping requests, in packets, to send in summary mode. The default value is <b>10</b>.</p> <p><b><i>inet   inet6</i></b>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><b><i>interval seconds</i></b>—(Optional) Number of seconds to wait before sending ping requests. The default value is <b>1</b>.</p> <p><b><i>no resolve</i></b>—(Optional) Do not attempt to display addresses symbolically.</p> <p><b><i>size value</i></b>—(Optional) Receive the specified number of bytes for each packet. The range is <b>0</b> through <b>65468</b> bytes. The default value is <b>64</b>.</p> <p><b><i>source source-address</i></b>—(Optional) Source address of the outgoing ping packets.</p> <p><b><i>summary</i></b>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p>
<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<a href="#">traceroute monitor on page 1113</a>
<b>Output Fields</b>	<p><a href="#">Table 95 on page 1113</a> describes the output fields for the <b>traceroute monitor</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 95: traceroute monitor Output Fields

Field Name	Field Description
<b>Host</b>	Hostname or IP address of the router at each hop.
<b>Loss%</b>	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
<b>Snt</b>	Number of ping requests sent to the router at this hop.
<b>Last</b>	Most recent round-trip time, in milliseconds, to the router at this hop.
<b>Avg</b>	Average round-trip time, in milliseconds, to the router at this hop.
<b>Best</b>	Shortest round-trip time, in milliseconds, to the router at this hop.
<b>Wrst</b>	Longest round-trip time, in milliseconds, to the router at this hop.
<b>StDev</b>	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

## Sample Output

### traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

	Host	Loss%	Snt	Last	Avg	Best	Wrst	StDev
1.	10.17.41.254	0.0%	17	0.7	1.0	0.6	5.4	1.2
2.	secret.net	0.0%	17	0.6	1.0	0.6	6.6	1.4
3.	top-secret.net	0.0%	17	0.6	0.6	0.6	0.6	0.0

## CHAPTER 7

# Troubleshooting

- [Troubleshooting Procedures on page 1115](#)

## Troubleshooting Procedures

---

- [Rebooting and Halting a QFX Series Product on page 1115](#)
- [Recovering from a Failed Software Installation on page 1116](#)
- [Recovering the Root Password on page 1117](#)
- [Troubleshooting Network Interfaces on page 1118](#)
- [Troubleshooting an Aggregated Ethernet Interface on page 1119](#)

## Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
```

Possible completions:

<[Enter]>	Execute this command
at	Time at which to perform the operation
in	Number of minutes to delay before operation
media	Boot media for next boot
message	Message to display to all users
	Pipe through a command

```
user@switch> request system reboot
```

```
Reboot the system ? [yes,no] (no) yes
```

```
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
```

Possible completions:

<[Enter]>	Execute this command
at	Time at which to perform the operation
in	Number of minutes to delay before operation
media	Boot media for next boot
message	Message to display to all users
	Pipe through a command

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the `request system halt` command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

## Recovering from a Failed Software Installation

**Problem** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message `Loading /boot/defaults/loader.conf` appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The `loader>` prompt appears.

3. Enter the following command:

```
loader> install [--format] [--external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).

- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45-to-DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None

- Stop bits: 1
  - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into  
  
The terminal emulation screen on your management device displays the switch's boot sequence.
  10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:  
  
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
  11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  
  
ok **boot -s**
  12. At the following prompt, enter **recovery** to start the root password recovery procedure.  
  
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: **recovery**
  13. Enter configuration mode in the CLI.
  14. Set the root password. For example:  
  
user@switch# **set system root-authentication plain-text-password**
  15. At the following prompt, enter the new root password. For example:  
  
New password: **juniper1**  
Retype new password:
  16. At the second prompt, reenter the new root password.
  17. After you have finished configuring the password, commit the configuration.  
  
root@host# **commit**  
commit complete
  18. Exit configuration mode in the CLI.
  19. Exit operational mode in the CLI.
  20. At the prompt, enter **y** to reboot the switch.  
  
Reboot the system? [y/n] **y**

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

---

**Problem** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause** By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution** Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Troubleshooting an Aggregated Ethernet Interface

**Problem** The `show interfaces terse` command shows that the LAG is down.

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

## Configuration File Terms

[Table 31 on page 26](#) lists the various configuration file terms used for the QFX Series and their definitions.

**Table 96: Configuration File Terms**

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

### Forms of the configure Command

The Junos OS supports three forms of the **configure** command: **configure**, **configure private**, and **configure exclusive**. These forms control how users edit and commit configurations and can be useful when multiple users configure the software. See [Table 97 on page 1124](#).

**Table 97: Forms of the configure Command**

Command	Edit Access	Commit Access
<b>configure</b>	<ul style="list-style-type: none"><li>• No one can lock the configuration. All users can make configuration changes.</li></ul> <p>When you enter configuration mode, the CLI displays the following information:</p> <ul style="list-style-type: none"><li>• A list of other users editing the configuration.</li><li>• Hierarchy levels the users are viewing or editing.</li><li>• Whether the configuration has been changed, but not committed.</li><li>• When multiple users enter conflicting configurations, the most recent change to be entered takes precedence.</li></ul>	<ul style="list-style-type: none"><li>• No one can lock the configuration. All users can commit all changes to the configuration.</li><li>• If you and another user make changes and the other user commits changes, your changes are committed as well.</li></ul>

---

Table 97: Forms of the configure Command (*continued*)

Command	Edit Access	Commit Access
<b>configure exclusive</b>	<ul style="list-style-type: none"> <li>One user locks the configuration and makes changes without interference from other users.</li> <li>Other users can enter and exit configuration mode, but they cannot commit the configuration.</li> <li>If you enter configuration mode while another user has locked the configuration (with the <b>configure exclusive</b> command), the CLI displays the user and the hierarchy level the user is viewing or editing.</li> <li>If you enter configuration mode while another user has locked the configuration, you can forcibly log out that user with the <b>request system logout</b> operational mode command. For details, see the <a href="#">CLI Explorer</a>.</li> </ul>	
<b>configure private</b>	<ul style="list-style-type: none"> <li>Multiple users can edit the configuration at the same time.</li> <li>Each user has a private candidate configuration to edit independently of other users.</li> <li>When multiple users enter conflicting configurations, the first commit operation takes precedence over subsequent commit operations.</li> </ul>	<ul style="list-style-type: none"> <li>When you commit the configuration, the router verifies that the operational (running) configuration has not been modified by another user before accepting your private candidate configuration as the new operational configuration.</li> <li>If the configuration has been modified by another user, you can merge the modifications into your private candidate configuration and attempt to commit again.</li> </ul>

### Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model—a candidate configuration is modified as desired and then committed to the system. When a configuration is committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The formerly active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and any other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (numbered 1 through 49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (`juniper.conf.gz.1`, `juniper.conf.gz.2`, `juniper.conf.gz.3`) are located in the `/config` directory. If the file `rescue.conf.gz` is saved on the system, this file should also be saved in the `/config` directory. The factory default files are located in the `/etc/config` directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

- [commit](#) on page 319

## Understanding Configuration Files

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration.

Juniper Networks Junos OS saves the 50 most recently committed configuration files on a switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.
- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

## Understanding How the Junos Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

The currently operational Junos OS configuration is stored in the file **juniper.conf** and the last three committed configurations are stored in the files **juniper.conf.1**, **juniper.conf.2**, and **juniper.conf.3**. These four files are located in the directory **/config**, which is on the switch's hard disk. The remaining 46 previous versions of committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config** on the hard disk.

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

[edit]

```
user@host# show | compare (filename| rollback n)
```

**filename** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

**n** is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
 type internal;
 hold-time 60;
 advertise-inactive;
 allow 1.1.1.1/32;
}
group fred {
 type external;
 peer-as 33333;
 allow 2.2.2.2/32;
}
group test-peers {
 type external;
 allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]

 -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
 type internal;
 hold-time 90;
 allow 1.1.1.1/32;
}
group fred {
 type external;
 advertise-inactive;
 peer-as 3333;
 allow 2.2.2.2/32;
}
```

#### Related Documentation

- [Creating and Returning to a Rescue Configuration on page 1132](#)

## Compressing the Current Configuration File

By default, the current operational configuration file is compressed, and is stored in the file **juniper.conf.gz**, in the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

**NOTE:** We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```

Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
user@host# commit
```

```
commit complete
user@host# commit
commit complete
```

- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```

Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

## Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the **rollback** command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
```

```
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

  - [Saving a Configuration to a File on page 1141](#)

## Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
filename <relative>
```

For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Press Ctrl-d to end input.

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
terminal <relative>
```

To replace an entire configuration, specify the **override** option at any level of the hierarchy. A **load override** operation completely replaces the current candidate configuration with the file you are loading. Thus, if you saved a complete configuration, use this option.

An **override** operation discards the current candidate configuration and loads the configuration in **filename** or the configuration that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. For an example, see [Figure 11 on page 1161](#).

To replace portions of a configuration, specify the **replace** option. The **load replace** operation looks for **replace:** tags that you added to the loaded file, and replaces the parts of the candidate configuration with whatever is specified after the tag. This is useful when you want more control over exactly what is being changed. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see [Figure 12 on page 1162](#).

If, in an **override** or **merge** operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

The **load merge** operation adds the saved file to the existing candidate configuration. This is useful if you are adding new configuration sections. For example, suppose that you are adding a BGP configuration to the **[edit protocols]** hierarchy level, where there was no BGP configuration before, you can use the **load merge** operation to combine the saved file configuration to the existing candidate configuration. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration.

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. The **load update** operation compares the candidate configuration and the file you are loading, and only changes the parts of the candidate configuration that are different from the new configuration. You would use this, for example, if there is an existing BGP configuration and the file you are loading changes it in some way.

To change part of the configuration with a patch file, specify the **patch** option. The **load patch** operation loads a file or terminal input that contains configuration changes. First, on a device that already has the configuration changes, you type the **show | compare** command to output the differences between two configurations. Then you can load the differences on another router. The advantage of the **load patch** command is that it saves you from having to copy snippets from different hierarchy levels into a text file prior to loading them into the target device. This might be a useful time saver if you are configuring several devices with the same options. For example, suppose that you configure a routing policy on Device router1 and you want to replicate the policy configuration on Device router2, router3, and router4, you can use the **load patch** operation.

First, run the **show | compare** command.

```
user@router1# show | compare rollback 3
[edit protocols ospf]
+ export default-static;
- export static-default
[edit policy-options]
+ policy-statement default-static {
```

```
+ from protocol static;
+ then accept;
+ }
```

Copy the output of the **show | compare** command to the clipboard, making sure to include the hierarchy levels. On Device router2, router3, and router4, type **load patch terminal** and paste the output. Press Enter and then press Ctrl-d to end the operation. If the patch input specifies different values for an existing statement, the patch input overrides the existing statement.

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
 bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see [Figure 15 on page 1163](#).

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities, as described in the [CLI Explorer](#).

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

#### Related Documentation

- [Examples: Loading a Configuration from a File on page 1161](#)

## Loading a Previous Configuration File

You can use the **rollback** <*number*> command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback** <*number*>

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 26](#)

## Returning to the Most Recently Committed Junos Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback

load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

- Related Documentation**
- [Rolling Back Junos OS Configuration Changes on page 1143](#)
  - [Returning to a Previously Committed Junos OS Configuration on page 1137](#)
  - [Understanding How the Junos Configuration Is Stored on page 1127](#)

## Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- [Returning to a Configuration Prior to the One Most Recently Committed on page 1137](#)
- [Displaying Previous Configurations on page 1137](#)
- [Comparing Configuration Changes with a Prior Version on page 1138](#)
- [Creating and Returning to a Rescue Configuration on page 1140](#)
- [Saving a Configuration to a File on page 1141](#)

### Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

### Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```
[edit]
user@host# show | compare (filename) rollback n)
```

***filename*** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

*n* is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
 type internal;
 hold-time 60;
 advertise-inactive;
 allow 1.1.1.1/32;
}
group fred {
 type external;
 peer-as 33333;
 allow 2.2.2.2/32;
}
group test-peers {
 type external;
 allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
```

```
-type external;
-allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
 type internal;
 hold-time 90;
 allow 1.1.1.1/32;
}
group fred {
 type external;
 advertise-inactive;
 peer-as 3333;
 allow 2.2.2.2/32;
}
```

---

### Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the **rollback** command fails, an error message appears, and the current configuration remains active.

---

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

### Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
 bgp {
 disable;
 group int {
 type internal;
 }
 }
 isis {
 disable;
 interface all {
 level 1 disable;
 }
 interface fxp0.0 {
 disable;
 }
 }
 ospf {
 traffic-engineering;
 reference-bandwidth 4g;
 ...
 }
}
```

- Related Documentation**

  - [Loading a Configuration from a File on page 1133](#)
  - [Viewing Files and Directories on a Device Running Junos OS](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1126](#)
  - [Loading a Previous Configuration File on page 1136](#)
  - [Reverting to the Rescue Configuration on page 165](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

- Related Documentation**
- [Setting or Deleting the Rescue Configuration on page 1145](#)
  - [Reverting to the Default Factory Configuration on page 163](#)

- [Configuration File Terms on page 26](#)

## Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

2. Show the current configuration (if any) for SNMP:

```
[edit]
user@host# show snmp
```

No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

```
[edit]
user@host# set snmp health-monitor
```

4. Show the new configuration:

```
[edit]
user@host# show snmp
health-monitor;
```

The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

```
[edit]
user@host# rollback
load complete
```

6. Show the configuration again to make sure your change is no longer present:

```
[edit]
user@host# show snmp
```

No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

```
[edit]
```

```
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

## Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
 bgp {
 disable;
 group int {
 type internal;
 }
 }
 isis {
 disable;
 interface all {
 level 1 disable;
 }
 interface fxp0.0 {
 disable;
 }
 }
}
```

```

 }
 ospf {
 traffic-engineering;
 reference-bandwidth 4g;
 ...
 }
}

```

## Setting or Deleting the Rescue Configuration

A rescue configuration is user-defined configuration that restores connectivity to switch. You set a current committed configuration to be the rescue configuration through the CLI. If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

- [Loading a Previous Configuration File on page 1136](#)
- [Configuration File Terms on page 26](#)
- [CLI Explorer](#)

## Uploading a Configuration File

You can create a configuration file on your local system, copy the file to the switch, and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the *Junos OS System Basics and Services Command Reference* at <http://www.juniper.net/techpubs/software/junos/index.html>.
2. In the configuration text file, use an option to perform the required action when the file is loaded. [Table 98 on page 1146](#) lists and describes some options for the **load** command.

Table 98: Options for the load Command

Options	Description
<b>merge</b>	Combines the current active configuration and the configuration in the filename you specify or the one that you type at the terminal. A <b>merge</b> operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
<b>override</b>	Discards the current candidate configuration and loads the configuration in the filename you specify or the one that you type at the terminal. When you use the <b>override</b> option and commit the configuration, all system processes reparse the configuration. You can use the <b>override</b> option at any level of the hierarchy.
<b>replace</b>	Searches for the <b>replace</b> tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the <b>replace</b> operation adds the statements marked with the <b>replace</b> tag to the active configuration.  <b>NOTE:</b> For this operation to work, you must include <b>replace</b> tags in the text file or in the configuration you type at the terminal.

- Press Ctrl+a to select all the text in the configuration file.
- Press Ctrl+c to copy the contents of the configuration text file to the Clipboard.
- Log in to the switch using your username and password.
- To enter configuration mode:  
user@switch> **configure**  
  
You will see this output, with the hash or pound mark indicating configuration mode.  
Entering configuration mode  
[edit]  
user@switch#
- Load the configuration file:  
[edit]  
user@switch# **load merge terminal**
- At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:  
[edit]  
user@switch# **load merge terminal**  
[Type ^D at a new line to end input]  
>Cursor is here. Paste the contents of the clipboard here<
- Press Enter.
- Press Ctrl+d to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

- [Understanding Configuration Files on page 1126](#)

## Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

You can configure a router or switch to transfer its configuration to an archive file periodically. The following tasks describe how to transfer the configuration to an archive site:

1. [Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive on page 1147](#)
2. [Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1147](#)
3. [Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1148](#)
4. [Configuring Archive Sites for Transfer of Active Configuration Files on page 1148](#)

### Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive

If you want to back up your device's current configuration to an archive site, you can configure the router or switch to transfer its currently active configuration by FTP or secure copy (SCP) periodically or after each commit.

To configure the router or switch to transfer its currently active configuration to an archive site, include statements at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
 ftp://username<:password>@host-address<:port>/url-path;
 scp://username<:password>@host-address<:port>/url-path;
}
transfer-interval interval;
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path"

### Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site

To configure the router or switch to periodically transfer its currently active configuration to an archive site, include the **transfer-interval** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-interval interval;
```

The *interval* is a period of time ranging from 15 through 2880 minutes.

## Configuring Transfer of the Current Active Configuration When a Configuration Is Committed

---

To configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration, include the **transfer-on-commit** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example,  
"scp://username<:password>@[ipv6-host-address]<:port>/url-path"

## Configuring Archive Sites for Transfer of Active Configuration Files

---

When you configure the router or switch to transfer its configuration files, you specify an archive site to which the files are transferred. If you specify more than one archive site, the router or switch attempts to transfer files to the first archive site in the list, moving to the next site only if the transfer fails.

When you use the **archive-sites** statement, you can specify a destination as an FTP URL, or SCP-style remote file specification. The URL type **file://** is also supported.

To configure the archive site, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
 ftp://username@host:<port>url-path password password;
 scp://username@host:<port>url-path password password;
 file://<path>/<filename>;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example,  
"scp://username<:password>@[ipv6-host-address]<:port>/url-path"

When you specify the archive site, do not add a forward slash (/) to the end of the URL.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

```
<router-name>_juniper.conf.n.gz_YYYYMMDD_HHMMSS
```

.....

**NOTE:** The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

.....

## Configuration Statements

## Default Configurations

- [QFX3500 Switch Default Configuration on page 1155](#)

### QFX3500 Switch Default Configuration

Each QFX Series product is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**, configures storm control and Ethernet switching on all interfaces, and enables IGMP snooping, RSTP, and LLDP protocols.

When you commit changes to the configuration, a new configuration file is created, which becomes the active configuration. You can always revert to the factory default configuration if you need to.

The following factory default configuration file is for a QFX3500 switch with 48 ports:

**NOTE:** In this example, xe-0/0/0 through xe-0/0/47 are the network interface ports.

```
protocols {
 igmp-snooping {

## clear log

---

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<i>filename</i> —Name of the specific log file to delete.  <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show log on page 846</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 1166</a>
<b>Output Fields</b>	See <a href="#">file list</a> for an explanation of output fields.

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:

-rw-r----- 1 root wheel 26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:

-rw-r----- 1 root wheel 57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear system commit

---

<b>Syntax</b>	clear system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance (or the actual user who scheduled the commit)
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system commit on page 898</a></li> </ul>

<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear system commit

```
user@host> clear system commit
Pending commit cleared.
```

#### clear system commit (None Pending)

```
user@host> clear system commit
No commit scheduled.
```

#### clear system commit (User Does Not Have Required Privilege Level)

```
user@host> clear system commit
error: Permission denied
```

## file archive

---

<b>Syntax</b>	<code>file archive destination <i>destination</i> source <i>source</i> &lt;compress&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
<b>Options</b>	<p><b>destination <i>destination</i></b>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none"><li>• For archived files—The suffix <b>.tar</b></li><li>• For archived and compressed files—The suffix <b>.tgz</b></li></ul> <p><b>source <i>source</i></b>—Source of the original file or files. Specify the source as a URL or filename.</p> <p><b>compress</b>—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix <b>.tgz</b>.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 57</a></li></ul>
<b>List of Sample Output</b>	<a href="#">file archive (Multiple Files) on page 1168</a> <a href="#">file archive (Single File) on page 1168</a> <a href="#">file archive (with Compression) on page 1169</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

---

<b>Syntax</b>	<code>file checksum md5 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Message Digest 5 (MD5) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename.  <b>filename</b> —Name of a local file for which to calculate the MD5 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum sha-256 on page 338</a></li><li>• <a href="#">file checksum sha1 on page 337</a></li><li>• <i>op</i></li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum md5 on page 1170</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

## file checksum sha1

<b>Syntax</b>	<code>file checksum sha1 &lt;pathname&gt; filename</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
<b>Options</b>	<p><b>pathname</b>—(Optional) Path to a filename.</p> <p><b>filename</b>—Name of a local file for which to calculate the SHA-1 checksum.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <a href="#">file checksum md5 on page 336</a></li> <li>• <a href="#">file checksum sha-256 on page 338</a></li> <li>• <i>op</i></li> </ul>

<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax
```

```
SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

<b>Syntax</b>	<code>file checksum sha-256 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename. <b>filename</b> —Name of a local file for which to calculate the SHA-256 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum md5 on page 336</a></li><li>• <a href="#">file checksum sha1 on page 337</a></li><li>• <i>op</i></li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha-256 on page 1172</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum sha-256

```
user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

## file compare

<b>Syntax</b>	<pre>file compare (files <i>filename filename</i>) &lt;context   unified&gt; &lt;ignore-white-space&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul>
<b>Options</b>	<p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>
<b>Required Privilege Level</b>	none
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 57</a></li> <li>• <a href="#">Viewing Core Files from Junos OS Processes on page 171</a></li> </ul>

## file delete

---

<b>Syntax</b>	<code>file delete <i>filename</i></code> <code>&lt;purge&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a file on the local router or switch.
<b>Options</b>	<b><i>filename</i></b> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.  <b><i>purge</i></b> —(Optional) Overwrite regular files before deleting them.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file delete on page 1176</a> <a href="#">file delete (Routing Matrix) on page 1176</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

### file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

## file list

<b>Syntax</b>	file list <detail   recursive> <filename>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of files on the local router or switch.
<b>Options</b>	<p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
<b>Additional Information</b>	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file list on page 1177</a> <a href="#">file list (Routing Matrix) on page 1177</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

### file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp

## file rename

<b>Syntax</b>	<code>file rename <i>source destination</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Rename a file on the local router or switch.
<b>Options</b>	<i>destination</i> —New name for the file.  <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file rename on page 1179</a> <a href="#">file rename (Routing Matrix) on page 1179</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```

```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

## file show

<b>Syntax</b>	<code>file show <i>filename</i></code> <code>&lt;encoding (base64   raw)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a file.
<b>Options</b>	<b><i>filename</i></b> —Name of a file. For a routing matrix, the filename must include the chassis information.  <b><code>encoding (base64   raw)</code></b> —(Optional) Encode file contents with base64 encoding or show raw text.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file show on page 1181</a> <a href="#">file show (Routing Matrix) on page 1181</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.

define msgbuf
 printf "%s", msgbuf->msg_ptr
end
```

```
hex dump of a block of memory
usage: dump address length
define dump
 p $arg0, $arg1
 set $ch = $arg0
 set $j = 0
 set $n = $arg1
 while ($j < $n)
 #printf "%x %x ",&$ch[$j],$ch[$j]
 printf "%x ",$ch[$j]
 set $j = $j + 1
 if (!($j % 16))
 printf "\n"
 end
 end
end
end
```

## request system configuration rescue delete

---

<b>Syntax</b>	request system configuration rescue delete
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete an existing rescue configuration.
<div>  <b>NOTE:</b> The [edit system configuration] hierarchy is not available on QFabric systems.         </div>	
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system configuration rescue save on page 372</a></li> <li>• <a href="#">request system software rollback on page 428</a></li> <li>• <a href="#">show system commit on page 898</a></li> </ul>

<b>Output Fields</b>	This command produces no output.

### Sample Output

#### request system configuration rescue save

```
user@host> request system configuration rescue save
```

## show system commit

<b>Syntax</b>	show system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the system commit history and any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear system commit on page 328</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system commit on page 1186</a> <a href="#">show system commit (At a Particular Time) on page 1186</a> <a href="#">show system commit (At the Next Reboot) on page 1186</a> <a href="#">show system commit (Rollback Pending) on page 1186</a> <a href="#">show system commit (QFX Series) on page 1186</a>
<b>Output Fields</b>	<a href="#">Table 82 on page 898</a> describes the output fields for the <b>show system commit</b> command. Output fields are listed in the approximate order in which they appear.

**Table 99: show system commit Output Fields**

Field Name	Field Description
Junos XML protocol	Displays the last 50 commit operations listed, most recent to first. The identifier <b>Junos XML protocol</b> designates a configuration created for recovery using the <b>request system configuration rescue save</b> command.
Junos XML protocol	Date and time of the commit operation.
Junos XML protocol	User who executed the commit operation.
Junos XML protocol	Method used to execute the commit operation: <ul style="list-style-type: none"> <li>• <b>Junos XML protocol</b>—CLI interactive user performed the commit operation.</li> <li>• <b>Junos XML protocol</b>—Junos XML protocol client performed the commit operation.</li> <li>• <b>synchronize</b>—The <b>commit synchronize</b> command was performed on the other Routing Engine.</li> <li>• <b>snmp</b>—An SNMP <b>set</b> request caused the commit operation.</li> <li>• <b>button</b>—A button on the router or switch was pressed to commit a rescue configuration for recovery.</li> <li>• <b>autoinstall</b>—A configuration obtained through autoinstallation was committed.</li> <li>• <b>other</b>—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.</li> </ul>

## Sample Output

### show system commit

```
user@host> show system commit

## show system rollback

**Syntax** `show system rollback number`  
`<compare number>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

**NOTE:** The `show system rollback` command is a purely operational mode command and cannot be issued with `run` from the configuration mode.

**Options** *number*—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

*compare number*—(Optional) Number of another previously committed (rollback) configuration to compare to rollback *number*. The output displays the differences between the two configurations. The range of values is 0 through 49.

**Required Privilege Level** view

**List of Sample Output** [show system rollback compare on page 1190](#)

### Sample Output

## test configuration

---

<b>Syntax</b>	<code>test configuration filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found.
<b>Options</b>	<b>filename</b> —Name of the configuration file.  <b>syntax-only</b> —Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">test configuration on page 1192</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

## Troubleshooting Procedures

---

- [Loading a Previous Configuration File on page 1193](#)
- [Reverting to the Default Factory Configuration on page 1194](#)
- [Reverting to the Rescue Configuration on page 1194](#)

### Loading a Previous Configuration File

You can use the **rollback** *<number>* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

**rollback** *<number>*

#### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
```

```
user@switch# commit
```

- Related Documentation**
- [Configuration File Terms on page 26](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1126](#)
  - [Loading a Previous Configuration File on page 1136](#)
  - [Reverting to the Rescue Configuration on page 165](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 1197](#)

### Understanding Software Infrastructure and Processes

The QFX Series products run the Juniper Networks Junos OS. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 1197](#)
- [Junos OS Processes on page 1198](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.

- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 35 on page 45 describes the primary Junos OS processes.

**Table 100: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.

Table 100: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Multicast snooping process	<del>multicast-snooping</del> multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

## Overview of Template Accounts for RADIUS and TACACS+ Authentication

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

## Understanding Login Authentication

You can control access to your network through the Juniper Networks QFX Series using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the **authentication-whitelist** statement.

You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.

On a single interface you can configure one or a combination of several authentication methods.

This topic covers:

- [MAC RADIUS Authentication on page 1201](#)

## MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices.

The EAP method supported for MAC RADIUS authentication on the QFX Series is EAP-MD5.

When you configure the **mac-radius restrict** option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

### Related Documentation

- [Configuring RADIUS Authentication on page 1233](#)

## Understanding LLDP

The QFX Series product uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The QFX Series products support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The QFX Series products support the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

**Related  
Documentation**

- [Configuring LLDP on page 1227](#)

## Understanding RADIUS Accounting

Juniper Networks QFX Series products support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the QFX Series supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the switch and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The switch forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 122.69.1.250.

4. The accounting server sends an *accounting-response* packet back to the switch confirming it has received the accounting request.
5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

**Related Documentation**

- [Configuring RADIUS System Accounting on page 1231](#)

## Understanding VSAs on the QFX Series

The Juniper Networks QFX Series products support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS).

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the switch as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches.

**Related Documentation**

- [Configuring Firewall Filters on page 4531](#)
- [Configuring RADIUS Authentication on page 1233](#)
- [VSA Match Conditions and Actions on page 1258](#)

## Juniper Networks Vendor-Specific RADIUS Attributes

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 101 on page 1204](#) lists the Juniper Networks VSAs you can configure.

Table 101: Juniper Networks Vendor-Specific RADIUS Attributes

Name	Description	Type	Length	String
Juniper-Local-User-Name	Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets.	1	≥3	One or more octets containing printable ASCII characters.
Juniper-Allow-Commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	2	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands”</a> on page 1220.
Juniper-Deny-Commands	Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	3	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands”</a> on page 1220.
Juniper-Allow-Configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	4	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”</a> on page 1219.
Juniper-Deny-Configuration	Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	5	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”</a> on page 1219.
Juniper-Interactive-Command	Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.	8	≥3	One or more octets containing printable ASCII characters.

Table 101: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

Name	Description	Type	Length	String
Juniper-Configuration-Change	Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.	9	≥3	One or more octets containing printable ASCII characters.
Juniper-User-Permissions	<p>Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets.</p> <p><b>NOTE:</b> When the <b>Juniper-User-Permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	10	≥3	<p>One or more octets containing printable ASCII characters.</p> <p>The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See <a href="#">Table 103 on page 1207</a>.</p>

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

## Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 102 on page 1206](#) lists the Juniper Networks VSAs you can configure.

Table 102: Juniper Networks Vendor-Specific TACACS+ Attributes

Name	Description	Length	String
<b>local-user-name</b>	Indicates the name of the user template used by this user when logging in to a device.	≥3	One or more octets containing printable ASCII characters.
<b>allow-commands</b>	Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 107 on page 1220</a> .
<b>allow-configuration</b>	Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1219.
<b>deny-commands</b>	Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 107 on page 1220</a> .
<b>deny-configuration</b>	Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 106 on page 1219</a> .
<b>user-permissions</b>	<p>Contains information the server uses to specify user permissions.</p> <p><b>NOTE:</b> When the <b>user-permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	≥3	One or more octets containing printable ASCII characters. See <a href="#">Table 103 on page 1207</a> .

## Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 1207](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 1210](#)

### Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in [Table 103 on page 1207](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

[Table 103 on page 1207](#) lists the Junos<sup>®</sup> operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

**Table 103: Login Class Permission Flags**

Permission Flag	Description
<b>access</b>	Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>access-control</b>	Can view and configure access information at the <b>[edit access]</b> hierarchy level.
<b>admin</b>	Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.
<b>admin-control</b>	Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.

Table 103: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>all-control</b>	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
<b>clear</b>	Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.
<b>configure</b>	Can enter configuration mode by using the <b>configure</b> command.
<b>control</b>	Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.
<b>field</b>	Can view field debug commands. Reserved for debugging support.
<b>firewall</b>	Can view the firewall filter configuration in configuration mode.
<b>firewall-control</b>	Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.
<b>floppy</b>	Can read from and write to the removable media.
<b>flow-tap</b>	Can view the flow-tap configuration in configuration mode.
<b>flow-tap-control</b>	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.
<b>flow-tap-operation</b>	Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have <b>flow-tap-operation</b> permission.  <b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.
<b>idp-profiler-operation</b>	Can view profiler data.
<b>interface</b>	Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.

Table 103: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>interface-control</b>	Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul>
<b>maintenance</b>	Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router by using the <b>request system</b> commands.
<b>network</b>	Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>pgcp-session-mirroring</b>	Can view the <b>pgcp</b> session mirroring configuration.
<b>pgcp-session-mirroring-control</b>	Can modify the <b>pgcp</b> session mirroring configuration.
<b>reset</b>	Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.
<b>rollback</b>	Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.
<b>routing</b>	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
<b>routing-control</b>	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level.
<b>secret</b>	Can view passwords and other authentication keys in the configuration.
<b>secret-control</b>	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
<b>security</b>	Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.

Table 103: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>security-control</b>	Can view and configure security information at the <b>[edit security]</b> hierarchy level.
<b>shell</b>	Can start a local shell on the router or switch by using the <b>start shell</b> command.
<b>snmp</b>	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
<b>snmp-control</b>	Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.
<b>system</b>	Can view system-level information in configuration and operational modes.
<b>system-control</b>	Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.
<b>trace</b>	Can view trace file settings and configure trace file properties.
<b>trace-control</b>	Can modify trace file settings and configure trace file properties.
<b>view</b>	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.
<b>view-configuration</b>	Can view all of the configuration excluding secrets, system scripts, and event options.  <b>NOTE:</b> Only users with the <b>maintenance</b> permission can view commit script, op script, or event script configuration.

### Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration** and

**deny-configuration**, **allow-commands** and **deny-commands**, and all user permission bits.

- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

## Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However, if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

### Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

### Using Local Password Authentication

---

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

### Order of Authentication Attempts

---

Table 104 on page 1213 describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 104: Order of Authentication Attempts

Syntax	Order of Authentication Attempts
<b>authentication-order radius;</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS server is available but authentication is rejected, deny access.</li> <li>4. If RADIUS servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ radius password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</li> </ol>
<b>authentication-order [ radius tacplus ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers.</li> <li>4. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>5. If TACACS+ server is available but authentication is rejected, deny access.</li> <li>6. If both RADIUS and TACACS+ servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If either RADIUS or TACACS+ servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ radius tacplus password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers.</li> <li>4. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>5. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</li> </ol>

Table 104: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<b>authentication-order tacplus;</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>3. If TACACS+ server is available but authentication is rejected, deny access.</li> <li>4. If TACACS+ servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If a TACACS+ server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ tacplus password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</li> </ol>
<b>authentication-order [ tacplus radius ];</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers.</li> <li>4. If RADIUS server is available and authentication is accepted, grant access.</li> <li>5. If RADIUS server is available but authentication is rejected, deny access.</li> <li>6. If both TACACS+ and RADIUS servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If either TACACS+ or RADIUS servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ tacplus radius password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers.</li> <li>4. If RADIUS server is available and authentication is accepted, grant access.</li> <li>5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.</li> </ol>

Table 104: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<code>authentication-order password;</code>	<ol style="list-style-type: none"> <li>1. Try to authenticate the user, using the password configured at the <code>[edit system login]</code> hierarchy level.</li> <li>2. If the authentication is accepted, grant access.</li> <li>3. If the authentication is rejected, deny access.</li> </ol>

**NOTE:** If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the `authentication-order` statement. If you want SSH logins to use the authentication methods configured in the `authentication-order` statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the `authentication-order` statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the `authentication-order` statement.

## Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

## Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 1216](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User's full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must

be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.

- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.
- User's access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in [“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”](#) on page 1219.
- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user's password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user user-name]
user@switch# set authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
  - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
```

```
ssh-rsa "1024 35 9727638204084251055468226757249864241630322
207404962528390382038690141584534964170019610608358722961563

625461667999278316123500438660915866283822489746732605661192
181489539813862940327687806538169602027491641637359132693963
44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in [“Configuring the Root Password” on page 1236](#).

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

#### Related Documentation

- [Configuring Junos OS User Accounts on page 1226](#)
- [Junos OS Login Classes Overview on page 1218](#)

## Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in [Table 105 on page 1218](#). The predefined login classes cannot be modified.

**Table 105: Predefined System Login Classes**

Login Class	Permission Flag Set
<b>operator</b>	clear, network, reset, trace, and view
<b>read-only</b>	view
<b>superuser or super-user</b>	all
<b>unauthorized</b>	None

**NOTE:**

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:

warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'

- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:

error: target '<class-name>' is a predefined class

**Related Documentation**

## Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the `allow/deny-configuration-regexps` and `allow/deny-configuration` statements at the `[edit system login class]` hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

[Table 106 on page 1219](#) lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

**Table 106: Configuration Mode Hierarchies—Common Regular Expression Operators**

Operator	Match
	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <code>(show system alarms) (show system software)</code> .
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.

**Table 106: Configuration Mode Hierarchies—Common Regular Expression Operators (*continued*)**

Operator	Match
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue <b>show interfaces detail</b> or <b>show interfaces extensive</b> .
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained.
*	Zero or more terms.
+	One or more terms.
.	Any character except for a space " ".

**Related Documentation**

- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies](#)
- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1253](#)

**Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands**

Use extended regular expressions to specify which operational mode commands are denied or allowed. [Table 107 on page 1220](#) lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

**Table 107: Common Regular Expression Operators to Allow or Deny Operational Mode Commands**

Operator	Match
	One of two or more terms separated by the pipe ( ) symbol. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <b>(show system alarms) (show system software)</b> .
^	At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue the <b>show interfaces detail</b> or <b>show interfaces extensive</b> command.

**Table 107: Common Regular Expression Operators to Allow or Deny Operational Mode Commands (*continued*)**

Operator	Match
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

**Related Documentation**

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 168](#)

## Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. [Table 108 on page 1221](#) shows the default requirements.

**Table 108: Special Requirements for Plain-Text Passwords**

Junos OS	Junos-FIPS
The password must be between 6 and 128 characters long.	FIPS passwords must be between 10 and 20 characters long
You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.	You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
Valid passwords must contain at least one change of case or character class.	Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # \$ % ^ & \* , + < > ; ;

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- [edit system diag-port-authentication]
- [edit system pic-console-authentication]
- [edit system root-authentication]
- [edit system login user *username* authentication]

The **change-type** statement specifies whether the password is checked for the following:

- The total number of character sets used (**character-set**)
- The total number of character set changes (**set-transitions**)

For example, the following password:

MyPassWd@2

has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (**M**–**y**, **y**–**P**, **P**–**a**, **s**–**W**, **W**–**d**, **d**–**@**, and **@**–**2**).

The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be 5 or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be

at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
 change-type character-sets;
 format md5;
 minimum-changes 1;
 minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
 change-type set-transitions;
 format sha1;
 maximum-length 20;
 minimum-changes 3;
 minimum-length 10;
}
```

## Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
permissions [permissions];
```

- *permissions*

## Configuring CLI Tips

The Junos OS CLI provides the option of configuring CLI tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

### Related Documentation

- [login-tip on page 255](#)

## Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
 class class-name;
 class {
 (encrypted-password "password" | plain-text-password);
 ssh-rsa "public-key";
 ssh-dsa "public-key";
 }
 full-name complete-name;
 uid uid-value;
 class class-name;
}
```

## Configuring LLDP

QFX Series products use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to identify a variety of devices quickly. The result is a LAN that interoperates smoothly and efficiently.

The LLDP protocol cannot be enabled by issuing the **set protocols lldp** statement at the **[edit]** hierarchy level. Enable the LLDP protocol by configuring it on all interfaces or on specific interfaces.

To configure basic LLDP options using the CLI:

1. Configure the advertisement interval in seconds:

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

2. Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded:

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

3. Configure LLDP on all interfaces or on a specific interface:

```
[edit protocols lldp]
user@switch# set interface (LLDP) all
```

4. Configure tracing operations for the LLDP protocol:

```
[edit protocols lldp]
user@switch# set traceoptions file lldptrace
```

#### Related Documentation

## Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

To configure the authentication order, include the **authentication-order** statement at the **[edit system]** hierarchy level:

```
[edit system]
authentication-order [authentication-methods];
```

Specify one or more of the following authentication methods in the preferred order, from first tried to last tried:

- **radius**—Verify the user using RADIUS authentication services
- **tacplus**—Verify the user using TACACS+ authentication services.
- **password**—Verify the user using the username and password configured locally by including the authentication statement at the **[edit system login user]** hierarchy level.

The CHAP authentication sequence cannot take more than 30 seconds. If it takes longer to authenticate a client, the authentication is abandoned and a new sequence is initiated.

For example, if you configure three RADIUS servers so that the router or switch attempts to contact each server three times, and with each retry the server times out after 3 seconds, then the maximum time given to the RADIUS authentication method before CHAP considers it a failure is 27 seconds. If you add more RADIUS servers to this configuration, they might not be contacted because the authentication process might be abandoned before these servers are tried.

The Junos OS enforces a limit on the number of standing authentication server requests that the CHAP authentication can have at one time. Thus, an authentication server method—RADIUS, for example—might fail to authenticate a client when this limit is exceeded. If it fails, the authentication sequence is reinitiated by the router or switch until authentication succeeds and the link is brought up. However, if the RADIUS servers are not available and if additional authentication methods such as **tacplus** or **password** are configured along with **radius**, the next authentication method is tried.

The following example shows how to configure **radius** and **password** authentication:

```
[edit system]
user@switch# authentication-order [radius password];
```

The following example shows how to delete the **radius** statement from the authentication order:

```
[edit system]
user@switch# delete authentication-order radius
```

The following example shows how to insert the **tacplus** statement after the **radius** statement:

```
[edit system]
user@switch# insert authentication-order tacplus after radius
```

- *authentication-order*

## Configuring Local User Template Accounts for User Authentication

You use local user template accounts when you need different types of templates for authentication. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the router and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, the Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is authenticated, the server returns the local username to the Junos OS, which then determines whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, the Junos OS selects the appropriate local user template locally configured on the router. If a local user template does not exist for the authenticated user, the router defaults to the **remote** template.

To configure different access privileges for users who share the local user template account, include the **allow-commands** and **deny-commands** commands in the authentication server configuration file.

To configure a local user template, include the **user local-username** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to the local users to whom the template applies:

```
[edit system login]
user local-username {
 full-name "Local user account";
 uid uid-value;
 class class-name;
}
```

This example configures the **sales** and **engineering** local user templates:

```
[edit]
system {
 login {
 user sales {
 uid uid-value;
```

```
 class class-name;
 }
 user engineering {
 uid uid-value;
 class class-name;
 }
}

user = simon {
 ...
 service = junos-exec {
 local-user-name = sales
 allow-commands = "configure"
 deny-commands = "shutdown"
 }
}
user = rob {
 ...
 service = junos-exec {
 local-user-name = sales
 allow-commands = "(request system) | (show rip neighbor)"
 deny-commands = "clear"
 }
}
user = harold {
 ...
 service = junos-exec {
 local-user-name = engineering
 allow-commands = "monitor | help | show | ping | traceroute"
 deny-commands = "configure"
 }
}
user = jim {
 ...
 service = junos-exec {
 local-user-name = engineering
 allow-commands = "show bgp neighbor"
 deny-commands = "telnet | ssh"
 }
}
```

When the login users Simon and Rob are authenticated, the switch applies the sales local user template. When login users Harold and Jim are authenticated, the switch applies the engineering local user template.

- [user \(Access\) on page 306](#)

## Configuring Management Access

To define the management access settings for the routing platform:

1. Next to Allow Telnet Access, select the check box to allow remote Telnet access to the routing platform.
2. Next to Allow SSH Access, selected the check box to allow remote SSH access to the routing platform.
3. Click **Apply** to apply the configuration.

### Related Documentation

## Configuring RADIUS System Accounting

With RADIUS accounting enabled, Juniper Networks routers or switches, acting as RADIUS clients, can notify the RADIUS server about user activities such as software logins, configuration changes, and interactive commands. The framework for RADIUS accounting is described in RFC 2866.

Tasks for configuring RADIUS system accounting are:

1. [Configuring Auditing of User Events on a RADIUS Server on page 1231](#)
2. [Specifying RADIUS Server Accounting and Auditing Events on page 1232](#)
3. [Configuring RADIUS Server Accounting on page 1232](#)

### Configuring Auditing of User Events on a RADIUS Server

To audit user events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [events];
destination {
 radius {
 server {
 server-address {
 accounting-port port-number;
 secret password;
 source-address address;
 retry number;
 timeout seconds;
 }
 }
 }
}
```

### Specifying RADIUS Server Accounting and Auditing Events

---

To specify the events you want to audit when using a RADIUS server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [events];
```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring RADIUS Server Accounting

---

To configure RADIUS server accounting, include the **server** statement at the **[edit system accounting destination radius]** hierarchy level:

```
server {
 server-address {
 accounting-port port-number;
 secret password;
 source-address address;
 retry number;
 timeout seconds;
 }
}
```

**server-address** specifies the address of the RADIUS server. To configure multiple RADIUS servers, include multiple **server** statements.

**NOTE:** If no RADIUS servers are configured at the **[edit system accounting destination radius]** statement hierarchy level, the Junos OS uses the RADIUS servers configured at the **[edit system radius-server]** hierarchy level.

**accounting-port *port-number*** specifies the RADIUS server accounting port number.

The default port number is 1813.

**NOTE:** If you enable RADIUS accounting at the **[edit access profile *profile-name* accounting-order]** hierarchy level, accounting is triggered on the default port of 1813 even if you do not specify a value for the **accounting-port** statement.

You must specify a secret (password) that the local router or switch passes to the RADIUS client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (" ").

In the **source-address** statement, specify a source address for the RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. The source address is a valid IPv4 address configured on one of the router or switch interfaces.

Optionally, you can specify the number of times that the router or switch attempts to contact a RADIUS authentication server by including the **retry** statement. By default, the router or switch retries three times. You can configure the router or switch to retry from 1 through 10 times.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a RADIUS server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure the timeout to be from 1 through 90 seconds.

## Configuring RADIUS Authentication

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

- [Configuring RADIUS Server Details on page 1233](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 1234](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1235](#)

### Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the **[edit system]** hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
 accounting-port port-number;
 port number;
 retry number;
 secret password;
 source-address source-address;
 timeout seconds;
}
```

**server-address** is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the **secret password** statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the **timeout** statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in

the **retry** statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the **source-address** statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple **radius-server** statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level, as described in [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1200](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile *profile-name* radius-server *server-address*]**
2. **[edit access radius-server *server-address*]**
3. **[edit system radius-server *server-address*]**

---

### Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters
- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
 authentication-order [radius password];
 radius-server {
 192.168.69.149 secret "9G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
 }
 radius-options {
```

```

 password-protocol mschap-v2;
 }
 login {
 user bob {
 class operator;
 }
 }
}

```

### Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```

[edit system radius-server server-address]
source-address source-address;

```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

### Configuring Remote Template Accounts for User Authentication

By default, the Junos OS uses remote template accounts for user authentication when:

- The authenticated user does not exist locally on the router or switch.
- The authenticated user's record in the authentication server specifies local user, or the specified local user does not exist locally on the router or switch.

To configure the remote template account, include the **user remote** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to remote users:

```

[edit system login]
user remote {
 full-name "All remote users";
 uid uid-value;
}

```

```
class class-name;
}
```

To configure different access privileges for users who share the remote template account, include the **allow-commands** and **deny-commands** statements in the authentication server configuration file.

**Related  
Documentation**

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1200](#)
- [user \(Access\)](#)
- [user \(Access\) on page 306](#)

## Configuring the Root Password

Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password.

**NOTE:** If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as superuser and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level:

```
[edit system]
root-authentication {
 (encrypted-password "password" | load-key-password URL | plain-text-password);
 ssh-dsa "public-key";
 ssh-rsa "public-key";
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@switch# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

To load an SSH key file, enter the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

You can also configure SSH RSA keys and SSH DSA keys to authenticate root logins. You can configure more than one public RSA or DSA key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@switch# set root-authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
 ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
 SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

#### Related Documentation

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
 community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
 client-list client-list-name {
 ip-addresses;
 }
}
```

```
community community-name {
 authorization authorization;
 client-list-name client-list-name;

- [snmp on page 1334](#)

## Configuring SSH Host Keys for Secure Copying of Data

Secure Shell (SSH) uses encryption algorithms to generate a host, server, and session key system that ensures secure data transfer. You can configure SSH host keys to support secure copy (SCP) as an alternative to FTP for the background transfer of data such as configuration archives and event logs. To configure SSH support for SCP, you must complete the following tasks:

- Specify SSH known hosts by including hostnames and host key information in the Routing Engine configuration hierarchy.
- Set an SCP URL to specify the host from which to receive data. Setting this attribute automatically retrieves SSH host key information from the SCP server.
- Verify that the host key is authentic.
- Accept the secure connection. Accepting this connection automatically stores host key information in the local host key database. Storing host key information in the configuration hierarchy automates the secure handshake and allows background data transfer using SCP.

Tasks to configure SSH host keys for secure copying of data are:

1. [Configuring SSH Known Hosts on page 1242](#)
2. [Configuring Support for SCP File Transfer on page 1242](#)
3. [Updating SSH Host Key Information on page 1243](#)

## Configuring SSH Known Hosts

To configure SSH known hosts, include the **host** statement, and specify hostname and host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level:

```
[edit security ssh-known-hosts]
host corporate-archive-server, ip-address {
 dsa-key key;
}
host archive-server-url {
 rsa-key key;
}
host server-with-ssh-version-1, ip-address {
 rsa1-key key;
}
```

Host keys are one of the following:

- **dsa-key**—Base64 encoded Digital Signature Algorithm (DSA) key.
- **rsa-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures.
- **rsa1-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures for SSH version 1 and SSH version 2.

## Configuring Support for SCP File Transfer

To configure a known host to support background SCP file transfers, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level.

```
[edit system archival configuration]
archive-sites {
 scp://username<:password>@host<:port>/url-path;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "scp://username<:password>@[host]<:port>/url-path";

Setting the **archive-sites** statement to point to an SCP URL triggers automatic host key retrieval. At this point, Junos OS connects to the SCP host to fetch the SSH public key, displays the host key message digest or fingerprint as output to the console, and terminates the connection to the server.

```
user@switch# set system archival configuration archive-sites "<scp-url-path>"
The authenticity of host <my-archive-server (<server-ip-address>)> can't be established.
RSA key fingerprint is <ascii-text key>. Are you sure you want to continue connecting
(yes/no)?
```

To verify that the host key is authentic, compare this fingerprint with a fingerprint that you obtain from the same host using a trusted source. If the fingerprints are identical,

accept the host key by entering **yes** at the prompt. The host key information is then stored in the Routing Engine configuration and supports background data transfers using SCP.

### Updating SSH Host Key Information

Typically, SSH host key information is automatically retrieved when you set a URL attribute for SCP using the **archival configuration archive-sites** statement at the **[edit system]** hierarchy level. However, if you need to manually update the host key database, use one of the following methods.

1. [Retrieving Host Key Information Manually on page 1243](#)
2. [Importing Host Key Information from a File on page 1243](#)

#### *Retrieving Host Key Information Manually*

To manually retrieve SSH public host key information, use the **fetch-from-server** option with the **set security ssh-known-hosts** command. You must include a hostname attribute with the **set security ssh-known-hosts fetch-from-server** command to specify the host from which to retrieve the SSH public key.

```
user@switch# set security ssh-known-hosts fetch-from-server <hostname>
```

#### *Importing Host Key Information from a File*

To manually import SSH host key information from the known-hosts file located at **/var/tmp/known-hosts** on the server, include the **load-key-file** option with the **set security ssh-known-hosts** command. You must include the path to the **known-hosts** file with the **set security ssh-known-hosts load-key-file** command to specify the location from which to import host key information.

```
user@switch# set security ssh-known-hosts load-key-file /var/tmp/known-hosts
```

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
 ciphers [cipher-1 cipher-2 cipher-3 ...]
 client-alive-count-max number;
 client-alive-interval seconds;
 connection-limit limit;
 hostkey-algorithm <algorithm | no-algorithm>;
 key-exchange algorithm;
 macs algorithm;
 max-sessions-per-connection number;
 no-tcp-forwarding;
 protocol-version [v1 v2];
 rate-limit limit;
 root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 1244](#)
- [Configuring the SSH Protocol Version on page 1244](#)
- [Configuring the Client Alive Mechanism on page 1245](#)

---

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

---

### Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [v1];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [v2];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [v1 v2];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

## Configuring TACACS+ Authentication

TACACS+ authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure TACACS+ configuration are:

- [Configuring TACACS+ Server Details on page 1245](#)
- [Specifying a Source Address for the Junos OS to Access External TACACS+ Servers on page 1246](#)
- [Configuring the Same Authentication Service for Multiple TACACS+ Servers on page 1247](#)
- [Configuring Juniper Networks Vendor-Specific TACACS+ Attributes on page 1247](#)

### Configuring TACACS+ Server Details

To use TACACS+ authentication on the router or switch, configure information about one or more TACACS+ servers on the network by including the **tacplus-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
tacplus-server server-address {
 port port-number;
 secret password;
 single-connection;
```

```
 timeout seconds;
}
```

**server-address** is the address of the TACACS+ server.

**port-number** is the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password included spaces, enclose the password in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can use the **single-connection** statement to have the software maintain one open Transmission Control Protocol (TCP) connection to the server for multiple requests, rather than opening a connection for each connection attempt.

**NOTE:** Early versions of the TACACS+ server do not support the **single-connection** option. If you specify this option and the server does not support it, Junos OS will be unable to communicate with that TACACS+ server.

To configure multiple TACACS+ servers, include multiple **tacplus-server** statements.

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

**NOTE:** Accounting should not be configured at the **[edit system]** hierarchy level; on a TX Matrix router, control is done under the switch-card chassis only.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level.

### Specifying a Source Address for the Junos OS to Access External TACACS+ Servers

You can specify which source address Junos OS uses when accessing your network to contact an external TACACS+ server for authentication. You can also specify which source address Junos OS uses when contacting a TACACS+ server for sending accounting information.

To specify a source address for a TACACS+ server for authentication, include the **source-address** statement at the **[edit system tacplus-server server-address]** hierarchy level:

```
[edit system tacplus-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

To specify a source address for a TACACS+ server for system accounting, include the **source-address** statement at the **[edit system accounting destination tacplus server server-address]** hierarchy level:

```
[edit system accounting destination tacplus server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

### Configuring the Same Authentication Service for Multiple TACACS+ Servers

To configure the same authentication service for multiple TACACS+ servers, include statements at the **[edit system tacplus-server]** and **[edit system tacplus-options]** hierarchy levels. For information about how to configure a TACACS+ server at the **[edit system tacplus-server]** hierarchy level.

To assign the same authentication service to multiple TACACS+ servers, include the **service-name** statement at the **[edit system tacplus-options]** hierarchy level:

```
[edit system tacplus-options]
service-name service-name;
```

**service-name** is the name of the authentication service. By default, the service name is set to **junos-exec**.

The following example shows how to configure the same authentication service for multiple TACACS+ servers:

```
[edit system]
tacplus-server {
 10.2.2.2 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
 10.3.3.3 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
}
tacplus-options {
 service-name bob;
}
```

### Configuring Juniper Networks Vendor-Specific TACACS+ Attributes

The Juniper Networks vendor-specific TACACS+ attributes enable you to configure access privileges for users on a TACACS+ server. They are specified in the TACACS+ server configuration file on a per-user basis. Junos OS retrieves these attributes through an authorization request of the TACACS+ server after authenticating a user. You do not need to configure these attributes to run Junos OS with TACACS+.

To specify these attributes, include a **service** statement of the following form in the TACACS+ server configuration file:

```
service = junos-exec {
 local-user-name = <username-local-to-router>
 allow-commands = "<allow-commands-regex>"
}
```

```
allow-configuration = "<allow-configuration-regex>"
deny-commands = "<deny-commands-regex>"
deny-configuration = "<deny-configuration-regex>"
}
```

This **service** statement can appear in a **user** or **group** statement.

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1200](#)
- [Junos OS User Authentication Methods on page 1216](#)

## Configuring TACACS+ System Accounting

You can use TACACS+ to track and log software logins, configuration changes, and interactive commands. To audit these events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [events];
destination {
 tacplus {
 server {
 server-address {
 port port-number;
 secret password;
 single-connection;
 timeout seconds;
 }
 }
 }
}
```

Tasks for configuring TACACS+ system accounting are:

1. [Specifying TACACS+ Auditing and Accounting Events on page 1248](#)
2. [Configuring TACACS+ Server Accounting on page 1249](#)

### Specifying TACACS+ Auditing and Accounting Events

---

To specify the events you want to audit when using a TACACS+ server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [events];
```

**events** is one or more of the following:

- **login**—Audit logins

- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring TACACS+ Server Accounting

To configure TACACS+ server accounting, include the **server** statement at the **[edit system accounting destination tacplus]** hierarchy level:

```
[edit system accounting destination tacplus]
server {
 server-address {
 port port-number;
 secret password;
 single-connection;
 timeout seconds;
 }
}
```

**server-address** specifies the address of the TACACS+ server. To configure multiple TACACS+ servers, include multiple **server** statements.

**NOTE:** If no TACACS+ servers are configured at the **[edit system accounting destination tacplus]** statement hierarchy level, Junos OS uses the TACACS+ servers configured at the **[edit system tacplus-server]** hierarchy level.

**port-number** specifies the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password contains spaces, enclose the entire password in quotation marks (" "). The password used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can maintain one open TCP connection to the server for multiple requests, rather than opening a connection for each connection attempt, by including the **single-connection** statement.

To ensure that start and stop requests for accounting of login events are correctly logged in the Accounting file instead of the Administration log file on a TACACS+ server, include either the **no-cmd-attribute-value** statement or the **exclude-cmd-attribute** at the **[edit system tacplus-options]** hierarchy level.

If you use the **no-cmd-attribute-value** statement, the value of the **cmd** attribute is set to a null string in the start and stop requests. If you use the **exclude-cmd-attribute** statement, the **cmd** attribute is totally excluded from the start and stop requests. Both statements

support the correct logging of accounting requests in the Accounting file, instead of the Administration file.

```
[edit system tacplus-options]
(no-cmd-attribute-value | exclude-cmd-attribute);
```

- [Configuring TACACS+ Authentication on page 1245](#)

## Defining Junos OS Login Classes

To define a login class and its access privileges, include the **class** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
class class-name {
 allow-commands "regular-expression";
 allow-configuration "regular-expression";
 deny-commands "regular-expression";
 deny-configuration "regular-expression";
 idle-timeout minutes;
 permissions [permissions];
}
```

**Related Documentation**

## Limiting the Number of User Login Attempts for SSH and Telnet Sessions

You can limit the number of times a user can attempt to enter a password while logging in through SSH or Telnet. The connection is terminated if a user fails to log in after the number of attempts specified. You can also specify a delay, in seconds, before a user can try to enter a password after a failed attempt. In addition, you can specify the threshold for the number of failed attempts before the user experiences a delay in being able to enter a password again.

To specify the number of times a user can attempt to enter a password while logging in, include the **retry-options** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
retry-options {
 tries-before-disconnect number;
 backoff-threshold number;
 backoff-factor seconds;
 maximum-time seconds;
 minimum-time seconds;
}
```

You can configure the following options:

- **tries-before-disconnect**—Number of times a user can attempt to enter a password when logging in. The connection closes if a user fails to log in after the number specified. The range is from 1 through 10, and the default is 10.
- **backoff-threshold**—Threshold for the number of failed login attempts before the user experiences a delay in being able to enter a password again. Use the **backoff-factor** option to specify the length of the delay in seconds. The range is from 1 through 3, and the default is 2.
- **backoff-factor**—Length of time, in seconds, before a user can attempt to log in after a failed attempt. The delay increases by the value specified for each subsequent attempt after the threshold. The range is from 5 through 10, and the default is 5 seconds.
- **maximum-time seconds**—Maximum length of time, in seconds, that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the **maximum-time** value, the connection is closed. The range is from 20 through 300 seconds, and the default is 120 seconds.
- **minimum-time**—Minimum length of time, in seconds, that a connection remains open while a user is attempting to enter a correct password. The range is from 20 through 60, and the default is 40.

## Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45-to-DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.

5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:

- Bits per second: 9600
- Data bits: 8
- Parity: None
- Stop bits: 1
- Flow control: None

9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

The terminal emulation screen on your management device displays the switch's boot sequence.

10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

- Related Documentation**
- [Configuring the Root Password on page 1236](#)

## Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

You can specify extended regular expressions with the **allow-configuration** and **deny-configuration** statements to define user access privileges to parts of the configuration hierarchy. Doing so overrides login class permission bits set for a user. You can also use wildcards to restrict access. When you define access privileges to parts of the configuration hierarchy, do the following tasks:

- Specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements.
- Put parentheses around an extended regular expression that connects two or more expressions with the pipe | symbol. For example:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

**NOTE:** Each expression separated by a pipe (|) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (|) symbol. You cannot define access to keywords such as **set**, **edit**, or **activate**.

When you explicitly provide access to configuration mode hierarchies or regular expressions using the **allow-configuration** statement, you add to the regular permissions set with the **permissions** statement. If you explicitly deny access to configuration mode hierarchies or regular expressions using the **deny-configuration** statement, you remove permissions for the specified configuration mode hierarchy from the default permissions provided by the **permissions** statement.

To explicitly provide access to an individual configuration mode hierarchy that would otherwise be denied, include the **allow-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-configuration "regular-expression";
```

To explicitly deny access to an individual configuration hierarchy that would otherwise be supported, include the **deny-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-configuration "regular-expression";
```

You can include one **deny-configuration** and one **allow-configuration** statement in each login class.

If you allow and deny the same set of configuration hierarchy levels, regular expressions, or commands, the **allow-configuration** statement permissions take precedence over the

permissions specified by the **deny-configuration** statement. For example, if you include **allow-configuration "system services"** and **deny-configuration "system services"**, the login class user can continue to edit the configuration or issue commands at the **edit system services** hierarchy level.

**Related  
Documentation**

- [Defining Access Privileges Using allow/deny-configuration Statements on page 1271](#)
- [Configuring Access Privilege Levels on page 1226](#)

## Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement

includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)"**. Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

#### Related Documentation

- [Example: Configuring Access Privileges for Operational Mode Commands on page 1263](#)
- [Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands on page 1220](#)
- *allow-commands*
- *deny-commands*

## Using Junos OS to Configure Logical System Administrators

Using Junos OS, you can partition a single router or switch into multiple logical devices that perform independent routing or switching tasks. When creating logical systems, you must configure logical system administrators and interfaces, assign logical interfaces to logical systems, and configure various other logical system statements.

The master administrator can assign one or more logical system administrators to each logical system. Once assigned to a logical system, administrators are restricted to viewing

only configurations of the logical system to which they are assigned and accessing only the operational commands that apply to that particular logical system. This restriction means that these administrators cannot access global configuration statements, and all command output is restricted to the logical system to which the administrators are assigned.

To configure logical system administrators, include the **logical-system *logical-system-name*** statement at the **[edit system login class *class-name*]** hierarchy level and apply the class to the user. For example:

```
[edit]
system {
 login {
 class admin1 {
 permissions all;
 logical-system logical-system-LS1;
 }
 class admin2 {
 permissions view; # Gives users assigned to class admin2 the ability to view
 # but not to change the configuration.
 logical-system logical-system-LS2;
 }
 user user1 {
 class admin1;
 }
 user user2 {
 class admin2;
 }
 }
}
```

Fully implementing logical systems requires that you also configure any protocols, routing statements, switching statements, and policy statements for the logical system.

- Related Documentation**
- *Defining Junos OS Login Classes*
  - [Defining Junos OS Login Classes on page 1250](#)

## Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```
Juniper-Allow-Commands+= "cmd1"
Juniper-Allow-Commands+= "cmd2"
Juniper-Allow-Commands+= "cmdn"
Juniper-Deny-Commands+= "cmd1"
Juniper-Deny-Commands+= "cmd2"
Juniper-Deny-Commands+= "cmdn"
Juniper-Allow-Configuration+= "regex1"
Juniper-Allow-Configuration+= "regex2"
Juniper-Allow-Configuration+= "regexn"
Juniper-Deny-Configuration+= "regex1"
Juniper-Deny-Configuration+= "regex2"
Juniper-Deny-Configuration+= "regexn"
Juniper-User-Permissions+= "permission-flag1"
Juniper-User-Permissions+= "permission-flag2"
Juniper-User-Permissions+= "permission-flagn"
```

For a TACACS+ server, specify the individual regular expressions using the following syntax:

```
allow-commands1="cmd1"
allow-commands2="cmd2"
allow-commandsn="cmdn"
deny-commands1="cmd1"
deny-commands2="cmd2"
deny-commandsn="cmdn"
allow-configuration1="regex1"
allow-configuration2="regex2"
allow-configurationn="regexn"
deny-configuration1="regex1"
deny-configuration2="regex2"
deny-configurationn="regexn"
user-permissions1="permission-flag1"
user-permissions2="permission-flag2"
user-permissionsn="permission-flagn "
```

**NOTE:**

- Numeric values 1 to *n* in the syntax (for a TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```
allow-commands1="cmd1"
allow-commands3="cmd3"
allow-commands2="cmd2"
deny-commands3="cmd3"
deny-commands2="cmd2"
deny-commands1="cmd1"
```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

---

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 1203](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 1205](#).

**NOTE:** When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the [edit system login class] hierarchy level using the `allow-commands`, `deny-commands`, `allow-configuration`, `deny-configuration`, or `permissions` statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

## VSA Match Conditions and Actions

EX Series switches and the QFX Series support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match **10.1.1.0/24 OR 11.1.1.0/24**), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

[Table 109 on page 1259](#) describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

**Table 109: Match Conditions**

Option	Description
<b>destination-mac</b> <i>mac-address</i>	Destination media access control (MAC) address of the packet.
<b>source-vlan</b> <i>source-vlan</i>	Name of the source VLAN.
<b>source-dot1q-tag</b> <i>tag</i>	Tag value in the 802.1Q header, in the range 0 through 4095.
<b>destination-ip</b> <i>ip-address</i>	Address of the final destination node.
<b>ip-protocol</b> <i>protocol-id</i>	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms:  <b>ah</b> , <b>egp</b> (8), <b>esp</b> (50), <b>gre</b> (47), <b>icmp</b> (1), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>tcp</b> (6), or <b>udp</b> (17)
<b>source-port</b> <i>port</i>	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <b>destination-port</b> .

Table 109: Match Conditions (*continued*)

Option	Description
<b>destination-port</b> <i>port</i>	<p>TCP or UDP destination port field. Normally, you specify this match in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cvspserver (2401), cmd (514), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), telnet (23), tacacs-ds (65), talk (517), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)</p>

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 110 on page 1260](#) shows the actions that you can specify in a term.

Table 110: Actions for VSAs

Option	Description
(allow   deny)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.
<b>forwarding-class</b> <i>class-of-service</i>	<p>(Optional) Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> </ul>
<b>loss-priority</b> (low   medium   high)	(Optional) Set the packet loss priority (PLP) to <b>low</b> , <b>medium</b> , or <b>high</b> . Specify both the forwarding class and loss priority.

## Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 1261](#)
- [Overview on page 1261](#)
- [Configuration on page 1261](#)

### Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**, **minimum-punctuations**, or **minimum-upper-cases**.

### Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
```

```
set system login password maximum-length 22
```

```
set system login password minimum-numeric 1
```

```
set system login password minimum-upper-cases 1
```

```
set system login password minimum-lower-cases 1
```

```
set system login password minimum-punctuations 1
```

### *Configuring Requirements for Plain-Text Passwords*

**Step-by-Step Procedure** This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.  

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.  

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.  

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```
4. Require users to set a password that has at least one punctuation-class character and at least one number.  

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

### *Results*

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
 minimum-length 12;
 maximum-length 22;
```

```

minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;

```

- Related Documentation**
- [Special Requirements for Junos OS Plain-Text Passwords on page 1221](#)
  - *password (Login)*

## Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```

[edit]
system {
 login {
 class user-accounts {
 permissions [configure admin admin-control];
 }
 class network-mgmt {
 permissions [configure snmp snmp-control];
 }
 }
}

```

- Related Documentation**
- [Configuring Access Privilege Levels on page 1226](#)

## Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```

[edit]
system {
 # This login class has operator privileges and the additional ability
 # to reboot the router.
 login {
 # This login class has operator privileges and the additional ability to reboot the
 # router or switch.
 class operator-and-boot {
 permissions [clear network reset trace view];
 allow-commands "request system reboot";
 }
 # This login class has operator privileges but can't use any commands beginning
 # with "set".
 # This login class has operator privileges
 # but cannot use any commands beginning with "set"
 class operator-no-set {
 permissions [clear network reset trace view];
 deny-commands "^set";
 }
 # This login class has operator privileges and can install software but not view
 # BGP information, and can issue the show route command, without specifying
 # commands or arguments under it.

```

```
class operator-and-install-but-no-bgp {
 permissions [clear network reset trace view];
 allow-commands "(request system software add)|(show route$)";
 deny-commands "show bgp";
}
}
```

**Related Documentation** • [Specifying Access Privileges for Junos OS Operational Mode Commands on page 168](#)

### Example: Configuring a Plain-Text Password for Root Logins

The following example shows how to set a plain-text password for root logins:

```
[edit]
user@switch# set system root-authentication plain-text-password
New password: type root password
Retype new password: retype root password
[edit]
user@switch# show
system {
 root-authentication {
 encrypted-password "$1$14c5.$sBopasddsdfs0";
 }
}
```

**Related Documentation** • [Configuring the Root Password on page 146](#)

### Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
 authentication-order [radius password];
 root-authentication {
 encrypted-password "9aHl)8gqQlgyjgjhgygjliiii"; # SECRET-DATA
 }
 name-server {
 10.1.1.1;
 10.1.1.2;
 }
}
```

```
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
system {
 radius-server {
 10.1.2.1 {
 secret "9aHlj8gqQlsdjerrhser"; # SECRET-DATA
 timeout 5;
 }
 10.1.2.2 {
 secret "9aHlj8gqQlcsdoiuardwefoiud"; # SECRET-DATA
 timeout 5;
 }
 }
}
```

**Related Documentation**

- [Configuring RADIUS Authentication](#)

### Example: Configuring RADIUS System Accounting

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting.

```
system {
 accounting {
 events [login change-log interactive-commands];
 destination {
 radius {
 server {
 10.5.5.5 {
 accounting-port 3333;
 secret 9dkafeqwrew;
 source-address 10.1.1.1;
 retry 3;
 timeout 3;
 }
 10.6.6.6 secret 9fe3erqwrez;
 10.7.7.7 secret 9f34929ftby;
 }
 }
 }
 }
}
```

**Related Documentation**

## Example: Configuring the Root Password

The following example shows how to configure the root password:

```
[edit]
user@switch# set system root-authentication encrypted-password
"$1$14c5.$sBopasddsd0"
[edit]
user@switch# show
system {
 root-authentication {
 encrypted-password "$1$14c5.$sBopasddsd0";
 }
}
```

### Related Documentation

- [Example: Configuring a Plain-Text Password for Root Logins on page 1264](#)
- [Configuring the Root Password on page 1236](#)

## Example: Configuring SSH Authentication for Root Logins

The following example shows how to configure two public DSA keys for SSH authentication of root logins:

```
[edit system]
root-authentication {
 encrypted-password "$1$1wp5tqMX$uy/u5H7OdXTwfWTmeJWXe/";
 ## SECRET-DATA;
 ssh-dsa "2354 95 9304@boojum.per";
 ssh-dsa "0483 02 8362@ecbatana.per";
}
```

### Related Documentation

- [Configuring the Root Password on page 146](#)
- [Special Requirements for Junos OS Plain-Text Passwords on page 1221](#)

## Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
 login {
 user philip {
 full-name "Philip of Macedonia";
 uid 1001;
 class super-user;
 authentication {
 encrypted-password "1poPPeY";
 }
 }
 }
}
```

```

}
user alexander {
 full-name "Alexander the Great";
 uid 1002;
 class view;
 authentication {
 encrypted-password "$1$14c5.$sBopasdFFdssdfFFdsdfs0";
 ssh-dsa "8924 37 5678 5678@gaugamela.per";
 ssh-dsa "6273 94 9283@boojum.per";
 }
}
user darius {
 full-name "Darius King of Persia";
 uid 1003;
 class operator;
 authentication {
 ssh-rsa "1024 37 12341234@ecbatana.per";
 }
}
user anonymous {
 class unauthorized;
}
user remote {
 full-name "All remote users";
 uid 9999;
 class read-only;
}
}
}

```

- Related Documentation**
- [Junos OS User Accounts Overview](#)
  - [Limiting the Number of User Login Attempts for SSH and Telnet Sessions](#)

## Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see ["Using Local Password Authentication" on page 1212](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

[edit]

```
system {
 authentication-order radius;
 login {
 user philip {
 full-name "Philip";
 uid 1001;
 class super-user;
 }
 user remote {
 full-name "All remote users";
 uid 9999;
 class operator;
 }
 }
}
```

**NOTE:** For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1200](#).

When a user logs in to a device, the user's login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the **[edit system login user]** hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the **edit system login user remote** hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
 authentication-order radius;
 login {
 user philip {
 full-name "Philip";
 uid 1001;
 class super-user;
 }
 user operator {
 full-name "All operators";
 uid 9990;
 class operator;
 }
 user remote {
 full-name "All remote users";
 }
 }
}
```

```

 uid 9999;
 class read-only;
 }
}

```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

**Related Documentation**

- [Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 1228](#)

## Example: Creating Login Classes with Specific Privileges

The following example shows how to create several user classes, each with specific privileges. In this example, you configure timeouts to disconnect the class members after a period of inactivity. Users' privilege levels, and therefore the classes of which they are members, should be dependent on their responsibilities within the organization, and the permissions shown here are only examples.

The first class of users (called “observation”) can only view statistics and configuration. They are not allowed to modify any configuration. The second class of users (called “operation”) can view and modify the configuration. The third class of users (called “engineering”) has unlimited access and control.

```

[edit]
system {
 login {
 class observation {
 idle-timeout 5;
 permissions [view];
 }
 class operation {
 idle-timeout 5;
 permissions [admin clear configure interface interface-control network
 reset routing routing-control snmp snmp-control trace-control
 firewall-control rollback];
 }
 class engineering {
 idle-timeout 5;
 permissions all;
 }
 }
}

```

```
}
```

**Related Documentation**

- [Defining Junos OS Login Classes](#)

## Example: Configuring User Login Accounts

The following example shows how to configure the local administrator account (**user admin**). If RADIUS fails or becomes unreachable, the login process reverts to password authentication on the local accounts on the router or switch.

```
[edit]
system {
 login {
 user admin {
 uid 1000;
 class engineering;
 authentication {
 encrypted-password "<PASSWORD>"; # SECRET-DATA
 }
 }
 }
}
```

**Related Documentation**

- [Configuring Junos OS User Accounts](#)

## Example: Configuring RADIUS Template Accounts

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```
[edit]
system {
 login {
 user observation {
 uid 1001;
 class observation;
 }
 user operation {
 uid 1002;
 class operation;
 }
 user engineering {
 uid 1003;
 class engineering;
 }
 }
}
```

**Related Documentation**

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1200](#)

## Defining Access Privileges Using allow/deny-configuration Statements

The following examples show how to configure access privileges for individual configuration mode hierarchy levels.

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@switch# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@switch# set deny-configuration "system login class m.*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit a configuration or issue commands (such as **commit**) at the login class or system services hierarchy levels:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

The following example shows how to configure permissions for individual configuration mode hierarchies:

```
[edit]
system {
 login { # This login class has operator privileges and the additional ability to edit
 # configuration at the system services hierarchy level.
 class only-system-services {
 permissions [configure];
 allow-configuration "system services";
 }
 # services commands.
 class all-except-system-services { # This login class has operator privileges but
 # cannot edit any system services configuration.
 permissions [all];
 deny-configuration "system services";
 }
 }
}
```

### Related Documentation

- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1253](#)

## Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet. Set the **backoff-threshold** to 2, the **back-off-factor** to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After

each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
 login {
 retry-options {
 backoff-threshold 2;
 backoff-factor 5;
 minimum-time 40;
 tries-before-disconnect 4;
 }
 password {
 }
 }
}
```

**NOTE:** This sample only shows the portion off the [edit system login] hierarchy level being modified.

<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure options for accounting statistics collection.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding RADIUS Accounting on page 1202</a></li><li>• <a href="#">Understanding VSAs on the QFX Series on page 1203</a></li><li>• <a href="#">Configuring RADIUS System Accounting on page 1231</a></li><li>• <a href="#">Configuring Remote Template Accounts for User Authentication on page 1235</a></li><li>• <a href="#">Configuring Local User Template Accounts for User Authentication on page 1229</a></li></ul>

## accounting-server

<b>Syntax</b>	<code>accounting-server[server-addresses];</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.
<b>Default</b>	Not enabled
<b>Options</b>	<i>server-addresses</i> —One or more addresses of RADIUS authentication servers.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>show network-access aaa statistics authentication</i></li> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Understanding 802.1X and RADIUS Accounting on EX Series Switches</i></li> <li>• <a href="#">Understanding RADIUS Accounting on page 1202</a></li> </ul>

## accounting-stop-on-access-deny

---

<b>Syntax</b>	accounting-stop-on-access-deny;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if the AAA server denies access to a supplicant.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

<b>Default</b>	Not enabled
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li><li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li><li>• <i>show network-access aaa statistics authentication</i></li><li>• <i>Configuring RADIUS Accounting</i></li></ul>

## accounting-stop-on-failure

<b>Syntax</b>	accounting-stop-on-failure;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if a supplicant fails AAA authorization, but the RADIUS server grants access. For example, a supplicant might fail AAA authentication because of an internal error such as a timeout.
<div>  <b>NOTE:</b> The [edit access] hierarchy is not available on QFabric systems. </div>	
<b>Default</b>	Not enabled
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and RADIUS Accounting on EX Series Switches</i></li> <li>• <i>Configuring RADIUS Accounting</i></li> <li>• <a href="#">Understanding RADIUS Accounting on page 1202</a></li> </ul>

## advertisement-interval

---

<b>Syntax</b>	<code>advertisement-interval seconds;</code>
<b>Hierarchy Level</b>	[edit protocols lldp], [edit routing-instances <i>routing-instance-name</i> protocols lldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for MX Series and T Series routers. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>For MX Series and T Series routers and EX Series switches, configure an interval for LLDP advertisement.</p> <p>For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.</p> <p>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration.</p> <div><p><b>NOTE:</b> The default value of <b>transmit-delay</b> is 2 seconds. If you configure the <b>advertisement-interval</b> as less than 8 seconds and you do not configure a value for <b>transmit-delay</b>, the default value of <b>transmit-delay</b> is automatically changed to 1 second in order to satisfy the requirement that the <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value.</p></div>
<b>Default</b>	Disabled.
<b>Options</b>	<b>seconds</b> —Interval between LLDP advertisement. <b>Default:</b> 30 <b>Range:</b> 5 through 32768
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LLDP</a></li><li>• <a href="#">show lldp on page 1362</a></li><li>• <a href="#">Configuring LLDP (CLI Procedure)</a></li><li>• <a href="#">Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</a></li><li>• <a href="#">transmit-delay</a></li><li>• <a href="#">Understanding LLDP on page 1201</a></li></ul>

---

## agent-address

---

<b>Syntax</b>	agent-address outgoing-interface;
<b>Hierarchy Level</b>	[edit snmp trap-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
<b>Options</b>	<b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. <b>Default:</b> Disabled (the agent address is not specified in SNMPv1 traps).
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Agent Address for SNMP Traps</i></li></ul>

## archival

<b>Syntax</b>	<pre> archival {   configuration {     archive-sites {       file://&lt;path&gt;/&lt;filename&gt;;       ftp://username@host:&lt;port&gt;url-path password password;       http://username@host:&lt;port&gt;url-path password password;       pasvftp://username@host:&lt;port&gt;url-path password password;       scp://username@host:&lt;port&gt;url-path password password;     }     transfer-interval interval;     transfer-on-commit;   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.
<div>  <p><b>NOTE:</b> The <code>edit system archival</code> hierarchy is not available on QFabric systems.</p> </div>	
<b>Options</b>	The remaining statements are explained separately.
<div>  <p><b>NOTE:</b> The <code>[edit system archival]</code> hierarchy is not available on QFabric systems.</p> </div>	
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1147</li> </ul>

## archive-sites (Configuration File)

<b>Syntax</b>	<pre>archive-sites {     file://&lt;path&gt;/&lt;filename&gt;;     ftp://username@host:&lt;port&gt;url-path password password;     http://username@host:&lt;port&gt;url-path password password;     pasvftp://username@host:&lt;port&gt;url-path password password;     scp://username@host:&lt;port&gt;url-path password password; }</pre>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.</p> <p>The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> <p><b><i>router-name_juniper.conf.n.gz_YYYYMMDD_HHMMSS.</i></b></p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div>
<b>Options</b>	<p>The prefix used in the configuration statement determines the form of transfer:</p> <p><b>file://</b> —transfer on a path to a named file</p> <p><b>ftp://</b> —transfer using active FTP server</p> <p><b>pasvftp://</b> —transfer to a device that only accepts passive FTP services</p>

**scp://** —transfer to a known host using background SCP file transfers

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

**Related Documentation**

---

## authentication-order

---

**Syntax**    authentication-order [none | password | radius];

**Hierarchy Level**    [edit [access profile](#) *profile-name*]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

**Default**    Not enabled

**Options**    none—No authentication for specified subscribers.

              password—Password authentication.

              radius—RADIUS authentication.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

---

## authentication-server

---

<b>Syntax</b>	<code>authentication-server [server-addresses];</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the RADIUS server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.
<b>Options</b>	<b>server-addresses</b> —Configure one or more RADIUS server addresses.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li><li>• <i>show network-access aaa statistics authentication</i></li></ul>

## authorization

---

<b>Syntax</b>	<code>authorization <i>authorization</i>;</code>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the access authorization for SNMP <b>Get</b> , <b>GetBulk</b> , <b>GetNext</b> , and <b>Set</b> requests.
<b>Options</b>	<p><i>authorization</i>—Access authorization level:</p> <ul style="list-style-type: none"><li>• <b>read-only</b>—Enable <b>Get</b>, <b>GetNext</b>, and <b>GetBulk</b> requests.</li><li>• <b>read-write</b>—Enable all requests, including <b>Set</b> requests. You must configure a view to enable <b>Set</b> requests.</li></ul>
	<div> <b>NOTE:</b> The <b>read-write</b> option is not supported on the QFX3000 QFabric system.</div>
	<b>Default:</b> <b>read-only</b>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SNMP Community String on page 6113</a></li></ul>

## categories

---

<b>Syntax</b>	<code>categories {     category; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group group-name]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the types of traps that are sent to the targets of the named trap group.
<b>Default</b>	If you omit the <b>categories</b> statement, all trap types are included in trap notifications.
<b>Options</b>	<b>category</b> —Name of a trap type: <b>authentication</b> , <b>chassis</b> , <b>configuration</b> , <b>link</b> , <b>remote-operations</b> , <b>rmon-alarm</b> , or <b>startup</b> .
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Trap Groups on page 6114</a></li> </ul>

## client-list

---

<b>Syntax</b>	<code>client-list client-list-name {     ip-addresses; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define a list of SNMP clients.
<b>Options</b>	<b>client-list-name</b> —Name of the client list.  <b>ip-addresses</b> —IP addresses of the SNMP clients to be added to the client list,
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 6115</a></li> </ul>

## client-list-name

---

<b>Syntax</b>	<code>client-list-name <i>client-list-name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Add a client list or prefix list to an SNMP community.
<b>Options</b>	<i>client-list-name</i> —Name of the client list or prefix list.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 6115</a></li></ul>

## clients

---

<b>Syntax</b>	<pre>clients {     <i>address</i> &lt;restrict&gt;; }</pre>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
<b>Default</b>	If you omit the <b>clients</b> statement, all SNMP clients using this community string are authorized to access the switch.
<b>Options</b>	<i>address</i> —Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple <i>address</i> options.  <i>restrict</i> —(Optional) Do not allow the specified SNMP client to access the switch.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the SNMP Community String</a></li></ul>

---

## commit-delay

---

<b>Syntax</b>	<code>commit-delay <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit snmp nonvolatile]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the timer for the SNMP <b>Set</b> reply and start of the commit.
<b>Options</b>	<b><i>seconds</i></b> —Delay between an affirmative SNMP <b>Set</b> reply and start of the commit operation. <b>Default:</b> 5 seconds
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Commit Delay Timer</i></li></ul>

## community (SNMP)

---

**Syntax**    `community community-name {  
                  authorization authorization;  
                  client-list-name client-list-name;  
                  clients {  
                      address restrict;  
                  }  
                  view view-name;  
                  }`

**Hierarchy Level**    [edit snmp]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

**NOTE:** The **authorization read-write** option is not supported on the QFX3000 QFabric system.

---

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

**Default**    If you omit the **community** statement, all SNMP requests are denied.

**Options**    **community-name**—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring the SNMP Community String on page 6113](#)

## configuration

<b>Syntax</b>	<pre>configuration {   transfer-interval interval;   transfer-on-commit;   archive-sites {     file://&lt;path&gt;/&lt;filename&gt;;     ftp://username@host:&lt;port&gt;url-path password password;     http://username@host:&lt;port&gt;url-path password password;     pasvftp://username@host:&lt;port&gt;url-path password password;     scp://username@host:&lt;port&gt;url-path password password;   } }</pre>
<b>Hierarchy Level</b>	[edit system archival]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the router or switch to periodically transfer its currently active configuration (or after each commit).
<div>  <p><b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div>	
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1147</a></li> <li>• <a href="#">archive on page 6299</a></li> <li>• <a href="#">archive-sites on page 1151</a></li> <li>• <a href="#">transfer-interval on page 1154</a></li> <li>• <a href="#">transfer-on-commit on page 1155</a></li> </ul>

## connection-limit

---

<b>Syntax</b>	connection-limit <i>limit</i> ;
<b>Hierarchy Level</b>	[edit system services finger], [edit system services ftp], [edit system services netconf ssh], [edit system services ssh], [edit system services telnet], [edit system services xnm-clear-text], [edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).
<b>Options</b>	<b>limit</b> —(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4). <b>Range:</b> 1 through 250 <b>Default:</b> 75

**NOTE:** The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured connection-limit value if the system resources are limited.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li><li>• <i>Configuring DTCP-over-SSH Service for the Flow-Tap Application</i></li><li>• <i>Configuring Finger Service for Remote Access to the Router</i></li><li>• <i>Configuring FTP Service for Remote Access to the Router or Switch</i></li><li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1243</a></li><li>• <i>Configuring Telnet Service for Remote Access to a Router or Switch</i></li></ul>

## contact

---

<b>Syntax</b>	<code>contact <i>contact</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysContact</b> object, which is the contact person for the managed system.
<b>Options</b>	<b>contact</b> —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the System Contact on a Device Running Junos OS</i></li> </ul>

## disable (LLDP)

---

<b>Syntax</b>	<code>disable;</code>
<b>Hierarchy Level</b>	<code>[edit protocols <a href="#">lldp</a>],</code> <code>[edit protocols <a href="#">interface lldp</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disable the LLDP configuration on the switch or on one or more interfaces.
<b>Default</b>	If you do not configure LLDP, it is disabled on the switch and on specific switch interfaces.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show lldp on page 1362</a></li> <li>• <i>Configuring LLDP (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li> <li>• <a href="#">Configuring LLDP on page 1227</a></li> <li>• <a href="#">Understanding LLDP on page 1201</a></li> </ul>

## falling-threshold (Health Monitor)

---

<b>Syntax</b>	<code>falling-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<b><i>percentage</i></b> —Lower threshold for the alarm entry. <b>Range:</b> 1 through 100 <b>Default:</b> 70 percent of the maximum possible value
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">rising-threshold on page 1331</a></li><li>• <a href="#">Configuring Health Monitoring on page 6119</a></li></ul>

## filter-duplicates

---

<b>Syntax</b>	<code>filter-duplicates;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Filter duplicate <b>Get</b> , <b>GetNext</b> , or <b>GetBulk</b> SNMP requests.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding the Implementation of SNMP on the QFabric System on page 6023</a></li><li>• <a href="#">Example: Configuring SNMP on page 6083</a></li></ul>

## full-name

---

<b>Syntax</b>	<code>full-name <i>complete-name</i>;</code>
<b>Hierarchy Level</b>	[edit system login user]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the complete name of a user.
<b>Options</b>	<i>complete-name</i> —Full name of the user. If the name contains spaces, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS User Accounts</i></li> <li>• <i>user</i></li> <li>• <a href="#">user on page 306</a></li> </ul>

## health-monitor

---

<b>Syntax</b>	<pre>health-monitor {   falling-threshold <i>percentage</i>;   interval <i>seconds</i>;   rising-threshold <i>percentage</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure health monitoring.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Health Monitoring on page 6119</a></li> <li>• <a href="#">Understanding Health Monitoring on page 6037</a></li> </ul>

## hold-multiplier

---

<b>Syntax</b>	<code>hold-multiplier <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series.
<b>Description</b>	Specify the multiplier used in combination with the <a href="#">advertisement-interval</a> value to determine the length of time LLDP information is held before it is discarded. The default value is 4 (or 120 seconds).
<b>Default</b>	Disabled.
<b>Options</b>	<b><i>number</i></b> —A number used as a multiplier. <b>Range:</b> 2 through 10 <b>Default:</b> 4 (or 120 seconds)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1362</a></li><li>• <i>Configuring LLDP (CLI Procedure)</i></li><li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li><li>• <a href="#">Configuring LLDP on page 1227</a></li><li>• <a href="#">Understanding LLDP on page 1201</a></li></ul>

## idle-timeout (Access)

<b>Syntax</b>	<code>idle-timeout seconds;</code>
<b>Hierarchy Level</b>	<code>[edit access group-profile <i>profile-name</i> ppp],</code> <code>[edit access profile <i>profile-name</i> client <i>client-name</i> ppp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the idle timeout for a user. The router might consider a PPP session to be idle because of the following reasons:</p> <ul style="list-style-type: none"> <li>• There is no ingress traffic on the PPP session.</li> <li>• There is no egress traffic.</li> <li>• There is neither ingress or egress traffic on the PPP session.</li> <li>• There is no ingress or egress PPP control traffic. This is applicable only if keepalives are enabled.</li> </ul>
<b>Options</b>	<p><b>seconds</b>—Number of seconds a user can remain idle before the session is terminated.</p> <p><b>Range:</b> 0 through 4,294,967,295 seconds</p> <p><b>Default:</b> 0</p>
<div>  <b>NOTE:</b> The <code>[edit access]</code> hierarchy is not available on QFabric systems. </div>	
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Group Profile for Defining L2TP Attributes</i></li> <li>• <i>Configuring PPP Properties for a Client-Specific Profile</i></li> <li>• <i>Applying PPP Attributes to L2TP LNS Subscribers with a User Group Profile</i></li> </ul>

## interface (LLDP)

---

<b>Syntax</b>	<pre>interface (all   <i>interface-name</i>) {     disable;     power-negotiation {         disable;     } }</pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure Link Layer Discovery Protocol (LLDP) on all interfaces or on a specific interface.

**NOTE:** On EX4300 switches, LLDP cannot be configured on the me0 or vme interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

---

<b>Default</b>	None
<b>Options</b>	<p><b>all</b>—All interfaces on the switch.</p> <p><b><i>interface-name</i></b>—Name of a specific interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LLDP (CLI Procedure)</a></li><li>• <a href="#">Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</a></li><li>• <a href="#">Configuring LLDP on page 1227</a></li><li>• <a href="#">Understanding LLDP on page 1201</a></li></ul>

---

## interval (Health Monitor)

---

<b>Syntax</b>	interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the interval between sampling of the object being monitored by the health monitor.
<b>Options</b>	<p><i>seconds</i>—Time between samples, in seconds.</p> <p><b>Range:</b> 1 through 2147483647 seconds</p> <p><b>Default:</b> 300 seconds</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6119</a></li></ul>

## lldp

---

**Syntax**    `lldp {  
    advertisement-interval seconds;  
    disable;  
    hold-multiplier number;  
    interface (all | [interface-name]) {  
        disable;  
        power-negotiation {  
            disable;  
        }  
    }  
    lldp-configuration-notification-interval seconds;  
    management-address ip-management-address;  
    netbios-snooping;  
    ptopo-configuration-maximum-hold-time seconds;  
    ptopo-configuration-trap-interval seconds;  
    traceoptions {  
        file filename <files number> <size size> <world-readable | no-world-readable>  
        <no-stamp> <replace>;  
        flag flag <disable>;  
    }  
    transmit-delay seconds;  
}`

**Hierarchy Level**    [edit protocols]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for QFX Series.

**Description**    Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as to receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

**NOTE:** The `transmit-delay` and `netbios-snooping` options are not available on QFabric systems.

---

**NOTE:** On EX4300 switches, LLDP cannot be configured on the `me0` or `vme` interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

---

<b>Default</b>	LLDP is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show lldp on page 1362</a></li> <li>• <i>Configuring LLDP (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li> <li>• <a href="#">Configuring LLDP on page 1227</a></li> <li>• <a href="#">Understanding LLDP on page 1201</a></li> </ul>

## lldp-configuration-notification-interval

---

<b>Syntax</b>	lldp-configuration-notification-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify how often SNMP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, trap notifications of database changes are disabled.
<b>Default</b>	SNMP trap notifications of LLDP database changes are disabled.
<b>Options</b>	<b>seconds</b> —Interval between trap notifications about LLDP database changes. <b>Range:</b> 0 through 3600
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show lldp on page 1362</a></li> </ul>

## location

---

<b>Syntax</b>	<code>location location;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysLocation</b> object, which is the physical location of the managed system.
<b>Options</b>	<b>location</b> —Location of the local system. You must enclose the name within quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the System Location for a Device Running Junos OS</i></li></ul>

## management-address

---

<b>Syntax</b>	<code>management-address ip-management-address;</code>
<b>Hierarchy Level</b>	[edit protocols <b>lldp</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the management address of the switch to be used in the LLDP Management type, length, and value (TLV) .
<b>Default</b>	LLDP Management TLV uses the IP address of the switch's management Ethernet interface ( <b>me0</b> ) or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis.
<b>Options</b>	<b>ip-management-address</b> —You can specify either an IPv4 or IPv6 management address for the switch.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1362</a></li><li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li><li>• <i>EX Series Switches Interfaces Overview</i></li><li>• <a href="#">Understanding LLDP on page 1201</a></li></ul>

## name

---

<b>Syntax</b>	<code>name <i>name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the system name from the command-line interface.
<b>Options</b>	<i>name</i> —System name override.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the System Name</i></li> </ul>

## nas-ip-address

---

<b>Syntax</b>	<code>nas-ip-address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the NAS-IP address for outgoing RADIUS packets.
<b>Options</b>	<i>ip-address</i> —IP address of the network access server (NAS) that requests user authentication.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Authentication</i></li> <li>• <a href="#">Configuring RADIUS Authentication on page 1233</a></li> </ul>

## nonvolatile

---

<b>Syntax</b>	<code>nonvolatile {     <a href="#">commit-delay</a> <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure options for SNMP <b>Set</b> requests.  The statement is explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Commit Delay Timer</i></li><li>• <i>commit-delay</i></li></ul>

## oid

---

<b>Syntax</b>	<code>oid <i>object-identifier</i> (exclude include);</code>
<b>Hierarchy Level</b>	[edit snmp view <i>view-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify an object identifier (OID) used to represent a subtree of MIB objects.
<b>Options</b>	<b>exclude</b> —Exclude the subtree of MIB objects represented by the specified OID.  <b>include</b> —Include the subtree of MIB objects represented by the specified OID.  <b>object-identifier</b> —OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MIB Views on page 6116</a></li></ul>

## order

---

<b>Syntax</b>	<code>order (radius   [ <i>accounting-order-data-list</i> ] );</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending accounting messages and updates.
<b>Default</b>	No order specified
<b>Options</b>	<p><b>radius</b>—RADIUS accounting for specified subscribers.</p> <p><b>[ <i>accounting-order-data-list</i> ]</b>— Set of data listing the authentication order to be used, enclosed by brackets. This can be any combination of the authentication methods, up to and including a full list of the entire authentication order.</p>

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li> <li>• <i>Configuring RADIUS Accounting</i></li> </ul>

## port (RADIUS Server)

---

<b>Syntax</b>	<code>port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit system radius-server <i>address</i> ], [edit system accounting destination radius server <i>address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the port number on which to contact the RADIUS server.
<b>Options</b>	<i>number</i> —Port number on which to contact the RADIUS server. <b>Default:</b> 1812 (as specified in RFC 2865)

**NOTE:** The [edit system accounting] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Authentication</i></li><li>• <a href="#">Configuring RADIUS Authentication on page 1233</a></li></ul>

## profile

**Syntax**    `profile profile-name {`  
                   `accounting {`  
                     `accounting-stop-on-access-deny;`  
                     `accounting-stop-on-failure;`  
                     `order ( radius | [ accounting-order-data-list ] );`  
                   `}`  
                   `authentication-order [ authentication-method ];`  
                   `radius {`  
                     `accounting-server [ server-addresses ];`  
                     `authentication-server [ server-addresses ];`  
                   `}`  
                   `}`

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                               Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

**Default**    Not enabled

**Options**    *profile-name*—Profile name of up to 32 characters.  
                   The remaining statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                   admin-control—To add this statement to the configuration.

**Related Documentation**    • *Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch*

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure protocols.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

- Related Documentation**
- [Junos OS Routing Protocols Configuration Guide](#)

## protocol-version

---

<b>Syntax</b>	<code>protocol-version <i>version</i>;</code>
<b>Hierarchy Level</b>	[edit system services ssh]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the secure shell (SSH) protocol version.
<b>Default</b>	v2—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.
<b>Options</b>	<i>version</i> —SSH protocol version: v1, v2, or both.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the SSH Protocol Version on page 1244</a></li> </ul>

## ptopo-configuration-maximum-hold-time

---

<b>Syntax</b>	<code>ptopo-configuration-maximum-hold-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure how long to maintain the physical topology database entries. The physical topology identifies the devices on the network and their physical interconnections.
<b>Options</b>	<i>seconds</i> —Time to maintain physical topology database entries. <b>Default:</b> 300 <b>Range:</b> 1 through 2147483647
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show lldp on page 1362</a></li> <li>• <a href="#">Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</a></li> <li>• <a href="#">Understanding LLDP on page 1201</a></li> </ul>

## ptopo-configuration-trap-interval

---

<b>Syntax</b>	<code>ptopo-configuration-trap-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify how often SNMP trap notifications are sent regarding changes in physical topology global statistics.
<b>Default</b>	SNMP trap notifications of changes in physical topology global statistics are disabled.
<b>Options</b>	<b><i>seconds</i></b> —Interval between SNMP trap notifications about physical topology global statistics. <b>Range:</b> 0 through 3600
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.

## radius

<b>Syntax</b>	radius { accounting-server [server-addresses]; authentication-server [server-addresses]; }
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple <b>radius</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p> <p>The statements are explained separately.</p>
<div>  <b>NOTE:</b> The [edit access] hierarchy is not available on QFabric systems.         </div>	
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li> <li>• <i>Filtering 802.1X Supplicants Using RADIUS Server Attributes</i></li> <li>• <i>Configuring RADIUS Accounting</i></li> </ul>

## radius-options (edit system)

---

<b>Syntax</b>	<pre>radius-options {   attributes {     nas-ip-address <i>ip-address</i>;   }   password-protocol <i>mschap-v2</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
	<div> <b>NOTE:</b> The <code>radius-options</code> statement is not available on QFabric systems.</div>
<b>Description</b>	Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.
<b>Options</b>	<p><b><code>nas-ip-address <i>ip-address</i></code></b>—IP address of the network access server (NAS) that requests user authentication.</p> <p><b><code>password-protocol <i>mschap-v2</i></code></b>—Protocol MS-CHAPv2, used for password authentication and password changing.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Authentication</a></li><li>• <a href="#">Configuring RADIUS Authentication on page 1233</a></li></ul>

## radius-server

<b>Syntax</b>	<pre>radius-server server-address {     accounting-port port-number;     port number;     retry number;     secret password;     source-address source-address;     timeout seconds; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure a RADIUS server for Point-to-Point Protocol (PPP).</p> <p>To configure multiple RADIUS servers, include multiple <b>radius-server</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p>
<b>Options</b>	<p><b>server-address</b>—Address of the RADIUS authentication server.</p> <p>The remaining statements are explained separately.</p>
<div>  <b>NOTE:</b> The <b>accounting-port</b> and <b>source-address</b> options are not available on QFabric systems.         </div>	
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Authentication on page 1233</a></li> <li>• <a href="#">accounting-port on page 223</a></li> <li>• <a href="#">port on page 1308</a></li> <li>• <a href="#">retry on page 275</a></li> <li>• <a href="#">secret on page 279</a></li> <li>• <a href="#">source-address on page 282</a></li> <li>• <a href="#">timeout on page 296</a></li> </ul>

## rate-limit

---

<b>Syntax</b>	<code>rate-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit system services finger], [edit system services ftp], [edit system services netconf ssh], [edit system services ssh], [edit system services telnet], [edit system services xnm-clear-text], [edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.
<b>Default</b>	150 connections
<b>Options</b>	<b>rate-limit <i>limit</i></b> —(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6). <b>Range:</b> 1 through 250 <b>Default:</b> 150
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li></ul>

## remote-debug-permission

<b>Syntax</b>	remote-debug-permission (qfabric-admin   qfabric-operator   qfabric-user);
<b>Hierarchy Level</b>	[edit system login user <i>username</i> authentication] [edit system root-authentication]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	(QFabric systems only) Configure authentication classes that permit or deny user access to individual components of the QFabric system.
<b>Default</b>	qfabric-user
<b>Options</b>	<p><b>qfabric-admin</b>—Permits a user to log in to individual QFabric system components, view operations, and change component configurations.</p> <p><b>qfabric-operator</b>—Permits a user to log in to individual QFabric system components and view component operations.</p> <p><b>qfabric-user</b>—Prevents a user from logging in to individual QFabric system components.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring QFabric System Login Classes</i></li> <li>• <a href="#">request component login on page 1356</a></li> <li>• <i>Understanding QFabric System Login Classes</i></li> </ul>

## retry

---

<b>Syntax</b>	<code>retry number;</code>
<b>Hierarchy Level</b>	[edit system radius server <i>server-address</i> ], [edit system accounting destination radius server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.
<b>Options</b>	<i>number</i> —Number of retries allowed for contacting a RADIUS server. <b>Range:</b> 1 through 10 <b>Default:</b> 3

**NOTE:** The [edit system accounting] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Authentication on page 1233</a></li><li>• <a href="#">Configuring RADIUS Accounting</a></li><li>• <a href="#">timeout on page 296</a></li></ul>

---

## rising-threshold (Health Monitor)

---

<b>Syntax</b>	<code>rising-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<p><b><i>percentage</i></b>—Upper threshold for the alarm entry.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 80 percent of the maximum possible value</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6119</a></li><li>• <a href="#">falling-threshold on page 1296</a></li></ul>

## root-login

---

<b>Syntax</b>	root-login (allow   deny   deny-password);
<b>Hierarchy Level</b>	[edit system services ssh]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Control user access through SSH.
<b>Default</b>	Allow user access through SSH.
<b>Options</b>	<b>allow</b> —Allow users to log in to the router or switch as root through SSH. <b>deny</b> —Disable users from logging in to the router or switch as root through SSH. <b>deny-password</b> —Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Root Login Through SSH on page 1244</a></li></ul>

---

## services (Switches)

---

**Syntax**

```
services {
 service-deployment {
 servers address {
 port-number port-number;
 }
 source-address address;
 }
 ssh {
 connection-limit limit;
 protocol-version [v1 v2];
 rate-limit limit;
 root-login (allow | deny | deny-password);
 }
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the switch so that users on remote systems can access the local switch through SSH.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## source-address (SNMP)

---

<b>Syntax</b>	source-address <i>address</i> ;
<b>Hierarchy Level</b>	[edit snmp trap-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.
<b>Options</b>	<p><b>address</b>—Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b>.</p> <p><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.)</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Source Address for SNMP Traps</i></li></ul>

## ssh

<b>Syntax</b>	<pre>ssh {   ciphers [ <i>cipher-1 cipher-2 cipher-3 ...</i>];   client-alive-count-max <i>seconds</i>;   client-alive-interval <i>seconds</i>;   connection-limit <i>limit</i>;   hostkey-algorithm &lt;<i>algorithm</i> no-<i>algorithm</i>&gt;;   key-exchange &lt;<i>algorithm</i>&gt;;   macs &lt;<i>algorithm</i>&gt;;   max-sessions-per-connection &lt;<i>number</i>&gt;;   no-tcp-forwarding;   protocol-version [<i>v1 v2</i>];   rate-limit <i>limit</i>;   root-login (<i>allow</i>   <i>deny</i>   <i>deny-password</i>); }</pre>
<b>Hierarchy Level</b>	[edit system services]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>client-alive-interval</b> and <b>client-alive-max-count</b> statements introduced in Junos OS Release 12.2.</p>
<b>Description</b>	<p>Allow SSH requests from remote systems to the local router or switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1243</a></li> </ul>

## tacplus-options

---

<b>Syntax</b>	<pre>tacplus-options {   (exclude-cmd-attribute   no-cmd-attribute-value);   service-name <i>service-name</i>;   timestamp-and-timezone; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Options for <b>no-cmd-attribute-value</b> and <b>exclude-cmd-attribute</b> introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Option for <b>timestamp-and-timezone</b> introduced in Junos OS Release 12.2.</p>
<b>Description</b>	Configure TACACS+ options for authentication and accounting.
<b>Options</b>	<p><b>exclude-cmd-attribute</b>—Exclude the <b>cmd</b> attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>no-cmd-attribute-value</b>—Set the <b>cmd</b> attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>service-name <i>service-name</i></b>—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.</p> <p><b>Default:</b> junos-exec</p> <p><b>timestamp-and-timezone</b>—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

---

## targets

---

<b>Syntax</b>	<code>targets {     <i>address</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure one or more systems to receive SNMP traps.
<b>Options</b>	<b><i>address</i></b> —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6114</a></li></ul>

## traceoptions (LLDP)

---

**Syntax**    `traceoptions {  
              file filename <files number> <size size> <world-readable | no-world-readable> <no-stamp>  
              <replace>;  
              flag flag <disable>;  
          }`

**Hierarchy Level**    [edit protocols [lldp](#)]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.

**NOTE:** The traceoptions statement is not supported on the QFX3000 QFabric system.

**Default**    Tracing operations are disabled.

**Options**    **file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **configuration**—Trace configuration operations.
- **interface**—Trace interface update events.
- **netbios**—Trace NetBIOS events.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.

- **vlan**—Trace VLAN update events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending output to it.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**world-readable**—(Optional) Enable unrestricted file access.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

## transfer-interval (Configuration)

---

<b>Syntax</b>	<code>transfer-interval <i>interval</i>;</code>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to periodically transfer its currently active configuration to an archive site.

**NOTE:** The `edit system archival` hierarchy is not available on QFabric systems.

---

**Options** *interval*—Interval at which to transfer the current configuration to an archive site.  
**Range:** 15 through 2880 minutes

**NOTE:** The `[edit system archival]` hierarchy is not available on QFabric systems.

---

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1147](#)
- [archive on page 6299](#)
- [configuration on page 1153](#)
- [transfer-on-commit on page 1155](#)

## transfer-on-commit

<b>Syntax</b>	transfer-on-commit;
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path" .

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1148</a></li> <li>• <a href="#">archive on page 6299</a></li> <li>• <a href="#">configuration on page 1153</a></li> <li>• <a href="#">transfer-interval on page 1154</a></li> </ul>

## trap-group

---

<b>Syntax</b>	<pre>trap-group <i>group-name</i> {     categories {         <i>category</i>;     }     destination-port <i>port-number</i>;     routing-instance <i>instance</i>;     targets {         <i>address</i>;     }     version (all   v1   v2); }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
<b>Options</b>	<p><b><i>group-name</i></b>—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring SNMP Trap Groups</i></li></ul>

## trap-options

---

<b>Syntax</b>	<pre>trap-options {   agent-address outgoing-interface;   source-address address; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring SNMP Trap Options</i></li> </ul>

## user (Access)

---

**Syntax**    `user username {  
              authentication {  
                  (encrypted-password "password" | plain-text-password);  
                  load-key-file URL;  
                  remote-debug-permission (qfabric-admin | qfabric-operator | qfabric-user);  
                  ssh-dsa "public-key" <from hostname>;  
                  ssh-rsa "public-key" <from hostname>;  
              }  
              class class-name;  
              full-name "complete-name";  
              uid uid-value;  
          }`

**Hierarchy Level**    [edit system login]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure access permission for individual users.

**Options**    The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

**Related Documentation**

## version

---

<b>Syntax</b>	version (all   v1   v2);
<b>Hierarchy Level</b>	[edit snmp trap-group <i>group-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the version number of SNMP traps.
<b>Default</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
<b>Options</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.  v1—Send SNMPv1 traps only.  v2—Send SNMPv2 traps only.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6114</a></li></ul>

# Administration

- [Routine Monitoring on page 1351](#)
- [Monitoring Commands on page 1352](#)

## Routine Monitoring

---

- [Monitoring SNMP on page 1351](#)

### Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

```
Alarm
```

Index	Variable description	Value	State
32768	Health Monitor: root file system utilization jnxHrStoragePercentUsed.1	58	active
32769	Health Monitor: /config file system utilization jnxHrStoragePercentUsed.2	0	active
32770	Health Monitor: RE 0 CPU utilization jnxOperatingCPU.9.1.0.0	0	active
32773	Health Monitor: RE 0 Memory utilization jnxOperatingBuffer.9.1.0.0	35	active
32775	Health Monitor: jkernel daemon CPU utilization Init daemon	0	active

Chassis daemon	50 active
Firewall daemon	0 active
Interface daemon	5 active
SNMP daemon	11 active
MIB2 daemon	42 active
...	

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0 = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0 = 24444184
sysContact.0 = J Smith
sysName.0 = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

SNMP statistics:

Input:

```
Packets: 0, Bad versions: 0, Bad community names: 0,
Bad community uses: 0, ASN parse errors: 0,
Too bigs: 0, No such names: 0, Bad values: 0,
Read onlys: 0, General errors: 0,
Total request varbinds: 0, Total set varbinds: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,
Get responses: 0, Traps: 0,
Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
Throttle drops: 0, Duplicate request drops: 0
```

Output:

```
Packets: 0, Too bigs: 0, No such names: 0,
Bad values: 0, General errors: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,
Get responses: 0, Traps: 0
```

### Sample Output

#### clear lldp statistics

```
user@switch> clear lldp statistics
```

#### clear lldp statistics interface

```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

## request component login

<b>Syntax</b>	<code>request component login <i>component-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	(QFabric systems only) Log in to a QFabric system component. To gain access to individual components by way of the <b>request component login</b> command, you must first provide the <b>qfabric-admin</b> or <b>qfabric-operator</b> class privilege to your user (for more information, see: <a href="#">remote-debug-permission</a> ).
<b>Options</b>	<b><i>component-name</i></b> —Specify the QFabric system component to which you wish to log in.
<b>Required Privilege Level</b>	admin
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring QFabric System Login Classes</i></li> <li>• <a href="#">remote-debug-permission on page 1329</a></li> <li>• <i>Understanding QFabric System Login Classes</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request component login (with qfabric-admin Privileges) on page 1356</a> <a href="#">request component login (with qfabric-operator Privileges) on page 1357</a> <a href="#">request component login (with qfabric-user Privileges) on page 1357</a>

## Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

### request component login (with qfabric-admin Privileges)

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
qfabric-admin@node-ee3093> ?
Possible completions:
clear Clear information in the system
file Perform file operations
help Provide help information
load Load information from file
monitor Show real-time debugging information
mtrace Trace multicast path from source to receiver
op Invoke an operation script
ping Ping remote target
quit Exit the management session
request Make system-level requests
restart Restart software process
save Save information to file
set Set CLI properties, date/time, craft interface message
show Show system information
ssh Start secure shell on another host
start Start shell
```

```

telnet Telnet to another host
test Perform diagnostic debugging
traceroute Trace route to remote host{master}
qfabric-admin@node-ee3093>

```

#### request component login (with qfabric-operator Privileges)

```

operator@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.

<b>Output Fields</b>	<a href="#">Table 111 on page 1358</a> lists the output fields for the <b>show ethernet-switching interfaces</b> command. Output fields are listed in the approximate order in which they appear.

**Table 111: show ethernet-switching interfaces Output Fields**

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of a switching interface.	All levels
<b>State</b>	Interface state. Values are <b>up</b> or <b>down</b> .	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>VLAN members</b>	Name of a VLAN.	none, <b>brief</b> , <b>detail</b> , <b>summary</b>

Table 111: show ethernet-switching interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Blocking</b>	Forwarding state of the interface: <ul style="list-style-type: none"> <li>• <b>blocked</b>—Traffic is not being forwarded on the interface.</li> <li>• <b>unblocked</b>—Traffic is forwarded on the interface.</li> <li>• <b>MAC limit exceeded</b>—The interface is temporarily disabled because of a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>MAC move limit exceeded</b>—The interface is temporarily disabled because of a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control in effect</b> —The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control shutdown in effect</b> —The interface is temporarily disabled because of a storm control shutdown error. The disabled interface is automatically restored to service when the disable timeout expires.</li> </ul>	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Index</b>	VLAN index internal to Junos OS software.	<b>detail</b>
<b>untagged   tagged</b>	Specifies whether the interface forwards IEEE802.1Q-tagged or untagged traffic.	<b>detail</b>

## Sample Output

### show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces
```

```

Interface State VLAN members Blocking
xe-0/0/0.0 up T1122 unblocked
xe-0/0/1.0 down default - MAC limit exceeded
xe-0/0/2.0 down default - MAC move limit exceeded
xe-0/0/3.0 down default - Storm control in effect
xe-0/0/4.0 down default unblocked
xe-0/0/5.0 down default unblocked
xe-0/0/6.0 down default unblocked
xe-0/0/7.0 down default unblocked
xe-0/0/8.0 down default unblocked
xe-0/0/9.0 up T111 unblocked
xe-0/0/10.0 down default unblocked
xe-0/0/11.0 down default unblocked
xe-0/0/12.0 down default unblocked
xe-0/0/13.0 down default unblocked
xe-0/0/14.0 down default unblocked
xe-0/0/15.0 down default unblocked
xe-0/0/16.0 down default unblocked
xe-0/0/17.0 down default unblocked
xe-0/0/18.0 down default unblocked
xe-0/0/19.0 up T111 unblocked
xe-0/1/0.0 down default unblocked
xe-0/1/1.0 down default unblocked
xe-0/1/2.0 down default unblocked
xe-0/1/3.0 down default unblocked

```

### show ethernet-switching interfaces summary

```
user@switch> show ethernet-switching interfaces summary
xe-0/0/0.0
xe-0/0/1.0
xe-0/0/2.0
xe-0/0/3.0
xe-0/0/8.0
xe-0/0/10.0
xe-0/0/11.0
```

### show ethernet-switching interfaces brief

```
user@switch> show ethernet-switching interfaces brief
Interface State VLAN members Blocking
xe-0/0/0.0 down default unblocked
xe-0/0/1.0 down employee-vlan unblocked
xe-0/0/2.0 down employee-vlan unblocked
xe-0/0/3.0 down employee-vlan unblocked
xe-0/0/8.0 down employee-vlan unblocked
xe-0/0/10.0 down default unblocked
xe-0/0/11.0 down employee-vlan unblocked
```

### show ethernet-switching interfaces detail

```
user@switch> show ethernet-switching interfaces detail
Interface: xe-0/0/0.0 Index: 65
State: down
VLANs:
 default untagged unblocked

Interface: xe-0/0/1.0 Index: 66
State: down
VLANs:
 employee-vlan untagged unblocked

Interface: xe-0/0/2.0 Index: 67
State: down
VLANs:
 employee-vlan untagged unblocked

Interface: xe-0/0/3.0 Index: 68
State: down
VLANs:
 employee-vlan untagged unblocked

Interface: xe-0/0/8.0 Index: 69
State: down
VLANs:
 employee-vlan untagged unblocked

Interface: xe-0/0/10.0 Index: 70
State: down
VLANs:
 default untagged unblocked

Interface: xe-0/0/11.0 Index: 71
State: down
VLANs:
 employee-vlan tagged unblocked
```

**show ethernet-switching interfaces interface-name**

```
user@switch> show ethernet-switching interfaces xe-0/0/0.0
 Interface State VLAN members Blocking
xe-0/0/0.0 down default unblocked
```

## show lldp

---

**Syntax**    `show lldp`  
              `<detail>`

**Release Information**    Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol–Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

**NOTE:** LLDP-MED is not available on the QFX Series.

---

**Options**    **none**—Display LLDP information for all interfaces.  
  
              **detail**—(Optional) Display detailed LLDP information for all interfaces.

**NOTE:** **fast-start** is not available on the QFX Series.

---

**Required Privilege Level**    view

**List of Sample Output**    [show lldp on page 1365](#)  
                                  [show lldp detail on page 1365](#)

**Output Fields**    [Table 112 on page 1363](#) lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 112: show lldp Output Fields

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .  <b>NOTE:</b> If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as <b>disabled</b> .	All levels
Advertisement interval	Frequency, in seconds, at which LLDP advertisements are sent.  This value is set by the <b>advertisement-interval</b> configuration statement.	All levels
Transmit delay	Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.  This value is set by the <b>transmit-delay</b> configuration statement.	All levels
Hold timer	Multiplier used in combination with the <b>advertisement-interval</b> value to determine the length of time LLDP information is held before it is discarded.  This value is set by the <b>hold-multiplier</b> configuration statement.	All levels
Notification interval	How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications of database changes are disabled.  This value is set by the <b>lldp-configuration-notification-interval</b> configuration statement.	All levels
Config Trap Interval	How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications of topology changes are disabled.  This value is set by the <b>ptopo-configuration-trap-interval</b> configuration statement.	All levels
Connection Hold timer	Amount of time the system maintains dynamic topology entries.  This value is set by the <b>ptopo-configuration-maximum-hold-time</b> configuration statement.	All levels
LLDP-MED	LLDP-MED operating state. The state can be <b>enabled</b> or <b>disabled</b> .	All levels
MED fast start count	Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second.  This value is set by the <b>fast-start</b> configuration statement.	All levels
Interface	Name of the interface for which LLDP configuration information is being reported.	All levels
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.	All levels

Table 112: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>LLDP</b>	LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .	All levels
<b>Power Negotiation</b>	LLDP power negotiation operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Neighbor count</b>	Total number of new LLDP neighbors detected since the last switch reboot.	<b>detail</b>
<b>Interface</b>	Name of the interface that is advertising VLAN information.	All levels
<b>Vlan-id</b>	VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.	<b>detail</b>
<b>Vlan-name</b>	VLAN name associated with the VLAN ID.	<b>detail</b>
<b>LLDP basic TLVs supported</b>	<p>Basic TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>Chassis identifier</b>—TLV that advertises the MAC address associated with the local system.</li> <li>• <b>Port identifier</b>—TLV that advertises the port identification for the specified port in the local system.</li> <li>• <b>Port description</b>—Interface name for the port.</li> <li>• <b>System name</b>—TLV that advertises the user-configured name of the local system.</li> <li>• <b>System description</b>—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable.</li> <li>• <b>System capabilities</b>—TLV that advertises the primary functions performed by the system—for example, bridge or router.</li> <li>• <b>Management address</b>—TLV that advertises the IP management address of the local system.</li> </ul>	<b>detail</b>
<b>Supported LLDP 802 TLVs</b>	<p>802.3 TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>MAC/PHY configuration status</b>—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable.</li> <li>• <b>Power via MDI</b>—TLV that advertises MDI power support, PSE power pair, and power class information.</li> <li>• <b>Link aggregation</b>—TLV that advertises if the interface is aggregated and its aggregated interface ID.</li> <li>• <b>Maximum frame size</b>—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames.</li> <li>• <b>Port VLAN tag</b>—TLV that advertises the VLAN tag configured on the interface.</li> <li>• <b>Port VLAN name</b>—TLV that advertises the VLAN name configured on the interface.</li> </ul>	<b>detail</b>

Table 112: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Supported LLDP MED TLVs</b>	<p>LLDP-MED TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>LLDP MED capabilities</b>—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15: <ul style="list-style-type: none"> <li>• 0—Capabilities</li> <li>• 1—Network Policy</li> <li>• 2—Location Identification</li> <li>• 3—Extended Power via MDI-PSE</li> <li>• 4—Inventory</li> <li>• 5–15—Reserved</li> </ul> </li> <li>• <b>Network policy</b>—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points.</li> <li>• <b>Endpoint location</b>—TLV that advertises the physical location of the endpoint.</li> <li>• <b>Extended power Via MDI</b>—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.</li> </ul>	<b>detail</b>

## Sample Output

### show lldp

```

user@switch> show lldp
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 4 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds

LLDP MED : Disabled
MED fast start count : 3 Packets

```

Interface	Parent Interface	LLDP	LLDP-MED	Power Negotiation
all	-	Enabled	Enabled	Enabled

### show lldp detail

```

user@switch> show lldp detail
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 4 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds

LLDP MED : Disabled
MED fast start count : 3 Packets

```

Interface	Parent Interface	LLDP	LLDP-MED	Power Negotiation
Neighbor count				
all	-	Enabled	Enabled	Enabled
8				

Interface	Parent Interface	Vlan-id	Vlan-name
xe-3/0/0.0	ae31.0	100	v100
xe-3/0/0.0	ae31.0	101	v101
xe-3/0/0.0	ae31.0	4000	v4000
xe-3/0/1.0	ae31.0	100	v100
xe-3/0/1.0	ae31.0	101	v101
xe-3/0/1.0	ae31.0	4000	v4000
xe-3/0/2.0	ae31.0	100	v100
xe-3/0/2.0	ae31.0	101	v101
xe-3/0/2.0	ae31.0	4000	v4000

LLDP basic TLVs supported:

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

Supported LLDP 802 TLVs:

MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port VLAN name.

Supported LLDP MED TLVs:

LLDP MED capabilities, Network policy, Endpoint location, Extended power Via MDI.

## show lldp local-information

<b>Syntax</b>	show lldp local-information
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the information that the switch provides in Link Layer Discovery Protocol (LLDP) advertisements to its neighbors.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring LLDP (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li> <li>• <a href="#">management-address on page 1304</a></li> <li>• <a href="#">Configuring LLDP on page 1227</a></li> <li>• <a href="#">Understanding LLDP on page 1201</a></li> </ul>

xe-3/0/7.0	ae31.0	581	xe-3/0/7.0	Up	Disabled

## show lldp neighbors

**Syntax** <show lldp *neighbors*>  
<interface *interface-ids*>

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display learned information about Link Layer Discovery Protocol (LLDP) on all neighboring interfaces or on selected interfaces.

**Options** **none**—Display learned LLDP information on all neighboring interfaces and devices.

**interface *interface-ids***—(Optional) Display learned LLDP information on the selected interfaces or devices.

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors in order to interoperate with a wider variety of converged network adapters (CNAs). As a result, information for those ports will not be listed in the output for this command.

**Output Fields** [Table 114 on page 1369](#) lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 114: show lldp neighbors Output Fields**

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.
Chassis ID	List of chassis identifiers for neighbors.
Port info	List of port information gathered from neighbors. This could be the port identifier or port description.
System name	List of system names gathered from neighbors.

Table 114: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
<b>LLDP Neighbor Information</b>	Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).
<b>Local Information</b>	Information about the local system (appears when the <b>interface</b> option is used).
<b>Index</b>	Local interface index (appears when the <b>interface</b> option is used).
<b>Time to live</b>	Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).
<b>Time mark</b>	Date and timestamp of information (appears when the <b>interface</b> option is used).
<b>Local Interface</b>	Name of the local physical interface (appears when the <b>interface</b> option is used).
<b>Parent Interface</b>	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).
<b>Local Port ID</b>	Local interface SNMP index (appears when the <b>interface</b> option is used).
<b>Ageout Count</b>	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the <b>interface</b> option is used).
<b>Neighbor Information</b>	Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).
<b>Chassis type</b>	Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).
<b>Chassis ID</b>	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).
<b>Port type</b>	Type of port identifier supplied, such as <b>locally assigned</b> (appears when the <b>interface</b> option is used).
<b>Port ID</b>	Port identifier of the port type listed (appears when the <b>interface</b> option is used).
<b>Port description</b>	Port description (appears when the <b>interface</b> option is used).
<b>System name</b>	Name supplied by the system on the interface (appears when the <b>interface</b> option is used).
<b>System Description</b>	Description supplied by the system on the interface (appears when the <b>interface</b> option is used).

Table 114: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
System capabilities	Capabilities (such as <b>Bridge</b> , <b>Router</b> , and <b>Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).
Management Info	<p>Details of management information: <b>Type</b> (such as <b>ipv4</b> or <b>ipv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li>• <b>ifindex(2)</b>—IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a virtual chassis) is used to manage the switch.</li> <li>• <b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul>
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include <b>Media endpoint class</b> (such as Class 3 for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , or <b>MED Model name</b> .
Organization Info	One or more entries listing remote information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).
Age	How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Local Interface	Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Chassis ID	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Port description	Port description (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
System name	NetBIOS name of the host (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).

## Sample Output

### show lldp neighbors

```
user@switch> show lldp neighbors
```

## show route instance

<b>Syntax</b>	show route instance <brief   detail   summary> <instance-name> <operational>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	(QFabric systems only) Display routing instance information.
<b>Options</b>	<p><b>none</b>—(Same as <b>brief</b>) Display standard information about all routing instances.</p> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to <b>brief</b>. (These options are not available with the <b>operational</b> keyword.)</p> <p><b>instance-name</b>—(Optional) Display information for a specified routing instance.</p> <p><b>operational</b>—(Optional) Display operational routing instances.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route instance on page 1376</a> <a href="#">show route instance detail on page 1376</a> <a href="#">show route instance operational on page 1377</a> <a href="#">show route instance summary on page 1377</a>
<b>Output Fields</b>	<a href="#">Table 116 on page 1375</a> lists the output fields for the <b>show route instance</b> command. Output fields are listed in the approximate order in which they appear.

**Table 116: show route instance Output Fields**

Field Name	Field Description	Level of Output
Instance or <i>instance-name</i>	Name of the routing instance.	All levels
Operational Routing Instances	( <b>operational</b> keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: <b>forwarding</b> or <b>virtual-router</b> .	All levels
State	State of the routing instance: <b>active</b> or <b>inactive</b> .	<b>detail</b>
Interfaces	Name of interfaces belonging to this routing instance.	<b>detail</b>
Tables	Tables (and number of routes) associated with this routing instance.	<b>detail</b>
Router ID	Identifier for the router.	<b>detail</b>

Table 116: show route instance Output Fields (*continued*)

Field Name	Field Description	Level of Output
Primary RIB	Primary table for this routing instance.	<b>brief none summary</b>
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

## show snmp statistics

<b>Syntax</b>	show snmp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear snmp statistics on page 6375</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show snmp statistics on page 1382</a>
<b>Output Fields</b>	<a href="#">Table 117 on page 1379</a> describes the output fields for the <b>show snmp statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 117: show snmp statistics Output Fields

Field Name	Field Description
<b>Input</b>	<p>Information about received packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets(snmplnPkts)</b>—Total number of messages delivered to the SNMP entity from the transport service.</li> <li>• <b>Bad versions—(snmplnBadVersions)</b> Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version.</li> <li>• <b>Bad community names—(snmplnBadCommunityNames)</b> Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity.</li> <li>• <b>Bad community uses—(snmplnBadCommunityUses)</b> Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.</li> <li>• <b>ASN parse errors—(snmplnASNParseErrs)</b> Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.</li> <li>• <b>Too big—(snmplnTooBigs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmplnNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmplnBadValues)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>Read only—(snmplnReadOnlys)</b> Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of <b>readOnly</b>. Only incorrect implementations of SNMP generate this error.</li> </ul>

Table 117: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> <li>• <b>General errors—(snmpInGenErrs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Total requests varbinds—(snmpInTotalReqVars)</b> Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP <b>GetRequest</b> and <b>GetNext</b> PDUs.</li> <li>• <b>Total set varbinds—(snmpInSetVars)</b> Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP <b>SetRequest</b> PDUs.</li> <li>• <b>Get requests—(snmpInGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get nexts—(snmpInGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Set requests—(snmpInSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get responses—(snmpInGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Traps—(snmpInTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> <li>• <b>Silent drops—(snmpSilentDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests.</li> <li>• <b>Proxy drops—(snmpProxyDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned.</li> <li>• <b>Commit pending drops</b>—Number of SNMP packets for <b>Set</b> requests dropped because of a previous pending SNMP <b>Set</b> request on the committed configuration.</li> <li>• <b>Throttle drops</b>—Number of SNMP packets for any requests dropped reaching the throttle limit.</li> </ul>

Table 117: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> <li>• <b>Unknown security models—(snmpUnknownSecurityModels)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine.</li> <li>• <b>Invalid messages—(snmpInvalidMsgs)</b> Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message.</li> <li>• <b>Unknown pdu handlers—(snmpUnknownPDUHandlers)</b> Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type.</li> <li>• <b>Unavailable contexts—(snmpUnavailableContexts)</b> Number of requests received for a context that is known to the SNMP engine, but is currently unavailable.</li> <li>• <b>Unknown contexts—(snmpUnknownContexts)</b> Total number of requests received for a context that is unknown to the SNMP engine.</li> <li>• <b>Unsupported security levels—(usmStatsUnsupportedSecLevels)</b> Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable).</li> <li>• <b>Not in time windows—(usmStatsNotInTimeWindows)</b> Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window.</li> <li>• <b>Unknown user names—(usmStatsUnknownUserNames)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine.</li> <li>• <b>Unknown engine ids—(usmStatsUnknownEngineIDs)</b> Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine.</li> <li>• <b>Wrong digests—(usmStatsWrongDigests)</b> Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value.</li> <li>• <b>Decryption errors—(usmStatsDecryptionErrors)</b> Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.</li> </ul>

Table 117: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Output</b>	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets—(snmpOutPkts)</b> Total number of messages passed from the SNMP entity to the transport service.</li> <li>• <b>Too big—(snmpOutTooBig)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmpOutNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmpOutBadValues)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>General errors—(snmpOutGenErrs)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Get requests—(snmpOutGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get nexts—(snmpOutGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs generated by the SNMP entity.</li> <li>• <b>Set requests—(snmpOutSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get responses—(snmpOutGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs generated by the SNMP entity.</li> <li>• <b>Traps—(snmpOutTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> </ul>

## Sample Output

### show snmp statistics

```

```

## ssh

<b>Syntax</b>	<pre>ssh host   &lt;bypass-routing&gt;   &lt;inet   inet6&gt;   &lt;interface interface-name&gt;   &lt;logical-system logical-system-name&gt;   &lt;routing-instance routing-instance-name&gt;   &lt;source address&gt;   &lt;v1   v2&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>ssh host   &lt;bypass-routing&gt;   &lt;inet   inet6&gt;   &lt;interface interface-name&gt;   &lt;routing-instance routing-instance-name&gt;   &lt;source address&gt;   &lt;v1   v2&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the <b>ssh</b> command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:</p> <pre>ssh address 'cli-command1 ; cli-command2 '</pre>
<b>Options</b>	<p><b>host</b>—Name or address of the remote system.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p><b>inet   inet6</b>—(Optional) Create an IPv4 or IPv6 connection, respectively.</p> <p><b>interface interface-name</b>—(Optional) Interface name for the SSH session. (This option does not work when <b>default-address-selection</b> is configured at the <b>[edit system]</b> hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)</p> <p><b>logical-system logical-system-name</b>—(Optional) Name of a particular logical system for the SSH attempt.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Name of the routing instance for the SSH attempt.</p>

**source address**—(Optional) Source address of the SSH connection.

**v1 | v2**—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

**Additional Information** To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

**Required Privilege Level** network

#### Understanding Enhanced Layer 2 Software Support

---

Enhanced Layer 2 software (ELS) is automatically supported if your device is running a Junos OS release that supports it. You do not need to take any action to enable ELS, and you cannot disable ELS.

ELS is available on the following EX Series switches and QFX Series devices.

Table 118: ELS Support

Device	Initial ELS Release
EX4300 switches	13.2X50-D10
EX9200 switches	12.3R2
QFX3500 switches	13.2X50-D15
QFX3600 switches	13.2X50-D15
QFX5100 switches	13.2X51-D10

ELS is supported on the EX4300 and EX9200 switches for all Junos OS releases, starting with the initial releases shown in [Table 36 on page 59](#).

ELS support was introduced on QFX3500 and QFX3600 switches in Junos OS Release 13.2X50-D15. ELS is only supported on the software package that supports Virtual Chassis (the **jinstall-qfx-3-\*** software package) for QFX3500 and QFX3600 switches.

For QFX5100 switches, ELS support was introduced in Junos OS Release 13.2X51-D10 and is supported on the **jinstall-qfx-5-\*** software package.

**NOTE:** ELS is not supported on software packages that can be installed in a QFabric system.

### Using the ELS Translator Tool

The ELS Translator is a web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations. This conversion tool supports all Juniper Networks EX Series, MX Series, and QFX Series platforms with ELS installed. The ELS Translator is hosted on Juniper Networks Customer Support website for EX Series switches, MX Series Universal Edge routers, and QFX Series switches and is available to registered users, internal users, partners, and premium service contract customers. You need to login using your Juniper Networks user name and password to access the ELS Translator tool.

[Click](#) to access the ELS translator tool.

If you are upgrading from a version of Junos OS that does not support ELS to a version of Junos OS that supports ELS, we recommend updating your configuration with the ELS Translator Tool using the following procedure:

1. Log onto your device using the console port.

**NOTE:** Only perform this procedure from the console port. You will lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Copy your entire existing configuration into another file. Save the file to a remote location. See [“Saving a Configuration to a File” on page 1141](#).
3. Retain the portion of your existing configuration related to management network connectivity (such as `[edit system]`). Delete all other top-level configuration hierarchy levels (such as `[edit interfaces]`, `[edit protocols]`, and `[edit vlans]`). Issue a **commit** operation to remove the deleted configuration hierarchy levels.
4. Perform the software upgrade. Reboot your device to complete the upgrade. See [“Software Installation Overview” on page 109](#)

**NOTE:** Maintain your console port connection during the reboot.

5. [Click](#) to access the ELS translator tool in a web browser. Follow the instructions on the page to update your configuration.
6. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator Tool onto your switch. See [“Uploading a Configuration File” on page 1145](#).
7. Commit the new configuration.

**NOTE:** It is possible a script might not translate correctly, so review translated scripts carefully before loading the converted configuration on your switch or other device.

## Configuring a VLAN

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series and QFX Series switches can function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting the unique VLAN name and configuring the VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id-number
```

2. Assign at least one interface to the VLAN:

```
[edit]
user@host# set interface interface-name family ethernet-switching vlan members vlan-name
```

---

### Configuring the Native VLAN Identifier

EX Series and QFX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to trunk, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name native-vlan-id number
```

3. Assign the interface to the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching vlan
members native-vlan-id-number
```

---

### Configuring Layer 2 Interfaces

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch's network interfaces.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for access interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode access
```

---

### Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when configuring the protocol family. For the inet or inet6 family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

### Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRBs allow the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named *irb* functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```

3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

### Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces aex
```

3. Specify the minimum number of links for the aggregated Ethernet interface (*aex*), that is, the defined bundle, to be labeled “up”:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp periodic interval
```

---

### Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

Table 119: Enhanced Layer 2 CLI Changes

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   analyzer {     name {       ...     }   } } </pre>	<pre> forwarding-options {   analyzer {     name {       ...     }   } } </pre>	Statements moved to different hierarchy.
<pre> ethernet-switching-options {   authentication-whitelist {     ...   } } </pre>	<pre> switch-options {   ...   authentication-whitelist {     ...   } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options {   bpdu-block {     ...   } } </pre>	<pre> protocols {   layer2-control {     bpdu-block {       ...     }   } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options {   dot1q-tunneling {     ether-type (0x8100   0x88a8   0x9100);     ...   } } </pre>	<pre> interfaces interface-name {   ether-options {     ethernet-switch-profile {       tag-protocol-id [tpids];     }   } }  interfaces interface-name {   aggregated-ether-options {     ethernet-switch-profile {       tag-protocol-id [tpids];     }   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   interfaces interface-name {     no-mac-learning;     ...   } } </pre>	<pre> switch-options {   interfaces interface-name {     no-mac-learning;     ...   } } </pre>	Hierarchy renamed.

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   mac-notification {     notification-interval seconds;   }   ... } </pre>	—	Statements deleted.
<pre> ethernet-switching-options {   mac-table-aging-time seconds;   ... } </pre>	<pre> protocols {   l2-learning {     global-mac-table-aging-time seconds;     ...   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   nonstop-bridging; } </pre>	<pre> protocols {   layer2-control {     nonstop-bridging {     }   } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options {   port-error-disable {     disable-timeout timeout;   }   ... } </pre>	<pre> interfaces interface-name family   ethernet-switching {     recovery-timeout seconds;   } </pre>	Statement replaced with a new statement.
<pre> ethernet-switching-options {   redundant-trunk-group {     group name {       description;       interface interface-name {         primary;       }       preempt-cutover-timer seconds;     }     ...   } } </pre>	<pre> switch-options {   redundant-trunk-group {     group name {       description;       interface interface-name {         primary;       }       preempt-cutover-timer seconds;     }     ...   } } </pre>	Hierarchy renamed.

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   secure-access-port {     interface (all   <i>interface-name</i>) {       (dhcp-trusted   no-dhcp-trusted );       static-ip <i>ip-address</i> {         mac <i>mac-address</i>;         vlan <i>vlan-name</i>;       }     }   }   vlan (all   <i>vlan-name</i>) {     (arp-inspection   no-arp-inspection );     dhcp-option82 {       disable;       circuit-id {         prefix <i>hostname</i>;         use-interface-description;         use-vlan-id;       }       remote-id {         prefix (<i>hostname</i>   mac   none);         use-interface-description;         use-string <i>string</i>;       }       vendor-id [<i>string</i>];     }     (examine-dhcp   no-examine-dhcp);   }   (ip-source-guard   no-ip-source-guard); } </pre>	<pre> vlans <i>vlan-name</i> forwarding-options{   dhcp-security {     arp-inspection;     group <i>group-name</i> {       interface <i>interface-name</i> {         static-ip <i>ip-address</i> {           mac <i>mac-address</i>;         }       }     }     overrides {       no-option-82;       trusted;     }   }   ip-source-guard;   no-dhcp-snooping;   option-82 {     circuit-id {       prefix {         host-name;         routing-instance-name;       }       use-interface-description (device           logical);       use-vlan-id;     }     remote-id {       host-name;       use-interface-description (device           logical);       use-string <i>string</i>;     }     vendor-id {       use-string <i>string</i>;     }   } } </pre>	<p>Statements moved to different hierarchy.</p> <p><b>NOTE:</b> The statement <b>examine-dhcp</b> does not exist in the changed hierarchy. Instead, DHCP snooping is enabled automatically when other DHCP security features are enabled on a VLAN. See <i>Configuring Port Security (CLI Procedure)</i> for additional information.</p>
<pre> ethernet-switching-options {   secure-access-port {     dhcp-snooping-file {       location <i>local_pathname</i>   <i>remote_URL</i>;       timeout <i>seconds</i>;       write-interval <i>seconds</i>;     }   } } </pre>	<pre> system [   processes [     dhcp-service     dhcp-snooping-file <i>local_pathname</i>         <i>remote_URL</i>;     write-interval <i>interval</i>;   ] ] </pre>	<p>Statement moved to different hierarchy.</p>
<pre> ethernet-switching-options {   secure-access-port vlan (all   <i>vlan-name</i>{     mac-move-limit   } } </pre>	<pre> vlans <i>vlan-name</i> switch-options {   mac-move-limit } </pre>	<p>Statement moved to different hierarchy.</p>

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   static {     vlan <i>vlan-id</i> {       mac <i>mac-address</i> next-hop         <i>interface-name</i>;       ...     }   } } </pre>	<pre> vlangs {   <i>vlan-name</i> {     switch-options {       interface <i>interface-name</i> {         static-mac <i>mac-address</i>;         ...       }     }   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   storm-control {     (...)   } } </pre>	<pre> forwarding-options {   storm-control-profiles <i>profile-name</i> {     (...)   } }  interfaces <i>interface-name</i> unit <i>number</i> family   ethernet-switching {     storm-control <i>storm-control-profile</i>;   } </pre>	Storm control configuration is done in two steps. The first step is to create a storm control profile at the [edit forwarding-options] hierarchy, and the second step is to bind the profile to a logical interface at the [edit interfaces] hierarchy. See <i>Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches</i> for additional information.
<pre> ethernet-switching-options {   traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt;       &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable           no-world-readable&gt;;     flag <i>flag</i> &lt;disable&gt;;     ...   } } </pre>	—	Statements removed.
<pre> ethernet-switching-options {   unknown-unicast-forwarding {     (...)   } } </pre>	<pre> switch-options {   unknown-unicast-forwarding {     (...)   } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options {   voip {     interface (all   [<i>interface-name</i>         access-ports]) {       forwarding-class (assured-forwarding           best-effort   expedited-forwarding           network-control);       vlan <i>vlan-name</i>;       ...     }   } } </pre>	<pre> switch-options {   voip {     interface (all   [<i>interface-name</i>         access-ports]) {       forwarding-class (assured-forwarding           best-effort   expedited-forwarding           network-control);       vlan <i>vlan-name</i>;       ...     }   } } </pre>	Hierarchy renamed.

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> interfaces <i>interface-name</i> {   ether-options {     link-mode <i>mode</i>;     speed (auto-negotiation   <i>speed</i>)   } } </pre>	<pre> interfaces <i>interface-name</i> {   link-mode <i>mode</i>;   speed <i>speed</i> } </pre>	Statements moved to different hierarchy.
<pre> interfaces <i>interface-name</i> {   unit <i>logical-unit-number</i> {     family ethernet-switching {       native-vlan-id <i>vlan-id</i>     }   } } </pre>	<pre> interfaces <i>interface-name</i> {   native-vlan-id <i>vlan-id</i> } </pre>	Statement moved to different hierarchy.
<pre> interfaces <i>interface-name</i> {   unit <i>logical-unit-number</i> {     family ethernet-switching {       port-mode <i>mode</i>     }   } } </pre>	<pre> interfaces <i>interface-name</i> {   unit <i>logical-unit-number</i> {     family ethernet-switching {       interface-mode <i>mode</i>     }   } } </pre>	Statement replaced with a new statement.
<pre> interfaces vlan </pre>	<pre> interfaces irb </pre>	Statement replaced with a new statement.

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> protocols {   igmp-snooping {     traceoptions {       file filename &lt;files number&gt;       &lt;no-stamp&gt; &lt;replace&gt;       &lt;size maximum-file-size&gt;       &lt;world-readable         no-world-readable&gt;;       flag flag &lt;flag-modifier&gt; &lt;disable&gt;;     }     vlan (all   vlan-identifier) {       disable;       data-forwarding {         receiver {           install;           source-vlans vlan-name;         }         source {           groups ip-address;         }       }       immediate-leave;       interface (all   interface-name) {         static {           group multicast-ip-address;         }         proxy {           source-address ip-address;         }       }       robust-count number;     }   } } </pre>	<pre> protocols {   igmp-snooping {     vlan vlan-name {       immediate-leave;       interface interface-name {         group-limit &lt;1..65535&gt;         host-only-interface         multicast-router-interface;         immediate-leave;         static {           group multicast-ip-address {             source &lt;&gt;           }         }       }     }     l2-querier {       source-address ip-address;     }     proxy {       source-address ip-address;     }     query-interval number;     query-last-member-interval number;     query-response-interval number;     robust-count number;     traceoptions {       file filename &lt;files number&gt;       &lt;no-stamp&gt; &lt;replace&gt;       &lt;size maximum-file-size&gt;       &lt;world-readable         no-world-readable&gt;;       flag flag &lt;flag-modifier&gt;;     }   } } </pre>	IGMP snooping is configured on a VLAN.
<pre> vlans {   vlan-name {     dot1q-tunneling {       customer-vlans (id   native   range);       layer2-protocol-tunneling all         protocol-name {         drop-threshold number;         shutdown-threshold number;         ...       }     }   } } </pre>	<pre> interface interface-name {   encapsulation extended-vlan-bridge;   flexible-vlan-tagging;   native-vlan-id number;   unit logical-unit-number {     input-vlan-map action;     output-vlan-map action;     vlan-id number;     vlan-id-list [vlan-id vlan-id-vlan-id];   } } </pre>	Statements replaced with new statements and moved to different hierarchy

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> vlsns {   vln-nme {     filter{       input filter-nme       output filter-nme;       ...     }   } } </pre>	<pre> vlsns {   vln-nme {     forwarding-options {       filter{         input filter-nme         output filter-nme;         ...       }     }   } } </pre>	Statements moved to different hierarchy.
<pre> vlsns {   vln-nme {     interface interface-nme {       egress;       ingress;       mapping (native (push   swap)   policy           tag (push   swap));       pvlan-trunk;       ...     }   } } </pre>	—	Statements removed. You can assign interfaces to a VLAN using the [edit interfaces <i>interface-nme</i> unit <i>logical-unit-number</i> family ethernet-switching vln members <i>vln-nme</i> ] hierarchy.
<pre> vlsns {   vln-nme {     isolation-id id-number;     ...   } } </pre>	—	Statement removed.
<pre> vlsns {   vln-nme {     l3-interface vln.logical-interface-number;     ...   } } </pre>	<pre> vlsns {   vln-nme {     l3-interface irb.logical-interface-number;     ...   } } </pre>	Syntax changed.
<pre> vlsns {   vln-nme {     l3-interface-ingress-counting       layer-3-interface-nme;     ...   } } </pre>	—	Statement removed. Ingress traffic is automatically tracked.

Table 119: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> vlands {   vlan-name {     mac-limit limit action action;     ...   } } </pre>	<pre> vlands {   vlan-name {     switch-options {       interface-mac-limit limit {         packet-action action;         ...       }     }   } }  vlands {   vlan-name {     switch-options {       interface interface-name {         interface-mac-limit limit {           packet-action action;           ...         }       }     }   } } </pre>	Statements moved to different hierarchies and renamed.
<pre> vlands {   vlan-name {     mac-table-aging-time seconds;     ...   } } </pre>	<pre> protocols {   l2-learning {     global-mac-table-aging-time seconds;     ...   } } </pre>	Statement moved to different hierarchy and renamed.

Layer 2 Learning and Forwarding for VLANs Overview

When you configure a VLAN, Layer 2 address learning is enabled by default. The VLAN learns unicast media access control (MAC) addresses to avoid flooding the packets to all the ports in the VLAN. Each VLAN creates a source MAC entry in its source and destination MAC tables for each source MAC address learned from packets received on the ports that belong to the VLAN.

**NOTE:** Traffic is not flooded back onto the interface on which it was received. However, because this “split horizon” occurs at a late stage, the packet statistics displayed by commands such as `show interfaces queue` will include flood traffic.

You can optionally disable MAC learning either for the entire device or for a specific VLAN or logical interface. You can also configure the following Layer 2 learning and forwarding properties:

- Static MAC entries for logical interfaces only
- Limit to the number of MAC addresses learned from a specific logical interface or from all the logical interfaces in a VLAN
- Size of the MAC address table for the VLAN
- MAC accounting for a VLAN

## Understanding Bridging and VLANs

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN. This topic explains the following concepts regarding bridging and VLANs:

- [History of VLANs on page 1402](#)
- [How Bridging of VLAN Traffic Works on page 1403](#)

---

### History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each *VLAN* is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

---

## How Bridging of VLAN Traffic Works

---

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

*Flooding* finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

*Filtering*, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

### Packets Are Either Tagged or Untagged

---

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The VLAN IDs 1 through 4094 can be assigned to VLANs, while VLAN IDs 0 and 4095 are reserved by Junos OS and cannot be assigned.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet. The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

In addition to the TPID EtherType value of 0x8100, switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also support values of 0x88a8 (Provider Bridging and Shortest Path Bridging) and 0x9100 (Q-in-Q).

For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

### Switch Interface Modes—Access, Trunk, or Tagged Access

---

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

#### **Access Mode**

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot a switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that VLAN instead of **default**.

On a switch that runs Junos OS that supports ELS, the VLAN named **default** is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see [“Trunk Mode and Native VLAN” on page 1405](#).

### **Trunk Mode**

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination.

On a switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on switches that run either type of software, you must configure the single VLAN on a trunk port as a *native VLAN*. For more information about native VLANs, see [“Trunk Mode and Native VLAN” on page 1405](#).

### **Trunk Mode and Native VLAN**

On a switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch's trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

### **Tagged-Access Mode**

Only switches that run Junos OS that does not use the ELS configuration style support tagged-access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.
- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.

**NOTE:** Control packets are never reflected back on the downstream port.

---

### **Additional Advantages of Using VLANs**

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.
- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For a switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group

network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

### Maximum VLANs and VLAN Members Per Switch

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On a switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports (vmember limit =  $\text{vlan max} * 8$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.

On a switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports (vmember limit =  $\text{vlan max} * 24$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

### A Default VLAN Is Configured on Most Switches

Some switches that run Junos OS that do not support the ELS configuration style are preconfigured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

**NOTE:** When a Juniper Networks QFX3500 or QFX3600 switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

## Assigning Traffic to VLANs

---

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.

### ***Assign VLAN Traffic According to the Interface Port Source***

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

### ***Assign VLAN Traffic According to the Source MAC Address***

In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on a switch that supports ELS, see [“Adding a Static MAC Address Entry to the Ethernet Switching Table \(CLI Procedure\)” on page 1527](#). To configure a static MAC-based VLAN on a switch that does not support ELS, see [“Adding a Static MAC Address Entry to the Ethernet Switching Table \(CLI Procedure\)” on page 1527](#).

## Forwarding VLAN Traffic

---

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols.

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. The same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under [“Trunk Mode” on page 1405](#).

## VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces

---

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

Switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named `irb`, while switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named `vlan`. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

  - [Interfaces Overview on page 1839](#)

## Understanding Routed VLAN Interfaces

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). VLANs limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN. For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs, you normally you need a router that connects the VLANs. However, you can accomplish this forwarding on a switch without using a router by configuring a routed VLAN interface (RVI). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

An RVI is a special type of Layer 3 virtual interface named **vlan**. Like normal Layer 3 interfaces, the **vlan** interface needs a logical unit number with an IP address. In fact, to be useful an RVI needs at least two logical units and two IP addresses—you must create units with addresses in each of the subnets associated with the VLANs between which you want traffic to be routed. That is, if you have two VLANs (for example, VLAN **red** and VLAN **blue**) with corresponding subnets, your RVI must have a logical unit with an address in the subnet for **red** and a logical unit with an address in the subnet for **blue**. The switch automatically creates direct routes to these subnets and uses these routes to forward traffic between VLANs.

**NOTE:** If you are using a version of Junos OS that supports Enhanced Layer 2 Software (ELS), you can also create a Layer 3 virtual interface named **irb** instead of **vlan**—that is, both statements are supported by ELS

Table 120 on page 1409 shows values you might use when configuring an RVI:

**Table 120: Sample RVI Values**

Property	Settings
VLAN names and tags (IDs)	<b>blue</b> , ID 100 <b>red</b> , ID 200
Subnets associated with VLANs	<b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
RVI name	interface <b>vlan</b>

Table 120: Sample RVI Values (*continued*)

Property	Settings
RVI units and addresses	logical unit 100: <b>192.0.2.1/25</b> logical unit 200: <b>192.0.2.129/25</b>

For the sake of consistency and to avoid confusion, [Table 120 on page 1409](#) shows RVI logical unit numbers that match the IDs of the corresponding VLANs. However, you do not have to assign logical unit numbers that match the VLAN IDs—you can use any values for the units. To bind the logical units of the RVI to the appropriate VLANs, you use the [l3-interface](#) statement.

Because RVIs operate at Layer 3, you can use Layer 3 services such as firewall filters or CoS rewriting with them. RVIs are similar to integrated routing and bridging (IRB) interfaces supported on Juniper routers and switch virtual interfaces (SVIs) and bridge-group virtual interfaces (BVI) supported on other vendors' devices.

[Table 121 on page 1410](#) shows the number of RVIs that each QFX platform supports.

Table 121: Number of Supported RVIs by Platform

Platform	Number of Supported RVIs
QFX3500	1200
QFX3000-G	2000
QFX3000-M	2000

  - [irb \(Interfaces\) on page 2067](#)

## Understanding MAC Learning

*MAC learning* is the process of obtaining the MAC addresses of all the nodes on a network.

When a node is first connected to an Ethernet LAN or VLAN, it has no information about the other nodes on the network. As data is sent through the network, data packets include a data frame listing their source and destination MAC addresses. The data frame is forwarded to a target port, which is connected to the second device. The MAC address is learned locally at the target port, which facilitates communications for frames that later enter the target port and contain addresses previously learned from a received frame.

MAC learning can also be enabled on a per-VLAN basis. See [Example: Disabling MAC Learning in a VLAN](#) for further information.

By default, MAC learning is enabled on the QFX Series.

### Introduction to the Media Access Control (MAC) Layer 2 Sublayer

This topic provides an introduction to the MAC sublayer of the data link layer (Layer 2).

In Layer 2 of a network, the Media Access Control (MAC) sublayer provides addressing and channel access control mechanisms that enable several terminals or network nodes to communicate in a network.

The MAC sublayer acts as an interface between the logical link control (LLC) Ethernet sublayer and Layer 1 (the physical layer). The MAC sublayer emulates a full-duplex logical communication channel in a multipoint network. This channel may provide unicast, multicast, or broadcast communication service. The MAC sublayer uses MAC protocols to prevent collisions.

In Layer 2, multiple devices on the same physical link can uniquely identify one another at the data link layer, by using the MAC addresses that are assigned to all ports on a switch. A MAC algorithm accepts as input a secret key and an arbitrary-length message to be authenticated, and outputs a MAC address.

A MAC address is a 12-digit hexadecimal number (48 bits in long). MAC addresses are usually written in one of these formats:

- MM:MM:MM:SS:SS:SS
- MM-MM-MM-SS-SS-SS

The first half of a MAC address contains the ID number of the adapter manufacturer. These IDs are regulated by an Internet standards body. The second half of a MAC address represents the serial number assigned to the adapter by the manufacturer.

Contrast MAC addressing, which works at Layer 2, with IP addressing, which runs at Layer 3 (networking and routing). One way to remember the difference is that the MAC addresses apply to a physical or virtual node, whereas IP addresses apply to the software implementation of that node. MAC addresses are typically fixed on a per-node basis, whereas IP addresses change when the node moves from one part of the network to another.

IP networks maintain a mapping between the IP and MAC addresses of a node using the Address Resolution Protocol (ARP) table. DHCP also typically uses MAC addresses when assigning IP addresses to nodes.

## Overview of Layer 2 Networking

Layer 2, also known as the Data Link Layer, is the second level in the seven-layer OSI reference model for network protocol design. Layer 2 is equivalent to the link layer (the lowest layer) in the TCP/IP network model. Layer 2 is the network layer used to transfer data between adjacent network nodes in a wide area network or between nodes on the same local area network.

A *frame* is a protocol data unit, the smallest unit of bits on a Layer 2 network. Frames are transmitted to and received from devices on the same local area network (LAN). Unlike bits, frames have a defined structure and can be used for error detection, control plane activities and so forth. Not all frames carry user data. The network uses some frames to control the data link itself..

At Layer 2, *unicast* refers to sending frames from one node to a single other node, whereas *multicast* denotes sending traffic from one node to multiple nodes, and *broadcasting* refers to the transmission of frames to all nodes in a network. A *broadcast domain* is a logical division of a network in which all nodes of that network can be reached at Layer 2 by a broadcast.

Segments of a LAN can be linked at the frame level using *bridges*. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN.

*Forwarding* is the relaying of packets from one network segment to another by nodes in the network. On a VLAN, a frame whose origin and destination are in the same VLAN are forwarded only within the local VLAN. A network segment is a portion of a computer network wherein every device communicates using the same physical layer.

Layer 2 contains two sublayers:

- Logical link control (LLC) sublayer, which is responsible for managing communications links and handling frame traffic.
- Media access control (MAC) sublayer, which governs protocol access to the physical network medium. By using the MAC addresses that are assigned to all ports on a switch, multiple devices on the same physical link can uniquely identify one another.

The ports, or interfaces, on a switch operate in either access mode, tagged-access, or trunk mode:

- *Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode.
- *Tagged-Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:
- *Trunk mode* ports handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to other devices or switches.

With native VLAN configured, frames that do not carry VLAN tags are sent over the trunk interface. If you have a situation where packets pass from a device to a switch in access mode, and you want to then send those packets from the switch over a trunk port, use native VLAN mode. Configure the single VLAN on the switch's port (which is in access mode) as a native VLAN. The switch's trunk port will then treat those frames differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, frames on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag). There is another native VLAN option. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Including the sublayers, Layer 2 on the QFX Series supports the following functionality:

- Unicast, multicast, and broadcast traffic.
- Bridging.
- VLAN 802.1Q—Also known as *VLAN tagging*, this protocol allows multiple bridged networks to transparently share the same physical network link by adding VLAN tags to an Ethernet frame.

- Extension of Layer 2 VLANs across multiple switches using Spanning Tree Protocol (STP) prevents looping across the network.
- *MAC learning*, including per-VLAN MAC learning and Layer 2 learning suppression—This process obtains the MAC addresses of all the nodes on a network
- Link aggregation—This process groups of Ethernet interfaces at the physical layer to form a single link layer interface, also known as a *link aggregation group (LAG)* or LAG bundle
- Storm control on the physical port for unicast, multicast, and broadcast
- STP support, including 802.1d, RSTP, MSTP, and Root Guard

## Understanding Layer 2 Broadcasting

In a Layer 2 network, *broadcasting* refers to sending traffic to all nodes on a network.

Layer 2 broadcast traffic stays within a local area network (LAN) boundary; known as the *broadcast domain*. Layer 2 broadcast traffic is sent to the broadcast domain using a MAC address of FF:FF:FF:FF:FF:FF. Every device in the broadcast domain recognizes this MAC address and passes the broadcast traffic on to other devices in the broadcast domain, if applicable. Broadcasting can be compared to unicasting (sending traffic to a single node) or multicasting (delivering traffic to a group of nodes simultaneously).

Layer 3 broadcast traffic, however, is sent to all devices in a network using a broadcast network address. For example, if your network address is 192.0.0.0, the broadcast network address is 192.255.255.255. In this case, only devices that belong to the 192.0.0.0 network receive the Layer 3 broadcast traffic. Devices that do not belong to this network drop the traffic.

Broadcasting is used in the following situations:

- Address Resolution Protocol (ARP) uses broadcasting to map MAC addresses to IP addresses. ARP dynamically binds the IP address (the logical address) to the correct MAC address. Before IP unicast packets can be sent, ARP discovers the MAC address used by the Ethernet interface where the IP address is configured.
- Dynamic Host Configuration Protocol (DHCP) uses broadcasting to dynamically assign IP addresses to hosts on a network segment or subnet.
- Routing protocols use broadcasting to advertise routes.

Excessive broadcast traffic can sometimes create a broadcast storm. A broadcast storm occurs when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses that create a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service.

## Understanding Unicast

*Unicasting* is the act of sending data from one node of the network to another. In contrast, multicast transmissions send traffic from one data node to multiple other data nodes.

*Unknown unicast* traffic consists of unicast frames with unknown destination MAC addresses. By default, the switch floods these unicast frames that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward any unknown unicast traffic to a specific trunk interface. (This channels the unknown unicast traffic to a single interface.)

## Understanding the Unified Forwarding Table

On the QFX5100 switch, you can control the allocation of forwarding table memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

This feature gives you the flexibility to configure your QFX5100 to match the needs of your particular network environment.

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 122 on page 1416](#) lists the profiles you can choose and the associated maximum values for each type of table entry.

Table 122: Unified Forwarding Table Profiles

Profile Name	MAC Table	Host Table (unicast and multicast addresses)						LPM Table	
	MAC Addresses	IPv4 unicast	IPv6 unicast	IPv4 (*, G)	IPv4 (S, G)	IPv6 (*, G)	IPv6 (S, G)	IPv4 Entries	IPv6 Entries (prefix <= 64)
<b>l2-profile-one</b>	288K	16K	8K	8K	8K	4K	4K	16K	8K
<b>l2-profile-two</b>	224K	80K	40K	40K	40K	20K	20K	16K	8K
<b>l2-profile-three</b> (default)	160K	144K	72K	72K	72K	36K	36K	16K	8K
<b>l3-profile</b>	96K	208K	104K	104K	104K	52K	52K	16K	8K
<b>lpm-profile</b> (Do not use for IPv6)	32K	16K	8K	8K	8K	4K	4K	128K	64K

Note that if the host or LPM table stores the maximum number of entries for any given type, the entire shared table is full and is unable to accommodate *any* entries of any other type. As you can see, different entry types occupy different amounts of memory. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address. [Table 123 on page 1416](#) lists various valid combinations that the host table can store if you use the **l2-profile-one** profile. Each row in the table represents a case in which the host table is full and cannot accommodate any more entries.

Table 123: Example Host Table Combinations Using l2-profile-one

IPv4 unicast	IPv6 unicast	IPv4 multicast (*, G)	IPv4 multicast (S, G)	IPv6 multicast (*, G)	IPv6 multicast (S, G)
16K	0	0	0	0	0
12K	2K	0	0	0	0
12K	0	2	2	0	0
8K	4K	0	0	0	0
4K	2K	2	2	0	0
0	4K	0	0	1K	1K

The LPM table is also shared and the same principles apply. [Table 124 on page 1417](#) provides examples of valid combinations that the LPM table can store, also using the **l2-profile-one** profile. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

Table 124: Example LPM Table Combinations Using l2-profile-one

IPv4 entries	IPv6 Entries (prefix <= 64)
16K	0
0	8K
8K	4K
4K	6K

**NOTE:** If you want to use more than 16 IPv6 addresses with prefix lengths greater than 64, you must follow the instructions at [“Configuring the Unified Forwarding Table” on page 1548](#). As that topic explains, if you increase the number of addresses with prefix lengths greater than 64, you reduce the amount of LPM-table memory available to store IPv6 addresses with prefixes less than or equal to 64.

## Proxy ARP

- [Understanding Proxy ARP on page 1417](#)

### Understanding Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

- [What Is ARP? on page 1417](#)
- [Proxy ARP Overview on page 1418](#)
- [Best Practices for Proxy ARP on page 1418](#)

#### What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch

maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

### Proxy ARP Overview

---

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

**NOTE:** For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.

You can configure proxy ARP for each interface. You can also configure proxy ARP for a VLAN by using a routed VLAN interface (RVI).

QFX Series devices support two modes of proxy ARP, restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- **Restricted**—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.
- **Unrestricted**—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Juniper Networks Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

### Best Practices for Proxy ARP

---

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP to restricted mode.
- Use restricted mode when configuring proxy ARP on RVIs.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

- [Understanding Root Protection for STP, RSTP, VSTP, and MSTP on page 1425](#)

### Overview of Spanning-Tree Protocols

QFX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default spanning-tree protocol on the QFX Series is RSTP. RSTP provides faster convergence times than STP. However, some legacy networks require the slower convergence times of basic STP.

The STP support provided for the QFX Series includes:

- IEEE 802.1d
- 802.1w RSTP
- 802.1s MSTP

If your network includes IEEE 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. See [“Configuring STP” on page 1553](#). When you explicitly configure STP, the QFX Series products use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP. If you use virtual LANs (VLANs), you should enable VSTP and use it on your network. See [“Understanding VSTP” on page 1422](#).

You can use the same operational commands (**show spanning-tree bridge** and **show spanning-tree interface**) to check the status of your spanning-tree configuration, regardless of which spanning-tree protocol has been configured.

STP uses bridge protocol data unit (BPDU) packets to exchange information with other switches. BPDUs send hello packets out at regular intervals to exchange information across bridges and detect loops in a network topology. There are two types of BPDUs:

- Configuration BPDUs—These BPDUs contain configuration information about the transmitting switch and its ports, including switch and port MAC addresses, switch priority, port priority, and port cost.
- Topology change notification (TCN) BPDUs—When a bridge needs to signal a topology change, it starts to send TCNs on its root port. The designated bridge receives the TCN, acknowledges it, and generates another one for its own root port. The process continues until the TCN reaches the root bridge.

STP uses the information provided by the BPDUs to elect a root bridge, identify root ports for each switch, identify designated ports for each physical LAN segment, and prune specific redundant links to create a loop-free tree topology. All leaf devices calculate the best path to the root device and place their ports in blocking or forwarding states based on the best path to the root. The resulting tree topology provides a single active Layer 2 data path between any two end stations.

### Understanding Spanning Tree Protocols on a QFabric System

Although there is no need to run STP in a QFabric system, you can connect a QFabric system to another Layer 2 device and use STP. STP traffic can only be processed on network Node groups. Other Node groups, such as redundant server Node groups and server Node groups, discard the STP bridge protocol data units (BPDUs) traffic and disable the interface automatically. Server Node groups only process host-facing protocols, whereas Network Node groups process all supported protocols.

#### **Related Documentation**

- [Understanding MSTP on page 1420](#)
- [Understanding RSTP on page 1421](#)
- [Understanding VSTP on page 1422](#)

## Understanding MSTP

Although RSTP provides faster convergence time than STP does, it still does not solve a problem inherent in STP: all VLANs within a LAN must share the same spanning tree. To solve this problem, the QFX Series products use Multiple Spanning Tree Protocol (MSTP) to create a loop-free topology in networks with multiple spanning-tree regions.

An MSTP region allows a group of bridges to be modeled as a single bridge. An MSTP region contains multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

An MSTP region can support up to 64 MSTIs, and each instance can support from 1 through 4094 VLANs.

- [Overview of Spanning-Tree Protocols on page 1419](#)
- [Understanding RSTP on page 1421](#)
- [Example: Configuring Network Regions for VLANs with MSTP on page 1480](#)

## Understanding RSTP

Juniper Networks QFX Series products use Rapid Spanning Tree Protocol (RSTP) on the network side of the QFX Series to provide quicker convergence time than the base Spanning Tree Protocol (STP) does. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state, which speeds up convergence.

Although STP provides basic loop prevention functionality, it does not provide fast network convergence when there are topology changes. The STP process to determine network state transitions is slower than the RSTP process because it is timer-based. A device must reinitialize every time a topology change occurs. The device must start in the listening state and transition to the learning state and eventually to a forwarding or blocking state. When default values are used for the maximum age (20 seconds) and forward delay (15 seconds), it takes 50 seconds for the device to converge. RSTP converges faster because it uses a handshake mechanism based on point-to-point links instead of the timer-based process used by STP.

For networks with virtual LANs (VLANs), you can use VLAN Spanning Tree Protocol (VSTP), which takes the paths of each VLAN into account when calculating routes. VSTP uses RSTP by default.

An RSTP domain running from the edge outward on a QFX Series product has the following components:

- A *root port*, which is the “best path” to the root device.
- A *designated port*, which indicates that the switch is the designated bridge for the other switch connecting to this port.
- An *alternate port*, which provides an alternate root port.
- A *backup port*, which provides an alternate designated port.

Port assignments change through messages exchanged throughout the domain. An RSTP device generates configuration messages once per hello time interval. If an RSTP device does not receive a configuration message from its neighbor after an interval of three hello times, it determines that the connection with the neighbor is lost. When a *root port* or a *designated port* fails on a device, the device generates a configuration message with the proposal bit set. Once its neighbor device receives this message, it verifies that this configuration message is valid for that port and starts a *synchronizing* operation to ensure that all of its ports are in sync with the new information.

Similar sets of messages propagate through the network, restoring the connectivity very quickly after a topology change (in a well-designed network that uses RSTP, network convergence can take as little as 0.5 seconds). If a device does not receive an agreement to a proposal message it has sent, it returns to the original IEEE 802.D convention.

RSTP was originally defined in the IEEE 802.1w draft specification and later incorporated into the IEEE 802.1D-2004 specification.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on the QFX Series.

- [Understanding MSTP on page 1420](#)
- [Understanding VSTP on page 1422](#)
- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466](#)

## Understanding VSTP

VLAN Spanning Tree Protocol (VSTP) enables Juniper Networks switches to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

You can configure VSTP for a maximum of 253 VLANs.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on a switch.

**NOTE:** We recommend that you enable VSTP on all VLANs that could receive VSTP bridge protocol data units (BPDUs).

## Understanding BPDU Protection for STP, RSTP, and MSTP

**NOTE:** Using the original CLI, you can disable BPDU protection on interfaces by issuing the `set ethernet-switching-options bpdu-block interface-name disable` command.

A Juniper Networks QFX Series product provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Bridge protocol data unit (BPDU) protection can help prevent STP misconfigurations that can lead to network outages.

A loop-free network is supported through the exchange of a special type of frame called a BPDU. Receipt of BPDUs on certain interfaces in an STP, RSTP, VSTP, or MSTP topology, however, can lead to network outages. Enable BPDU protection on those interfaces to prevent these outages.

Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a user bridge application running on a device connected to the switch can also generate BPDUs. If these BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations, and those miscalculations can lead to network outages.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If BPDUs are received on a protected interface, the interface is disabled and stops forwarding frames.

Not only can you configure BPDU protection on a switch with a spanning tree, but also on a switch without a spanning tree. This type of topology typically consists of a non-STP switch connected to an STP switch through a trunk interface.

To configure BPDU protection on a switch with a spanning tree, include the **bpdu-block-on-edge** statement at the `[edit protocols (stp | mstp | rstp)]` hierarchy level. To configure BPDU protection on a switch without a spanning tree, include the **bpdu-block** statement at the `[edit ethernet-switching-options interface interface-name]` hierarchy level.

If BPDUs are sent to an interface (indicating that the misconfiguration has been corrected), the interface can be unblocked in one of two ways:

- If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.
- Use the operational mode command **clear ethernet-switching bpdu-error**.

Disabling the BPDU protection configuration does not unblock the interface.

## Understanding Loop Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks QFX Series product provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from entering a forwarding state that would cause a loop to open in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can mistakenly transition to the forwarding state if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and ensures that both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It does not transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**alarm**, **block**, or both).

An interface can be configured for either loop protection or root protection, but not for both.

- Related Documentation**

## Understanding Root Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks QFX Series product provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

You can also see BPDUs generated when you run a bridge application on a device attached to the switch. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive higher-priority BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives more STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state), and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving more STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

### **Bridging and VLAN Configuration Examples**

---

- [Example: Configuring Routing Between VLANs on One Switch on page 1428](#)
- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1433](#)

## Example: Configuring Routing Between VLANs on One Switch

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs you normally you need a router that connects the VLANs. However, you can accomplish this on a Juniper Networks switch without using a router by configuring a routed VLAN interface (RVI). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

- [Requirements on page 1428](#)
- [Overview and Topology on page 1428](#)
- [Configure Layer 2 switching for two VLANs on page 1429](#)
- [Verification on page 1432](#)

### Requirements

This example uses the following hardware and software components:

- One switch
- Junos OS Release 11.1 or later

### Overview and Topology

This example uses an RVI to route traffic between two VLANs on the same switch. The topology is shown in [Figure 16 on page 1428](#).

Figure 16: RVI with One Switch

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch and configuring an RVI to enable routing between the VLANs. One VLAN, called **blue**, is for the sales and marketing group, and a second, called **red**, is for the customer support team. The sales and support groups each have their own file servers and wireless access points. Each VLAN must have a unique name, tag (VLAN ID), and distinct IP subnet. [Table 125 on page 1428](#) lists the components of the sample topology.

Table 125: Components of the Multiple VLAN Topology

Property	Settings
VLAN names and tag IDs	blue, ID 100 red, ID 200

Table 125: Components of the Multiple VLAN Topology (*continued*)

Property	Settings
Subnets associated with VLANs	<b>blue:</b> 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>red:</b> 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Interfaces in VLAN <b>blue</b>	Sales server port: <b>xe-0/0/4</b> Sales wireless access points: <b>xe-0/0/6</b>
Interfaces in VLAN <b>red</b>	Support server port: <b>xe-0/0/0</b> Support wireless access points: <b>xe-0/0/2</b>
RVI name	interface <b>vlan</b>
RVI units and addresses	logical unit 100: <b>192.0.2.1/25</b>  logical unit 200: <b>192.0.2.129/25</b>

This configuration example creates two IP subnets, one for the blue VLAN and the second for the red VLAN. The switch bridges traffic within the VLANs. For traffic passing between two VLANs, the switch routes the traffic using an RVI on which you have configured addresses in each IP subnet.

To keep the example simple, the configuration steps show only a few interfaces and VLANs. Use the same configuration procedure to add more interfaces and VLANs. By default, all interfaces are in access mode, so you do not have to configure the port mode.

### Configure Layer 2 switching for two VLANs

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**blue** and **red**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/4 unit 0 description "Sales server port"
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/6 unit 0 description "Sales wireless access point port"
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/0 unit 0 description "Support servers"
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members red
set interfaces xe-0/0/2 unit 0 description "Support wireless access point port"
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members red
set interfaces vlan unit 100 family inet address 192.0.2.1/25
set interfaces vlan unit 200 family inet address 192.0.2.129/25
set vlans blue l3-interface vlan.100
set vlans blue vlan-id 100
set vlans red vlan-id 200
set vlans red l3-interface vlan.200
```

**Step-by-Step Procedure** To configure the switch interfaces and the VLANs to which they belong:

1. Configure the interface for the sales server in the blue VLAN:  

```
[edit interfaces xe-0/0/4 unit 0]
user@switch# set description "Sales server port"
user@switch# set family ethernet-switching vlan members blue
```
2. Configure the interface for the wireless access point in the blue VLAN:  

```
[edit interfaces xe-0/0/6 unit 0]
user@switch# set description "Sales wireless access point port"
user@switch# set family ethernet-switching vlan members blue
```
3. Configure the interface for the support server in the red VLAN:  

```
[edit interfaces xe-0/0/0 unit 0]
user@switch# set description "Support server port"
user@switch# set family ethernet-switching vlan members red
```
4. Configure the interface for the wireless access point in the red VLAN:  

```
[edit interfaces xe-0/0/2 unit 0]
user@switch# set description "Support wireless access point port"
user@switch# set family ethernet-switching vlan members red
```

**Step-by-Step Procedure** Now create the VLANs and the RVI. The RVI will have logical units in the broadcast domains of both VLANs.

1. Create the red and blue VLANs by configuring the VLAN IDs for them:  

```
[edit vlans]
user@switch# set blue vlan-id 100
user@switch# set red vlan-id 200
```
2. Create the interface named `vlan` with a logical unit in the sales broadcast domain (blue VLAN):  

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 192.0.2.1/25
```

The unit number is arbitrary and does not have to match the VLAN tag ID. However, configuring the unit number to match the VLAN ID can help avoid confusion.

**NOTE:** If you are using a version of Junos OS that supports Enhanced Layer 2 Software (ELS), you can also create a Layer 3 virtual interface named `l3-interface` instead of `vlan`.

---

3. Add a logical unit in the support broadcast domain (red VLAN) to the `vlan` interface:  

```
[edit interfaces]
user@switch# set vlan unit 200 family inet address 192.0.2.129/25
```
4. Complete the RVI configuration by binding the red and blue VLANs (Layer 2) with the appropriate logical units of the `vlan` interface (Layer 3):  

```
[edit vlans]
user@switch# set blue l3-interface vlan.100
user@switch# set red l3-interface vlan.200
```

Display the results of the configuration:

```

user@switch> show configuration
interfaces {
 xe-0/0/4 {
 unit 0 {
 description "Sales server port";
 family ethernet-switching {
 vlan members blue;
 }
 }
 }
 xe-0/0/6 {
 unit 0 {
 description "Sales wireless access point port";
 family ethernet-switching {
 vlan members blue;
 }
 }
 }
 xe-0/0/0 {
 unit 0 {
 description "Support server port";
 family ethernet-switching {
 vlan members red;
 }
 }
 }
 xe-0/0/2 {
 unit 0 {
 description "Support wireless access point port";
 family ethernet-switching {
 vlan members red;
 }
 }
 }
 vlan {
 unit 100 {
 family inet address 192.0.2.1/25;
 }
 unit 200 {
 family inet address 192.0.2.129/25;
 }
 }
}
vlands {
 blue {
 vlan-id 100;
 interface xe-0/0/4.0;
 interface xe-0/0/6.0;
 l3-interface vlan 100;
 }
 red {
 vlan-id 200;
 interface xe-0/0/0.0;
 interface xe-0/0/2.0;
 l3-interface vlan 200;
 }
}

```

```
}
}
```

**TIP:** To quickly configure the blue and red VLAN interfaces, issue the `load merge terminal` command, copy the hierarchy, and paste it into the switch terminal window.

## Verification

To verify that the **blue** and **red** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1432](#)
- [Verifying That Traffic Can Be Routed Between the Two VLANs on page 1432](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the VLANs **blue** and **red** have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
Name Tag Interfaces
default 100 xe-0/0/0.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/6.0,
blue 100 xe-0/0/4.0, xe-0/0/6.0,
red 200 xe-0/0/0.0, xe-0/0/2.0, *
mgmt me0.0*
```

**Meaning** The `show vlans` command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **blue** and **red** VLANs have been created. The **blue** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/4.0** and **xe-0/0/6.0**. VLAN **red** has a tag ID of 200 and is associated with interfaces **xe-0/0/0.0** and **xe-0/0/2.0**.

### *Verifying That Traffic Can Be Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** Verify that the RVI logical units are up:

```
user@switch> show interfaces terse
vlan.100 up up inet 192.0.2.1/25
vlan.200 up up inet 192.0.2.129/25
```

**NOTE:** At least one port (access or trunk) with an appropriate VLAN assigned to it must be up for the vlan interface to be up.

Verify that switch has created routes that use the RVI logical units:

```
user@switch> show route
192.0.2.0/25 *[Direct/0] 1d 03:26:45
 > via vlan.100
192.0.2.1/32 *[Local/0] 1d 03:26:45
 Local via vlan.100
192.0.2.128/25 *[Direct/0] 1d 03:26:45
 > via vlan.200
192.0.2.129/32 *[Local/0] 1d 03:26:45
 Local via vlan.200
```

List the Layer 3 routes in the switch's Address Resolution Protocol (ARP) table:

```
user@switch> show arp
```

MAC Address	Address	Name	Flags
00:00:0c:06:2c:0d	192.0.2.7	vlan.100	None
00:13:e2:50:62:e0	192.0.2.132	vlan.200	None

**Meaning** The output of the **show interfaces** and **show route** commands show that the Layer 3 RVI logical units are working and the switch has used them to create direct routes that it will use to forward traffic between the VLAN subnets. The **show arp** command displays the mappings between the IP addresses and MAC addresses for devices on both **vlan.100** (associated with VLAN **blue**) and **vlan.200** (associated with VLAN **red**). These two devices can communicate.

## Example: Setting Up Basic Bridging and a VLAN on the QFX Series

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices—storage devices, file servers, and other LAN components—in a LAN and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure basic bridging and VLANs for the QFX Series:

- [Requirements on page 1434](#)
- [Overview and Topology on page 1434](#)

- [Configuration on page 1434](#)
- [Verification on page 1443](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX Series
- A configured and provisioned QFX Series product

Overview and Topology

To use a switch to connect network devices on a LAN, you must at a minimum configure bridging and VLANs. By default, bridging is enabled on all switch interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **employee-vlan**, which is automatically configured. When you plug in access devices—such as desktop computers, file servers, and printers—they are joined immediately into the **employee-vlan** VLAN, and the LAN is up and running.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.) You use the ports to connect devices that have their own power sources. Table 1 details the topology used in this configuration example.

Table 126: Components of the Basic Bridging Configuration Topology

Property	Settings
Switch hardware	QFX3500 switch, with 48 10-Gbps Ethernet ports
VLAN name	<b>employee-vlan</b>
VLAN ID	10
Connections to file servers	<b>xe-0/0/17</b> and <b>xe-0/0/18</b>
Direct connections to desktop PCs and laptops	<b>xe-0/0/0</b> through <b>xe-0/0/16</b>
Connections to integrated printer/fax/copier machines	<b>xe-0/0/19</b> through <b>xe-0/0/40</b>
Unused ports	<b>xe-0/0/41</b> through <b>xe-0/0/47</b>

Configuration

CLI Quick Configuration

To quickly configure a VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 10
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
```

```

set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan

```

### Step-by-Step Procedure

To set up basic bridging and a VLAN:

1. Create a VLAN named employee-vlan and specify the VLAN ID of 10 for it:

```

[edit vlans]
user@switch# set employee-vlan vlan-id 10

```

2. Assign interfaces xe-0/0/0 through xe-0/0/40 to the employee-vlan VLAN:

```

[edit interface]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan

```

```
user@switch# set xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan
```

3. Connect the two file servers to ports xe-0/0/17 and xe-0/0/18.
4. Connect the desktop PCs and laptops to ports xe-0/0/0 through xe-0/0/16.
5. Connect the integrated printer/fax/copier machines to ports xe-0/0/19 through xe-0/0/40.

**Results** Check the results of the configuration:

```
user@switch> show configuration
xe-0/0/0 {
 unit 0 {

 members employee-vlan;
 }
 }
}
```

### Verification

To verify that switching is operational and that **employee-vlan** has been created, perform these tasks:

- [Verifying That the VLAN Has Been Created on page 1443](#)
- [Verifying That Interfaces Are Associated with the Proper VLANs on page 1444](#)

#### *Verifying That the VLAN Has Been Created*

**Purpose** Verify that the VLAN named **employee-vlan** has been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
Routing instance VLAN name Tag Interfaces
default-switch employee-vlan 10
 xe-0/0/0.0
 xe-0/0/1.0
 xe-0/0/2.0
 xe-0/0/3.0
 xe-0/0/4.0
 xe-0/0/5.0
 xe-0/0/6.0
 xe-0/0/7.0
 xe-0/0/8.0
 xe-0/0/9.0
 xe-0/0/10.0
 xe-0/0/11.0
 xe-0/0/12.0
 xe-0/0/13.0
 xe-0/0/14.0
 xe-0/0/15.0
 xe-0/0/16.0
 xe-0/0/17.0
 xe-0/0/18.0
 xe-0/0/19.0
 xe-0/0/20.0
 xe-0/0/21.0
 xe-0/0/22.0
 xe-0/0/23.0
 xe-0/0/24.0
 xe-0/0/25.0
 xe-0/0/26.0
 xe-0/0/27.0
 xe-0/0/28.0
 xe-0/0/29.0
 xe-0/0/30.0
 xe-0/0/31.0
 xe-0/0/32.0
 xe-0/0/33.0
 xe-0/0/34.0
 xe-0/0/35.0
 xe-0/0/36.0
 xe-0/0/37.0
 xe-0/0/38.0
 xe-0/0/39.0
 xe-0/0/40.0
...

```

**Meaning** The `show vlans` command lists the VLANs configured on the switch. This output shows that the VLAN `employee-vlan` has been created.

#### *Verifying That Interfaces Are Associated with the Proper VLANs*

**Purpose** Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

**Action** List all interfaces on which switching is enabled:

```

user@switch> show ethernet-switching interfaces

**Meaning** The **show ethernet-switching interfaces** command lists all interfaces on which switching is enabled (in the **Logical interface** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, xe-0/0/0 through xe-0/0/40, are all part of VLAN **employee-vlan**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows xe-0/0/0.0 instead of xe-0/0/0. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

## Bridging and VLAN Configuration Examples (Original CLI Only)

- [Example: Disabling MAC Learning on page 1450](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 1451](#)

### Example: Disabling MAC Learning

By default, MAC learning is enabled on the QFX Series. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning on the QFX Series. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Example: Disabling MAC Learning” on page 1457](#).

- To disable MAC learning in a VLAN:

```
[edit]
user@switch# edit ethernet-switching-options interfaces xe-0/0/0.0
[edit ethernet-switching-options interfaces xe-0/0/0.0]
user@switch# set no-mac-learning
```

- To reenablen MAC learning:

```
[edit]
user@switch# edit ethernet-switching-options interfaces xe-0/0/0.0
[edit ethernet-switching-options interfaces xe-0/0/0.0]
user@switch# delete no-mac-learning
```

- To verify the status of MAC learning on the QFX Series:

```
user@switch> show ethernet-switching table
Learning stats: 10 learn msg rcvd, 2 error, 0 forced update
Interface Local pkts Transit pkts Error
xe-0/0/0.0 0 6 1
xe-0/0/22.0 0 0 0
xe-0/0/1.0 0 4 1
xe-0/0/2.0 0 0 0
xe-0/0/3.0 0 0 0
xe-0/0/4.0 0 0 0
xe-0/0/19.0 0 0 0
xe-0/0/18.0 0 0 0
xe-0/0/9.0 0 0 0
```

## Example: Setting Up Bridging with Multiple VLANs

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices in a LAN—storage devices, file servers, and other network components—and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Example: Setting Up Bridging with Multiple VLANs” on page 1458](#).

This example describes how to configure bridging for the QFX Series and how to create two VLANs to segment the LAN:

- [Requirements on page 1452](#)
- [Overview and Topology on page 1452](#)
- [Configuration on page 1453](#)
- [Verification on page 1455](#)

### Requirements

This example uses the following hardware and software components:

- A configured and provisioned QFX3500 switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview and Topology

Switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as file servers. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and enables you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers and other resources. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/0/0 through xe-0/1/15, are excluded.)

**Table 127: Components of the Multiple VLAN Topology**

Property	Settings
Switch hardware	QFX3500 switch configured with 48 10-Gbps Ethernet ports (xe-0/0/0 through xe-0/0/47)

Table 127: Components of the Multiple VLAN Topology (*continued*)

Property	Settings
VLAN names and tag IDs	<b>sales</b> , tag 100 <b>support</b> , tag 200
VLAN subnets	<b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Interfaces in VLAN <b>sales</b>	File servers: <b>xe-0/0/20</b> and <b>xe-0/0/21</b>
Interfaces in VLAN <b>support</b>	File servers: <b>xe-0/0/46</b> and <b>xe-0/0/47</b>
Unused interfaces	<b>xe-0/0/2</b> and <b>xe-0/0/25</b>

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

### Configuration

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/20 unit 0 description "Sales file server port"
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/46 unit 0 description "Support file server port"
set interfaces xe-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

**Step-by-Step Procedure** Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the file server in the **sales** VLAN:  

```
[edit interfaces xe-0/0/20 unit 0]
user@switch# set description "Sales file server port"
user@switch# set family ethernet-switching vlan members sales
```
2. Configure the interface for the file server in the **support** VLAN:  

```
[edit interfaces xe-0/0/46 unit 0]
user@switch# set description "Support file server port"
user@switch# set family ethernet-switching vlan members support
```
3. Create the subnet for the **sales** broadcast domain:  

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25
```
4. Create the subnet for the **support** broadcast domain:  

```
[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25
```
5. Configure the VLAN tag IDs for the **sales** and **support** VLANs:  

```
[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200
```
6. To route traffic between the **sales** and **support** VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:  

```
[edit vlans]
user@switch# set sales l3-interface vlan.0
user@switch# set support l3-interface vlan.1
```

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
 xe-0/0/20 {
 unit 0 {
 description "Sales file server port";
 family ethernet-switching {
 vlan members sales;
 }
 }
 }
 xe-0/0/46 {
 unit 0 {
 description "Support file server port";
 family ethernet-switching {
 vlan members support;
 }
 }
 }
 vlans {
 unit 0 {
 family inet address 192.0.2.1/25;
 }
 unit 1 {
 family inet address 192.0.2.129/25;
 }
 }
}
```

```

 }
 }
}
vllans {
 sales {
 vllan-id 100;
 interface xe-0/0/0.0;
 interface xe-0/0/3/0;
 interface xe-0/0/20.0;
 interface xe-0/0/22.0;
 l3-interface vllan 0;
 }
 support {
 vllan-id 200;
 interface xe-0/0/24.0;
 interface xe-0/0/26.0;
 interface xe-0/0/44.0;
 interface xe-0/0/46.0;
 l3-interface vllan 1;
 }
}
}

```

**TIP:** To quickly configure the sales and support VLAN interfaces, issue the `load merge terminal` command. Then copy the hierarchy and paste it into the switch terminal window.

## Verification

Verify that the **sales** and **support** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1455](#)
- [Verifying That Traffic Is Being Routed Between the Two VLANs on page 1456](#)
- [Verifying That Traffic Is Being Switched Between the Two VLANs on page 1456](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** To list all VLANs configured on the switch, use the **show vlans** command:

```

user@switch> show vlans
Name Tag Interfaces
default
 xe-0/0/1.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/5.0,

 xe-0/0/18.0, xe-0/0/19.0, xe-0/0/21.0, xe-0/0/23.0*,
 xe-0/0/25.0, xe-0/0/27.0, xe-0/0/28.0, xe-0/0/29.0,

```

```

xe-0/0/30.0, xe-0/0/31.0, xe-0/0/32.0, xe-0/0/33.0,
xe-0/0/34.0, xe-0/0/35.0, xe-0/0/36.0, xe-0/0/37.0,
xe-0/0/38.0, xe-0/0/39.0, xe-0/0/40.0, xe-0/0/41.0,
xe-0/0/42.0, xe-0/0/43.0, xe-0/0/45.0, xe-0/0/47.0,
xe-0/1/0.0*, xe-0/1/1.0*, xe-0/1/2.0*, xe-0/1/3.0*

sales 100
 xe-0/0/0.0*, xe-0/0/3.0, xe-0/0/20.0, xe-0/0/22.0

support 200
 xe-0/0/0.24, xe-0/0/26.0, xe-0/0/44.0, xe-0/0/46.0*

mgmt
 me0.0*

```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/0.0**, **xe-0/0/3.0**, **xe-0/0/20.0**, and **xe-0/0/22.0**. VLAN **support** has a tag ID of 200 and is associated with interfaces **xe-0/0/24.0**, **xe-0/0/26.0**, **xe-0/0/44.0**, and **xe-0/0/46.0**.

#### *Verifying That Traffic Is Being Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** List the Layer 3 routes in the switch Address Resolution Protocol (ARP) table:

```

user@switch> show arp
MAC Address Address Name Flags
00:00:0c:06:2c:0d 192.0.2.3 vlan.0 None
00:13:e2:50:62:e0 192.0.2.11 vlan.1 None

```

**Meaning** Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

#### *Verifying That Traffic Is Being Switched Between the Two VLANs*

**Purpose** Verify that learned entries are being added to the Ethernet switching table.

**Action** List the contents of the Ethernet switching table:

```

user@switch> show ethernet-switching table

Ethernet-switching table: 8 entries, 5 learned
VLAN MAC address Type Age Interfaces
default * Flood - All-members
default 00:00:05:00:00:01 Learn - xe-0/0/10.0
default 00:00:5e:00:01:09 Learn - xe-0/0/13.0
default 00:19:e2:50:63:e0 Learn - xe-0/0/23.0
sales * Flood - All-members
sales 00:00:5e:00:07:09 Learn - xe-0/0/0.0

```

support	*	Flood	- All-members
support	00:00:5e:00:01:01	Learn	- xe-0/0/46.0

**Meaning** The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **xe-0/0/0.0** and **xe-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1433](#)
- [Understanding Bridging](#)

## Bridging and VLAN Configuration Examples (ELS CLI Only)

- [Example: Disabling MAC Learning on page 1457](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 1458](#)

### Example: Disabling MAC Learning

By default, MAC learning is enabled on the QFX Series. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning on the QFX Series. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Example: Disabling MAC Learning” on page 1450](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

- To disable MAC learning in a VLAN:

```
[edit]
user@switch# set vlans vlan10 switch-options interface xe-0/0/0.0 no-mac-learning
```

- To reenable MAC learning:

```
[edit] vlans vlan10 switch-options interface xe-0/0/0.0
user@switch# delete no-mac-learning
```

- To verify the status of MAC learning on the QFX Series:

```
user@switch> show ethernet-switching table
Learning stats: 10 learn msg rcvd, 2 error, 0 forced update
Interface Local pkts Transit pkts Error
xe-0/0/0.0 0 6 1
xe-0/0/22.0 0 0 0
xe-0/0/1.0 0 4 1
xe-0/0/2.0 0 0 0
xe-0/0/3.0 0 0 0
xe-0/0/4.0 0 0 0
xe-0/0/19.0 0 0 0
xe-0/0/18.0 0 0 0
```

xe-0/0/9.0                      0                      0                      0

## Example: Setting Up Bridging with Multiple VLANs

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices in a LAN—storage devices, file servers, and other network components—and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure bridging for the QFX Series and how to create two VLANs to segment the LAN:

**NOTE:** This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#). If your switch runs software that does not support ELS, see [“Example: Setting Up Bridging with Multiple VLANs” on page 1451](#).

- [Requirements on page 1458](#)
- [Overview and Topology on page 1458](#)
- [Configuration on page 1459](#)
- [Verification on page 1461](#)

### Requirements

---

This example uses the following hardware and software components:

- A configured and provisioned QFX3500 switch
- Junos OS Release 13.2X50-D15 or later for the QFX Series

### Overview and Topology

---

Switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as file servers. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and enables you

to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers and other resources. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.)

**Table 128: Components of the Multiple VLAN Topology**

Property	Settings
Switch hardware	QFX3500 switch configured with 48 10-Gbps Ethernet ports (xe-0/0/0 through xe-0/0/47)
VLAN names and tag IDs	<b>sales</b> , tag 100 <b>support</b> , tag 200
VLAN subnets	<b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Interfaces in VLAN <b>sales</b>	File servers: xe-0/0/20 and xe-0/0/21
Interfaces in VLAN <b>support</b>	File servers: xe-0/0/46 and xe-0/0/47
Unused interfaces	xe-0/0/2 and xe-0/0/25

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

### Configuration

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members sales
```

```

set interfaces xe-0/0/20 unit 0 description "Sales file server port"
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/46 unit 0 description "Support file server port"
set interfaces xe-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3-interface irb.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface irb.1

```

### Step-by-Step Procedure

Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the file server in the **sales** VLAN:

```

[edit interfaces xe-0/0/20 unit 0]
user@switch# set description "Sales file server port"
user@switch# set family ethernet-switching vlan members sales

```

2. Configure the interface for the file server in the **support** VLAN:

```

[edit interfaces xe-0/0/46 unit 0]
user@switch# set description "Support file server port"
user@switch# set family ethernet-switching vlan members support

```

3. Create the subnet for the **sales** broadcast domain:

```

[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25

```

4. Create the subnet for the **support** broadcast domain:

```

[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25

```

5. Configure the VLAN tag IDs for the **sales** and **support** VLANs:

```

[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200

```

6. To route traffic between the **sales** and **support** VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:

```

[edit vlans]
user@switch# set sales l3-interface irb.0
user@switch# set support l3-interface irb.1

```

Display the results of the configuration:

```

user@switch> show configuration
interfaces {
 xe-0/0/20 {
 unit 0 {
 description "Sales file server port";
 family ethernet-switching {
 vlan members sales;
 }
 }
 }
 xe-0/0/46 {

```

```

 unit 0 {
 description "Support file server port";
 family ethernet-switching {
 vlan members support;
 }
 }
 vlans {
 unit 0 {
 family inet address 192.0.2.1/25;
 }
 unit 1 {
 family inet address 192.0.2.129/25;
 }
 }
}
}
vlans {
 sales {
 vlan-id 100;
 interface xe-0/0/0.0;
 interface xe-0/0/3.0;
 interface xe-0/0/20.0;
 interface xe-0/0/22.0;
 l3-interface irb0;
 }
 support {
 vlan-id 200;
 interface xe-0/0/24.0;
 interface xe-0/0/26.0;
 interface xe-0/0/44.0;
 interface xe-0/0/46.0;
 l3-interface irb1;
 }
}
}

```

**TIP:** To quickly configure the sales and support VLAN interfaces, issue the `load merge terminal` command. Then copy the hierarchy and paste it into the switch terminal window.

## Verification

Verify that the **sales** and **support** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1462](#)
- [Verifying That Traffic Is Being Routed Between the Two VLANs on page 1462](#)
- [Verifying That Traffic Is Being Switched Between the Two VLANs on page 1463](#)

**Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces**

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** To list all VLANs configured on the switch, use the **show vlans** command:

```
user@switch> show vlans
Name Tag Interfaces
default
xe-0/0/1.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/5.0,
xe-0/0/6.0, xe-0/0/7.0, xe-0/0/8.0, xe-0/0/9.0,
xe-0/0/10.0*, xe-0/0/11.0, xe-0/0/12.0, xe-0/0/13.0*,
xe-0/0/14.0, xe-0/0/15.0, xe-0/0/16.0, xe-0/0/17.0,
xe-0/0/18.0, xe-0/0/19.0, xe-0/0/21.0, xe-0/0/23.0*,
xe-0/0/25.0, xe-0/0/27.0, xe-0/0/28.0, xe-0/0/29.0,
xe-0/0/30.0, xe-0/0/31.0, xe-0/0/32.0, xe-0/0/33.0,
xe-0/0/34.0, xe-0/0/35.0, xe-0/0/36.0, xe-0/0/37.0,
xe-0/0/38.0, xe-0/0/39.0, xe-0/0/40.0, xe-0/0/41.0,
xe-0/0/42.0, xe-0/0/43.0, xe-0/0/45.0, xe-0/0/47.0,
xe-0/1/0.0*, xe-0/1/1.0*, xe-0/1/2.0*, xe-0/1/3.0*

sales 100
xe-0/0/0.0*, xe-0/0/3.0, xe-0/0/20.0, xe-0/0/22.0

support 200
xe-0/0/0.24, xe-0/0/26.0, xe-0/0/44.0, xe-0/0/46.0*

mgmt
me0.0*
```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/0.0**, **xe-0/0/3.0**, **xe-0/0/20.0**, and **xe-0/0/22.0**. VLAN **support** has a tag ID of 200 and is associated with interfaces **xe-0/0/24.0**, **xe-0/0/26.0**, **xe-0/0/44.0**, and **xe-0/0/46.0**.

**Verifying That Traffic Is Being Routed Between the Two VLANs**

**Purpose** Verify routing between the two VLANs.

**Action** List the Layer 3 routes in the switch Address Resolution Protocol (ARP) table:

```
user@switch> show arp
MAC Address Address Name Flags
00:00:0c:06:2c:0d 192.0.2.3 vlan.0 None
00:13:e2:50:62:e0 192.0.2.11 vlan.1 None
```

**Meaning** Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

**Verifying That Traffic Is Being Switched Between the Two VLANs**

**Purpose** Verify that learned entries are being added to the Ethernet switching table.

**Action** List the contents of the Ethernet switching table:

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table: 8 entries, 5 learned
```

VLAN	MAC address	Type	Age	Interfaces
default	*	Flood		- All-members
default	00:00:05:00:00:01	Learn		- xe-0/0/10.0
default	00:00:5e:00:01:09	Learn		- xe-0/0/13.0
default	00:19:e2:50:63:e0	Learn		- xe-0/0/23.0
sales	*	Flood		- All-members
sales	00:00:5e:00:07:09	Learn		- xe-0/0/0.0
support	*	Flood		- All-members
support	00:00:5e:00:01:01	Learn		- xe-0/0/46.0

**Meaning** The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **xe-0/0/0.0** and **xe-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

## Proxy ARP Example (Original CLI Only)

---

- [Example: Configuring Proxy ARP on page 1463](#)

### Example: Configuring Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) on switch to enable the switch to respond to ARP queries for network addresses by offering its own MAC address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

This example shows how to configure proxy ARP on an access switch:

- [Requirements on page 1463](#)
- [Overview and Topology on page 1464](#)
- [Configuration on page 1464](#)
- [Verification on page 1465](#)

#### Requirements

---

This example uses the following hardware and software components:

- One QFX3500 switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview and Topology

This example shows the configuration of proxy ARP on an interface using restricted mode. In restricted mode, the switch does not act as a proxy for hosts on the same subnet.

The topology for this example consists of one switch. When a host wants to communicate with a host that is not already in its ARP table, it broadcasts an ARP request for the MAC address of the destination host:

- When proxy ARP is not enabled, a host that shares the same IP address replies directly to the ARP request, providing its MAC address, and future transmissions are sent directly to the destination host MAC address.
- When proxy ARP is enabled, the switch responds to ARP requests, providing the switch's MAC address—even when the destination IP address is the same as the source IP address. Thus, communications must be sent through the switch and then routed through the switch to the appropriate destination.

## Configuration

To configure proxy ARP, perform the following tasks:

### CLI Quick Configuration

To quickly configure proxy ARP on an interface, copy the following command and paste it into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 unit 0 proxy-arp restricted
```

### Step-by-Step Procedure

You configure proxy ARP on individual interfaces.

1. To configure proxy ARP on an interface:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 proxy-arp restricted
```

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid a situation wherein the switch's response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

```
[edit interfaces]
user@switch# set xe-0/0/3 no-gratuitous-arp-request
```

**Results** Display the results of the configuration:

```
user@switch> show configuration
interfaces {
 xe-0/0/3 {
 unit 0 {
 proxy-arp restricted;
 family ethernet-switching;
```

```
 }
}
```

## Verification

To verify that the switch is sending proxy ARP messages, perform these tasks:

- [Verifying That the Switch Is Sending Proxy ARP Messages on page 1465](#)

### *Verifying That the Switch Is Sending Proxy ARP Messages*

**Purpose** Verify that the switch is sending proxy ARP messages.

**Action** List the system statistics for ARP messages:

```
user@switch> show system statistics arp
arp:
 90060 datagrams received
 34 ARP requests received
 610 ARP replies received
 2 resolution request received
 0 unrestricted proxy requests
 0 restricted proxy requests
 0 received proxy requests
 0 unrestricted proxy requests not proxied
 0 restricted proxy requests not proxied
 0 datagrams with bogus interface
 0 datagrams with incorrect length
 0 datagrams for non-IP protocol
 0 datagrams with unsupported op code
 0 datagrams with bad protocol address length
 0 datagrams with bad hardware address length
 0 datagrams with multicast source address
 0 datagrams with multicast target address
 0 datagrams with my own hardware address
 0 datagrams for an address not on the interface
 0 datagrams with a broadcast source address
 294 datagrams with source address duplicate to mine
 89113 datagrams which were not for me
 0 packets discarded waiting for resolution
 0 packets sent after waiting for resolution
 309 ARP requests sent
 35 ARP replies sent
 0 requests for memory denied
 0 requests dropped on entry
 0 requests dropped during retry
 0 requests dropped due to interface deletion
 0 requests on unnumbered interfaces
 0 new requests on unnumbered interfaces
 0 replies for from unnumbered interfaces
 0 requests on unnumbered interface with non-subnetted donor
 0 replies from unnumbered interface with non-subnetted donor
```

**Meaning** The statistics show that two proxy ARP requests were received. The **unrestricted proxy requests not proxied** and **restricted proxy requests not proxied** fields indicate that all the unproxied ARP requests received have been proxied by the switch.

## STP Configuration Examples

---

- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466](#)
- [Example: Configuring Network Regions for VLANs with MSTP on page 1480](#)
- [Example: Connecting an Access Switch to a Distribution Switch on page 1504](#)
- [Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1513](#)
- [Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 1517](#)
- [Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1521](#)

### Example: Configuring Faster Convergence and Improving Network Stability with RSTP

The QFX Series products use Rapid Spanning Tree Protocol (RSTP) to provide a loop-free topology. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state. RSTP provides quicker reconvergence time than original STP because it uses protocol handshake messages rather than fixed timeouts. Eliminating the need to wait for timers to expire makes RSTP more efficient than STP.

This example describes how to configure RSTP on four QFX3500 switches:

- [Requirements on page 1466](#)
- [Overview and Topology on page 1467](#)
- [Configuring RSTP on Switch 1 on page 1468](#)
- [Configuring RSTP on Switch 2 on page 1471](#)
- [Configuring RSTP on Switch 3 on page 1473](#)
- [Configuring RSTP on Switch 4 on page 1476](#)
- [Verification on page 1478](#)

#### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

Overview and Topology

In this example, QFX3500 switches are connected in the topology displayed in Figure 17 on page 1467 to create a loop-free topology.

Figure 17: Network Topology for RSTP

The interfaces shown in Table 129 on page 1467 will be configured for RSTP.

**i** **NOTE:** You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 129: Topology for Configuring RSTP on the QFX Series

Components	Settings
Switch 1	The following ports on Switch 1 are connected in this way: <ul style="list-style-type: none"><li>• xe-0/0/9 is connected to Switch 2</li><li>• xe-0/0/13 is connected to Switch 4</li><li>• xe-0/0/11 is connected to Switch 3</li></ul>
Switch 2	The following ports on Switch 2 are connected in this way: <ul style="list-style-type: none"><li>• xe-0/0/14 is connected to Switch 1</li><li>• xe-0/0/18 is connected to Switch 3</li></ul>

Table 129: Topology for Configuring RSTP on the QFX Series (*continued*)

Components	Settings
Switch 3	<p>The following ports on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/26</b> is connected to Switch 1</li> <li>• <b>xe-0/0/28</b> is connected to Switch 2</li> <li>• <b>xe-0/0/24</b> is connected to Switch 4</li> </ul>
Switch 4	<p>The following ports on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/19</b> is connected to Switch 1</li> <li>• <b>xe-0/0/23</b> is connected to Switch 3</li> </ul>
VLAN names and tag IDs	<p><b>sales-vlan</b>, tag 10  <b>engineering-vlan</b>, tag 20  <b>publications-vlan</b>, tag 30  <b>support-vlan</b>, tag 40</p>

This configuration example creates a loop-free topology between four switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

### Configuring RSTP on Switch 1

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

[edit]

```
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
```

```

set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/13.0 cost 1000
set protocols rstp interface xe-0/0/13.0 mode point-to-point
set protocols rstp interface xe-0/0/9.0 cost 1000
set protocols rstp interface xe-0/0/9.0 mode point-to-point
set protocols rstp interface xe-0/0/11.0 cost 1000
set protocols rstp interface xe-0/0/11.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 1:

1. Configure the VLANs `sales-vlan`, `engineering-vlan` and `publications-vlan`, and `support-vlan`:  
  

```

[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30

```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:  
  

```

[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]

```
3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

- ```

[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk

```
4. Configure RSTP on the switch:

```

[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface xe-0/0/13.0 cost 1000
user@switch1# rstp interface xe-0/0/13.0 mode point-to-point
user@switch1# rstp interface xe-0/0/9.0 cost 1000

```

```
user@switch1# rstp interface xe-0/0/9.0 mode point-to-point
user@switch1# rstp interface xe-0/0/11.0 cost 1000
user@switch1# rstp interface xe-0/0/11.0 mode point-to-point
```

Results Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  xe-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
    interface xe-0/0/13.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/9.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/11.0 {
      cost 1000;
      mode point-to-point;
    }
  }
}
```

```

}
vlans {
  sales-vlan {
    vlan-id 10;
  }
  engineering-vlan {
    vlan-id 20;
  }
  publications-vlan {
    vlan-id 30;
  }
  support-vlan {
    vlan-id 40;
  }
}

```

Configuring RSTP on Switch 2

CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

NOTE: If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface xe-0/0/14.0 cost 1000
set protocols rstp interface xe-0/0/14.0 mode point-to-point
set protocols rstp interface xe-0/0/18.0 cost 1000
set protocols rstp interface xe-0/0/18.0 mode point-to-point

```

Step-by-Step Procedure

To configure interfaces and RSTP on Switch 2:

1. Configure the VLANs **sales-vlan**, **engineering-vlan** and **publications-vlan**, and **support-vlan**:

```
[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40
```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
```
3. Configure the port mode for the interfaces:

NOTE: If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the **interface-mode** statement instead of the **port-mode** statement. The **port-mode** statement has been replaced with the **interface-mode** statement.

- ```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
```
4. Configure RSTP on the switch:
 

```
[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface xe-0/0/14.0 cost 1000
user@switch2# rstp interface xe-0/0/14.0 mode point-to-point
user@switch2# rstp interface xe-0/0/18.0 cost 1000
user@switch2# rstp interface xe-0/0/18.0 mode point-to-point
```

### Results

Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
 xe-0/0/14 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
 }
}
```

```

xe-0/0/18 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
}
}
protocols {
 rstp {
 bridge-priority 32k;
 interface xe-0/0/14.0 {
 cost 1000;
 mode point-to-point;
 }
 interface xe-0/0/18.0 {
 cost 1000;
 mode point-to-point;
 }
 }
}
}
vlangs {
 sales-vlan {
 vlan-id 10;
 }
 engineering-vlan {
 vlan-id 20;
 }
 publications-vlan {
 vlan-id 30;
 }
 support-vlan {
 vlan-id 40;
 }
}
}

```

### Configuring RSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlangs sales-vlan description "Sales VLAN"

```

```

set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface xe-0/0/26.0 cost 1000
set protocols rstp interface xe-0/0/26.0 mode point-to-point
set protocols rstp interface xe-0/0/28.0 cost 1000
set protocols rstp interface xe-0/0/28.0 mode point-to-point
set protocols rstp interface xe-0/0/24.0 cost 1000
set protocols rstp interface xe-0/0/24.0 mode point-to-point

```

#### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface xe-0/0/26.0 cost 1000
user@switch3# rstp interface xe-0/0/26.0 mode point-to-point
user@switch3# rstp interface xe-0/0/28.0 cost 1000
user@switch3# rstp interface xe-0/0/28.0 mode point-to-point
user@switch3# rstp interface xe-0/0/24.0 cost 1000
user@switch3# rstp interface xe-0/0/24.0 mode point-to-point
```

**Results** Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
 xe-0/0/26 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
 }
 xe-0/0/28 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
 }
 xe-0/0/24 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
 }
}
protocols {
 rstp {
 bridge-priority 8k;
 interface xe-0/0/26.0 {
 cost 1000;
 mode point-to-point;
 }
 interface xe-0/0/28.0 {
 cost 1000;
 mode point-to-point;
 }
 }
}
```

```

 interface xe-0/0/24.0 {
 cost 1000;
 mode point-to-point;
 }
 }
 bridge-priority 8k;
}
}
}
}
}
}
vpls {
 sales-vlan {
 vlan-id 10;
 }
 engineering-vlan {
 vlan-id 20;
 }
 publications-vlan {
 vlan-id 30;
 }
 support-vlan {
 vlan-id 40;
 }
}
}

```

#### Configuring RSTP on Switch 4

##### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/23.0 cost 1000
set protocols rstp interface xe-0/0/23.0 mode point-to-point
set protocols rstp interface xe-0/0/19.0 cost 1000
set protocols rstp interface xe-0/0/19.0 mode point-to-point

```

**Step-by-Step Procedure** To configure interfaces and RSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch4# rstp bridge-priority 16k
user@switch4# rstp interface all cost 1000
user@switch4# rstp interface xe-0/0/23.0 cost 1000
user@switch4# rstp interface xe-0/0/23.0 mode point-to-point
user@switch4# rstp interface xe-0/0/19.0 cost 1000
user@switch4# rstp interface xe-0/0/19.0 mode point-to-point
```

**Results** Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
 xe-0/0/23 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
 }
}
```

```
xe-0/0/19 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members [10 20 30 40];
 }
 }
 }
}
protocols {
 rstp {
 bridge-priority 16k;
 interface xe-0/0/23.0 {
 cost 1000;
 mode point-to-point;
 }
 interface xe-0/0/19.0 {
 cost 1000;
 mode point-to-point;
 }
 }
}
vlands {
 sales-vlan {
 vlan-id 10;
 }
 engineering-vlan {
 vlan-id 20;
 }
 publications-vlan {
 vlan-id 30;
 }
 support-vlan {
 vlan-id 40;
 }
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying RSTP Configuration on Switch 1 on page 1478](#)
- [Verifying RSTP Configuration on Switch 2 on page 1479](#)
- [Verifying RSTP Configuration on Switch 3 on page 1479](#)
- [Verifying RSTP Configuration on Switch 4 on page 1480](#)

### *Verifying RSTP Configuration on Switch 1*

**Purpose** Verify that the RSTP configuration on Switch 1 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/13.0	128:527	128:525	16384.0019e25040e0	1000	BLK	ALT
xe-0/0/9.0	128:529	128:513	32768.0019e2503d20	1000	BLK	ALT
xe-0/0/11.0	128:531	128:513	8192.0019e25051e0	1000	FWD	ROOT

**Meaning** See the topology in [Figure 17 on page 1467](#). The operational mode command **show spanning-tree interface** shows that **xe-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocked.

#### *Verifying RSTP Configuration on Switch 2*

**Purpose** Verify that the RSTP configuration on Switch 2 is correct.

**Action** In operational mode issue the **show spanning-tree interface** command:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/14.0	128:513	128:513	32768.0019e2503d20	1000	BLK	DESC
xe-0/0/18.0	128:519	128:515	8192.0019e25051e0	1000	FWD	ROOT

**Meaning** See the topology in [Figure 17 on page 1467](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/18.0** is in a forwarding state and the root port. The other interface on Switch 2 is blocked.

#### *Verifying RSTP Configuration on Switch 3*

**Purpose** Verify that the RSTP configuration on Switch 3 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch3> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/26.0	128:513	128:513	8192.0019e25051e0	1000	FWD	DESC
xe-0/0/28.0	128:515	128:515	8192.0019e25051e0	1000	FWD	DESC
xe-0/0/24.0	128:517	128:517	8192.0019e25051e0	1000	FWD	DESC

**Meaning** See the topology in [Figure 17 on page 1467](#). The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

#### *Verifying RSTP Configuration on Switch 4*

**Purpose** Verify the RSTP configuration on Switch 4.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch4> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/23.0	128:523	128:517	8192.0019e25051e0	1000	FWD	ROOT
xe-0/0/19.0	128:525	128:525	16384.0019e25040e0	1000	FWD	DESC

**Meaning** See the topology in [Figure 17 on page 1467](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/23.0** is the root interface and is in the forwarding state.

### Example: Configuring Network Regions for VLANs with MSTP

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning-tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

You can create up to 64 MSTI instances for QFX Series products, and each MSTI supports up to 4094 VLANs.

This example describes how to configure MSTP on four QFX3500 switches:

- [Requirements on page 1481](#)
- [Overview and Topology on page 1481](#)
- [Configuring MSTP on Switch 1 on page 1484](#)
- [Configuring MSTP on Switch 2 on page 1487](#)
- [Configuring MSTP on Switch 3 on page 1490](#)
- [Configuring MSTP on Switch 4 on page 1493](#)
- [Verification on page 1496](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

---

### Overview and Topology

When the number of VLANs grows in a network, MSTP provides a more faster way of creating a loop-free topology using MSTIs. Each MSTI in the spanning-tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.

Figure 18: Network Topology for MSTP

The interfaces shown in [Table 130 on page 1482](#) will be configured for MSTP.

**NOTE:** You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

Table 130: Topology for Configuring MSTP on the QFX Series

Components	Settings
Switch 1	<p>The following ports on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"> <li>xe-0/0/9 is connected to Switch 2</li> <li>xe-0/0/13 is connected to Switch 4</li> <li>xe-0/0/11 is connected to Switch 3</li> </ul>
Switch 2	<p>The following ports on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"> <li>xe-0/0/14 is connected to Switch 1</li> <li>xe-0/0/18 is connected to Switch 3</li> </ul>

Table 130: Topology for Configuring MSTP on the QFX Series (*continued*)

Components	Settings
Switch 3	<p>The following ports on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/26</b> is connected to Switch 1</li> <li>• <b>xe-0/0/28</b> is connected to Switch 2</li> <li>• <b>xe-0/0/24</b> is connected to Switch 4</li> </ul>
Switch 4	<p>The following ports on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/19</b> is connected to Switch 1</li> <li>• <b>xe-0/0/23</b> is connected to Switch 3</li> </ul>
VLAN names and tag IDs	<b>sales-vlan</b> , tag 10 <b>engineering-vlan</b> , tag 20 <b>publications-vlan</b> , tag 30 <b>support-vlan</b> , tag 40
MSTIs	1 2

The topology in [Figure 18 on page 1482](#) shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The **sales-vlan** supports sales traffic and has a VLAN tag identifier of 10.
- The **engineering-vlan** supports data traffic and has a VLAN tag identifier of 20.
- The **publications-vlan** supports publications VLAN traffic (for supplicants that fail 802.1X authentication) and has a VLAN tag identifier of 30.
- The **support-vlan** supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, 1 and 2, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

## Configuring MSTP on Switch 1

**CLI Quick Configuration** To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/13.0 cost 1000
set protocols mstp interface xe-0/0/13.0 mode point-to-point
set protocols mstp interface xe-0/0/9.0 cost 1000
set protocols mstp interface xe-0/0/9.0 mode point-to-point
set protocols mstp interface xe-0/0/11.0 cost 1000
set protocols mstp interface xe-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface xe-0/0/11.0 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

**Step-by-Step Procedure** To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30
user@switch1# set support-vlan description "Support VLAN"
user@switch1# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface xe-0/0/13.0 cost 1000
user@switch1# mstp interface xe-0/0/13.0 mode point-to-point
user@switch1# mstp interface xe-0/0/9.0 cost 1000
user@switch1# mstp interface xe-0/0/9.0 mode point-to-point
user@switch1# mstp interface xe-0/0/11.0 cost 4000
user@switch1# mstp interface xe-0/0/11.0 mode point-to-point
user@switch1# mstp msti 1 bridge-priority 16k
user@switch1# mstp msti 1 vlan [10 20]
user@switch1# mstp msti 1 interface xe-0/0/11.0 cost 4000
user@switch1# mstp msti 2 bridge-priority 8k
user@switch1# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
 xe-0/0/13 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members 10;
 members 20;

}

```

### Configuring MSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface xe-0/0/14.0 cost 1000
set protocols mstp interface xe-0/0/14.0 mode point-to-point
set protocols mstp interface xe-0/0/18.0 cost 1000
set protocols mstp interface xe-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
user@switch2# mstp interface xe-0/0/14.0 cost 1000
user@switch2# mstp interface xe-0/0/14.0 mode point-to-point
user@switch2# mstp interface xe-0/0/18.0 cost 1000
user@switch2# mstp interface xe-0/0/18.0 mode point-to-point
user@switch2# mstp interface all cost 1000
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]
```

### Results

Check the results of the configuration:

```
user@switch2> show configuration

}
```

### Configuring MSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface xe-0/0/26.0 cost 1000
set protocols mstp interface xe-0/0/26.0 mode point-to-point
set protocols mstp interface xe-0/0/28.0 cost 1000
set protocols mstp interface xe-0/0/28.0 mode point-to-point
set protocols mstp interface xe-0/0/24.0 cost 1000
set protocols mstp interface xe-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]
```

#### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface xe-0/0/26.0 cost 1000
user@switch3# mstp interface xe-0/0/26.0 mode point-to-point
user@switch3# mstp interface xe-0/0/28.0 cost 1000
user@switch3# mstp interface xe-0/0/28.0 mode point-to-point
user@switch3# mstp interface xe-0/0/24.0 cost 1000
user@switch3# mstp interface xe-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
 xe-0/0/26 {
 unit 0 {
 family ethernet-switching {

 }
}

```

### Configuring MSTP on Switch 4

**CLI Quick Configuration** To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/23.0 cost 1000
set protocols mstp interface xe-0/0/23.0 mode point-to-point
set protocols mstp interface xe-0/0/19.0 cost 1000
set protocols mstp interface xe-0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface xe-0/0/23.0 cost 1000
user@switch4# mstp interface xe-0/0/23.0 mode point-to-point
user@switch4# mstp interface xe-0/0/19.0 cost 1000
user@switch4# mstp interface xe-0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

### Results

Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
 xe-0/0/23 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
```

```

 members 10;
 members 20;
 members 30;
 members 40;
 }
}
}
xe-0/0/19 {
 unit 0 {
 family ethernet-switching {
 port-mode trunk;
 vlan {
 members 10;
 members 20;
 members 30;
 members 40;
 }
 }
 }
}
}
protocols {
 mstp {
 configuration-name region1;
 bridge-priority 16k;
 interface xe-0/0/23.0 {

 }
}

```

```
}
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying MSTP Configuration on Switch 1 on page 1496](#)
- [Verifying MSTP Configuration on Switch 2 on page 1498](#)
- [Verifying MSTP Configuration on Switch 3 on page 1500](#)
- [Verifying MSTP Configuration on Switch 4 on page 1502](#)

### *Verifying MSTP Configuration on Switch 1*

**Purpose** Verify the MSTP configuration on Switch 1.

**Action** Use the operational mode commands:

```
user@switch1> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/13.0	128:527	128:525	16384.0019e25040e0	1000	FWD	ROOT
xe-0/0/9.0	128:529	128:513	32768.0019e2503d20	1000	BLK	ALT
xe-0/0/11.0	128:531	128:513	8192.0019e25051e0	4000	BLK	ALT

```
Spanning tree interface parameters for instance 1
```

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/13.0	128:527	128:525	16385.0019e25040e0	1000	FWD	ROOT
xe-0/0/9.0	128:529	128:513	32769.0019e2503d20	1000	BLK	ALT
xe-0/0/11.0	128:531	128:513	4097.0019e25051e0	4000	BLK	ALT

```
Spanning tree interface parameters for instance 2
```

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role

  - [Understanding MSTP on page 1420](#)

## Example: Connecting an Access Switch to a Distribution Switch

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect an access switch to a distribution switch:

- [Requirements on page 1504](#)
- [Overview and Topology on page 1505](#)
- [Configuring the Access Switch on page 1505](#)
- [Configuring the Distribution Switch on page 1509](#)
- [Verification on page 1511](#)

### Requirements

---

This example uses the following hardware and software components:

- For the distribution switch, one EX 4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an EX-UM-2XFP uplink module with two 10-Gigabit Ethernet XFP ports.
- For the access switch, one EX 3200-24P, which has twenty-four 1-Gigabit Ethernet ports, all of which support Power over Ethernet (PoE), and an uplink module with four 1-Gigabit Ethernet ports.

- Junos OS Release 11.1 or later for the QFX Series

### Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single access switch to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on the access switch's uplink module connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

[Table 131 on page 1505](#) explains the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

**Table 131: Components of the Topology for Connecting an Access Switch to a Distribution Switch**

Property	Settings
Access switch hardware	EX 3200-24P, 24 1-Gigabit Ethernet ports, all PoE-enabled ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 4-port 1-Gigabit Ethernet uplink module (EX-UM-4SFP)
Distribution switch hardware	EX 4200-24F, 24 1-Gigabit Ethernet fiber SPF ports ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 2-port 10-Gigabit Ethernet XFP uplink module (EX-UM-4SFP)
VLAN names and tag IDs	<b>sales</b> , tag 100 <b>support</b> , tag 200
VLAN subnets	<b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Trunk port interfaces	On the access switch: <b>ge-0/1/0</b> On the distribution switch: <b>ge-0/0/0</b>
Access port interfaces in VLAN <b>sales</b> (on access switch)	Avaya IP telephones: <b>ge-0/0/3</b> through <b>ge-0/0/19</b> Wireless access points: <b>ge-0/0/0</b> and <b>ge-0/0/1</b> Printers: <b>ge-0/0/22</b> and <b>ge-0/0/23</b> File servers: <b>ge-0/0/20</b> and <b>ge-0/0/21</b>
Access port interfaces in VLAN <b>support</b> (on access switch)	Avaya IP telephones: <b>ge-0/0/25</b> through <b>ge-0/0/43</b> Wireless access points: <b>ge-0/0/24</b> Printers: <b>ge-0/0/44</b> and <b>ge-0/0/45</b> File servers: <b>ge-0/0/46</b> and <b>ge-0/0/47</b>
Unused interfaces on access switch	<b>ge-0/0/2</b> and <b>ge-0/0/25</b>

### Configuring the Access Switch

To configure the access switch:

#### CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

[edit]

```

set interfaces ge-0/0/0 unit 0 description "Sales Wireless access point port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description "Sales phone port"
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description "Sales printer port"
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description "Sales file server port"
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/24 unit 0 description "Support wireless access point port"
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/26 unit 0 description "Support phone port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description "Support printer port"
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description "Support file server port"
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/1/0 unit 0 description "Uplink module port connection to distribution switch"
set interfaces ge-0/1/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/1/0 unit 0 family ethernet-switching native-vlan-id 1
set interfaces ge-0/1/0 unit 0 family ethernet-switching vlan members [sales support]
set interfaces vlan unit 0 family inet address 192.0.2.1/25
set interfaces vlan unit 1 family inet address 192.0.2.129/25
set vlans sales interface ge-0/0/0.0
set vlans sales interface ge-0/0/3.0
set vlans sales interface ge-0/0/22.0
set vlans sales interface ge-0/0/20.0
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans sales vlan-description "Sales VLAN"
set vlans support interface ge-0/0/24.0
set vlans support interface ge-0/0/26.0
set vlans support interface ge-0/0/44.0
set vlans support interface ge-0/0/46.0
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
set vlans support vlan-description "Support VLAN"

```

#### Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:  

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set description "Uplink module port connection to distribution switch"
user@access-switch# set ethernet-switching port-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:  

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching vlanmembers [sales support]
```
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):  

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching native-vlan-id 1
```
4. Configure the sales VLAN:  

```
[edit vlans sales]user@access-switch# set vlan-description "Sales VLAN"
user@access-switch# set vlan-id (VLANs) 100
user@access-switch# set l3-interface (VLAN) vlan.0
```
5. Configure the support VLAN:

- ```
[edit vlans support]user@access-switch# set vlan-description "Support
VLAN"user@access-switch# set vlan-id (VLANs) 200user@access-switch# set
l3-interface (VLAN) vlan.1
```
6. Create the subnet for the sales broadcast domain:

```
[edit interfaces]user@access-switch# set vlan unit 0 family inet address 192.0.2.1/25
```
 7. Create the subnet for the support broadcast domain:

```
[edit interfaces]user@access-switch# set vlan unit 1 family inet address 192.0.2.129/25
```
 8. Configure the interfaces in the sales VLAN:

```
[edit interfaces]user@access-switch# set ge-0/0/0 unit 0 description "Sales wireless
access point port"user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching
vlan members salesuser@access-switch# set ge-0/0/3 unit 0 description "Sales phone
port"user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members
salesuser@access-switch# set ge-0/0/20 unit 0 description "Sales file server
port"user@access-switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members
salesuser@access-switch# set ge-0/0/22 unit 0 description "Sales printer
port"user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members
sales
```
 9. Configure the interfaces in the support VLAN:

```
[edit interfaces]user@access-switch# set ge-0/0/24 unit 0 description "Support
wireless access point port"user@access-switch# set ge-0/0/24 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/26 unit 0
description "Support phone port"user@access-switch# set ge-0/0/26 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/44 unit 0
description "Support printer port"user@access-switch# set ge-0/0/44 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/46 unit 0
description "Support file server port"user@access-switch# set ge-0/0/46 unit 0 family
ethernet-switching vlan members support
```
 10. Configure descriptions and VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]user@access-switch# set sales vlan-description "Sales
VLAN"user@access-switch# set sales vlan-id 100user@access-switch# set support
vlan-description "Support VLAN"user@access-switch# set support vlan-id 200
```
 11. To route traffic between the sales and support VLANs and associate a Layer 3 interface with each VLAN:

```
[edit vlans]user@access-switch# set sales l3-interface vlan.0user@access-switch#
set support l3-interface vlan.1
```

Results Display the results of the configuration:

```
user@access-switch> show
interfaces {
  ge-0/0/0 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description "Sales phone port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
}
```

```
    }  
  }

  }  
}  
ge-0/1/0 {  
  unit 0 {  
    description "Uplink module port connection to distribution switch";  
    family ethernet-switching {  
      port-mode trunk;  
    }  
  }  
}
```

```

        vlan members [ sales support ];
        native-vlan-id 1;
    }
}
vlan {
    unit 0 {
        family inet address 192.0.2.1/25;
    }
    unit 1 {
        family inet address 192.0.2.129/25;
    }
}
vlangs {
    sales {
        vlan-id 100;
        vlan-description "Sales VLAN";
        l3-interface vlan.0;
    }
    support {
        vlan-id 200;
        vlan-description "Support VLAN";
        l3-interface vlan.1;
    }
}
}

```

TIP: To quickly configure the distribution switch, issue the `load merge terminal` command, then copy the hierarchy and paste it into the switch terminal window.

Configuring the Distribution Switch

To configure the distribution switch:

CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```

set interfaces ge-0/0/0 description "Connection to access switch"
set interfaces ge-0/0/0 ethernet-switching port-mode trunk
set interfaces ge-0/0/0 ethernet-switching vlan members [ sales support ]
set interfaces vlan unit 0 family inet address 192.0.2.2/25
set interfaces vlan unit 1 family inet address 192.0.2.130/25
set vlans sales vlan-description "Sales VLAN"
set vlans sales vlan-id 100
set vlans sales l3-interface vlan.0
set vlans support vlan-description "Support VLAN"
set vlans support vlan-id 200
set vlans support l3-interface vlan.1

```

**Step-by-Step
Procedure**

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:

[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set description "Connection to access switch" user@distribution-switch# set ethernet-switching port-mode trunk
2. Specify the VLANs to be aggregated on the trunk port:

[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set ethernet-switching vlan members [sales support]
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):

[edit interfaces]user@distribution-switch# set ge-0/0/0 ethernet-switching native-vlan-id 1
4. Configure the sales VLAN:

[edit vlans sales]user@distribution-switch# set vlan-description "Sales VLAN" user@distribution-switch# set vlan-id (VLANs) 100 user@distribution-switch# set l3-interface (VLAN) vlan.0
5. Configure the support VLAN:

[edit vlans support]user@distribution-switch# set vlan-description "Support VLAN" user@distribution-switch# set vlan-id (VLANs) 200 user@distribution-switch# set l3-interface (VLAN) vlan.1
6. Create the subnet for the sales broadcast domain:

[edit interfaces]user@distribution-switch# set vlan unit 0 family inet address 192.0.2.2/25
7. Create the subnet for the support broadcast domain:

[edit interfaces] user@distribution-switch# set vlan unit 1 family inet address 192.0.2.130/25

Results Display the results of the configuration:

```
user@distribution-switch> show
interfaces {
  ge-0/0/0 {
    description "Connection to access switch";
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan members [ sales support ];
        native-vlan-id 1;
      }
    }
  }
}
vlan {
  unit 0 {
    family inet address 192.0.2.2/25;
  }
  unit 1 {
    family inet address 192.0.2.130/25;
  }
}
}
```

```
vlan {  
  sales {  
    vlan-id 100;  
    vlan-description "Sales VLAN";  
    l3-interface vlan.0;  
  }  
  support {  
    vlan-id 200;  
    vlan-description "Support VLAN";  
    l3-interface vlan.1;  
  }  
}
```

TIP: To quickly configure the distribution switch, issue the `load merge terminal` command, then copy the hierarchy and paste it into the switch terminal window.

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the VLAN Members and Interfaces on the Access Switch on page 1511](#)
- [Verifying the VLAN Members and Interfaces on the Distribution Switch on page 1512](#)

Verifying the VLAN Members and Interfaces on the Access Switch

Purpose Verify that the **sales** and **support** have been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans
```

| Name | Tag | Interfaces |
|---------|-----|---|
| default | | ge-0/0/1.0, ge-0/0/2.0, ge-0/0/4.0, ge-0/0/5.0,
ge-0/0/6.0, ge-0/0/7.0, ge-0/0/8.0*, ge-0/0/9.0,

ge-0/0/10.0, ge-0/0/11.0*, ge-0/0/12.0, ge-0/0/13.0,
ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0,
ge-0/0/18.0, ge-0/0/19.0*, ge-0/0/21.0, ge-0/0/23.0,
ge-0/0/25.0, ge-0/0/27.0*, ge-0/0/28.0, ge-0/0/29.0,
ge-0/0/30.0, ge-0/0/31.0*, ge-0/0/32.0, ge-0/0/33.0,
ge-0/0/34.0, ge-0/0/35.0*, ge-0/0/36.0, ge-0/0/37.0,
ge-0/0/38.0, ge-0/0/39.0*, ge-0/0/40.0, ge-0/0/41.0,
ge-0/0/42.0, ge-0/0/43.0*, ge-0/0/45.0, ge-0/0/47.0,
ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0* |
| sales | 100 | ge-0/0/0.0*, ge-0/0/3.0, ge-0/0/20.0, ge-0/0/22.0,
ge-0/1/0.0*, |
| support | 200 | ge-0/0/24.0*, ge-0/0/26.0, ge-0/0/44.0, ge-0/0/46.0, |
| mgmt | | me0.0* |

Meaning The output shows the **sales** and **support** VLANs and the interfaces associated with them.

Verifying the VLAN Members and Interfaces on the Distribution Switch

Purpose Verify that the **sales** and **support** have been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans
```

| Name | Tag | Interfaces |
|---------|-----|---|
| default | | ge-0/0/1.0, ge-0/0/2.0, ge-0/0/3.0, ge-0/0/4.0,
ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0*, ge-0/0/8.0,

ge-0/0/9.0, ge-0/0/10.0*, ge-0/0/11.0, ge-0/0/12.0,
ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0,
ge-0/0/17.0, ge-0/0/18.0*, ge-0/0/19.0, ge-0/0/20.0,
ge-0/0/21.0, ge-0/0/22.0*, ge-0/0/23.0, ge-0/1/1.0*,
ge-0/1/2.0*, ge-0/1/3.0* |
| sales | 100 | ge-0/0/0.0* |
| support | 200 | ge-0/0/0.0* |
| mgmt | | me0.0* |

Meaning The output shows the **sales** and **support** VLANs associated to interface **ge-0/0/0.0**. Interface **ge-0/0/0.0** is the trunk interface connected to the access switch.

 - [Example: Setting Up Bridging with Multiple VLANs on page 1451](#)
 - [Understanding Bridging](#)

Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Configure BPDU protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

This example describes how to configure BPDU protection on access interfaces in QFX Series products in an RSTP topology:

- [Requirements on page 1513](#)
- [Overview and Topology on page 1514](#)
- [Configuration on page 1515](#)
- [Verification on page 1515](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series

- Two edged-linked switches in an RSTP topology

NOTE: By default, RSTP is enabled on the QFX Series.

Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, receipt of BPDUs on certain interfaces in an STP, RSTP, or MSTP topology. It can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on those interfaces that should not receive BPDUs.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If a BPDU is received on a BPDU-protected interface, the interface is disabled and stops forwarding frames.

Two switches are displayed in [Figure 19 on page 1514](#). In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are access ports.

This example shows you how to configure interface **xe-0/0/5** and interface **xe-0/0/6** as edge ports and how to configure BPDU protection. When BPDU protection is enabled, the interfaces transition to a blocking state when they receive BPDUs.

Figure 19: BPDU Protection Topology

Table 132 on page 1515 shows the components that will be configured for BPDU protection.

Table 132: Components of the Topology for Configuring BPDU Protection on the QFX Series

| Component | Settings |
|-------------------------------|--|
| Switch 1 (Distribution Layer) | Switch 1 is connected to Switch 2 on a trunk interface. |
| Switch 2 (Access Layer) | Switch 2 has these access ports that require BPDU protection: <ul style="list-style-type: none"> • xe-0/0/5 • xe-0/0/6 |

This configuration example uses an RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

Configuration

CLI Quick Configuration

To quickly configure BPDU protection on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/5 edge
set protocols rstp interface xe-0/0/6 edge
set protocols rstp bpdu-block-on-edge
```

Step-by-Step Procedure

To configure BPDU protection:

1. Configure interface `xe-0/0/5` and interface `xe-0/0/6` on Switch 2 as edge ports:

```
[edit protocols rstp]
user@switch# set interface xe-0/0/5 edge
user@switch# set interface xe-0/0/6 edge
```

2. Configure BPDU protection on all edge ports:

```
[edit protocols rstp]
user@switch# set bpdu-block-on-edge
```

Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/5.0 {
  edge;
}
interface xe-0/0/6.0 {
  edge;
}
bpdu-block-on-edge;
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before BPDU Protection Is Triggered on page 1516](#)
- [Verifying That BPDU Protection Is Working Correctly on page 1516](#)

Displaying the Interface State Before BPDU Protection Is Triggered

Purpose Before BPDUs are being received from the devices connected to interface **xe-0/0/5** and interface **xe-0/0/6**, confirm the interface state.

Action You can verify the interface state using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface | Port ID | Designated
port ID | Designated
bridge ID | Port
Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/1.0 | 128:514 | 128:514 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/2.0 | 128:515 | 128:515 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/3.0 | 128:516 | 128:516 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/4.0 | 128:517 | 128:517 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/5.0 | 128:518 | 128:518 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/6.0 | 128:519 | 128:519 | 32768.0019e2503f00 | 20000 | FWD | DESG |

[output truncated]

Meaning The output shows that interface **xe-0/0/5.0** and interface **xe-0/0/6.0** are designated ports in a forwarding state.

Verifying That BPDU Protection Is Working Correctly

Purpose In this example, the devices connected to Switch 2 start sending BPDUs to interface **xe-0/0/5.0** and interface **xe-0/0/6.0**. Verify that BPDU protection is configured on the interfaces.

Action You can verify that BPDU protection is configured on the interfaces by using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface | Port ID | Designated
port ID | Designated
bridge ID | Port
Cost | State | Role |
|--------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/1.0 | 128:514 | 128:514 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/2.0 | 128:515 | 128:515 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/3.0 | 128:516 | 128:516 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/4.0 | 128:517 | 128:517 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/5.0 | 128:518 | 128:518 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| (Bpdu-Incon) | | | | | | |
| xe-0/0/6.0 | 128:519 | 128:519 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| (Bpdu-Incon) | | | | | | |
| xe-0/0/7.0 | 128:520 | 128:1 | 16384.00aabbcc0348 | 20000 | FWD | ROOT |

[output truncated]

Meaning When BPDUs are sent from the devices to interface **xe-0/0/5.0** and interface **xe-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state blocks the interfaces and prevents them from forwarding traffic.

Disabling the BPDU protection configuration on an interface does not unblock the interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. Otherwise, use the operational mode command **clear ethernet-switching bpd-error** to unblock the interface.

If the devices connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state. In such cases, you need to find and repair the misconfiguration on the devices that is triggering the sending of BPDUs to Switch 2.

- Related Documentation**
- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466](#)
 - [Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 1517](#)

 - [Understanding BPDU Protection for STP, RSTP, and MSTP on page 1423](#)

Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol

(MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would create a loop in the network.

This example describes how to configure loop protection for an interface for the QFX Series in an RSTP topology:

- [Requirements on page 1518](#)
- [Overview and Topology on page 1518](#)
- [Configuration on page 1520](#)
- [Verification on page 1520](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Three switches in an RSTP topology

NOTE: By default, RSTP is enabled for the QFX Series.

Overview and Topology

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop appears in the spanning tree. Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted, and the ultimate result is a network outage.

NOTE: An interface can be configured for either loop protection or root protection, but not for both.

Three switches are displayed in [Figure 20 on page 1519](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **xe-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **xe-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

Figure 20: Network Topology for Loop Protection

Table 133 on page 1519 shows the components that will be configured for loop protection.

Table 133: Topology for Configuring Loop Protection on the QFX Series

| Components | Settings |
|------------|---|
| Switch 1 | Switch 1 is the root bridge. |
| Switch 2 | Switch 2 has the root port xe-0/0/7 . |
| Switch 3 | Switch 3 is connected to Switch 1 through interface xe-0/0/6 . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure loop protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

Configuration

- CLI Quick Configuration** To quickly configure loop protection on interface **xe-0/0/6**:
- ```
[edit]
set protocols rstp interface xe-0/0/6 bpdu-timeout-action block
```
- Step-by-Step Procedure** To configure loop protection:
1. Configure interface **xe-0/0/6** on Switch 3:
- ```
[edit protocols rstp]
user@switch# set interface xe-0/0/6 bpdu-timeout-action block
```

Results Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/6.0 {
  bpdu-timeout-action {
    block;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Loop Protection Is Triggered on page 1520](#)
- [Verifying That Loop Protection Is Working on an Interface on page 1521](#)

Displaying the Interface State Before Loop Protection Is Triggered

Purpose Before loop protection is triggered on interface **xe-0/0/6**, confirm that the interface is blocked.

Action Display the interface state and role before applying root protection:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface | Port ID | Designated
port ID | Designated
bridge ID | Port
Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/1.0 | 128:514 | 128:514 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/2.0 | 128:515 | 128:515 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/3.0 | 128:516 | 128:516 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/4.0 | 128:517 | 128:517 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/5.0 | 128:518 | 128:518 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/6.0 | 128:519 | 128:2 | 16384.00aabbcc0348 | 20000 | BLK | ALT |

[output truncated]

Meaning The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/6.0** is the alternate port and is blocked.

Verifying That Loop Protection Is Working on an Interface

Purpose Verify that the loop protection configuration on interface **xe-0/0/6**. RSTP has been disabled on interface **xe-0/0/4** on Switch 1. This stops BPDUs from being sent to interface **xe-0/0/6** and triggering loop protection on that interface.

Action Display the interface state and role after applying root protection:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface | Port ID | Designated
port ID | Designated
bridge ID | Port
Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/1.0 | 128:514 | 128:514 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/2.0 | 128:515 | 128:515 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/3.0 | 128:516 | 128:516 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/4.0 | 128:517 | 128:517 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/5.0 | 128:518 | 128:518 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/6.0 | 128:519 | 128:519 | 32768.0019e2503f00 | 20000 | BLK | DIS |

(Loop-Incon)
[output truncated]

Meaning The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

- Related Documentation**
- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466](#)
 - [Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1521](#)
 - [Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1513](#)
 - [Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on page 1424](#)

Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees

QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to enforce the root bridge placement in the network manually.

This example describes how to configure root protection on an interface for the QFX Series.

- [Requirements on page 1522](#)
- [Overview and Topology on page 1522](#)
- [Configuration on page 1524](#)
- [Verification on page 1524](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Four switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

NOTE: By default, RSTP is enabled on the QFX Series.

Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

You can also see BPDUs generated when you run a bridge application on a device attached to the switch. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

To prevent this from happening, enable root protection on interfaces that should not receive more BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

NOTE: An interface can be configured for either root protection or loop protection, but not for both.

Four switches are displayed in [Figure 21 on page 1523](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **xe-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **xe-0/0/7** to prevent it from transitioning to become the root port.

Figure 21: Network Topology for Root Protection

[Table 134 on page 1523](#) shows the components that will be configured for root protection.

Table 134: Topology for Configuring Root Protection on the QFX Series

| Component | Settings |
|-----------|---|
| Switch 1 | Switch 1 is connected to Switch 4 through interface xe-0/0/7 . |
| Switch 2 | Switch 2 is connected to Switch 1 and Switch 3. Interface xe-0/0/4 is the alternate port in the RSTP topology. |
| Switch 3 | Switch 3 is the root bridge and is connected to Switch 1 and Switch 2. |

Table 134: Topology for Configuring Root Protection on the QFX Series (*continued*)

| Component | Settings |
|-----------|---|
| Switch 4 | Switch 4 is connected to Switch 1. After loop protection is configured on interface xe-0/0/7 , Switch 4 sends more BPDUs that trigger loop protection on interface xe-0/0/7 . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure root protection for STP or MSTP topologies at the **[edit protocols (mstp | stp)]** hierarchy level.

Configuration

CLI Quick Configuration To quickly configure root protection on interface **xe-0/0/7**, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/7 no-root-port
```

Step-by-Step Procedure To configure root protection:

1. Configure interface **xe-0/0/7**:

```
[edit protocols rstp]
user@switch#
set interface xe-0/0/7 no-root-port
```

Results Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/7.0 {
  no-root-port;
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Root Protection Is Triggered on page 1524](#)
- [Verifying That Root Protection Is Working on the Interface on page 1525](#)

Displaying the Interface State Before Root Protection Is Triggered

Purpose Before root protection is triggered on interface **xe-0/0/7**, confirm the interface state.

Action Confirm the state of the interfaces before root protection is configured:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface | Port ID | Designated
port ID | Designated
bridge ID | Port
Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/1.0 | 128:514 | 128:514 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/2.0 | 128:515 | 128:515 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/3.0 | 128:516 | 128:516 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/4.0 | 128:517 | 128:517 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/5.0 | 128:518 | 128:2 | 16384.00aabbcc0348 | 20000 | BLK | ALT |
| xe-0/0/6.0 | 128:519 | 128:1 | 16384.00aabbcc0348 | 20000 | FWD | ROOT |
| xe-0/0/7.0 | 128:520 | 128:520 | 32768.0019e2503f00 | 20000 | FWD | DESG |

[output truncated]

Meaning The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/7.0** is a designated port in a forwarding state.

Verifying That Root Protection Is Working on the Interface

Purpose A configuration change takes place on Switch 4. A lower bridge priority on Switch 4 causes it to send more BPDUs to interface **xe-0/0/7**. Receipt of more BPDUs on interface **xe-0/0/7** triggers root protection. Verify that root protection is operating on interface **xe-0/0/7**.

Action Verify that root protection has been configured and is operating correctly:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface | Port ID | Designated
port ID | Designated
bridge ID | Port
Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/1.0 | 128:514 | 128:514 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/2.0 | 128:515 | 128:515 | 32768.0019e2503f00 | 20000 | BLK | DIS |
| xe-0/0/3.0 | 128:516 | 128:516 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/4.0 | 128:517 | 128:517 | 32768.0019e2503f00 | 20000 | FWD | DESG |
| xe-0/0/5.0 | 128:518 | 128:2 | 16384.00aabbcc0348 | 20000 | BLK | ALT |
| xe-0/0/6.0 | 128:519 | 128:1 | 16384.00aabbcc0348 | 20000 | FWD | ROOT |
| xe-0/0/7.0 | 128:520 | 128:520 | 32768.0019e2503f00 | 20000 | BLK | DIS |

(Root-Incon)
[output truncated]

Meaning The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/7.0** has transitioned to a loop inconsistent state. The loop inconsistent state blocks the interface and prevents it from becoming a candidate for the root port. When the root bridge no longer receives more STP BPDUs from the interface, the interface recovers and transitions back to a forwarding state. Recovery is automatic.

Bridging and VLAN Configuration Tasks

- [Configuring Static ARP Entries on page 1526](#)

Configuring Static ARP Entries

You can create static ARP table entries, which are explicit mappings between IP addresses and MAC addresses.

- To configure a static ARP entry:

```
[edit interfaces interface-name unit logical-unit-number family inet address address]  
user@switch# set arp ip-address (mac | multicast-mac) mac-address
```

The IP address that you specify must be part of the subnet defined in the enclosing **address** statement.

To associate a multicast MAC address with a unicast IP address, use the **multicast-mac** statement.

Specify the MAC address as 6 hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*; for example, 0011.2233.4455 or 00:11:22:33:44:55.

- [Configuring MAC Table Aging on page 1532](#)
- [Configuring Routed VLAN Interfaces on page 1532](#)
- [Configuring the Native VLAN Identifier on page 1534](#)
- [Configuring VLANs on page 1534](#)

- [Creating a Series of Tagged VLANs on page 1536](#)
- [Disabling MAC Learning on page 1537](#)

Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Adding a Static MAC Address Entry to the Ethernet Switching Table \(CLI Procedure\)” on page 1539](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

The Ethernet switching table, also known as the forwarding table, specifies the known locations of VLAN nodes. There are two ways to populate the Ethernet switching table on a switch. The easiest method is to let the switch update the table with MAC addresses.

The second way to populate the Ethernet switching table is to manually insert a VLAN node location into the table. You can do this to reduce flooding and speed up the switch's automatic learning process. To further optimize the switching process, indicate the next hop (next interface) packets will use after leaving the node.

Before configuring a static MAC address, be sure that you have:

- Set up the VLAN. See [Configuring VLANs for EX Series Switches \(CLI Procedure\)](#) or [“Configuring VLANs” on page 1534](#).

To add a MAC address to the Ethernet switching table:

1. Specify the MAC address to add to the table:

```
[edit ethernet-switching-options]
set static vlan vlan-name mac mac-address
```

2. Indicate the next hop MAC address for packets sent to the indicated MAC address:

```
[edit ethernet-switching-options]
set static vlan vlan-name mac mac-address next-hop interface
```

Related Documentation

- [Understanding Bridging and VLANs on EX Series Switches](#)

Configuring MAC Limiting (CLI Procedure)

This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring MAC Limiting \(CLI Procedure\)” on page 1539](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

This topic describes various ways of configuring a limitation on MAC addresses in packets that are received and forwarded by the switch.

Before you can change a MAC limit that was previously set for an interface or a VLAN, you must first clear existing entries in the MAC address forwarding table that correspond to the change you want to make. Thus, to change the limit on an interface, first clear the MAC address forwarding table entries for that interface. To change the limit on all interfaces and VLANs, clear all MAC address forwarding table entries. To change the limit on a VLAN, clear the MAC address forwarding table entries for that VLAN.

To clear MAC addresses from the forwarding table:

- Clear MAC address entries from a specific interface (here, the interface is **ge-0/0/1**) in the forwarding table:

```
user@switch> clear ethernet-switching-table interface ge-0/0/1
```

- Clear all MAC address entries in the forwarding table:

```
user@switch> clear ethernet-switching-table
```

- Clear MAC address entries from a specific VLAN (here, the VLAN is **vlan-abc**):

```
user@switch> clear ethernet-switching-table vlan vlan-abc
```

The different ways of setting a MAC limit are described in the following sections:

- [Configuring MAC Limiting for Port Security by Limiting the Number of MAC Addresses That Can be Learned on Interfaces on page 1528](#)
- [Configuring MAC Limiting for Port Security by Specifying MAC Addresses That Are Allowed on page 1529](#)
- [Configuring MAC Limiting for VLANs on page 1529](#)

Configuring MAC Limiting for Port Security by Limiting the Number of MAC Addresses That Can be Learned on Interfaces

To configure MAC limiting for port security by setting a maximum number of MAC addresses that can be learned on interfaces.

- Apply the MAC limit on a single interface (here, the interface is **ge-0/0/1**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 mac-limit 10
```

When no action is specified for configuring the MAC limit on an interface, the switch performs the default action **drop** if the limit is exceeded.

- Apply the MAC limit on a single access interface, on the basis of its membership within a specific VLAN (here, the interface is **ge-0/0/1** and the VLAN is **v1**).

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 vlan v1 mac-limit 5
```

With this type of configuration, the switch drops any additional packets if the limit is exceeded, and also logs a message.

- Apply the limit to all access interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all mac-limit 10
```

When no action is specified for configuring the MAC limit on all interfaces, the switch performs the default action **drop** if the limit is exceeded:

Configuring MAC Limiting for Port Security by Specifying MAC Addresses That Are Allowed

You must clear existing entries in the MAC address forwarding table prior to changing the MAC address limit.

To configure MAC limiting for port security by specifying allowed MAC addresses:

- On a single interface (here, the interface is ge-0/0/2):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
```
- On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch#set interface all allowed-mac 00:05:85:3A:82:80
user@switch#set interface all allowed-mac 00:05:85:3A:82:81
user@switch#set interface all allowed-mac 00:05:85:3A:82:83
```

Configuring MAC Limiting for VLANs

You must clear existing entries in the MAC address forwarding table before you can change the MAC address limit.

MAC limiting for a VLAN restricts the MAC addresses that can be learned for that VLAN, but does *not* drop the packet. Therefore, setting the MAC limit on a VLAN is not considered a port-security feature.

NOTE: The configuration of specific allowed MAC addresses does not apply to VLANs.

To configure MAC limiting for a VLAN using the CLI:

- Limit the number of dynamic MAC addresses on a VLAN:

If the MAC limit on a specific VLAN is exceeded, the switch logs the MAC addresses of packets that cause the limit to be exceeded. No other action is possible.

```
[edit vlans]
user@switch# set vlan-abc mac-limit 20
```

NOTE: When you are applying a MAC limit on a VLAN, do not set `mac-limit` to 1 for a VLAN composed of Routed VLAN Interfaces (RVIs) or a VLAN composed of aggregated Ethernet bundles using LACP. In these cases, setting the `mac-limit` to 1 prevents the switch from learning MAC addresses other than the automatic addresses:

- For RVIs, the first MAC address inserted into the forwarding database is the MAC address of the RVI.
- For aggregated Ethernet bundles using LACP, the first MAC address inserted into the forwarding database in the forwarding table is the source address of the protocol packet.

If the VLAN is composed of regular access or trunk interfaces, you can set the `mac-limit` to 1 if you choose to do so.

Configuring MAC Notification

When a MAC address is learned or unlearned, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as *MAC notification*.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- [Enabling MAC Notification on page 1531](#)
- [Disabling MAC Notification on page 1531](#)
- [Setting the MAC Notification Interval on page 1531](#)

Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

```
[edit ethernet-switching-options]  
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, 60 seconds):

```
[edit ethernet-switching-options]  
user@switch# set mac-notification notification-interval 60
```

Disabling MAC Notification

MAC notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit ethernet-switching-options]  
user@switch# delete mac-notification
```

Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 5
```

**Related
Documentation**

- [Verifying That MAC Notification Is Working Properly on page 1669](#)

Configuring MAC Table Aging

MAC table aging ensures that a switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

To manage MAC entries more efficiently, you can configure an entry's aging time, which is the maximum time that an entry can remain in the MAC address table before it is deleted because it has reached its maximum age.

NOTE: This task uses Junos OS for Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring MAC Table Aging” on page 1541](#).

You can use the **set-mac-table-aging-time** command to configure how long entries remain in the Ethernet switching table before expiring. Here the VLAN is **employee-vlan**:

```
[edit vlans employee-vlan]
user@switch# set mac-table-aging-time 200
```

**Related
Documentation**

- [Example: Setting Up Bridging with Multiple VLANs on page 1451](#)
- [Example: Connecting an Access Switch to a Distribution Switch on page 1504](#)

Configuring Routed VLAN Interfaces

Routed VLAN interfaces (RVIs) enable a switch to recognize which packets are being sent to local addresses so that they are bridged whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address look-ups.

To configure the routed VLAN interface:

1. Create the VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@switch# set vlans support vlan-id 111
```

2. Assign an interface to the VLAN by specifying the logical interface (with the **unit** statement) and specifying the VLAN name as the member:

```
[edit]
user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members
support
```

3. Create the subnet for the VLAN's broadcast domain:

```
[edit]
user@switch# set interfaces vlan unit 111 family inet address 111.111.111.1/24
```

4. Bind a Layer 3 interface with the VLAN:

```
[edit]
user@switch# set vlans support l3-interface vlan.111
```

NOTE: Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces vlan terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|------------------|--------|
| vlan | up | up | | | |
| vlan.111 | up | up | inet | 111.111.111.1/24 | |

```
user@switch> show vlans
```

| Name | Tag | Interfaces |
|---------------|-----|---------------------------------------|
| default | | None |
| employee-vlan | 20 | ge-1/0/0.0, ge-1/0/1.0, ge-1/0/2.0 |

**Related
Documentation**

Configuring the Native VLAN Identifier

Switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. The logical interface on which untagged packets are received must have the same native VLAN ID as that on the physical interface.

NOTE: This task uses Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring the Native VLAN Identifier \(CLI Procedure\)” on page 1543](#).

To configure the native VLAN ID using the CLI:

1. Configure the port mode as **trunk** so that the interface is on multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.

```
[edit interfaces xe-0/0/3 unit 0 family ethernet-switching]
user@switch# set port-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces xe-0/0/3 unit 0 family ethernet-switching]
user@switch# set native-vlan-id 3
```

Related Documentation

- [Understanding Bridging and VLANs on page 1402](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 1451](#)

Configuring VLANs

Switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

NOTE: This task uses Junos OS for the QFX Series that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring VLANs” on page 1544](#).

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Specify the description of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set description vlan-description
```

2. Specify the unique name of the VLAN:

NOTE: In a QFabric system, do not configure “default” as the name of a VLAN. Though the QFabric system will allow you to configure and commit a VLAN with the name “default” in the current software with no commit errors, it will not work. Junos OS 12.2 and onwards will not allow you to commit a VLAN with the name “default.”

```
[edit interfaces interface-name unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID range for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

or

```
[edit vlans]
user@switch# set vlan-name vlan-range vlan-id-low-vlan-id-high
```

5. Specify the maximum time that an entry can remain in the forwarding table before it ages out:

```
[edit vlans]
user@switch# set vlan-name mac-table-aging-time time
```

6. Specify a VLAN firewall filter to be applied to incoming or outgoing packets:

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

Related Documentation

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1433](#)
- [Configuring Routed VLAN Interfaces on page 1532](#)
- [Creating a Series of Tagged VLANs on page 1536](#)
- [Understanding Bridging and VLANs on page 1402](#)

Creating a Series of Tagged VLANs

When you divide an Ethernet LAN into multiple VLANs, each VLAN is assigned a unique IEEE 802.1Q tag. This tag is associated with each frame in the VLAN, and the network nodes receiving the traffic can use the tag to identify which VLAN a frame is associated with.

Instead of configuring VLANs and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames can detect which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10 through 12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag 10
- VLAN **employee-11**, tag 11
- VLAN **employee-12**, tag 12

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.

NOTE: This task uses Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does support ELS, see [“Creating a Series of Tagged VLANs” on page 1546..](#)

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-range 120-130
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlanmembers employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlan members 120-130
```

Associating a series of tagged VLANs to an interface by name or by VLAN range has the same result: VLANs **__employee_120__** through **__employee_130__** are created.

NOTE: When a series of VLANs is created using the `vlan-range` command, the VLAN names are preceded and followed by a double underscore.

Disabling MAC Learning

By default, MAC learning is globally enabled on all nodes in a QFX Series product. This topic describes how to disable MAC learning, as well as how to reenable and verify that MAC learning has been enabled or disabled.

Disabling dynamic MAC learning on the QFX Series prevents a node from learning source and destination MAC addresses.

NOTE: This task uses Junos OS for QFX3500 and QFX3600 switches does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Disabling MAC Learning” on page 1547](#).

- To disable MAC learning on the QFX Series:

```
[edit ethernet-switching-options interfaces interface]
user@switch# set no-mac-learning
```

- To enable MAC learning on the QFX Series:

```
[edit ethernet-switching-options interfaces interface]
```

```
user@switch# delete no-mac-learning
```

```
user@switch# deactivate no-mac-learning
```

- To verify the status of MAC learning on the QFX Series, view the Ethernet MAC learning statistics in operational mode.

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table: 2 entries, 1 learned
```

| VLAN | MAC address | Type | Age | Interfaces |
|---------|-------------------|-------|-----|---------------|
| default | * | Flood | | - All-members |
| default | 00:1f:12:39:90:80 | Learn | 29 | xe-/0/0.0 |

- [Creating a Series of Tagged VLANs on page 1546](#)
- [Disabling MAC Learning on page 1547](#)

Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Adding a Static MAC Address Entry to the Ethernet Switching Table \(CLI Procedure\)”](#) on page 1527. For ELS details, see [“Getting Started with Enhanced Layer 2 Software”](#) on page 58.

The Ethernet switching table, also known as the forwarding table, specifies the known locations of VLAN nodes and the addresses of devices within those nodes. There are two ways to populate the Ethernet switching table on a switch. The easiest method is to let the switch update the table with MAC addresses.

The second way to populate the Ethernet switching table is to manually insert addresses into the table. You can do this to reduce flooding and speed up the switch's automatic learning process.

Before configuring a static MAC address, be sure that you have:

- Set up the VLAN. See *Configuring VLANs for EX Series Switches (CLI Procedure)* or [“Configuring VLANs”](#) on page 1534.

To configure an interface to have a static MAC address:

```
[edit vlans vlan-name switch-options interface interface-name]  
user@switch# set static-mac mac-address
```

Related Documentation

Configuring MAC Limiting (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Configuring MAC Limiting \(CLI Procedure\)”](#) on page 1527. For ELS details, see [“Getting Started with Enhanced Layer 2 Software”](#) on page 58.

This topic describes various ways of configuring a limitation on MAC addresses in packets that are received and forwarded by the switch.

NOTE: On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

The different ways of setting a MAC limit are described in the following sections:

- [Limiting the Number of MAC Addresses Learned by an Interface on page 1540](#)
- [Limiting the Number of MAC Addresses Learned by a VLAN on page 1540](#)

Limiting the Number of MAC Addresses Learned by an Interface

To secure a port, you can set the maximum number of MAC addresses that can be learned by an interface:

- Set the MAC limit on an interface, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit switch-options]
user@switch# set interface interface-name interface-mac-limit limit packet-action
action
```

After you set a new MAC limit for the interface, the system clears existing entries in the MAC address forwarding table associated with the interface.

Limiting the Number of MAC Addresses Learned by a VLAN

To limit the number of MAC addresses learned by a VLAN:

1. Set the maximum number of MAC addresses that can be learned by a VLAN, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit vlans]
user@switch# set vlan-name switch-options mac-table-size limit packet-action
action
```

2. Set the maximum number of MAC addresses that can be learned by one *or* all interfaces in the VLAN, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit vlans]
user@switch# set vlan-name switch-options interface interface-name
interface-mac-limit limit packet-action action
[edit vlans]
user@switch# set vlan-name switch-options interface-mac-limit limit packet-action
action
```

NOTE: If you specify a MAC limit and packet action for all interfaces in the VLAN *and* a specific interface in the VLAN, the MAC limit and packet action specified at the specific interface level takes precedence. Also, at the VLAN interface level, only the drop and drop-and-log options are supported.

After you set new MAC limits for a VLAN by using the **mac-table-size** statement or for interfaces associated with a VLAN by using the **interface-mac-limit** statement, the system clears the corresponding existing entries in the MAC address forwarding table.

- Related Documentation**
- [Understanding Bridging and VLANs on EX Series Switches](#)
 - [Configuring Persistent MAC Learning \(CLI Procedure\)](#)

Configuring MAC Table Aging

MAC table aging ensures that a switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

To manage MAC entries more efficiently, you can configure an entry's aging time, which is the maximum time that an entry can remain in the MAC address table before it is deleted because it has reached its maximum age.

NOTE: This task uses Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Configuring MAC Table Aging” on page 1532](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

You can use the **set-mac-table-aging-time** command to configure how long entries remain in the Ethernet switching table before expiring. Here the VLAN is **employee-vlan**:

```
[edit vlans employee-vlan switch-options]
user@switch# set mac-table-aging-time 200
```

- Related Documentation**
- [Understanding Bridging and VLANs on page 1402](#)
 - [Example: Setting Up Bridging with Multiple VLANs on page 1458](#)
 - [Example: Connecting an Access Switch to a Distribution Switch on page 1504](#)

Configuring Routed VLAN Interfaces

Routed VLAN interfaces (RVIs) enable a switch to recognize which packets are being sent to local addresses so that they are bridged whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address look-ups.

To configure the routed VLAN interface:

1. Create the VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@switch# set vlans support vlan-id 111
```

2. Assign an interface to the VLAN by specifying the logical interface (with the **unit** statement) and specifying the VLAN name as the member:

```
[edit]
user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members
support
```

3. Create the subnet for the VLAN's broadcast domain:

```
[edit]
user@switch# set interfaces vlan unit 111 family inet address 111.111.111.1/24
```

4. Bind a Layer 3 interface with the VLAN:

```
[edit]
user@switch# set vlans support l3-interface vlan.111
```

NOTE: Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces vlan terse
Interface      Admin Link Proto  Local          Remote
vlan           up    up
vlan.111       up    up   inet   111.111.111.1/24
```

```
user@switch> show vlans
Name      Tag    Interfaces
default
employee-vlan  20    ge-1/0/0.0, ge-1/0/1.0, ge-1/0/2.0
marketing    40    ge-1/0/10.0, ge-1/0/20.0, ge-1/0/30.0
support      111    ge-0/0/18.0
mgmt         bme0.32769, bme0.32771*
```

```
user@switch> show ethernet-switching table
Ethernet-switching table: 1 entries, 0 learned
VLAN      MAC address      Type      Age Interfaces
support    00:19:e2:50:95:a0 Static      - Router
```

Documentation

Configuring the Native VLAN Identifier (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring the Native VLAN Identifier (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on [page 58](#).

Switches can receive and forward routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received. The logical interface on which untagged packets are to be received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface.

To configure the native VLAN ID by using the command-line interface (CLI):

1. On the interface on which you want untagged data packets to be received, set the interface mode to **trunk**, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family
ethernet-switching interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@switch# set interface-name native-vlan-id vlan-id
```

3. Specify that the logical interface that will receive the untagged data packets is a member of the native VLAN:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family
ethernet-switching vlan members vlan-id
```

Configuring VLANs

Switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

NOTE: This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#). If your switch runs software that does not support ELS, see [“Configuring VLANs” on page 1534](#).

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Specify the description of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set description vlan-description
```

2. Specify the unique name of the VLAN:

NOTE: Switches that run Junos OS with the ELS configuration style do not support a default VLAN. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist.

```
[edit interfaces interface-name unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID list for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

or

```
[edit vlans]
user@switch# set vlan-name vlan-id-list [vlan-ids | vlan-id--vlan-id]
```

5. Specify the maximum time that an entry can remain in the forwarding table before it ages out:

```
[edit vlans]
user@switch# set vlan-name switch-options mac-table-aging-time time
```

6. Specify a VLAN firewall filter to be applied to incoming or outgoing packets:

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

Related Documentation

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1433](#)
- [Configuring Routed VLAN Interfaces on page 1532](#)

- [Creating a Series of Tagged VLANs on page 1536](#)
- [Understanding Bridging and VLANs on page 1402](#)

Creating a Series of Tagged VLANs

When you divide an Ethernet LAN into multiple VLANs, each VLAN is assigned a unique IEEE 802.1Q tag. This tag is associated with each frame in the VLAN, and the network nodes receiving the traffic can use the tag to identify which VLAN a frame is associated with.

Instead of configuring VLANs and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames can detect which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10 through 12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag 10
- VLAN **employee-11**, tag 11
- VLAN **employee-12**, tag 12

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.

NOTE: This task uses Junos OS for Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Creating a Series of Tagged VLANs” on page 1536](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-id-list [ 120-130 ]
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlanmembers employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlan members 120-130
```

Associating a series of tagged VLANs to an interface by name or by VLAN range the same result: VLANs **__employee_120__** through **__employee_130__** are created.

NOTE: When a series of VLANs is created using the `vlan-id-list` command, the VLAN names are preceded and followed by a double underscore.

Related Documentation

Disabling MAC Learning

By default, MAC learning is globally enabled on all nodes in a QFX Series product. This topic describes how to disable MAC learning, as well as how to reenable and verify that MAC learning has been enabled or disabled.

NOTE: This task uses Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#). If your switch runs software that does not support ELS, see [“Disabling MAC Learning” on page 1537](#).

Disabling dynamic MAC learning on the QFX Series prevents a node from learning source and destination MAC addresses.

- To disable MAC learning on the QFX Series:

```
[edit vlans vlan-name switch-options interface interface-name]
user@switch# set no-mac-learning
```

- To enable MAC learning on the QFX Series:

```
[edit vlans vlan-name switch-options interface interface-name]
user@switch# delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify the status of MAC learning on the QFX Series, view the Ethernet MAC learning statistics in operational mode.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 2 entries, 1 learned
VLAN          MAC address      Type      Age Interfaces
default       *                Flood     - All-members
default       00:1f:12:39:90:80 Learn      29 xe-/0/0.0
```

Unified Forwarding Table Configuration Task

- [Configuring the Unified Forwarding Table on page 1548](#)

Configuring the Unified Forwarding Table

- [Configuring an Address-Storage Profile on page 1548](#)
- [Configuring IPv6 Addresses with /65 to /127 Prefix Lengths on page 1550](#)

Configuring an Address-Storage Profile

On the QFX5100 switch, you can control the allocation of memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 135 on page 1548](#) lists the profiles you can choose and the associated values for each type of entry.

Table 135: Unified Forwarding Table Profiles

| Profile Name | MAC Table | Host Table (unicast and multicast addresses) | | | | | | LPM Table | |
|-----------------------|---------------|--|--------------|-------------|-------------|-------------|-------------|--------------|-----------------------------|
| | MAC Addresses | IPv4 unicast | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) | IPv4 Entries | IPv6 Entries (prefix <= 64) |
| l2-profile-one | 288K | 16K | 8K | 8K | 8K | 4K | 4K | 16K | 8K |
| l2-profile-two | 224K | 80K | 40K | 40K | 40K | 20K | 20K | 16K | 8K |

Table 135: Unified Forwarding Table Profiles (*continued*)

| Profile Name | MAC Table | Host Table (unicast and multicast addresses) | | | | | | LPM Table | |
|---|-----------|--|------|------|------|-----|-----|-----------|-----|
| l2-profile-three
(default) | 160K | 144K | 72K | 72K | 72K | 36K | 36K | 16K | 8K |
| l3-profile | 96K | 208K | 104K | 104K | 104K | 52K | 52K | 16K | 8K |
| lpm-profile
(Do not use for IPv6) | 32K | 16K | 8K | 8K | 8K | 4K | 4K | 128K | 64K |

Note that if the host or LPM table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see “[Understanding the Unified Forwarding Table](#)” on page 1415.

To configure the profile that you want, enter and commit the following statement:

[edit]

```
user@switch# set chassis forwarding-options profile-name
```

NOTE: When you configure a profile, all the data interfaces on the switch restart. The management interfaces are unaffected.

The settings for **l2-profile-three** are configured by default. That is, if you do not enter a **set forwarding-options chassis profile-name** statement, these settings are configured.

WARNING: The **lpm-profile** does not work for IPv6 traffic. Do not use this profile for IPv6.

Configuring IPv6 Addresses with /65 to /127 Prefix Lengths

If you want to use more than 16 IPv6 addresses with prefixes in the range /65 through /127 you must enter and commit the following statement:

```
[edit]
user@switch# set chassis forwarding-options profile-name num-65-127-prefix value
```

in which *value* can be a value in the range 1 through 128. Each increment adds support for 16 IPv6 addresses with prefixes between /65 and /127, for a maximum of 2048 such addresses (16 x 128 = 2048). The system supports 16 of these addresses by default, so to increase the number of supported addresses, you must enter a value of 2 or greater. For example, if you enter 2, the system will support 32 IPv6 addresses with prefixes in the range /65 through /127.

Each increment that you add for IPv6 addresses with prefixes in the range /65 through /127 reduces the number of forwarding table entries that are available for IPv4 addresses and IPv6 addresses with prefixes outside this range. If you enter 128 to configure support for the maximum number of IPv6 addresses with prefixes in the range /65 through /127, the portion of the longest prefix match section of the forwarding table available to IPv4 addresses and IPv6 addresses with prefixes outside the /65 through /127 range is reduced by 8K.

NOTE: When you configure the `num-65-127-prefix` value, all the data interfaces on the switch restart. The management interfaces are unaffected.

Forwarding Mode Configuration Task

- [Configuring the Forwarding Mode on page 1550](#)

Configuring the Forwarding Mode

By default, QFX Series products forward packets using store-and-forward mode. You can configure all the interfaces on a QFX series switch or QFabric to use cut-through mode instead.

To enable cut-through switching mode, enter the following statement:

```
[edit forwarding-options]
user@switch# set cut-through
```

Related Documentation

- [cut-through on page 1562](#)

Proxy ARP Configuration Task (Original CLI Only)

- [Configuring Proxy ARP on page 1551](#)

Configuring Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 proxy-arp restricted
```

BEST PRACTICE: We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch is not a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid the situation of the switch's response to a gratuitous ARP request appearing to the host to be an indication of an IP conflict:

To configure proxy ARP on a routed VLAN interface (RVI):

```
[edit interfaces]
user@switch# set vlan unit 100 proxy-arp restricted
```

Proxy ARP Configuration Task (ELS CLI Only)

- [Configuring Proxy ARP \(CLI Procedure\) on page 1552](#)

Configuring Proxy ARP (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Proxy ARP (CLI Procedure)* or “[Configuring Proxy ARP](#)” on [page 1551](#). For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on [page 58](#).

You can configure proxy Address Resolution Protocol (ARP) on your switch to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number proxy-arp (restricted |
unrestricted)
```

BEST PRACTICE: We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you decide to use unrestricted mode, disable gratuitous ARP requests on the interface to avoid a situation wherein the switch's response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

To configure proxy ARP on an integrated routing and bridging (IRB) interface:

```
[edit interfaces]
user@switch# set irb.logical-unit-number proxy-arp restricted
```

STP Configuration Tasks

- [Configuring STP on page 1553](#)
- [Unblocking an Interface That Receives BPDUs in Error on page 1553](#)

Configuring STP

The default spanning-tree protocol on the QFX Series is Rapid Spanning Tree Protocol (RSTP). RSTP provides faster convergence times than Spanning Tree Protocol (STP) does. However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. When you explicitly configure STP, the QFX Series products use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP.

To configure STP using the CLI:

1. Delete the RSTP configuration on the interface (here, the interface is **xe-0/0/5**):

```
[edit]
user@switch# delete protocols rstp interface xe-0/0/5
```

2. Configure STP on the interface:

```
[edit]
user@switch# set protocols stp interface xe-0/0/5
```

3. Commit the configuration:

```
[edit]
user@switch# commit
```

Unblocking an Interface That Receives BPDUs in Error

NOTE: BPDUs block protection is disabled on Node devices.

QFX Series switches use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

After you fix the misconfiguration that triggered the sending of BPDUs to an interface, you can unblock the interface and return it to service.

NOTE: This task describes how to use both the original CLI and the Enhanced Layer 2 Software (ELS) CLI. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 58](#).

To unblock an interface after fixing the misconfiguration that triggered the BPDUs and return it to service:

- (Original CLI) Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit ethernet-switching-options]
user@switch# set bpdublockdisable-timeout 30 interface xe-0/0/6
```

- (ELS CLI) Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit protocols layer2-control]
user@switch# set bpdublockdisable-timeout 30 interface xe-0/0/6
```

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpdublock interface xe-0/0/6
```

STP Configuration Tasks (Original CLI Only)

- [Configuring VLAN Spanning Tree Protocol on page 1554](#)

Configuring VLAN Spanning Tree Protocol

VLAN Spanning Tree Protocol (VSTP) enables the QFX Series to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining the best paths within the VLANs instead of within the entire network.

NOTE: This task uses Junos OS for the QFX Series that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring VLAN Spanning-Tree Protocol” on page 1556](#).

To configure VSTP:

1. (Optional) Enable Rapid Spanning Tree Protocol (RSTP):

```
[edit protocols]
user@switch# set rstp
```

VSTP can run on a maximum of 253 VLANs; RSTP runs on the remaining VLANs if configured. Enabling RSTP ensures that a spanning-tree protocol runs on all VLANs.

2. Enable VSTP.

- To enable VSTP on multiple VLANs using a VLAN group:

```
[edit protocols]
```

```
user@switch# set vstp vlan-group group group-name vlan vlan-id-range
```

- To enable VSTP on all VLANs:

```
[edit protocols]
user@switch# set vstp vlan all
```

NOTE: You must enable RSTP if you used the `set vstp vlan all` statement to enable VSTP and if the switch has more than 253 VLANs. If you use the `set vstp vlan all` statement to enable VSTP on a switch with more than 253 VLANs, the configuration cannot be committed.

- To enable VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vstp vlan vlan-id
```

- To enable VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vstp vlan vlan-name
```

Related Documentation

- [Understanding VSTP on page 1422](#)

STP Configuration Tasks (ELS CLI Only)

- [Configuring VLAN Spanning-Tree Protocol on page 1556](#)

Configuring VLAN Spanning-Tree Protocol

You can configure the VLAN Spanning-Tree Protocol (VSTP) under the following hierarchy levels:

NOTE: This task supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Configuring VLAN Spanning Tree Protocol” on page 1554](#).

- [edit *logical-systems logical-system-name protocols*]
- [edit *logical-systems logical-system-name routing-instances routing-instance-name protocols*]
- [edit *protocols*]
- [edit *routing-instances routing-instance-name protocols*]

The routing instance type can be either **virtual-switch** or **layer2-control**.

To configure the VLAN Spanning-Tree Protocol:

1. Enable VSTP as the version of spanning-tree protocol to be configured:

```
[edit]
```

```
user@host@ edit ... protocols (STP Type) vstp
```

2. (Optional) For compatibility with older bridges that do not support VSTP, you can run force VSTP to run as the original IEEE 802.1D Spanning-Tree Protocol (STP) version:

```
[edit ... protocols vstp]
```

```
user@host# set force-version stp
```

NOTE: If VSTP has been forced to run as the original STP version, you can revert back to VSTP by first removing the **force-version** statement from the configuration and then entering the **clear spanning-tree protocol-migration** configuration mode command.

3. Configure the interfaces that participate in the VSTP instance.

a. Enable configuration of the interface:

```
[edit ... protocols vstp]
user@host# edit interface interface-name
```

b. Configure the interface priority:

```
[edit ... protocols vstp interface interface-name]
user@host# set priority interface-priority
```

c. (Optional) By default, the interface link cost is determined by the link speed. You can configure the interface link cost to control which bridge is the designated bridge and which port is the designated port:

```
[edit ... protocols vstp interface interface-name]
user@host# set cost interface-link-cost
```

d. Configure the interface link mode to identify point-to-point links:

```
[edit ... protocols vstp interface interface-name]
user@host# set mode (p2p | shared)
```

Specify **p2p** if the link is point to point. Specify **shared** if the link is a shared media.

e. (Optional) Configure the interface as an edge port:

```
[edit ... protocols vstp interface interface-name]
user@host# set edge
```

Edge ports do not expect to receive bridge protocol data unit (BPDU) packets. If a BPDU packet is received for an edge port, the port becomes a nonedge port.

You can also enable BPDU root protection for all spanning-tree protocol instances on the interface. BPDU root protect ensures the port is the spanning-tree designated port. If the port receives superior BPDU packets, root protect moves this port to a root-prevented spanning-tree state. For configuration details, see *Checking the Status of Spanning-Tree Instance Interfaces*.

4. Enable configuration of a VLAN instance:

```
[edit ... protocols vstp]
user@host# edit vlan vlan-id
```

5. Configure the bridge priority

```
[edit ... protocols vstp vlan vlan-id]
user@host# set bridge-priority bridge-priority
```

For more information, see *Bridge Priority for Election of Root Bridge and Designated Bridge*.

6. Configure hello BPDU timers.

- a. Configure the maximum expected arrival time of hello BPDUs:

```
[edit ... protocols vstp vlan vlan-id]  
user@host# set max-age seconds
```

- b. Configure the time interval at which the root bridge transmits configuration BPDUs:

```
[edit ... protocols vstp vlan vlan-id]  
user@host# set hello-time seconds
```

7. (Optional) By default, the bridge port remains in the listening and learning states for 15 seconds before transitioning to the forwarding state. You can specify a delay from 4 through 20 seconds instead:

```
[edit ... protocols vstp vlan vlan-id]  
user@host# set forward-delay seconds
```

8. Configure the interfaces that participate in the VSTP instance.

- a. Enable configuration of the interface:

```
[edit ... protocols vstp vlan vlan-id]  
user@host# edit interface interface-name
```

- b. Configure the interface priority:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]  
user@host# set priority interface-priority
```

- c. (Optional) By default, the interface link cost is determined by the link speed. You can configure the interface link cost to control which bridge is the designated bridge and which port is the designated port:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]  
user@host# set cost interface-link-cost
```

- d. Configure the interface link mode to identify point-to-point links:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]  
user@host# set mode (p2p | shared)
```

Specify **p2p** if the link is point to point. Specify **shared** if the link is a shared media.

- e. (Optional) Configure the interface as an edge port:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]  
user@host# set edge
```

Edge ports do not expect to receive bridge protocol data unit (BPDU) packets. If a BPDU packet is received for an edge port, the port becomes a nonedge port

You can also enable BPDU root protection for all spanning-tree protocol instances on the interface. BPDU root protect ensures the port is the spanning-tree designated port. If the port receives superior BPDU packets, root protect moves this port to a root-prevented spanning-tree state. For configuration details, see *Checking the Status of Spanning-Tree Instance Interfaces*.

9. Verify the VSTP configuration:

```
[edit]  
... { # Optional logical system and/or routing instance  
  protocols (STP Type) {  
    vstp {
```

```

force-version stp; # Optional.
interface interface-name {
    priority interface-priority;
    cost interface-link-cost; # Optional.
    mode (p2p | shared);
    edge; # Optional.
}
vlan vlan-id {
    bridge-priority bridge-priority;
    max-age seconds;
    hello-time seconds;
    forward-delay seconds; # Optional.
    interface interface-name {
        priority interface-priority;
        cost interface-link-cost; # Optional.
        mode (p2p | shared);
        edge; # Optional.
    }
}
}
}
}

```

Unified Forwarding Table Configuration Statements

- [forwarding-options \(chassis\) on page 1560](#)
- [num-65-127-prefix on page 1561](#)

forwarding-options (chassis)

Syntax forwarding options *profile-name* {
 num-65-127-prefix *value*
 }

Hierarchy Level [edit [chassis](#)]

Release Information Statement introduced in Junos 13.2 for the QFX Series.

Description Configure a unified forwarding table profile to allocate the amount a memory available for the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

Options **profile-name**—name of the profile to use for memory allocation in the unified forwarding table. [Table 136 on page 1560](#) lists the profiles you can choose and the associated values for each type of entry.

Table 136: Unified Forwarding Table Profiles

| Profile Name | MAC Table | Host Table (unicast and multicast addresses) | | | | | | LPM Table | |
|--|---------------|--|--------------|-------------|-------------|-------------|-------------|--------------|-----------------------------|
| | MAC Addresses | IPv4 unicast | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) | IPv4 Entries | IPv6 Entries (prefix <= 64) |
| l2-profile-one | 288K | 16K | 8K | 8K | 8K | 4K | 4K | 16K | 8K |
| l2-profile-two | 224K | 80K | 40K | 40K | 40K | 20K | 20K | 16K | 8K |
| l2-profile-three
(default) | 160K | 144K | 72K | 72K | 72K | 36K | 36K | 16K | 8K |
| l3-profile | 96K | 208K | 104K | 104K | 104K | 52K | 52K | 16K | 8K |
| lpm-profile
(Do not use for IPv6) | 32K | 16K | 8K | 8K | 8K | 4K | 4K | 128K | 64K |

Note that if the host or LPM table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see [“Understanding the Unified Forwarding Table” on page 1415](#).

WARNING: The `lpm-profile` does not work for IPv6 traffic. Do not use this profile for IPv6.

proxy-arp

| | |
|--|--|
| Syntax | proxy-arp (restricted unrestricted); |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.6 for EX Series switches.
restricted added in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| Description | For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address. |
| <div>  NOTE: You must configure the IP address and the inet family for the interface when you enable proxy ARP. </div> | |
| Default | Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own. |
| Options | <ul style="list-style-type: none"> • none—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address. • restricted—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address. • unrestricted—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address. |
| | Default: unrestricted |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

bpdu-timeout-action

| | |
|---------------------------------|---|
| Syntax | bpdu-timeout-action {
alarm;
block;
} |
| Hierarchy Level | [edit protocols mstp interface (all <i>interface-name</i>)],
[edit protocols rstp interface (all <i>interface-name</i>)],
[edit protocols stp interface (all <i>interface-name</i>)],
[edit protocols vstp vlan <i>vlan-id</i> interface (all <i>interface-name</i>)] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure the BPDU timeout action on a specific interface. You must configure at least one action (alarm , block , or both).

The remaining statements are explained separately. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466 • Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 1517 • Example: Configuring Network Regions for VLANs with MSTP on page 1480 • Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on page 1424 • Understanding VSTP on page 1422 • show spanning-tree bridge on page 1706 • show spanning-tree interface |

bridge-priority

| | |
|---------------------------------|---|
| Syntax | <code>bridge-priority <i>priority</i>;</code> |
| Hierarchy Level | [edit protocols mstp],
[edit protocols mstp <i>msti-id</i>],
[edit protocols rstp],
[edit protocols stp],
[edit protocols vstp <i>vlan</i> <i>vlan-id</i>] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment. |
| Options | <i>priority</i> —Bridge priority. It can be set only in increments of 4096.
Range: 0 through 61,440
Default: 32,768 |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Example: Configuring Network Regions for VLANs with MSTP on page 1480• Understanding MSTP on page 1420• Understanding VSTP on page 1422• show spanning-tree bridge on page 1706• show spanning-tree interface |

configuration-name (MSTP)

| | |
|---------------------------------|---|
| Syntax | configuration-name <i>configuration-name</i> ; |
| Hierarchy Level | [edit protocols mstp] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Specify the configuration name. The configuration name is the MSTP region name carried in the MSTP BPDUs. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466• Example: Configuring Network Regions for VLANs with MSTP on page 1480• Understanding MSTP on page 1420• show spanning-tree bridge on page 1706• <i>show spanning-tree interface</i> |

cost (STP)

| | |
|---------------------------------|---|
| Syntax | <code>cost cost;</code> |
| Hierarchy Level | [edit protocols mstp interface (all <i>interface-name</i>)],
[edit protocols mstp msti msti-id interface interface-name],
[edit protocols rstp (Spanning Trees) interface (all <i>interface-name</i>)],
[edit protocols stp interface (all <i>interface-name</i>)],
[edit protocols vstp vlan vlan-id interface (all <i>interface-name</i>)] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link cost to control which bridge is the designated bridge and which interface is the designated interface. |
| Default | Link cost is determined by the link speed. |
| Options | cost —Link cost associated with the port.
Range: 1 through 200,000,000 |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Understanding MSTP on page 1420• Overview of Spanning-Tree Protocols on page 1419• Understanding VSTP on page 1422• show spanning-tree bridge on page 1706• show spanning-tree interface |

disable (STP)

| | |
|---------------------------------|---|
| Syntax | disable; |

[edit protocols vstp],
[edit protocols vstp vlan <i>vlan-id</i> interface (all <i>interface-name</i>)] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Disable STP, MSTP, RSTP, or VSTP on the switch or on a specific interface. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Example: Configuring Network Regions for VLANs with MSTP on page 1480 • Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466 • Understanding MSTP on page 1420 • Overview of Spanning-Tree Protocols on page 1419 • Understanding VSTP on page 1422 • show spanning-tree bridge on page 1706 • show spanning-tree interface |

disable-timeout (BPDU)

| | |
|---------------------------------|---|
| Syntax | <code>disable-timeout <i>timeout</i>;</code> |
| Hierarchy Level | [edit ethernet-switching-options bpdv-block]
[edit protocols layer2-control bpdv-block] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled. |
| Default | The disable timeout is not enabled. |
| Options | timeout: Length of time, in seconds, that the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service.
Range: 10 through 3600 seconds |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Example: Configuring Network Regions for VLANs with MSTP on page 1480• Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466• Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1513• Understanding BPDU Protection for STP, RSTP, and MSTP on page 1423• show spanning-tree bridge on page 1706• show spanning-tree interface on page 1711 |

edge (STP)

| | |
|---------------------------------|---|
| Syntax | edge; |
| Hierarchy Level | [edit protocols mstp interface (all <i>interface-name</i>)],

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning-tree regions.

The statements are explained separately.

Default MSTP is disabled.

| | |
|---------------------------------|---|
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Example: Configuring Network Regions for VLANs with MSTP on page 1480 • Understanding MSTP on page 1420 • show spanning-tree bridge on page 1706 • show spanning-tree interface on page 1711 |

no-root-port

| | |
|---------------------------------|---|
| Syntax | no-root-port; |
| Hierarchy Level | [edit protocols mstp interface (all <i>interface-name</i>)],
[edit protocols rstp interface (all <i>interface-name</i>)],
[edit protocols stp interface (all <i>interface-name</i>)],
[edit protocols vstp vlan <i>vlan-id</i> interface (all <i>interface-name</i>)] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Configure an interface to be a spanning tree designated port. If the bridge receives more STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving more STP BPDUs on the root-protected interface, interface traffic is no longer blocked. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none"> • Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1521 • Example: Configuring Network Regions for VLANs with MSTP on page 1480 • Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1466 • Understanding VSTP on page 1422 • show spanning-tree bridge on page 1706 • show spanning-tree interface on page 1711 |

}`

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, providing shorter convergence times than those provided with basic STP.

The statements are explained separately.

Default RSTP is enabled on all Ethernet switching interfaces.

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

| Syntax | <pre> stp { disable; bridge-priority <i>priority</i>; forward-delay <i>seconds</i>; hello-time <i>seconds</i>; interface (all <i>interface-name</i>) { disable; bpdu-timeout-action { block; alarm; } cost <i>cost</i>; edge; mode <i>mode</i>; no-root-port; priority <i>priority</i>; } max-age <i>seconds</i>; traceoptions { file <i>name</i> <replace> <size <i>size</i>> <files <i>number</i>> <no-stamp> <(world-readable no-world-readable)>; flag <i>flag</i> <<i>flag-modifier</i>> <disable>; } } </pre> |
| Hierarchy Level | [edit protocols] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | <p>When you explicitly configure STP, a switch uses the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).</p> <p>The remaining statements are explained separately.</p> |
| Default | STP is disabled; by default, RSTP is enabled on all Ethernet switching ports. |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1513 • Configuring STP on page 1553 • Overview of Spanning-Tree Protocols on page 1419 • show spanning-tree bridge on page 1706 • show spanning-tree interface on page 1711 |

traceoptions (STP)

| | |
|---------------------|--|
| Syntax | <pre>traceoptions {
 file <i>name</i> <replace> <size <i>size</i>> <files <i>number</i>> <no-stamp>
 <(world-readable no-world-readable)>;
 flag <i>flag</i> <flag-modifier> <disable>;
}</pre> |
| Hierarchy Level | [edit protocols mstp],
[edit protocols rstp],
[edit protocols stp],
[edit protocols vstp vlan <i>vlan-id</i>]
[edit protocols layer2-control] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |

NOTE: traceoptions is not supported on QFabric systems.

Description Set STP protocol-level tracing options.

Default Traceoptions is disabled.

Options **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *name*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file `/var/log/stp-log`.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 1 trace file only

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the STP-specific tracing options:

- **all**—Trace all operations.
- **all-failures**—Trace all failure conditions.
- **bpdu**—Trace BPDU reception and transmission.

- **bridge-detection-state-machine**—Trace the bridge detection state machine.
- **events**—Trace events of the protocol state machine.
- **port-information-state-machine**—Trace the port information state machine.
- **port-migration-state-machine**—Trace the port migration state machine.
- **port-receive-state-machine**—Trace the port receive state machine.
- **port-role-select-state-machine**—Trace the port role selection state machine.
- **port-role-transit-state-machine**—Trace the port role transit state machine.
- **port-transmit-state-machine**—Trace the port transmit state machine.
- **port-state-transit-state-machine**—Trace the port state transit state machine.
- **ppmd**—Trace the state and events for the ppm process.
- **state-machine-variables**—Trace when the state machine variables change.
- **timers**—Trace protocol timers.
- **topology-change-state-machine**—Trace the topology change state machine.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.

Default: If you do not specify this option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Prevent any user from reading the log file.

replace—(Optional) Replace an existing trace file if there is one.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.O**. When the **trace-file** again reaches its maximum size, **trace-file.O** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.O**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

l3-interface (VLAN)

| | |
|----------------------------|---|
| Syntax | <code>l3-interface (vlan.logical-interface-number irb.logical-interface-number);</code> |
| Hierarchy Level | [edit vlan <i>vlan-name</i>] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series.
irb option introduced in Junos OS Release 13.2 for the QFX Series. |
| Description | Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between VLANs. Traffic between VLANs must be routed, which requires a common Layer 3 interface. |
| Default | No Layer 3 (routing) interface is associated with the VLAN. |
| Options | <code>vlan.logical-interface-number</code> —Number of the logical interface. Use the unit number that you used when you created the vlan interface with a set interfaces vlan unit statement. |

NOTE: You can use this statement with versions of Junos OS that do not and do not support Enhanced Layer 2 Software (ELS).

`irb.logical-interface-number`—Logical interface defined with a **set interfaces irb** statement.

NOTE: Use this statement with versions of Junos OS that support Enhanced Layer 2 Software (ELS).

members

| | |
|----------------------------|---|
| Syntax | <code>members [(all <i>names</i> <i>vlan-ids</i>)];</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit 0 family ethernet-switching <i>vlan</i>] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For trunk interfaces, configure the VLANs for which the interface can carry traffic. |

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after *vlan* or *vlangs* in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

- Options**
- all**—Specify that this trunk interface be a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

NOTE: Each VLAN that is configured must have a specified VLAN ID when you attempt to commit the configuration; otherwise, the configuration commit fails. Also, *all* cannot be the name of a VLAN on the switch.

names—Names of one or more VLANs.

vlan-ids—Numeric identifiers of one or more VLANs.

- Required Privilege Level**
- routing**—To view this statement in the configuration.
- routing-control**—To add this statement to the configuration.

native-vlan-id

| | |
|---------------------------------|--|
| Syntax | <code>native-vlan-id <i>vlan-id</i>;</code> |
| Hierarchy Level | For platforms without ELS:

<code>[edit interfaces <i>interface-name</i> unit 0 family ethernet-switching],</code>

For platforms with ELS:

<code>[edit interfaces <i>interface-name</i>]</code> |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | <p>Configure the VLAN identifier to associate with untagged packets received on the interface. The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface. To configure the logical interface, include the vlan-id statement (matching the native-vlan-id statement on the physical interface) at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</code> hierarchy level.</p> <p>When the native-vlan-id statement is combined with the interface-mode statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.</p> <p>When the native-vlan-id statement is combined with the flexible-vlan-tagging statement, untagged packets are accepted on the interfaces that are configured for Q-in-Q tunneling.</p> <p>.</p> |
| Options | <p>vlan-id—Numeric identifier of the VLAN.</p> <p>Range: 1 through 4094</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none">• Junos OS Network Interfaces Configuration Guide•• show ethernet-switching interfaces on page 1358• show vlans on page 1722 |

no-mac-learning

| | |
|---------------------------------|--|
| Syntax | <code>no-mac-learning <i>limit</i>;</code> |
| Hierarchy Level | For platforms without ELS:

[edit ethernet-switching-options interfaces <i>interface-name</i>]

For platforms with ELS:

[edit vlans <i>vlan-name</i> switch-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Disable MAC address learning for the specified interface. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member. |
| Default | MAC learning is enabled. |
| Required Privilege Level | routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration. |
| Related Documentation | • |

static (Static MAC-Based VLANs)

| | |
|---------------------------------|--|
| Syntax | <pre>static { vlan <i>vlan-name</i> { mac <i>mac-address</i> { next-hop <i>interface-name</i>; } } }</pre> |
| Hierarchy Level | [edit ethernet-switching-options] |
| Release Information | Statement introduced in Junos OS Release 11.1 for EX Series switches. |
| Description | Specify VLAN and MAC addresses to add to the Ethernet switching table.

The remaining statements are explained separately. |
| Required Privilege Level | system—To view this statement in the configuration.
system-control—To add this statement to the configuration. |

drop-threshold

| | |
|---------------------------------|--|
| Syntax | <code>drop-threshold <i>number</i>;</code> |
| Hierarchy Level | <code>[edit vlans <i>vlan-name</i> dot1q-tunneling layer2-protocol-tunneling (all <i>protocol-name</i>)]</code> |
| Release Information | Statement introduced in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | <p>Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold value must be less than or equal to the shutdown threshold value.</p> <p>L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.</p> |
| | <div> NOTE: If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.</div> |
| | <p>You can specify a drop threshold value without specifying a shutdown threshold value.</p> |
| Default | No drop threshold is specified. |
| Options | <p><i>number</i>—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs.</p> <p>Range: 1 through 1000</p> |
| Required Privilege Level | system—To view this statement in the configuration.
system-control—To add this statement to the configuration. |

traceoptions (Ethernet Switching Options)

Syntax `traceoptions {
 file filename <files number> <no-stamp> <replace> <size size> <world-readable |
 no-world-readable>;
 flag flag <disable>;
 }`

Hierarchy Level [edit [ethernet-switching-options](#)]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

NOTE: The `traceoptions` statement is not supported on the QFX3000 QFabric system.

Description Define global tracing operations for access security features on Ethernet switches.

Default The `traceoptions` feature is disabled by default.

Options **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename* —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

files *number* —(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached (**xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag* —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **access-security**—Trace access security events.
- **all**—All tracing operations.
- **analyzer**—Trace analyzer events.
- **config-internal**—Trace internal configuration operations.
- **filter**—Trace filter transaction events.
- **forwarding-database**—Trace forwarding database events.

- **general**—Trace general events.
- **interface**—Trace interface events.
- **krt**—Trace communications over routing sockets.
- **lib**—Trace library calls.
- **nexthop**—Trace next-hop events.
- **normal**—Trace normal events.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **rtg**—Trace redundant trunk group events.
- **state**—Trace state transitions.
- **stp**—Trace spanning-tree events.
- **task**—Trace Ethernet-switching task processing.
- **timer**—Trace Ethernet-switching timer processing.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vlan**—Trace VLAN events.

no-stamp—(Optional) Do not timestamp the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending to it.

Default: If you do not include this option, tracing output is appended to an existing trace file.

size size —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes

Range: 10 KB through 1 gigabyte

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

| | |
|---------------------------|---|
| Required Privilege | routing—To view this statement in the configuration. |
| Level | routing-control—To add this statement to the configuration. |

vlan (Ethernet)

| | |
|---------------------------------|---|
| Syntax | <pre>vlan {
 members [(all names vlan-ids)];
}</pre> |
| Hierarchy Level | [edit interfaces ge-chassis/slot/port unit logical-unit-number ethernet-switching],
[edit interfaces xe-chassis/slot/port unit logical-unit-number ethernet-switching] |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | For Gigabit Ethernet and aggregated Ethernet interfaces, assign an 802.1Q VLAN tag ID to a logical interface.

The statements are explained separately. |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Example: Setting Up Bridging with Multiple VLANs on page 1451• Junos OS Network Interfaces Configuration Guide |

vlan (Static MAC-based VLANs)

| | |
|---------------------------------|--|
| Syntax | <pre>vlan vlan-name {
 mac mac-address {
 next-hop interface-name;
 }
}</pre> |
| Hierarchy Level | [edit ethernet-switching-options static] |
| Release Information | Statement introduced in Junos OS Release 11.1 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Specify the name of a VLAN to add to the Ethernet switching table. |
| Options | vlan-name —Name of the VLAN to add to the Ethernet switching table.
The remaining statements are explained separately. |
| Required Privilege Level | system—To view this statement in the configuration.
system-control—To add this statement to the configuration. |
| Related Documentation | <ul style="list-style-type: none">• Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure) on page 1527 |

vlan (Unknown Unicast)

Syntax `vlan (all | vlan-name) {
 interface interface-name;
 }`

Hierarchy Level [edit [ethernet-switching-options](#) unknown-unicast-forwarding]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Specify a VLAN from which unknown unicast packets will be forwarded, or specify that the packets should be forwarded from *all* VLANs. Unknown unicast packets are forwarded from a VLAN to a specific trunk interface.

The remaining statement is explained separately.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlangs` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options `all`—All VLANs.

`vlan-name`—Name of a VLAN.

Required Privilege Level `routing`—To view this statement in the configuration.
 `routing-control`—To add this statement to the configuration.

[edit vlans] Configuration Statement Hierarchy on the QFX Series

This topic lists supported and unsupported configuration statements in the **[edit vlans]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *QFX Series Virtual Chassis Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit vlans\] Hierarchy Level on page 1640](#)
- [Unsupported Statements in the \[edit vlans\] Hierarchy Level on page 1642](#)

Supported Statements in the [edit vlans] Hierarchy Level

The following hierarchy shows the **[edit vlans]** configuration statements supported on one or more of the EX Series switches:

```
vlans {  
  vlan-name {  
    description text-description;
```

```

domain-type bridge;
forwarding-options {
  dhcp-security {
    arp-inspection;
    group group-name {

}
```

Unsupported Statements in the [edit vlans] Hierarchy Level

All statements in the [edit vlans] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

Table 137: Unsupported [edit vlans] Configuration Statements on EX Series Switches

| Statement | Hierarchy Level |
|---|-----------------|
| NOTE: Variables, such as <i>filename</i> , are not shown in the statements or hierarchies. | |
| mcae-mac-synchronize | [edit vlans] |
| no-irb-layer-2-copy | [edit vlans] |

Hierarchy Level [edit forwarding-options],
[edit vlans forwarding-options]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the switch and enable the switch to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

The extended DHCP and DHCPv6 relay agent options configured with the **dhcp-relay** and **dhcpv6** statements are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router at the same time.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

| | |
|---------------------------------|---|
| Description | (MX Series routers, EX Series switches, and the QFX Series) Configure a limit to the number of MAC addresses that can be learned from a bridge domain or VLAN, virtual switch, or set of bridge domains or VLANs. |
| Default | All devices except the EX Series switches: 1024 MAC addresses for each logical interface; EX Series switches: 65,536 MAC addresses for each interface and VLAN. |
| Options | <p>limit—Maximum number of MAC addresses learned from an interface.</p> <p>Range: 1 through 131,071 MAC addresses per interface, or 1 through 65,535 MAC addresses per interface</p> <p>The remaining statement is explained separately.</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p> |

interface-mode

| | |
|--------------------------|--|
| Syntax | interface-mode (access trunk); |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge],
[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge] |
| Release Information | Statement introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series. |
| Description | <p> NOTE: This statement supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see port-mode. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 58.</p> <p>(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the trunk option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the vlan-id or vlan-id-list statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the access option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the vlan-id statement.</p> <p> NOTE: On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure interface-mode and irb for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see <i>Configuring a Trunk Interface on a Bridge Network</i>.</p> |
| Options | <p>access—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the vlan-id statement.</p> <p>trunk—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the vlan-id or vlan-id-list statement.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

Release Information Statement introduced in Junos OS Release 8.4.
 Support for the **switch-options** statement added in Junos OS Release 9.2.
 Support for top-level configuration for the **virtual-switch** type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.

Support for logical systems added in Junos OS Release 9.6.

[edit switch-options interface *interface-name* interface-mac-limit *limit*], [edit switch-options interface-mac-limit *limit*], [edit switch-options mac-table-size *limit*], [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit *limit*], [edit vlans *vlan-name* switch-options interface-mac-limit *limit*], and [edit vlans *vlan-name* switch-options mac-table-size *limit*] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.

Support for EVPNs introduced in Junos OS Release 13.2 on MX Series 3D Universal Edge Routers.

Support at the [edit switch-options interface *interface-name* interface-mac-limit *limit*] hierarchy level and hierarchy levels under [edit vlans *vlan-name*] introduced in Junos OS Release 13.2X50-D10 for EX Series switches and Junos OS Release 13.2 for the QFX Series.

Description Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

Default

NOTE: On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

Options

- drop**—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.
- drop-and-log**—(EX Series switches and QFX Series only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
- log**—(EX Series switches and QFX Series only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
- none**—(EX Series switches and QFX Series only) Forward packets with new source MAC addresses, and learn the new source MAC address.
- shutdown**—(EX Series switches and QFX Series only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 13.2 for the QFX Series.
Statements for private VLANs and Q-in-Q tunneling introduced in Junos OS Release 12.1 for the QFX Series.

Description Configure VLAN properties on the QFX Series.

Default If you use the default factory configuration, all switch interfaces become part of the VLAN default.

Options *vlan-name*—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.

The remaining statements are described separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Verifying That MAC Notification Is Working Properly

Purpose Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

Action To verify that MAC notification is enabled or disabled and also to verify the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 30
```

Meaning The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 30 seconds.

Related Documentation • [Configuring MAC Notification on page 1531](#)

Verifying That a Series of Tagged VLANs Has Been Created

Purpose Verify that a series of tagged VLANs has been created on the switch.

Action 1. Display the VLANs in the ascending order of their VLAN ID:

```
user@switch> show vlans sort-by tag
```

| Name | Tag | Interfaces |
|------------------|-----|--------------|
| __employee_120__ | 120 | xe-0/0/22.0* |
| __employee_121__ | 121 | xe-0/0/22.0* |
| __employee_122__ | 122 | xe-0/0/22.0* |
| __employee_123__ | 123 | xe-0/0/22.0* |
| __employee_124__ | 124 | xe-0/0/22.0* |
| __employee_125__ | 125 | xe-0/0/22.0* |
| __employee_126__ | 126 | xe-0/0/22.0* |
| __employee_127__ | 127 | xe-0/0/22.0* |
| __employee_128__ | 128 | xe-0/0/22.0* |
| __employee_129__ | 129 | xe-0/0/22.0* |
| __employee_130__ | 130 | xe-0/0/22.0* |

2. Display the VLANs by the alphabetical order of the VLAN name:

```
user@switch> show vlans sort-by name
```

| Name | Tag | Interfaces |
|------------------|-----|--------------|
| __employee_120__ | 120 | xe-0/0/22.0* |
| __employee_121__ | 121 | xe-0/0/22.0* |
| __employee_122__ | 122 | xe-0/0/22.0* |
| __employee_123__ | 123 | xe-0/0/22.0* |
| __employee_124__ | 124 | xe-0/0/22.0* |
| __employee_125__ | 125 | xe-0/0/22.0* |
| __employee_126__ | 126 | xe-0/0/22.0* |
| __employee_127__ | 127 | xe-0/0/22.0* |
| __employee_128__ | 128 | xe-0/0/22.0* |
| __employee_129__ | 129 | xe-0/0/22.0* |
| __employee_130__ | 130 | xe-0/0/22.0* |

3. Display the VLANs by specifying the VLAN range name (here, the VLAN range name is **employee**):

```
user@switch> show vlans employee
```

| Name | Tag | Interfaces |
|------------------|-----|------------|
| __employee_120__ | 120 | |

```

__employee_121__ 121      xe-0/0/22.0*
__employee_122__ 122      xe-0/0/22.0*
__employee_123__ 123      xe-0/0/22.0*
__employee_124__ 124      xe-0/0/22.0*
__employee_125__ 125      xe-0/0/22.0*
__employee_126__ 126      xe-0/0/22.0*
__employee_127__ 127      xe-0/0/22.0*
__employee_128__ 128      xe-0/0/22.0*
__employee_129__ 129      xe-0/0/22.0*
__employee_130__ 130      xe-0/0/22.0*

```

Meaning The sample output shows the VLANs configured on the switch. The series of tagged VLANs is displayed: `__employee_120__` through `__employee_130__`. Each of the tagged VLANs is configured on the trunk interface `xe-0/0/22.0`. The asterisk (*) next to the interface name indicates that the interface is **UP**.

When a series of VLANs is created using the `vlan-range` statement, the VLAN names are preceded and followed by a double underscore.

 - [Creating a Series of Tagged VLANs on page 1546](#)

Verifying That Proxy ARP Is Working Correctly

Purpose Verify that the switch is sending proxy ARP messages.

Action List the system statistics for ARP:

```

user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
    610 ARP replies received
    2 resolution request received
    0 unrestricted proxy requests
    0 restricted proxy requests
    0 received proxy requests
    0 unrestricted proxy requests not proxied
    0 restricted proxy requests not proxied
    0 datagrams with bogus interface
    0 datagrams with incorrect length
    0 datagrams for non-IP protocol
    0 datagrams with unsupported op code
    0 datagrams with bad protocol address length
    0 datagrams with bad hardware address length

```

```
0 datagrams with multicast source address
0 datagrams with multicast target address
0 datagrams with my own hardware address
0 datagrams for an address not on the interface
0 datagrams with a broadcast source address
294 datagrams with source address duplicate to mine
89113 datagrams which were not for me
0 packets discarded waiting for resolution
0 packets sent after waiting for resolution
309 ARP requests sent
35 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
0 replies for from unnumbered interfaces
0 requests on unnumbered interface with non-subnetted donor
0 replies from unnumbered interface with non-subnetted donor
```

Meaning The statistics show that two proxy ARP requests were received. The **unrestricted proxy requests not proxied** and **restricted proxy requests not proxied** fields indicate that all the unproxied ARP requests received have been proxied by the switch.

clear ethernet-switching bpdu-error

| | |
|---------------------------------|--|
| Syntax | clear ethernet-switching bpdu-error interface <i>interface-name</i> |
| Release Information | Command introduced in Junos OS Release 9.1 for EX Series switches. Command updated in Junos OS Release 11.1 for EX Series switches—a BPDU error shuts down the interface and this command brings the interface back up.
Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Clear bridge protocol data unit (BPDU) errors from an interface and bring up the interface. |
| Options | <i>interface-name</i> —Clear BPDU errors on the specified interface. |
| Required Privilege Level | clear |
| Related Documentation | <ul style="list-style-type: none">• show spanning-tree interface on page 1711• Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches• Understanding BPDU Protection for STP, RSTP, and MSTP on page 1423 |

Sample Output

clear ethernet-switching bpdu-error interface

```
user@switch> clear ethernet-switching bpdu-error interface xe-0/0/1.0
```

clear ethernet-switching layer2-protocol-tunneling error

| | |
|---------------------------------|--|
| Syntax | clear ethernet-switching layer2-protocol-tunneling error
<interface <i>interface-name</i> > |
| Release Information | Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Clear Layer 2 protocol tunneling (L2PT) errors on one or more interfaces. If an interface has been disabled because the amount of Layer 2 protocol traffic exceeded the shutdown threshold or because the switch has detected an error in the network topology or configuration, use this command to reenable the interface. |
| Options | none —Clears L2PT errors on all interfaces.

interface <i>interface-name</i> —(Optional) Clear L2PT errors on the specified interface. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • <i>Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</i> • <i>Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</i> • <i>Configuring Layer 2 Protocol Tunneling</i> |

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics vlan v2
```

clear ethernet-switching table

| | |
|----------------------------|---|
| Syntax | clear ethernet-switching table
<interface <i>interface-name</i> >
<mac <i>mac-address</i> >
<management-vlan>
<persistent-mac < <i>interface</i> <i>mac-address</i> >>
<vlan <i>vlan-name</i> > |
| Syntax (QFX Series) | clear ethernet-switching table
<interface <i>interface-name</i> >
<mac <i>mac-address</i> >
<persistent-mac < <i>interface</i> <i>mac-address</i> >>
<vlan <i>vlan-name</i> > |
| Release Information | Command introduced in Junos OS Release 9.3 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | <p> NOTE: On a QFabric system, using this command on an FCoE-enabled VLAN when FCoE sessions are active can cause traffic flooding and FCoE traffic drop. The FCoE sessions are not terminated and the traffic reconverges after a short period of time.</p> <p>Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).</p> |
| Options | <p>none—Clear learned entries in the Ethernet switching table, except for persistent MAC addresses.</p> <p>interface <i>interface-name</i>—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.</p> <p>mac <i>mac-address</i>—(Optional) Clear the specified learned MAC address from the Ethernet switching table.</p> <p>management-vlan—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.</p> <p>persistent-mac <<i>interface</i> <i>mac-address</i>>—(Optional) Clear all MAC addresses, including persistent MAC addresses. Use the interface option to clear all MAC addresses on an interface, or use the mac-address option to clear all entries for a specific MAC address.</p> <p>Use this command whenever you move a device in your network that has a persistent MAC address on the switch. If you move the device to another port on the switch and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address and the device will not be able to connect. If the original port is down when you move the device, then the new port</p> |

will learn the MAC address and the device can connect—however, unless you cleared the MAC address on the original port, when the port comes back up, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the address is removed from the new port and the device loses connectivity.

vlan *vlan-name*—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

Required Privilege Level

show ethernet-switching layer2-protocol-tunneling interface

| | |
|---------------------------------|--|
| Syntax | <code>show ethernet-switching-layer2-protocol-tunneling interface</code>
<code><interface-name></code> |
| Release Information | Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Display information about Layer 2 protocol tunneling (L2PT) on interfaces that have been configured for L2PT. |
| Options | none —Display L2PT information about all interfaces on which L2PT is enabled.
interface-name —(Optional) Display L2PT information for the specified interface. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show ethernet-switching layer2-protocol-tunneling statistics on page 1686 • show ethernet-switching layer2-protocol-tunneling vlan on page 1689 • <i>Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</i> • show ethernet-switching layer2-protocol-tunneling statistics on page 1686 • show ethernet-switching layer2-protocol-tunneling vlan on page 1689 • <i>Configuring Layer 2 Protocol Tunneling</i> |
| List of Sample Output | show ethernet-switching layer2-protocol-tunneling interface on page 1685
show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0 on page 1685 |
| Output Fields | Table 139 on page 1684 lists the output fields for the show ethernet-switching layer2-protocol-tunneling interface command. Output fields are listed in the approximate order in which they appear. |

Table 139: show ethernet-switching layer2-protocol-tunneling interface Output Fields

| Field Name | Field Description |
|--------------------|---|
| Interface | Name of an interface on the switch. |
| Operation | Type of operation being performed on the interface. Values are Encapsulation and Decapsulation . |
| State | State of the interface. Values are active and shutdown . |
| Description | If the interface state is shutdown , displays why the interface is shut down. If the description says Loop detected , it means that the interface is an access interface that has received L2PT-enabled PDUs. Access interfaces should not receive L2PT-enabled PDUs. This scenario might mean that there is a loop in the network. |

Sample Output

show ethernet-switching layer2-protocol-tunneling interface

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface
```

```
Layer2 Protocol Tunneling information:
```

| Interface | Operation | State | Description |
|------------|---------------|----------|-----------------------------|
| xe-0/0/0.0 | Encapsulation | Shutdown | Shutdown threshold exceeded |
| xe-0/0/1.0 | Decapsulation | Shutdown | Loop detected |
| xe-0/0/2.0 | Decapsulation | Active | |

show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0
```

```
Layer2 Protocol Tunneling information:
```

| Interface | Operation | State | Description |
|------------|---------------|----------|-----------------------------|
| xe-0/0/0.0 | Encapsulation | Shutdown | Shutdown threshold exceeded |

show ethernet-switching layer2-protocol-tunneling statistics

| | |
|---------------------------------|--|
| Syntax | <code>show ethernet-switching-layer2-protocol-tunneling statistics</code>
<code><interface <i>interface-name</i>></code>
<code><vlan <i>vlan-name</i>></code> |
| Release Information | Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Display Layer 2 protocol tunneling (L2PT) statistics for Layer 2 PDU packets received by the switch. |
| | <div> NOTE: The <code>show ethernet-switching-layer2-protocol-tunneling statistics</code> command does not display L2PT statistics for Layer 2 PDU packets transmitted from the switch.</div> |
| Options | <code>none</code> —Display L2PT statistics for all interfaces on which you enabled L2PT.

<code>interface <i>interface-name</i></code> —(Optional) Display L2PT statistics for the specified interface.

<code>vlan <i>vlan-name</i></code> —(Optional) Display L2PT statistics for the specified VLAN. |

show ethernet-switching layer2-protocol-tunneling statistics vlan v2 on page 1687 |
| Output Fields | Table 140 on page 1687 lists the output fields for the <code>show ethernet-switching layer2-protocol-tunneling statistics</code> command. Output fields are listed in the approximate order in which they appear. |

Table 140: show ethernet-switching layer2-protocol-tunneling statistics Output Fields

| VLAN | Field Description |
|------------------|--|
| VLAN | Name of a VLAN on which L2PT has been configured. |
| Interface | Name of an interface on which L2PT has been configured. |
| Protocol | Name of a protocol for which L2PT has been enabled. Values are all , 802.1x , 802.3ah , cdp , e-lmi , gvrp , lACP , lldp , mmrp , mvrp , stp , udld , vstp , and vtp . |
| Operation | Type of operation being performed on the interface. Values are Encapsulation and Decapsulation . |
| Packets | Number of packets that have been encapsulated or de-encapsulated. |
| Drops | Number of packets that have exceeded the drop threshold and have been dropped. |
| Shutdowns | Number of times that packets have exceeded the shutdown threshold and the interface has been shut down. |

Sample Output

show ethernet-switching layer2-protocol-tunneling statistics

```
user@switch> show ethernet-switching layer2-protocol-tunneling statistics
```

```
Layer2 Protocol Tunneling Statistics:
VLAN  Interface  Protocol  Operation  Packets  Drops  Shutdowns
v1    xe-0/0/0.0  mvrp     Encapsulation  0        0      0
v1    xe-0/0/1.0  mvrp     Decapsulation  0        0      0
v1    xe-0/0/2.0  mvrp     Decapsulation  60634    0      0
v2    xe-0/0/0.0  cdp      Encapsulation  0        0      0
v2    xe-0/0/0.0  gvrp     Encapsulation  0        0      0
v2    xe-0/0/0.0  lldp     Encapsulation  0        0      0
```

show ethernet-switching layer2-protocol-tunneling statistics interface xe-0/0/0.0

```
user@switch> show ethernet-switching layer2-protocol-tunneling statistics interface xe-0/0/0.0
```

```
Layer2 Protocol Tunneling Statistics:
VLAN  Interface  Protocol  Operation  Packets  Drops  Shutdowns
v1    xe-0/0/0.0  mvrp     Encapsulation  0        0      0
v2    xe-0/0/0.0  cdp      Encapsulation  0        0      0

show ethernet-switching layer2-protocol-tunneling vlan

| | |
|---------------------------------|---|
| Syntax | <code>show ethernet-switching-layer2-protocol-tunneling vlan <vlan-name></code> |
| Release Information | Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Display information about Layer 2 protocol tunneling (L2PT) on VLANs that have been configured for L2PT. |
| Options | none —Display information about L2PT for the VLANs on which you have configured L2PT.
vlan-name —(Optional) Display information about L2PT for the specified VLAN. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show ethernet-switching layer2-protocol-tunneling interface on page 1684 • show ethernet-switching layer2-protocol-tunneling statistics on page 1686 • show vlans • Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches • Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure) • show vlans on page 1722 • Configuring Layer 2 Protocol Tunneling |
| List of Sample Output | show ethernet-switching layer2-protocol-tunneling vlan on page 1690
show ethernet-switching layer2-protocol-tunneling vlan v2 on page 1690 |
| Output Fields | Table 141 on page 1689 lists the output fields for the show ethernet-switching layer2-protocol-tunneling vlan command. Output fields are listed in the approximate order in which they appear. |

Table 141: show ethernet-switching layer2-protocol-tunneling vlan Output Fields

| Field Name | Field Description |
|---------------------------|--|
| VLAN | Name of the VLAN on which L2PT has been configured. |
| Protocol | Name of a protocol for which L2PT has been enabled. Values are all , 802.1x , 802.3ah , cdp , e-lmi , gvrp , lacp , lldp , mrrp , mvrp , stp , vstp , and vtp . |
| Drop Threshold | Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the switch begins dropping the Layer 2 PDUs. |
| Shutdown Threshold | Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the interface is disabled. |

Sample Output

show ethernet-switching layer2-protocol-tunneling vlan

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan
```

```
Layer2 Protocol Tunneling VLAN information:
VLAN      Protocol      Drop      Shutdown
              Threshold Threshold
v1         mvrp          100       200
v2         cdp           0         0
v2         cdp           0         0
v2         gvrp          0         0
```

show ethernet-switching layer2-protocol-tunneling vlan v2

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan v2
```

```
Layer2 Protocol Tunneling VLAN information:
VLAN      Protocol      Drop      Shutdown
              Threshold Threshold
v2         cdp           0         0
v2         cdp           0         0
v2         gvrp          0         0
```

show ethernet-switching mac-learning-log

| | |
|---------------------------------|---|
| Syntax | show ethernet-switching mac-learning-log |
| Release Information | Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Displays the event log of learned MAC addresses. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show ethernet-switching table on page 1700 • show ethernet-switching interfaces on page 1358 |
| List of Sample Output | show ethernet-switching mac-learning-log on page 1691 |
| Output Fields | Table 142 on page 1691 lists the output fields for the show ethernet-switching mac-learning-log command. Output fields are listed in the approximate order in which they appear. |

Table 142: show ethernet-switching mac-learning-log Output Fields

| Field Name | Field Description |
|------------------------|---|
| Date and Time | Timestamp when the MAC address was added or deleted from the log. |
| vlan_name | VLAN name. A value defined by the user for all user-configured VLANs. |
| MAC | Learned MAC address. |
| Deleted Added | MAC address deleted from or added to the MAC learning log. |
| Blocking | Forwarding state of the interface: <ul style="list-style-type: none"> • blocked—Traffic is not being forwarded on the interface. • unblocked—Traffic is forwarded on the interface. |

Sample Output

show ethernet-switching mac-learning-log

```

user@switch> show ethernet-switching mac-learning-log
Mon Feb 25 08:07:05 2008
  vlan_name v1 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name v9 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name HR_vlan mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name v3 mac 00:00:00:00:00:00 was deleted

```

show ethernet-switching mac-notification

| | |
|--------------------------|---|
| Syntax | show ethernet-switching mac-notification |
| Release Information | Command introduced in Junos OS Release 9.6 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display information about MAC notification. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none">Verifying That MAC Notification Is Working Properly |
| List of Sample Output | show ethernet-switching mac-notification (MAC Notification Enabled) on page 1693
show ethernet-switching mac-notification (MAC Notification Disabled) on page 1693 |
| Output Fields | Table 143 on page 1693 lists the output fields for the show ethernet-switching mac-notification command. Output fields are listed in the order in which they appear. |

Table 143: show ethernet-switching mac-notification Output Fields

| Field Name | Field Description |
|-----------------------|--|
| Notification Status | MAC notification status: <ul style="list-style-type: none">Enabled—MAC notification is enabled.Disabled—MAC notification is disabled. |
| Notification Interval | MAC notification interval in seconds. |

Sample Output

show ethernet-switching mac-notification (MAC Notification Enabled)

```
user@switch> show ethernet-switching mac-notification
Notification Status      : Enabled
Notification Interval    : 30
```

Sample Output

show ethernet-switching mac-notification (MAC Notification Disabled)

```
user@switch> show ethernet-switching mac-notification
Notification Status      : Disabled
Notification Interval    : 0
```

show ethernet-switching statistics aging

| | |
|---------------------------------|---|
| Syntax | show ethernet-switching statistics aging
<brief detail> |
| Release Information | Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display media access control (MAC) aging statistics. |
| Options | none —(Optional) Display MAC aging statistics.
brief detail —(Optional) Display the specified level of output. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • show ethernet-switching statistics mac-learning on page 1696 • mac-table-aging-time on page 1621 • Configuring MAC Table Aging on page 1532 |
| List of Sample Output | show ethernet-switching statistics aging on page 1695 |
| Output Fields | Table 144 on page 1694 lists the output fields for the show ethernet-switching statistics aging command. Output fields are listed in the approximate order in which they appear. |

Table 144: show ethernet-switching statistics aging Output Fields

| Field Name | Field Description | Level of Output |
|------------------------------------|---|-----------------|
| Total age messages received | Total number of aging messages received from the hardware. | All levels |
| Immediate aging | Aging message indicating that the entry should be removed immediately. | All levels |
| MAC address seen | Aging message indicating that the MAC address has been detected by hardware and that the aging timer should be stopped. | All levels |
| MAC address not seen | Aging message indicating that the MAC address has not been detected by the hardware and that the aging timer should be started. | All levels |
| Error age messages | The received aging message contains the following errors: <ul style="list-style-type: none"> • Invalid VLAN—The VLAN of the packet does not exist. • No such entry—The MAC address and VLAN pair provided by the aging message does not exist. • Static entry—An unsuccessful attempt was made to age out a static MAC entry. | All levels |

Sample Output

show ethernet-switching statistics aging

```
user@switch> show ethernet-switching statistics aging
```

```
Total age messages received: 0
```

```
Immediate aging: 0, MAC address seen: 0, MAC address not seen: 0
```

```
Error age messages: 0
```

```
Invalid VLAN: 0, No such entry: 0, Static entry: 0
```

Table 146: show ethernet-switching table Output Fields

| Field Name | Field Description | Level of Output |
|------------|-------------------|-----------------|
| VLAN | Name of a VLAN. | All levels |

Table 146: show ethernet-switching table Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--------------------|---|--------------------------|
| MAC address | MAC address associated with the VLAN. | All levels |
| Type | Type of MAC address: <ul style="list-style-type: none"> • static—The MAC address is manually created. • learn—The MAC address is learned dynamically from a packet's source MAC address. • flood—The MAC address is unknown and flooded to all members. | All levels |
| Age | Time remaining before the entry ages out and is removed from the Ethernet switching table. | All levels |
| Interfaces | Interface associated with learned MAC addresses or with the All-members option (flood entry). | All levels |
| Learned | For learned entries, the time at which the entry was added to the Ethernet switching table. | detail, extensive |

Sample Output

show ethernet-switching table

```

| Output Fields | Table 147 on page 1706 lists the output fields for the show spanning-tree bridge command. Output fields are listed in the approximate order in which they appear. |

Table 147: show spanning-tree bridge Output Fields

| Field Name | Field Description |
|-----------------------|---|
| Routing instance name | Name of the routing instance under which the bridge is configured. |
| Enabled protocol | Spanning Tree Protocol type enabled. |
| Root ID | Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. |

Table 147: show spanning-tree bridge Output Fields (*continued*)

| Field Name | Field Description |
|---------------------------------|---|
| Root cost | Calculated cost to reach the root bridge from the bridge where the command is entered. |
| Root port | Interface that is the current elected root port for this bridge. |
| CIST regional root | Bridge ID of the elected MSTP regional root bridge. |
| CIST internal root cost | Calculated cost to reach the regional root bridge from the bridge where the command is entered. |
| Hello time | Configured number of seconds between transmissions of configuration bridge protocol data units (BPDUs). |
| Maximum age | Configured maximum expected arrival time of hello bridge protocol data units (BPDUs). |
| Forward delay | How long an STP bridge port remains in the listening and learning states before transitioning to the forwarding state. |
| Hop count | Configured maximum number of hops a BPDUs can be forwarded in the MSTP region. |
| Message age | Number of elapsed seconds since the most recent BPDUs was received. |
| Number of topology changes | Total number of STP topology changes detected since the routing device last booted. |
| Time since last topology change | Number of elapsed seconds since the most recent topology change. |
| Bridge ID (Local) | Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. |
| Extended system ID | System identifier. |
| MSTI regional root | Bridge ID of the elected MSTP regional root bridge. |

Sample Output

show spanning-tree interface

| | |
|---|--|
| Syntax | show spanning-tree interface
<brief detail>
<msti <i>msti-id</i> >
<routing-instance <i>routing-instance-name</i> >
<vlan-id <i>vlan-id</i> > |
| Syntax (EX Series Switches and the QFX Series) | show spanning-tree interface
<brief detail>
<msti <i>msti-id</i> >
<vlan-id <i>vlan-id</i> > |
| Release Information | Command introduced in Junos OS Release 8.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series. |
| Description | Display the configured or calculated interface-level STP parameters. |
| Options | <p>none—Display brief STP interface information.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>msti <i>msti-id</i>—(Optional) Display STP interface information for the specified MST instance.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Display STP interface information for the specified routing instance.</p> <p>vlan-id <i>vlan-id</i>—(Optional) Display STP interface information for the specified VLAN.</p> |
| Required Privilege Level | view |
| List of Sample Output | show spanning-tree interface on page 1712
show spanning-tree interface (QFX Series) on page 1713
show spanning-tree interface detail on page 1713
show spanning-tree interface msti on page 1715
show spanning-tree interface vlan-id on page 1715
show spanning-tree interface (VSTP) on page 1716
show spanning-tree interface vlan-id (VSTP) on page 1716 |
| Output Fields | Table 148 on page 1711 lists the output fields for the show spanning-tree interface command. Output fields are listed in the approximate order in which they appear. |

Table 148: show spanning-tree Interface Output Fields

| Field Name | Field Description |
|-----------------------|---|
| Interface name | Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance. |

Table 148: show spanning-tree Interface Output Fields (*continued*)

| Field Name | Field Description |
|-----------------------------|---|
| Port ID | Logical interface identifier configured to participate in the MSTP or VSTP instance. |
| Designated port ID | Port ID of the designated port for the LAN segment to which this interface is attached. |
| Designated bridge ID | Bridge ID of the designated bridge for the LAN segment to which this interface is attached. |
| Port Cost | Configured cost for the interface. |
| Port State | STP port state: forwarding (FWD), blocking (BLK), listening, learning, or disabled. |
| Port Role | MSTP, VSTP, or RSTP port role: designated (DESG), backup (BKUP), alternate (ALT), (ROOT), or Root Prevented (Root-Prev). |
| Link type | MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge. |
| Alternate | Identifies the interface as an MSTP, VSTP, or RSTP alternate root port (Yes) or nonalternate root port (No). |
| Boundary Port | Identifies the interface as an MSTP regional boundary port (Yes) or nonboundary port (No). |

Sample Output

| Field Name | Field Description |
|-----------------------------|--|
| Context id | Internally generated identifier. |
| Region name | MSTP region name carried in the MSTP BPDUs. |
| Revision | Revision number of the MSTP configuration. |
| Configuration digest | Numerical value derived from the VLAN-to-instance mapping table. |
| MSTI | MST instance identifier. |
| Member VLANs | VLAN identifiers associated with the MSTI. |

Sample Output

show spanning-tree mstp configuration detail

```
user@host> show spanning-tree mstp configuration routing-instance vs1 detail
MSTP configuration information
Context identifier      : 1
Region name            : henry
Revision               : 3
Configuration digest    : 0x6da4b5c4fd587757eef35675365e1

MSTI      Member VLANs
0 0-99,101-199,201-4094
1 100
2 200
```

show spanning-tree mstp configuration detail (QFX Series)

```
user@1f0> show spanning-tree mstp configuration routing-instance vs1 detail
MSTP configuration information
Context identifier      : 1
Region name            : henry
Revision               : 3
Configuration digest    : 0x6da4b5c4fd587757eef35675365e1

MSTI      Member VLANs
0 0-99,101-199,201-4094
1 100
2 200

show spanning-tree statistics interface routing-instance detail on page 1720 |
| Output Fields | Table 150 on page 1719 lists the output fields for the show spanning-tree statistics command. Output fields are listed in the approximate order in which they appear. |

Table 150: show spanning-tree statistics Output Fields

| Field Name | Field Description |
|--|---|
| Message type | Type of message being counted. |
| BPDUs sent | Total number of BPDUs sent. |
| BPDUs received | Total number of BPDUs received. |
| BPDUs sent in last interval | Number of BPDUs sent within a specified interval. |
| BPDUs received in last interval | Number of BPDUs received within a specified interval. |
| Interface | Interface for which the statistics are being displayed. |

Table 150: show spanning-tree statistics Output Fields (*continued*)

| Field Name | Field Description |
|------------------------|--|
| Next BPDU transmission | Number of seconds until the next BPDU is scheduled to be sent. |

Sample Output

show spanning-tree statistics routing-instance

```

user@host> show spanning-tree statistics routing-instance vs1 detail
Routing instance level STP statistics
Message type           : bpdus
BPDUs sent             : 1396
BPDUs received         : 1027
BPDUs sent in last interval : 5      (duration: 4 sec)
BPDUs received in last interval: 4    (duration: 4 sec)

```

show spanning-tree statistics interface routing-instance detail

```

user@host> show spanning-tree statistics interface ge-11/1/4 routing-instance vs1 detail
Interface  BPDUs sent  BPDUs received  Next BPDU
                                     transmission
ge-11/1/4      7           190           0

```

show system statistics arp

| | |
|---------------------------------|--|
| Syntax | show system statistics arp |
| Release Information | Command introduced in Junos OS Release 9.6 for EX Series switches. |
| Description | Display system-wide Address Resolution Protocol (ARP) statistics. |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> • <i>Example: Configuring Proxy ARP on an EX Series Switch</i> • Verifying That Proxy ARP Is Working Correctly on page 1671 |

show system statistics arp

```

user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
    610 ARP replies received
    0 resolution request received
    0 unrestricted proxy requests
    0 restricted proxy requests
    0 received proxy requests
    0 unrestricted proxy requests not proxied
    0 restricted proxy requests not proxied
    0 datagrams with bogus interface
    0 datagrams with incorrect length
    0 datagrams for non-IP protocol
    0 datagrams with unsupported op code
    0 datagrams with bad protocol address length
    0 datagrams with bad hardware address length
    0 datagrams with multicast source address
    0 datagrams with multicast target address
    0 datagrams with my own hardware address
    0 datagrams for an address not on the interface
    0 datagrams with a broadcast source address
    294 datagrams with source address duplicate to mine
    89113 datagrams which were not for me
    0 packets discarded waiting for resolution
    0 packets sent after waiting for resolution
    309 ARP requests sent
    35 ARP replies sent
    0 requests for memory denied
    0 requests dropped on entry
    0 requests dropped during retry
    0 requests dropped due to interface deletion
    0 requests on unnumbered interfaces
    0 new requests on unnumbered interfaces
    0 replies for from unnumbered interfaces
    0 requests on unnumbered interface with non-subnetted donor
    0 replies from unnumbered interface with non-subnetted donor

```

show vlans

Syntax **show vlans**
 <brief | detail | extensive>
 <dot1q-tunneling>
 <sort-by (tag | name)>
 <vlan-range-name>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.
 Option **dot1q-tunneling** added in Junos OS Release 12.1 for the QFX Series.

Description Display information about VLANs configured on bridged Ethernet interfaces. For interfaces configured to support a VoIP VLAN and a data VLAN, the **show vlans** command displays both tagged and untagged membership for those VLANs.

NOTE: When a series of VLANs is created using the **vlan-range** statement, such VLAN names are preceded and followed by a double underscore. For example, a series of VLANs using the VLAN range 1 through 3 and the base VLAN name **marketing** would be displayed as **__marketing_1__**, **__marketing_2__**, and **__marketing_3__**.

NOTE: To display an 802.1X supplicant successfully authenticated in multiple-suppliant mode with dynamic VLAN movement, use the **show vlans *vlan-name* extensive** operational mode command, where ***vlan-name*** is the dynamic VLAN.

Options **none**—Display information for all VLANs. VLAN information is displayed by VLAN name in ascending order.

brief | detail | extensive—(Optional) Display the specified level of output.

sort-by (tag | name)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

vlan-range-name—(Optional) Display VLANs in ascending order of VLAN range names.

Required Privilege Level view

Output Fields Table 115 on page 1373 lists the output fields for the **show vlans** command. Output fields are listed in the approximate order in which they appear.

Table 151: show vlans Output Fields

| Field Name | Field Description | Level of Output |
|-----------------------------|--|--------------------------|
| Name | Name of a VLAN. | none, brief |
| Tag | 802.1Q tag applied to this VLAN. If none is displayed, no tag is applied. | All levels |
| Interfaces | Interface associated with learned MAC addresses or All-members option (flood entry). An asterisk (*) beside the interface indicates that the interface is UP . | All levels |
| Address | IP address. | none, brief |
| Ports Active /Total | Number of interfaces associated with a VLAN: Active indicates interfaces that are UP , and Total indicates interfaces that are active and inactive. | brief |
| VLAN | Name of a VLAN. | detail, extensive |
| Admin state | State of the interface. Values are:

enabled —The interface is turned on, and the physical link is operational and can pass packets. | detail,extensive |
| MAC learning Status | Indicates if MAC learning is disabled. | detail, extensive |
| Description | Description for the VLAN. | detail,extensive |
| Primary IP | Primary IP address associated with a VLAN. | detail |
| Number of interfaces | Number of interfaces associated with a VLAN. Both the total number of interfaces and the number of active interfaces associated with a VLAN are displayed. | detail, extensive |
| STP | Spanning tree associated with a VLAN. | detail,extensive |
| Tagged interfaces | Tagged interfaces with which a VLAN is associated. | detail,extensive |

Table 151: show vlans Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------|---|-------------------|
| Untagged interfaces | Untagged interfaces with which a VLAN is associated. | detail. extensive |
| Dot1q Tunneling Status | Indicates if Q-in-Q tunneling is enabled. | extensive |
| Customer VLAN ranges | List of customer VLAN (C-VLAN) ranges associated with this service VLAN (S-VLAN). | extensive |
| Private VLAN Mode | The private VLAN mode for this VLAN. Values include Primary , Isolated , and Community . | extensive |
| Primary VLAN | Primary VLAN tag for this secondary VLAN. | extensive |
| Internal Index | VLAN index internal to Junos OS software. | extensive |
| Origin | Manner in which the VLAN was created: static or learn . | extensive |
| Protocol | Port-based VLAN or MAC-based VLAN. MAC-based protocol is displayed when VLAN assignment is done either statically or dynamically through 802.1X, | extensive |
| IP addresses | IP address associated with a VLAN. | extensive |
| Number of MAC entries | For MAC-based VLANs created either statically or dynamically, the MAC addresses associated with an interface. | extensive |
| Number of mapping rules | Number of mapping rules for Q-in-Q tunneling (Push) and VLAN translation (Swap). | |
| Secondary VLANs | Secondary VLANs associated with a primary VLAN. | extensive |
| Isolated VLANs | Isolated VLANs associated with a primary VLAN. | extensive |
| Community VLANs | Community VLANs associated with a primary VLAN. | extensive |
| VLANs summary | VLAN counts: <ul style="list-style-type: none"> • Total—Total number of VLANs on the switch. • Configured VLANs—Number of VLANs that are based on user-configured settings. • Internal VLANs—Number of VLANs created by the system with no explicit configuration or protocol—for example, the default VLAN and the VLAN created when a trunk interface is not configured with native VLAN membership. • Temporary VLANs—Number of VLANs from the previous configuration that the system retains for a limited time after restart. Temporary VLANs are converted into one of the other types of VLAN, or are removed from the system if the current configuration does not require them. | All levels |

Table 151: show vlans Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------------|--|-----------------|
| Dot1q VLANs summary | 802.1Q VLAN counts: <ul style="list-style-type: none"> • Total—Total number of 802.1Q-tagged and untagged VLANs on the switch. • Tagged VLANs—Number of 802.1Q-tagged VLANs. • Untagged VLANs—Number of untagged 802.1Q VLANs. • Private VLAN—Counts of the following kinds of 802.1Q private VLANs (PVLANS): <ul style="list-style-type: none"> • Primary VLANs—Number of primary forwarding private VLANs. • Community VLANs—Number of community transporting and forwarding private VLANs. • Isolated VLANs—Number of isolated receiving and forwarding private VLANs. • Inter-switch-isolated VLANs—Number of inter-switch isolated receiving and forwarding private VLANs. | All levels |
| Dot1q Tunneled VLANs summary | Q-in-Q-tunneled VLAN counts: <ul style="list-style-type: none"> • Total—Total number of Q-in-Q-tunneled VLANs on the switch. • Private VLAN—Counts of primary, community, and isolated Q-in-Q-tunneled private VLANs (PVLANS). | All levels |

Troubleshooting

- [Troubleshooting Procedures on page 1731](#)

Troubleshooting Procedures

- [Troubleshooting Ethernet Switching on page 1731](#)

Troubleshooting Ethernet Switching

Problem Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

Solution Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message,

thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

Graceful Restart Concepts

With routing protocols, any service interruption requires that an affected router recalculate adjacencies with neighboring routers, restore routing table entries, and update other protocol-specific information. An unprotected restart of a router can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Three main types of graceful restart are available on Juniper Networks routing platforms:

- Graceful restart for aggregate and static routes and for routing protocols—Provides protection for aggregate and static routes and for Border Gateway Protocol (BGP), End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), next-generation RIP (RIPng), and Protocol Independent Multicast (PIM) sparse mode routing protocols.
- Graceful restart for MPLS-related protocols—Provides protection for Label Distribution Protocol (LDP), Resource Reservation Protocol (RSVP), circuit cross-connect (CCC), and translational cross-connect (TCC).
- Graceful restart for virtual private networks (VPNs)—Provides protection for Layer 2 and Layer 3 VPNs.

Graceful restart works similarly for routing protocols and MPLS protocols and combines components of these protocol types to enable graceful restart in VPNs. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart thus enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Most graceful restart implementations define two types of routers—the restarting router and the helper router. The restarting router requires rapid restoration of forwarding state information so it can resume the forwarding of network traffic. The helper router assists the restarting router in this process. Graceful restart configuration statements typically affect either the restarting router or the helper router.

Understanding VRRP

The Juniper Networks QFX Series supports the Virtual Router Redundancy Protocol (VRRP). This topic covers:

- [Overview of VRRP on page 1736](#)
- [Sample VRRP Topology on page 1737](#)

Overview of VRRP

Configuring end hosts on your network with static default routes minimizes configuration effort and complexity and reduces processing overhead on the end hosts. When hosts are configured with static routes, the failure of the default gateway normally results in a catastrophic event, isolating all hosts that are unable to detect available alternate paths to their gateway. Using Virtual Router Redundancy Protocol (VRRP) enables you to dynamically provide alternative gateways for end hosts if the primary gateway fails.

VRRP (defined in RFC 3768) provides dynamic failover of IP addresses from one router to another in the event of failure. You can implement VRRP to provide a highly available default path to a gateway without needing to configure dynamic routing or router discovery protocols on end hosts.

Switches configured with VRRP share a virtual IP address, which is the address you configure as the default route on the hosts. At any time, one of the switches is the VRRP master, meaning that it owns the virtual IP address and is the active default gateway. The other devices are backups. The switches dynamically assign master and backup roles based on priorities that you configure (**1 through 255**). If the master fails, the backup switch with the highest priority becomes the master within a few seconds. This is done without any interaction with the hosts.

In VRRP operation, the master sends advertisements to the backup switches at regular intervals. The default interval is 1 second. If the backup switches do not receive an advertisement for a set period, the backup with the highest priority takes over as master within a few seconds and begins forwarding packets. This is done without any interaction with the hosts.

NOTE: Priority 255 cannot be set for routed VLAN interfaces (RVIs).

You can configure two QFabric systems to participate in a VRRP configuration as if they were two standalone switches. One benefit of this configuration is if you use VMware's vMotion, virtual machines can transition between hosts connected to the QFabric systems without updating their default gateway information. For example, a virtual machine running on a host connected to a QFabric system in data center A can transition to a host connected to a QFabric system in data center B without needing to resolve a new gateway IP address and MAC address.

Sample VRRP Topology

Figure 22 on page 1737 illustrates a basic VRRP topology. In this example, switches A and B are running VRRP and share the virtual IP address 10.1.1.1. The default gateway for each of the clients is 10.1.1.1.

Figure 22: Basic VRRP Topology

The following illustrates basic VRRP behavior using Figure 22 on page 1737 for reference:

1. When any of the servers wants to send traffic out of the LAN, it sends the traffic to the default gateway address of 10.1.1.1. This is a virtual IP address (VIP) owned by VRRP group 100. Because switch A is the master of the group, the VIP is associated with the "real" address 10.1.1.251 on switch A, and traffic from the servers is actually

sent to this address. (Switch A is the master because it has been configured with a higher priority value.)

2. If there is a failure on switch A that prevents it from forwarding traffic to or from the servers—for example, if the interface connected to the LAN fails—switch B becomes the master and assumes ownership of the VIP. The servers continue to send traffic to the VIP, but because the VIP is now associated with the “real” address 10.1.1.252 on switch B (because of change of master), the traffic is sent to switch B instead of switch A.
3. If the problem that caused the failure on switch A is corrected, switch A becomes the master again and reasserts ownership of the VIP. In this case, the servers resume sending traffic to switch A.

Notice that no configuration changes are required on the servers for them to switch between sending traffic to switch A and switch B. When the VIP moves between 10.1.1.251 and 10.1.1.252, the change is detected by normal TCP-IP behavior and no configuration or intervention is required on the servers.

Configuring Routing Protocols Graceful Restart

This topic includes the following sections:

- [Enabling Graceful Restart on page 1739](#)
- [Configuring Graceful Restart Options for BGP on page 1740](#)
- [Configuring Graceful Restart Options for ES-IS on page 1741](#)
- [Configuring Graceful Restart Options for IS-IS on page 1741](#)

- [Configuring Graceful Restart Options for RIP and RIPng on page 1743](#)
- [Configuring Graceful Restart Options for PIM Sparse Mode on page 1744](#)
- [Tracking Graceful Restart Events on page 1745](#)

Enabling Graceful Restart

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {  
  graceful-restart;
```

```
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

NOTE: Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```
[edit]
routing-options {
  graceful-restart {
    disable;
    restart-duration seconds;
  }
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

NOTE: If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

Configuring Graceful Restart Options for BGP

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]
protocols {
  bgp {
    graceful-restart {
      disable;
      restart-time seconds;
      stale-routes-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

NOTE: To set BGP graceful restart properties or disable them for a group, include the desired statements at the `[edit protocols bgp group group-name graceful-restart]` hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the `[edit protocols bgp group group-name neighbor ip-address graceful-restart]` hierarchy level.

NOTE: Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

Configuring Graceful Restart Options for ES-IS

On J Series Services Routers, to configure the duration of the ES-IS graceful restart period, include the `restart-duration` statement at the `[edit protocols esis graceful-restart]` hierarchy level.

```
[edit]
protocols {
  esis {
    graceful-restart {
      disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable ES-IS graceful restart capability, include the `disable` statement at the `[edit protocols esis graceful-restart]` hierarchy level.

Configuring Graceful Restart Options for IS-IS

To configure the duration of the IS-IS graceful restart period, include the `restart-duration` statement at the `[edit protocols isis graceful-restart]` hierarchy level.

```
[edit]
protocols {
  isis {
    graceful-restart {
      disable;
      helper-disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

```
}
```

To disable IS-IS graceful restart helper capability, include the **helper-disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level. To disable IS-IS graceful restart capability, include the **disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

NOTE: If you configure Bidirectional Forwarding Detection (BFD) and graceful restart for IS-IS, graceful restart might not work as expected.

NOTE: You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols isis]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1745](#).

Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  ospf | ospfv3 {
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf**

graceful-restart] hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
  graceful-restart {
    helper-disable <both | restart-signaling | standard>
  }
```

To reenable the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

TIP: You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospfv3)]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1745](#).

NOTE: You cannot enable OSPFv3 graceful restart between a routing platform running Junos OS Release 7.5 and earlier and a routing platform running Junos OS Release 7.6 or later. As a workaround, make sure both routing platforms use the same Junos OS version.

NOTE: If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

Configuring Graceful Restart Options for RIP and RIPng

To configure the duration of the RIP or RIPng graceful restart period, include the **restart-time** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  (rip | ripng) {
    graceful-restart {
      disable;
      restart-time seconds;
    }
  }
}
```

```
routing-options {  
    graceful-restart;  
}
```

To disable RIP or RIPng graceful restart capability, include the **disable** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

Configuring Graceful Restart Options for PIM Sparse Mode

PIM sparse mode continues to forward existing multicast packet streams during a graceful restart, but does not forward new streams until after the restart is complete. After a restart, the routing platform updates the forwarding state with any updates that were received from neighbors and occurred during the restart period. For example, the routing platform relearns the join and prune states of neighbors during the restart, but does not apply the changes to the forwarding table until after the restart.

PIM sparse mode-enabled routing platforms generate a unique 32-bit random number called a generation identifier. Generation identifiers are included by default in PIM hello messages, as specified in the IETF Internet draft *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*. When a routing platform receives PIM hellos containing generation identifiers on a point-to-point interface, Junos OS activates an algorithm that optimizes graceful restart.

Before PIM sparse mode graceful restart occurs, each routing platform creates a generation identifier and sends it to its multicast neighbors. If a PIM sparse mode-enabled routing platform restarts, it creates a new generation identifier and sends it to its neighbors. When a neighbor receives the new identifier, it resends multicast updates to the restarting router to allow it to exit graceful restart efficiently. The restart phase completes when either the PIM state becomes stable or when the restart interval timer expires.

If a routing platform does not support generation identifiers or if PIM is enabled on multipoint interfaces, the PIM sparse mode graceful restart algorithm does not activate, and a default restart timer is used as the restart mechanism.

To configure the duration of the PIM graceful restart period, include the **restart-duration** statement at the **[edit protocols pim graceful-restart]** hierarchy level:

```
[edit]  
protocols {  
    pim {  
        graceful-restart {  
            disable;  
            restart-duration seconds;  
        }  
    }  
}  
routing-options {  
    graceful-restart;  
}
```

To disable PIM sparse mode graceful restart capability, include the **disable** statement at the **[edit protocols pim graceful-restart]** hierarchy level.

NOTE: Multicast forwarding can be interrupted in two ways. First, if the underlying routing protocol is unstable, multicast reverse-path-forwarding (RPF) checks can fail and cause an interruption. Second, because the forwarding table is not updated during the graceful restart period, new multicast streams are not forwarded until graceful restart is complete.

Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols *protocol* traceoptions flag]** hierarchy level:

```
[edit protocols]
isis {
  traceoptions {
    flag graceful-restart;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag graceful-restart;
  }
}
```

Configuration Task for Graceful Switchover

- [Configuring Graceful Routing Engine Switchover in a Virtual Chassis \(CLI Procedure\) on page 1746](#)

Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis, one member switch is assigned the master role and has the master Routing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up the Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two switches in a Virtual Chassis configuration with mastership priority of 255:

```
[edit]
user@switch# set virtual-chassis member 0 mastership-priority 255
[edit]
user@switch# set virtual-chassis member 1 mastership-priority 255
```

2. Set up graceful Routing Engine switchover:

```
[edit]
user@switch# set chassis redundancy graceful-switchover
```

Commit the configuration.

NOTE: We recommend that you use the `commit synchronize` command to save any configuration changes that you make to a multimember Virtual Chassis.

Configuration Example for VRRP

- [Example: Configuring VRRP for Load Sharing on page 1746](#)

Example: Configuring VRRP for Load Sharing

If you do not want to dedicate a switch to be a VRRP backup (and therefore leave it idle unless the master fails), you can create a load-sharing configuration in which each participating switch simultaneously acts as a master and a backup.

One reason to use a load-sharing (active-active) configuration is that you are more likely to actively monitor and maintain both switches and notice if a problem occurs on either

of them. If you use a configuration in which one switch is only a backup (an active-backup configuration), you might be less likely to pay attention to the backup switch while it is idle. In the worst case, this could lead to the backup switch developing an undetected problem and not being able to perform adequately when a failover occurs.

- [Requirements on page 1747](#)
- [Overview and Topology on page 1747](#)
- [Configuring VRRP on Both Switches on page 1748](#)
- [Verification on page 1750](#)

Requirements

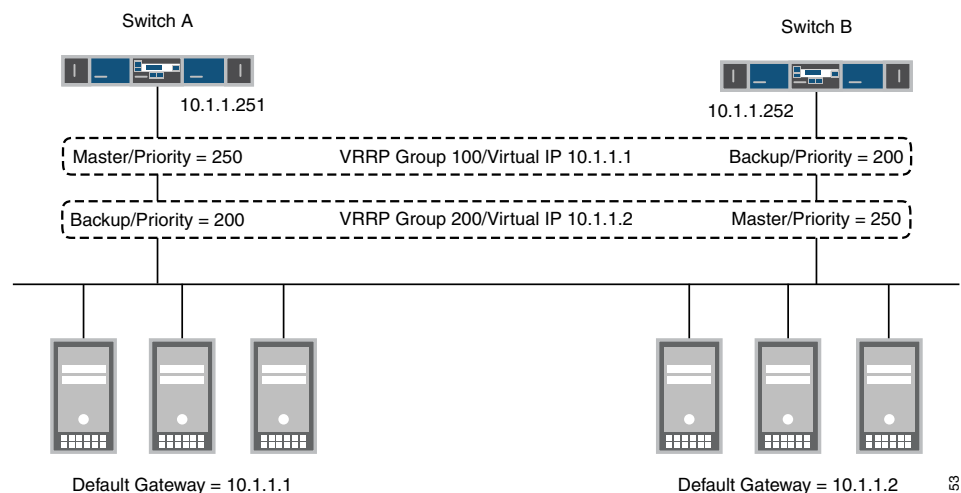

This example uses the following hardware and software components:

- Two QFX3500 switches
- Junos OS Release 11.3 or later
- Static routing or a dynamic routing protocol enabled on both switches.

Overview and Topology

This example uses two VRRP groups, each of which has its own virtual IP address. Devices on the LAN use one of these virtual IP addresses as their default gateway. If one of the switches fails, the other switch takes over for it. In the topology shown in [Figure 23 on page 1747](#), for example, Switch A is the master for VRRP group 100. If Switch A fails, Switch B takes over and forwards traffic that the end devices send to the default gateway address 10.1.1.1.

Figure 23: VRRP Load-Sharing Configuration

This example shows a simple configuration to illustrate the basic steps for configuring two switches running VRRP to back each other up. [Table 152 on page 1748](#) lists VRRP settings for each switch.

Table 152: Settings for VRRP Load-Sharing Example

| Switch A | Switch B |
|---|---|
| VRRP Group 100: <ul style="list-style-type: none"> Interface address: 10.1.1.251 VIP: 10.1.1.1 Priority: 250 | VRRP Group 100: <ul style="list-style-type: none"> Interface address: 10.1.1.252 VIP: 10.1.1.1 Priority: 200 |
| VRRP Group 200: <ul style="list-style-type: none"> Interface address: 10.1.1.251 VIP: 10.1.1.2 Priority: 200 | VRRP Group 200: <ul style="list-style-type: none"> Interface address: 10.1.1.252 VIP: 10.1.1.2 Priority: 250 |

In addition to configuring the two switches as shown, you must configure your end devices so that some of them use one of the virtual IP addresses as their default gateway and the remaining end devices use the other virtual IP address as their default gateway.

Note that if a failover occurs, the remaining switch might be unable to handle all of the traffic, depending on the demand.

Configuring VRRP on Both Switches

CLI Quick Configuration

Enter the following on Switch A:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 priority 200
```

Enter the following on Switch B:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 priority 250
```

Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch A:

1. Create VRRP group 100 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
```
4. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 200
```

Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch B:

1. Create VRRP group 100 on Switch B and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```
2. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
```

Switch A remains the master for group 100 because it has the highest priority for this group.
3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
```
4. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

Switch B becomes the master for group 200 because it has the highest priority for this group.

Results Display the results of the configuration on Switch A:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.251 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 250
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 200
          }
        }
      }
    }
  }
}
```

```

    }
  }
}
}
}

```

Display the results of the configuration on Switch B:

```

user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.252 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 200
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 250
          }
        }
      }
    }
  }
}

```

Verification

- [Verifying that VRRP is Working on Switch A on page 1750](#)
- [Verifying that VRRP is Working on Switch B on page 1751](#)

Verifying that VRRP is Working on Switch A

Purpose Verify that VRRP is active on Switch A and that the master and backup roles are correct.

Action Use the following command to verify that VRRP is active on Switch A and that the switch is master for group 100 and backup for group 200.

```
user@switch> show vrrp
```

| Interface
Address | State | Group | VR state | Timer | Type |
|----------------------|-------|-------|----------|-------------|----------------------------|
| xe-0/0/0.0 | up | 100 | master | A .0327 1c1 | 10.1.1.251
vip 10.1.1.1 |
| xe-0/0/0.0 | up | 200 | backup | A .0327 1c1 | 10.1.1.251
vip 10.1.1.2 |

Meaning The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group

200 does not arrive before the timer expires, Switch A asserts itself as the master for this group.

Verifying that VRRP is Working on Switch B

Purpose Verify that VRRP is active on Switch B and that the master and backup roles are correct.

Action Use the following command to verify that VRRP is active on Switch B and that the switch is backup for group 100 and master for group 200.

```
user@switch> show vrrp
```

| Interface Address | State | Group | VR state | Timer | Type |
|-------------------|-------|-------|----------|--|------|
| xe-0/0/0.0 | up | 100 | backup | A .0327 1c1 10.1.1.252
vip 10.1.1.1 | |
| xe-0/0/0.0 | up | 200 | master | A .0327 1c1 10.1.1.252
vip 10.1.1.2 | |

Meaning The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 100 does not arrive before the timer expires, Switch B asserts itself as the master for this group.

Configuring Basic VRRP Support

To configure basic VRRP support, configure VRRP groups on interfaces by including the **vrrp-group** statement:

```
vrrp-group group-id {  
    priority number;  
    virtual-address [ addresses ];  
}
```

An interface can be a member of multiple VRRP groups.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**

For each interface, you must configure the following:

- Group identifier—Assign a value from 0 through 255. You must use the same identifier for each switch in the VRRP group.
- Priority—Assign a value from 1 through 255. The switch with the highest priority becomes the VRRP master. Assign different priorities to each switch in the VRRP group. If there are two or more switches with the same priority, the switch with the VRRP interface that has the highest IP address becomes the master.
- Virtual IP address—Normally, you configure only one address per group, but you can configure as many as eight addresses. Do not include a prefix length in a virtual IP address. The following considerations apply to configuring a virtual IP address:
 - You must configure the same address on all the switches in the VRRP group.
 - If you configure a virtual IP address to be the same as a physical interface address, the switch with that interface becomes the master for the group. You must configure the priority to be 255, and you must configure preemption by including the **preempt** statement.
 - If the virtual IP address is not the same as the physical interface address, you must ensure that the address does not appear anywhere else in the switch configuration. For example, verify that you do not use this address for another interface (including an aggregated Ethernet interface) or for a static ARP entry.

.....

NOTE: If you enable MAC source address filtering on an interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the **source-address-filter** statement at the **[edit interfaces *interface-name*]** hierarchy. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 3768. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

.....

 - [Configuring the Startup Period for VRRP Operations on page 1754](#)
 - [Configuring VRRP Authentication \(IPv4 Only\) on page 1753](#)

Configuring VRRP Authentication (IPv4 Only)

VRRP (IPv4 only) protocol exchanges can be authenticated to guarantee that only trusted switches participate in a VRRP group. By default, VRRP authentication is disabled. You can configure one of the following authentication methods for a group, and each switch in the same group must use the same method:

- Simple authentication—Uses a text password included in the transmitted packet. The receiving switch uses an authentication key (password) to verify the packet.
- Message Digest 5 (MD5) algorithm—Adds an authentication header (AH) to the IP packet that encapsulates the VRRP packet. You create an authentication key that is used to create a hash of the packet, and the hash is stored in the AH. A receiving switch recalculates the hash on the incoming packet and compares the hashes. If they are identical, the packet is valid and is accepted. Otherwise the switch drops the incoming packet.

To enable authentication and specify an authentication method, include the **authentication-type** statement.

authentication-type *authentication*;

authentication can be **simple** or **md5**. The authentication type must be the same for all the switches in the VRRP group.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

If you include the **authentication-type** statement, you can configure a key (password) on each interface by including the **authentication-key** statement:

authentication-key *key*;

key (the password) is an ASCII string. For simple authentication, it can be from 1 through 8 characters long. For MD5 authentication, it can be from 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").

NOTE: The key must be the same for all switches in the VRRP group.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

Configuring the Startup Period for VRRP Operations

Configure the startup-silent period interval to avoid alarms caused by the delay or interruption of the incoming VRRP advertisement packets while an interface is coming online. The period starts when the state of a VRRP interface is changed from down to up. During this period, Master Down Events are ignored.

To configure the startup period for VRRP operations, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]  
  startup-silent-period seconds;
```

**Related
Documentation**

- [Understanding VRRP on page 1736](#)
- [Configuring Basic VRRP Support on page 1752](#)
- [Example: Configuring VRRP for Load Sharing on page 1746](#)

Configuring the Advertisement Interval for the VRRP Master

By default, the master switch sends VRRP advertisement packets every second to all members of the VRRP group. These packets indicate that the master switch is still operational. If the master switch fails or becomes unreachable, the backup switch with the highest priority value becomes the new master switch.

You can modify the advertisement interval in seconds or in milliseconds; the interval must be the same for all routing platforms in the VRRP group.

This topic contains the following sections:

- [Modifying the Advertisement Interval in Seconds on page 1754](#)
- [Modifying the Advertisement Interval in Milliseconds on page 1755](#)

Modifying the Advertisement Interval in Seconds

To modify the time, in seconds, between the sending of VRRP advertisement packets, include the **advertise-interval** statement:

```
advertise-interval seconds;
```

The interval can be from 1 through 255 seconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

Modifying the Advertisement Interval in Milliseconds

To modify the time, in milliseconds, between the sending of VRRP advertisement packets, include the **fast-interval** statement:

```
fast-interval milliseconds;
```

The interval can be from 100 through 999 milliseconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

NOTE: Junos OS sets the advertisement interval to 0 in VRRP packets. When you configure VRRP with other vendors' equipment, the **fast-interval** statement works correctly only when the other equipment also has the advertisement interval set to 0 in the VRRP packet. Otherwise, Junos OS interprets other routers' settings as advertisement timer errors.

Configuring VRRP Preemption and Hold Time

- [Configuring VRRP Preemption on page 1755](#)
- [Configuring the Preemption Hold Time on page 1756](#)
- [Overriding the Hold Time on page 1756](#)

Configuring VRRP Preemption

By default, a higher-priority VRRP backup switch preempts a lower-priority master switch. To explicitly enable this behavior, include the following statement:

```
preempt;
```

To prohibit a higher-priority VRRP backup switch from preempting a lower-priority master switch, include the following statement on the lower-priority switch:

```
no-preempt;
```

You can include these statements at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

Configuring the Preemption Hold Time

You can also configure a preemption hold time, which is the number of seconds a higher-priority backup router that has just started up waits before preempting the master router. You might want to configure a hold time so that routing protocols or other Junos OS components converge before preemption occurs.

The hold time is applied only on startup. By default, the hold-time value is 0 seconds, meaning that preemption can occur immediately after the backup router starts up.

To modify the preemption hold-time value, configure the following statement:

hold-time *seconds*;

The hold time can be from 0 through 3600 seconds.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address vrrp-group *group-id*] preempt**

Overriding the Hold Time

You can use the **asymmetric-hold-time** statement to configure a VRRP master to fail over to the backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.

When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.

You can include this statement at the following hierarchy level:

- **[edit protocols vrrp]**

- [Example: Configuring VRRP for Load Sharing on page 1746](#)

Configuring a Route to Be Tracked

A VRRP master can track a route and dynamically trigger a new master router election if the route becomes unreachable. To enable this behavior, you must configure a cost that will be subtracted from the priority of the master if the tracked route becomes unreachable. The new priority must be less than the priority of one of the backups so that the backup becomes the new master.

To configure a route to be tracked, include the following statements:

```
track {
  priority-hold-time seconds;
  route prefix/prefix-length routing-instance default priority-cost priority;
}
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

The **prefix** and **prefix-length** values specify the route to be tracked. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority of the master changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **priority-cost** option is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

Related Documentation

- [Understanding VRRP on page 1736](#)
- [Configuring Basic VRRP Support on page 1752](#)
- [Example: Configuring VRRP for Load Sharing on page 1746](#)
- [Configuring a Logical Interface to Be Tracked on page 1757](#)

Configuring a Logical Interface to Be Tracked

VRRP can track whether a logical interface is up, down, or not present, and can change the priority of the switch based on the state of the interface, which might trigger a new master election. VRRP can also track the operational speed of a logical interface and update the priority of the switch when the speed crosses a configured threshold. For each VRRP group, you can track as many as 10 logical interfaces.

When interface tracking is enabled on a switch, you cannot assign the switch a priority of 255 to make it the master for the group.

To configure a logical interface to be tracked, include the following statements:

```
track {
  interface interface-name {
    bandwidth-threshold bits-per-second priority-cost priority;
    priority-cost priority;
  }
  priority-hold-time seconds;
}
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]

The interface specified is the interface to be tracked for the VRRP group. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **bandwidth-threshold** statement specifies a threshold for the tracked interface. If the bandwidth of the tracked interface drops below the threshold value, the system subtracts the bandwidth threshold **priority-cost** value from the VRRP priority for the switch. You can create as many as five **bandwidth-threshold** statements for each tracked interface.

The interface **priority-cost** statement is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

WARNING: On a QFabric system, do not apply interface tracking to a multichassis link aggregation group (MC-LAG) that includes an interface belonging to a network Node group device and an interface belonging to a server Node group device. If you do apply interface tracking to an MC-LAG configured in this way, a priority update will not occur if the state of the MC-LAG interface changes.

If you configure tracking for more than one interface, Junos OS subtracts the sum of the priority costs for the tracked interfaces from the VRRP priority if all the tracked interfaces fail. However, if you configure the interface **priority-cost** statement and the bandwidth threshold **priority-cost** statement, they are not added together. The switch uses only one priority cost for a tracked interface, as indicated in [Table 153 on page 1758](#):

Table 153: Interface State and Priority Cost Usage

| Tracked Interface State | Priority Cost Usage |
|--|--|
| Down | priority cost <i>priority</i> |
| Not down; media speed below one or more bandwidth thresholds | Priority-cost of the lowest applicable bandwidth threshold |

You must configure an interface priority cost only if you do not configure any bandwidth thresholds. If you do not configure an interface **priority-cost** value and the interface fails, Junos OS subtracts the bandwidth threshold **priority-cost** value of the lowest bandwidth threshold from the priority of the switch.

Configuring a Backup to Accept Packets Destined for the Virtual IP Address

By default, a switch configured to be a VRRP backup but acting as the master does not process packets sent to the virtual IP address—that is, packets in which the destination address is the virtual IP address. To configure a backup switch to process packets sent to the virtual IP address while it is acting as the master, include the **accept-data** statement on the backup:

```
accept-data;
```

You can include this statement at the following hierarchy level:

- `[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group] group-id`

To explicitly prohibit the backup from accepting packets destined for the virtual IP address while acting as master, include the **no-accept-data** statement:

```
no-accept-data;
```

If you include the **accept-data** statement, configure the connected hosts so that they:

- Process gratuitous ARP requests.
- Do not use packets other than ARP replies to update their ARP cache.

This statement is disabled by default. If you enable it, your configuration does not comply with RFC 3768.

To restrict incoming IP packets to ICMP only, you must configure firewall filters to accept only ICMP packets.

- Related Documentation**
- [Understanding VRRP on page 1736](#)
 - [Configuring Basic VRRP Support on page 1752](#)
 - [Example: Configuring VRRP for Load Sharing on page 1746](#)

Configuring Passive ARP Learning for VRRP Backups

By default, VRRP backup switches drop ARP requests for the MAC address of the VRRP IP. This means that backups do not learn the ARP mappings (IP address to MAC address mappings) for the hosts sending the requests. If it becomes the master, the configured backup must learn all the entries that were present in the ARP cache of the original master. In environments with many directly attached hosts, the number of ARP entries to learn can be very large. This can cause a significant delay while the backup transitions

to the master state, during which traffic transmitted to some of the hosts might be dropped.

Passive ARP learning enables the ARP cache in the backup to learn approximately the same contents as the ARP cache in the master, thus preventing the problem of needing to learn many ARP entries quickly. To enable passive ARP learning, include the **passive-learning** statement at the **[edit system arp]** hierarchy level:

```
[edit system arp]
passive-learning;
```

We recommend setting passive learning on both the backup and master VRRP switches. Doing so prevents the need to manually configure a master that fails and becomes a backup. While a switch operates as the master, the passive learning configuration has no impact. The configuration takes effect only when a switch operates as a backup.

Configuring the Silent Period

When the state of a VRRP interface changes from down to up, a silent period begins. During this period, any master down events are ignored. Configure the silent period interval to avoid problems that can be caused if incoming VRRP advertisement packets are delayed or interrupted while an interface starts up.

To configure the silent period, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
startup-silent-period seconds;
```

**Related
Documentation**

- [Example: Configuring VRRP for Load Sharing on page 1746](#)

Configuring Inheritance for a VRRP Group

Junos OS enables you to configure VRRP groups on the various subnets of a VLAN to inherit the state and configuration of one of the groups, which is known as the *active VRRP group*. By configuring inheritance, you can prevent VRRP groups other than the active group from sending out VRRP advertisements. When the **vrrp-inherit-from** configuration statement is included in the configuration, only the active VRRP group from which the other VRRP groups are inheriting the state sends out VRRP advertisements; the groups inheriting the state do not send any VRRP advertisements, because the state is maintained only on the group from which the state is inherited.

If the **vrrp-inherit-from** statement is not configured, each of the VRRP master groups in the various subnets on the VLAN sends out separate VRRP advertisements and adds to the traffic on the VLAN.

To configure inheritance for a VRRP group, include the **vrrp-inherit-from** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**:

```
[edit interfaces interface-name unit logical-unit-number family inet address address
  vrrp-group group-id]
  vrrp-inherit-from vrrp-group;
```

When you configure a group to inherit a state from another group, note the following conditions:

- Both inheriting groups and active groups must be on the same physical interface and logical system. However, the groups need not necessarily be on the same VLAN or logical interface.
- Both inheriting groups and active groups must be on the same routing instances; however, this limitation does not apply for groups on the integrated routing and bridging (IRB) interfaces.

When you include the **vrrp-inherit-from** statement for a VRRP group, the VRRP group inherits the following parameters from the active group:

- **advertise-interval**
- **authentication-key**
- **authentication-type**
- **fast-interval**
- **preempt | no-preempt**
- **priority**
- **track interfaces**
- **track route**

However, you can configure the **accept-data | no-accept-data** statement for the group to specify whether the interface should accept packets destined for the virtual IP address.

| Description | Disable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. |

NOTE: When you disable graceful restart at one level in the configuration statement hierarchy, it is also disabled at lower levels in the same hierarchy. For example, if you disable graceful restart at the [edit protocols bgp group *group-name*] hierarchy level, it is disabled for all the peers in the group. Therefore, if you want to enable graceful restart for some peers in a group and disable it for others, enable graceful restart at the [edit protocols bgp group *group-name*] hierarchy level and disable graceful restart for each peer at the [edit protocols bgp group *group-name* neighbor *address*] hierarchy level.

graceful-restart (Protocols OSPF)

| | |
|----------------------------|---|
| Syntax | <pre>graceful-restart {
 disable;
 helper-disable (standard restart-signaling both);
 no-strict-lsa-checking;
 notify-duration <i>seconds</i>;
 restart-duration <i>seconds</i>;
}</pre> |
| Hierarchy Level | [edit logical-systems <i>logical-system-name</i> protocols (ospf ospf3)],
[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)],
[edit protocols (ospf ospf3)],
[edit routing-instances <i>routing-instance-name</i> protocols ospf] |
| Release Information | Statement introduced before Junos OS Release 7.4.
Support for the no-strict-lsa-checking statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for the helper mode standard , restart-signaling , and both options introduced in Junos OS Release 11.4.
Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| Description | Configure graceful restart for OSPF.

Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level. |
| Options | <p>disable—Disable graceful restart for OSPF.</p> <p>helper-disable (standard restart-signaling both)—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The standard, restart-signaling, and both options are only supported for OSPFv2. Specify standard to disable helper mode for standard graceful restart (based on RFC 3623). Specify restart-signaling to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify both to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p>Default: Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p>no-strict-lsa-checking—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p> |

NOTE: The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

notify-duration seconds—Estimated time needed to send out purged grace LSAs over all the interfaces.

Range: 1 through 3600 seconds

Default: 30 seconds

restart-duration seconds—Estimated time needed to reacquire a full OSPF neighbor from each area.

Range: 1 through 3600 seconds

Default: 180 seconds

| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS 11.3 for the QFX Series. |
| Description | Enable Virtual Router Redundancy Protocol (VRRP) IPv4 authentication and specify the authentication scheme for the VRRP group. If you enable authentication, you must specify a password by including the authentication-key statement.

All routers in the VRRP group must use the same authentication scheme and password. |

NOTE: When VRRPv3 is enabled, the **authentication-type** and **authentication-key** statements cannot be configured for any VRRP groups.

| | |
|---------------------------------|---|
| Options | <p><i>authentication</i>—Authentication scheme:</p> <ul style="list-style-type: none"> simple—Use a simple password. The password is included in the transmitted packet, so this method of authentication is relatively insecure. md5—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing platform uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme. <p>Default: none (no authentication is performed).</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |

bandwidth-threshold

| | |
|---------------------------------|---|
| Syntax | <code>bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>;</code> |
| Hierarchy Level | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> vrrp-group <i>group-id</i> track interface <i>interface-name</i>],
[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>group-id</i> track interface <i>interface-name</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> vrrp-group <i>group-id</i> track interface <i>interface-name</i>],
[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>group-id</i> track interface <i>interface-name</i>] |
| Release Information | Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS 11.3 for the QFX Series. |
| Description | Specify the bandwidth threshold for Virtual Router Redundancy Protocol (VRRP) logical interface tracking. |
| Options | <p><i>bits-per-second</i>—Bandwidth threshold for the tracked interface. When the bandwidth of the tracked interface drops below the specified value, the VRRP group uses the bandwidth threshold priority cost value. You can include up to five bandwidth threshold statements for each interface you track.</p> <p>Range: 1 through 10000000000000 bits per second</p> <p><i>priority-cost <i>priority</i></i>—The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

failover-delay

| | |
|---------------------------------|--|
| Syntax | <code>failover-delay <i>milliseconds</i>;</code> |
| Hierarchy Level | [edit protocols vrrp] |
| Release Information | Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | <p>If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).</p> <p>If you configure a failover delay, the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.</p> |
| Options | <p><i>milliseconds</i>—Specify the failover delay time, in milliseconds.</p> <p>Range: 50 through 2000</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p> |
| Related Documentation | <ul style="list-style-type: none"> • Troubleshooting VRRP on page 1835 • show vrrp on page 1824 |

fast-interval

| | |
|--|---|
| Syntax | <code>fast-interval milliseconds;</code> |
| Hierarchy Level | <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</code>
<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</code>
<code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</code>
<code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</code> |
| Release Information | Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS 11.3 for the QFX Series. |
| Description | Configure the interval, in milliseconds, between Virtual Router Redundancy Protocol (VRRP) advertisement packets.

All routers in the VRRP group must use the same advertisement interval. |
| Options | <i>milliseconds</i> —Interval between advertisement packets.
Range: 10 through 40,950 milliseconds (range extended from 100–999 to 10–40,950 in Junos OS Release 12.2). |
| <hr/> <div> NOTE: When configuring VRRP for IPv4, if you have chosen not to enable VRRPv3, you cannot set a value less than 100 for <i>fast-interval</i>. Commit check fails if a value less than 100 is configured.</div> <hr/> | |
| Default: 1 second | |
| Required Privilege Level | interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration. |

traceoptions

Syntax traceoptions {
 file <filename> <files number> <match regular-expression> <microsecond-stamp>
 <size size> <world-readable | no-world-readable>;
 flag flag;
 no-remote-trace;
 }

Hierarchy Level [edit protocols vrrp]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.

Description Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.

To specify more than one tracing operation, include multiple **flag** statements.

By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory **/var/log**.

NOTE: The traceoptions statement is not supported on a QFabric system.

Default If you do not include this statement, no VRRP-specific tracing operations are performed.

Options **filename filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, VRRP tracing output is placed in the file **vrrpd**.

files number—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.

Range: 0 through 4,294,967,296 files

Default: 3 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the VRRP-specific tracing options:

- **all**—All VRRP tracing operations
- **database**—Database changes
- **general**—General events
- **interfaces**—Interface changes

- **normal**—Normal events
- **packets**—Packets sent and received
- **state**—State transitions
- **timer**—Timer events

match *regex*—(Optional) Refine the output to include only those lines that match the given regular expression.

microsecond-stamp—(Optional) Provide a timestamp with microsecond granularity.

no-world-readable—Restrict users from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your routing platform

Default: 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—Allow users to read the log file.

- [Operational Mode Commands for VRRP on page 1823](#)

Operational Mode Commands for Graceful Restart

- [Verifying Graceful Restart Operation on page 1799](#)
- [show bgp neighbor](#)
- [show log](#)
- [show \(ospf | ospf3\) overview](#)

Verifying Graceful Restart Operation

This topic contains the following sections:

- [Graceful Restart Operational Mode Commands on page 1799](#)
- [Verifying BGP Graceful Restart on page 1800](#)
- [Verifying IS-IS and OSPF Graceful Restart on page 1800](#)
- [Verifying CCC and TCC Graceful Restart on page 1801](#)

Graceful Restart Operational Mode Commands

To verify proper operation of graceful restart, use the following commands:

- **show bgp neighbor** (for BGP graceful restart)
- **show log** (for IS-IS and OSPF/OSPFv3 graceful restart)
- **show (ospf | ospfv3) overview** (for OSPF/OSPFv3 graceful restart)
- **show rsvp neighbor detail** (for RSVP graceful restart—helper router)
- **show rsvp version** (for RSVP graceful restart—restarting router)
- **show ldp session detail** (for LDP graceful restart)
- **show connections** (for CCC and TCC graceful restart)

- **show route instance detail** (for Layer 3 VPN graceful restart and for any protocols using graceful restart in a routing instance)
- **show route protocol l2vpn** (for Layer 2 VPN graceful restart)

For more information about these commands and a description of their output fields, see the [CLI Explorer](#).

Verifying BGP Graceful Restart

To view graceful restart information for BGP sessions, use the **show bgp neighbor** command:

```
user@PE1> show bgp neighbor 192.255.10.1
Peer: 192.255.10.1+179 AS 64595 Local: 192.255.5.1+1106 AS 64595
  Type: Internal   State: Established   Flags: <>
  Last State: OpenConfirm   Last Event: RecvKeepAlive
  Last Error: None
  Export: [ static ]
  Options:<Preference LocalAddress HoldTime GracefulRestart Damping PeerAS Refresh>

Local Address: 192.255.5.1 Holdtime: 90 Preference: 170
IPSec SA Name: hope
Number of flaps: 0
Peer ID: 192.255.10.1      Local ID: 192.255.5.1      Active Holdtime: 90
Keepalive Interval: 30
NLRI for restart configured on peer: inet-unicast
NLRI advertised by peer: inet-unicast
NLRI for this session: inet-unicast
Peer supports Refresh capability (2)
Restart time configured on the peer: 180
Stale routes from peer are kept for: 180
Restart time requested by this peer: 300
NLRI that peer supports restart for: inet-unicast
NLRI that peer saved forwarding for: inet-unicast
NLRI that restart is negotiated for: inet-unicast
NLRI of received end-of-rib markers: inet-unicast
NLRI of all end-of-rib markers sent: inet-unicast
Table inet.0 Bit: 10000
  RIB State: restart is complete
  Send state: in sync
  Active prefixes: 0
  Received prefixes: 0
  Suppressed due to damping: 0
Last traffic (seconds): Received 19   Sent 19   Checked 19
Input messages: Total 2      Updates 1      Refreshes 0      Octets 42
Output messages: Total 3      Updates 0      Refreshes 0      Octets 116
Output Queue[0]: 0
```

Verifying IS-IS and OSPF Graceful Restart

To view graceful restart information for IS-IS and OSPF, configure traceoptions (see [“Tracking Graceful Restart Events” on page 1745](#)).

Here is the output of a traceoptions log from an OSPF restarting router:

```
Oct  8 05:20:12 Restart mode - sending grace lsas
Oct  8 05:20:12 Restart mode - estimated restart duration timer triggered
Oct  8 05:20:13 Restart mode - Sending more grace lsas
```

Here is the output of a traceoptions log from an OSPF helper router:

```
Oct  8 05:20:14 Helper mode for neighbor 192.255.5.1
Oct  8 05:20:14 Received multiple grace lsa from 192.255.5.1
```

Verifying CCC and TCC Graceful Restart

To view graceful restart information for CCC and TCC connections, use the **show connections** command. The following example assumes four remote interface CCC connections between CE1 and CE2:

```
user@PE1> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)
UN -- uninitialized
NP -- not present
WE -- wrong encapsulation
DS -- disabled
Dn -- down
-> -- only outbound conn is up
<- -- only inbound conn is up
Up -- operational
RmtDn -- remote CCC down
Restart -- restarting

Legend for connection types
if-sw: interface switching
rmt-if: remote interface switching
lsp-sw: LSP switching

Legend for circuit types
intf -- interface
tlsp -- transmit LSP
rlsp -- receive LSP
```

CCC Graceful restart : Restarting

| Connection/Circuit | Type | St | Time last up | # Up trans |
|--------------------|--------|---------|--------------|------------|
| CE1-CE2-0 | rmt-if | Restart | ----- | 0 |
| fe-1/1/0.0 | intf | Up | | |
| PE1-PE2-0 | tlsp | Up | | |
| PE2-PE1-0 | rlsp | Up | | |

Output Fields [Table 154 on page 1803](#) describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 154: show bgp neighbor Output Fields

| Field Name | Field Description |
|--------------|---|
| Peer | Address of the BGP neighbor. The address is followed by the neighbor port number. |
| AS | AS number of the peer. |
| Local | Address of the local routing device. The address is followed by the peer port number. |
| Type | Type of peer: Internal or External . |
| State | <p>Current state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer. |
| Flags | <p>Internal BGP flags:</p> <ul style="list-style-type: none"> • Aggregate Label—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • CleanUp—The peer session is being shut down. • Delete—This peer has been deleted. • Idled—This peer has been permanently idled. • ImportEval—At the last commit operation, this peer was identified as needing to reevaluate all received routes. • Initializing—The peer session is initializing. • SendRtn—Messages are being sent to the peer. • Sync—This peer is synchronized with the rest of the peer group. • TryConnect—Another attempt is being made to connect to the peer. • Unconfigured—This peer is not configured. • WriteFailed—An attempt to write to this peer failed. |

Table 154: show bgp neighbor Output Fields (*continued*)

| Field Name | Field Description |
|-------------------|---|
| Last state | <p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer. |
| Last event | <p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Closed—The BGP session closed. • ConnectRetry—The transport protocol connection failed, and BGP is trying again to connect. • HoldTime—The session ended because the hold timer expired. • KeepAlive—The local routing device sent a BGP keepalive message to the peer. • Open—The local routing device sent a BGP open message to the peer. • OpenFail—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • RecvKeepAlive—The local routing device received a BGP keepalive message from the peer. • RecvNotify—The local routing device received a BGP notification message from the peer. • RecvOpen—The local routing device received a BGP open message from the peer. • RecvUpdate—The local routing device received a BGP update message from the peer. • Start—The peering session started. • Stop—The peering session stopped. • TransportError—A TCP error occurred. |
| Last error | <p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Cease—An error occurred, such as a version mismatch, that caused the session to close. • Finite State Machine Error—In setting up the session, BGP received a message that it did not understand. • Hold Time Expired—The session's hold time expired. • Message Header Error—The header of a BGP message was malformed. • Open Message Error—A BGP open message contained an error. • None—No errors occurred in the BGP session. • Update Message Error—A BGP update message contained an error. |
| Export | Name of the export policy that is configured on the peer. |
| Import | Name of the import policy that is configured on the peer. |

Table 154: show bgp neighbor Output Fields (*continued*)

| Field Name | Field Description |
|--|--|
| Options | Configured BGP options: <ul style="list-style-type: none"> • AddressFamily—Configured address family: inet or inet-vpn. • AuthKeyChain—Authentication key change is enabled. • DropPathAttributes—Certain path attributes are configured to be dropped from neighbor updates during inbound processing. • GracefulRestart—Graceful restart is configured. • HoldTime—Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent. • IgnorePathAttributes—Certain path attributes are configured to be ignored in neighbor updates during inbound processing. • Local Address—Address configured with the local-address statement. • Multihop—Allow BGP connections to external peers that are not on a directly connected network. • NLRI—Configured MBGP state for the BGP group: multicast, unicast, or both if you have configured nlri any. • Peer AS—Configured peer autonomous system (AS). • Preference—Preference value configured with the preference statement. • Refresh—Configured to refresh automatically when the policy changes. • Rib-group—Configured routing table group. |
| Path-attributes dropped | Path attribute codes that are dropped from neighbor updates. |
| Path-attributes ignored | Path attribute codes that are ignored during neighbor updates. |
| Authentication key change | (appears only if the authentication-keychain statement has been configured) Name of the authentication keychain enabled. |
| Authentication algorithm | (appears only if the authentication-algorithm statement has been configured) Type of authentication algorithm enabled: hmac or md5 . |
| Address families configured | Names of configured address families for the VPN. |
| Local Address | Address of the local routing device. |
| Remove-private options | Options associated with the remove-private statement. |
| Holdtime | Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent. |
| Flags for NLRI inet-label-unicast | Flags related to labeled-unicast: <ul style="list-style-type: none"> • TrafficStatistics—Collection of statistics for labeled-unicast traffic is enabled. |

Table 154: show bgp neighbor Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Traffic statistics | Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> • Options—Options configured for collecting statistics about labeled-unicast traffic. • File—Name and location of statistics log files. • size—Size of all the log files, in bytes. • files—Number of log files. |
| Traffic Statistics Interval | Time between sample periods for labeled-unicast traffic statistics, in seconds. |
| Preference | Preference value configured with the preference statement. |
| Outbound Timer | Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the out-delay parameter is configured to a non-zero value. |
| Number of flaps | Number of times the BGP session has gone down and then come back up. |
| Peer ID | Router identifier of the peer. |
| Group index | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels. |
| Peer index | Index that is unique within the BGP group to which the peer belongs. |
| Local ID | Router identifier of the local routing device. |
| Local Interface | Name of the interface on the local routing device. |
| Active holdtime | Hold time that the local routing device negotiated with the peer. |
| Keepalive Interval | Keepalive interval, in seconds. |
| BFD | Status of BFD failure detection. |
| Local Address | Name of directly connected interface over which direct EBGP peering is established. |
| NLRI for restart configured on peer | Names of address families configured for restart. |
| NLRI advertised by peer | Address families supported by the peer: unicast or multicast . |
| NLRI for this session | Address families being used for this session. |
| Peer supports Refresh capability | Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> . |
| Restart time configured on peer | Configured time allowed for restart on the neighbor. |

Table 154: show bgp neighbor Output Fields (*continued*)

| Field Name | Field Description |
|--|---|
| Stale routes from peer are kept for | When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down. |
| Peer does not support Restarter functionality | Graceful restart restarter-mode is disabled on the peer. |
| Peer does not support Receiver functionality | Graceful restart helper-mode is disabled on the peer. |
| Restart time requested by this peer | Restart time requested by this neighbor during capability negotiation. |
| Restart flag received from the peer | When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the end-of-rib marker from the speaker before advertising routing information to the speaker. |
| NLRI that peer supports restart for | Neighbor supports graceful restart for this address family. |
| NLRI peer can save forwarding state | Neighbor supporting this address family saves all forwarding states. |
| NLRI that peer saved forwarding for | Neighbor saves all forwarding states for this address family. |
| NLRI that restart is negotiated for | Router supports graceful restart for this address family. |
| NLRI of received end-of-rib markers | Address families for which end-of-routing-table markers are received from the neighbor. |
| NLRI of all end-of-rib markers sent | Address families for which end-of-routing-table markers are sent to the neighbor. |
| Peer supports 4 byte AS extension (peer-as 1) | Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later. |
| NLRIs for which peer can receive multiple paths | Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.

Possible value is inet-unicast . |
| NLRIs for which peer can send multiple paths: inet-unicast | Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.

Possible value is inet-unicast . |

Table 154: show bgp neighbor Output Fields (*continued*)

| Field Name | Field Description |
|-------------------------------|--|
| Table inet.number | <p>Information about the routing table:</p> <ul style="list-style-type: none"> • RIB State—BGP is in the graceful restart process for this routing table: restart is complete or restart in progress. • Bit—Number that represents the entry in the routing table for this peer. • Send state—State of the BGP group: in sync, not in sync, or not advertising. • Active prefixes—Number of prefixes received from the peer that are active in the routing table. • Received prefixes—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • Accepted prefixes—Total number of prefixes from the peer that have been accepted by a routing policy. • Suppressed due to damping—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. |
| Last traffic (seconds) | Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked. |
| Input messages | Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB. |
| Output messages | Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB. |
| Input dropped path attributes | <p>Information about dropped path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count. |
| Input ignored path attributes | <p>Information about ignored path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count. |
| Output queue | Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs. |
| Trace options | Configured tracing of BGP protocol packets and operations. |
| Trace file | Name of the file to receive the output of the tracing operation. |
| Filter Updates recv | <p>(orf option only) Number of outbound-route filters received for each configured address family.</p> <p>NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.</p> |

Table 154: show bgp neighbor Output Fields (*continued*)

| Field Name | Field Description |
|--------------------------------|---|
| Immediate | (orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.

NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list. |
| Filter | (orf option only) Type of prefix filter received: prefix-based or extended-community . |
| Received filter entries | (orf option only) List of received filters displayed. |
| seq | (orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries. |
| prefix | (orf option only) Address for the prefix entry that matches the filter. |
| minlength | (orf option only) Minimum prefix length, in bits, required to match this prefix. |
| maxlength | (orf option only) Maximum prefix length, in bits, required to match this prefix. |
| match | (orf option only) For this prefix match, whether to permit or deny route updates. |

show log

| | |
|----------------------------|---|
| Syntax | show log
<filename user <username>> |
| Syntax (QFabric System) | show log filename
<device-type (device-id device-alias)> |
| Syntax (TX Matrix Routers) | show log
<all-lcc lcc number scc>
<filename user <username>> |
| Release Information | Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option <i>device-type (device-id device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series. |
| Description | List log files, display log file contents, or display information about users who have logged in to the router or switch. |
| Options | none —List all log files.

<all-lcc lcc number scc>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none">• director-device—Display logs for Director devices.• infrastructure-device—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).• interconnect-device—Display logs for Interconnect devices.• node-device—Display logs for Node devices. |

NOTE: If you specify the *device-type* optional parameter, you must also specify either the *device-id* or *device-alias* optional parameter.

(*device-id | device-alias*)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

Table 155: show ospf overview Output Fields (*continued*)

| Field name | Field Description | Level of Output |
|----------------------------------|--|-----------------|
| Router ID | Router ID of the routing device. | All levels |
| Route table index | Route table index. | All levels |
| Configured overload | Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires. | All levels |
| Topology | Topology identifier. | All levels |
| Prefix export count | Number of prefixes exported into OSPF. | All levels |
| Full SPF runs | Number of complete Shortest Path First calculations. | All levels |
| SPF delay | Delay before performing consecutive Shortest Path First calculations. | All levels |
| SPF holddown | Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached. | All levels |
| SPF rapid runs | Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins. | All levels |
| LSA refresh time | Refresh period for link-state advertisement (in minutes). | All levels |
| Database protection state | Current state of database protection. | All levels |
| Warning threshold | Threshold at which a warning message is logged (percentage of maximum LSA count). | All levels |
| Non self-generated LSAs | Number of LSAs whose router ID is not equal to the local router ID: Current , Warning (threshold), and Allowed . | All levels |
| Ignore time | How long the database has been in the ignore state. | All levels |
| Reset time | How long the database must stay out of the ignore or isolated state before it returns to normal operations. | All levels |
| Ignore count | Number of times the database has been in the ignore state: Current and Allowed . | All levels |
| Restart | Graceful restart capability: enabled or disabled . | All levels |
| Restart duration | Time period for complete reacquisition of OSPF neighbors. | All levels |
| Restart grace period | Time period for which the neighbors should consider the restarting routing device as part of the topology. | All levels |

Table 155: show ospf overview Output Fields (*continued*)

| Field name | Field Description | Level of Output |
|-------------------------------|---|------------------|
| Graceful restart helper mode | (OSPFv2) Standard graceful restart helper capability (based on RFC 3623): enabled or disabled . | All levels |
| Restart-signaling helper mode | (OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): enabled or disabled . | All levels |
| Helper mode | (OSPFv3) Graceful restart helper capability: enabled or disabled . | All levels |
| Trace options | OSPF-specific trace options. | extensive |
| Trace file | Name of the file to receive the output of the tracing operation. | extensive |
| Area | Area number. Area 0.0.0.0 is the backbone area. | All levels |
| Stub type | Stub type of area: Normal Stub , Not Stub , or Not so Stubby Stub . | All levels |
| Authentication Type | Type of authentication: None , Password , or MD5 .

NOTE: The Authentication Type field refers to the authentication configured at the <code>[edit protocols ospf area area-id]</code> level. Any authentication configured for an interface in this area will not affect the value of this field. | All levels |
| Area border routers | Number of area border routers. | All levels |
| Neighbors | Number of autonomous system boundary routers. | All levels |

Sample Output

show ospf overview

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.245.6
  Route table index: 0
  Configured overload, expires in 118 seconds
  LSA refresh time: 50 minutes
  Restart: Enabled
    Restart duration: 20 sec
    Restart grace period: 40 sec
    Helper mode: enabled
  Area: 0.0.0.0
    Stub type: Not Stub

Operational Mode Commands for VRRP

- `show vrrp`

show vrrp

| | |
|---------------------------------|--|
| Syntax | <pre>show vrrp <brief detail extensive summary> <interface <i>interface-name</i>> <track interfaces></pre> |
| Release Information | Statement introduced in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| Description | Display information and status about VRRP groups. |
| Options | <p>none—(Same as brief) Display brief status information about all VRRP interfaces.</p> <p>brief detail extensive summary—(Optional) Display the specified level of output.</p> <p>interface <i>interface-name</i>—(Optional) Display information and status about the specified VRRP interface.</p> <p>track interfaces—(Optional) Display information and status about VRRP track interfaces.</p> |
| Required Privilege Level | view |
| Related Documentation | <ul style="list-style-type: none"> Configuring VRRP for IPv6 (CLI Procedure) |
| List of Sample Output | show vrrp on page 1829

show vrrp summary on page 1832
show vrrp track detail on page 1832
show vrrp track summary on page 1833 |
| Output Fields | Table 156 on page 1824 lists the output fields for the show vrrp command. Output fields are listed in the approximate order in which they appear. |

Table 156: show vrrp Output Fields

| Field Name | Field Description | Level of Output |
|------------------------|--|--|
| Interface | Name of the logical interface. | none, brief, extensive, summary |
| Interface index | Physical interface index number, which reflects its initialization sequence. | extensive |
| Groups | Total number of VRRP groups configured on the interface. | extensive |

Table 156: show vrrp Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|---------------------------------------|
| Active | Total number of VRRP groups that are active (that is, whose interface state is either up or down). | extensive |
| Interface VRRP PDU statistics | Nonerrored statistics for the logical interface: <ul style="list-style-type: none"> • Advertisement sent—Number of VRRP advertisement protocol data units (PDUs) that the interface has transmitted. • Advertisement received—Number of VRRP advertisement PDUs received by the interface. • Packets received—Number of VRRP packets received for VRRP groups on the interface. • No group match received—Number of VRRP packets received for VRRP groups that do not exist on the interface. | extensive |
| Interface VRRP PDU error statistics | Errored statistics for the logical interface: <ul style="list-style-type: none"> • Invalid IPAH next type received—Number of packets received that use the IP Authentication Header protocol (IPAH) and that do not encapsulate VRRP packets. • Invalid VRRP ttl value received—Number of packets received whose IP time-to-live (TTL) value is not 255. • Invalid VRRP version received—Number of packets received whose VRRP version is not 2. • Invalid VRRP pdu type received—Number of packets received whose VRRP PDU type is not 1. • Invalid VRRP authentication type received—Number of packets received whose VRRP authentication is not none, simple, or md5. • Invalid VRRP IP count received—Number of packets received whose VRRP IP count exceeds 8. • Invalid VRRP checksum received—Number of packets received whose VRRP checksum does not match the calculated value. | extensive |
| Physical interface | Name of the physical interface. | detail, extensive |
| Unit | Logical unit number. | All levels |
| Address | Address of the physical interface. | none, brief, detail, extensive |
| Index | Physical interface index number, which reflects its initialization sequence. | detail, extensive |
| SNMP ifIndex | SNMP index number for the physical interface. | detail, extensive |
| VRRP-Traps | Status of VRRP traps: Enabled or Disabled . | detail, extensive |

Table 156: show vrrp Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-------------------------------------|--|---------------------------------|
| Type and Address | Identifier for the address and the address itself: <ul style="list-style-type: none"> • lcl—Configured local interface address. • mas—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router. • vip—Configured virtual IP addresses. | none, brief, summary |
| Interface state or Int state | State of the physical interface: <ul style="list-style-type: none"> • down—The device is present and the link is unavailable. • not present—The interface is configured, but no physical device is present. • unknown—The VRRP process has not had time to query the kernel about the state of the interface. • up—The device is present and the link is established. | none, brief, extensive, summary |
| Group | VRRP group number. | none, brief, extensive, summary |
| State | VRRP state: <ul style="list-style-type: none"> • backup—The interface is acting as the backup router interface. • bringup—VRRP is just starting, and the physical device is not yet present. • idle—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • initializing—VRRP is initializing. • master—The interface is acting as the master router interface. • transition—The interface is changing between being the backup and being the master router. | extensive |
| Priority | Configured VRRP priority for the interface. | detail, extensive |
| Advertisement interval | Configured VRRP advertisement interval. | detail, extensive |
| Authentication type | Configured VRRP authentication type: none , simple , or md5 . | detail, extensive |
| Preempt | Whether preemption is allowed on the interface: yes or no . | detail, extensive |
| Accept-data mode | Whether the interface is configured to accept packets destined for the virtual IP address: yes or no . | detail, extensive |
| VIP count | Number of virtual IP addresses that have been configured on the interface. | detail, extensive |
| VIP | List of virtual IP addresses configured on the interface. | detail, extensive |
| Advertisement timer | Time until the advertisement timer expires. | detail, extensive |

Table 156: show vrrp Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|-----------------------------|--|-------------------|
| Master router | IP address of the interface that is acting as the master. If the VRRP interface is down, the output is N/A . | detail, extensive |
| Virtual router uptime | Time that the virtual router has been up. | detail, extensive |
| Master router uptime | Time that the master router has been up. | detail, extensive |
| Virtual MAC | MAC address associated with the virtual IP address. | detail, extensive |
| Tracking | Whether tracking is enabled or disabled . | detail, extensive |
| Current priority | Current operational priority for being the VRRP master. | detail, extensive |
| Configured priority | Configured base priority for being the VRRP master. | detail, extensive |
| Priority hold-time | Minimum time interval, in seconds, between successive changes to the current priority. Disabled indicates no minimum interval. | detail, extensive |
| Remaining-time | (track option only) Displays the time remaining in the priority hold-time interval. | detail |
| Interface tracking | Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces. | detail extensive |
| Interface/Tracked interface | Name of the tracked interface. | detail extensive |
| Int state/Interface state | Current operational state of the tracked interface: up or down . | detail, extensive |
| Int speed/Speed | Current operational speed, in bits per second, of the tracked interface. | detail, extensive |
| Incurred priority cost | Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority. | detail, extensive |
| Threshold | Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred.

An entry of down means that the corresponding priority cost is incurred when the interface is down. | detail, extensive |
| Route tracking | Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes. | detail, extensive |
| Route count | The number of routes being tracked. | detail, extensive |

Table 156: show vrrp Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|--|--|--------------------------|
| Route | The IP address of the route being tracked. | detail, extensive |
| VRF name | The VPN routing and forwarding (VRF) routing instance that the tracked route is in. | detail, extensive |
| Route state | The state of the route being tracked: up , down , or unknown . | detail, extensive |
| Priority cost | Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down. | detail, extensive |
| Active | Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred. | detail, extensive |
| Group VRRP PDU statistics | Number of VRRP advertisements sent and received by the group. | extensive |
| Group VRRP PDU error statistics | Errored statistics for the VRRP group: <ul style="list-style-type: none"> • Bad authentication type received—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be none, simple, or md5 and must be the same for all routers in the VRRP group. • Bad password received—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group. • Bad MD5 digest received—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router. • Bad advertisement timer received—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group. • Bad VIP count received—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance. • Bad VIPADDR received—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance. | extensive |
| Group state transition statistics | State transition statistics for the VRRP group: <ul style="list-style-type: none"> • Idle to master transitions—Number of times that the VRRP instance transitioned from the idle state to the master state. • Idle to backup transitions—Number of times that the VRRP instance transitioned from the idle state to the backup state. • Backup to master transitions—Number of times that the VRRP instance transitioned from the backup state to the master state. • Master to backup transitions—Number of times that the VRRP instance transitioned from the master state to the backup state. | extensive |
| Vlan-id | ID of Vlan | detail |

Table 156: show vrrp Output Fields (*continued*)

| Field Name | Field Description | Level of Output |
|------------|--|-----------------|
| VR state | VRRP information: <ul style="list-style-type: none"> • backup—The interface is acting as the backup router interface. • bringup—VRRP is just starting, and the physical device is not yet present. • idle—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • initializing—VRRP is initializing. • master—The interface is acting as the master router interface. • transition—The interface is changing between being the backup and being the master router. | none, brief |
| Timer | VRRP timer information: <ul style="list-style-type: none"> • A—Time, in seconds, until the advertisement timer expires. • D—Time, in seconds, until the Master is Dead timer expires. | none, brief |

Sample Output

show vrrp

```

user@host> show vrrp
Interface      State      Group  VR state  Timer  Type  Address
ge-0/0/0.121   up         1      master    A 1.052 1c1  gec0::12:1:1:1
                                     vip  ge80::12:1:1:99
                                     vip  gec0::12:1:1:99

Troubleshooting Procedures

- [Troubleshooting VRRP on page 1835](#)

Troubleshooting VRRP

Problem If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

Solution Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

Interfaces Overview

Juniper Networks QFX Series products have two types of interfaces: network interfaces and special interfaces. This topic provides brief information about these interfaces. For additional information, see the *Junos OS Network Interfaces Library for Routing Devices*.

- [Network Interfaces on page 1839](#)
- [Special Interfaces on page 1840](#)

Network Interfaces

Network interfaces connect to the network and carry network traffic. [Table 157 on page 1839](#) lists the types of network interfaces supported on the QFX Series.

Table 157: Network Interface Types and Purposes

| Type | Purpose |
|--------------------------------|---|
| Aggregated Ethernet interfaces | You can group Ethernet interfaces at the physical layer to form a single link-layer interface, also known as a <i>link aggregation group (LAG)</i> or <i>bundle</i> . These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth. |

Table 157: Network Interface Types and Purposes (*continued*)

| Type | Purpose |
|---|--|
| Channelized Interfaces | <p>40-Gbps QSFP+ ports can be configured to operate as four 10-Gigabit Ethernet (<i>xe</i>) interfaces. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. By default, the four 40-Gbps QSFP+ ports operate as 40-Gigabit Ethernet (<i>et</i>) ports. When an <i>et</i> port is channelized to four <i>xe</i> ports, a colon is used to signify the four separate channels. For example, on a QFX3500 standalone switch with port 2 on PIC 1 configured as four 10-Gigabit Ethernet ports, the interface names are <i>xe-0/1/2:0</i>, <i>xe-0/1/2:1</i>, <i>xe-0/1/2:2</i>, and <i>xe-0/1/2:3</i>.</p> <p>NOTE: You cannot configure channelized interfaces to operate as Virtual Chassis ports.</p> |
| Ethernet Interfaces | You can configure Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet interfaces to connect to other servers, storage, and switches. You can configure 40-Gigabit data plane uplink ports to connect a Node device to an Interconnect devices as well as for Virtual Chassis ports (VCPs). |
| Fibre Channel interfaces | You can use Fibre Channel interfaces to connect the switch to a Fibre Channel over Ethernet (FCoE) forwarder or a Fibre Channel switch in a storage area network (SAN). You can configure Fibre Channel interfaces only on ports 0 through 5 and 42 through 47 on QFX3500 devices. Fibre Channel interfaces do not forward Ethernet traffic. |
| LAN access interfaces | You can use these interfaces to connect to other servers, storage, and switches. When you power on a QFX Series product and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports. |
| Multichassis aggregated Ethernet (MC-AE) interfaces | You can group a LAG on one standalone switch with a LAG on another standalone switch to create a MC-AE. The MC-AE provides load balancing and redundancy across the two standalone switches. |
| Tagged-access mode interfaces | You can use tagged-access interfaces to connect a switch to an access layer device. Tagged-access interfaces can accept VLAN-tagged packets from multiple VLANs. |
| Trunk interfaces | You can use trunk interfaces to connect to other switches or routers. To use a port for this type of connection, you must explicitly configure the port interface for trunk mode. The interfaces from the switches or routers must also be configured for trunk mode. In this mode, the interface can be in multiple VLANs and accept tagged packets from multiple devices. Trunk interfaces typically connect to other switches and to routers on the LAN. |
| Virtual Chassis ports (VCPs) | You can use Virtual Chassis ports to send and receive Virtual Chassis Control Protocol (VCCP) traffic, and to create, monitor, and maintain the Virtual Chassis. On QFX3500 and QFX3600 standalone switches, you can configure 40-Gigabit Ethernet QSFP+ uplink ports (non-channelized) or fixed SFP+ 10-Gigabit Ethernet ports as VCPs by issuing the request virtual-chassis-vc-port-set CLI command. |

Special Interfaces

Table 158 on page 1840 lists the types of special interfaces supported on the QFX Series.

Table 158: Special Interface Types and Purposes

| Type | Purpose |
|--------------|--|
| Console port | Each QFX Series product has a serial port, labeled CON or CONSOLE , for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch. |

Table 158: Special Interface Types and Purposes (*continued*)

| Type | Purpose |
|---|--|
| Loopback interface | All QFX Series products have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch. |
| Management interface | The Juniper Networks Junos OS for the QFX Series includes management Ethernet interfaces. The management Ethernet interface provides an out-of-band method for connecting to a standalone switch and QFabric system. |
| Routed VLAN interfaces (RVI and IRB interfaces) | <p>QFX Series products use a Layer 3 routed VLAN interface (called RVI in the original CLI, and called IRB in Enhanced Layer 2 Software) vlan to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network.</p> <p>The RVI or IRB functions as a logical router, eliminating the need for having both a switch and a router. The RVI or IRB must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it.</p> |

Overview of Uplink Failure Detection

Uplink failure detection allows a switch to detect link failure on uplink interfaces and to propagate this information to the downlink interfaces, so that servers connected to those downlinks can switch over to secondary interfaces.

Uplink failure detection supports network adapter teaming and provides network redundancy. In network adapter teaming, all of the network interface cards (NICs) on a server are configured in a primary or secondary relationship and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link. With uplink failure detection, the switch monitors uplink interfaces for link failures. When it detects a failure, it disables the downlink interfaces. When the server detects disabled downlink interfaces, it switches over to the secondary link to help ensure that the traffic of the failed link is not dropped.

This topic describes:

- [Uplink Failure Detection Configuration on page 1842](#)
- [Failure Detection Pair on page 1842](#)

Uplink Failure Detection Configuration

Uplink failure detection allows switches to monitor uplink interfaces to spot link failures. When a switch detects a link failure, it automatically disables the downlink interfaces bound to the uplink interface. A server that is connected to the disabled downlink interface triggers a network adapter failover to a secondary link to avoid any traffic loss.

Figure 24 on page 1842 illustrates a typical setup for uplink failure detection.

Figure 24: Uplink Failure Detection Configuration on Switches

For uplink failure detection, you specify a group of uplink interfaces to be monitored and downlink interfaces to be brought down when an uplink fails. The downlink interfaces are bound to the uplink interfaces within the group. If all uplink interfaces in a group go down, then the switch brings down all downlink interfaces within that group. If any uplink interface returns to service, then the switch brings all downlink interfaces in that group back to service.

The switch can monitor both physical interface links and logical interface links for uplink failures, but you must put the two types of interfaces into separate groups.

NOTE: For logical interfaces, the server must send keepalives between the switch and the server to detect failure of logical links.

Failure Detection Pair

Uplink failure detection requires that you create pairs of uplink and downlink interfaces in a group. Each pair includes one of each of the following:

- A link-to-monitor interface—The link-to-monitor interfaces specify the uplinks the switch monitors. You can configure a maximum of eight uplink interfaces as link-to-monitor interfaces for a group.
- A link-to-disable interface—The link-to-disable interfaces specify the downlinks the switch disables when the switch detects an uplink failure. You can configure a maximum of 48 downlinks to disable in the group.

The link-to-disable interfaces are bound to the link-to-monitor interfaces within the group. When a link-to-monitor interface returns to service, the switch automatically enables all link-to-disable interfaces in the group.

Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single, aggregated Ethernet interface, also known as a *link aggregation group (LAG)* or *bundle*.

Link aggregation is used to aggregate Ethernet interfaces between two devices. You can create a LAG between a QFX Series product and a router, switch, aggregation switch, server, or other devices. The aggregated Ethernet interfaces that participate in a LAG are called member links. Because a LAG is composed of multiple member links, even if one member link fails, the LAG continues to carry traffic over the remaining links.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard and is used as a discovery protocol.

NOTE: To ensure load balancing across the aggregated Ethernet (AE) interfaces on a redundant server Node group, the members of the AE must be equally distributed across the redundant server Node group.

- [Link Aggregation Group on page 1843](#)
- [Link Aggregation Control Protocol \(LACP\) on page 1844](#)

Link Aggregation Group

To create a LAG:

1. Create a logical aggregated Ethernet interface.
2. Define the parameters associated with the logical aggregated Ethernet interface, such as a logical unit, interface properties, and Link Aggregation Control Protocol (LACP).
3. Define the member links to be contained within the aggregated Ethernet interface—for example, two 10-Gigabit Ethernet interfaces.
4. Configure LACP for link detection.

Keep in mind these hardware and software guidelines:

- Up to 32 Ethernet interfaces can be grouped to form a LAG on a QFX3500 switch, a redundant server Node group, a server Node group, and a network Node group on a QFabric system.

NOTE: If you try to commit a configuration containing more than 32 Ethernet interfaces in a LAG, you will receive an error message saying that the group limit of 32 has been exceeded, and the configuration checkout has failed.

- Up to 63 LAGs are supported on a QFX3500 switch.
- Up to 48 LAGs are supported on redundant server Node groups and server Node groups on a QFabric system, and up to 128 LAGs are supported on network Node groups on a QFabric system. You can configure LAGs across Node devices in redundant server Node groups, server Node groups, and network Node groups.
- The LAG must be configured on both sides of the link.
- The interfaces on either side of the link must be set to the same speed and be in full-duplex mode.

NOTE: Junos OS for the QFX Series assigns a unique ID and port priority to each port. The ID and priority are not configurable.

Link Aggregation Control Protocol (LACP)

LACP is one method of bundling several physical interfaces to form one logical aggregated Ethernet interface. The LACP mode can be active or passive. The transmitting link is known as the *actor*, and the receiving link is known as the *partner*. If the actor and partner are both in passive mode, they do not exchange LACP packets, and the aggregated Ethernet links do not come up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is in passive mode on aggregated Ethernet interfaces. To initiate transmission of LACP packets and response to LACP packets, you must enable LACP active mode. You can configure Ethernet links to actively transmit protocol data units (PDUs), or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. You can configure both VLAN-tagged and untagged aggregated Ethernet interfaces without LACP enabled. LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the LAG without user intervention.
- Link monitoring to check whether both ends of the bundle are connected to the correct group.

When a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server may not be able to exchange LACP PDUs. In such a situation you can configure an interface to be in the **up** state even if no PDUs are exchanged. Use the **force-up** statement to configure an interface when

the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When there are no received PDUs, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

Understanding Interface Naming Conventions

The QFX Series uses a naming convention for defining the interfaces that is similar to that of other platforms running under Juniper Networks Junos OS. This topic provides brief information about the naming conventions used for interfaces on the QFX Series.

This topic describes:

- [Physical Part of an Interface Name on page 1845](#)
- [Logical Part of an Interface Name on a Switch Running QFabric Software Package on page 1849](#)
- [Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software on page 1849](#)
- [Wildcard Characters in Interface Names on page 1849](#)

Physical Part of an Interface Name

Interfaces in Junos OS are specified as follows:

device-name:type-fpc/pic/port

QFX Series products apply this convention as follows:

- *device-name*—(QFabric systems only) The *device-name* is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.
- *type*—The QFX Series interfaces use the following media types:
 - **fc**—Fibre Channel interface
 - **ge**—Gigabit Ethernet interface
 - **xe**—10-Gigabit Ethernet interface

- **xle**—40-Gigabit Ethernet interface (QFX3500 and QFX3600 switches running a QFabric software package)
 - **et**—40-Gigabit Ethernet interface (QFX3500, QFX3600, and QFX5100 switches running Enhanced Layer 2 Software)
 - **fte**—40-Gigabit data plane uplink interface (QFX3500 and QFX3600 switches running a QFabric software package)
 - **me**—Management interface
 - **em**—Management interface on QFX5100 switches.
- **fpc**—Flexible PIC Concentrator. QFX Series interfaces use the following convention for the FPC number in interface names:
 - On QFX3500 and QFX3600 devices running a QFabric software package, the FPC number is always **0**.

The FPC number indicates the slot number of the line card that contains the physical interface.

- On QFX3500 and QFX3600 switches running Enhanced Layer 2 Software, the member ID of a member in a Virtual Chassis determines the FPC number.

NOTE: Every member in a Virtual Chassis must have a unique member ID, otherwise the Virtual Chassis will not be created.

- On standalone QFX5100 switches, the FPC number is always **0**.
- **pic**—QFX Series interfaces use the following convention for the PIC (Physical Interface Card) number in interface names:
 - On a QFX3500 switch running a QFabric software package, PIC **0** can support 48 ports, PIC **1** can support 16 10-Gigabit Ethernet ports, and PIC **2** can support 4 40-Gigabit Ethernet ports.
 - On a QFX3500 switch running Enhanced Layer 2 software, PIC **0** can support 48 ports, and PIC **1** can support 16 10-Gigabit Ethernet ports, and 4 40-Gigabit Ethernet ports.
 - On a QFX3500 Node device running a QFabric software package, PIC **0** can support 48 ports and PIC **1** can support four 40-Gigabit data plane uplink ports.
 - On a QFX3600 switch running a QFabric software package, PIC **0** can support 64 10-Gigabit Ethernet ports, and PIC **1** can support 16 40-Gigabit Ethernet ports.
 - On a QFX3600 switch running Enhanced Layer 2 software, PIC **0** can support 64 10-Gigabit Ethernet ports and can also support 16 40-Gigabit Ethernet ports.
 - On a QFX3600 Node device running a QFabric software package, PIC **0** can support 56 10-Gigabit Ethernet ports, and PIC **1** can support 8 40-Gigabit data plane uplink ports, and up to 14 40-Gigabit Ethernet ports.

- On a QFX5100-48S switch running Enhanced Layer 2 software, PIC 0 provides six 40-Gbps QSFP+ ports and 48 10-Gigabit Ethernet interfaces.
- On a QFX5100-24Q switch running Enhanced Layer 2 software, PIC 0 provides 24 40-Gbps QSFP+ ports. PIC 1 and PIC 2 can each contain a QFX-EM-4Q expansion module, and each expansion module provides 4 40-Gbps QSFP+ ports
- On a QFX5100-96S switch running Enhanced Layer 2 software, PIC 0 provides 96 10-Gigabit Ethernet interfaces and 8 40-Gbps QSFP+ ports .
- *port*—QFX Series interfaces use the following convention for port numbers:
 - On a QFX3500 switch running a QFabric software package, there are 48 network access ports (10-Gigabit Ethernet) labeled 0 through 47 on PIC 0 and, 16 network access ports labeled 0 through 15 on PIC 1, and four 40-Gbps QSFP+ ports labeled Q0 through Q3 on PIC 2. You can use the QSFP+ ports to connect the Node device to Interconnect devices.

By default, the 40-Gbps QSFP+ ports are configured to operate as 10-Gigabit Ethernet ports. You can use QSFP+ to four SFP+ copper breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. Optionally, you can choose to configure the QSFP+ ports as 40-Gigabit Ethernet ports (see [“Configuring the QSFP+ Port Type on QFX3500 Standalone Switches” on page 2034](#)).

- On a QFX3500 switch running Enhanced Layer 2 software, there are 48 network access ports labeled 0 through 47 on PIC 0 and 4 40-Gbps QSFP+ ports labeled Q0 through Q3 on PIC 1. See [“Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches” on page 2028](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX3600 switch running a QFabric software package, there are 64 network access ports (10-Gigabit Ethernet) labeled Q0 through Q15 on PIC 0, and there are 16 network access ports (40-Gigabit Ethernet) labeled Q0 through Q15 on PIC 1.

By default, all the QSFP+ ports are configured to operate as 40-Gigabit Ethernet ports. Optionally, you can choose to configure the QSFP+ ports as 10-Gigabit Ethernet ports (see [“Configuring the Port Type on QFX3600 Standalone Switches” on page 2032](#)) and use QSFP+ to four SFP+ copper breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches.

- On a QFX3600 Node device running a QFabric software package, PIC 0 can support up to 56 10-Gigabit Ethernet ports labeled Q2 through Q15, and PIC 1 can support up to 8 40-Gigabit data plane uplink ports labeled Q0 through Q7, and up to 14 40-Gigabit Ethernet ports labeled Q2 through Q15. See [Configuring the Port Type on QFX3600 Node Devices](#) for information on how to configure the 40-Gbps QSFP+ ports.

On a QFX3600 Node device, by default, four 40-Gbps QSFP+ ports (labeled Q0 through Q3) are configured for uplink connections between your Node device and your Interconnect devices, and twelve 40-Gbps QSFP+ ports (labeled Q4 through Q15) use QSFP+ to four SFP+ copper breakout cables to support up to 48 10-Gigabit Ethernet ports for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (Q0 through Q7) for uplink connections between your Node device

and your Interconnect devices, and ports Q2 through Q15 for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks (see *Configuring the Port Type on QFX3600 Node Devices*).

- On a QFX3600 switch running Enhanced Layer 2 software, PIC 0 can support 64 network access ports (10-Gigabit Ethernet ports) labeled Q0 through Q15 and 16 40-Gigabit Ethernet ports labeled Q0 through Q15. See [“Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches” on page 2028](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX5100-48S switch running Enhanced Layer 2 software, PIC 0 can support 48 network access ports (10-Gigabit Ethernet ports) labeled 0 through 47 and 6 40-Gbps QSFP+ ports labeled 48 through 53. See [“Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches” on page 2028](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX5100-24Q switch running Enhanced Layer 2 software, PIC 0 can support 24 40-Gbps QSFP+ ports labeled 0 through 24. PIC 1 and PIC 2 each support one 40-Gbps QSFP+ port, for a total of two 40-Gbps QSFP+ ports. See [“Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches” on page 2028](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.

NOTE: You cannot channelize the 40-Gbps QSFP+ ports provided in the two QFX-EM-4Q expansion modules. Also, even though there is a total of 128 physical ports, only 104 logical ports can be channelized.

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. See [“Configuring the System Mode on QFX5100 Switches” on page 2030](#) for information on how to configure the system mode.

- On a QFX5100-96S switch running Enhanced Layer 2 software, PIC 0 can support 96 10-Gigabit Ethernet ports labeled 0 through 95, and 8 40-Gbps QSFP+ ports labeled 96 through 103. See [“Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches” on page 2028](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.

NOTE: You can only channelize the 40-Gbps QSFP+ ports provided in ports 96 and 100, because only 104 logical ports can be channelized.

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. See [“Configuring the System Mode on QFX5100 Switches” on page 2030](#) for information on how to configure the system mode.

Logical Part of an Interface Name on a Switch Running QFabric Software Package

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16384. In the virtual part of the name, a period (.) separates the port and logical unit numbers: *device-name* (QFabric systems only): *type-fpc/pic/port.logical-unit-number*. For example, if you issue the **show ethernet-switching interfaces** command on a system with a default VLAN, the resulting display shows the logical interfaces associated with the VLAN:

| Interface | State | VLAN members | Blocking |
|-------------------------|-------|-----------------|-----------|
| node-device1:xe-0/0/1.0 | down | remote-analyzer | unblocked |
| node-device1:xe-0/0/2.0 | down | default | unblocked |
| node-device1:xe-0/0/3.0 | down | default | unblocked |

When you configure aggregated Ethernet interfaces, you configure a logical interface, which is called a *bundle* or a *LAG*. Each LAG can include up to eight Ethernet interfaces, depending on the switch model.

Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software

Channelizing enables you to configure four 10-Gigabit Ethernet interfaces from a 40-Gigabit Ethernet QSFP+ interface. By default, a 40-Gigabit Ethernet QSFP+ interface is named *et-fpc/pic/port*. The resulting 10-Gigabit Ethernet interfaces appear in the following format: *xe-fpc/pic/port:channel*, where channel can be a value of 0 through 3.

For example, if an *et* interface named **et-0/0/3** is channelized to four 10-Gigabit Ethernet interfaces, the resulting 10-Gigabit Ethernet interface names will be **xe-0/0/3:0**, **xe-0/0/3:1**, **xe-0/0/3:2**, and **xe-0/0/3:3**:

| Interface | Admin | Link | Proto | Local | Remote |
|------------|-------|------|-------|-------|--------|
| xe-0/0/3:0 | up | down | | | |
| xe-0/0/3:1 | up | down | | | |
| xe-0/0/3:2 | up | down | | | |
| xe-0/0/3:3 | up | down | | | |

Wildcard Characters in Interface Names

In the **show interfaces** and **clear interfaces** commands, you can use wildcard characters in the *interface-name* option to specify groups of interface names without having to type each name individually. You must enclose all wildcard characters except the asterisk (*) in quotation marks (" ").

Understanding Interface Ranges on the QFX Series

You can use the interface ranges to group interfaces of the same type that share a common configuration profile. This helps reduce the time and effort in configuring interfaces on Juniper Networks QFX Series products. The configurations common to all the interfaces can be included in the interface range definition.

The interface range definition contains the name of the interface range defined, the names of the individual member interfaces that do not fall in a series of interfaces, a range of interfaces defined in the member range, and the configuration statements common to all the interfaces. An interface range defined with member ranges and individual members but without any common configurations is also a valid definition.

NOTE: The interface range definition is supported only for Gigabit Ethernet, 10-Gigabit Ethernet, and Fibre Channel interfaces.

The common configurations defined in the interface range will be overridden by the local configuration.

The defined interface ranges can be used at places where the **interface** statement is used in the following configuration hierarchies:

- **ethernet-switching-options analyzer *name* input egress interface**
- **ethernet-switching-options analyzer *name* input ingress interface**
- **ethernet-switching-options analyzer output interface**
- **ethernet-switching-options bpdv-block interface**

Understanding Layer 3 Logical Interfaces

A Layer 3 logical interface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 logical interfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks QFX3500 Switch to a Layer 2 switch. Only one physical connection is required between the switches. You can also use Layer 3 logical interfaces to provide alternative gateway addresses for smart DHCP relay.

To create Layer 3 logical interfaces on a switch, enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.
