YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

	About the Documentation	cxxi
	Documentation and Release Notes	cxxi
	Supported Platforms	cxxi
	Using the Examples in This Manual	cxxi
	Merging a Full Example	cxxii
	Merging a Snippet	cxxii
	Documentation Conventions	cxxiii
	Documentation Feedback	cxxiv
	Requesting Technical Support	cxxv
	Self-Help Online Tools and Resources	cxxv
	Opening a Case with JTAC	cxxvi
Part 1	QFX5100 Switch Overview	
Chapter 1	QFX5100 Switch Overview	3
	QFX5100 Switch Hardware Overview	3
	QFX5100 Hardware	3
	System Software	5
Part 2	Software Feature Support	
Chapter 2	Software Feature Support for the QFX Series	9
	QFX5100 Software Features Overview	9
Part 3	Junos OS Basics	
Chapter 3	Overview	19
	Software Overview	19
	QFX5100 Software Features Overview	19
	Configuration File Terms	26
	Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements	27
	In-Service Software Upgrade (ISSU) System Requirements	27
	In-Service Software Upgrade (ISSU) Protocol and Process Support	28
	Junos OS Commit Model for Router or Switch Configuration	29
	Junos OS Package Names	30
	NTP Time Server and Time Services Overview	31
	Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)	32

Understanding Autoinstallation of Configuration Files	33
Typical Uses for Autoinstallation	34
Autoinstallation Configuration Files and IP Addresses	34
Typical Autoinstallation Process on a New Switch	34
Understanding DHCP Services for Switches	36
DHCP Client/Server Model	36
Using DHCP	36
DHCP Relay Servers and DHCP Servers	37
Legacy DHCP and Extended DHCP for Server Versions	37
Configuring DHCP on a Switch	38
How DHCP Works	38
Understanding In-Service Software Upgrade (ISSU)	40
In-Service Software Upgrade Process	40
Understanding Nonstop Software Upgrade on QFX Series Switches	41
Requirements for Performing an NSSU	41
How an NSSU Works	42
NSSU Limitations	43
NSSU and Junos OS Release Support	43
Overview of NSSU Configuration and Operation	43
Understanding Software Infrastructure and Processes	44
Routing Engine and Packet Forwarding Engine	44
Junos OS Processes	44
Understanding System Snapshot on QFX Series Switches	46
Understanding Zero Touch Provisioning	47
Understanding Zero Touch Provisioning	47
Zero Touch Provisioning Process	49
Zero Touch Provisioning Restart Process Triggers	52
User Interfaces	54
CLI User Interface Overview	54
CLI Overview	54
CLI Key Features	54
CLI Command Modes	55
Configuring CLI Tips	56
Format for Specifying Filenames and URLs in Junos OS CLI Commands	57
Getting Started with Enhanced Layer 2 Software	58
Understanding Enhanced Layer 2 Software Support	58
Using the ELS Translator Tool	59
Configuring a VLAN	60
Configuring the Native VLAN Identifier	61
Configuring Layer 2 Interfaces	61
Configuring Layer 3 Interfaces	61
Configuring an IRB Interface	62
Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface	62
Enhanced Layer 2 CLI Configuration Statement and Command Changes	63
Junos OS Operational Mode Commands That Combine Other Commands	72

Overview of Junos OS CLI Operational Mode Commands	73
CLI Command Categories	73
Commonly Used Operational Mode Commands	74
Overview of Navigating the CLI	75
CLI Command Hierarchy	76
CLI Configuration Statements	76
Moving Among Hierarchy Levels	76
Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS	
Operational Commands	77
Understanding Junos OS CLI Configuration Mode	78
Configuration Mode Commands	79
Configuration Statements and Identifiers	80
Configuration Statement Hierarchy	82
Licenses	84
Junos OS Feature Licenses	84
Software Features That Require Licenses on the QFX Series	85
Junos OS Feature License Keys	86
Release-Tied License Keys and Upgrade Licenses on MX Series	
Routers	86
Licensable Ports on MX5, MX10, and MX40 Routers	88
Generating the License Keys for a Standalone QFX Series Device	89
Adding New Licenses (CLI Procedure)	91
Deleting a License (CLI Procedure)	92
Saving License Keys	93
Verifying Junos OS License Installation	94
Displaying Installed Licenses	94
Displaying License Usage	95
Chapter 4	
Installation	97
Software Installation	97
Configuring Zero Touch Provisioning	98
Junos OS Package Names	102
Performing a Recovery Installation on a QFX Series Device	103
Performing a Recovery Installation on a QFX5100 Switch	105
Performing an In-Service Software Upgrade (ISSU)	106
Preparing the Switch for Software Installation	106
Upgrading the Software Using ISSU	107
Recovering from a Failed Software Installation	108
Software Installation Overview	109
Upgrading Jloader Software on QFX Series Devices	110
Jloader Software Version 1.1.4 Guidelines	111
Upgrading Jloader Software on a QFX3500 Switch	112
Upgrading Jloader Software on a QFabric System	115
Upgrading Software on QFX3500, QFX3600, and QFX5100 Switches	121
Downloading Software Files with a Browser	121
Accessing Software Downloaded to a Remote Location	122
Connecting to the Console Port	122
Backing Up the Current Configuration Files	122
Installing a Standard Software Package	122

	Upgrading to an ELS-Based Software Package	123
	Upgrading Software on QFX3500 and QFX3600 Virtual Chassis Using Nonstop Software Upgrade	125
	Preparing the Switch for Software Installation	125
	Upgrading the Software Using NSSU	126
	Upgrading Software Using Automatic Software Download	127
Chapter 5	Configuration	129
	Initial Configuration	129
	Configuring Autoinstallation of Configuration Files (CLI Procedure)	130
	Configuring a DHCP Client (CLI Procedure)	132
	Configuring a DHCP Server on Switches (CLI Procedure)	133
	Configuring an Extended DHCP Server on a Switch	133
	Configuring a Legacy DHCP Server on a Switch (CLI Procedure)	134
	Configuring a DNS Name Server for Resolving a Hostname into Addresses	135
	Configuring the Domain Name for the Router or Switch	136
	Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains	136
	Configuring the Hostname of the Router or Switch	137
	Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types	138
	Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch	138
	Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses	139
	Configuring the Junos OS to Display a System Login Announcement	139
	Configuring the Junos OS to Display a System Login Message	140
	Configuring the Junos OS to Extend the Default Port Address Range	141
	Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages	141
	Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets	141
	Configuring NTP Authentication Keys	142
	Configuring the NTP Time Server and Time Services	143
	Configuring the Router or Switch to Operate in Client Mode	143
	Configuring the Router or Switch to Operate in Symmetric Active Mode	144
	Configuring the Router or Switch to Operate in Broadcast Mode	144
	Configuring the Router or Switch to Operate in Server Mode	144
	Specifying the Physical Location of the Switch	145
	Configuring the Root Password	146
	Configuring the Router or Switch to Listen for Broadcast Messages Using NTP	148
	Configuring the Router or Switch to Listen for Multicast Messages Using NTP	148
	Configuring System Alarms to Appear Automatically Upon Login	149
	Configuring Time-Based User Access	149
	Configuring the Timeout Value for Idle Login Sessions	150

Configuring a QFX3500 Device as a Standalone Switch	151
Creating an Emergency Boot Device for a QFX Series Device	153
Creating a Snapshot and Using It to Boot a QFX Series Switch	154
Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch	154
Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch	155
Creating a Snapshot on the Alternate Slice of the Boot Media	155
Creating a Snapshot and Using It to Boot a QFX5100 Switch	156
Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Switch	156
Including the Year or Millisecond in Timestamps	157
Mapping the Hostname of the Switch to IP Addresses	158
Methods for Configuring Junos OS	159
Junos OS Command-Line Interface (CLI)	160
ASCII File	160
J-Web Package	160
Junos XML Management Protocol Software	161
NETCONF XML Management Protocol Software	161
Configuration Commit Scripts	161
Modifying the Default Time Zone for a Router or Switch Running Junos OS	162
Rebooting and Halting a QFX Series Product	162
Reverting to the Default Factory Configuration	163
Reverting to the Default Factory Configuration by Using the request system zeroize Command	164
Reverting to the Rescue Configuration	165
Saving Core Files Generated by Junos OS Processes	165
Setting a Custom Time Zone on Routers or Switches Running Junos OS	165
Importing and Installing Time Zone Files	166
Configuring a Custom Time Zone	167
Setting the Date and Time	167
Specifying Access Privileges for Junos OS Operational Mode Commands	168
Synchronizing and Coordinating Time Distribution Using NTP	170
Configuring NTP	170
Configuring the NTP Boot Server	170
Specifying a Source Address for an NTP Server	170
Viewing Core Files from Junos OS Processes	171
Configuration Examples	172
Example: Changing the Requirements for Junos OS Plain-Text Passwords	172
Example: Configuring the Domain Name for the Router or Switch	174
Example: Configuring the Name of the Switch, IP Address, and System ID	174
Example: Configuring NTP	174
Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization	177

Configuration Statements	178

Chapter 7	Troubleshooting	1115
	Troubleshooting Procedures	1115
	Rebooting and Halting a QFX Series Product	1115
	Recovering from a Failed Software Installation	1116
	Recovering the Root Password	1117
	Troubleshooting Network Interfaces	1118
	The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down	1118
	Troubleshooting an Aggregated Ethernet Interface	1119
Part 4	Configuration and File Management	
Chapter 8	Overview	1123
	Configuration Files Overview	1123
	Configuration File Terms	1123
	Software Overview	1124
	Forms of the configure Command	1124
	Junos OS Commit Model for Router or Switch Configuration	1125
	Understanding Configuration Files	1126
	Understanding How the Junos Configuration Is Stored	1127
Chapter 9	Configuration	1129
	Configuration Tasks	1129
	Comparing Configuration Changes with a Prior Version	1129
	Compressing the Current Configuration File	1131
	Creating and Returning to a Rescue Configuration	1132
	Loading a Configuration from a File	1133
	Loading a Previous Configuration File	1136
	Returning to the Most Recently Committed Junos Configuration	1136
	Returning to a Previously Committed Junos OS Configuration	1137
	Returning to a Configuration Prior to the One Most Recently Committed	1137
	Displaying Previous Configurations	1137
	Comparing Configuration Changes with a Prior Version	1138
	Creating and Returning to a Rescue Configuration	1140
	Saving a Configuration to a File	1141
	Reverting to the Default Factory Configuration	1142
	Reverting to the Rescue Configuration	1142
	Rolling Back Junos OS Configuration Changes	1143
	Saving a Configuration to a File	1144
	Setting or Deleting the Rescue Configuration	1145
	Uploading a Configuration File	1145
	Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site	1147
	Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive	1147
	Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site	1147

	Configuring Transfer of the Current Active Configuration When a Configuration Is Committed	1148
	Configuring Archive Sites for Transfer of Active Configuration Files . . .	1148
	Configuration Statements	1149
	archival	1150
	archive-sites (Configuration File)	1151
	configuration	1153
	transfer-interval (Configuration)	1154
	transfer-on-commit	1155
	Default Configurations	1155
	QFX3500 Switch Default Configuration	1155
	Configuration Examples	1161
	Examples: Loading a Configuration from a File	1161
Chapter 10	Administration	1165
	Operational Commands	1165
	clear log	1166
	clear system commit	1167
	file archive	1168
	file checksum md5	1170
	file checksum sha1	1171
	file checksum sha-256	1172
	file compare	1173
	file delete	1176
	file list	1177
	file rename	1179
	file show	1181
	request system configuration rescue delete	1183
	request system configuration rescue save	1184
	show system commit	1185
	show system configuration archival	1187
	show system configuration rescue	1188
	show system rollback	1190
	test configuration	1192
Chapter 11	Troubleshooting	1193
	Troubleshooting Procedures	1193
	Loading a Previous Configuration File	1193
	Reverting to the Default Factory Configuration	1194
	Reverting to the Rescue Configuration	1194

Part 5	User and Access Management	
Chapter 12	Overview	1197
	Software Overview	1197
	Understanding Software Infrastructure and Processes	1197
	Routing Engine and Packet Forwarding Engine	1197
	Junos OS Processes	1198
	Access Control Overview	1199
	Overview of Template Accounts for RADIUS and TACACS+	
	Authentication	1200
	Understanding Login Authentication	1200
	MAC RADIUS Authentication	1201
	Understanding LLDP	1201
	Understanding RADIUS Accounting	1202
	Understanding VSAs on the QFX Series	1203
	Juniper Networks Vendor-Specific RADIUS Attributes	1203
	Juniper Networks Vendor-Specific TACACS+ Attributes	1205
	Understanding Junos OS Access Privilege Levels	1207
	Junos OS Login Class Permission Flags	1207
	Allowing or Denying Individual Commands for Junos OS Login	
	Classes	1210
	Junos OS Authentication Order for RADIUS, TACACS+, and Password	
	Authentication	1211
	Using RADIUS or TACACS+ Authentication	1211
	Using Local Password Authentication	1212
	Order of Authentication Attempts	1212
	Junos OS User Authentication Methods	1216
	Junos OS User Accounts Overview	1216
	Junos OS Login Classes Overview	1218
	Regular Expressions for Allowing and Denying Junos OS Configuration Mode	
	Hierarchies	1219
	Regular Expressions for Allowing and Denying Junos OS Operational Mode	
	Commands	1220
	Special Requirements for Junos OS Plain-Text Passwords	1221
Chapter 13	Configuration	1225
	Configuration Tasks	1225
	Configuring Access Privilege Levels	1226
	Configuring CLI Tips	1226
	Configuring Junos OS User Accounts	1226
	Configuring LLDP	1227
	Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and	
	Local Password Authentication	1228
	Configuring Local User Template Accounts for User Authentication	1229
	Configuring Management Access	1231
	Configuring RADIUS System Accounting	1231
	Configuring Auditing of User Events on a RADIUS Server	1231
	Specifying RADIUS Server Accounting and Auditing Events	1232

Configuring RADIUS Server Accounting	1232
Configuring RADIUS Authentication	1233
Configuring RADIUS Server Details	1233
Configuring MS-CHAPv2 for Password-Change Support	1234
Specifying a Source Address for the Junos OS to Access External RADIUS Servers	1235
Configuring Remote Template Accounts for User Authentication	1235
Configuring the Root Password	1236
Configuring SNMP	1237
Configuring SSH Host Keys for Secure Copying of Data	1241
Configuring SSH Known Hosts	1242
Configuring Support for SCP File Transfer	1242
Updating SSH Host Key Information	1243
Configuring SSH Service for Remote Access to the Router or Switch	1243
Configuring the Root Login Through SSH	1244
Configuring the SSH Protocol Version	1244
Configuring the Client Alive Mechanism	1245
Configuring TACACS+ Authentication	1245
Configuring TACACS+ Server Details	1245
Specifying a Source Address for the Junos OS to Access External TACACS+ Servers	1246
Configuring the Same Authentication Service for Multiple TACACS+ Servers	1247
Configuring Juniper Networks Vendor-Specific TACACS+ Attributes . .	1247
Configuring TACACS+ System Accounting	1248
Specifying TACACS+ Auditing and Accounting Events	1248
Configuring TACACS+ Server Accounting	1249
Defining Junos OS Login Classes	1250
Limiting the Number of User Login Attempts for SSH and Telnet Sessions	1250
Recovering the Root Password	1251
Specifying Access Privileges for Junos OS Configuration Mode Hierarchies	1253
Specifying Access Privileges for Junos OS Operational Mode Commands	1254
Using Junos OS to Configure Logical System Administrators	1255
Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands	1256
VSA Match Conditions and Actions	1258
Configuration Examples	1260
Example: Changing the Requirements for Junos OS Plain-Text Passwords	1261
Example: Configuring Access Privilege Levels	1263
Example: Configuring Access Privileges for Operational Mode Commands	1263
Example: Configuring a Plain-Text Password for Root Logins	1264
Example: Configuring RADIUS Authentication	1264
Example: Configuring RADIUS System Accounting	1265
Example: Configuring the Root Password	1266

Example: Configuring SSH Authentication for Root Logins	1266
Example: Configuring User Accounts	1266
Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication	1267
Example: Creating Login Classes with Specific Privileges	1269
Example: Configuring User Login Accounts	1270
Example: Configuring RADIUS Template Accounts	1270
Defining Access Privileges Using allow/deny-configuration Statements . . .	1271

Part 6	Ethernet Features	
Chapter 15	Overview	1387
	Enhanced Layer 2 Software (ELS) CLI	1387
	Getting Started with Enhanced Layer 2 Software	1387
	Understanding Enhanced Layer 2 Software Support	1387
	Using the ELS Translator Tool	1388
	Configuring a VLAN	1389
	Configuring the Native VLAN Identifier	1390
	Configuring Layer 2 Interfaces	1390
	Configuring Layer 3 Interfaces	1390
	Configuring an IRB Interface	1391
	Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface	1391
	Enhanced Layer 2 CLI Configuration Statement and Command Changes	1392
	Bridging and VLANs	1401
	Layer 2 Learning and Forwarding for VLANs Overview	1401
	Understanding Bridging and VLANs	1402
	History of VLANs	1402
	How Bridging of VLAN Traffic Works	1403
	Packets Are Either Tagged or Untagged	1404
	Switch Interface Modes—Access, Trunk, or Tagged Access	1404
	Additional Advantages of Using VLANs	1406
	Maximum VLANs and VLAN Members Per Switch	1407
	A Default VLAN Is Configured on Most Switches	1407
	Assigning Traffic to VLANs	1408
	Forwarding VLAN Traffic	1408
	VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces	1408
	Understanding Routed VLAN Interfaces	1409
	Understanding MAC Learning	1410
	Layer 2 Networking	1411
	Introduction to the Media Access Control (MAC) Layer 2 Sublayer	1411
	Overview of Layer 2 Networking	1412
	Understanding Layer 2 Broadcasting	1414
	Understanding Unicast	1415
	Understanding the Unified Forwarding Table	1415
	Proxy ARP	1417
	Understanding Proxy ARP	1417
	What Is ARP?	1417
	Proxy ARP Overview	1418
	Best Practices for Proxy ARP	1418
	Spanning Trees	1419
	Overview of Spanning-Tree Protocols	1419
	Understanding Spanning Tree Protocols on a QFabric System	1420
	Understanding MSTP	1420
	Understanding RSTP	1421
	Understanding VSTP	1422

	Understanding BPDU Protection for STP, RSTP, and MSTP	1423
	Understanding Loop Protection for STP, RSTP, VSTP, and MSTP	1424
	Understanding Root Protection for STP, RSTP, VSTP, and MSTP	1425
Chapter 16	Configuration	1427
	Bridging and VLAN Configuration Examples	1427
	Example: Configuring Routing Between VLANs on One Switch	1428
	Example: Setting Up Basic Bridging and a VLAN on the QFX Series	1433
	Bridging and VLAN Configuration Examples (Original CLI Only)	1450
	Example: Disabling MAC Learning	1450
	Example: Setting Up Bridging with Multiple VLANs	1451
	Bridging and VLAN Configuration Examples (ELS CLI Only)	1457
	Example: Disabling MAC Learning	1457
	Example: Setting Up Bridging with Multiple VLANs	1458
	Proxy ARP Example (Original CLI Only)	1463
	Example: Configuring Proxy ARP	1463
	STP Configuration Examples	1466
	Example: Configuring Faster Convergence and Improving Network Stability with RSTP	1466
	Example: Configuring Network Regions for VLANs with MSTP	1480
	Example: Connecting an Access Switch to a Distribution Switch	1504
	Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations	1513
	Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree	1517
	Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees	1521
	Bridging and VLAN Configuration Tasks	1526
	Configuring Static ARP Entries	1526
	Bridging and VLAN Configuration Tasks (Original CLI Only)	1526
	Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)	1527
	Configuring MAC Limiting (CLI Procedure)	1527
	Configuring MAC Limiting for Port Security by Limiting the Number of MAC Addresses That Can be Learned on Interfaces	1528
	Configuring MAC Limiting for Port Security by Specifying MAC Addresses That Are Allowed	1529
	Configuring MAC Limiting for VLANs	1529
	Configuring MAC Notification	1531
	Enabling MAC Notification	1531
	Disabling MAC Notification	1531
	Setting the MAC Notification Interval	1531
	Configuring MAC Table Aging	1532
	Configuring Routed VLAN Interfaces	1532
	Configuring the Native VLAN Identifier	1534
	Configuring VLANs	1534
	Creating a Series of Tagged VLANs	1536
	Disabling MAC Learning	1537

Bridging and VLAN Configuration Tasks (ELS CLI Only)	1538
Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)	1539
Configuring MAC Limiting (CLI Procedure)	1539
Limiting the Number of MAC Addresses Learned by an Interface	1540
Limiting the Number of MAC Addresses Learned by a VLAN	1540
Configuring MAC Table Aging	1541
Configuring Routed VLAN Interfaces	1542
Configuring the Native VLAN Identifier (CLI Procedure)	1543
Configuring VLANs	1544
Creating a Series of Tagged VLANs	1546
Disabling MAC Learning	1547
Unified Forwarding Table Configuration Task	1548
Configuring the Unified Forwarding Table	1548
Configuring an Address-Storage Profile	1548
Configuring IPv6 Addresses with /65 to /127 Prefix Lengths	1550
Forwarding Mode Configuration Task	1550
Configuring the Forwarding Mode	1550
Proxy ARP Configuration Task (Original CLI Only)	1550
Configuring Proxy ARP	1551
Proxy ARP Configuration Task (ELS CLI Only)	1551
Configuring Proxy ARP (CLI Procedure)	1552
STP Configuration Tasks	1552
Configuring STP	1553
Unblocking an Interface That Receives BPDUs in Error	1553
STP Configuration Tasks (Original CLI Only)	1554
Configuring VLAN Spanning Tree Protocol	1554
STP Configuration Tasks (ELS CLI Only)	1555
Configuring VLAN Spanning-Tree Protocol	1556
Unified Forwarding Table Configuration Statements	1559
forwarding-options (chassis)	1560

Part 8

Interfaces

Chapter 23

Overview 1839

Interfaces Overview	1839
Interfaces Overview	1839
Network Interfaces	1839
Special Interfaces	1840
Overview of Uplink Failure Detection	1841
Uplink Failure Detection Configuration	1842
Failure Detection Pair	1842
Understanding Aggregated Ethernet Interfaces and LACP	1843
Link Aggregation Group	1843
Link Aggregation Control Protocol (LACP)	1844
Understanding Interface Naming Conventions	1845
Physical Part of an Interface Name	1845
Logical Part of an Interface Name on a Switch Running QFabric Software Package	1849
Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software	1849
Wildcard Characters in Interface Names	1849
Understanding Interface Ranges on the QFX Series	1850
Understanding Layer 3 Logical Interfaces	1851
Understanding Management Interfaces	1852
Understanding Multichassis Link Aggregation	1853
Active-Active Mode	1854
ICCP and ICL-PL	1855
Failure Handling	1855
Multichassis Link Protection	1856
MC-LAG Packet Forwarding	1856
Layer 3 Routing	1856
Spanning Tree Protocol (STP) Guidelines	1856
MC-LAG Upgrade Guidelines	1857
Layer 2 Unicast Features Supported	1857
Layer 2 Multicast Features Supported	1858
IGMP Snooping on an Active-Active MC-LAG	1858
Layer 3 Unicast Features Supported	1859
VRRP Active-Standby Support	1859
Routed VLAN Interface (RVI) MAC Address Synchronization	1859
Address Resolution Protocol (ARP)	1860
DHCP Relay with Option 82	1860
Private VLAN (PVLAN)	1861
Layer 3 Multicast	1861
Understanding Port Ranges and System Modes	1862
Port Ranges for Different Media Types	1863
Supported System Modes	1883
Understanding Redundant Trunk Links	1885
Understanding Generic Routing Encapsulation	1887
Overview of GRE	1887
GRE Tunneling	1887

	Configuration Limitations	1890
Chapter 24	Configuration	1891
	Configuration Examples	1891
	Example: Configuring Interfaces for Uplink Failure Detection	1891
	Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch	1896
	Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch	1900
	Example: Configuring Multichassis Link Aggregation	1904
	Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP	1926
	Example: Configuring Multichassis Link Aggregation with Layer 3 MAC Address Synchronization	1963
	Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol (VRRP)	1983
	Example: Configuring Redundant Trunk Links for Faster Recovery	2010
	Configuration Tasks	2015
	Configuring Gigabit and 10-Gigabit Ethernet Interfaces	2015
	Configuring Port Mode	2015
	Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces	2016
	Configuring the IP Options	2016
	Configuring Aggregated Ethernet LACP	2017
	Configuring Ethernet Loopback Capability	2018
	Configuring Interfaces for Uplink Failure Detection	2018
	Configuring a Layer 3 Logical Interface	2019
	Configuring Link Aggregation	2019
	Creating an Aggregated Ethernet Interface	2020
	Configuring the VLAN Name and VLAN ID Number	2020
	Configuring Aggregated Ethernet LACP	2021
	Configuring Multichassis Link Aggregation	2022
	Configuring Generic Routing Encapsulation Tunneling	2025
	Configuring a GRE Tunnel	2026
	Configuring IPv6 Addresses with /65 to /127 Prefix Lengths	2027
	Configuration Tasks (ELS Only)	2027
	Channelizing Interfaces on QFX3500, QFX3600, and QFX5100 Switches	2028
	Configuring the System Mode on QFX5100 Switches	2030
	Configuration Tasks (Original CLI Only)	2032
	Configuring the Port Type on QFX3600 Standalone Switches	2032
	Configuring the QSFP+ Port Type on QFX3500 Standalone Switches	2034
	Configuration Statements	2035

Chapter 26	Troubleshooting	2293
	Troubleshooting Procedures	2293
	Troubleshooting an Aggregated Ethernet Interface	2293
	Troubleshooting Multichassis Link Aggregation	2293
	MAC Addresses Learned on MC-AE Interfaces Are Not Removed from	
	the MAC Address Table	2294
	MC-LAG Peer Does Not Go into Standby Mode	2295

	Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive	2295
	Redirect Filters Take Priority over User-Defined Filters	2295
	Operational Command Output Is Wrong	2295
	ICCP Connection Might Take Up to 60 Seconds to Become Active	2296
	MAC Address Age Learned on an MC-AE Interface Is Reset to Zero	2296
	MAC Address Is Not Learned Remotely in a Default VLAN	2296
	Snooping Entries Learned on MC-AE Interfaces Are Not Removed	2296
	ICCP Does Not Come Up After You Add or Delete an Authentication Key	2297
	Local Status Is Standby When It Should Be Active	2297
	Packets Loop on the Server When ICCP Fails	2297
	Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change	2297
	No Commit Checks Are Done for ICL-PL Interfaces	2297
	Double Failover Scenario	2298
	Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up	2298
	Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer	2298
	AE Interfaces Go Down	2298
	Flooding of Upstream Traffic	2298
	Troubleshooting Network Interfaces	2299
	The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down	2299
Part 9	Routing Options	
Chapter 27	Overview	2303
	Routing Options Overview	2303
	Overview of Routing Options	2303
	Understanding Virtual Router Routing Instances	2304
	Understanding Distributed Periodic Packet Management	2304
	Understanding Bidirectional Forwarding Detection (BFD)	2305
	Understanding the Unified Forwarding Table	2305
Chapter 28	Configuration	2309
	Configuration Tasks	2309
	Configuring Static Routing	2310
	Configuring Per-Packet Load Balancing	2310
	Configuring Distributed Periodic Packet Management	2312
	Disabling or Enabling Distributed Periodic Packet Management Globally	2312
	Disabling or Enabling Distributed Periodic Packet Management for LACP Packets	2312
	Configuring Virtual Router Routing Instances	2313

Part 10	Border Gateway Protocol	
Chapter 31	Overview	2631
	BGP Overview	2631
	Understanding BGP	2632
	Autonomous Systems	2632
	AS Paths and Attributes	2632
	External and Internal BGP	2633
	Multiple Instances of BGP	2633
	BGP Routes Overview	2634
	BGP Messages Overview	2635
	Open Messages	2635
	Update Messages	2636
	Keepalive Messages	2636
	Notification Messages	2636
	Understanding the Advertisement of Multiple Paths to a Single Destination in BGP	2636
Chapter 32	Configuration	2639
	Basic BGP Configuration	2639
	Examples: Configuring External BGP Peering	2639
	Understanding External BGP Peering Sessions	2639
	Example: Configuring External BGP Point-to-Point Peer Sessions	2640
	Example: Configuring External BGP on Logical Systems with IPv6 Interfaces	2647
	Examples: Configuring Internal BGP Peering	2662
	Understanding Internal BGP Peering Sessions	2662
	Example: Configuring Internal BGP Peer Sessions	2663
	Example: Configuring Internal BGP Peering Sessions on Logical Systems	2674
	Configuring BGP Monitoring Protocol Version 3	2685
	BGP Path Attribute Configuration	2688
	Example: Configuring BGP Local Preference	2688
	Understanding the BGP Local Preference	2688
	Example: Configuring the Local Preference Value for BGP Routes	2688
	Examples: Configuring BGP MED	2701
	Understanding the MED Attribute	2701
	Example: Configuring the MED Attribute Directly	2703
	Example: Configuring the MED Using Route Filters	2716
	Example: Configuring the MED Using Communities	2729
	Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates	2730
	Examples: Configuring BGP Local AS	2740
	Understanding the BGP Local AS Attribute	2740
	Example: Configuring a Local AS for EBGp Sessions	2745
	Example: Configuring a Private Local AS for EBGp Sessions	2755
	Example: Configuring the Accumulated IGP Attribute for BGP	2760
	Understanding the Accumulated IGP Attribute for BGP	2761
	Example: Configuring the Accumulated IGP Attribute for BGP	2761

BGP Policy Configuration	2799
Example: Configuring BGP Interactions with IGPs	2799
Understanding Routing Policies	2799
Example: Injecting OSPF Routes into the BGP Routing Table	2800
Example: Configuring BGP Route Advertisement	2803
Understanding Route Advertisement	2803
Example: Configuring BGP Prefix-Based Outbound Route Filtering	2807
Example: Configuring EBGp Multihop	2811
Understanding BGP Multihop	2811
Example: Configuring EBGp Multihop Sessions	2811
Example: Configuring BGP Route Preference (Administrative Distance)	2820
Understanding Route Preference Values	2820
Example: Configuring the Preference Value for BGP Routes	2821
Example: Configuring BGP Path Selection	2827
Understanding BGP Path Selection	2827
Example: Ignoring the AS Path Attribute When Selecting the Best Path	2830
Example: Removing Private AS Numbers	2837
Understanding Private AS Number Removal from AS Paths	2838
Example: Removing Private AS Numbers from AS Paths	2839
BGP BFD Configuration	2844
Example: Configuring BFD for BGP	2844
Understanding BFD for BGP	2844
Example: Configuring BFD on Internal BGP Peer Sessions	2845
Example: Configuring BFD Authentication for BGP	2853
Understanding BFD Authentication for BGP	2853
Example: Configuring BFD Authentication for BGP	2854
BGP Load Balancing Configuration	2858
Examples: Configuring BGP Multipath	2858
Understanding BGP Multipath	2858
Example: Load Balancing BGP Traffic	2858
Example: Configuring Single-Hop EBGp Peers to Accept Remote Next Hops	2863
Example: Advertising Multiple BGP Paths to a Destination	2875
Understanding the Advertisement of Multiple Paths to a Single Destination in BGP	2875
Example: Advertising Multiple Paths in BGP	2876
Example: Advertising Multiple Paths in BGP	2901
Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing	2926
IBGP Scaling Configuration	2928
Example: Configuring BGP Route Reflectors	2928
Understanding BGP Route Reflectors	2928
Example: Configuring a Route Reflector	2930
Example: Configuring BGP Confederations	2945
Understanding BGP Confederations	2945
Example: Configuring BGP Confederations	2946

BGP Security Configuration	2951
Example: Configuring BGP Route Authentication	2952
Understanding Route Authentication	2952
Example: Configuring Route Authentication for BGP	2953
Examples: Configuring TCP and BGP Security	2958
Understanding Security Options for BGP with TCP	2958
Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers	2959
Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List	2964
Example: Limiting TCP Segment Size for BGP	2967
BGP Flap Configuration	2972
Example: Preventing BGP Session Resets	2972
Understanding BGP Session Resets	2972
Example: Preventing BGP Session Flaps When VPN Families Are Configured	2972
Examples: Configuring BGP Flap Damping	2979
Understanding Damping Parameters	2979
Example: Configuring Damping Parameters	2980
Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family	2989
BGP Monitoring Configuration	2999
Example: Configuring BGP Trace Operations	2999
Understanding Trace Operations for BGP Protocol Traffic	2999
Example: Viewing BGP Trace Files on Logical Systems	3001

	Multiarea Adjacency for OSPF	3401
	Example: Configuring Multiarea Adjacency for OSPF	3402
	Example: Disabling OSPFv2 Compatibility with RFC 1583	3405
	OSPFv2 Compatibility with RFC 1583 Overview	3406
	Example: Disabling OSPFv2 Compatibility with RFC 1583	3406

OSPF Interface Configuration	3407
Examples: Configuring OSPF Interfaces	3407
About OSPF Interfaces	3408
Example: Configuring an Interface on a Broadcast or Point-to-Point Network	3409
Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network	3411
Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network	3414
Example: Configuring OSPF Demand Circuits	3416
Example: Configuring a Passive OSPF Interface	3418
Example: Configuring OSPFv2 Peer interfaces	3420
OSPF Route Control Configuration	3422
Examples: Configuring OSPF Route Summarization	3422
Understanding OSPF Route Summarization	3422
Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements	3423
Example: Limiting the Number of Prefixes Exported to OSPF	3428
Configuring OSPF Refresh and Flooding Reduction in Stable Topologies	3430
Examples: Configuring OSPF Traffic Control	3431
Understanding OSPF Traffic Control	3431
Example: Controlling the Cost of Individual OSPF Network Segments	3433
Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth	3437
Example: Controlling OSPF Route Preferences	3439
Example: Configuring OSPF Overload Mode	3441
OSPF Overload Function Overview	3441
Example: Configuring OSPF to Make Routing Devices Appear Overloaded	3442
OSPF Fault Detection Configuration	3445
Example: Configuring OSPF Timers	3445
OSPF Timers Overview	3445
Example: Configuring OSPF Timers	3446
Example: Configuring BFD for OSPF	3451
BFD for OSPF Overview	3451
Example: Configuring BFD for OSPF	3454
Example: Configuring BFD Authentication for OSPF	3457
BFD Authentication for OSPF Overview	3458
Configuring BFD Authentication for OSPF	3459
OSPF Redundancy Features Configuration	3462
Examples: Configuring Graceful Restart for OSPF	3462
Graceful Restart for OSPF Overview	3463
Example: Configuring Graceful Restart for OSPF	3464
Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart	3468
Example: Configuring the Helper Capability Mode for OSPFv3 Graceful Restart	3472

Example: Disabling Strict LSA Checking for OSPF Graceful Restart . . .	3475
OSPF Traffic Engineering Configuration	3478
Examples: Configuring OSPF Traffic Engineering	3478
OSPF Support for Traffic Engineering	3478
Example: Enabling OSPF Traffic Engineering Support	3481
Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface	3485
Example: Configuring OSPF Passive Traffic Engineering Mode	3487
OSPF Passive Traffic Engineering Mode	3487
Example: Configuring OSPF Passive Traffic Engineering Mode	3487
OSPF Database Protection Configuration	3490
Example: Configuring OSPF Database Protection	3490
OSPF Database Protection Overview	3490
Configuring OSPF Database Protection	3491
OSPF Policy Configuration	3492
Examples: Configuring OSPF Routing Policy	3492
Understanding OSPF Routing Policy	3492
Example: Injecting OSPF Routes into the BGP Routing Table	3494
Example: Redistributing Static Routes into OSPF	3497
Example: Configuring an OSPF Import Policy	3500
Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF	3504
Examples: Configuring Routing Policy for Network Summaries	3508
Import and Export Policies for Network Summaries Overview	3508
Example: Configuring an OSPF Export Policy for Network Summaries	3508
Example: Configuring an OSPF Import Policy for Network Summaries	3517
OSPF Monitoring Configuration	3525
Example: Configuring OSPF Trace Options	3525
Tracing OSPF Protocol Traffic	3525

Part 14	MPLS Applications	
Chapter 43	Overview	3737
	MPLS Overview	3737
	MPLS on the QFX Series Overview	3737
	Understanding MPLS Components for the QFX Series	3738
	Provider Edge Switches	3738
	Provider Switch	3739
	Components Required for All Switches in the MPLS Network	3739
	Understanding MPLS Label Operations on the QFX Series	3741
	MPLS Label-Switched Paths and MPLS Labels	3741
	Reserved Labels	3742
	MPLS Label Operations	3742
	Penultimate-Hop Popping and Ultimate-Hop Popping	3743
	Understanding CoS MPLS EXP Classifiers and Rewrite Rules	3744
	EXP Classifiers	3745
	EXP Rewrite Rules	3745
	Schedulers	3746

	Understanding Using MPLS-Based Layer 3 VPNs on the QFX Series	3747
	MPLS-Based Layer 3 VPNs	3747
	MPLS Features	3748
	MPLS Feature Support on the QFX Series Overview	3748
	Supported MPLS Features	3748
	Unsupported MPLS Features	3749
	Supported MPLS and ECMP Scaling Values	3750
Chapter 44	Configuration	3753
	Configuration Guidelines	3753
	MPLS Configuration Guidelines	3753
	Configuration Examples	3754
	Example: Configuring MPLS-Based Layer 3 VPNs	3754
	Example: Tunneling IPv6 Traffic over MPLS IPv4 Networks	3763
	Configuration Tasks	3771
	Configuring MPLS on Provider Edge Switches	3772
	Configuring the Ingress PE Switch	3772
	Configuring the Egress PE Switch	3773
	Configuring MPLS on Provider Switches	3775
	Configuring Static Label Switched Paths for MPLS	3776
	Configuring the Ingress PE Switch	3777
	Configuring the Provider and the Egress PE Switch	3777
	Configuring MPLS Firewall Filters	3778
	Configuring an MPLS Firewall Filter	3779
	Applying an MPLS Firewall Filter to an MPLS Interface	3780
	Configuring CoS Bits for an MPLS Network	3781
	Configuring a Global MPLS EXP Classifier	3782
	Configuring Rewrite Rules for MPLS EXP Classifiers	3783
	Configuring MPLS to Gather Statistics	3784
	Configuring Automatic Bandwidth Allocation for LSPs	3785
	Configuring Automatic Bandwidth Allocation on LSPs	3786
	Requesting Automatic Bandwidth Allocation Adjustment	3791
	Configuring Reporting of Automatic Bandwidth Allocation Statistics	3792
	Configuring MPLS Firewall Filters and Policers	3795
	Configuring MPLS Firewall Filters	3796
	Examples: Configuring MPLS Firewall Filters	3796
	Configuring Policers for LSPs	3797
	Configuration Statements	3798
	[edit protocols mpls] Hierarchy Level	3798
	[edit protocols rsvp] Hierarchy Level	3802

Chapter 46	Troubleshooting	3933
	Troubleshooting Procedures	3933
	Issues and Limitations in Operation of MPLS Features on the QFX Series . .	3933
Part 15	Multicast	
Chapter 47	Overview	3937
	Introduction to PIM Basics	3937
	PIM Overview	3937
	Basic PIM Network Components	3939
	PIM on Aggregated Interfaces	3940
	Introduction to PIM Sparse Mode	3940
	Understanding PIM Sparse Mode	3941
	Rendezvous Point	3942
	RP Mapping Options	3943
	Designated Router	3943
	Introduction to Static RP	3944
	Understanding Static RP	3944
	Introduction to Anycast RP	3944
	Understanding RP Mapping with Anycast RP	3945
	Introduction to PIM Bootstrap Router	3945
	Understanding the PIM Bootstrap Router	3945
	Introduction to PIM Filtering	3946
	Understanding Multicast Message Filters	3946
	Filtering MAC Addresses	3947
	Filtering RP and DR Register Messages	3947
	Introduction to PIM RPT and SPT Cutover	3948
	Understanding Multicast Rendezvous Points, Shared Trees, and Rendezvous-Point Trees	3948
	Building an RPT Between the RP and Receivers	3949
	PIM Sparse Mode Source Registration	3950
	Multicast Shortest-Path Tree	3953
	SPT Cutover	3954
	SPT Cutover Control	3957
	Introduction to IGMP	3957
	Understanding Group Membership Protocols	3957
	Understanding IGMP	3959
	Introduction to IGMP Snooping	3961
	IGMP Snooping Overview	3962
	How IGMP Snooping Works	3962
	How IGMP Snooping Works with Routed VLAN Interfaces	3962
	How Hosts Join and Leave Multicast Groups	3963
	IGMP Snooping and Forwarding Interfaces	3963
	General Forwarding Rules	3964
	Using a Switch as an IGMP Querier	3964
	Introduction to MLD	3965
	Understanding MLD	3965

	Introduction to MSDP	3968
	Understanding MSDP	3968
	Filtering MSDP SA Messages	3969
	Introduction to Source-Specific Multicast	3970
	Source-Specific Multicast Groups Overview	3970
	Understanding PIM Source-Specific Mode	3971
	PIM SSM	3972
	Introduction to Multicast VLAN Registration	3974
	Understanding Multicast VLAN Registration	3974
	How MVR Works	3974
Chapter 48	Configuration	3977
	PIM Basics	3977
	Changing the PIM Version	3978
	Modifying the PIM Hello Interval	3978
	Preserving Multicast Performance by Disabling Response to the ping Utility	3979
	Configuring PIM Trace Options	3980
	Disabling PIM	3982
	Disabling the PIM Protocol	3982
	Disabling PIM On an Interface	3983
	Disabling PIM for a Family	3983
	Disabling PIM for a Rendezvous Point	3984
	PIM Designated Router	3984
	Configuring Interface Priority for PIM Designated Router Selection	3984
	Configuring PIM Designated Router Election on Point-to-Point Links	3985
	PIM Sparse Mode	3986
	Enabling PIM Sparse Mode	3986
	Configuring PIM Join Load Balancing	3987
	Modifying the Join State Timeout	3990
	Example: Enabling Join Suppression	3991
	Static RP	3995
	Configuring Local PIM RPs	3995
	Configuring the Static PIM RP Address on the Non-RP Routing Device	3997
	Anycast RP	3998
	Example: Configuring PIM Anycast With or Without MSDP	3999
	Configuring a PIM Anycast RP Router with MSDP	4002
	Configuring a PIM Anycast RP Router Using Only PIM	4003
	Configuring All PIM Anycast Non-RP Routers	4004
	Example: Configuring Multiple RPs in a Domain with Anycast RP	4005
	PIM Bootstrap Router	4007
	Configuring PIM Bootstrap Properties for IPv4 or IPv6	4007
	Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain	4009
	Example: Configuring PIM BSR Filters	4009
	PIM Filtering	4010
	Configuring Interface-Level PIM Neighbor Policies	4010
	Filtering Outgoing PIM Join Messages	4011
	Filtering Incoming PIM Join Messages	4012

Configuring Register Message Filters on a PIM RP and DR	4013
PIM RPT and SPT Cutover	4015
Example: Configuring the PIM Assert Timeout	4015
Example: Configuring the PIM SPT Threshold Policy	4018
PIM and the BFD Protocol	4021
Configuring BFD for PIM	4021
Configuring BFD Authentication for PIM	4023
Configuring BFD Authentication Parameters	4023
Viewing Authentication Information for BFD Sessions	4024
IGMP	4026
Configuring IGMP	4026
Enabling IGMP	4028
Changing the IGMP Version	4029
Modifying the IGMP Host-Query Message Interval	4030
Modifying the IGMP Last-Member Query Interval	4030
Specifying Immediate-Leave Host Removal for IGMP	4031
Filtering Unwanted IGMP Reports at the IGMP Interface Level	4032
Accepting IGMP Messages from Remote Subnetworks	4033
Modifying the IGMP Query Response Interval	4034
Modifying the IGMP Robustness Variable	4035
Limiting the Maximum IGMP Message Rate	4036
Enabling IGMP Static Group Membership	4036
Recording IGMP Join and Leave Events	4043
Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces	4044
Tracing IGMP Protocol Traffic	4045
Disabling IGMP	4047
IGMP Snooping	4047
Configuring IGMP Snooping	4048
Example: Configuring IGMP Snooping	4049
Using a Switch as an IGMP Querier	4051
IGMP Snooping (Original CLI Only)	4051
Changing the IGMP Snooping Group Timeout Value	4051
Configuring Multicast VLAN Registration (CLI Procedure)	4053
Example: Configuring Multicast VLAN Registration	4054
IGMP Snooping (ELS CLI Only)	4059
Configuring VLAN-Specific IGMP Snooping Parameters	4059
MLD	4059
Examples: Configuring MLD	4059
Understanding MLD	4060
Configuring MLD	4063
Enabling MLD	4064
Modifying the MLD Version	4065
Modifying the MLD Host-Query Message Interval	4065
Modifying the MLD Query Response Interval	4066
Modifying the MLD Last-Member Query Interval	4066
Specifying Immediate-Leave Host Removal for MLD	4067
Filtering Unwanted MLD Reports at the MLD Interface Level	4068
Example: Modifying the MLD Robustness Variable	4069

Limiting the Maximum MLD Message Rate	4070
Enabling MLD Static Group Membership	4070
Example: Recording MLD Join and Leave Events	4077
Configuring the Number of MLD Multicast Group Joins on Logical Interfaces	4079
Tracing MLD Protocol Traffic	4081
Disabling MLD	4082
MSDP	4083
Configuring MSDP	4083
Tracing MSDP Protocol Traffic	4084
Configuring the Interface to Accept Traffic from a Remote Source	4086
Example: Configuring MSDP	4087
Example: Configuring MSDP with Active Source Limits and Mesh Groups	4088
Example: Configuring PIM Anycast With or Without MSDP	4094
Configuring a PIM Anycast RP Router with MSDP	4097
Source-Specific Multicast	4098
Example: Configuring PIM SSM on a Network	4098
Example: Configuring an SSM-Only Domain	4100
Example: Configuring SSM Mapping	4100
Example: Configuring Source-Specific Multicast Groups with Any-Source Override	4103
Example: Configuring SSM Maps for Different Groups to Different Sources	4106
Multiple SSM Maps and Groups for Interfaces	4106
Example: Configuring Multiple SSM Maps Per Interface	4107

Part 16**Chapter 50****Security**

Overview	4409
Firewall Filters	4409
Overview of Firewall Filters	4409
Firewall Filter Types	4410
Firewall Filter Components	4411
Firewall Filter Processing	4411
Understanding Filter-Based Forwarding	4412
Understanding How Firewall Filters Are Evaluated	4412
Understanding How Firewall Filters Control Packet Flows	4414
Understanding Firewall Filter Match Conditions	4415
Filter Match Conditions	4415
Numeric Filter Match Conditions	4416
Interface Filter Match Conditions	4416
IP Address Filter Match Conditions	4417
MAC Address Filter Match Conditions	4417
Bit-Field Filter Match Conditions	4418
Firewall Filter Match Conditions and Actions	4419
Understanding How a Firewall Filter Tests a Protocol	4433
Understanding Firewall Filter Planning	4434
Planning the Number of Firewall Filters to Create	4435
Understanding How Many Firewall Filters Are Supported	4436
Egress Filters	4437
Avoid Configuring too Many Filters	4437
Policers can Limit Egress Filters	4438
Planning for Filter-Specific Policers	4438
Planning for Filter-Based Forwarding	4439
Understanding Firewall Filter Processing Points for Bridged and Routed Packets	4439
Applying Firewall Filters to Interfaces	4440
Policers	4441
Overview of Policers	4441
Policer Overview	4441
Policer Types	4442
Policer Actions	4443
Policer Colors	4443
Filter-Specific Policers	4444
Suggested Naming Convention for Policers	4444
Policer Counters	4445
Policer Algorithms	4445
How Many Policers are Supported?	4445
Policers can Limit Egress Firewall Filters	4445
Understanding Policers with Link Aggregation Groups	4446
Understanding Color-Blind Mode for Single-Rate Tricolor Marking	4447
Understanding Color-Aware Mode for Single-Rate Tricolor Marking	4447
Summary of PLP Changes	4447
Understanding Color-Blind Mode for Two-Rate Tricolor Marking	4449

Understanding Color-Aware Mode for Two-Rate Tricolor Marking	4449
Summary of PLP Changes	4449
Effect on Green Packets (Low PLP)	4450
Effect on Yellow Packets (Medium PLP)	4450
Effect on Red Packets (High PLP)	4451
Port Security	4451
Overview of Access Port Protection	4451
Mitigation of Ethernet Switching Table Overflow Attacks	4452
Mitigation of Rogue DHCP Server Attacks	4452
Protection Against ARP Spoofing Attacks	4452
Protection Against DHCP Snooping Database Alteration Attacks	4453
Protection Against DHCP Starvation Attacks	4453
Port Security Overview	4454
Understanding DHCP Snooping for Port Security	4456
DHCP Snooping Basics	4456
DHCP Snooping Process	4457
DHCP Server Access	4458
DHCP Snooping Table	4461
Static IP Address Additions to the DHCP Snooping Database	4461
Snooping DHCP Packets That Have Invalid IP Addresses	4461
Prioritizing Snooped Packets	4462
Understanding DAI for Port Security	4463
Address Resolution Protocol	4463
ARP Spoofing	4463
Dynamic ARP Inspection	4464
Prioritizing Inspected Packets	4464
Understanding MAC Limiting and MAC Move Limiting for Port Security	4465
MAC Limiting	4465
MAC Move Limiting	4466
Actions for MAC Limiting	4466
MAC Addresses That Exceed the MAC Limit or MAC Move Limit	4466
Understanding Trusted and Untrusted Ports	4467
Understanding Trusted DHCP Servers for Port Security	4467
Understanding DHCP Option 82 for Port Security	4468
DHCP Option 82 Processing	4468
Suboption Components of Option 82	4469
Configurations That Support Option 82	4469
Understanding Static ARP Entries	4470
Device Security	4471
Understanding Storm Control	4471
Understanding Unicast RPF	4473
Unicast RPF for Switches Overview	4473
Unicast RPF Implementation	4474
When to Enable Unicast RPF	4474
When Not to Enable Unicast RPF	4475
Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches	4476
Understanding Unknown Unicast Forwarding	4477

Chapter 51	Configuration	4479
	Firewall and Policer Configuration Examples	4479
	Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device	4479
	Example: Using Two-Color Policers and Prefix Lists	4483
	Example: Using Policers to Manage Oversubscription	4486
	Port Security Configuration Examples (Original CLI Only)	4488
	Example: Configuring Basic Port Security Features	4488
	Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks	4495
	Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks	4499
	Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks	4503
	Example: Configuring DHCP Snooping, DAI, and MAC Limiting on a Switch with Access to a DHCP Server Through a Second Switch	4506
	Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks	4513
	Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks	4518
	Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server	4521
	Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server	4525
	Device Security Configuration Example (Original CLI Only)	4527
	Example: Configuring Storm Control to Prevent Network Outages	4527
	Device Security Configuration Example (ELS CLI Only)	4529
	Example: Configuring Storm Control to Prevent Network Outages	4529
	Firewall and Policer Configuration Tasks	4531
	Configuring Firewall Filters	4531
	Configuring a Firewall Filter	4532
	Applying a Firewall Filter to a Port	4533
	Applying a Firewall Filter to a VLAN	4534
	Applying a Firewall Filter to a Layer 3 (Routed) Interface	4534
	Applying Firewall Filters to Interfaces	4535
	Assigning Forwarding Classes and Loss Priority	4536
	Configuring Color-Blind Egress Policers for Medium-Low PLP	4537
	Configuring Two-Color and Three-Color Policers to Control Traffic Rates	4538
	Configuring Two-Color Policers	4538
	Configuring Three-Color Policers	4539
	Specifying Policers in a Firewall Filter Configuration	4539
	Applying a Firewall Filter That Includes a Policer	4540
	Configuring MPLS Firewall Filters and Policers	4540
	Configuring MPLS Firewall Filters	4540
	Examples: Configuring MPLS Firewall Filters	4541
	Configuring Policers for LSPs	4542

Port Security Configuration Tasks (Original CLI Only)	4542
Configuring Port Security (CLI Procedure)	4543
Enabling DHCP Snooping	4544
Enabling Dynamic ARP Inspection (DAI)	4544
Limiting Dynamic MAC Addresses on an Interface	4544
Enabling Persistent MAC Learning on an Interface	4545
Limiting MAC Address Movement	4545
Configuring Trusted DHCP Servers on an Interface	4545
Configuring MAC Limiting	4545
Configuring MAC Move Limiting (CLI Procedure)	4547
Configuring Autorecovery for MAC Limited or Storm Control Interfaces (CLI Procedure)	4549
Configuring the none Action to Override a MAC Limit Applied to All Interfaces (CLI Procedure)	4549
Configuring Static ARP Entries	4550
Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure)	4550
Enabling DHCP Snooping (CLI Procedure)	4551
Enabling DHCP Snooping	4552
Applying CoS Forwarding Classes to Prioritize Snooped Packets	4552
Enabling Dynamic ARP Inspection (CLI Procedure)	4553
Enabling DAI	4554
Applying CoS Forwarding Classes to Prioritize Inspected Packets	4554
Enabling a Trusted DHCP Server (CLI Procedure)	4555
Enabling a Trusted Port for DHCP	4556
Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)	4557
Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure)	4560
Device Security Configuration Tasks	4562
Configuring Unicast RPF (CLI Procedure)	4562
Disabling Unicast RPF (CLI Procedure)	4564
Configuring Unknown Unicast Forwarding (CLI Procedure)	4565

Chapter 52 Administration	4669
Routine Monitoring	4669
Monitoring Firewall Filter Traffic	4669
Monitoring Traffic for All Firewall Filters and Policers That Are Configured	4669
Monitoring Traffic for a Specific Firewall Filter	4670
Monitoring Traffic for a Specific Policer	4670
Monitoring Port Security	4671
Verifying That Firewall Filters Are Operational	4672

	Verifying That DAI Is Working Correctly	4673
	Verifying That DHCP Snooping Is Working Correctly	4673
	Verifying That MAC Limiting Is Working Correctly	4674
	Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly	4675
	Verifying That Allowed MAC Addresses Are Working Correctly	4676
	Verifying That Interfaces Are Shut Down	4676
	Customizing the Ethernet Switching Table Display to View Information for a Specific Interface	4677
	Verifying That MAC Move Limiting Is Working Correctly	4677
	Verifying That the Port Error Disable Setting Is Working Correctly	4678
	Verifying Unicast RPF Status	4679
	Verifying That a Trusted DHCP Server Is Working Correctly	4681
	Verifying That Three-Color Policers Are Operational	4682
	Verifying That Two-Color Policers Are Operational	4683
	Monitoring Commands	4683
	clear arp inspection statistics	4684
	clear dhcp snooping binding	4685
	clear ethernet-switching port-error	4686
	clear firewall	4687
	show arp inspection statistics	4688
	show dhcp snooping binding	4689
	show firewall	4691
	show firewall policer	4695
	show interfaces filters	4697
Chapter 53	Troubleshooting	4699
	Troubleshooting Procedures	4699
	Troubleshooting Firewall Filter Configuration	4699
	Firewall Filter Configuration Returns a No Space Available in TCAM Message	4699
	Filter Counts Previously Dropped Packet	4701
	Matching Packets Not Counted	4701
	Counter Reset When Editing Filter	4702
	Cannot Include loss-priority and policer Actions in Same Term	4702
	Cannot Egress Filter Certain Traffic Originating on QFX Switch	4702
	Firewall Filter Match Condition Not Working with Q-in-Q Tunneling	4703
	Egress Firewall Filters with Private VLANs	4703
	Egress Filtering of L2PT Traffic Not Supported	4704
	Cannot Drop BGP Packets in Certain Circumstances	4704
	Invalid Statistics for Policer	4704
	Policers can Limit Egress Filters	4704
	Troubleshooting Policer Configuration	4705
	Incomplete Count of Packet Drops	4706
	Counter Reset When Editing Filter	4706
	Invalid Statistics for Policer	4706
	Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured	4706

	Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured	4707
	Policers Can Limit Egress Filters	4708
Part 17	Services	
Chapter 54	Overview	4713
	Port Mirroring	4713
	Understanding Port Mirroring	4713
	Port Mirroring Overview	4713
	Port-Mirroring Terminology	4714
	Port Mirroring Constraints and Limitations	4715
	Understanding Layer 3 Logical Interfaces	4718
	DHCP Relay	4718
	DHCP and BOOTP Relay Overview	4718
Chapter 55	Configuration	4721
	Configuration Examples	4721
	Example: Configuring Port Mirroring for Local Analysis	4721
	Example: Configuring Port Mirroring for Remote Analysis	4726
	Configuration Tasks	4730
	Configuring Port Mirroring	4730
	Configuring Port Mirroring for Local Analysis	4731
	Configuring Port Mirroring for Remote Analysis	4731
	Filtering the Traffic Entering an Analyzer	4732
	Configuring DHCP and BOOTP Relay	4733
	Configuring a DHCP and BOOTP Relay Agent	4733
	Configuring DHCP Smart Relay	4735
	Configuration Statements for Port Mirroring	4736

	interface (BOOTP)	4771
	maximum-hop-count	4772
	minimum-wait-time	4772
	no-listen	4773
	server (DHCP and BOOTP Relay Agent)	4773
Chapter 56	Administration	4775
	Monitoring Commands for Port Mirroring	4775
	show analyzer	4776
Chapter 57	Troubleshooting	4779
	Troubleshooting Procedures	4779
	Troubleshooting Port Mirroring	4779
	Port Mirroring Constraints and Limitations	4779
	Egress Port Mirroring with VLAN Translation	4781
	Egress Port Mirroring with Private VLANs	4781
Part 18	Storage	
Chapter 58	Overview	4785
	Software Features Overview	4785
	Overview of Fibre Channel on the QFX Series	4786
	Fibre Channel Transport Protocol	4787
	How FC Works on the QFX Series	4787
	Supported FC Features and Functions	4789
	Lossless Transport Support	4789
	Overview of FIP	4790
	Fibre Channel, FCoE, FIP, and FIP Snooping	4791
	Understanding Fibre Channel	4792
	FC Fabrics	4792
	FC Port Types	4792
	FC Switches	4793
	Adapters	4793

N_Port ID Virtualization (NPIV)	4793
FC Services	4794
Understanding DCB Features and Requirements	4795
Lossless Transport	4796
ETS	4797
DCBX	4797
Understanding FCoE	4799
FCoE Devices	4800
FCoE Frames	4801
Virtual Links	4802
FCoE VLANs	4802
Understanding FCoE Transit Switch Functionality	4804
Understanding an FCoE-FC Gateway	4808
Gateway FC Fabric	4809
Fabric Services	4810
FCoE-FC Gateway Traffic Switching	4810
Understanding FCoE-FC Gateway Functions	4812
Login and Logout	4812
FCoE and FC Frame Handling	4812
Data Center Bridging	4812
Disabling the Fabric WWN Verification Check	4813
Load Balancing	4814
Understanding FCoE and FIP Session High Availability	4815
High Availability for Fibre Channel Process Termination (FCoE-FC Gateway Mode)	4815
High Availability for FIP Snooping	4815
Nonstop Software Upgrade (QFabric Systems)	4816
Understanding FIP Functions	4817
FIP VLAN Discovery	4818
FIP Discovery	4818
FIP FLOGI	4819
FIP FDISC	4820
FIP Maintenance (Keepalive Messages)	4820
FIP LOGO	4821
Understanding FIP Implementation	4821
FIP Basics	4821
Fabric Login and FIP Login Overview	4822
Proxy FIP Discovery	4823
Proxy FIP Initialization	4824
Proxy FIP Maintenance	4824
Proxy FIP Logout	4825
Understanding FIP Parameters on an FCoE-FC Gateway	4825
FIP Keepalive Advertisement Period	4825
Addressing Mode	4826
FC-MAP	4827
FCoE Trusted Fabric	4827
Maximum Number of FCoE Sessions Per ENode	4827
Priority	4828
Understanding Fibre Channel Virtual Links	4828

Understanding Interfaces on an FCoE-FC Gateway	4829
Native FC Interfaces to the FC Switch	4830
FIP Login Session Limits	4831
Trusted and Untrusted Interfaces	4835
Buffer-to-Buffer Credit Recovery	4835
FCoE VLAN Interface to FCoE Devices	4836
Assigning Interfaces to a Fibre Channel Fabric	4839
Deleting a Fibre Channel Interface	4840
Understanding Load Balancing in an FCoE-FC Gateway Proxy Fabric	4841
Load-Balancing Algorithms	4842
Load-Rebalancing Methods	4846
NP_Port Interface FIP Session Limit Effect on Load Balancing	4847
Load-Balancing Triggers and Timing	4847
Load Rebalancing Behavior When a Link Goes Down	4849
Interface Load Calculation Algorithm	4850
Load-Balancing Scenarios	4851
Load Balancing on the FCoE Interfaces (Ethernet Links)	4856
Understanding OxID Hash Control for FCoE Traffic Load Balancing	4857
Understanding VN_Port to VF_Port FIP Snooping on an FCoE Transit	
Switch	4858
FC Network Security	4859
VN2VF_Port FIP Snooping Functions	4860
FIP Snooping Firewall Filters	4860
Session Scalability	4860
VN2VF_Port FIP Snooping Implementation	4861
T11 VN2VF_Port FIP Snooping Specification	4864
Understanding VN_Port to VN_Port FIP Snooping on an FCoE Transit	
Switch	4865
VN2VN_Port FIP Snooping and FIP Snooping Virtual Links	4865
VN2VN_Port Communication Modes	4866
Network Security	4867
VN2VN_Port FIP Snooping Functions	4867
Scalability	4867
VN2VN_Port FIP Snooping Implementation	4867
ENode-Facing Interfaces	4868
Network-Facing Interfaces (Connecting to Another Transit Switch) . .	4869
Beacon Period (VN2VN_Port FIP Snooping Link Maintenance)	4870
QFabric System Differences in VN2VN_Port FIP Snooping Traffic	
Handling	4870
Understanding FIP Snooping, FBF, and MVR Filter Scalability	4872
VFP TCAM Architecture and Allocation	4872
VFP TCAM Entry Consumption	4873
Rejected Filter Configurations (No Available VFP TCAM Space) . . .	4876
VFP TCAM Allocation and Consumption (Scaling) Examples	4877
Filter Configuration Recommendations	4879
Understanding MC-LAGs on an FCoE Transit Switch	4881
Supported Topology	4881
FIP Snooping and FCoE Trusted Ports	4883
CoS and Data Center Bridging (DCB)	4884

	Understanding CoS Flow Control (Ethernet PAUSE and PFC)	4885
	Ethernet PAUSE	4885
	PFC	4889
	Lossless Transport Support Summary	4893
	Understanding Fibre Channel Terminology	4895
	DCBX	4905
	Understanding DCBX	4905
	DCBX Basics	4906
	DCBX Modes and Support	4907
	DCBX Attribute Types	4909
	DCBX Application Protocol TLV Exchange	4911
	DCBX and PFC	4912
	DCBX and ETS	4912
	Understanding DCBX Application Protocol TLV Exchange	4915
	Applications	4915
	Application Maps	4916
	Classifying and Prioritizing Application Traffic	4917
	Enabling Interfaces to Exchange Application Protocol Information	4918
	Disabling DCBX Application Protocol Exchange	4918
Chapter 59	Configuration	4921
	Configuration Examples	4921
	Example: Configuring CoS PFC for FCoE Traffic	4921
	Example: Configuring DCBX Application Protocol TLV Exchange	4929
	Configuration Examples (Original CLI Only)	4940
	Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG	4940
	Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric	4963
	Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)	4977
	Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches)	4982
	Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch)	4990
	Example: Configuring Automated Fibre Channel Interface Load Rebalancing	4999
	Configuration Examples (ELS CLI for Platforms that Support FCoE Only)	5002
	Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG	5002
	Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)	5025
	Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches)	5030
	Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch)	5036
	Configuration Tasks (Fibre Channel, FCoE, FIP, and FIP Snooping)	5044
	Configuring an FCoE-FC Gateway Fibre Channel Fabric	5045
	Disabling the Fabric WWN Verification Check	5047

Configuring a Physical Fibre Channel Interface	5048
Configuring a Fibre Channel Interface	5049
Configuring an FCoE VLAN Interface on an FCoE-FC Gateway	5051
Assigning Interfaces to a Fibre Channel Fabric	5054
Deleting a Fibre Channel Interface	5055
Disabling Storm Control on FCoE Interfaces on an FCoE-FC Gateway	5056
Defining the Proxy Load-Balancing Algorithm	5056
Simulating On-Demand Fibre Channel Link Load Rebalancing (Dry Run Test)	5058
Enabling and Disabling CoS OxID Hash Control	5059
Configuring FIP on an FCoE-FC Gateway	5059
Setting the Maximum Number of FIP Login Sessions per ENode	5062
Setting the Maximum Number of FIP Login Sessions per FC Interface	5063
Setting the Maximum Number of FIP Login Sessions per FC Fabric	5064
Setting the Maximum Number of FIP Login Sessions per Node Device	5065
Configuring VLAN Interfaces for FCoE Traffic on an FCoE Transit Switch	5066
Configuring VN2VF_Port FIP Snooping and FCoE Trusted Interfaces on an FCoE Transit Switch	5069
Disabling VN2VF_Port FIP Snooping on an FCoE-FC Gateway Switch Interface	5072
Enabling VN2VN_Port FIP Snooping and Configuring the Beacon Period on an FCoE Transit Switch	5073
Configuration Tasks (DCBX)	5074
Configuring the DCBX Mode	5075
Configuring DCBX Autonegotiation	5076
Disabling the ETS Recommendation TLV	5079
Defining an Application for DCBX Application Protocol TLV Exchange	5079
Configuring an Application Map for DCBX Application Protocol TLV Exchange	5081

Chapter 61	Troubleshooting	5279
	Troubleshooting Procedures	5279
	Troubleshooting Dropped FCoE Traffic	5279
	Troubleshooting Fibre Channel Interface Deletion	5282
	Troubleshooting Dropped FIP Traffic	5283
Part 19	Traffic Management	
Chapter 62	Overview	5289
	CoS Upgrade and Change Overview	5289
	Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)	5290
	Overview of CoS Upgrade Requirements to Junos OS Release 12.2	5291
	Overview of CoS Upgrade Requirements to Junos OS Release 12.3 (QFX3500 and QFX3600 Switches) or to Junos OS Release 13.1 (QFabric Systems)	5293
	Support for Six Lossless Forwarding Classes	5293
	Scheduling on QFabric System Node Device Fabric (fte) Ports	5295
	Strict-High Priority Scheduling on QFabric System Node Device Fabric (fte) Ports	5295
	Overview of CoS Changes Introduced in Junos OS Release 11.3	5296
	CoS Default Value Changes	5296
	Queue Priority Configuration Changes	5301
	Minimum Guaranteed Bandwidth (Transmit Rate and Guaranteed Rate) Changes	5302
	Excess Rate Statement Disabled	5302
	Queue Scheduling (Low and Strict-High Priority Queues)	5303
	Multidestination Traffic Changes	5303
	Overview of CoS Changes Introduced in Junos OS Release 12.2	5304
	Lossless Forwarding Classes (fcoe and no-loss)	5304
	Default MTU for Headroom Buffer Calculation for Lossless Forwarding Classes	5305
	CoS for Layer 3 Physical Interfaces	5305
	DSCP IPv6 Classifiers and Rewrite Rules	5305
	CoS Overview	5306
	Overview of Junos OS CoS for the QFX Series	5307
	CoS Standards	5307
	How Junos CoS Works	5308
	Default CoS Behavior	5309
	Overview of Policers	5309
	Policer Overview	5310
	Policer Types	5310
	Policer Actions	5311
	Policer Colors	5312
	Filter-Specific Policers	5312
	Suggested Naming Convention for Policers	5313
	Policer Counters	5313
	Policer Algorithms	5313
	How Many Policers are Supported?	5313

Policers can Limit Egress Firewall Filters	5314
Understanding Junos CoS Components	5315
Code-Point Aliases	5315
Policers	5315
Classifiers	5315
Forwarding Classes	5316
Forwarding Class Sets	5316
Flow Control (Ethernet PAUSE and Priority-Based Flow Control)	5316
Tail-Drop Profiles	5317
Schedulers	5317
Rewrite Rules	5318
Understanding CoS Packet Flow	5319
CoS Inputs and Outputs Overview	5321
Understanding Default CoS Settings	5322
Default Forwarding Classes and Queue Mapping	5322
Default Forwarding Class Sets (Priority Groups)	5323
Default Code-Point Aliases	5323
Default Classifiers	5325
Default Rewrite Rules	5328
Default Drop Profile	5328
Default Schedulers	5328
Default Scheduler Maps	5328
Default Shared Buffer Configuration	5329
Understanding Host Inbound Traffic Classification	5329
Understanding Host Routing Engine Outbound Traffic Queues and Defaults	5330
Understanding CoS Code-Point Aliases	5332
Default Code-Point Aliases	5332
Understanding CoS Classifiers	5334
Interfaces and Output Queues	5334
Behavior Aggregate Classifiers	5335
Fixed Classifiers on Ethernet Interfaces	5338
Fixed Classifiers on Native Fibre Channel Interfaces (NP_Ports)	5339
Multifield Classifiers	5339
Packet Classification for Routed VLAN Interfaces (RVIs)	5340
Understanding CoS MPLS EXP Classifiers and Rewrite Rules	5341
EXP Classifiers	5341
EXP Rewrite Rules	5342
Schedulers	5343
Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces . .	5344
Supported Classifier and Rewrite Rule Types	5344
Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration	5345
Default Classifiers	5347
Default Rewrite Rules	5348
Classifier Precedence	5348
Classifier Behavior and Limitations	5349
Rewrite Rule Precedence and Behavior	5350

Classifier and Rewrite Rule Configuration Interaction with Ethernet	
Interface Configuration	5351
Understanding CoS Forwarding Classes	5354
Default Forwarding Classes	5354
Forwarding Class Configuration Rules	5356
Lossless Transport Support	5357
Understanding CoS Forwarding Class Sets (Priority Groups)	5359
Understanding Default CoS Scheduling and Classification	5360
Default Classification	5360
Default Scheduling	5363
Default DCBX Advertisement	5364
Default Scheduling and Classification Summary	5364
Understanding CoS Hierarchical Port Scheduling (ETS)	5366
Hierarchical Scheduling and ETS	5367
ETS Advertisement in DCBX	5368
Hierarchical Scheduling Process	5368
Strict-High Priority Queues and Hierarchical Scheduling	5369
Default Hierarchical Scheduling	5370
Understanding CoS Output Queue Schedulers	5371
Output Queue Scheduling Components	5371
Default Schedulers	5372
Transmit Rate (Minimum Guaranteed Bandwidth)	5373
Sharing Extra Bandwidth	5374
Shaping Rate (Maximum Bandwidth)	5374
Scheduling Priority	5375
Scheduler Drop-Profile Maps	5376
Buffer Size	5376
Scheduler Maps	5377
Understanding CoS Priority Group Scheduling	5378
Priority Group Scheduling Components	5378
Default Traffic Control Profile	5379
Guaranteed Rate (Minimum Guaranteed Bandwidth)	5379
Sharing Extra Bandwidth	5379
Shaping Rate (Maximum Bandwidth)	5380
Scheduler Maps	5380
Understanding CoS Traffic Control Profiles	5381
Understanding CoS Priority Group and Queue Guaranteed Rates (Minimum	
Bandwidth)	5382
Guaranteeing Bandwidth Using Hierarchical Scheduling	5382
Priority Group Guaranteed Rate (Minimum Bandwidth)	5384
Queue Transmit Rate (Minimum Bandwidth)	5384
Understanding CoS Priority Group Shaping and Queue Shaping (Maximum	
Bandwidth)	5385
Priority Group Shaping	5385
Queue Shaping	5385
Shaping Maximum Bandwidth Using Hierarchical Scheduling	5386
Understanding CoS Scheduling Behavior and Configuration	
Considerations	5387

Understanding CoS Buffer Configuration	5391
Buffer Pools	5392
Default Buffer Pool Values	5400
Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios	5403
Optimizing Buffer Configuration	5406
General Buffer Configuration Rules and Considerations	5408
Understanding CoS Tail-Drop Profiles	5409
Drop Profile Parameters	5410
Default Drop Profile	5411
Packet Drop Method	5411
Drop Profile Maps	5412
Congestion Prevention	5412
Understanding CoS Rewrite Rules	5414
Understanding CoS Flow Control (Ethernet PAUSE and PFC)	5416
Ethernet PAUSE	5416
PFC	5420
Lossless Transport Support Summary	5424
QFX Series Standalone Switches, QFabric Systems Only	5426
Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows	5427
Lossless Transport Features Introduced in Junos OS Release 12.3	5427
Default Lossless Priority Configuration	5428
Configuring Lossless Priorities	5431
Backward Compatibility with Junos OS Releases Earlier Than Release 12.3	5443
Configuration Rules and Recommendations	5444
Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway	5446
Priority Remapping Configuration	5446
Configuration Rules	5447
Fate Sharing	5448
Understanding DCB Features and Requirements	5449
Lossless Transport	5449
ETS	5450
DCBX	5451
Understanding DCBX	5452
DCBX Basics	5452
DCBX Modes and Support	5453
DCBX Attribute Types	5456
DCBX Application Protocol TLV Exchange	5457
DCBX and PFC	5458
DCBX and ETS	5458
Understanding DCBX Application Protocol TLV Exchange	5461
Applications	5461
Application Maps	5462
Classifying and Prioritizing Application Traffic	5463
Enabling Interfaces to Exchange Application Protocol Information	5464
Disabling DCBX Application Protocol Exchange	5464

	QFX5100 Switches Only	5465
	Understanding PFC Functionality Across Layer 3 Interfaces	5465
	QFX3500 and QFX3600 Virtual Chassis Only	5467
	CoS on QFX Series Virtual Chassis Switch Ports	5468
	Access Interface CoS Support	5468
	VCP Interface CoS Support	5470
	CPU-Generated Host Outbound Traffic	5472
Chapter 63	Configuration	5473
	Configuration Examples	5473
	Example: Configuring CoS Hierarchical Port Scheduling (ETS)	5474
	Example: Configuring Unicast Classifiers	5495
	Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers	5498
	Example: Configuring Tail-Drop Profiles	5501
	Example: Configuring Drop Profile Maps	5503
	Example: Configuring Forwarding Classes	5505
	Example: Configuring Forwarding Class Sets	5508
	Example: Configuring Queue Schedulers	5511
	Example: Configuring Queue Scheduling Priority	5516
	Example: Configuring Traffic Control Profiles (Priority Group Scheduling)	5519
	Example: Configuring Minimum Guaranteed Output Bandwidth	5521
	Example: Configuring Maximum Output Bandwidth	5526
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic	5530
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled	5535
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic	5541
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic	5547
	Configuration Examples (QFX Series Standalone Switches, QFabric Systems Only)	5553
	Example: Configuring CoS PFC for FCoE Traffic	5553
	Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG	5561
	Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)	5584
	Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface	5593
	Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces	5601
	Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)	5615
	Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway	5631

Example: Configuring DCBX Application Protocol TLV Exchange	5640
Configuration Examples (QFX5100 Switches Only)	5651
Example: Configuring PFC Across Layer 3 Interfaces	5651
Configuration Tasks	5669
Configuring CoS	5670
Defining CoS Code-Point Aliases	5672
Defining CoS Unicast BA Classifiers (DSCP, DSCP IPv6, IEEE 802.1p)	5673
Configuring a Global MPLS EXP Classifier	5674
Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers	5675
Configuring CoS Tail-Drop Profiles	5676
Configuring CoS Drop Profile Maps	5677
Defining CoS Forwarding Classes	5677
Defining CoS Forwarding Class Sets	5679
Defining CoS Queue Schedulers	5679
Defining CoS Queue Scheduling Priority	5682
Changing the Host Outbound Traffic Default Queue Mapping	5683
Defining CoS Traffic Control Profiles (Priority Group Scheduling)	5684
Configuring CoS PFC (Congestion Notification Profiles)	5685
Enabling and Disabling CoS Symmetric Ethernet PAUSE Flow Control . .	5688
Configuring CoS Asymmetric Ethernet PAUSE Flow Control	5689
Configuring Global Ingress and Egress Shared Buffers	5690
Defining CoS Rewrite Rules	5693
Configuring Rewrite Rules for MPLS EXP Classifiers	5695
Assigning CoS Components to Interfaces	5696
Configuration Tasks (QFX Series Standalone Switches, QFabric Systems Only)	5697
Configuring CoS Fixed Classifier Rewrite Values for Native FC Interfaces (NP_Ports)	5698
Configuring the DCBX Mode	5700
Configuring DCBX Autonegotiation	5701
Disabling the ETS Recommendation TLV	5704
Defining an Application for DCBX Application Protocol TLV Exchange . . .	5704
Configuring an Application Map for DCBX Application Protocol TLV Exchange	5706
Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange	5707

About the Documentation

- Documentation and Release Notes on page cxxi
- Supported Platforms on page cxxi
- Using the Examples in This Manual on page cxxi
- Documentation Conventions on page cxxiii
- Documentation Feedback on page cxxiv
- Requesting Technical Support on page cxxv

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- QFX Series standalone switches

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page cxxiii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 2 on page cxxiii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at

<https://www.juniper.net/cgi-bin/docbugreport/>. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>
- Join and participate in the Juniper Networks Community Forum: <http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

PART 1

QFX5100 Switch Overview

- [QFX5100 Switch Overview on page 3](#)

CHAPTER 1

QFX5100 Switch Overview

- [QFX5100 Switch Hardware Overview on page 3](#)

QFX5100 Switch Hardware Overview

The QFX5100 line of switches is Juniper Network's second generation of top-of-rack switch solutions for data centers and campus distribution or aggregation environments. The QFX5100 portfolio consists of high-performance fixed-configuration switches that add higher port densities, additional scalability, and improved latency to the QFX Series.

This topic covers:

- [QFX5100 Hardware on page 3](#)
- [System Software on page 5](#)

QFX5100 Hardware

QFX5100 switches offer two compact 1 U product SKUs and a 2 U product SKU that provide wire-speed packet performance, very low latency, and rich set of Layer 2 and Layer 3 features. In addition to a high-throughput Packet Forwarding Engine, the performance of the control plane running on all the QFX5100 product SKUs is enhanced by the 1.5 Ghz dual core Intel CPU with 8 GB of memory and 32 GB of solid-state drive (SSD) storage.

The QFX5100 line of switches include both 10GE and 40GE fixed-configurations:

- QFX5100-48S

As shown in [Figure 1 on page 4](#), the QFX5100-48S is a 10-Gigabit Ethernet Enhanced Small Form-Factor Pluggable (SFP+) top-of-rack switch with 48 SFP+ ports and 6 Quad SFP+ (QSFP+) ports. Each SFP+ port can operate as a native 10 Gbps port or as a 1 Gbps port; each QSFP+ port can operate at native 40 Gbps speed or as 4 independent 10 Gbps port speeds. The 6 QSFP+ ports can be used as either access ports or as uplinks. The QFX5100-48S provides full duplex throughput of 1.44 Tbps. The QFX5100-48S has a 1 U form factor and comes standard with redundant fans and redundant power supplies. The model can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

Figure 1: QFX5100-48S Switch

- QFX5100-24Q

As shown in [Figure 2 on page 4](#), the QFX5100-24Q is a 40-Gigabit Ethernet QSFP+ switch with 24 high-density QSFP+ ports. Each QSFP+ port can operate as a native 40 Gbps port or as 4 independent 10 Gbps ports. The QFX5100-24Q has a 1U form factor and comes standard with redundant fans and redundant power supplies. The model can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

The QFX5100-24Q has two module bays for the optional expansion module, QFX-EM-4Q, which can add a total of 8 additional QSFP+ ports to the chassis. When fully populated with QFX-EM-4Q Expansion Modules, the QFX5100-24Q is equivalent to 128 interfaces (96 + 16 + 16). Of these total ports, 104 logical ports are available for 10G port channelization. All ports on the QFX5100-24Q and QFX-EM-4Q can be configured as either access ports or as uplinks. The QFX5100-24Q provides full duplex throughput of 2.56 Tbps.

Figure 2: QFX5100-24Q Switch

As shown in [Figure 3 on page 4](#), the QFX-EM-4Q is an expansion module for the QFX5100-24Q. The module provides 4 additional QSFP+ ports that can be hot-inserted or hot-removed from the switch.

Figure 3: QFX-EM-4Q Expansion Module

- QFX5100-96S

As shown in [Figure 4 on page 5](#), the QFX5100-96S is a 10-Gigabit Ethernet Enhanced Small Form-Factor Pluggable (SFP+) top-of-rack switch with 96 SFP+ ports and 8 Quad SFP+ (QSFP+) ports. Each SFP+ port can operate as a native 10 Gbps port or as a 1 Gbps port; each QSFP+ port can operate at native 40 Gbps speed

or as 4 independent 10 Gbps port speeds. The 8 QSFP+ ports can be used as either access ports or as uplinks. The QFX5100-96S has a 2 U form factor and comes standard with redundant fans and redundant power supplies. The model can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

Figure 4: QFX5100-96S Switch

System Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on a QFX5100 switch's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX5100 switches also runs on all Juniper Networks EX Series switches, and J Series, M Series, MX Series, and T Series routers.

For more information about which features are supported on QFX Series devices, see *QFX Series Software Features Overview*.

You manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

Feature	QFX5100
System logging (syslog) over IPv4	Junos OS 13.2X51-D10
Licensing	Junos OS 13.2X51-D10

Table 4: CoS Features

Feature	QFX5100
Class of service (CoS)—Class-based queuing with prioritization	Junos OS 13.2X51-D10
CoS—Multidestination	Junos OS 13.2X51-D10
CoS support on link aggregation groups (LAGs)	Junos OS 13.2X51-D10
Enhanced transmission selection (ETS)	Junos OS 13.2X51-D10
CoS rewrite rules	Junos OS 13.2X51-D10
Queue shaping	Junos OS 13.2X51-D10
Priority-based flow control (PFC)	Junos OS 13.2X51-D10
Re-marking of bridged packets	Junos OS 13.2X51-D10
Weighted random early detection (WRED) tail-drop profiles	Junos OS 13.2X51-D10
802.3X Ethernet PAUSE autonegotiation enhancements	Junos OS 13.2X51-D10
Layer 3 ingress packet classification and egress rewrite rule class-of-service features	Junos OS 13.2X51-D10
Software buffer configurability	Junos OS 13.2X51-D10

Table 5: High Availability and Resiliency Features

Feature	QFX5100
Graceful protocol restart for BGP	Junos OS 13.2X51-D10
Graceful protocol restart for OSPF	Junos OS 13.2X51-D10
Link aggregation groups (LAGs)	Junos OS 13.2X51-D10
Support for 32 members in a link aggregation group (LAG)	Junos OS 13.2X51-D10
Multichassis link aggregation	Junos OS 13.2X51-D10
Virtual Router Redundancy Protocol (VRRP)	Junos OS 13.2X51-D10

Table 5: High Availability and Resiliency Features (*continued*)

Feature	QFX5100
In-Service Software Upgrade (ISSU)	Junos OS 13.2X51-D15
Zero Touch Provisioning (ZTP)	Junos OS 13.2X51-D15

Table 6: Interface Features

Feature	QFX5100
Auto-channelization	Junos OS 13.2X51-D15
Interface ranges	Junos OS 13.2X51-D10
Interface channelization	Junos OS 13.2X51-D10
VLAN-tagged Layer 3 logical interfaces	Junos OS 13.2X51-D10
Digital optical monitoring (DOM)	Junos OS 13.2X51-D10
IPv4 over generic routing encapsulation (GRE) tunnels— encapsulation support	Junos OS 13.2X51-D10

Table 7: IP Address Management Features

Feature	QFX5100
Static addresses	Junos OS 13.2X51-D10
IPv4 support for telnet	Junos OS 13.2X51-D10
IPv6 support for neighbor discovery, router advertisements, stateless autoconfiguration, SSH, Telnet, ping, traceroute, path MTU, static routing, dynamic routing (BGP, IS-ISv6, OSPFv3), MLDv1 and v2, graceful restart, virtual routers, SNMP, CoS, VRRPv3, Radius, TACACS+, AAA, NTP, and syslog	Junos OS 13.2X51-D10

Table 8: Layer 2 Network Protocol Features

Feature	QFX5100
802.1Q VLAN tagging	Junos OS 13.2X51-D10
BPDU protection for spanning-tree protocols	Junos OS 13.2X51-D10
Jumbo frames on routed VLAN interfaces (RVIs)	Junos OS 13.2X51-D10
Link Layer Discovery Protocol (LLDP)	Junos OS 13.2X51-D10
Loop protection for spanning-tree protocols	Junos OS 13.2X51-D10

Table 8: Layer 2 Network Protocol Features (*continued*)

Feature	QFX5100
Root protection for spanning-tree protocols	Junos OS 13.2X51-D10
Spanning tree:	Junos OS 13.2X51-D10
<ul style="list-style-type: none"> Spanning Tree Protocol (STP) Rapid Spanning Tree Protocol (RSTP) Multiple Spanning Tree Protocol (MSTP) VLAN Spanning Tree Protocol (VSTP) RSTP and VSTP concurrent configuration 	
VLAN ranges	Junos OS 13.2X51-D10
Proxy ARP	Junos OS 13.2X51-D10
Redundant trunk groups	Junos OS 13.2X51-D10
Unified forwarding table	Junos OS 13.2X51-D10

Table 9: Layer 3 Protocol Features

Feature	QFX5100
Bidirectional Forwarding Detection (BFD)	Junos OS 13.2X51-D10
Border Gateway Protocol (BGP)	Junos OS 13.2X51-D10
BGP for IPv6	Junos OS 13.2X51-D10
BGP monitoring protocol (BMP) v 3	Junos OS 13.2X51-D15
BGP support for advertising multiple paths to IPv6 addresses	Junos OS 13.2X51-D15
Intermediate System-to-Intermediate System (IS-IS)	Junos OS 13.2X51-D10
IS-ISv6	Junos OS 13.2X51-D10
Open Shortest Path First (OSPF) v2	Junos OS 13.2X51-D10
OSPFv3	Junos OS 13.2X51-D10
Per-packet load balancing (ECMP)	Junos OS 13.2X51-D10
64 ECMP paths	Junos OS 13.2X51-D15
Routing Information Protocol versions 1 and 2 (RIPv1 and RIPv2)	Junos OS 13.2X51-D10
Routed VLAN interfaces (RVIs)	Junos OS 13.2X51-D10

Table 9: Layer 3 Protocol Features (*continued*)

Feature	QFX5100
Static routes	Junos OS 13.2X51-D10
Virtual router routing instances for unicast protocols	Junos OS 13.2X51-D10
Virtual router routing instances for multicast protocols	Junos OS 13.2X51-D10

Table 10: Multicast Protocol Features

Feature	QFX5100
IGMPv1 and v2	Junos OS 13.2X51-D10
IGMPv3	Junos OS 13.2X51-D10
IGMPv1 and v2 snooping	Junos OS 13.2X51-D10
IGMP querier	Junos OS 13.2X51-D10
IGMP filtering	Junos OS 13.2X51-D10
Multicast Listener Discovery (MLD) Protocol , v1 and v2	Junos OS 13.2X51-D10
Protocol Independent Multicast sparse mode (PIM SM)	Junos OS 13.2X51-D10
Protocol Independent Multicast source-specific multicast (PIM SSM)	Junos OS 13.2X51-D10
Bidirectional Forwarding Detection (BFD) for PIM	Junos OS 13.2X51-D10

Table 11: MPLS Features

Related Documentation

Configuration File Terms

Table 31 on page 26 lists the various configuration file terms used for the QFX Series and their definitions.

Table 31: Configuration File Terms

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.

Table 31: Configuration File Terms (*continued*)

Term	Definition
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements

Many statements in the Junos OS configuration include an option to specify an IP address or route prefix. This option is represented in one of the following ways:

- ***network/prefix-length***—Network portion of the IP address, followed by a slash and the destination prefix length (previously called the subnet mask). For example, 10.0.0.1/8.
- ***network***—IP address. For example, 10.0.0.2.
- ***destination-prefix/prefix-length***—Route prefix, followed by a slash and the destination prefix length. For example, 192.168.1.10/32.

You enter all IP addresses in classless mode. You can enter the IP address with or without a prefix length, in standard dotted notation (for example, 1.2.3.4), or hexadecimal notation as a 32-bit number in network-byte order (for example, 0x01020304). If you omit any octets, they are assumed to be zero. Specify the prefix length as a decimal number from 1 through 32.

In-Service Software Upgrade (ISSU) System Requirements

To perform an in-service software upgrade (ISSU), your device must be running Junos OS Release 13.2X51-D15 or later.

NOTE: ISSU does not support extension application packages developed with the Junos SDK.

- [In-Service Software Upgrade \(ISSU\) Protocol and Process Support on page 28](#)

[In-Service Software Upgrade \(ISSU\) Protocol and Process Support](#)

Table 32 on page 28 lists the protocols and processes that are supported during an ISSU. Protocols that are not supported might cause packet loss.

Table 32: ISSU Protocol Support

Protocol	Junos OS Release
Graceful Routing Engine switchover (GRES)	Junos OS 13.2X51-D15 and above
Internet Group Management Protocol (IGMP)	Junos OS 13.2X51-D15 and above
Layer 2 MAC routes	Junos OS 13.2X51-D15 and above
Layer 3 unicast and multicast routes	Junos OS 13.2X51-D15 and above
Layer 2 multicast routes	Junos OS 13.2X51-D15 and above
Link Aggregation Control Protocol (LACP)	Junos OS 13.2X51-D15 and above
<p>NOTE: Configure LACP before you issue an ISSU.</p> <p>The LACP periodic fast mode is not supported. Instead, configure the periodic slow mode. If you configure the periodic fast mode, the configuration can be committed without any commit or system log error messages, but you might experience a larger than expected amount of traffic drops. Traffic drops occur because the LACP links go down during an ISSU.</p> <p>Link changes are processed after an ISSU is complete.</p>	
Multicast Listener Discovery (MLD) snooping	Junos OS 13.2X51-D15 and above
Spanning tree protocols:	Junos OS 13.2X51-D15 and above
<ul style="list-style-type: none"> • Multiple Spanning Tree Protocol (MSTP) • Rapid Spanning Tree Protocol (RSTP) • Spanning Tree Protocol (STP) • VLAN Spanning Tree Protocol (VSTP)

Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model—a candidate configuration is modified as desired and then committed to the system. When a configuration is committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The formerly active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and any other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (numbered 1 through 49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

NOTE: The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

NOTE: When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

package-name-m.nZx.y-domestic-signed.tgz

where:

- ***package-name*** is the name of the package—for example, ***jinstall-qfx***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***11.1***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, ***1.5***.

A sample switch software package name is:

jinstall-qfx-11.1R1.5-domestic-signed.tgz

NTP Time Server and Time Services Overview

When configuring the Network Time Protocol (NTP), you can specify which system on the network is the authoritative time source, or time server, and how time is synchronized between systems on the network. To do this, you configure the router or switch to operate in one of the following modes:

- Client mode—In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.
- Symmetric active mode—In this mode, the local router or switch and the remote system can synchronize with each other. You use this mode in a network in which either the local router or switch or the remote system might be a better source of time.

NOTE: Symmetric active mode can be initiated by either the local or the remote system. Only one system needs to be configured to do so. This means that the local system can synchronize with any system that offers symmetric active mode without any configuration whatsoever. However, we strongly encourage you to configure authentication to ensure that the local system synchronizes only with known time servers.

- Broadcast mode—In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the local router or switch is operating as a transmitter.
- Server mode—In this mode, the local router or switch operates as an NTP server.

NOTE: In NTP server mode, the Junos OS supports authentication as follows:

- If the NTP request from the client comes with an authentication key (such as a key ID and message digest sent with the packet), the request is processed and answered based on the authentication key match.
- If the NTP request from the client comes without any authentication key, the request is processed and answered without authentication.

Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)

Before you upgrade to Junos OS Release 11.3, you must deactivate the CoS configuration if the CoS configuration includes any of the following features:

- **excess-rate** option
- **strict-high** or **high** priority queues
- Any of the Junos OS Release 11.1 or 11.2 default multdestination forwarding classes

CAUTION: If your CoS configuration contains any of the features listed above and you attempt to upgrade from Junos OS Release 11.1 or 11.2 to a later version without first editing the configuration, the Junos OS might not restart.

Junos OS Release 11.3 and later for QFX Series no longer supports the **excess-rate** statement, the **strict** priority option, or the default multdestination forwarding classes used in Junos OS Release 11.1 and 11.2. In addition, Junos OS Release 11.3 introduces new restrictions on how to configure and use **strict-high** priority queues.

This topic does not describe how to perform the software upgrade procedure. It describes how to deactivate your CoS configuration, edit your CoS configuration, and reactivate your CoS configuration at the appropriate times.

Use the following procedure to upgrade safely from Junos OS Release 11.1 or 11.2 to a later release:

1. Deactivate the CoS configuration *before* you upgrade the software:

```
user@switch# deactivate class-of-service
```
2. Follow the upgrade procedure to Junos OS Release 11.3 or later software.
3. Make the following changes to the CoS configuration while the CoS configuration is still deactivated:
 - Remove the **excess-rate** statement from the CoS configuration if you have used it at the **[edit class-of-service schedulers]** or **[edit class-of-service traffic-control-profiles]** hierarchy level.
 - Remove the **strict-high** and **strict** priority queue configurations if you have used them at the **[edit class-of-service schedulers]** hierarchy level.
 - Remove the default multdestination forwarding classes (**mcast-be**, **mcast-af**, **mcast-ef**, and **mcast-nc**) if you have used them at the **[edit class-of-service schedulers]**, **[edit class-of-service rewrite-rules]**, **[edit class-of-service classifiers]**, **[edit class-of-service scheduler-maps]**, or **[edit class-of-service forwarding-class-sets]** hierarchy level. Alternatively, you can change the mapping of the multdestination traffic to use the new default multdestination forwarding class (**mcast**).
4. If desired, configure **strict-high** priority queues in accordance with the Junos OS Release 11.3 or later configuration rules, and map multdestination traffic to the default multdestination forwarding class (**mcast**).

5. Activate the CoS configuration:

```
user@switch# activate class-of-service
```

6. Commit the CoS configuration:

```
user@switch# commit
```

NOTE: If you configured the `transmit-rate` option for any queues under the `[edit class-of-service schedulers]` hierarchy level, if the rate is configured as an exact rate in Mbps, we recommend that you reconfigure the `transmit-rate` option as a percentage. This is because the scheduler converts exact rates to percentages, and when the exact rate is below 1 Gbps, some granularity may be lost in the conversion. You can avoid this potential issue by specifying the `transmit-rate` option as a percentage.

Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

- [Typical Uses for Autoinstallation on page 34](#)
- [Autoinstallation Configuration Files and IP Addresses on page 34](#)
- [Typical Autoinstallation Process on a New Switch on page 34](#)

Typical Uses for Autoinstallation

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

Autoinstallation Configuration Files and IP Addresses

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- **hostname.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, **hostname** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

Typical Autoinstallation Process on a New Switch

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.
2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
 - a. If the DHCP server specifies the host-specific configuration file **hostname.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
 - b. If the switch does not locate a **hostname.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
 - c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.
 - d. If the switch determines its hostname, it sends a TFTP request for the **hostname.conf** file.
 - e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.
 3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a Juniper Networks EX Series Ethernet Switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, router or switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

This topic describes:

- [DHCP Client/Server Model on page 36](#)
- [Using DHCP on page 36](#)
- [DHCP Relay Servers and DHCP Servers on page 37](#)
- [Legacy DHCP and Extended DHCP for Server Versions on page 37](#)
- [Configuring DHCP on a Switch on page 38](#)
- [How DHCP Works on page 38](#)

DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See [Figure 5 on page 36](#).

Figure 5: DHCP Client/Server Model

Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually

create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, the new software is downloaded and installed. See [“Upgrading Software Using Automatic Software Download” on page 127](#).

DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server. For directions on configuring a DHCP relay server, see *DHCP/BOOTP Relay for Switches Overview*.

Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series switches and on the QFX Series. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch. See *EX Series Switch Software Features Overview* for a list of switches that support the extended DHCP server.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients. For details, see *High Availability Features for EX Series Switches Overview*.
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see *Understanding Virtual Routing Instances on EX Series Switches*.

NOTE: Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See *EX Series Switch Software Features Overview* for a list of switches that support extended DHCP (VR-aware DHCP).

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in [Table 33 on page 38](#):

Table 33: Legacy DHCP and Extended DHCP Server Hierarchy Levels

DHCP Service	Hierarchy
Extended DHCP server	<code>edit system services dhcp-local-server</code>
Extended DHCP address pool	<code>edit access address-assignment pool</code>
Legacy DHCP server	<code>edit system services dhcp</code>
Legacy DHCP relay	<code>edit forwarding-options helpers bootp</code>
Extended DHCP relay	<code>edit forwarding-options dhcp-relay</code>
Legacy DHCP address pool	<code>edit system services dhcp pool</code>

DHCP clients on a switch are always configured at the hierarchy level `[edit interfaces interface-name family dhcp]`.

Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

For directions for configuring either a legacy DHCP server or an extended DHCP server, see “[Configuring a DHCP Server on Switches \(CLI Procedure\)](#)” on page 133.

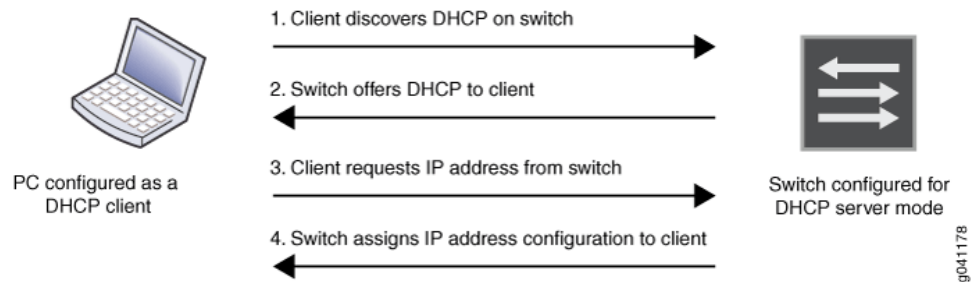

To configure a DHCP client, set the client’s DHCP interface address in the `[edit interfaces interface-name unit 0 family inet dhcp]` hierarchy. For directions for configuring a DHCP client on a switch, see “[Configuring a DHCP Client \(CLI Procedure\)](#)” on page 132.

How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message

from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See [Figure 6 on page 39](#).

Figure 6: DHCP Four-Step Transfer

NOTE: Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

Understanding In-Service Software Upgrade (ISSU)

An in-service software upgrade (ISSU) enables you to upgrade between two different Junos OS releases with minimal disruption on the control plane and with minimal disruption of traffic. During an ISSU, the Junos OS runs in two separate virtual machines (VMs)—one VM is in the master role acting as the master Routing Engine, and the other VM is in the backup role acting as the backup Routing Engine. The Junos OS is upgraded on the backup VM. After a successful software upgrade, the backup VM then becomes the master VM, and the original master VM is no longer needed and is shut down.

NOTE: ISSU is supported in Junos OS Release 13.2X51-D15 and later.

ISSU provides the following benefits:

- Eliminates network downtime during software image upgrades
- Reduces operating costs, while delivering higher service levels
- Allows fast implementation of new features
- [In-Service Software Upgrade Process on page 40](#)

In-Service Software Upgrade Process

When you request an ISSU on a standalone QFX5100 switch:

1. The management process (mgd) verifies that non-stop routing (NSR), graceful Routing Engine switchover (GRES), and non-stop bridging (NSB) are enabled.
2. The switch downloads and validates the software package.
3. The ISSU state machine spawns the backup Routing Engine (RE) with the newer software.
4. The ISSU state machine checks to see if the backup RE has synchronized all of the data with the master RE.
5. The ISSU state machine moves the devices (for example, forwarding ASIC, FPGA, management port and serial console) from the master RE to the backup RE.
6. The mastership is switched between the REs, so the backup RE becomes the master RE.
7. The old master RE is shut down.

Understanding Nonstop Software Upgrade on QFX Series Switches

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member switches in a QFX Series Virtual Chassis with minimal network traffic disruption during the upgrade.

NSSU is supported on both QFX3500 and QFX3600 Virtual Chassis platforms.

Performing an NSSU provides these benefits:

- No disruption to the control plane—NSSU uses graceful Routing Engine switchover (GRES) to ensure no disruption to the control plane. During the upgrade process, interface, kernel, and routing protocol information is preserved.
- Minimal disruption to network traffic—An NSSU minimizes network traffic disruption by:
 - Upgrading line cards one at a time permits traffic to continue to flow through the line cards that are not being upgraded.
 - Upgrading member switches one at a time enables the master and backup to maintain their master and backup roles (although mastership will change) without disruption to traffic.

To achieve minimal disruption to traffic, you must configure link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards or Virtual Chassis members. When one member link of a LAG is down, the remaining links are up, and traffic continues to flow through the LAG.

NOTE: Because NSSU upgrades the software on each line card or on each Virtual Chassis member one at a time, an upgrade using NSSU can take longer than an upgrade using the `request system software add` command.

This topic covers:

- [Requirements for Performing an NSSU on page 41](#)
- [How an NSSU Works on page 42](#)
- [NSSU Limitations on page 43](#)
- [NSSU and Junos OS Release Support on page 43](#)
- [Overview of NSSU Configuration and Operation on page 43](#)

Requirements for Performing an NSSU

The following requirements apply to Virtual Chassis:

- All Virtual Chassis members and all Routing Engines must be running the same Junos OS release.
- Graceful Routing Engine switchover (GRES) must be enabled.

- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis members or on different line cards.

The following are requirements for Virtual Chassis members:

- The Virtual Chassis members must be connected in a ring topology so that no member is isolated as a result of another member being rebooted. This topology prevents the Virtual Chassis from splitting during an NSSU.
- The Virtual Chassis master and backup must be adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
- The Virtual Chassis must be preprovisioned so that the linecard role has been explicitly assigned to member switches acting in a linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), and the remaining switches must maintain their linecard roles.
- A two-member Virtual Chassis must have **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.

How an NSSU Works

This section describes what happens when you request an NSSU on these switches and Virtual Chassis:

- [QFX3500 and QFX3600 Virtual Chassis on page 42](#)

QFX3500 and QFX3600 Virtual Chassis

When you request an NSSU on an a QFX3500 or QFX3600 Virtual Chassis:

1. The Virtual Chassis master verifies that:
 - The backup is online and running the same software version.
 - Graceful Routing Engine switchover (GRES) is enabled.
 - The Virtual Chassis has a preprovisioned configuration.
2. The master installs the new software image on the backup and reboots it.
3. The master resynchronizes the backup.
4. The master installs the new software image on member switches that are in the linecard role and reboots them, one at a time. The master waits for each member to become online and active before starting the software upgrade on the next member.
5. When all members that are in the linecard role have been upgraded, the master performs a graceful Routing Engine switchover, and the upgraded backup becomes the master.
6. The software on the original master is upgraded and the original master is automatically rebooted. After the original master has rejoined the Virtual Chassis, you can optionally return control to it by requesting a graceful Routing Engine switchover.

NSSU Limitations

You cannot use an NSSU to downgrade the software—that is, to install an earlier version of the software than is currently running on the switch. To install an earlier software version, use the **request system software add** command.

You cannot roll back to the previous software version after you perform an upgrade using NSSU. If you need to rollback to the previous software version, you can do so by rebooting from the alternate root partition if you have not already copied the new software version into the alternate root partition.

NSSU and Junos OS Release Support

A Virtual Chassis must be running a Junos OS release that supports NSSU before you can perform an NSSU. If a Virtual Chassis is running a software version that does not support NSSU, use the **request system software add** command.

[Table 34 on page 43](#) lists the QFX Series switches and Virtual Chassis that support NSSU and the Junos OS release at which they began supporting it.

Table 34: Platform and Release Support for NSSU

Platform	Junos OS Release
QFX3500 Virtual Chassis	13.2X50-D15 or later
QFX3600 Virtual Chassis	13.2X50-D15 or later

Overview of NSSU Configuration and Operation

You must ensure that the configuration of the switch or Virtual Chassis meets the requirements described in [“Requirements for Performing an NSSU” on page 41](#). NSSU requires no additional configuration.

You perform an NSSU by executing the **request system software nonstop-upgrade** command. For detailed instructions on how to perform an NSSU, see the topics in Related Documentation.

Understanding Software Infrastructure and Processes

The QFX Series products run the Juniper Networks Junos OS. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 44](#)
- [Junos OS Processes on page 44](#)

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
 - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
 - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
 - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

[Table 35 on page 45](#) describes the primary Junos OS processes.

Table 35: Junos OS Processes

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>

Table 35: Junos OS Processes (*continued*)

Process	Name	Description
Multicast snooping process	multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

Understanding System Snapshot on QFX Series Switches

NOTE: On QFX3500 and QFX3600 switches running Enhanced Layer 2 Software, all of the directories that reside in the “/” partition are read only.

You can create copies of the software running on a QFX Series switch using the system snapshot feature. The system snapshot feature takes a “snapshot” of the files currently used to run the switch—the complete contents of the **/config** and **/var** directories, which include the running Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use this snapshot to boot the switch at the next boot up or as a backup boot option.

You can only use snapshots to move files to external memory if the switch was booted from internal memory, or to move files to internal memory if the switch was booted from external memory. You cannot create a snapshot in the memory source that booted the switch even if the snapshot is being created on a different partition in the same memory source.

Snapshots are particularly useful for moving files onto USB flash drives. You cannot use the **copy** command or any other file-moving technique to move files from an internal memory source to USB memory on the switch.

System snapshots on the QFX Series switch have the following limitations:

- You cannot use snapshots to move files to any destination outside of the switch other than an installed external USB flash drive.
- Snapshot commands are always executed on a local switch.

Understanding Zero Touch Provisioning

- [Understanding Zero Touch Provisioning on page 47](#)
- [Zero Touch Provisioning Process on page 49](#)
- [Zero Touch Provisioning Restart Process Triggers on page 52](#)

Understanding Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning, in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning.

Zero Touch Provisioning allows you to provision new Juniper Networks switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default factory configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If the DHCP server does not respond or provide the software image and configuration files, the switch boots with the preinstalled software and default factory configuration. On switches running Enhanced Layer 2 Software, Junos Extended Dynamic Host Configuration Protocol (JDHCP) is used instead of legacy DHCP. JDHCP supports the same functionality as DHCP, and all configuration options remain the same. JDHCP is an enhanced version of legacy DHCP software.

NOTE: For detailed information regarding the DHCP and DHCP options, refer to RFC2131 (<http://www.ietf.org/rfc/rfc2131.txt>) and RFC2132 (www.ietf.org/rfc/rfc2132.txt). Also, this document refers to Internet Systems Consortium (ISC) DHCP version 4.2. For more information regarding this version, refer to <http://www.isc.org/software/dhcp/documentation>.

The Zero Touch Provisioning process will either upgrade or downgrade the Junos OS version. During a downgrade:

- On an EX Series switch, If you downgrade to a software version earlier than Junos OS Release 12.2, in which Zero Touch Provisioning is not supported, the configuration file autoinstall phase of the Zero Touch Provisioning process does not happen.
- On an EX Series switch, to downgrade to a software version that does not support resilient dual-root partitions (Junos OS Release 10.4R2 or earlier), you must perform some manual work on the switch. For more information, see *Understanding Resilient Dual-Root Partitions on Switches*.

.....

NOTE: On QFX3500 and QFX3600 switches running the original CLI, you cannot use ZTP to upgrade from Junos OS Release 12.2 and later to Junos OS Release 13.2X51-D15.

.....

Zero Touch Provisioning Process

When you boot a switch with the default factory configuration, the following process happens:

1. If DHCP option 43, suboption 00 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

2. If DHCP option 43, suboption 02 (a symbolic link to the software image file on the FTP, HTTP, or TFTP server), the switch compares the version of the provided software image to the version of the software installed on the switch.
 - If the Junos OS versions are different, the switch downloads the software image from the FTP, HTTP, or TFTP server, installs the Junos OS, and reboots using the default factory configuration.
 - If the software versions are the same, the switch does not upgrade the software.
3. If DHCP option 43, suboption 01 (the name of the configuration file on the FTP, TFTP, or HTTP server) is configured:

If DHCP option 43 suboption 01 is not specified, the switch uses the default factory configuration.

If both DHCP option 43 suboption 01 and suboption 2 are specified, suboption 01 is processed before suboption 02. The Junos OS is upgraded, and then the configuration file is applied.

4. If DHCP option 43, suboption 03 (the transfer mode setting) is configured, the switch accesses the FTP, HTTP, or TFTP server using the specified transfer mode setting—for example, FTP.

If DHCP option 43, suboption 03, is not configured, TFTP becomes the transfer mode automatically.

5. If DHCP option 43, suboption 04 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

NOTE: DHCP option 43 suboptions 05 through 255 are reserved.

6. If DHCP option 150 or option 66 is specified, the IP address of the FTP, HTTP, or TFTP server is configured.

.....

NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

.....

7. (Optional) If DHCP option 7 is specified, you can configure one or more system log (syslog) servers.

8. (Optional) If DHCP option 42 is specified, you can configure one or more NTP servers.
9. (Optional) If DHCP option 12 is specified, you can configure the hostname of the switch.

Zero Touch Provisioning Restart Process Triggers

ZTP restarts when any of the following events occur:

- Request for configuration file or image file fails.
- Configuration file is incorrect, and commit fails.
- No configuration file and no image file is available.
- Image file is corrupted, and installation fails.
- No file server information is available.
- DHCP client does not have valid ZTP parameters configured.
- When none of the DHCP client interfaces goes to a bound state.
- ZTP transaction fails after six attempts to fetch configuration file or image file.

When any of these events occur, ZTP resets the DHCP client state machine on all of the DHCP client-configured interfaces (management and network) and then restarts the state machine. Restarting the state machine enables the DHCP client to get the latest DHCP server-configured parameters.

Before ZTP restarts, approximately 15 to 30 seconds must elapse to allow enough time to build a list of bound and unbound DHCP client interfaces.

The list of bound and unbound DHCP client interfaces can contain:

- No entries.
- Multiple DHCP client interfaces.

Priority is given to the DHCP client interfaces that have received all ZTP parameters (software image file, configuration file, and file server information) from the DHCP server.

After the lists of bound and unbound client interfaces are created, and a DHCP client gets selected for ZTP activity, then any existing default route is deleted, and the DHCP client interface that was selected adds a new default route. In order to add a new default route, only one ZTP instance can be active.

After ZTP restarts, the DHCP client attempts fetching files from the DHCP server for up to six times, with ten to fifteen seconds elapsing between attempts. Every attempt, whether successful or not, is logged and can be seen on the console.

If there is a failure, or the number of attempts exceeds the limit, ZTP stops. ZTP then clears the DHCP client bindings and restarts state machine on the DHCP-configured interfaces.

The ZTP restart process continues until there is either a successful software upgrade, or an operator manually commits a user configuration and deletes the ZTP configuration.

CLI User Interface Overview

- [CLI Overview on page 54](#)
- [CLI Key Features on page 54](#)
- [CLI Command Modes on page 55](#)

CLI Overview

The command-line interface (CLI) is the software interface you use to access, monitor, configure, troubleshoot, and manage a device running Junos OS. You can access the CLI either from the console or through a network connection. The CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel.

The CLI provides a variety of UNIX utilities, such as Emacs-style keyboard sequences, which allows you to perform the following actions:

- Move around on a command line and scroll through recently executed commands.
- Match regular expressions to locate and replace values and identifiers in a configuration.
- Filter command output.
- Log file entries.
- Store and archive device files on a UNIX-based file system.

You can exit the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage processes, and perform other tasks.

CLI Key Features

The CLI commands and statements follow a hierarchical organization and have consistent syntax. The CLI provides the following features for ease of use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating.

For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.

- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with the Junos OS, you can use many of the CLI commands without referring to the documentation.
- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press Tab or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

CLI Command Modes

The CLI has two modes, operational mode and configuration mode.

- Operational mode—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot Junos OS and devices and network connectivity. Operational mode is indicated by the > prompt—for example, **user@switch> clear**
- Configuration mode—A Junos OS device configuration is stored as a hierarchy of statements. In configuration mode, you can define all properties of the Juniper Networks Junos OS, including interfaces, VLANs, Virtual Chassis information, user access, and several system hardware properties. To enter configuration mode, enter the **configure** command. Configuration mode is indicated by the # prompt and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]  
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you

must issue another **commit** command within the defined period of time (10 minutes by default), or the system reverts to the previous configuration.

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (>) and the configuration mode prompt is a pound sign (#).

When you log in to the switch and type the **cli** command, you are automatically in operational mode. To switch to configuration mode, type the **configure** command or the **edit** command.

The CLI prompt changes from **user@switch>** to **user@switch#**, and a banner appears to indicate the hierarchy level.

To return to operational mode as well as commit your changes, enter **command and-quit**. To return to operational mode without committing any of your changes, enter **exit**.

To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command.

- [Overview of Navigating the CLI on page 75](#)
- *CLI User Guide*
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 313](#)

Configuring CLI Tips

The Junos OS CLI provides the option of configuring CLI tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

- Related Documentation**

 - [Defining Junos OS Login Classes](#)
 - [login-tip on page 255](#)

Format for Specifying Filenames and URLs in Junos OS CLI Commands

In some command-line interface (CLI) commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication load-key-file**, and **request system software add**—you can include a filename. On a routing matrix, you can include chassis information (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**) as part of the filename.

A *routing matrix* is a multichassis architecture composed of either one TX Matrix router and from one to four T640 routers connected to the TX Matrix router, or one TX Matrix Plus router and from one to four T1600 routers connected to the TX Matrix Plus router. From the perspective of the user interface, the routing matrix appears as a single router. On a routing matrix composed of the TX Matrix router and T640 routers, the TX Matrix router controls all the T640 routers. On a routing matrix composed of a TX Matrix Plus router and T1600 routers, the TX Matrix Plus router controls all the T1600 routers.

You can specify a filename or URL in one of the following ways:

- **filename**—File in the user's current directory on the local CompactFlash card (not applicable on the QFX Series). You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in Hypertext Transfer Protocol (HTTP) or FTP.

NOTE: Wildcards are supported only by the **file (compare | copy | delete | list | rename | show)** commands. When you issue the **file show** command with a wildcard, it must resolve to one filename.

- **path/filename**—File on the local flash disk.
- **/var/filename** or **/var/path/filename**—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> file delete lcc0-re0:/var/tmp/junk
```
- **a:filename** or **a:path/filename**—File on the local removable media. The default path is **/** (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- **hostname:/path/filename**, **hostname:filename**, **hostname:path/filename**, or **"scp://hostname/path/filename"**—File on an **scp/ssh** client. This form is not available in the worldwide version of the Junos OS. The default path is the user's home directory on the remote system. You can also specify **hostname** as **username@hostname**.

- **ftp://hostname/path/filename**—File on an FTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. The default path is the user's home directory. To specify an absolute path, the path must start with **%2F**; for example, **ftp://hostname/%2Fpath/filename**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net/filename
file copy ftp.hostname.net: Not logged in.
```

```
user@host> file copy ftp://username:prompt@ftp.hostname.net/filename
Password for username@ftp.hostname.net:
```

- **re0:/path/filename** or **re1:/path/filename**—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> show log lcc0-re1:chassisd
```

NOTE: You cannot specify a URL for a file on a Hypertext Transfer Protocol (HTTP) server, because HTTP URLs are not writable.

Understanding Enhanced Layer 2 Software Support

Enhanced Layer 2 software (ELS) is automatically supported if your device is running a Junos OS release that supports it. You do not need to take any action to enable ELS, and you cannot disable ELS.

ELS is available on the following EX Series switches and QFX Series devices.

Table 36: ELS Support

Device	Initial ELS Release
EX4300 switches	13.2X50-D10
EX9200 switches	12.3R2
QFX3500 switches	13.2X50-D15
QFX3600 switches	13.2X50-D15
QFX5100 switches	13.2X51-D10

ELS is supported on the EX4300 and EX9200 switches for all Junos OS releases, starting with the initial releases shown in [Table 36 on page 59](#).

ELS support was introduced on QFX3500 and QFX3600 switches in Junos OS Release 13.2X50-D15. ELS is only supported on the software package that supports Virtual Chassis (the **jinstall-qfx-3-*** software package) for QFX3500 and QFX3600 switches.

For QFX5100 switches, ELS support was introduced in Junos OS Release 13.2X51-D10 and is supported on the **jinstall-qfx-5-*** software package.

NOTE: ELS is not supported on software packages that can be installed in a QFabric system.

Using the ELS Translator Tool

The ELS Translator is a web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations. This conversion tool supports all Juniper Networks EX Series, MX Series, and QFX Series platforms with ELS installed. The ELS Translator is hosted on Juniper Networks Customer Support website for EX Series switches, MX Series Universal Edge routers, and QFX Series switches and is available to registered users, internal users, partners, and premium service contract customers. You need to login using your Juniper Networks user name and password to access the ELS Translator tool.

[Click](#) to access the ELS translator tool.

If you are upgrading from a version of Junos OS that does not support ELS to a version of Junos OS that supports ELS, we recommend updating your configuration with the ELS Translator Tool using the following procedure:

1. Log onto your device using the console port.

NOTE: Only perform this procedure from the console port. You will lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Copy your entire existing configuration into another file. Save the file to a remote location. See [“Saving a Configuration to a File” on page 1141](#).
3. Retain the portion of your existing configuration related to management network connectivity (such as `[edit system]`). Delete all other top-level configuration hierarchy levels (such as `[edit interfaces]`, `[edit protocols]`, and `[edit vlans]`). Issue a **commit** operation to remove the deleted configuration hierarchy levels.
4. Perform the software upgrade. Reboot your device to complete the upgrade. See [“Software Installation Overview” on page 109](#)

NOTE: Maintain your console port connection during the reboot.

5. [Click](#) to access the ELS translator tool in a web browser. Follow the instructions on the page to update your configuration.
6. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator Tool onto your switch. See [“Uploading a Configuration File” on page 1145](#).
7. Commit the new configuration.

NOTE: It is possible a script might not translate correctly, so review translated scripts carefully before loading the converted configuration on your switch or other device.

Configuring a VLAN

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series and QFX Series switches can function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting the unique VLAN name and configuring the VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id-number
```

2. Assign at least one interface to the VLAN:

```
[edit]
user@host# set interface interface-name family ethernet-switching vlan members vlan-name
```

Configuring the Native VLAN Identifier

EX Series and QFX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to trunk, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.

```
[edit interfaces]
user@host# set interface interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@host# set interface interface-name native-vlan-id number
```

3. Assign the interface to the native VLAN ID:

```
[edit interfaces]
user@host# set interface interface-name unit logical-unit-number family ethernet-switching vlan
members native-vlan-id-number
```

Configuring Layer 2 Interfaces

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch's network interfaces.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for access interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode access
```

Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when configuring the protocol family. For the inet or inet6 family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRBs allow the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named *irb* functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```

3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces aex
```

3. Specify the minimum number of links for the aggregated Ethernet interface (*aex*), that is, the defined bundle, to be labeled “up”:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp periodic interval
```

Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

Table 37: Enhanced Layer 2 CLI Changes

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options { analyzer { name { ... } } } </pre>	<pre> forwarding-options { analyzer { name { ... } } } </pre>	Statements moved to different hierarchy.
<pre> ethernet-switching-options { authentication-whitelist { ... } } </pre>	<pre> switch-options { ... authentication-whitelist { ... } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options { bpdu-block { ... } } </pre>	<pre> protocols { layer2-control { bpdu-block { ... } } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options { dot1q-tunneling { ether-type (0x8100 0x88a8 0x9100); ... } } </pre>	<pre> interfaces interface-name { ether-options { ethernet-switch-profile { tag-protocol-id [tpids]; } } } interfaces interface-name { aggregated-ether-options { ethernet-switch-profile { tag-protocol-id [tpids]; } } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options { interfaces interface-name { no-mac-learning; ... } } </pre>	<pre> switch-options { interfaces interface-name { no-mac-learning; ... } } </pre>	Hierarchy renamed.

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options { mac-notification { notification-interval seconds; } ... } </pre>	—	Statements deleted.
<pre> ethernet-switching-options { mac-table-aging-time seconds; ... } </pre>	<pre> protocols { l2-learning { global-mac-table-aging-time seconds; ... } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options { nonstop-bridging; } </pre>	<pre> protocols { layer2-control { nonstop-bridging { } } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options { port-error-disable { disable-timeout timeout; } ... } </pre>	<pre> interfaces interface-name family ethernet-switching { recovery-timeout seconds; } </pre>	Statement replaced with a new statement.
<pre> ethernet-switching-options { redundant-trunk-group { group name { description; interface interface-name { primary; } preempt-cutover-timer seconds; } ... } } </pre>	<pre> switch-options { redundant-trunk-group { group name { description; interface interface-name { primary; } preempt-cutover-timer seconds; } ... } } </pre>	Hierarchy renamed.

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options { secure-access-port { interface (all interface-name) { (dhcp-trusted no-dhcp-trusted); static-ip ip-address { mac mac-address; vlan vlan-name; } } } vlan (all vlan-name) { (arp-inspection no-arp-inspection); dhcp-option82 { disable; circuit-id { prefix hostname; use-interface-description; use-vlan-id; } remote-id { prefix (hostname mac none); use-interface-description; use-string string; } vendor-id [string]; } (examine-dhcp no-examine-dhcp); } (ip-source-guard no-ip-source-guard); } </pre>	<pre> vlans vlan-name forwarding-options{ dhcp-security { arp-inspection; group group-name { interface interface-name { static-ip ip-address { mac mac-address; } } } overrides { no-option-82; trusted; } } ip-source-guard; no-dhcp-snooping; option-82 { circuit-id { prefix { host-name; routing-instance-name; } use-interface-description (device logical); use-vlan-id; } remote-id { host-name; use-interface-description (device logical); use-string string; } vendor-id { use-string string; } } } </pre>	<p>Statements moved to different hierarchy.</p> <p>NOTE: The statement examine-dhcp does not exist in the changed hierarchy. Instead, DHCP snooping is enabled automatically when other DHCP security features are enabled on a VLAN. See <i>Configuring Port Security (CLI Procedure)</i> for additional information.</p>
<pre> ethernet-switching-options { secure-access-port { dhcp-snooping-file { location local_pathname remote_URL; timeout seconds; write-interval seconds; } } } </pre>	<pre> system [processes [dhcp-service dhcp-snooping-file local_pathname remote_URL; write-interval interval;]] </pre>	<p>Statement moved to different hierarchy.</p>
<pre> ethernet-switching-options { secure-access-port vlan (all vlan-name { mac-move-limit } } </pre>	<pre> vlans vlan-name switch-options { mac-move-limit } </pre>	<p>Statement moved to different hierarchy.</p>

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options { static { vlan <i>vlan-id</i> { mac <i>mac-address</i> next-hop interface-name; } } } </pre>	<pre> vlangs { <i>vlan-name</i> { switch-options { interface <i>interface-name</i> { static-mac <i>mac-address</i>; } } } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options { storm-control { (...) } } </pre>	<pre> forwarding-options { storm-control-profiles <i>profile-name</i> { (...) } } interfaces <i>interface-name</i> unit <i>number</i> family ethernet-switching { storm-control <i>storm-control-profile</i>; } </pre>	Storm control configuration is done in two steps. The first step is to create a storm control profile at the [edit forwarding-options] hierarchy, and the second step is to bind the profile to a logical interface at the [edit interfaces] hierarchy. See <i>Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches</i> for additional information.
<pre> ethernet-switching-options { traceoptions { file <i>filename</i> <files <i>number</i>> <no-stamp> <replace> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <disable>; } } </pre>	—	Statements removed.
<pre> ethernet-switching-options { unknown-unicast-forwarding { (...) } } </pre>	<pre> switch-options { unknown-unicast-forwarding { (...) } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options { voip { interface (all [<i>interface-name</i> access-ports]) { forwarding-class (assured-forwarding best-effort expedited-forwarding network-control); vlan <i>vlan-name</i>; } } } </pre>	<pre> switch-options { voip { interface (all [<i>interface-name</i> access-ports]) { forwarding-class (assured-forwarding best-effort expedited-forwarding network-control); vlan <i>vlan-name</i>; } } } </pre>	Hierarchy renamed.

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> interfaces <i>interface-name</i> { ether-options { link-mode <i>mode</i>; speed (auto-negotiation <i>speed</i>) } } </pre>	<pre> interfaces <i>interface-name</i> { link-mode <i>mode</i>; speed <i>speed</i> } </pre>	Statements moved to different hierarchy.
<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { native-vlan-id <i>vlan-id</i> } } } </pre>	<pre> interfaces <i>interface-name</i> { native-vlan-id <i>vlan-id</i> } </pre>	Statement moved to different hierarchy.
<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { port-mode <i>mode</i> } } } </pre>	<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { interface-mode <i>mode</i> } } } </pre>	Statement replaced with a new statement.
<pre> interfaces vlan </pre>	<pre> interfaces irb </pre>	Statement replaced with a new statement.

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> protocols { igmp-snooping { traceoptions { file filename <files number> <no-stamp> <replace> <size maximum-file-size> <world-readable no-world-readable>; flag flag <flag-modifier> <disable>; } vlan (all vlan-identifier) { disable; data-forwarding { receiver { install; source-vlans vlan-name; } source { groups ip-address; } } immediate-leave; interface (all interface-name) { static { group multicast-ip-address; } proxy { source-address ip-address; } } robust-count number; } } } </pre>	<pre> protocols { igmp-snooping { vlan vlan-name { immediate-leave; interface interface-name { group-limit <1..65535> host-only-interface multicast-router-interface; immediate-leave; static { group multicast-ip-address { source <> } } } } l2-querier { source-address ip-address; } proxy { source-address ip-address; } query-interval number; query-last-member-interval number; query-response-interval number; robust-count number; traceoptions { file filename <files number> <no-stamp> <replace> <size maximum-file-size> <world-readable no-world-readable>; flag flag <flag-modifier>; } } } </pre>	IGMP snooping is configured on a VLAN.
<pre> vlans { vlan-name { dot1q-tunneling { customer-vlans (id native range); layer2-protocol-tunneling all protocol-name { drop-threshold number; shutdown-threshold number; ... } } } } </pre>	<pre> interface interface-name { encapsulation extended-vlan-bridge; flexible-vlan-tagging; native-vlan-id number; unit logical-unit-number { input-vlan-map action; output-vlan-map action; vlan-id number; vlan-id-list [vlan-id vlan-id-vlan-id]; } } </pre>	Statements replaced with new statements and moved to different hierarchy

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> vlands { vlan-name { filter{ input filter-name output filter-name; ... } } } </pre>	<pre> vlands { vlan-name { forwarding-options { filter{ input filter-name output filter-name; ... } } } } </pre>	Statements moved to different hierarchy.
<pre> vlands { vlan-name { interface interface-name { egress; ingress; mapping (native (push swap) policy tag (push swap)); pvlan-trunk; ... } } } </pre>	—	Statements removed. You can assign interfaces to a VLAN using the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching vlan members <i>vlan-name</i>] hierarchy.
<pre> vlands { vlan-name { isolation-id id-number; ... } } </pre>	—	Statement removed.
<pre> vlands { vlan-name { l3-interface vlan.logical-interface-number; ... } } </pre>	<pre> vlands { vlan-name { l3-interface irb.logical-interface-number; ... } } </pre>	Syntax changed.
<pre> vlands { vlan-name { l3-interface-ingress-counting layer-3-interface-name; ... } } </pre>	—	Statement removed. Ingress traffic is automatically tracked.

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> vlangs { vlan-name { mac-limit limit action action; ... } } </pre>	<pre> vlangs { vlan-name { switch-options { interface-mac-limit limit { packet-action action; ... } } } } vlangs { vlan-name { switch-options { interface interface-name { interface-mac-limit limit { packet-action action; ... } } } } } </pre>	Statements moved to different hierarchies and renamed.
<pre> vlangs { vlan-name { mac-table-aging-time seconds; ... } } </pre>	<pre> protocols { l2-learning { global-mac-table-aging-time seconds; ... } } </pre>	Statement moved to different hierarchy and renamed.
<pre> vlangs { vlan-name { no-local-switching; ... } } </pre>	—	Statement removed.
<pre> vlangs { vlan-name { no-mac-learning; ... } } </pre>	<pre> vlangs { vlan-name { switch-options { no-mac-learning limit ... } } } </pre>	Statement moved to different hierarchy.
<pre> vlangs { vlan-name { primary-vlan vlan-name; ... } } </pre>	—	Statement removed.

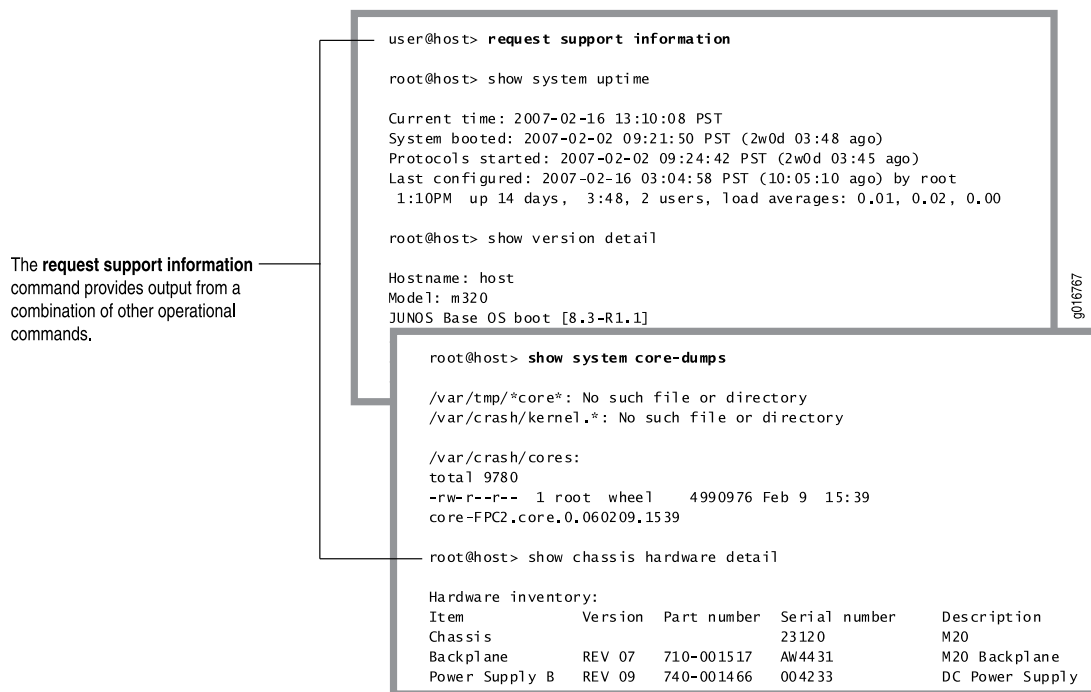

Table 37: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre>vlan { vlan-name { vlan-prune; ... } }</pre>	—	Statement removed.
<pre>vlan { vlan-name { vlan-range vlan-id-low-vlan-id-high; ... } }</pre>	<pre>vlan { vlan-name { vlan-id-list [vlan-id-numbers]; ... } }</pre>	Statement replaced with new statement.

Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in [Figure 7 on page 72](#).

Figure 7: Commands That Combine Other Commands

Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 73](#)
- [Commonly Used Operational Mode Commands on page 74](#)

CLI Command Categories

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.
 - **clear**—Clear statistics and protocol database information.
 - **mtrace**—Trace mtrace packets from source to receiver.
 - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
 - **ping**—Determine the reachability of a remote network host.
 - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
 - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
 - **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the [CLI Explorer](#).
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the [CLI Explorer](#).
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the [CLI Explorer](#).
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the [CLI Explorer](#).

- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the [CLI Explorer](#).
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see “[Understanding Junos OS CLI Configuration Mode](#)” on page 78.
- A command—**quit**—to exit the CLI. For information about this command, see the [CLI Explorer](#).
- For more information about the CLI operational mode commands, see the [CLI Explorer](#) and the [CLI Explorer](#).

Commonly Used Operational Mode Commands

Table 38 on page 74 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

Table 38: Commonly Used Operational Mode Commands

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	show version
Log files	Contents of the log files	monitor
	Log files and their contents and recent user logins	show log
Remote systems	Host reachability and network connectivity	ping
	Route to a network system	traceroute
Configuration	Current system configuration	show configuration
Manipulate files	List of files and directories on the router or switch	file list
	Contents of a file	file show
Interface information	Detailed information about interfaces	show interfaces

Table 38: Commonly Used Operational Mode Commands (*continued*)

Items to Check	Description	Command
Chassis	Chassis alarm status	show chassis alarms
	Information currently on craft display	show chassis craft-interface
	Router or switch environment information	show chassis environment
	Hardware inventory	show chassis hardware
Routing table information	Information about entries in the routing tables	show route
Forwarding table information	Information about data in the kernel's forwarding table	show route forwarding-table
IS-IS	Adjacent routers or switches	show isis adjacency
OSPF	Display standard information about OSPF neighbors	show ospf neighbor
BGP	Display information about BGP neighbors	show bgp neighbor
MPLS	Status of interfaces on which MPLS is running	show mpls interface
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	show mpls lsp
	Routes that form a label-switched path	show route label-switched-path
RSVP	Status of interfaces on which RSVP is running	show rsvp interface
	Currently active RSVP sessions	show rsvp session
	RSVP packet and error counters	show rsvp statistics

Overview of Navigating the CLI

This topic describes how to navigate the CLI.

- [CLI Command Hierarchy on page 76](#)
- [CLI Configuration Statements on page 76](#)
- [Moving Among Hierarchy Levels on page 76](#)

CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command. [Figure 8 on page 76](#) illustrates a portion of the **show** command hierarchy.

Figure 8: CLI Command Hierarchy

To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of your Ethernet switching options for your interfaces, use the command **show ethernet-switching-options interfaces**.

CLI Configuration Statements

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

Moving Among Hierarchy Levels

You can use the CLI commands to navigate the levels of the configuration statement hierarchy:

- **edit**— Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
- **exit**— Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the **edit** command. Alternatively, you can use the **quit** command. The **exit** and **quit** commands are interchangeable.
- **up**— Moves up the hierarchy one level at a time.
- **top**— Moves directly to the top level of the hierarchy.

Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

1. Use the ? prompt to list options available for the command. For example:

```
user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>          Execute this command
brief              Display brief output
descriptions       Display interface description strings
detail             Display detailed output
extensive           Display extensive output
media              Display media information
snmp-index         SNMP index of interface
statistics         Display statistics and detailed output
terse              Display terse output
|                 Pipe through a command
```

2. Choose the option you wish to use with the command. (See [Figure 9 on page 77](#).)

Figure 9: Command Output Options

Figure 9 displays three examples of command output options for the `show interfaces fe-1/1/1` command in Junos OS operational mode.

Command output with the **brief option.**

```
user@host> show interfaces fe-1/1/1 brief
Physical interface: fe-1/1/1, Enabled, Physical link is Down
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
  Disabled, Source filtering: Disabled,
  Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
```

Command output with the **terse option.**

```
user@host> show interfaces fe-1/1/1 terse
Interface      Admin Link Proto  Local      Remote
fe-1/1/1       up    down
```

Command output with the **extensive option.**

```
user@host> show interfaces fe-1/1/1 extensive
Physical interface: fe-1/1/1, Enabled, Physical link is Down
  Interface index: 141, SNMP ifIndex: 33, Generation: 24
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
  Disabled, Source filtering: Disabled,
  Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues     : 4 supported, 4 maximum usable queues
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:90:69:d0:f8:9e, Hardware address: 00:90:69:d0:f8:9e
  Last flapped   : 2007-02-02 09:26:25 PST (2w0d 03:40 ago)
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes : 0          0 bps
    Output bytes : 0          0 bps
    Input packets: 0          0 pps
    Output packets: 0          0 pps
  --- (more) ---
```

Understanding Junos OS CLI Configuration Mode

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*, a router configuration is stored as a hierarchy of statements. In configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- [Configuration Mode Commands on page 79](#)
- [Configuration Statements and Identifiers on page 80](#)
- [Configuration Statement Hierarchy on page 82](#)

Configuration Mode Commands

Table 39 on page 79 summarizes each CLI configuration mode command. The commands are organized alphabetically.

Table 39: Summary of Configuration Mode Commands

Command	Description
activate	Remove the inactive: tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the commit command.
annotate	Add comments to a configuration. You can add comments only at the current hierarchy level.
commit	Commit the set of changes to the database and cause the changes to take operational effect.
copy	Make a copy of an existing statement in the configuration.
deactivate	Add the inactive: tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the commit command.
delete	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
edit	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
exit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The quit and exit commands are synonyms.
extension	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
help	Display help about available configuration statements.
insert	Insert an identifier into an existing hierarchy.
load	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 39: Summary of Configuration Mode Commands (*continued*)

Command	Description
quit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The quit and exit commands are synonyms.
rename	Rename an existing configuration statement or identifier.
replace	Replace identifiers or values in a configuration.
rollback	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the commit configuration command.
run	Run a top-level CLI command without exiting from configuration mode.
save	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
set	Create a statement hierarchy and set identifier values. This is similar to edit except that your current level in the hierarchy does not change.
show	Display the current configuration.
status	Display the users currently editing the configuration.
top	Return to the top level of configuration command mode, which is indicated by the [edit] banner.
up	Move up one level in the statement hierarchy.
update	Update a private database.
wildcard	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 40 on page 81 describes top-level CLI configuration mode statements.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

Table 40: Configuration Mode Top-Level Statements

Statement	Description
access	Configure the Challenge Handshake Authentication Protocol (CHAP). For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
accounting-options	Configure accounting statistics data collection for interfaces and firewall filters. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
chassis	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
class-of-service	Configure class-of-service parameters. For information about the statements in this hierarchy, see the <i>Junos OS Class of Service Library for Routing Devices</i> .
firewall	Define filters that select packets based on their contents. For information about the statements in this hierarchy, see the <i>Routing Policy Feature Guide for Routing Devices</i> .
forwarding-options	Define forwarding options, including traffic sampling options. For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
groups	Configure configuration groups. For information about statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
interfaces	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
policy-options	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. For information about the statements in this hierarchy, see the <i>Routing Policy Feature Guide for Routing Devices</i> .
protocols	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the <i>Junos OS Routing Protocols Library for Routing Devices</i> and the <i>Junos OS MPLS Applications Library for Routing Devices</i> .

Table 40: Configuration Mode Top-Level Statements (*continued*)

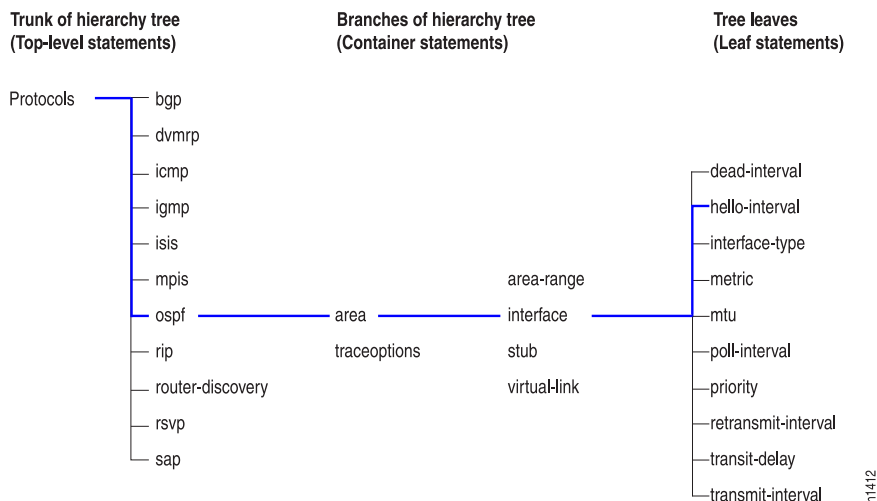

Statement	Description
routing-instances	Configure multiple routing instances. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
routing-options	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
security	Configure IP Security (IPsec) services. For information about the statements in this hierarchy see the <i>Junos OS Administration Library for Routing Devices</i> .
snmp	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
system	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .

For specific information on configuration statements, see the Junos OS configuration guides.

Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see [Figure 10 on page 82](#)). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 10: Configuration Mode Hierarchy of Statements

Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. [Figure 10 on page 82](#) illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in [Figure 10 on page 82](#) as **[edit protocols ospf area area-number interface interface-name]** and displays the configuration as follows:

```
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
      interface so-0/0/1 {
        hello-interval 5;
      }
    }
  }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain “oneliners” at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric 10** is a oneliner because the **level** container statement with identifier **1**, its child statement **metric**, and its corresponding attribute **10** all appear on a single line in the hierarchy:

```
[edit protocols]
isis {
  interface ge-0/0/0.0 {
    level 1 metric 10;
  }
}
```

Likewise, in the following example, **dynamic-profile** *dynamic-profile-name* **aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier *dynamic-profile-name*, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

Software Features That Require Licenses on the QFX Series

The following Junos OS features require an Advanced Feature License (AFL) on QFX Series devices:

NOTE: If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- Multiprotocol Label Switching (MPLS)
- Fibre Channel support

[Table 41 on page 85](#) lists the licenses you can purchase for each QFX Series software feature.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

Table 41: Junos OS Feature Licenses and Model Numbers for QFX Series Devices

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multi-protocol Label Switching (MPLS)	QFX3500, QFX3600, QFX5100-48S, and QFX5100-48T switches.	One per switch	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multi-protocol Label Switching (MPLS)	QFX5100-24Q and QFX5100-96S switches.	One per switch	QFX5100-HDNSE-LIC
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1

Table 41: Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB

Junos OS Feature License Keys

Some Junos OS software features require a license to be activated. To enable each licensed feature, you must purchase, install, manage, and verify a license key that corresponds to the licensed feature.

Release-Tied License Keys and Upgrade Licenses on MX Series Routers

The Junos OS licensing infrastructure currently associates a license feature with attributes such as date, platform, and validity. In addition to these attributes, for MX Series routers

running Junos OS Release 12.2 and later, a licensed feature can be associated with a release number at the time of generating the license key. This type of release-tied license key is used to validate a particular licensed feature while attempting a software upgrade. The upgrade process aborts if the release number in the license key is earlier than the Junos OS release number to which the system is being upgraded.

Additionally, an upgrade license key can be generated for a release-tied licensed feature. An upgrade license key is used for carrying forward a capacity license to the upgrade release. Although an upgrade license might be an acceptable license on the current release, it does not add to the existing capacity limit. The capacity added in the upgrade license key is valid for the upgrade software release only.

The release number embedded in the license key indicates the maximum release number up to which Junos OS can be upgraded.

As an example, assume that your system is running Junos OS Release 12.2 and is using the **scale-subscriber** licensed feature with a later release-tied upgrade license key installed. If you request a software upgrade to the later release of Junos OS, the software upgrade operation fails and the following error message is displayed:

```
mgd: error: No valid upgrade license found for feature 'scale-subscriber'.  
Aborting Software upgrade.  
Validation failed
```

In this example, to successfully upgrade to the later release of Junos OS, the release number included in the upgrade license key should be greater than or equal to the later release number. Also, you can perform software upgrades up to the previous release without any additional license keys to retain the existing scale limit.

NOTE:

When you install a release-tied license, the following apply:

- You can purchase an upgrade capacity license only if a base capacity license for the same scale-tier has already been generated or purchased.
- You cannot install an upgrade license if the capacity does not match any of the existing base capacity licenses on the system.
- The license installation fails when you install a lower release number license key on a higher software release number.
- A release-tied license can be installed on a Junos OS release number that is lower than or equal to the release number included in the license key. For example, a 12.2 license key is valid on Junos OS Release 12.1.
- An upgrade license is valid only on the target release number specified in the license key, but can be installed on an earlier Junos OS release. For example, a 4 K scale-tier upgrade license for Junos OS Release 12.2 can be installed on an earlier release, and the installed count of licenses remains unaltered.
- Release-tied licenses of the previous release are not deleted on upgrading Junos OS to a newer release version.

Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity.

[Table 42 on page 88](#) displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

Table 42: Upgrade Licenses for Enhancing Port Capacity

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 <ul style="list-style-type: none"> • 1/MIC0 	f1—MX5 to MX10 upgrade	Slot 1 and 2 <ul style="list-style-type: none"> • 1/MIC0 • 1/MIC1
MX10	40G	0x555	Slot 1 and 2 <ul style="list-style-type: none"> • 1/MIC0 • 1/MIC1 	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> • 1/MIC1 • First 2 ports on 0/MIC0
MX40	60G	0x554	Slot 1, Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> • 1/MIC0 • 1/MIC1 • First 2 ports on 0/MIC0 	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 <ul style="list-style-type: none"> • 1/MIC1 • All 4 ports on 0/MIC0

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
 - An f1 feature ID on an MX10 upgrade license key rejects the license.
 - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

Generating the License Keys for a Standalone QFX Series Device

When you purchase a Junos OS software feature license for a QFX Series device, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the device's serial number) for the device, and then add the license key on the device.

Before generating the license keys for a device:

- Purchase the required licenses for the device. See "[Software Features That Require Licenses on the QFX Series](#)" on page 85.
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Determine the serial number of the device. For instructions, see *Locating the Serial Number on a QFX3500 Device or Component*.

To generate the license keys for a device:

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

NOTE: To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Device** option button, and click **Continue**.

The Generate Licenses - QFX Series Product Devices page appears.

4. In the **Device Serial Number** field, enter the serial number for the device.
5. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
6. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
7. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

8. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Devices page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

9. Select the file format in which you want to obtain your new license keys.
10. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

**Related
Documentation**

- [Software Features That Require Licenses on the QFX Series on page 85](#)
- [Adding New Licenses \(CLI Procedure\) on page 91](#)

- *Locating the Serial Number on a QFX3500 Device or Component*

Adding New Licenses (CLI Procedure)

Before adding new licenses, complete the following tasks:

- Purchase the required licenses.
- Establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your device.

NOTE: On QFabric systems, install your licenses in the default partition of the QFabric system and not on the individual components (Node devices and Interconnect devices).

To add a new license key to the device using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To add a license key from a file or URL, enter the following command, specifying the filename or the URL where the key is located:

```
user@host> request system license add filename | url
```

- To add a license key from the terminal, enter the following command:

```
user@host> request system license add terminal
```

2. When prompted, enter the license key, separating multiple license keys with a blank line.

If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit license entry mode.

3. Go on to [“Verifying Junos OS License Installation” on page 94](#).

On routers that have Graceful Routing Engine switchover (GRES) enabled, after successfully adding the new license on the master Routing Engine, the license keys are automatically synchronized on the backup Routing Engine as well. However, in case GRES is not enabled, the new license is added on each Routing Engine separately. This ensures that the license key is enabled on the backup Routing Engine during changeover of mastership between the Routing Engines.

To add a new license key to a router with dual Routing Engines without GRES:

1. After adding the new license key on the master Routing Engine, use the **request chassis routing-engine master switch** command to have the backup Routing Engine become the master Routing Engine.
2. Log in to the active Routing Engine and add the new license key, repeating the same process.

NOTE: Adding a license key to the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-adding operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

Deleting a License (CLI Procedure)

Before deleting a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

You have the options to delete a single license, delete all licenses, or delete a list of licenses enclosed in brackets.

1. Display the licenses available to be deleted.

```
user@host> request system license delete license-identifier-list ?
```

```
Possible completions:
```

E00468XXX4	License key identifier
JUNOS10XXX1	License key identifier
JUNOS10XXX2	License key identifier
JUNOS10XXX3	License key identifier
JUNOS10XXX4	License key identifier
[Open a set of values

2. To delete a license key or keys from a device using the CLI operational mode, select one of the following methods:

- Delete a single license by specifying the license ID. Using this option, you can delete only one license at a time.

```
user@host> request system license delete license-identifier
```

- Delete all license keys from the current device.

```
user@host> request system license delete all
```

- Delete multiple license keys from the current device. Specify the license identifier for each key and enclose the list of identifiers in brackets.

```
user@host> request system license delete license-identifier-list [JUNOS10XXX1  
JUNOS10XXX3 JUNOS10XXX4 ...]
```

```
Delete license(s) ?
```

```
[yes,no] (no) yes
```

3. Go on to [“Verifying Junos OS License Installation” on page 94.](#)

NOTE: Deleting a license key from the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-deleting operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

Saving License Keys

Before saving a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To save the licenses installed on a device to a file using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To save the installed license keys to a file or URL, enter the following command:

```
user@host> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named **license.config**:

- To save a license key from the terminal, enter the following command:

```
user@host> request system license save ftp://user@host/license.config
```

2. Go on to [“Verifying Junos OS License Installation” on page 94.](#)

Related Documentation

- [Adding New Licenses \(CLI Procedure\) on page 91](#)
- [Deleting a License \(CLI Procedure\) on page 92](#)
- [Junos OS Feature Licenses on page 84](#)
- [Verifying Junos OS License Installation on page 94](#)

Verifying Junos OS License Installation

To verify Junos OS license management, perform the following tasks:

- [Displaying Installed Licenses on page 94](#)
- [Displaying License Usage on page 95](#)

Displaying Installed Licenses

Purpose Verify that the expected licenses are installed and active on the router or switch.

Action From the CLI, enter the **show system license** command.

Sample Output

```
user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-acct	0	1	0	permanent
subscriber-auth	0	1	0	permanent
subscriber-addr	0	1	0	permanent
subscriber-vlan	0	1	0	permanent
subscriber-ip	0	1	0	permanent
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

```

Licenses installed:
License identifier: E000185416
License version: 2
Features:
  subscriber-acct - Per Subscriber Radius Accounting
                  permanent
  subscriber-auth - Per Subscriber Radius Authentication
                  permanent
  subscriber-addr - Address Pool Assignment
                  permanent
  subscriber-vlan - Dynamic Auto-sensed Vlan
                  permanent
  subscriber-ip   - Dynamic and Static IP
                  permanent

```

Meaning The output shows a list of the license usage and a list of the licenses installed on the router or switch. Verify the following information:

- Each license is present. Licenses are listed in ascending alphanumeric order by license ID.
- The state of each license is **permanent**.

NOTE: A state of invalid indicates that the license key is not a valid license key. Either it was entered incorrectly or it is not valid for the specific device.

- The feature for each license is the expected feature. The features enabled are listed by license. An all-inclusive license has all features listed.
- All configured features have the required licenses installed. The Licenses needed column must show that no licenses are required.

Displaying License Usage

Purpose Verify that the licenses fully cover the feature configuration on the router or switch.

Action From the CLI, enter the **show system license usage** command.

Sample Output

```
user@host> show system license usage
```

	Licenses	Licenses	Licenses	Expiry
Feature name	used	installed	needed	
subscriber-addr	1	0	1	29 days
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

Meaning The output shows any licenses installed on the router or switch and how they are used. Verify the following information:

- Any configured licenses appear in the output. The output lists features in ascending alphabetical order by license name. The number of licenses appears in the third column. Verify that you have installed the appropriate number of licenses.
- The number of licenses used matches the number of configured features. If a licensed feature is configured, the feature is considered used. The sample output shows that the subscriber address pooling feature is configured.
- A license is installed on the router or switch for each configured feature. For every feature configured that does not have a license, one license is needed.

For example, the sample output shows that the subscriber address feature is configured but that the license for the feature has not yet been installed. The license must be installed within the remaining grace period to be in compliance.

Configuring Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning (ZTP), in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning.

Zero Touch Provisioning allows you to provision new switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If the DHCP server does not respond or provide the software image and configuration files, the switch continues using the preinstalled Junos OS software and default factory configuration. On switches running Enhanced Layer 2 Software, Junos Extended Dynamic Host Configuration Protocol (JDHCP) is used instead of legacy DHCP. JDHCP supports the same functionality as DHCP, and all configuration options remain the same. JDHCP is an enhanced version of legacy DHCP software.

NOTE: If the ZTP configuration is enabled, the switch broadcasts DHCP DISCOVER packets on its interfaces. If the DHCP server on the network responds with DHCP vendor options set with the necessary values to initiate ZTP, then ZTP proceeds. To disable broadcasting the DHCP DISCOVER packets without performing the ZTP process, manually delete the `auto-image-upgrade` statement located at the `[edit chassis]` hierarchy. If ZTP completes without errors, the `auto-image-upgrade` statement is automatically deleted.

Before you begin:

- Ensure that the switch has access to the following network resources:
 - A DHCP server to lease IP addresses and information on software images and configuration files on the network.
Refer to your DHCP server documentation for configuration instructions.
 - The File Transfer Protocol (anonymous FTP), Hypertext Transfer Protocol (HTTP), Trivial File Transfer Protocol (TFTP) server on which the software image and configuration files are stored

NOTE: Although TFTP is supported, we recommend that you use FTP or HTTP instead, because these transport protocols are more reliable.

- A Domain Name System (DNS) server to perform reverse DNS lookup
- (Optional) An NTP server to perform time synchronization on the network
- (Optional) A system log (syslog) server to manage system log messages and alerts
- Locate and record the MAC address printed on the switch chassis.

CAUTION: We recommend that you do not commit a user configuration while the switch is performing ZTP activity—for example, updating the software image or applying a configuration file.

Perform the following steps to configure ZTP:

1. Boot the switch.

The switch continues to use the preinstalled Junos OS software and default factory configuration.

2. Issue the **request system zeroize** command on the switch.
3. Download the software image file and the configuration file to the FTP, HTTP, TFTP, server that the switch will download these files from.

You can download either one or both of these files.

4. Configure the DHCP server to provide the necessary information to the switch.

Configure IP address assignment.

You can configure dynamic or static IP address assignment for the switch's management address. To determine the switch's management MAC address for static IP address mapping, add 1 to the last byte of the switch's MAC address, which you noted before you began this procedure.

5. Define the format of the vendor-specific information for DHCP option 43 in the `dhcpd.conf` file.

Here is an example of an ISC DHCP 4.2 server `dhcpd.conf` file:

```
option space NEW_OP; option;
option NEW_OP.config-file-name code 1 = text;
option NEW_OP.image-file-type code 2 = text;
option NEW_OP.transfer-mode code 3 = text;
option NEW_OP.alt-image-file-name code 4 = text;
option NEW_OP-encapsulation code 43 = encapsulate NEW_OP;
```

6. Configure the following DHCP option 43 suboptions:

- Suboption 00: The name of the software image file to install

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

```
option NEW_OP.image-file-name  
"/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
```

- Suboption 01: The name of the configuration file to install

```
option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
```

- Suboption 02: The symbolic link to the software image file to install

```
option NEW_OP.image-file-type "symlink";
```

NOTE: If you do not specify suboption 2, the Zero Touch Provisioning process handles the software image as a filename, not a symbolic link.

- Suboption 03: The transfer mode that the switch uses to access the TFTP/FTP/HTTP server

```
option NEW_OP.transfer-mode "ftp";
```

NOTE: If suboption 03 is not configured, TFTP becomes the transfer mode by default.

- Suboption 04: The name of the software image file to install

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

NOTE: DHCP option 43 suboptions 05 through 255 are reserved.

```
option NEW_OP.alt-image-file-name  
"/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
```

7.

NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

Configure DHCP option 150 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option option-150 code 150 "10.100.31.71";
```

- 8. Configure DHCP option 66 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option tftp-server-name "10.100.31.71";
```

- 9. (Optional) Configure DHCP option 7 to specify one or more system log (syslog) servers.

```
option log-servers 10.100.31.72;
```

10. (Optional) Configure DHCP option 42 to specify one or more NTP servers.

```
option ntp-servers 10.100.31.73;
```

11. (Optional) Configure DHCP option 12 to specify the hostname of the switch.

```
option hostname "jn-switch35";
```

The following sample configuration shows the DHCP options you just configured:

```
host jn-switch35 {
  hardware ethernet ac:4b:c8:29:5d:02;
  fixed-address 10.100.31.36;
  option tftp-server-name "10.100.31.71";
  option host-name "jn-switch35";
  option log-servers 10.100.31.72;
  option ntp-servers 10.100.31.73;
  option NEW_OP.image-file-name
    "/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
  option NEW_OP.transfer-mode "ftp";
  option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
}
```

Based on the DHCP options you just configured, the following statements are appended to the Junos OS configuration file (for example, **jn-switch35.config**):

```
system {
  host-name jn-switch35;
  syslog {
    host 10.100.31.72 {
      any any;
    }
  }
  ntp {
    server 10.100.31.73;
  }
}
```

12. Connect the switch to the network that includes the DHCP server and the FTP, HTTP, or TFTP server.
13. Boot the switch with the default configuration.
14. Monitor the ZTP process by looking at the following log files.

NOTE: When SLAX (live operating system based on Linux) scripts are issued, the **op-script.log** and **event-script.log** files are produced.

- /var/log/dhcp_logfile
- /var/log/image_load_log
- /var/log/op-script.log
- /var/log/event-script.log

You can also monitor the ZTP process by looking at error messages and issuing operational commands. See [“Monitoring Zero Touch Provisioning” on page 310](#) for more information.

Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

package-name-m.nZx.y-domestic-signed.tgz

where:

- ***package-name*** is the name of the package—for example, ***jinstall-qfx***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***11.1***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, ***1.5***.

A sample switch software package name is:

jinstall-qfx-11.1R1.5-domestic-signed.tgz

Performing a Recovery Installation on a QFX Series Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device for a QFX Series Device” on page 153](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

WARNING: The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

NOTE: Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September  4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

Related Documentation

- [Creating an Emergency Boot Device for a QFX Series Device on page 153](#)

Performing a Recovery Installation on a QFX5100 Switch

If Junos OS on your switch is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the switch.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device for a QFX Series Device” on page 153](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the switch to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

WARNING: The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
Install Junos Snapshot
[13.2-20131115_x_132_x51_vjunos.0Boot to host shell [debug]
```

4. Select **Install Junos** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.
5. The switch copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the software is finished being copied from the emergency device to the QFX5100 switch, the QFX5100 switch reboots from the internal flash storage on which the

software was just installed. When the reboot is complete, the switch displays the Junos OS login prompt:

```
root@switch#
```

6. Create a new configuration as you did when the switch was shipped from the factory, or restore the previously saved configuration file to the switch.
7. Remove the emergency boot device.

**Related
Documentation**

- [Creating an Emergency Boot Device for a QFX Series Device on page 153](#)

Performing an In-Service Software Upgrade (ISSU)

You can use an in-service software upgrade to upgrade the software running on the switch with minimal traffic disruption during the upgrade.

NOTE: ISSU is supported in Junos OS Release 13.2X51-D15 and later.

This topic covers:

1. [Preparing the Switch for Software Installation on page 106](#)
2. [Upgrading the Software Using ISSU on page 107](#)

Preparing the Switch for Software Installation

Before you begin software installation using ISSU:

- Ensure that nonstop active routing (NSR), nonstop bridging (NSB), and graceful Routing Engine switchover (GRES) are enabled. NSB and GRES enable NSB-supported Layer 2 protocols to synchronize protocol information between the master and backup Routing Engines.

To verify that nonstop active routing is enabled:

NOTE: If nonstop active routing is enabled, then graceful Routing Engine switchover is enabled.

```
user@switch> show task replication
Stateful Replication: Enabled
RE mode: Master
```

If nonstop active routing is not enabled (**Stateful Replication is Disabled**), see *Configuring Nonstop Active Routing* for information on how to enable it.

- Enable nonstop bridging (NSB). See *Configuring Nonstop Bridging* for information on how to enable it.
- (Optional) Back up the system software—Junos OS, the active configuration, and log files—on the switch to an external storage device with the [request system snapshot](#) command.

Upgrading the Software Using ISSU

This procedure describes how to upgrade the software running on a standalone switch:

To upgrade the switch using ISSU:

1. Download the software package by following the procedure in the Downloading Software Files with a Browser section in “Upgrading Software on QFX3500, QFX3600, and QFX5100 Switches” on page 121.
2. Copy the software package or packages to the switch. We recommend that you copy the file to the `/var/tmp` directory.
3. Log in to the console connection. Using a console connection allows you to monitor the progress of the upgrade.
4. Start the ISSU:
 - On the switch, enter:

```
user@switch> request system software in-service-upgrade
/var/tmp/package-name.tgz
```

where *package-name.tgz* is, for example, `jinstall-132_x51_vjunos.domestic.tgz`.

NOTE: During the upgrade, you will not be able to access the Junos OS CLI.

The switch displays status messages similar to the following messages as the upgrade executes:

```
jinstall-132_x51_vjunos.domestic.tgz reboot
ISSU: Validating Image
Prepare for ISSU
spawn the backup VM
ISSU: Preparing Backup RE
Backup upgrade done
ISSU: Backup RE Prepare Done
waiting for backup RE switchover ready
GRES operational
Initiating Chassis In-Service-Upgrade
Chassis ISSU Started
ISSU: Preparing Daemons
ISSU: Daemons Ready for ISSU
ISSU: Starting Upgrade for FRUs
ISSU: FPC Warm Booting
ISSU: FPC Warm Booted
ISSU: Preparing for Switchover
ISSU: Ready for Switchover
Checking In-Service-Upgrade status
  Item          Status          Reason
  FPC 0         Online (ISSU)
send ISSU done to chassisd on backup VM
Chassis ISSU Completed
ISSU: IDLE
mgd_package_issu: Initiate em0 device handoff
```

NOTE: An ISSU might stop instead of abort if the FPC is at the warm boot stage. Also, any links that go down and up will not be detected during a warm boot of the Packet Forwarding Engine (PFE).

NOTE: If the ISSU process stops, you can look at the log files to diagnose the problem. The log files are located at `/var/log/vjunos-log.tgz`.

5. Log in after the reboot of the switch completes. To verify that the software has been upgraded, enter the following command:

```
user@switch> show version
```

6. To ensure that the resilient dual-root partitions feature operates correctly, copy the new Junos OS image into the alternate root partitions of all of the switch:

```
user@switch> request system snapshot slice alternate
```

Resilient dual-root partitions allow the switch to boot transparently from the alternate root partition if the system fails to boot from the primary root partition.

- [request system software in-service-upgrade on page 406](#)

Recovering from a Failed Software Installation

Problem If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

Solution If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

Hit [Enter] to boot immediately, or space bar for command prompt.

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [--format] [--external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
 - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
 - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

Software Installation Overview

A QFX Series product is delivered with the Junos OS preinstalled. As new features and software fixes become available, you can upgrade your software to use them.

When you power on the switch, it starts (boots) using the installed software.

You upgrade the Junos OS on a switch by copying a software package to a switch or other system on your local network and then using the CLI to install the new software on the switch. You then reboot the switch, which boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the installation package removes all files from the `/var/tmp` directory of the switch and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

If you encounter any difficulties during software installation or an upgrade, you can use the recovery installation procedure to install the Junos OS on the switch.

Upgrading Jloader Software on QFX Series Devices

Jloader software contains a boot loader (Uboot), which is used to bring up QFX Series devices and load the Junos OS from the flash memory of these devices. You can upgrade Jloader software on QFX3500 switches, QFX3500 and QFX3600 Node devices, and QFX3600-I and QFX3008-I Interconnect devices.

NOTE: Before you upgrade the Jloader software, see [Table 43 on page 110](#), [Table 44 on page 110](#), and [Table 45 on page 111](#) to make sure that you are upgrading to the right version of Jloader software for the Junos OS software release running on your QFX3500 switches, or Node devices and Interconnect devices in your QFabric system.

See [Table 46 on page 111](#) to see which Uboot software versions are available and the filenames of the Jloader software packages.

Table 43: Junos OS and Jloader Software Compatibility Matrix for the QFX3500 Switch and QFX3500 Node Device

Uboot Software Release Number	Jloader Software Package Name
1.1.2	jloader-qfx-11.3X30.9-signed.tgz
1.1.4 (11.3R3 and 11.3R2 releases only. Not supported on 11.3R1)	jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz
1.1.4 (12.1R1 release and later)	jloader-qfx-12.1-20120125_pr.0-signed.tgz
1.1.5 (12.2X50-D10.3 and later)	jloader-qfx-12.2X50.D10.3-signed.tgz
1.1.8 (13.1X50-D15.1 and later)	jloader-qfx-13.3-20130831_pr_branch_qfd.0.tgz

Jloader Software Version 1.1.4 Guidelines

Jloader Release 1.1.4 is compatible with Junos OS Release 11.3R3 and 11.3R2, and Junos OS Release 12.1R1 and later. Jloader Release 1.1.4 is not compatible with Junos OS Release 11.3R1. The Jloader software package names are different for versions 1.1.4 (Junos OS 11.3R3 and 11.3R2) and 1.1.4 (Junos OS 12.2R1 release and later), but the binaries are the same. Because the binaries are the same, you can upgrade or downgrade to any Junos OS release.

- If you have Junos OS Release 11.3 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz** software package.
- If you have Junos OS Release 11.3R2 installed and want to upgrade to Junos OS Release 12.1, you do not need to upgrade the Jloader Release and can continue to use Jloader Release 1.1.2.
- If you have Junos OS Release 12.1 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-12.1-20120125_pr.0-signed.tgz** software package.
- If you upgrade to Junos OS Release 12.1, you can upgrade to Jloader Release 1.1.4 using the **jloader-qfx-12.1-20120125_pr.0-signed.tgz** software package.

Upgrading Jloader Software on a QFX3500 Switch

The Jloader software for a QFX3500 switch resides in two flash memory banks. At any time, one bank acts as the primary bank, and the QFX3500 switch boots from it. The other bank is the backup bank—if the QFX3500 switch cannot boot from the primary bank, it boots from the backup bank. When you upgrade the Jloader software, the upgraded software is installed in the backup bank, which then becomes the new primary bank. Thus the primary and backup banks alternate each time you upgrade the Jloader software, with the primary bank containing the most recently installed version of the software, and the backup bank containing the previous version. To upgrade the Jloader software on a QFX3500 switch, you must perform the upgrade twice: once for each bank. Each upgrade requires that you to reboot the QFX3500 switch.

NOTE: If you are running Junos OS Release 11.3R1 or Junos OS Release 11.3R2, you must use the **no-validate** option when you issue the **request system software add** command to upgrade the Jloader software. Otherwise, the installation will fail and you receive a configuration error. The **no-validate** option is not required for Junos OS Release 11.3R3 and later.

NOTE: After you upgrade the Jloader software on the first bank, the software package is deleted after you reboot. Make sure that you have either downloaded the Jloader software package to either a remote site or in a local directory on the switch, such as the **/var/tmp** directory on the QFX3500 device.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html> .
The Junos Platforms Download Software page appears.
2. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.

4. Select the Software tab and then select the install package you want to download in the Install Package section.
5. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
6. Enter your name and password and press **Enter**.
7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Open or save the **jloader-qfx-version-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
9. Log in to the QFX3500 switch and enter the shell. We recommend using a console connection.
10. Determine the version of the Jloader software package installed on the switch.

For example:

```
root@switch% ls
gres-tp krt_gencfg_filter.txt
jloader-qfx-11.3-20110510.0-signed.tgz
```

11. Determine the version of the Uboot software that is running in the bank:

For example:

```
root@switch% kenv | grep boot.version
boot.version="1.0.7"
```

12. Enter the CLI and install the Jloader software package.

- To install a Jloader software package that is located in the **/var/tmp** directory, issue the **request system software add /var/tmp/jloader-qfx-version.tgz no-validate** command:

For example:

```
user@switch> request system software add
/var/tmp/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

You see the following messages during the installation:

```
Verified jloader-qfx-11.3-20110510.0.tgz signed by PackageProduction_11_3_0
Adding jloader-qfx...
Installation in progress, please wait...
Mounted jloader-qfx package on /dev/md8...
Verified manifest signed by PackageProduction_11_3_0
Verified jloader-qfx-11.3-20110510.0 signed by PackageProduction_11_3_0
Registering jloader-qfx as unsupported
```

```
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3-20110510.0-signed.tgz
...
Saving state for rollback ...
```

```
juniper@qfx3500>
```

- To install a Jloader software package located on a remote server using FTP, issue the **request system software add**

/ftp://hostname/pathname/jloader-qfx-version-signed.tgz no-validate
command.

For example:

```
user@switch> request system software add  
/ftp://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

- To install a Jloader software package located on a remote server using HTTP, issue the **request system software add /http://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

For example:

```
user@switch> request system software add  
/http://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

13. When prompted, reboot the Control Board by issuing the **request system reboot** command.

For example:

```
user@switch> request system reboot  
Reboot the system ? [yes,no] (no) yes
```

14. Enter the shell and verify that the version of the Uboot software in the primary bank is the version you just installed.

For example:

```
root@switch% kenv | grep boot.version  
boot.version="1.1.1"
```

15. To install the Jloader software package on the current backup bank, repeat Step 10 through Step 14.

Upgrading Jloader Software on a QFabric System

This procedure explains how to upgrade the Jloader software on your Node devices and Interconnect devices. The example shows how to upgrade the Jloader Release 1.1.1 to 1.1.2 on a Node device with the serial number BBAK1186.

NOTE: Before you upgrade the Jloader software, make sure you have the serial numbers of the Node devices, Interconnect devices, and Control Boards in the Interconnect devices you want to upgrade.

1. Issue the **show chassis hardware node-device ?** command to view the serial numbers of the Node devices.

For example:

```
user@qfabric> show chassis hardware node-device ?
<node-device>      Node device identifier
BBAK1186            Node device
BBAK3149            Node device
BBAK3177            Node device
BBAK8063            Node device
BBAK8799            Node device
P2443-C             Node device
P2515-C             Node device
P3708-C             Node device
P3885-C             Node device
P3916-C             Node device
node0               Node device
node1               Node device
node2               Node device
node3               Node device
node4               Node device
node5               Node device
node6               Node device
node7               Node device
node8               Node device
```

An example of a Node device serial number is BBAK1186.

2. Issue the **show chassis hardware interconnect-device ?** command to view the serial numbers of the Interconnect devices.

For example:

```
user@qfabric> show chassis hardware interconnect-device ?
Possible completions:
interconnect-device  Interconnect device identifier
IC-F1052             Interconnect device
IC-F3947             Interconnect device
```

The Interconnect device serial numbers are IC-F1052 and IC-F3947.

3. Issue the **show chassis hardware interconnect-device name** command to view the serial numbers of the Control Boards in the Interconnect device.

For example:

```
user@qfabric> show chassis hardware interconnect-device IC-F3947
```

Hardware inventory:

Item	Version	Part number	Serial number	Description
Chassis	REV 10		F3947	QFXC08-3008
Midplane	REV 10	750-035835	F3947-C	QFX Midplane
CB 0 Board	REV 14	750-035855	ZJ9432	QFX Chassis Control Board
Routing Engine 0		BUILTIN	BUILTIN	QFX Routing Engine
CB 1 Board	REV 14	750-035855	ZJ9404	QFX Chassis Control Board

The Control Board serial numbers are ZJ9432 and ZJ9404.

4. Issue the **show chassis firmware node-device *name*** command to see which version of Uboot software you have installed on your Node device.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
```

Part	Type	Version
node4	U-Boot	1.1.6 (May 10 2011 - 04:52:59) 1.1.1
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.1. The loader software version appears after the timestamp for U-Boot 1.1.6.

5. Issue the **show chassis firmware interconnect-device *name*** command to see which version of Uboot software you have installed on the Routing Engines located on the Control Boards of the Interconnect device.

For example:

```
user@qfabric> show chassis firmware interconnect-device IC-F3947
```

Part	Type	Version
Routing Engine 0	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1
Routing Engine 1	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.4. The loader software version appears after the timestamp for U-Boot 1.1.6.

6. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms Download Software page appears.

7. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
8. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
9. Select the **Software** tab and then select the install package you want to download in the Install Package section.

10. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
11. Enter your username and password, and press **Enter**.
12. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
13. Open or save the **jloader-qfx-version-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
14. Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download /path/package-name** command.

For example:

```
user@qfabric> request system software download
ftp://server/files/jloader-qfx-11.3X30.9-signed.tgz
```

15. Log in to the Director device as root and enter the shell to verify that you have downloaded the Jloader software package. We recommend using a console connection. The software package is copied from where you downloaded it and is placed locally on the QFabric system in the **/pbdata/packages** directory.

For example:

```
[root@dg0] # pwd
/pbdata/packages

[root@dg0] # ls
jloader-qfx-11.3X30.9-signed.tgz
```

16. Before you copy over the Jloader software package to the Node device or Interconnect device, determine the directory that matches the serial number of the Node device or Interconnect device that you want to upgrade. View the remote logs and the Node device and Interconnect device serial numbers by issuing the **ls /pbdata/export/rlogs** command at the command line of the Director device before you copy the software package over to the device.

NOTE: The **/pbdata/export/rlogs/node-device-serial-ID** and **/pbdata/export/rlogs/interconnect-device-serial-ID** directories on the Director device are NFS mounted as the **/tftpboot/logfiles** directories on the Node device and Interconnect device. These directories are created for all Node devices and Interconnect devices in a QFabric system. The Jloader files are stored in the **/tftpboot/logfiles** directories for each Node device and Interconnect device.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs
02de4930-828b-11e1-a319-00e081c57938 c9898afe-828b-11e1-956c-00e081c57938
04103b2a-29d5-e011-bf8a-0e6bdf3aa1e6 eeba4aac-828b-11e1-85e2-00e081c57938
1e2739e0-828b-11e1-bf74-00e081c57938 F1052
8d8a978c-828b-11e1-a833-00e081c57938 F3947
ad55b89e-828b-11e1-b70e-00e081c57938 P2443-C
BBAK1186 P2515-C
```

BBAK3149	P3708-C
BBAK3177	P3885-C
BBAK8063	P3916-C
BBAK8799	

BBAK1186 is the serial number of the Node device that needs to be upgraded.

17. Copy the Jloader software package from the `/var/tmp` directory to the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # cp jloader-qfx-11.3X30.9-signed.tgz /pbdata/export/rlogs/BBAK1186
```

18. Confirm that the Jloader software package you copied over is in the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs/BBAK1186
jloader-qfx-11.3X30.9-signed.tgz
```

19. Issue the `/root/dns.dump` command to find out the internal IP addresses of the Node device or Interconnect device.

```
[root@dg0 tmp] # /root/dns.dump
; <<>> DiG 9.3.6-P1-RedHat-9.3.6-4.P1.e15 <<>> -t axfr pkg.dcbg.juniper.net
@169.254.0.1
;; global options: printcmd
pkg.dcbg.juniper.net. 600 IN SOA ns.pkg.dcbg.juniper.net.
mail.pkg.dcbg.juniper.net. 152 3600 600 7200 3600
pkg.dcbg.juniper.net. 600 IN NS ns.pkg.dcbg.juniper.net.
pkg.dcbg.juniper.net. 600 IN A 169.254.0.1
pkg.dcbg.juniper.net. 600 IN MX 1 mail.pkg.dcbg.juniper.net.
dcfnnode---DCF-ROOT.pkg.dcbg.juniper.net. 45 IN A 169.254.192.17
dcfnnode---DRE-0.pkg.dcbg.juniper.net. 45 IN A 169.254.3.3

dcfnnode-ad55b89e-828b-11e1-b70e-00e081c57938.pkg.dcbg.juniper.net. 45 IN A
169.254.128.20
dcfnnode-BBAK1186.pkg.dcbg.juniper.net. 45 IN A 169.254.128.14
```

The internal IP address for BBAK1186 is 169.254.128.14.

20. Upgrade the Jloader software on the Node device or Interconnect device.

Before you can upgrade the Jloader software, you need to use SSH to log in to the Node device or Interconnect device and verify that the software is in the `/tftpboot/logfiles` directory.

- a. Use SSH to log in to the Node device or Interconnect device.

For example:

```
[root@dg0 tmp] # ssh 160.254.128.14
root@169.254.128.14's password:
--- JUNOS 11.3X30.10 built 2012-03-11 22:55:43 UTC
At least one package installed on this device has limited support.
Run 'file show /etc/notices/unsupported.txt' for details.
root@sng3%
```

- b. Verify that the Jloader software package is in the `tftpboot/logfiles` directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /tftpboot/logfiles
.index                               jloader-qfx-11.3X30.9-signed.tgz
```

- c. Copy the Jloader software package from the **/tftpboot/logfiles** directory to the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% cp /tftpboot/logfiles/jloader-qfx-11.3X30.9-signed.tgz /var/tmp
```

- d. Verify that the Jloader software package is in the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /var/tmp
.snap                               jloader-qfx-11.3X30.9-signed.tgz
    tmp
gres-tp                            krt_gencfg_filter.txt
    vc-autoupgrade
if-rtbdb                           rtsdb
```

- e. Enter CLI mode and issue the **request system software add /var/tmp/jloader-qfx-version-signed.tgz** command.

For example:

```
root@sng3% cli
root@sng3> request system software add /var/tmp/jloader-qfx-11.3X30.9-signed.tgz

Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3X30.9-signed.tgz ...
Saving state for rollback ...
```

Upgrade has completed successfully.
Reboot is now required.

- f. Reboot both the Node device and Interconnect device twice, because they each contain two partitions.

For example:

```
root@sng3> request system reboot
Reboot the system ? [yes,no] (no) yes
Shutdown NOW!
[pid 37663]
```

```
root@sng3>
```

```
*** FINAL System shutdown message from root@sng3 ***
```

```
System going down IMMEDIATELY
```

- g. Verify that the Uboot software on the Node device or Interconnect device has been upgraded to the new Uboot software by logging in to the QFabric CLI and issuing either the **show chassis firmware node-device *name*** command or the **show chassis firmware interconnect-device *name*** command.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
Part                Type      Version
node4               U-Boot   1.1.6 (Nov 19 2011 - 11:42:07) 1.1.2
                                loader   FreeBSD/MIPS U-Boot bootstrap loader
0.1
```

The Uboot software version is now 1.1.2. The loader software version appears after the timestamp for U-Boot 1.1.6.

Upgrading Software on QFX3500, QFX3600, and QFX5100 Switches

To upgrade Junos OS, you need to install the appropriate upgrade package on the QFX Series. Upgrading involves these tasks:

1. [Downloading Software Files with a Browser on page 121](#)
2. [Accessing Software Downloaded to a Remote Location on page 122](#)
3. [Connecting to the Console Port on page 122](#)
4. [Backing Up the Current Configuration Files on page 122](#)
5. [Installing a Standard Software Package on page 122](#)
6. [Upgrading to an ELS-Based Software Package on page 123](#)

Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website, go to <http://www.juniper.net/support/>.

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. In the **Install Package** section of the **Software** tab, select the **Install Package** for the release.
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Save the **jinstall-qfx-<version>-domestic-signed.tgz** file on your computer.
10. Open or save the installation package either to the local system in the **var/tmp** directory or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

Accessing Software Downloaded to a Remote Location

To access the installation package if you downloaded it to a remote location (for example, any system other than the switch):

1. From the command line, make sure you are in the **/var/tmp** directory of the switch.
2. Start the shell interface:
`user@switch> start shell`
3. Initiate an FTP, TFTP, or scp session.

In this example, FTP is used.

- `>ftp`
4. Use FTP to access the remote location where the installation package resides.
`ftp ftp://<hostname>/<pathname>/<package-name-m.mZx-distribution>.tgz.`
where `<package-name-m.mZx-distribution>.tgz` is
`jinstall-qfx-11.1R1.5-domestic-signed.tgz`
5. When prompted, enter your username and password.
6. Use the **get** command to transfer the installation package from the remote location to your **/var/tmp** directory on your switch.

`get <package-name-m.mZx-distribution>.tgz`

7. Close the FTP session:

`bye`

Connecting to the Console Port

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that may occur.

Backing Up the Current Configuration Files

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

`user@switch> save filename`

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

Installing a Standard Software Package

NOTE: Before you install the software, back up any critical files in **/var/home**. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

NOTE: If you are upgrading from a standard software package to an ELS-based package, see the *Upgrading to an ELS-Based Software Package* section.

Install the software in one of two ways:

If the installation package resides locally on the switch, execute the **request system software add validate <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add validate
/var/tmp/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

If the Install Package resides remotely, execute the **request system software add validate <pathname> <source> reboot** command.

For example:

```
user@switch# request system software add validate
ftp://ftpserver/directory/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

Upgrading to an ELS-Based Software Package

To upgrade your switch from a version of Junos OS that does not support Enhanced Layer 2 Software (ELS) to a version of Junos OS that supports ELS, we recommend performing the following procedure.

NOTE: Because this procedure can cause service outages, we recommend that you avoid performing this procedure on switches carrying traffic in a production network.

1. Log in to your device using the console port.

NOTE: Only perform this procedure from the console port. You can lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Set your device to standalone mode by issuing the **request chassis device-mode standalone** command. Do not reboot your system at this time.

NOTE: This step is only required for new devices shipped from the factory or QFabric system Node devices that you plan to redeploy in a QFX Series Virtual Chassis.

3. Choose whether you wish to reuse your previous configuration or not.
 - To reuse your previous configuration as part of the software upgrade, you must convert the configuration from the original style Junos OS CLI to the ELS CLI format using the following steps:

NOTE: We recommend this procedure for customers currently using a QFX3500 or QFX3600 switch as a standalone device.

- a. Copy your entire existing configuration into a text file. Save the file to a remote location or USB drive.
 - b. Retain the portion of your existing configuration related to management network connectivity (such as **[edit system]** and management interfaces). Delete all other configuration elements (such as the **[edit protocols]** and **[edit vlans]** hierarchy levels, non-management interfaces, and so on). Issue a **commit** operation to remove the deleted configuration.
 - c. Perform the software upgrade with the **validate** option and reboot your device to complete the upgrade by issuing the **request system software add validate reboot** command. Maintain your console port connection during the reboot.
 - d. Using a web browser, navigate to the [ELS Translator Tool](#). Follow the instructions on the page to convert your saved configuration file to the new ELS CLI format.
 - e. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator Tool and load it in to your switch.
 - f. Issue a **commit** operation to activate the translated configuration.
- To delete your current configuration and upgrade the software, follow these steps:

NOTE: We recommend this procedure for customers with new QFX3500 or QFX3600 devices shipped from the factory or QFabric system Node devices that will be redeployed in a QFX Series Virtual Chassis.

- a. Perform a software upgrade with the **no-validate** option by issuing the **request system software add no-validate** command.
- b. Delete the configuration and set the device to factory defaults by issuing the **request system zeroize** command. The device automatically reboots and reverts to a factory default configuration.
- c. Configure your device using the ELS CLI format.

Upgrading Software on QFX3500 and QFX3600 Virtual Chassis Using Nonstop Software Upgrade

You can use nonstop software upgrade (NSSU) to upgrade the software running on all member switches with minimal traffic disruption during the upgrade.

NSSU is supported on the following Virtual Chassis platforms:

- QFX3500 Virtual Chassis
- QFX3600 Virtual Chassis

This topic covers:

- [Preparing the Switch for Software Installation on page 125](#)
- [Upgrading the Software Using NSSU on page 126](#)

Preparing the Switch for Software Installation

Before you begin software installation using NSSU:

- Ensure that the Virtual Chassis is configured correctly to support NSSU. Verify that:
 - The Virtual Chassis members are connected in a ring topology. A ring topology prevents the Virtual Chassis from splitting during an NSSU.
 - The Virtual Chassis master and backup are adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
 - The Virtual Chassis is preprovisioned so that the linecard role has been explicitly assigned to member switches acting in the linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), and the other member switches must maintain their linecard roles.
 - A two-member Virtual Chassis has **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.
- Verify that the members are running the same version of the software:

```
user@switch> show version
```

If the Virtual Chassis members are not running the same version of the software, use the [request system software add](#) command to upgrade the software on the inconsistent members.

- Ensure that graceful Routing Engine switchover (GRES) is enabled.
- (Optional) Back up the system software—Junos OS, the active configuration, and log files—on each member to an external storage device with the [request system snapshot](#) command.

Upgrading the Software Using NSSU

This procedure describes how to upgrade the software running on all Virtual Chassis members using NSSU. When the upgrade completes, all members are running the new version of the software. Because a graceful Routing Engine switchover occurs during the upgrade, the original Virtual Chassis backup is the new master.

To upgrade all members using NSSU:

1. Download the software package by following the procedure in the Downloading Software Files with a Browser section in “Upgrading Software on QFX3500, QFX3600, and QFX5100 Switches” on page 121.
2. Copy the software package or packages to the Virtual Chassis. We recommend that you copy the file to the `/var/tmp` directory on the master.
3. Log in to the Virtual Chassis using the console connection or the virtual management Ethernet (VME) interface. Using a console connection allows you to monitor the progress of the master switch reboot.
4. Start the NSSU:
 - On a QFX3500 or QFX3600 Virtual Chassis, enter:

```
user@switch> request system software nonstop-upgrade  
/var/tmp/package-name.tgz
```

where *package-name.tgz* is, for example,
`jinstall-qfx-3-13.2X50-D15.3-domestic-signed.tgz`.

The switch displays status messages similar to the following messages as the upgrade executes:

```
Chassis ISSU Check Done  
ISSU: Validating Image  
ISSU: Preparing Backup RE  
Installing image on other FPC's along with the backup

ISSU: IDLE

*** FINAL System shutdown message from user@switch ***

System going down IMMEDIATELY

```

```

Shutdown NOW!
[pid 9336]

```

5. Log in after the reboot of the original master switch completes. To verify that the software on all Routing Engines in the Virtual Chassis members has been upgraded, enter the following command:

```
user@switch> show version
```

6. To ensure that the resilient dual-root partitions feature operates correctly, copy the new Junos OS image into the alternate root partitions of all members:

```
user@switch> request system snapshot slice alternate all-members
```

Resilient dual-root partitions allow the switch to boot transparently from the alternate root partition if the system fails to boot from the primary root partition.

Upgrading Software Using Automatic Software Download

The automatic software download feature uses the DHCP message exchange process to download and install software packages. You configure the automatic software download feature on switches acting as DHCP clients. You must enable automatic software download on the switch before the software upgrade can occur.

You configure a path to a software package file on the DHCP server. The server communicates the path to the software package file through DHCP server messages.

If you enable automatic software download, the DHCP client switch compares the software package name in the DHCP server message to the name of the software package that booted the switch. If the software packages are different, the DHCP client switch downloads and installs the software package specified in the DHCP server message.

Before you upgrade software using automatic software download, ensure that you have configured DHCP services for the switch, including configuring a path to a boot server and a boot file. See [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 133](#) for information about using the CLI to configure DHCP services and settings. See [Configuring DHCP Services \(J-Web Procedure\)](#) for information about using the J-Web interface to configure DHCP services and settings.

To enable automatic software download on an EX Series switch acting as a DHCP client:

```
[edit chassis]
user@switch# set auto-image-upgrade
```

After automatic software download is enabled on your DHCP client switch and after DHCP services are enabled on your network, an automatic software download can occur at any time as part of the DHCP message exchange process.

If an automatic software download occurs, you see the following message on the switch:

```
Auto-image upgrade started
On successful installation system will reboot automatically
```

The switch reboots automatically to complete the upgrade.

Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically deploy multiple devices from a central location in the network.

To specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a switch to operate as a DHCP server. For more information, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 133](#).
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
 - A host-specific file with the name **hostname.conf** for each switch undergoing autoinstallation. Replace **hostname** with the name of a switch. The **hostname.conf** file typically contains all the configuration information necessary for the switch with this hostname.
 - A default configuration file named **switch.conf** with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.
- Physically attach the switch to the network using a Gigabit Ethernet port.
- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.
- If the switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the switch.
- If you are using **hostname.conf** files for autoinstallation, you must also complete the following tasks:
 - Configure the DHCP server to provide a **hostname.conf** filename to each switch. Each switch uses its **hostname.conf** filename to request a configuration file from the TFTP server. Copy the necessary **hostname.conf** configuration files to the TFTP server.
 - Create a default configuration file named **network.conf**, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a **hostname.conf** filename to a new switch, the switch uses **network.conf** to resolve its hostname based on its IP address.

Alternatively, you can add the IP-address-to-hostname mapping entry for the switch to a DNS database file.

The switch uses the hostname to request a **hostname.conf** file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@switch# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
```

NOTE: You can also use an FTP address, for example, `ftp://user:password@sftpconfig.sp.com`.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

```
[edit system]
user@switch# set autoinstallation interfaces ge-0/0/0 bootp
```

Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 133](#).

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in [Table 47 on page 132](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

Table 47: DHCP Client Settings

Configuration Statement	Description
client-identifier	Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.
lease-time	Ttime in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.

Table 47: DHCP Client Settings (*continued*)

Configuration Statement	Description
<code>retransmission-attempt</code>	Number of times the client attempts to retransmit a DHCP packet.
<code>retransmission-interval</code>	Time between transmission attempts.
<code>server-address</code>	IP address of the server that the client queries for an IP address.
<code>update-server</code>	TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.
<code>vendor-option</code>	Vendor class ID (CPU's manufacturer ID string) for the DHCP client.

**Related
Documentation**

- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 133](#)
- [Understanding DHCP Services for Switches on page 36](#)

Configuring a DHCP Server on Switches (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, optional reconfiguration of default settings on DHCP clients and configuration of a DHCP server. This topic covers configuration of the DHCP server. For directions for reconfiguring a DHCP client, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 132](#).

You can configure either of two versions of a DHCP server on a switch—either the extended server version or the legacy server version. We recommend that you use the extended server configuration unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 133](#)
2. [Configuring a Legacy DHCP Server on a Switch \(CLI Procedure\) on page 134](#)

Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before assigning them to clients.

1. Create an address pool for DHCP IP addresses:

[edit]

```
user@switch# set access address-pool address-pool
```

2. Configure addresses for DHCP dynamic assignment:

```
[edit access address-assignment]
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface for DHCP:

```
[edit system services dhcp-local-server]
user@switch# set group group-name interface interface-name
```

4. Optionally, process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]
user@switch# set overrides process-inform
```

5. Optionally, redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first
```

6. Optionally, enable dynamic reconfiguration triggered by the DHCP extended server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]
user@switch# set reconfigure

[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure
```

Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

```
[edit system services dhcp]
user@switch# set pool (Legacy DHCP) network-range
```

NOTE: Step 2 through step 15 assign global values at the [edit system services dhcp] hierarchy level. You can also assign the same values to a specific pool using those same commands at the [edit system services dhcp pool network-range] hierarchy level.

2. Optionally, change the domain search list used to resolve hostnames:

```
[edit system services dhcp]
user@switch# set domain-search [ domain-list ]
```

3. Optionally, change the domain name server (DNS) name that the DHCP server advertises to clients:

```
[edit system services dhcp]
```

```
user@switch# set name-server address
```

- Optionally, change the DHCP options:

```
[edit system services dhcp]
user@switch# set option id-number
```

- Optionally, change the devices advertised to clients:

```
[edit system services dhcp]
user@switch# set router address
```

- Optionally, change the SIP server:

```
[edit system services dhcp]
user@switch# set sip-server addresses-or-names
```

For more information, see *Configuring a DHCP SIP Server (CLI Procedure)*.

- Optionally, change the DHCP client's hardware address:

```
[edit system services dhcp]
user@switch# set static-binding mac-address
```

- Optionally, change the NetBIOS name server:

```
[edit system services dhcp]
user@switch# set wins-server address
```

Configuring a DNS Name Server for Resolving a Hostname into Addresses

To have the router or switch resolve hostnames into addresses, you must configure one or more Domain Name System (DNS) name servers by including the **name-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
name-server {
  address;
}
```

The following example shows how to configure two DNS name servers:

```
[edit]
user@switch# set system name-server 192.168.1.253
[edit]
user@switch# set system name-server 192.168.1.254
[edit]
user@switch# show
system {
  name server {
    192.168.1.253;
    192.168.1.254;
  }
}
```

- Related Documentation
- [name-server on page 263](#)

Configuring the Domain Name for the Router or Switch

For each router or switch, you should configure the name of the domain in which the router or switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.

To configure the domain name, include the **domain-name** statement at the **[edit system]** hierarchy level:

```
[edit system]
domain-name domain-name;
```

The following example shows how to configure the domain name:

```
[edit]
user@host# set system domain-name company.net
[edit]
user@host# show
system {
    domain-name company.net;
}
```

- Related Documentation
- *domain-name*
 - [domain-name on page 246](#)
 - [Example: Configuring the Domain Name for the Router or Switch on page 174](#)

Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains

If your router or switch is included in several different domains, you can configure those domain names to be searched.

To configure more than one domain to be searched, include the **domain-search** statement at the **[edit system]** hierarchy level:

```
[edit system]
domain-search [ domain-list ];
```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched:

```
[edit system]
domain-search [ domainone.net domainonealternate.com ]
```

- Related Documentation
- [Example: Configuring the Domain Name for the Router or Switch on page 174](#)
 - [Reaching a Domain Name System Server](#)
 - [Configuring a DNS Name Server for Resolving a Hostname into Addresses on page 135](#)

Configuring the Hostname of the Router or Switch

The hostname of the device provides its identification for many purposes. Junos OS uses the configured hostname as part of the command prompt, to prepend log files and other accounting information, as well as in other places where knowing the device identity is useful. We recommend that the hostname be descriptive and memorable.

Optionally, instead of configuring the hostname at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the hostname, especially if the device has dual Routing Engines. This procedure uses groups called **re0** and **re1** as an example.

To set the hostname:

1. Include the **host-name** statement in the configuration.

The name value must be less than 256 characters.

```
[edit groups group-name system]
host-name hostname;
```

For example:

```
[edit groups re0 system]
root@# set host-name san-jose-router
```

```
[edit groups re1 system]
root@# set host-name san-jose-router1
```

2. If you used one or more configuration groups, apply the configuration groups, substituting the appropriate group names.

For example:

```
[edit]
user@host# set apply-groups [re0 re1]
```

3. Commit the changes.

```
[edit]
root@# commit
```

The hostname subsequently appears in the device CLI prompt.

```
san-jose-router@#
```

Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

NOTE: By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

alarm-name is the name of an alarm.

- [System-Wide Alarms and Alarms for Each Interface Type](#)
- [Chassis Conditions That Trigger Alarms](#)
- [Silencing External Devices Connected to Alarm Relay Contacts](#)

Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch

By default, the router or switch sends protocol redirect messages. To disable the sending of redirect messages by the router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-redirects;
```

To reenable the sending of redirect messages on the router or switch, delete the **no-redirects** statement from the configuration.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces interface-name unit logical-unit-number family family]** hierarchy level.

Related Documentation

- [Configuring the Junos OS to Ignore ICMP Source Quench Messages](#)
- [Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets on page 141](#)
- [Junos OS Network Interfaces Library for Routing Devices](#)

Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

Related Documentation

- *Configuring the Junos OS to Disable the Routing Engine Response to Multicast Ping Packets*

Configuring the Junos OS to Display a System Login Announcement

By default, no login announcement is displayed. To configure a system login announcement, include the **announcement** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
announcement text;
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

TIP: You can use the same special characters described to format your system login announcement.

Related Documentation

- *Defining Junos OS Login Classes*
- *Configuring the Junos OS to Display a System Login Message*

Configuring the Junos OS to Display a System Login Message

By default, no login message is displayed on the router or switch. To configure a system login message, include the **message** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
message text;
```

If the message text contains any spaces, enclose it in quotation marks.

You can format the message using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

The following is a sample login message configuration:

```
[edit]
system {
  login {
    message "\n\n\n\tUNAUTHORIZED USE OF THIS SYSTEM\n
\tIS STRICTLY PROHIBITED!\n\n\tPlease contact
\t'company-noc@company.com\t' to gain\naccess
to this equipment if you need authorization.\n\n\n";
  }
}
```

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet router1
Trying 1.1.1.1...
Connected to router1.
Escape character is '^J'.
```

```
UNAUTHORIZED USE OF THIS SYSTEM
IS STRICTLY PROHIBITED!
```

```
Please contact 'company-noc@company.com' to gain
access to this equipment if you need authorization.
```

```
router1 (tty0)
```

```
login:
```

A system login message appears before the user logs in. A system login announcement appears after the user logs in.

- [Defining Junos OS Login Classes](#)
 - [message on page 257](#)

Configuring the Junos OS to Extend the Default Port Address Range

By default, the upper range of a port address is 5000. You can increase the range from which the port number can be selected to decrease the probability that someone can determine your port number.

- To configure the Junos OS to extend the default port address range, include the **source-port** statement at the **[edit system internet-options]** hierarchy level:

```
[edit system internet-options]
source-port upper-limit upper-limit;
```

upper-limit *upper-limit* is the upper limit of a source port address and can be a value from 5000 through 65,355.

- Related Documentation**
- [Configuring the Junos OS to Disable TCP RFC 1323 Extensions](#)
 - [Configuring the Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses](#)
 - [source-port on page 283](#)

Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

To limit the rate at which ICMPv4 messages can be generated and received by the Routing Engine, include the **icmpv4-rate-limit** statement at the **[edit system internet-options]** hierarchy level:

```
icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
```

The bucket size is the number of seconds in the rate-limiting bucket. The packet rate is the rate-limiting packets earned per second. Specify a **bucket-size** from 0 through 4294967295 seconds. The default value is 5 seconds. Specify a **packet-rate** from 0 through 4,294,967,295. The default value is 1000.

- Related Documentation**
- [icmpv4-rate-limit on page 249](#)

Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets

By default, the source address included in locally generated Transmission Control Protocol/IP (TCP/IP) packets, such as FTP traffic, and in User Datagram Protocol (UDP) and IP packets, such as Network Time Protocol (NTP) requests, is chosen as the local address for the interface on which the traffic is transmitted. This means that the local address chosen for packets to a particular destination might change from connection to connection based on the interface that the routing protocol has chosen to reach the destination when the connection is established. If multiple equal-cost next hops are present for a destination, locally generated packets use the **lo0** address as a source.

- To configure the software to select a fixed address to use as the source for locally generated IP packets, include the **default-address-selection** statement at the **[edit system]** hierarchy level:

```
[edit system]  
default-address-selection;
```

If you include the **default-address-selection** statement in the configuration, the Junos OS chooses the system default address as the source for most locally generated IP packets. The default address is usually an address configured on the **lo0** loopback interface. For example, if you specified that SSH and telnet use a particular address, but you also have **default-address selection** configured, the system default address is used.

**Related
Documentation**

- [default-address-selection on page 241](#)

Configuring NTP Authentication Keys

Time synchronization can be authenticated to ensure that the switch obtains its time services only from known sources. By default, network time synchronization is unauthenticated. The switch will synchronize to whatever system appears to have the most accurate time. We strongly encourage you to configure authentication of network time services.

To authenticate other time servers, include the **trusted-key** statement at the **[edit system ntp]** hierarchy level. Only time servers that transmit network time packets containing one of the specified key numbers are eligible to be synchronized. Additionally, the key needs to match the value configured for that key number. Other systems can synchronize to the local switch without being authenticated.

```
[edit system ntp]  
trusted-key [ key-numbers ];
```

Each key can be any 32-bit unsigned integer except 0. Include the **key** option in the **peer**, **server**, or **broadcast** statements to transmit the specified authentication key when transmitting packets. The key is necessary if the remote system has authentication enabled so that it can synchronize to the local system.

To define the authentication keys, include the **authentication-key** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
authentication-key key-number type value password;
```

number is the key number, **type** is the authentication type (only Message Digest 5 [MD5] is supported), and **password** is the password for this key. The key number, type, and password must match on all systems using that particular key for authentication.

**Related
Documentation**

- [NTP Time Server and Time Services Overview on page 31](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 177](#)

- [trusted-key on page 305](#)
- *authentication-key*

Configuring the NTP Time Server and Time Services

When you use NTP, configure the router or switch to operate in one of the following modes:

- Client mode
- Symmetric active mode
- Broadcast mode
- Server mode

The following topics describe how to configure these modes of operation:

1. [Configuring the Router or Switch to Operate in Client Mode on page 143](#)
2. [Configuring the Router or Switch to Operate in Symmetric Active Mode on page 144](#)
3. [Configuring the Router or Switch to Operate in Broadcast Mode on page 144](#)
4. [Configuring the Router or Switch to Operate in Server Mode on page 144](#)

Configuring the Router or Switch to Operate in Client Mode

To configure the local router or switch to operate in client mode, include the **server** statement and other optional statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
server address <key key-number> <version value> <prefer>;
authentication-key key-number type type value password;
boot-server address;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement, as described in .

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in client mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$EgfcvX7VY4ZEcwgoHjkP5Q3CuREyv87";
boot-server 10.1.1.1;
```

```
server 10.1.1.1 key 1 prefer;  
trusted-key 1;
```

Configuring the Router or Switch to Operate in Symmetric Active Mode

To configure the local router or switch to operate in symmetric active mode, include the **peer** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
peer address <key key-number> <version value> <prefer>;
```

Specify the address of the remote system. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2 or 3, include the **version** option.

If you configure more than one remote system, you can mark one system preferred by including the **prefer** option:

```
peer address <key key-number> <version value> prefer;
```

Configuring the Router or Switch to Operate in Broadcast Mode

To configure the local router or switch to operate in broadcast mode, include the **broadcast** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
broadcast address <key key-number> <version value> <ttl value>;
```

Specify the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2, or 3, include the **version** option.

Configuring the Router or Switch to Operate in Server Mode

In server mode, the router or switch acts as an NTP server for clients when the clients are configured appropriately. The only prerequisite for “server mode” is that the router or switch must be receiving time from another NTP peer or server. No other configuration is necessary on the router or switch.

To configure the local router or switch to operate as an NTP server, include the following statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
authentication-key key-number type type value password;
```

```
server address <key key-number> <version value> <prefer>;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, or 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in server mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$tXERuBEreWx-wtuLNdboaUjH.T3AtOESe";
server 172.17.27.46 prefer;
trusted-key 1;
```

Specifying the Physical Location of the Switch

To specify the physical location of the switch, specify the following options for the **location** statement at the **[edit system]** hierarchy level:

- **altitude *feet***—Number of feet above sea level.
- **building *name***—Name of the building, 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code *code***—Two-letter country code.
- **floor *number***—Floor in the building.
- **hcoord *horizontal-coordinate***—Bellcore Horizontal Coordinate.
- **lata *service-area***—Long-distance service area.
- **latitude *degrees***—Latitude in degree format.
- **longitude *degrees***—Longitude in degree format.
- **npa-nxx *number***—First six digits of the phone number (area code and exchange).
- **postal-code *postal-code***—Postal code.
- **rack *number***—Rack number.
- **vcoord *vertical-coordinate***—Bellcore Vertical Coordinate.

The following example shows how to specify the physical location of the switch:

```
[edit system]
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

**Related
Documentation**

- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 174](#)

Configuring the Root Password

The Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password.

NOTE: If you configure a blank password using the `encrypted-password` statement at the `[edit system root-authentication]` hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as superuser and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the `[edit system]` hierarchy level and configuring one of the password options:

```
[edit system]
root-authentication {
  (encrypted-password "password" | plain-text-password);
  load-key-file URL filename;
  ssh-dsa "public-key" <from hostname>;
  ssh-ecdsa "public-key" <from hostname>;
  ssh-rsa "public-key" <from hostname>;
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@host# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
 - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
 - Valid passwords must contain at least one change of case or character class.

You can use the **load-key-file** *URL filename* statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file** *URL* statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Optionally, you can use the **ssh-dsa**, **ssh-ecdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@host# set root-authentication load-key-file my-host:.ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
  SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

Related Documentation

- [Recovering the Root Password](#)

Configuring the Router or Switch to Listen for Broadcast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet by including the **broadcast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
broadcast-client;
```

When the router or switch detects a broadcast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *broadcast client* mode, in which it listens for, and synchronizes to, succeeding broadcast messages.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

Related Documentation

- [Configuring the Router or Switch to Listen for Multicast Messages Using NTP on page 148](#)
- [Configuring the NTP Time Server and Time Services on page 143](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 177](#)

Configuring the Router or Switch to Listen for Multicast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet by including the **multicast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
multicast-client <address>;
```

When the router or switch receives a multicast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *multicast client* mode, in which it listens for, and synchronizes to, succeeding multicast messages.

You can specify one or more IP addresses. (You must specify an address, not a hostname.) If you do, the router or switch joins those multicast groups. If you do not specify any addresses, the software uses **224.0.1.1**.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

Related Documentation

- [Configuring the Router or Switch to Listen for Broadcast Messages Using NTP on page 148](#)
- [Configuring the NTP Time Server and Time Services on page 143](#)

Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]
login-alarms;
```

For more information on the **show system alarms** command, see the [CLI Explorer](#).

- Related Documentation**
- *System Alarms on J Series Routers*
 - [show system alarms on page 872](#)

Configuring Time-Based User Access

The Junos OS enables you to configure time-based restrictions for user access to log in to a device. This is useful for restricting the time and duration of user logins for all users belonging to a login class. You can specify the days of the week when users can log in, the access start time, and the access end time.

- To configure user access on specific days of the week, without any restrictions on the duration of login, include the **allowed-days** statement only.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
  }
}
```

- To configure user access on all the days of the week for a specific duration, include the **access-start** and **access-end** statements only.

```
[edit system]
login {
  class class-name {
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

- To configure user access on specific days of the week for a specified duration, include the **allowed-days**, **access-start**, and **access-end** statements.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

Specify the start time and end time in **HH:MM** (24-hour) format, where **HH** represents the hours and **MM** represents the minutes.

NOTE: Access start time and end time that spans across 12:00 AM on a specified day results in the user having access until the next day, even if the access day is not explicitly configured. For instance, the following configuration results in the user having access until 6:00 AM on Tuesday and Thursday, although the **allowed-days** statement specifies access only on Monday and Wednesday:

```
[edit system]
login {
  class operator-night-shift {
    allowed-days [ monday wednesday ];
    access-start 2000;
    access-end 0600;
  }
}
```

Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.
Warning: session will be closed in 1 minute if there is no activity
Warning: session will be closed in 10 seconds if there is no activity
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

 - *idle-timeout*
 - [idle-timeout on page 250](#)

Configuring a QFX3500 Device as a Standalone Switch

If you are using the QFX3500 device as a standalone switch, you must perform the initial configuration of the QFX3500 device through the console port using the command-line interface (CLI). If you are using the QFX3500 as a Node device in a QFX3000 QFabric system, you instead perform the initial setup of a QFabric system on a QFX3100 Director device (see *Performing the QFabric System Initial Setup on a QFX3100 Director Group*).

Before you begin connecting and configuring a QFX3500 device, set the following parameter values on the console server or PC:

- Baud Rate—9600
- Flow Control—None
- Data—8
- Parity—None
- Stop Bits—1
- DCD State—Disregard

To connect and configure the device from the console:

1. Connect the console port to a laptop or PC using the supplied RJ-45 cable and RJ-45 to DB-9 adapter. The console (**CON**) port is located on the front panel of the device.
2. Log in as **root**. There is no password. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

```
login: root
```
3. Start the CLI.

```
root@% cli
```
4. Enter configuration mode.

```
root> configure
```

5. Add a password to the root administration user account.

```
[edit]
root@# set system root-authentication plain-text-password
New password: password
Retype new password: password
```

6. (Optional) Configure the name of the device. If the name includes spaces, enclose the name in quotation marks (" ").

```
[edit]
root@# set system host-name host-name
```

7. Configure the default gateway.

```
[edit]
root@# set routing-options static route default next-hop address
```

8. Configure the IP address and prefix length for the device management interface.

```
[edit]
root@# set interfaces me0 unit 0 family inet address address/prefix-length
```

CAUTION: Configuring the two management Ethernet interfaces within the same subnet is not supported.

NOTE: The management ports are on the front panel of the QFX3500 device. They are labeled C0 and C1 on the front panel. In the CLI they are referred to as me0 and me1.

9. (Optional) Configure the static routes to remote prefixes with access to the management port.

```
[edit]
root@# set routing-options static route remote-prefix next-hop destination-ip retain
no-readvertise
```

10. Enable telnet service.

```
[edit]
root@# set system services telnet
```

NOTE: When Telnet is enabled, you cannot log in to a QFX3500 device through Telnet using root credentials. Root login is allowed only for SSH access.

11. Commit the configuration to activate it on the device.

```
[edit]
root@# commit
```

Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

NOTE: In the following procedure, we assume that you are creating the emergency boot device on a QFX device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX device:

1. Use FTP to copy the installation media image into the `/var/tmp` directory on the QFX device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the `su` command:

```
% su
Password: password
```

NOTE: The password is the root password for the QFX device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 device:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
```

```
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Creating a Snapshot and Using It to Boot a QFX Series Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

- [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 154](#)
- [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 155](#)
- [Creating a Snapshot on the Alternate Slice of the Boot Media on page 155](#)

Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the QFX Series switch USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

```
user@switch> request system snapshot partition
```

NOTE: This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.
 - To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```
 - To reboot the switch using a snapshot in a specific partition on the USB flash drive:

```
user@switch> request system reboot slice 1
```

Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:

```
user@switch> request system snapshot partition
```

NOTE: This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.
 - To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```
 - To reboot the switch using a snapshot in a specific partition in internal memory:

```
user@switch> request system reboot slice 1
```

Creating a Snapshot on the Alternate Slice of the Boot Media

The alternate slice of the boot media contains a backup software image that the switch can boot from if it is unable to boot from the primary slice. When you upgrade software, the new software image gets copied only to the primary slice of the boot media.

To create a snapshot of the currently booted software image on the backup slice of the boot media:

```
user@switch> request system reboot slice alternate
```

After the system boots up, you will see the following message before the login prompt:

WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted up from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

The system will generate an alarm indicating that the switch has booted from the backup slice.

**Related
Documentation**

- [Verifying That a System Snapshot Was Created on a QFX Series Switch](#)
- [Understanding System Snapshot on QFX Series Switches on page 46](#)

Creating a Snapshot and Using It to Boot a QFX5100 Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the **/config** directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. You can use the snapshot to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

- [Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Switch on page 156](#)

Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on an external USB flash drive after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on an external USB flash drive:

- An external USB flash drive that meets the QFX Series switch USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on the external USB flash drive and use it to boot the switch:

1. Insert the external USB flash drive.
2. Issue the **request system snapshot** command.
3. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.

- Insert the external USB flash drive.
- Power cycle the device.

The external USB flash drive is detected.

- The software prompts you with the following options:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
Install Junos Snapshot [13.2-20131115_x_132_x51_vjunos.0
Boot to host shell [debug]
```

- Select **Install Junos Snapshot** to install the snapshot located on the external USB flash drive to the switch.

The switch copies the software from the external USB flash drive, occasionally displaying status messages. When the software is finished being copied from the external USB flash drive to the QFX5100 switch, the QFX5100 switch then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the switch displays the Junos OS login prompt:

```
root@switch#
```

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

```
Aug 21 12:36:30.401 2006
```

NOTE: Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the **[edit system syslog file filename]** hierarchy level along with the **time-format** statement, the **time-format** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

- Related Documentation**
- [Single-Chassis System Logging Configuration Overview](#)
 - [Examples: Configuring System Logging](#)

Mapping the Hostname of the Switch to IP Addresses

To map a hostname of a switch to one or more IP addresses, include the **inet** statement at the **[edit system static-host-mapping *hostname*]** hierarchy level:

```
[edit system]
static-host-mapping {
  hostname {
    inet [ addresses ];
    alias [ aliases ];
  }
}
```

hostname is the name specified by the **host-name** statement at the **[edit system]** hierarchy level.

For each host, you can specify one or more aliases.

Methods for Configuring Junos OS

You can use any of the methods shown in [Table 48 on page 159](#) to configure Junos OS:

Table 48: Methods for Configuring Junos OS

Method	Description
Command-line interface (CLI)	Create the configuration for the device using the CLI. You can enter commands from a single command line, and scroll through recently executed commands.
ASCII file	Load an ASCII file containing a configuration that you created earlier, either on this system or on another system. You can then activate and run the configuration file, or you can edit it using the CLI and then activate it.
J-Web graphical user interface (GUI)	Use the J-Web graphical user interface (GUI) to configure the device. J-Web enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser. The J-Web GUI is preinstalled on J Series Services Routers and is an optional software package that can be installed on M Series and T Series routers. J-Web is not available for the QFX Series.
Junos XML management protocol (API)	Use Junos XML protocol Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the Junos XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The Junos XML management protocol is customized for Junos OS, and operations in the API are equivalent to those in the Junos OS CLI.
NETCONF application programming interface (API)	Use NETCONF Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the NETCONF XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The NETCONF XML management protocol includes features that accommodate the configuration data models of multiple vendors.
Configuration commit scripts	Create scripts that run at commit time to enforce custom configuration rules. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). Commit scripts are not available for the QFX Series.

The following sections contain complete descriptions of the methods you can use to configure Junos OS:

- [Junos OS Command-Line Interface \(CLI\) on page 160](#)
- [ASCII File on page 160](#)
- [J-Web Package on page 160](#)
- [Junos XML Management Protocol Software on page 161](#)

- [NETCONF XML Management Protocol Software on page 161](#)
- [Configuration Commit Scripts on page 161](#)

Junos OS Command-Line Interface (CLI)

The Junos OS CLI is a straightforward command interface. You use Emacs-style keyboard sequences to move around on a command line and scroll through a buffer that contains recently executed commands. You type commands on a single line, and the commands are executed when you press the Enter key. The CLI also provides command help and command completion. For more information about the CLI, see the *CLI User Guide* and [CLI Explorer](#).

ASCII File

You can load an ASCII file containing a configuration that you created earlier, either on this system or another system. You can then activate and run the configuration file as is, or you can edit it using the CLI and then activate it.

J-Web Package

As an alternative to entering CLI commands, the Junos OS supports the J-Web graphical user interface (GUI). The J-Web user interface enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled.

The J-Web user interface is preinstalled on J Series Services Routers. It is provided as an optional, licensed software package (jweb package) on M Series and T Series routers. The jweb package is not included in jinstall and jbundle software bundles. It must be installed separately. To install the package on M Series and T Series routers, follow the procedure described in the *Installation and Upgrade Guide*.

J-Web supports weak (56-bit) encryption by default. This enables international customers to install J-Web and use HTTPS connections for J-Web access. Domestic customers can also install the jcrypto strong encryption package. This package automatically overrides the weak encryption. For more information about the J-Web GUI, see the *J-Web Interface User Guide*.

NOTE: Because the J-Web package is bundled separately from other packages, it is possible to have a version mismatch between J-Web and other Junos OS packages you have installed.

To check for a version mismatch, use the `show system alarms` CLI command. If the version number does not match exactly, a system alarm appears. For example, if you install the 7.4R1.2 jroute package and the 7.4R1.1 jweb package, an alarm is activated. For more information on the `show system alarms` command, see the [CLI Explorer](#).

Junos XML Management Protocol Software

The Junos XML management protocol is an Extensible Markup Language (XML) application that client applications use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and operations in the API are equivalent to Junos OS CLI configuration mode commands. The Junos XML management protocol includes a set of Perl modules that enable client applications to communicate with a Junos XML protocol server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and Junos XML management protocol software, see the *Junos XML Management Protocol Developer Guide*.

NETCONF XML Management Protocol Software

The NETCONF XML management protocol is an Extensible Markup Language (XML) application that client applications can use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and includes features that accommodate the configuration data models of multiple vendors. The NETCONF XML management protocol includes a set of Perl modules that enable client applications to communicate with a NETCONF server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and NETCONF XML management protocol software, see the *NETCONF XML Management Protocol Developer Guide*.

Configuration Commit Scripts

You can create and use scripts that run at commit time to enforce custom configuration rules. If a configuration breaks the custom rules, the script can generate actions that the Junos OS performs. These actions include:

- Generating custom error messages
- Generating custom warning messages
- Generating custom system log messages
- Making changes to the configuration

Configuration commit scripts also enable you to create macros, which expand simplified custom aliases for frequently used configuration statements into standard Junos configuration statements. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). For more information, see the *Junos OS Automation Library*.

Related Documentation

- *Junos OS Configuration from External Devices*

Modifying the Default Time Zone for a Router or Switch Running Junos OS

The default local time zone on the router or switch is UTC (Coordinated Universal Time, formerly known as Greenwich Mean Time, or GMT).

- To modify the local time zone, include the **time-zone** statement at the **[edit system]** hierarchy level:

```
[edit system]
time-zone (GMT hour-offset | time-zone);
```

You can use the **GMT *hour-offset*** option to set the time zone relative to UTC (GMT) time. By default, ***hour-offset*** is 0. You can configure this to be a value from -14 to +12.

You can also specify the **time-zone** value as a string such as PDT (Pacific Daylight Time) or WET (Western European Time), or specify the continent and major city.

NOTE: Junos OS complies with the POSIX time-zone standard, which is counter-intuitive to the way time zones are generally indicated relative to UTC. A time zone ahead of UTC (east of the Greenwich meridian) is commonly indicated as GMT +*n*; for example, the Central European Time (CET) zone is indicated as GMT +1. However, this is not true for POSIX time zone designations. POSIX indicates CET as GMT-1. If you include the **set system time-zone GMT+1** statement for a router in the CET zone, your router time will be set to one hour behind GMT, or two hours behind the actual CET time. For this reason, you might find it easier to use the POSIX time-zone strings, which you can list by entering **set system time-zone ?**.

For the time zone change to take effect for all processes running on the router or switch, you must reboot the router or switch.

The following example shows how to change the current time zone to **America/New_York**:

```
[edit]
user@host# set system time-zone America/New_York
[edit]
user@host# show
system {
    time-zone America/New_York;
}
```

Related Documentation

- [NTP Time Server and Time Services Overview on page 31](#)
- [Setting a Custom Time Zone on Routers or Switches Running Junos OS on page 165](#)

Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>          Execute this command
```

at	Time at which to perform the operation
in	Number of minutes to delay before operation
media	Boot media for next boot
message	Message to display to all users
	Pipe through a command

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
at             Time at which to perform the operation
in             Number of minutes to delay before operation
media          Boot media for next boot
message        Message to display to all users
|             Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1.

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related
Documentation**

- [Understanding Configuration Files on page 1126](#)
- [Loading a Previous Configuration File on page 1136](#)
- [Reverting to the Rescue Configuration on page 165](#)

Reverting to the Default Factory Configuration by Using the **request system zeroize** Command

The **request system zeroize** command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the **request system zeroize media** command.

CAUTION: Before issuing **request system zeroize**, use the **request system snapshot** command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the **request system zeroize** command:

1.

```
user@switch> request system zeroize
warning: System will be rebooted and may not boot without configuration
Erase all data, including configuration and log files? [yes,no] (yes)
```
2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch. See or [“Configuring a QFX3500 Device as a Standalone Switch” on page 151](#)

**Related
Documentation**

- [request system zeroize on page 445](#)

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

Related Documentation

- [Setting or Deleting the Rescue Configuration on page 1145](#)

Saving Core Files Generated by Junos OS Processes

By default, when an internal Junos OS process generates a core file, the file and associated context information are saved for debugging purposes in a compressed tar file named **/var/tmp/process-name.core.core-number.tgz**. The contextual information includes the configuration and system log message files.

- To disable the saving of core files and associated context information:

```
[edit system]
no-saved-core-context;
```

- To save the core files only:

```
[edit system]
saved-core-files number;
```

Where **number** is the number of core files to save and can be a value from 1 through 10.

- To save the core files along with the contextual information:

```
[edit system]
saved-core-context;
```

Related Documentation

- [Viewing Core Files from Junos OS Processes on page 171](#)

Setting a Custom Time Zone on Routers or Switches Running Junos OS

You can update the time zone database information on routers or switches running Junos OS. This feature simplifies time zone management in devices running Junos OS by allowing

for future unforeseen time zone database adjustments. You can configure your router or switch to use a custom time zone database file that you create to meet your requirements by editing an existing time zone database file.

Tasks for setting a custom time zone are:

1. [Importing and Installing Time Zone Files on page 166](#)
2. [Configuring a Custom Time Zone on page 167](#)

Importing and Installing Time Zone Files

To import and install time zone files, follow these steps:

1. Download the time zone files archive and untar them to a temporary directory such as `/var/tmp`:

```
# mkdir -p /var/tmp/tz && cd /var/tmp/tz && rm *
# wget 'ftp://ftp.iana.org/tz/tzdata-latest.tar.gz'
# tar xvfz tzdata*.gz
africa
antarctica
asia
australasia
europe
northamerica
southamerica
pacificnew
etcetera
factory
backward
systemv
solar87
solar88
solar89
iso3166.tab
zone.tab
leapseconds
yearistype.sh
```

NOTE: If needed, you can edit the above untarred files to create or modify time zones.

2. Select the names of time zone files to compile and feed them to the following script. For example, to generate **northamerica** and **asia** tz files:

```
# /usr/libexec/ui/compile-tz northamerica asia
```

3. Enable the use of the generated tz files using the CLI:

```
[edit]
# set system use-imported-time-zones
[edit]
# set system time-zone ?
```

This should show the newly generated tz files in `/var/db/zoneinfo/`.

4. Set the time zone and commit the configuration:

```
[edit]
# set system time-zone <your-time-zone>
# commit
```

5. Verify that the time zone change has taken effect:

```
[edit]
# run show system uptime
```

Configuring a Custom Time Zone

To use a custom time zone, follow these steps:

1. Download a time zones archive (from a known or designated source) to the router or switch. Compile the time zone archive using the `zic` time zone compiler, which generates `tz` files.
2. Using the CLI, configure the router or switch to enable the use of the generated `tz` files as follows:

```
[edit]
user@host# set system use-imported-time-zones
```

3. Display the imported time zones (saved in the directory `/var/db/zoneinfo/`):

```
[edit]
user@host# set system time-zone ?
```

If you do not configure the router to use imported time zones, the Junos OS default time zones are shown (saved in the directory `/usr/share/zoneinfo/`).

Related Documentation

- *NTP Overview*
- [NTP Time Server and Time Services Overview on page 31](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 177](#)
- *use-imported-time-zones*

Setting the Date and Time

1. Enter operational mode in the CLI.
2. Enter the following command:

```
user@switch> set date YYYYMMDDHHMM.ss source-address
```

For example, the following command sets the date and time.

```
user@switch# set date 201102151010.55
```

3. To set the date and time from an NTP server, enter the following command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from an NTP server:

```
user@switch# set date ntp 200.40.40.1
```

4. To set the date and time from more than one NTP server, enter the same command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from more than one NTP server:

```
user@switch# set date ntp 200.40.40.1 200.40.40.2
```

Related Documentation

- *set date*

Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

NOTE: Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

allow-commands = "(monitor.*)|(ping.*)|(show.*)|(exit)" . Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

Synchronizing and Coordinating Time Distribution Using NTP

Using NTP to synchronize and coordinate time distribution in a large network involves these tasks:

1. [Configuring NTP on page 170](#)
2. [Configuring the NTP Boot Server on page 170](#)
3. [Specifying a Source Address for an NTP Server on page 170](#)

Configuring NTP

- To configure NTP on the router or switch, include the **ntp** statement at the **[edit system]** hierarchy level:

```
[edit system]
ntp {
  authentication-key number type type value password;
  boot-server (address | hostname);
  broadcast <address> <key key-number> <version value> <ttn value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

Configuring the NTP Boot Server

When you boot the router or switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP will not be able to synchronize to a time server if the server's time appears to be very far off of the local router's or switch's time.

- To configure the NTP boot server, include the **boot-server** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
boot-server (address | hostname);
```

Specify either the IP address or the hostname of the network server.

Specifying a Source Address for an NTP Server

For IP version 4 (IPv4), you can specify that if the NTP server configured at the **[edit system ntp]** hierarchy level is contacted on one of the loopback interface addresses, the reply always uses a specific source address. This is useful for controlling which source address NTP uses to access your network when it is either responding to or sending an NTP client request from your network.

To configure the specific source address that the reply will always use, and the source address that requests initiated by NTP server will use, include the **source-address** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

NOTE: If a firewall filter is applied on the loopback interface, ensure that the source address specified for the NTP server at the **[edit system ntp]** hierarchy level is explicitly included as one of the match criteria in the firewall filter. This enables the Junos OS to accept traffic on the loopback interface from the specified source address.

The following example shows a firewall filter with the source address 10.0.10.100 specified in the **from** statement included at the **[edit firewall filter firewall-filter-name]** hierarchy:

```
[edit firewall filter Loopback-Interface-Firewall-Filter]
term Allow-NTP {
  from {
    source-address {
      172.17.27.46/32; // IP address of the NTP server
      10.0.10.100/32; // Source address specified for the NTP server
    }
  }
  then accept;
}
```

If no source address is configured for the NTP server, include the primary address of the loopback interface in the firewall filter.

Viewing Core Files from Junos OS Processes

When an internal Junos process generates a core file, the output found at **/var/crash/** and **/var/tmp/** can now be viewed. This provides a quick method of finding core issues across large networks.

Use the CLI command **show system core-dumps** to view core files.

```
root@host> show system core-dumps
-rw----- 1 root  wheel  268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root  field   3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root  wheel   27775914 Jun 18 17:59 /var/crash/kernel.0
```

Configuration Examples

- [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 172](#)
- [Example: Configuring the Domain Name for the Router or Switch on page 174](#)
- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 174](#)
- [Example: Configuring NTP on page 174](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 177](#)

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 172](#)
- [Overview on page 172](#)
- [Configuration on page 172](#)

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**s, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
```

```
set system login password maximum-length 22
```

```
set system login password minimum-numeric 1
```

```
set system login password minimum-upper-cases 1
```

```
set system login password minimum-lower-cases 1
```

```
set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure

This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.

```
user@host> edit
[edit]
user@host# edit system login password
```

2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```

3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```

4. Require users to set a password that has at least one punctuation-class character and at least one number.

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

Example: Configuring the Domain Name for the Router or Switch

The following example shows how to configure the router or switch domain name:

```
[edit]
user@host# set system domain-name company.net
[edit]
user@host# show
system {
    domain-name company.net;
}
```

- Related Documentation**
- [domain-name on page 246](#)
 - [Configuring the Domain Name for the Router or Switch on page 136](#)

Example: Configuring the Name of the Switch, IP Address, and System ID

The following example shows how to configure the switch name, map the name to an IP address and alias, and configure a system identifier:

```
[edit]
user@switcht# set system host-nameswitch-sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 inet 192.168.1.77
[edit]
user@switcht# set system static-host-mapping switch-sj1 alias sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 sysid 1921.6800.1077
[edit]
user@switcht# show
system {
    host-name switch-sj1;
    static-host-mapping {
        switch-sj1 {
            inet 192.168.1.77;
            alias sj1;
            sysid 1921.6800.1077;
        }
    }
}
```

- Related Documentation**
- [Configuring Basic Router or Switch Properties](#)

Example: Configuring NTP

The Network Time Protocol (NTP) provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network. NTP uses a returnable-time design in which a distributed subnet of time servers operating in a self-organizing, hierarchical

primary-secondary configuration synchronizes local clocks within the subnet and to national time standards by means of wire or radio. The servers also can redistribute reference time using local routing algorithms and time daemons.

This example shows how to configure NTP:

- [Requirements on page 175](#)
- [Overview on page 175](#)
- [Configuration on page 175](#)
- [Verification on page 176](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later
- A switch connected to a network on which an NTP boot server and NTP server reside

Overview

Debugging and troubleshooting are much easier when the timestamps in the log files of all switches are synchronized, because events that span a network can be correlated with synchronous entries in multiple logs. We recommend using the Network Time Protocol (NTP) to synchronize the system clocks of your switch and other network equipment.

In this example, an administrator wants to synchronize the time in a switch to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date are obtained when the router or switch boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme is used to hash the key value for authentication, which prevents the switch from synchronizing with an attacker's host that is posing as the time server.

Configuration

To configure NTP:

CLI Quick Configuration

To quickly configure NTP, copy the following commands and paste them into the switch's terminal window:

```
[edit system]
set ntp boot-server 10.1.4.1
set ntp server 10.1.4.2
set ntp authentication-key 2 type md5 value "$9$aH1j8"
```

Step-by-Step Procedure

To configure NTP :

1. Specify the boot server:

```
[edit system]
user@switch# set ntp boot-server 10.1.4.1
```
2. Specify the NTP server:

- ```
[edit system]
user@switch# set ntp server 10.1.4.2
```
3. Specify the key number, authentication type (MD5), and key for authentication:

```
[edit system]
user@switch# set ntp authentication-key 2 type md5 value "9aH1j8"
```

**Results** Check the results:

```
[edit system]
user@switch# show
ntp {
 boot-server 10.1.4.1;
 authentication-key 2 type md5 value "9aH1j8"; ## SECRET-DATA
 server 10.1.4.2;
}
```

---

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Checking the Time on page 176](#)
- [Displaying the NTP Peers on page 176](#)
- [Displaying the NTP Status on page 177](#)

#### *Checking the Time*

**Purpose** Check the time that has been set on the switch.

**Action** Enter the **show system uptime** operational mode command to display the time.

```
user@switch> show system uptime
fpc0:

Current time: 2009-06-12 12:49:03 PDT
System booted: 2009-05-15 06:24:43 PDT (4w0d 06:24 ago)
Protocols started: 2009-05-15 06:27:08 PDT (4w0d 06:21 ago)
Last configured: 2009-05-27 14:57:03 PDT (2w1d 21:52 ago) by admin1
12:49PM up 28 days, 6:24, 1 user, load averages: 0.05, 0.06, 0.01
```

**Meaning** The output shows that the current date and time are June 12, 2009 and 12:49:03 PDT. The switch booted 4 weeks, 6 hours, and 24 minutes ago, and its protocols were started approximately 3 minutes before it booted. The switch was last configured by user **admin1** on May 27, 2009, and there is currently one user logged in to the switch.

The output also shows that the load average is 0.05 seconds for the last minute, 0.06 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

#### *Displaying the NTP Peers*

**Purpose** Verify that the time has been obtained from an NTP server.

**Action** Enter the **show ntp associations** operational mode command to display the NTP server from switch obtained its time.

```
user@switch> show ntp associations
 remote refid st t when poll reach delay offset jitter
=====
*ntp5.domain1.ne .GPS. 1 u 414 1024 377 3.435 4.002 0.765
```

**Meaning** The asterisk (\*) in front of the NTP server name, or peer, indicates that the time is synchronized and obtained from this server. The delay, offset, and jitter are displayed in milliseconds.

### *Displaying the NTP Status*

**Purpose** View the configuration of the NTP server and the status of the system.

**Action** Enter the **show ntp status** operational mode command to view the status of the NTP.

```
user@switch> show ntp status
status=0644 leap_none, sync_ntp, 4 events, event_peer/strat_chg,
version="ntpd 4.2.0-a Mon Apr 13 19:09:05 UTC 2009 (1)",
processor="powerpc", system="JUNOS9.5R1.8", leap=00, stratum=2,
precision=-18, rootdelay=2.805, rootdispersion=42.018, peer=48172,
refid=172.17.28.5,
reftime=cddd397a.60e6d7bf Fri, Jun 12 2009 13:30:50.378, poll=10,
clock=cddd3b1b.ec5a2bb4 Fri, Jun 12 2009 13:37:47.923, state=4,
offset=3.706, frequency=-23.018, jitter=1.818, stability=0.303
```

**Meaning** The output shows status information about the switch and the NTP.

## **Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization**

Debugging and troubleshooting are much easier when the timestamps in the log files of all the routers or switches are synchronized, because events that span the network can be correlated with synchronous entries in multiple logs. We strongly recommend using the Network Time Protocol (NTP) to synchronize the system clocks of routers, switches, and other network equipment.

By default, NTP operates in an entirely unauthenticated manner. If a malicious attempt to influence the accuracy of a router or switch's clock succeeds, it could have negative effects on system logging, make troubleshooting and intrusion detection more difficult, and impede other management functions.

The following sample configuration synchronizes all the routers or switches in the network to a single time source. We recommend using authentication to make sure that the NTP

peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date is obtained when the router boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme should be used to hash the key value for authentication, which prevents the router or switch from synchronizing with an attacker's host posing as the time server.

```
[edit]
system {
 ntp {
 authentication-key 2 type md5 value "9aHlj8gqQ1gijjghgjgiiii"; # SECRET-DATA
 boot-server 10.1.4.1;
 server 10.1.4.2;
 }
}
```

## accounting

---

```
Syntax accounting {
 destination {
 radius {
 server {
 server-address {
 accounting-port port-number;
 secret password;
 source-address address;
 retry number;
 timeout seconds;
 }
 }
 }
 }
 tacplus {
 server {
 server-address {
 port port-number;
 secret password;
 single-connection;
 timeout seconds;
 }
 }
 }
 }
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure audit of TACACS+ or RADIUS authentication events, configuration changes, and interactive commands.

**Options** The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.</p> <p>For EX-Series switches, set only the time interval between ARP updates.</p>                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>aging-timer</b>—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.</p> <p><b>passive-learning</b> (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.</p> <p><b>Default:</b> 20 minutes</p> <p><b>Range:</b> 1 to 240 minutes</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Release Information      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Options                  | <p><b>encrypted-password "<i>password</i>"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file</b>—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.</p> <p><b>plain-text-password</b>—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>remote-debug-permission</b> (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.</p> <p><b>ssh-dsa "<i>public-key</i>"</b>—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "<i>public-key</i>"</b>—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> |
| Required Privilege Level | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.                                                                                                                                                                                                                                            |
| <b>Default</b>                  | If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b><i>authentication-methods</i></b>—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:</p> <ul style="list-style-type: none"><li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the [edit system login user] hierarchy level.</li><li>• <b>radius</b>—Use RADIUS authentication services.</li><li>• <b>tacplus</b>—Use TACACS+ authentication services.</li></ul> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Configure the server that NTP queries when the router or switch boots to determine the local date and time.</p> <p>When you boot the router or switch, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local router's or switch's time. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the router or switch boots up.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Configure the local router or switch to operate in broadcast mode with the remote system at the specified address to send periodic broadcast messages to a client population. Normally, you include this statement only when the local router or switch is operating as a transmitter.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>address</b>—Broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be <b>224.0.1.1</b>.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer).</p> <p><b>tll value</b>—(Optional) Time-to-live (TTL) value to use.<br/> <b>Range:</b> 1 through 255<br/> <b>Default:</b> 1</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.<br/> <b>Range:</b> 1 through 4<br/> <b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## commit

---

**Syntax**    `commit {  
          allow-transients;  
          direct-access;  
          file filename {  
              checksum (md5 | sha-256 | sha1) hash;  
              optional;  
              refresh;  
              refresh-from url;  
              sourceurl;  
          }  
          refresh;  
          refresh-from url;  
          traceoptions {  
              file <filename> <files number> <size size> <world-readable | no-world-readable>;  
              flag flag;  
              no-remote-trace;  
          }  
          }`

**Hierarchy Level**    [edit system scripts]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    For Junos OS commit scripts, configure the commit-time scripting mechanism.

**Options**    The statements are explained separately.

**Required Privilege Level**    maintenance—To view this statement in the configuration.  
                                  maintenance-control—To add this statement to the configuration.

| <b>Description</b>                                                                                                                                                                                                                             | Compress the current operational configuration file. The file is stored in the file <b>juniper.conf</b> , in the <b>/config</b> file system, along with the last three committed versions of the configuration. However, with large networks, the current configuration file might exceed the available space in the <b>/config</b> file system. Compressing the current configuration file allows the file to fit in the file system, typically reducing the size of the file by 90 percent. The current configuration file is compressed on the second commit of the configuration after the first commit is made to include the <b>compress-configuration-files</b> statement. |
| <div>  <p><b>NOTE:</b> We recommend that you enable compression of the configuration files to minimize the amount of disk space that they require.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Configure the characteristics of the console port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>                  | The console port is enabled and its speed is 9600 baud.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>disable</b>—Disable console login connections.</p> <p><b>insecure</b>—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.</p> <p><b>log-out-on-disconnect</b>—Log out the session when the data carrier on the console port is lost.</p> <p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port: <b>ansi</b>, <b>vt100</b>, <b>small-xterm</b>, or <b>xterm</b>.</p> |
| <b>Required Privilege Level</b> | <p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Use the loopback interface, <b>lo0</b>, as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as <b>fxp0</b>. The <b>lo0</b> interface is the interface to the switch's Routing Engine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>                  | <p>The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:</p> <ul style="list-style-type: none"> <li>• The primary address on the loopback interface <b>lo0</b> that is <i>not</i> <b>127.0.0.1</b> is used.</li> <li>• The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.</li> </ul> <p>By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.</p> <p>An interface's <i>primary address</i> is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's <i>preferred address</i> is the default local address used for packets sourced by the local switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.</p> <p>To configure a different primary address or preferred address, include the <b>primary</b> or <b>preferred</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] or [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] hierarchy levels.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## destination (Accounting)

---

```
Syntax destination {
 radius {
 server {
 server-address {
 accounting-port port-number;
 secret password;
 source-address address;
 retry number;
 timeout seconds;
 }
 }
 }
 tacplus {
 server {
 server-address {
 port port-number;
 secret password;
 single-connection;
 timeout seconds;
 }
 }
 }
 }
```

**Hierarchy Level** [edit system accounting]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**radius** statement added in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the authentication server.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement is used in combination with the <b>change-type</b> statement. If the change type is <b>character-sets</b>, then the number of character sets included in the password is checked against the specified minimum. If the change type is <b>set-transitions</b>, then the number of character set changes in the password is checked against the specified minimum.</p> |
| <b>Default</b>                  | For Junos OS, the minimum number of changes is 1. For Junos-FIPS software, the minimum number of changes is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <i>number</i> —Minimum number of character sets (or character set changes) required for the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>backoff-threshold <i>number</i></b>—Threshold for the number of failed login attempts before the user experiences a delay when attempting to reenter a password. Use the <b>backoff-factor</b> option to specify the length of delay, in seconds.</p> <p><b>Range:</b> 1 through 3</p> <p><b>Default:</b> 2</p> <p><b>backoff-factor <i>seconds</i></b>—Length of delay after each failed login attempt. The length of delay increases by this value for each subsequent login attempt after the value specified in the <b>backoff-threshold</b> option.</p> <p><b>Range:</b> 5 through 10</p> <p><b>Default:</b> 5</p> <p><b>maximum-time <i>seconds</i></b>—Maximum length of time that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured <b>maximum-time</b>, the connection is closed.</p> <p><b>Range:</b> 20 through 300</p> <p><b>Default:</b> 120</p> <p><b>minimum-time <i>seconds</i></b>—Minimum length of time that the connection remains open while the user is attempting to enter a password to log in.</p> <p><b>Range:</b> 20 through 60</p> <p><b>Default:</b> 20</p> <p><b>tries-before-disconnect <i>number</i></b>—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.</p> <p><b>Range:</b> 1 through 10</p> <p><b>Default:</b> 10</p> |

| <b>Description</b>              | Configure the authentication methods for the root-level user, whose username is <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>encrypted-password "password"</b>— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for the <b>encrypted-password</b> option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>plain-text-password</b>—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p> <p><b>ssh-dsa "public-key"</b>—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.</p> <p><b>ssh-rsa "public-key"</b>—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.</p> |
| <b>Required Privilege Level</b> | <p><b>admin</b>—To view this statement in the configuration.</p> <p><b>admin-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | For NTP, configure the switch to operate in client mode with the remote system at the specified server address. In this mode, the local switch can be synchronized with the remote system, but the remote system can never be synchronized with the local switch.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series .                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | For Junos OS commit scripts, specify the location of the source file for an enabled script located in the <code>/var/db/scripts/commit</code> directory. When you include the <b>refresh</b> statement at the same hierarchy level and commit the configuration, the local copy is overwritten by the version stored at the specified URL. |
| <b>Options</b>                  | <i>url</i> —The source specified as an HTTP URL, FTP URL, or scp-style remote file specification.                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | <b>maintenance</b> —To view this statement in the configuration.<br><b>maintenance-control</b> —To add this statement to the configuration.                                                                                                                                                                                                |

## source-address (NTP, RADIUS, System Logging, or TACACS+)

---

|                                 |                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>source-address source-address;</code>                                                                                                                                                                                                                                                                            |
| <b>Hierarchy Level</b>          | [edit system accounting destination radius server <i>server-address</i> ],<br>[edit system accounting destination tacplus server <i>server-address</i> ],<br>[edit system ntp],<br>[edit system radius-server <i>server-address</i> ],<br>[edit system syslog],<br>[edit system tacplus-server <i>server-address</i> ] |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Specify a source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine.                                                                                                                                  |
| <b>Options</b>                  | <i>source-address</i> —Valid IP address configured on one of the switch interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all <b>host hostname</b> statements at the [edit system syslog] hierarchy level.                            |
| <b>Required Privilege Level</b> | <b>system</b> —To view this statement in the configuration.<br><b>system-control</b> —To add this statement to the configuration.                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>alias <i>alias</i></b>—Alias for the hostname.</p> <p><b>hostname</b>—Fully qualified hostname.</p> <p><b>inet <i>address</i></b>—IP address. You can specify one or more IP addresses for the host.</p> <p><b>sysid <i>system-identifier</i></b>—ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address 208.197.169.18 is 2081.9716.9018 in BCD.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## tacplus

---

**Syntax**

```
tacplus {
 server {
 server-address {
 port port-number;
 secret password;
 single-connection;
 timeout seconds;
 }
 }
}
```

**Hierarchy Level** [edit system accounting destination]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure TACACS+.

**Options** *server-address*—Address of the TACACS+ authentication server.  
  
The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description         | Define tracing operations for commit or op scripts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Default             | If you do not include this statement, no script-specific tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options             | <p><b>filename</b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>. By default, commit script process tracing output is placed in the file <code>cscript.log</code> and op script process tracing is placed in the file <code>op-script.log</code>. If you include the <b>file</b> statement, you must specify a filename. To retain the default, you can specify <code>cscript.log</code> or <code>op-script.log</code> as the filename.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed and compressed to <i>trace-file.0.gz</i>. When <i>trace-file</i> again reaches its maximum size, <i>trace-file.0.gz</i> is renamed <i>trace-file.1.gz</i> and <i>trace-file</i> is renamed and compressed to <i>trace-file.0.gz</i>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Log all operations</li><li>• <b>events</b>—Log important events</li><li>• <b>input</b>—Log script input data</li><li>• <b>offline</b>—Generate data for offline development</li><li>• <b>output</b>—Log script output data</li><li>• <b>rpc</b>—Log script RPCs</li><li>• <b>xslt</b>—Log the XSLT library</li></ul> <p><b>no-world-readable</b>—Restrict file access to owner. This is the default.</p> |

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed and compressed to **trace-file.0.gz**. When **trace-file** again reaches its maximum size, **trace-file.0.gz** is renamed **trace-file.1.gz** and **trace-file** is renamed and compressed to **trace-file.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | Define tracing operations for Layer 2 learning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>             | The <b>traceoptions</b> feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p>You can specify the following options:</p> <ul style="list-style-type: none"><li>• <b>no-world-readable</b>—(Optional) Restrict file access to the user who created the file.</li><li>• <b>size <i>size</i></b> —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>files</b> option. Use <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify gigabytes.</li><li>• <b>world-readable</b>—(Optional) Enable unrestricted file access.</li></ul> <p><b>flag <i>flag</i></b> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations.</li><li>• <b>bmac-next-hop</b>—Trace backbone MAC next hop operations.</li><li>• <b>bridge-bmac-next-hop</b>—Trace backbone MAC next hop bridge operations.</li><li>• <b>bridging-interface</b>—Trace interface bridge operations.</li><li>• <b>bridging-domain</b>—Trace bridging domain operations.</li><li>• <b>configuration</b>—Trace configuration operations.</li><li>• <b>flood-next-hop</b>—Trace flood next hop operations.</li><li>• <b>initialization</b>—Trace initialization operations.</li><li>• <b>interface-device</b>—Trace interface device operations.</li><li>• <b>interface-family</b>—Trace interface family operations.</li></ul> |

- **interface-logical**—Trace logical interface operations.
- **ipc**—Trace inter-process communications operations.
- **irb**—Trace integrated routing and bridging operations.
- **isid**—Trace i-tagged service ID operations.
- **kack**—Trace kernel-acknowledgment.
- **learning-domain**—Trace learning domain operations.
- **logical-system**—Trace logical system operations.
- **mac-learning**—Trace MAC address learning.
- **mc-ae**—Trace multichassis aggregated Ethernet interface operations.
- **redundant-trunk-group**—Trace redundant trunk group operations.
- **routing-instance**—Trace routing instance operations.
- **routing-socket**—Trace routing socket operations.
- **storm-control**—Trace storm control operations.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vpls-ping**—Trace Virtual Private VLAN Service (VPLS) ping operations.

**in-memory-debug**—Enable trace parameters in the memory.

**level**—Specify level of debugging output.

**no-remote-trace**—Disable remote tracing.

## CHAPTER 6

# Administration

- [Routine Monitoring on page 307](#)
- [Operational Commands on page 316](#)

### Routine Monitoring

---

- [Monitoring System Process Information on page 307](#)
- [Monitoring System Properties on page 308](#)
- [Monitoring Interface Status and Traffic on page 309](#)
- [Monitoring Zero Touch Provisioning on page 310](#)
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 313](#)
- [Verifying a Unified In-Service Software Upgrade \(ISSU\) on page 314](#)
- [Verifying Autoinstallation Status on page 314](#)
- [Verifying That Automatic Software Download Is Working Correctly on page 315](#)

### Monitoring System Process Information

**Purpose** View the processes running on the QFX Series.

**Action** To view the software processes running on the QFX Series:  
[edit system]  
  
user@switch> [show system processes](#)

**Meaning** [Table 49 on page 307](#) summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

**Table 49: Summary of System Process Information Output Fields**

| Field | Values                     |
|-------|----------------------------|
| PID   | Identifier of the process. |
| Name  | Owner of the process.      |

Table 49: Summary of System Process Information Output Fields (*continued*)

| Field              | Values                                                   |
|--------------------|----------------------------------------------------------|
| State              | Current state of the process.                            |
| CPU Load           | Percentage of the CPU that is being used by the process. |
| Memory Utilization | Amount of memory that is being used by the process.      |
| Start Time         | Time of day when the process started.                    |

  - [show system uptime on page 1025](#)

## Monitoring System Properties

**Purpose** View system properties such as the name and IP address of a QFX Series product and resource usage.

**Action** To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

**Meaning** [Table 50 on page 308](#) summarizes key output fields in the system properties display.

Table 50: Summary of Key System Properties Output Fields

| Field                      | Values                                                                                                  | Additional Information                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>General Information</b> |                                                                                                         |                                                        |
| Serial Number              | Serial number for a QFX Series product.                                                                 |                                                        |
| Junos OS Version           | Version of Junos OS active on the switch, including whether the software is for domestic or export use. | Export software is for use outside the USA and Canada. |
| Hostname                   | Name of the QFX Series product.                                                                         |                                                        |
| IP Address                 | IP address of the QFX Series product.                                                                   |                                                        |
| Loopback Address           | Loopback address.                                                                                       |                                                        |
| Domain Name Server         | Address of the domain name server.                                                                      |                                                        |

Table 50: Summary of Key System Properties Output Fields (*continued*)

| Field                   | Values                                                                                                                                       | Additional Information                                                           |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Time Zone               | Time zone on the QFX Series product.                                                                                                         |                                                                                  |
| Time                    |                                                                                                                                              |                                                                                  |
| Current Time            | Current system time, in Coordinated Universal Time (UTC).                                                                                    |                                                                                  |
| System Booted Time      | Date and time when the QFX Series product was last booted and how long it has been running.                                                  |                                                                                  |
| Protocol Started Time   | Date and time when the protocols were last started and how long they have been running.                                                      |                                                                                  |
| Last Configured Time    | Date and time when a configuration was last committed. This field also shows the name of the user who issued the last <b>commit</b> command. |                                                                                  |
| Load Average            | CPU load average for 1, 5, and 15 minutes.                                                                                                   |                                                                                  |
| Storage Media           |                                                                                                                                              |                                                                                  |
| Internal Flash Memory   | Usage details of internal flash memory.                                                                                                      |                                                                                  |
| External Flash Memory   | Usage details of external USB flash memory.                                                                                                  |                                                                                  |
| Logged in Users Details |                                                                                                                                              |                                                                                  |
| User                    | Username of any user logged in to the switch.                                                                                                |                                                                                  |
| Terminal                | Terminal through which the user is logged in.                                                                                                |                                                                                  |
| From                    | System from which the user has logged in. A hyphen indicates that the user is logged in through the console.                                 |                                                                                  |
| Login Time              | Time when the user logged in.                                                                                                                | This is the <b>user@switch</b> field in <b>show system users</b> command output. |
| Idle Time               | How long the user has been idle.                                                                                                             |                                                                                  |

## Monitoring Interface Status and Traffic

- Purpose** View interface status to monitor interface bandwidth utilization and traffic statistics on the QFX Series product.

- Action**
- To view interface status for all the interfaces, enter [show interfaces xe](#).
  - To view status and statistics for a specific interface, enter [show interfaces xe interface-name](#).
  - To view status and traffic statistics for all interfaces, enter either [show interfaces xe detail](#) or [show interfaces xe extensive](#).

**Meaning** For details about output from the CLI commands, see [show interfaces xe](#).

## Monitoring Zero Touch Provisioning

You can use the console and operational commands to monitor Zero Touch Provisioning.

1. [Using the Console to Monitor Zero Touch Provisioning on page 310](#)
2. [Using System Log Alerts to Monitor Zero Touch Provisioning on page 311](#)
3. [Using Error Messages to Monitor Zero Touch Provisioning on page 311](#)
4. [Using System Log Files to Monitor Zero Touch Provisioning on page 311](#)
5. [Using the show dhcp client binding Command on page 312](#)
6. [Using the show dhcp client statistics Command on page 312](#)

### Using the Console to Monitor Zero Touch Provisioning

---

The following Zero Touch Provisioning (ZTP) activities are displayed on the console during the ZTP process:

- Starting and ending times of ZTP process.
- Lists of bound and unbound DHCP client interfaces.
- DHCP options that DHCP servers send to DHCP clients.
- Logs indicating which interfaces are used for ZTP.
- ZTP parameters that DHCP clients obtain from DHCP servers.
- File names of configuration and image files, names of file servers, protocols used to fetch files, and times when DHCP servers fetch configuration and image files.
- Failure states caused by files not being on servers, or unreachable servers, and time outs.
- Number of attempts made, and number of attempts remaining, for retry in current ZTP cycle.
- Completion of file transfers.
- Installation, reboot, and state of ZTP process.
- Internal state errors and termination of ZTP process.
- Logs for when default routes were added or deleted.

### Using System Log Alerts to Monitor Zero Touch Provisioning

**Purpose** In this example, the system log alert alerts you that the auto-image upgrade will start.

**Action** Use the following system log alert to monitor the auto-image upgrade process.

```
"ALERT:Auto-image upgrade will start. This can terminate config CLI session(s).
Modified configuration will be lost. To stop Auto-image, in CLI do the
following: 'edit; delete chassis auto-image-upgrade; commit'."
```

```
"Checking whether image upgrade is already invoked"
```

**Meaning** This system log alert indicates that the auto-image upgrade will start, and provides information on how to stop the auto-image upgrade process.

### Using Error Messages to Monitor Zero Touch Provisioning

**Purpose** Error messages provide information on which DHCP options are not configured.

**Action** Use the information in the following error message to find out which DHCP options are not configured.

```
"DHCP Log Server Option"
"DHCP Host Name Option"
"DHCP NTP Server Option"
```

**Meaning** The error message indicates that the DHCP log server, hostname, and NTP server options are not configured.

### Using System Log Files to Monitor Zero Touch Provisioning

**Purpose** System log files provide information on the state of the auto-upgrade process, lists of bound and unbound DHCP client interfaces, IP addresses of file servers, names and locations of image and configuration files, and successful and failed attempts at fetching configuration and image files.

**Action** Use the information in the following system log files to monitor the auto-upgrade process.

```
Auto Image Upgrade: Start fetching config-file file from server 1.1.1.1 through
irb using ftp
```

```
Auto Image Upgrade: Tried [2] attempts to fetch config-file file from server
1.1.1.1 through irb. Summary: "Retrieving /config-file
:: Failed to open file.". To retry [4] times.
```

```
Auto Image Upgrade: Tried [4] attempts to fetch config-file file from server
1.1.1.1 through irb. Summary: "Retrieving /config-fileconfig-file
:: Failed to open file.". To retry [2] times.
```

```
Auto Image Upgrade: Tried [6] attempts to fetch config-file file from server
1.1.1.1 through irb. Summary: "Retrieving /config-file
:: Failed to open file.". To retry [0] times.
```

Auto Image Upgrade: All [6] attempts to fetch config-file file from server 1.1.1.1 through irb FAILED. Start retry again in few minutes.

**Meaning** These system log files indicate that there were six failed attempts to fetch the configuration file from the file server, the IP address of the file server, the DHCP client interface name, and the number of times the retry process occurred.

---

### Using the show dhcp client binding Command

**Purpose** Issue the **show dhcp client binding** command to display DHCP client binding information

**Action** Issue the **show dhcp client binding** command to display the IP address of the DHCP client, the hardware address of the DHCP client, number of seconds in which the DHCP client's IP address lease expires, state of the DHCP client IP address in the binding table, and the name of the interface that has active client bindings.

#### show dhcp client binding

```
user@switch# show dhcp client binding
IP address Hardware address Expires State Interface
0.0.0.0 00:22:83:2a:db:dc 0 SELECTING irb.0
6.6.6.13 00:22:83:2a:db:dd 49201 BOUND vme.0
0.0.0.0 00:22:83:2a:db:df 0 SELECTING xe-0/0/0.0
0.0.0.0 00:22:83:2a:db:e0 0 SELECTING xe-0/0/1.0
```

**Meaning** The output of this command shows that there is one client interface that is bound, and that there are three interfaces that are receiving DHCP offers from the DHCP server.

---

### Using the show dhcp client statistics Command

**Purpose** Issue the **show dhcp client statistics** command to display DHCP client statistics.

**Action** Issue the **show dhcp client statistics** command to display DHCP client statistics, such as the number of packets dropped, and the number DHCP and BOOTP messages sent and received.

#### show dhcp client statistics

```
user@switch# show dhcp client statistics
Packets dropped:
 Total 14
 Send error 14
Messages received:
 BOOTREPLY 5
 DHCPOFFER 1
 DHCPACK 4
 DHCPNAK 0
 DHCPFORCERENEW 0
Messages sent:
 BOOTREQUEST 6751
 DHCPDECLINE 0
 DHCPDISCOVER 6747
 DHCPREQUEST 4
 DHCPINFORM 0
 DHCPRELEASE 0
```

|            |   |
|------------|---|
| DHCPRENEW  | 0 |
| DHCPREBIND | 0 |

**Meaning** The output of this command displays how many packets were dropped with errors, the number of BOOTREPLY and DHCPOFFER messages that were received, and the number of BOOTREQUEST and DHCPREQUEST messages that were sent.

## Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- Junos XML Management Protocol Application Programming Interface (API)—Application programmers can use the Junos XML Management Protocol API to monitor and configure Juniper Networks QFX Series products. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring the QFX Series.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF API to monitor and configure Juniper Networks QFX Series products.
- Junos OS commit scripts—You can define scripts to enforce custom configuration tasks, enforce consistency, prevent common mistakes, and more. Every time you commit a new candidate configuration, the active commit scripts are called to inspect the new candidate configuration. If a configuration violates your custom rules, the script can instruct the Junos OS to perform various actions, including making changes to the configuration and generating custom, warning, and system log messages.
- Junos OS Op scripts—You can add your own commands to the operation-mode CLI. You can use these scripts to automate troubleshooting of known network problems and correct them.
- Junos OS event scripts—You can use event scripts to diagnose and fix issues, monitor the overall status of the system, and examine errors periodically. Event scripts are similar to op scripts except that certain events on the switch will trigger these scripts.
- Junos Space—The Junos Space application design allows multiple users concurrent access to its user interface. It also includes applications for network infrastructure automation.

## Verifying a Unified In-Service Software Upgrade (ISSU)

**Purpose** Verify the status of FPCs and their corresponding PICs after the most recent unified ISSU.

**Action** Issue the **show chassis in-service-upgrade** command on the master Routing Engine:

```
user@host> show chassis in-service-upgrade
Item Status Reason
FPC 0 Online
FPC 1 Online
FPC 2 Online
 PIC 0 Online
 PIC 1 Online
FPC 3 Offline Offlined by CLI command
FPC 4 Online
 PIC 1 Online
FPC 5 Online
 PIC 0 Online
FPC 6 Online
 PIC 3 Online
FPC 7 Online
```

**Meaning** See [show chassis in-service-upgrade](#) for more information.

- Related Documentation**

## Verifying Autoinstallation Status

**Purpose** Display the status of the autoinstallation feature.

**Action** From the CLI, enter the **show system autoinstallation status** command.

### Sample Output

```
user@switch> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 10.25.100.1
Interface:
 Name: ge-0/0/0
 State: Configuration Acquisition
 Acquired:
 Address: 192.168.124.75
 Hostname: host-ge-000
 Hostname source: DNS
 Configuration filename: switch-ge-000.conf
 Configuration filename server: 10.25.100.3
 Address acquisition:
```

```

Protocol: DHCP Client
Acquired address: None
Protocol: RARP Client
Acquired address: None
Interface:
Name: ge-0/0/1
State: None
Address acquisition:
Protocol: DHCP Client
Acquired address: None
Protocol: RARP Client
Acquired address: None

```

**Meaning** The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

**Related Documentation**

## Verifying That Automatic Software Download Is Working Correctly

**Purpose** Verify that the automatic software download feature is working correctly.

**Action** Use the `show system services dhcp client interface-name` command to verify that the automatic software download feature has been used to install a software package.

```

user@switch> show system services dhcp client ge-0/0/1.0
Logical Interface Name ge-0/0/1.0
Hardware address 00:0a:12:00:12:12
Client Status bound
Vendor Identifier ether
Server Address 10.1.1.1
Address obtained 10.1.1.89
Lease Obtained at 2009-08-20 18:13:04 PST
Lease Expires at 2009-08-22 18:13:04 PST

DHCP Options :
Name: name-server, Value: [10.209.194.131, 2.2.2.2, 3.3.3.3]
Name: server-identifier, Value: 10.1.1.1
Name: router, Value: [10.1.1.80]
Name: boot-image,
Value: jinstall-ex-4200-9.6R1.5-domestic-signed.tgz
Name: boot-image-location,
Value: 10.1.1.25:/bootfiles/

```

**Meaning** The output from this command shows the name and location of the software package under DHCP options when automatic software download was last used to install a software package. The sample output in DHCP options shows that the last DHCP server message to arrive on the DHCP client had a boot server address of 192.168.1.165 and a boot file named jinstall-ex-4200-9.6R1.5-domestic-signed.tgz. If automatic software download was enabled on this client switch during the last DHCP message exchange, these values were used by the switch to upgrade the software.

| <b>Release Information</b> | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Option <b>fast-synchronize</b> added in Junos OS Release 12.2.<br>Option <b>synchronize scripts</b> introduced in Junos OS Release 13.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | Commit the set of changes to the database and cause the changes to take operational effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>at &lt;"string"&gt;</b>—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.</p> <p><b>string</b> is <b>reboot</b> or the future time to activate the configuration changes. Enclose the <b>string</b> value (including <b>reboot</b>) in quotation marks (" "). You can specify time in two formats:</p> <ul style="list-style-type: none"> <li>A time value in the form <b>hh:mm[:ss]</b> (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the <b>commit at</b> configuration command is issued. Use 24-hour time for the <b>hh</b> value; for example, <b>04:30:00</b> is 4:30:00 AM, and <b>20:00</b> is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.</li> <li>A date and time value in the form <b>yyyy-mm-dd hh:mm[:ss]</b> (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the <b>commit at</b> command is issued. Use 24-hour time for the <b>hh</b> value. For example, <b>2003-08-21 12:30:00</b> is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.</li> </ul> <p>For example, <b>commit at "18:00:00"</b>. For date and time, include both values in the same set of quotation marks. For example, <b>commit at "2005-03-10 14:00:00"</b>.</p> <p>A <i>commit check</i> is performed when you issue the <b>commit at</b> configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.</p> |

**NOTE:** If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at configuration** command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see the [CLI Explorer](#).

**and-quit**—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

**check**—(Optional) Verify the syntax of the configuration, but do not activate it.

**comment** <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab"**.

**confirmed** <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is 1 through 65,535 minutes, and the default is 10 minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

**display detail**—(Optional) Monitors the commit process.

**NOTE:** In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the **more** pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

**fast-synchronize**—(Optional) Configure the commits to run in parallel on both the master and backup Routing Engines to reduce the time taken for commit synchronization.

**NOTE:** The **fast-synchronize** statement is not supported on QFX Series devices when used in a Virtual Chassis.

**synchronize <force> <scripts>**—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the **commit synchronize** command. The Routing Engine on which you execute this command (request Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine are terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

When you issue the **commit synchronize** command with the **scripts** option, the device synchronizes all commit, event, lib, and op scripts from the requesting Routing Engine to the responding Routing Engine and also commits and synchronizes the configuration. If the commit check operation fails for the requesting Routing Engine, the process stops, and the scripts are not copied to the responding Routing Engine. If the commit check or commit operation fails for the responding Routing Engine, the scripts are still synchronized, since the synchronization occurs prior to the commit check operation on the responding Routing Engine.

If the **load-scripts-from-flash** statement is configured for the requesting Routing Engine, the device synchronizes the scripts from flash memory on the requesting Routing Engine to flash memory on the responding Routing Engine. Otherwise, the device synchronizes the scripts from the hard disk on the requesting Routing Engine to the hard disk on the responding Routing Engine. The device synchronizes all scripts regardless of whether they are enabled in the configuration or have been updated since the last synchronization.

**NOTE:** When you issue the **commit synchronize** command, you must use the **apply-groups re0** and **re1** commands. For information about how to use groups, see *Disabling Inheritance of a Junos OS Configuration Group*.

The responding Routing Engine must use Junos OS Release 5.0 or later.

**Required Privilege Level**

**configure**—To enter configuration mode.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:

-rw-r----- 1 root wheel 26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:

-rw-r----- 1 root wheel 57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear chassis display message

| <b>Description</b>                    | <p>(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.</p>                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                        | <p><b>none</b>—Clear or stop a text message on the craft interface display.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> <li>• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> <li>• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> </ul> |

**node-device *name***—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

**scc**—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Output Fields** See *show chassis craft-interface* for an explanation of output fields.

## Sample Output

### clear chassis display message

The following example displays and then clears the text message on the craft interface display:

```
user@host> show chassis craft-interface
Red alarm: LED off, relay off
Yellow alarm: LED off, relay off
Host OK LED: On
Host fail LED: Off
FPCs 0 1 2 3 4 5 6 7

Green .. *.. * *.

| <b>Description</b>                    | Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                        | <p><b>none</b>—Clear all pending system software reboots or halts.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.</p> <p><b>all-members</b>—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.</p> <p><b>both-routing-engines</b>—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix</p> |

Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

**infrastructure *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

**scc**—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level**

maintenance

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

### clear system reboot (TX Matrix Router)

```
user@host> clear system reboot
scc-re0:

No shutdown/reboot scheduled.
lcc0-re0:

No shutdown/reboot scheduled.
lcc2-re0:

No shutdown/reboot scheduled.
```

### clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

| <b>Description</b>              | <p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul> |
| <b>Options</b>                  | <p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | file list<br><detail   recursive><br><filename>                                                                                                                                                                                                                                                                                                                      |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                             |
| <b>Description</b>              | Display a list of files on the local router or switch.                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>              |
| <b>Additional Information</b>   | The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command. |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```

```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

| <b>Description</b>         | Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>dhcp-snooping</b>—(QFX Series switches) Loads DHCP snooping entries.</p> <p><b>factory-default</b>—Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on.</p> <p>On J Series Services Routers, pressing and holding down the Config button on the router for 15 seconds causes the factory configuration to be loaded and committed. However, this operation deletes all other configurations on the router; using the <b>load factory-default</b> command does not.</p> <p><b>filename</b>—Name of the file to load. For information about specifying the filename, see <i>Viewing Files and Directories on a Device Running Junos OS</i>.</p> <p><b>merge</b>—Combine the configuration that is currently shown in the CLI with the configuration.</p> <p><b>override</b>—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.</p> <p><b>patch</b>—Change part of the configuration and mark only those parts as changed.</p> <p><b>replace</b>—Look for a <b>replace</b> tag in <i>filename</i>, delete the existing statement of the same name, and replace it with the configuration.</p> <p><b>set</b>—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as <b>set</b>, <b>edit</b>, <b>exit</b>, and <b>top</b>.</p> <p><b>relative</b>—(Optional) Use the <b>merge</b> or <b>replace</b> option without specifying the full hierarchy level.</p> <p><b>terminal</b>—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.</p> <p><b>update</b>—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.</p> |

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

load merge  
load replace  
load override  
load update

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

**Release Information**    Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO\_REQUEST messages to elicit ICMP ECHO\_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

**Options** **host**—IP address or hostname of the remote system to ping.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**count requests**—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

**detail**—(Optional) Include in the output the interface on which the ping reply was received.

**do-not-fragment**—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

**NOTE:** In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

**inet**—(Optional) Ping Packet Forwarding Engine IPv4 routes.

**inet6**—(Optional) Ping Packet Forwarding Engine IPv6 routes.

**interface source-interface**—(Optional) Interface to use to send the ping requests.

**interval seconds**—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

**logical-system logical-system-name**—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system logical-system-name** command and then run the **ping** command. To return to the main router or switch, enter the **clear cli logical-system** command.

**loose-source value**—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point *value*** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                    |

| List of Sample Output    | <a href="#">ping hostname on page 354</a><br><a href="#">ping hostname rapid on page 354</a><br><a href="#">ping hostname size count on page 354</a>                                                                                                                                                                                                                                                               |
| Output Fields            | When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately. |

## Sample Output

### ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes
64 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.028 ms
64 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=1.053 ms
64 bytes from 192.168.169.254: icmp_seq=2 ttl=253 time=1.025 ms
64 bytes from 192.168.169.254: icmp_seq=3 ttl=253 time=1.098 ms
64 bytes from 192.168.169.254: icmp_seq=4 ttl=253 time=1.032 ms
64 bytes from 192.168.169.254: icmp_seq=5 ttl=253 time=1.044 ms
^C [abort]
```

### ping hostname rapid

```
user@host> ping skye rapid
PING skye.net (192.168.169.254): 56 data bytes
!!!!
--- skye.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.956/0.974/1.025/0.026 ms
```

### ping hostname size count

```
user@host> ping skye size 200 count 5
PING skye.net (192.168.169.254): 200 data bytes
208 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.759 ms

## Sample Output

### request chassis beacon fpc 0 on (QFX Series)

```
user@switch> request chassis beacon fpc 0 on

Beacon set to ON
```

### request chassis beacon node-device (QFabric System)

```
user@switch> request chassis beacon node-device node1 on
```

node1 ON

**request chassis beacon on interconnect-device fpc (QFabric System)**

user@switch> request chassis beacon on interconnect-device fpc 2

FPC 2 ON

## request chassis fpc

| <b>Description</b>                                   | (M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i> .                                                                                                               |
| <b>Options</b>                                       | <p><b>offline</b>—Take the FPC offline.</p> <p><b>online</b>—Bring the FPC online.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:</p>                                                                                                                                                                                                |

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

**restart**—Restart the FPC.

**slot slot-number**—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace **slot-number** with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9.
  - EX6210 switches—Replace **slot-number** with a value from 0 through 9.

**NOTE:** These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace **slot-number** with a value from 0 through 7.
- EX8216 switches—Replace **slot-number** with a value from 0 through 15.
- PTX5000 Packet Transport Router—Replace **slot-number** with a value from 0 through 7.

**all-members**—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

[request chassis fpc \(MX Series Routers with Media Services Blade \[MSB\]\) on page 360](#)  
[request chassis fpc \(MX2020 Router\) on page 360](#)  
[request chassis fpc \(MX2010 Router\) on page 360](#)

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request chassis fpc](#)

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

### [request chassis fpc \(MX Series Routers with Media Services Blade \[MSB\]\)](#)

```
user@host> request chassis fpc slot 0
Possible completions:
offline Take FPC offline
online Bring FPC online
restart Restart FPC
```

### [request chassis fpc \(MX2020 Router\)](#)

```
user@host >request chassis fpc online slot 2
FPC 2 already online
```

### [request chassis fpc \(MX2010 Router\)](#)

```
user@host >request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
```

## request chassis pic

| <b>Release Information</b>                           | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.3 for ACX4000 Routers.</p> <p>Command introduced in Junos OS Release 13.2 for the QFX Series.</p> |
| <b>Description</b>                                   | Control the operation of the PIC.                                                                                                                                                                                                                                               |

**NOTE:** The `request chassis pic (offline | online) fpc-slot slot number pic-slot slot-number` command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the `show chassis hardware` command.

**NOTE:** T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only `online` and `offline` command options to PIC slot 0 are allowed. Use of the `online` and `offline` command options for PIC slot 1 with the described router and PIC combination is not allowed.

**NOTE:** In T Series routers, when the PIC state is set from `offline` to `online` or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC `offline` or `online`:

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify
```

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
```

**Options**   **offline**—Take the PIC offline.

**online**—Bring the PIC online.

**fpc-slot *slot-number***—Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—0.
  - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
  - EX8208 switches—0 through 7 (line card).
  - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.
- M40 and M40e routers—0 through 7.
- M120 routers—0 through 5.
- M160 routers—0 through 7.
- M320 routers—0 through 7.
- MX 5, MX10, and MX40 routers—0 or 1.
- MX80 routers—0 or 1.
- MX240 routers—0 through 2
- MX480 routers—0 through 5
- MX2020 routers—0 through 19.
- MX2010 routers—0 through 9.
- MX960 routers—0 through 11.
- PTX5000 routers—0 or 1.
- T Series routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the **lcc *number*** option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, replace *slot-number* with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the *number* of the T1600 or T4000 router by using the lcc number option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, for the FPC slot number, replace *slot-number* with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace *slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```

user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline

```

- QFX5100 standalone switches—0.

**pic-slot *slot-number***—PIC slot number.

- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—***slot-number*** corresponds to the slot number of the Packet Forwarding Engine.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- T1600 router —0, 1, 2, or 3.
- T4000 router—0, 1, 2, or 3.
- QFX5100 standalone switches—0, 1, or 2. PIC 0 is used for all interfaces that are not configured on expansion modules, and PIC 1 and PIC 2 are used for interfaces configured on expansion modules.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

| <b>Description</b>                                          | For routers or switches with multiple Routing Engines, control which Routing Engine is the master.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run

the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the *Junos OS High Availability Library for Routing Devices*.

---

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

---

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

---

**Options**    **acquire**—Attempt to become the master Routing Engine.

**release**—Request that the other Routing Engine become the master.

**switch**—Toggle mastership between Routing Engines.

The **acquire**, **release**, and **switch** options have the following suboptions:

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX240, MX480, MX960, MX2010, and MX2020 routers only) (Optional) Available only with the **switch** option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace *member-id* with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**force**—(Optional) Available only with the acquire option. Force the change to a new master Routing Engine.

**NOTE:** The **force** option is not supported on the MX104 router.

**Additional Information** Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (**RE0**) is the master and the Routing Engine in slot 1 (**RE1**) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the *Junos OS Administration Library for Routing Devices*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

**NOTE:** Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

**Required Privilege Level** maintenance

**List of Sample Output** [request chassis routing-engine master acquire on page 368](#)  
[request chassis routing-engine master switch on page 368](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request chassis routing-engine master acquire](#)

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

### [request chassis routing-engine master switch](#)

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
```

Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...

Complete. The other Routing Engine becomes the master.

Switch mastership back to the local Routing Engine:

user@host> **request chassis routing-engine master switch**

warning: Traffic will be interrupted while the PFE is re-initialized

Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...

Complete. The local routing engine becomes the master.

## request message

| <b>Description</b>               | <p>Stop the router or switch software.</p> <div><p><b>NOTE:</b> When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, use the <b>member</b> option from the Node group CLI. You cannot issue this command from the QFabric CLI.</p><p>When you issue this command on a QFX5100 switch, you are not prompted to reboot. You must power cycle the switch to reboot.</p></div> |
| <b>Options</b>                   | <p><b>none</b>—Stop the router or switch software immediately.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router.</p>                                                                                                                                                                                                                                                                                     |

On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

**at time** —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- **+minutes**—Number of minutes from now to stop the software.
- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

**backup-routing-engine**—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

**both-routing-engines**—(Optional) Halt both Routing Engines at the same time.

**director-device *director-device-id***—(QFabric systems only) Halt a specific Director device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

**in *minutes***—(Optional) Number of minutes from now to stop the software. This option is an alias for the **at +minutes** option.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

## Sample Output

### request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

### request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

### request system halt (Immediately)

```
user@host> request system halt at now
```

### request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

## request system license add

**Release Information** Command introduced in Junos OS Release 8.0.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Power off the software.

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the **member** option. You cannot issue this command from the QFabric CLI.

**Options** **none**—Power off the router or switch software immediately.

**all-chassis**—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.

**all-lcc**—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.

**at *time***—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- **+*minutes***—Number of minutes from now to power off the software.
- ***yymmddhhmm***—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to power off the software.

**both-routing-engines**—(Optional) Power off both Routing Engines at the same time.

**in *minutes***—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +*minutes*** option.

**lcc *number***—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before powering off the software.

**other-routing-engine**—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

**sfc *number***—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

**slice slice**—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

**Required Privilege Level** maintenance

**List of Sample Output** [request system power-off on page 386](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request system power-off](#)

```
user@host> request system power-off message "This router will be powered off in 30 minutes.
Please save your data and log out immediately."
warning: This command will not halt the other routing-engine.
If planning to switch off power, use the both-routing-engines option.
Power Off the system ? [yes,no] (no) yes

*** FINAL System shutdown message from remote@nutmeg ***
System going down IMMEDIATELY

This router will be powered off in 30 minutes. Please save your data and log out
immediately.

Shutdown NOW!
[pid 5177]
```

## request system reboot

**Syntax (QFX Series)** request system reboot  
 <all <graceful>>  
 <at time>  
 <director-device *name*>  
 <director-group <graceful>>  
 <fabric <graceful>>  
 <in minutes>  
 <media >  
 <message "text">  
 <node-group *name*>  
 <slice (1 | 2 | alternate)>

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Reboot the Junos OS.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

**Options** **none**—Reboots the software immediately.

**all**—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

**at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **+minutes**—Number of minutes from now to reboot the software.
- **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

**director-device *name***—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

**director-group**—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**graceful**—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**media (external | internal)**—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before rebooting the software.

**node-group name**—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

**routing-engine**—(Optional) Reboot the Routing Engine.

**slice (1 | 2 | alternate)**—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

**NOTE:** The slice option is not supported on the QFX5100 switch, because there is no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to previous version of Junos OS, issue the **request system software rollback** command.

---

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level** maintenance

**Related Documentation**

- [clear system reboot on page 329](#)
- [Rebooting and Halting a QFX Series Product on page 162](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (At 2300)

```
user@switch> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@switch> request system reboot at now
```

### request system reboot (At 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

### request system reboot director-device

```
user@switch> request system reboot director-device Node1
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

### request system reboot director-group

```
user@switch> request system reboot director-group
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

### request system reboot director-group graceful

```
user@switch> request system reboot director-group graceful
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

## request system snapshot

---

**Syntax**    request system snapshot  
              <config-partition>  
              <media>  
              <partition>  
              <root-partition>  
              slice alternate

**Release Information**    Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Copy the currently running Junos OS and configuration to alternate media. This command takes a snapshot of the contents of the / (root), and **/var** partitions on the media used to boot the switch and then copies the snapshot to alternate media. If the switch was booted from internal flash memory, the snapshot is copied to an external USB flash drive. If the switch was booted from an external USB flash drive, the snapshot is copied to internal flash memory.

**Options**    **none**—Create a snapshot on the alternate media—that is, the external media if you booted the switch using software stored on internal media or internal media if you booted the switch using software stored on external media.

**config-partition**—(Optional) Create a snapshot of the configuration partition only and store it onto the default /altconfig on the hard disk device or an /altconfig on a USB device.

**media type**—(Optional) Specify the boot device the software is copied to:

- compact-flash—Copy software to the primary compact flash drive.
- external—Copy software to an external mass storage device, such as a USB flash drive. If a USB drive is not connected, the switch displays an error message.
- internal—Copy software to an internal flash drive.
- removable-compact-flash—Copy software to the removable compact flash drive.

**partition**—(Optional) Partition the destination media before copying over the snapshot.

**root-partition**—(Optional) Create a snapshot of the root partition only and store it onto the default /altroot on the hard disk device or an /altroot on a USB device.

**slice alternate**—(Optional) Take a snapshot of the active root partition and copy it to the alternate slice on the boot media.

**Required Privilege Level**    view

```

## request system software add

---

**Syntax** request system software add *package-name*  
<best-effort-load>  
<delay-restart>  
<force>  
<no-copy>  
<no-validate>  
<re0 | re1>  
<reboot>  
<set [*package-name package-name*]>  
<unlink>  
<upgrade-with-config>  
<upgrade-with-config-format *format*>  
<validate>

**Syntax (EX Series Switches)** request system software add *package-name*  
<best-effort-load>  
<delay-restart>  
<force>  
<no-copy>  
<no-validate>  
<re0 | re1>  
<reboot>  
<set [*package-name package-name*]>  
<upgrade-with-config>  
<upgrade-with-config-format *format*>  
<validate>

**Syntax (TX Matrix Router)** request system software add *package-name*  
<best-effort-load>  
<delay-restart>  
<force>  
<lcc *number* | scc>  
<no-copy>  
<no-validate>  
<re0 | re1>  
<reboot>  
<set [*package-name package-name*]>  
<unlink>  
<upgrade-with-config>  
<upgrade-with-config-format *format*>  
<validate>

**Syntax (TX Matrix Plus Router)** request system software add *package-name*  
<best-effort-load>  
<delay-restart>  
<force>  
<lcc *number* | sfc *number*>  
<no-copy>  
<no-validate>  
<re0 | re1>  
<reboot>  
<set [*package-name package-name*]>

	<pre> &lt;unlink&gt; &lt;upgrade-with-config&gt; &lt;upgrade-with-config-format <i>format</i>&gt; &lt;validate&gt; </pre>
Syntax (MX Series Router)	<pre> request system software add <i>package-name</i> &lt;best-effort-load&gt; &lt;delay-restart&gt; &lt;force&gt; &lt;member <i>member-id</i>&gt; &lt;no-copy&gt; &lt;no-validate&gt; &lt;re0   re1&gt; &lt;reboot&gt; &lt;set [<i>package-name package-name</i>]&gt; &lt;unlink&gt; &lt;upgrade-with-config&gt; &lt;upgrade-with-config-format <i>format</i>&gt; &lt;validate&gt; </pre>
Syntax (QFX Series)	<pre> request system software add <i>package-name</i> &lt;best-effort-load&gt; &lt;component all&gt; &lt;delay-restart&gt; &lt;force&gt; &lt;no-copy&gt; &lt;no-validate&gt; &lt;partition&gt; &lt;reboot&gt; &lt;unlink&gt; &lt;upgrade-with-config&gt; &lt;upgrade-with-config-format <i>format</i>&gt; &lt;validate&gt; </pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>best-effort-load</b> and <b>unlink</b> options added in Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>set [<i>package-name package-name</i>]</b> option added in Junos OS Release 11.1 for EX Series switches.</p> <p><b>set [<i>package-name package-name</i>]</b> option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.</p>

**NOTE:** On EX Series switches, the **set [*package-name package-name*]** option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the **set [*package-name package-name*]** option allows you to install multiple software packages and software add-on packages at the same time.

**upgrade-with-config** and **upgrade-with-config-format** *format* options added in Junos OS Release 12.3 for M Series routers, MX Series routers, T Series routers, EX Series Ethernet switches, and QFX Series devices.

Description

**NOTE:** We recommend that you always download the software image to **/var/tmp** only. On EX Series and QFX Series switches, you must use the **/var/tmp** directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

Options

**package-name**—Location from which the software package or bundle is to be installed.

For example:

- **/var/tmp/package-name**—For a software package or bundle that is being installed from a local directory on the router or switch.
- **protocol://hostname/pathname/package-name**—For a software package or bundle that is to be downloaded and installed from a remote location. Replace **protocol** with one of the following:
  - **ftp**—File Transfer Protocol.  
Use **ftp://hostname/pathname/package-name**. To specify authentication credentials, use **ftp://<username>:<password>@hostname/pathname/package-name**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.  
Use **http://hostname/pathname/package-name**. To specify authentication credentials, use **http://<username>:<password>@hostname/pathname/package-name**. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).  
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use **scp://<username>:<password>@hostname/pathname/package-name**.

**NOTE:**

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the `scp` protocol in the `request system software add` command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support `scp`.  
Use the `file copy` command to copy the software package or bundle from the remote location to the `/var/tmp` directory on the hard disk:  
`file copy scp://source/package-name /var/tmp`  
Then install the software package or bundle using the `request system software add` command:  
`request system software add /var/tmp/package-name`
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the `unlink` option to achieve the same effect and allow the installation to be completed.

**best-effort-load**—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

**component all**—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

**delay-restart**—(Optional) Install a software package or bundle, but do not restart software processes.

**force**—(Optional) Force the addition of the software package or bundle (ignore warnings).

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace ***member-id*** with a value of 0 or 1.

**partition**—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

**scc**—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router. Replace ***number*** with 0.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

**no-validate**—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

**re0 | re1**—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

**reboot**—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

**set [*package-name package-name*]**—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

**unlink**—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the **unlink** option to remove the software package from this directory after a successful upgrade is completed.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format *format***—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

**NOTE:** The `upgrade-with-config` and `upgrade-with-config-format` options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the `.failed` suffix.

**validate**—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

**NOTE:** The `validate` option only works on systems that do not have `graceful-switchover` (GRES) enabled. To use the `validate` option on a system with GRES, either disable GRES for the duration of the installation, or install using the command `request system software in-service-upgrade`, which requires nonstop active routing (NSR) to be enabled when using GRES.

#### Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the `request system snapshot` command to back up the software, including the configuration, to the `/altroot` and `/altconfig` file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the `request system snapshot` command again to back up the new software to the `/altroot` and `/altconfig` file systems.

**NOTE:** The `request system snapshot` command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

After you run the `request system snapshot` command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, `jkernl`, last. Add the operating system package, `jkernl`, first and the routing software package, `jroute`, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add *package-name*** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add *package-name*** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

...

```

### request system software add component all (QFabric Systems)

```

user@switch> request system software add /pbdata/packages/jinstall-qfabric-12.2X50-D1.3.rpm
component all
...

```

## request system software delete

---

<b>Syntax</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Router)</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   scc&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   sfc <i>number</i>&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <b>set</b> [ <i>package-name package-name</i> ] added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways. Option <b>reboot</b> introduced in Junos OS Release 12.3.
<b>Description</b>	Remove a software package or bundle from the router or switch.

**CAUTION:** Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

- Options**    *software-package*—Software package or bundle name. You can delete any or all of the following software bundles or packages:
- **jbase**—(Optional) Junos base software suite
  - **jcrypto**—(Optional, in domestic version only) Junos security software
  - **jdocs**—(Optional) Junos online documentation file
  - **jkernel**—(Optional) Junos kernel software suite
  - **jpfe**—(Optional) Junos Packet Forwarding Engine support
  - **jroute**—(Optional) Junos routing software suite
  - **junos**—(Optional) Junos base software

**NOTE:** On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

**force**—(Optional) Ignore warnings and force removal of the software.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

**scc**—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

**set [package-name package-name]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc number**—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the `/altroot` and `/altconfig` file systems (on routers) or the `/`, `/altroot`, `/config`, `/var`, and `/var/tmp` file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the `/altroot` and `/altconfig` file systems (on routers) or the `/`, `/altroot`, `/config`, `/var`, and `/var/tmp` file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

**Required Privilege Level** maintenance

## request system software download

---

Syntax (QFabric System)	request system software download <i>path package-name</i>
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Download a software package from a location on the Director device, mounted external USB flash drive, remote FTP or SCP location, or other location.
Options	<p><b>path</b>—Location where the software package is located. For example:</p> <ul style="list-style-type: none"><li>• <b>/pbdata/packages/package-name</b>—For a software package that is being installed from a local directory on the switch.</li><li>• <b>protocol://hostname/pathname/package-name</b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b>protocol</b> with one of the following:<ul style="list-style-type: none"><li>• <b>ftp</b>—File Transfer Protocol. Use <b>ftp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li><li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version). Use <b>scp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>.</li></ul></li></ul>
Required Privilege Level	maintenance

```

## request system software in-service-upgrade

---

<b>Syntax</b>	<code>request system software in-service-upgrade <i>package-name</i></code> <code>&lt;no-old-master-upgrade&gt;</code> <code>&lt;reboot&gt;</code>
<b>Syntax (QFX5100 Switches)</b>	<code>request system software in-service-upgrade <i>package-name</i></code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0.</p> <p>Command introduced in Junos OS Release 12.3R2, 13.1R2, and 13.2R1 for TX Matrix Plus routers.</p> <p>Command introduced in Junos OS Release 13.2 for PTX5000 routers.</p> <p>Command introduced in Junos OS Release 13.2 X51-D15 for the QFX Series.</p>
<b>Description</b>	<p>Perform a unified in-service software upgrade (ISSU). A unified ISSU enables you to upgrade from one Junos OS Release to another with no disruption on the control plane and with minimal disruption of traffic. In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled. On QFX5100 switches, nonstop bridging (NSB) must be enabled if you are using the Layer 2 Control Protocol process (l2cpd) to transmit Layer 2 spanning tree protocols in a Layer 2 bridge environment.</p>
<b>Options</b>	<p><b><i>package-name</i></b>—Location from which the software package or bundle is to be installed. For example:</p> <ul style="list-style-type: none"><li>• <b><i>/var/tmp/package-name</i></b>—For a software package or bundle that is being installed from a local directory on the router.</li><li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following:<ul style="list-style-type: none"><li>• <b>ftp</b>—File Transfer Protocol</li><li>• <b>http</b>—Hypertext Transfer Protocol</li><li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version)</li></ul></li></ul> <p><b>no-old-master-upgrade</b>—(Optional) When the <b>no-old-master-upgrade</b> option is included, after the backup Routing Engine is rebooted with the new software package and a switchover occurs to make it the new master Routing Engine, the former master (new backup) Routing Engine will not be upgraded to the new software. In this case, you must manually upgrade the former master (new backup) Routing Engine. If you do not include the <b>no-old-master-upgrade</b> option, the system will automatically upgrade the former master Routing Engine.</p> <p><b>reboot</b>—(Optional) When the <b>reboot</b> option is included, the former master (new backup) Routing Engine is automatically rebooted after being upgraded to the new software. When the <b>reboot</b> option is not included, you must manually reboot the former master (new backup) Routing Engine using the <b>request system reboot</b> command.</p>

<b>Additional Information</b>	<p>The following conditions apply to unified ISSUs:</p> <ul style="list-style-type: none"> <li>Unified ISSU is not supported on every platform. For a list of supported platforms, see <i>Unified ISSU System Requirements</i>.</li> <li>Unsupported PICs are restarted during a unified ISSU on certain routing devices. For information about supported PICs, see the <i>Junos OS High Availability Library for Routing Devices</i>.</li> <li>Unsupported protocols will experience packet loss during a unified ISSU. For information about supported protocols, see the <i>Junos OS High Availability Library for Routing Devices</i>.</li> <li>During a unified ISSU, you cannot bring any PICs online or offline on certain routing devices.</li> </ul> <p>For more information, see the <i>Junos OS High Availability Library for Routing Devices</i>.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>request system software abort</i></li> <li><a href="#">show chassis in-service-upgrade on page 754</a></li> <li><i>Unified ISSU Concepts</i></li> <li><i>Performing a Unified ISSU</i></li> </ul>

## request system software nonstop-upgrade

<b>Syntax</b>	<pre>request system software nonstop-upgrade (<i>package-name</i>   set [<i>package-name</i> <i>package-name</i>]) &lt;no-copy&gt; &lt;no-old-master-upgrade&gt; &lt;reboot &gt; &lt;unlink&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Option <b>set [<i>package-name package-name</i>]</b> added in Junos OS Release 12.1 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p>
<b>Description</b>	<p>Perform a nonstop software upgrade (NSSU) on a switch with redundant Routing Engines or on a Virtual Chassis. The behavior of this command depends on which switch or Virtual Chassis it is executed on:</p> <ul style="list-style-type: none"> <li>When you execute this command on an EX3300, EX4200, EX4300, EX4500, or EX4550 Virtual Chassis or QFX3500 and QFX3600 Virtual Chassis, or a mixed Virtual Chassis composed of any combination of EX4200, EX4500, and EX4550 switches, all Virtual Chassis members are upgraded. The original Virtual Chassis backup becomes the master. The original master is automatically upgraded and rebooted and rejoins the Virtual Chassis as the backup after the upgrade completes.</li> <li>When you execute this command on an EX6200 or EX8200 switch, both the backup and master Routing Engines are upgraded, with the original backup Routing Engine becoming the new master at the end of the upgrade. <p>The original master Routing Engine is automatically rebooted on an EX6200 switch.</p> <p>The original master Routing Engine is not automatically rebooted on an EX8200 switch unless you specify the <b>reboot</b> option.</p> </li> <li>When you execute this command on an EX8200 Virtual Chassis, all master and backup Routing Engines are upgraded in the Virtual Chassis, including the external Routing Engines. The original backup Routing Engines become the new master Routing Engines. The original master Routing Engines are not automatically rebooted, unless you specify the <b>reboot</b> option.</li> </ul> <p>This command has the following requirements:</p> <ul style="list-style-type: none"> <li>All Virtual Chassis members and all Routing Engines must be running the same Junos OS release.</li> <li>Graceful Routing Engine switchover (GRES) must be enabled.</li> <li>Nonstop active routing (NSR) must be enabled.</li> </ul>

**NOTE:** Although nonstop bridging (NSB) does not have to be enabled for you to use this command, we recommend that you enable NSB. Enabling NSB ensures that all NSB-supported Layer 2 protocols operate seamlessly during the Routing Engine switchover that is part of the NSSU. See *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*.

**NOTE:** Nonstop active routing (NSR) and nonstop bridging (NSB) are not supported on QFX3500 and QFX3600 Virtual Chassis.

- The command must be executed from the master Routing Engine on a standalone switch or from the master on a Virtual Chassis.
- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis members (for EX3300, EX4200, EX4300, EX4500, EX4550, QFX3500 and QFX3600 Virtual Chassis, and mixed Virtual Chassis) or on different line cards (for EX6200 and EX8200 switches, and for EX8200 Virtual Chassis).
- For EX3300, EX4200, EX4300, EX4500, EX4550, QFX3500 and QFX3600 Virtual Chassis, and mixed Virtual Chassis:
  - The Virtual Chassis members must be connected in a ring topology. A ring topology prevents the Virtual Chassis from splitting during an NSSU.
  - The Virtual Chassis master and backup must be adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
  - The Virtual Chassis must be preprovisioned so that the linecard role has been explicitly assigned to member switches acting in a linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their Routing Engine roles (although mastership will change), and the remaining switches must maintain their linecard roles.
  - A two-member Virtual Chassis must have **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.

**Options** **package-name**—Location from which the software package or bundle is to be installed.  
For example:

- **/var/tmp/package-name**—For a software package or bundle that is being installed from a local directory on the switch.
- **protocol://hostname/pathname/package-name**—For a software package or bundle that is to be downloaded and installed from a remote location. Replace **protocol** with one of the following:
  - **ftp**—File Transfer Protocol.

Use **ftp://hostname/pathname/package-name**. To specify authentication credentials, use

**ftp://<username>:<password>@hostname/pathname/package-name**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.

- **http**—Hypertext Transfer Protocol.  
Use **http://hostname/pathname/package-name**. To specify authentication credentials, use  
**http://<username>:<password>@hostname/pathname/package-name**. If a password is required and you omit it, you are prompted for it.
- **scp**—Secure copy (available only for Canada and U.S. version).  
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use  
**scp://<username>:<password>@hostname/pathname/package-name**.

**NOTE:** The *pathname* in the protocol is the relative path to the user home directory on the remote system and not the root directory.

**set [package-name package-name]**—(Mixed Virtual Chassis only) Locations of the EX4200 and the EX4500 installation packages. These packages must be for the same Junos OS release. See the description of the *package-name* option for information about how to specify the location of the installation packages.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of package or bundle files.

**no-old-master-upgrade**—(Optional) (EX8200 switches only) Upgrade the backup Routing Engine only. After the upgrade completes, the original master Routing Engine becomes the backup Routing Engine and continues running the previous software version.

**reboot**—(Optional) (EX8200 switches and EX8200 Virtual Chassis only) When the **reboot** option is included, the original master (new backup) Routing Engines are automatically rebooted after being upgraded to the new software. When the **reboot** option is not included, you must manually reboot the original master (new backup) Routing Engines using the **request system reboot** command.

**NOTE:** If you do not use the **reboot** option on an EX8200 Virtual Chassis, you must establish a connection to the console port on the Switch Fabric and Routing Engine (SRE) module or Routing Engine (RE) module to perform the manual reboot of the backup Routing Engines.

**unlink**—(Optional) Remove the software package after a successful upgrade is completed.

## request system software rollback

---

<b>Syntax</b>	request system software rollback
<b>Syntax (EX Series Switches)</b>	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
<b>Syntax (TX Matrix Router)</b>	request system software rollback <lcc <i>number</i>   scc> <reboot>
<b>Syntax (TX Matrix Plus Router)</b>	request system software rollback <lcc <i>number</i>   sfc <i>number</i> > <reboot>
<b>Syntax (MX Series Router)</b>	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command behavior changed in Junos OS Release 12.1. Option <b>reboot</b> introduced in Junos OS Release 12.3.
<b>Description</b>	<p>For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful <b>request system software add</b> command.</p> <p>As of Junos OS 12.1 and greater, revert to the last known good state before the most recent <b>request system software (add   delete)</b> command. For example, using rollback in Junos OS 12.1 after using <b>request system software add</b> restores the system to a known good state prior to using the <b>add</b> command. Similarly, using rollback in Junos OS 12.1 after using <b>request system software delete</b> restores the system to a known good state prior to using the <b>delete</b> command.</p> <p>A software rollback fails if any required package (or a <b>jbundle</b> package containing the required package) cannot be found in /var/sw/pkg.</p> <p><i>Additional Information</i></p> <ul style="list-style-type: none"><li>On M Series and T Series routers, if <b>request system software add &lt;jinstall&gt; reboot</b> was used for the previous installation, then <b>request system software rollback</b> has no effect. In this case, use <b>jinstall</b> to reinstall the required package.</li></ul>

- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.

**Options** **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**none**—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

**scc**—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level** maintenance

## request system software validate

---

Syntax	request system software validate <i>package-name</i> <set [ <i>package-name package-name</i> ]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Syntax (TX Matrix Router)	request system software validate <i>package-name</i> <lcc <i>number</i>   scc> <set [ <i>package-name package-name</i> ]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Syntax (TX Matrix Plus Router)	request system software validate <i>package-name</i> <lcc <i>number</i>   sfc <i>number</i> > <set [ <i>package-name package-name</i> ]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Syntax (MX Series Router)	request system software validate <i>package-name</i> <member <i>member-id</i> > <set [ <i>package-name package-name</i> ]> <upgrade-with-config> <upgrade-with-config-format <i>format</i> >
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. set [ <i>package-name package-name</i> ] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways. upgrade-with-config and upgrade-with-config-format <i>format</i> options added in Junos OS Release 12.3 for M Series routers, MX Series routers, and T Series routers.
Description	Validate candidate software against the current configuration of the router.
Options	<b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

***package-name***—Name of the software bundle or package to test.

**scc**—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format *format***—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

**NOTE:** The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

**Additional Information** By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>request system software abort</i></li><li>• <a href="#">request system software add on page 392</a></li><li>• <a href="#">request system software delete on page 400</a></li><li>• <a href="#">request system software rollback on page 428</a></li><li>• <i>Routing Matrix with a TX Matrix Plus Router Solutions Page</i></li></ul>

```

## request system storage cleanup

<b>Syntax</b>	request system storage cleanup <dry-run>
<b>Syntax (EX Series Switches)</b>	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
<b>Syntax (MX Series Router)</b>	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	request system storage cleanup <component ( <i>serial number</i>   <i>UUID</i>   all)> <director-group <i>name</i> > <dry-run> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <name-tag <i>name-tag</i> > <node-group <i>name</i> > <prune> <qfabric (component <i>name</i> )   dry-run   name-tag   repository> <repository (core   log)>
<b>Release Information</b>	Command introduced in Junos OS Release 7.4. <b>dry-run</b> option introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.
<b>Options</b>	<b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Delete files on the Virtual Chassis master Routing Engine only.

**NOTE:** To delete files on the other members of the Virtual Chassis configuration, log in to each backup Routing Engine and delete the files using the **request system storage cleanup local** command.

**component (*UUID* | *serial number* | all)**—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

**director-group *name***—(QFabric systems only) (Optional) Delete files on the Director group.

**dry-run**—(Optional) List files proposed for deletion (without deleting them).

**infrastructure *name***—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Delete files on the Interconnect device.

**local**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**name-tag *name-tag***—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

**node-group *name***—(QFabric systems only) (Optional) Delete files on the Node group.

**prune**—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

**qfabric component *name***—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

**repository (*core* | *log*)**—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

**Additional Information** If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

**Required Privilege Level** maintenance

**List of Sample Output** [request system storage cleanup dry-run on page 437](#)  
[request system storage cleanup on page 438](#)  
[request system storage cleanup director-group \(QFabric Systems\) on page 438](#)  
[request system storage cleanup infrastructure device-name \(QFabric Systems\) on page 440](#)  
[request system storage cleanup interconnect-device device-name \(QFabric Systems\) on page 441](#)  
[request system storage cleanup node-group group-name \(QFabric Systems\) on page 442](#)  
[request system storage cleanup qfabric component device-name \(QFabric Systems\) on page 443](#)  
[request system storage cleanup qfabric component device-name repository core \(QFabric Systems\) on page 443](#)  
[request system storage cleanup qfabric component all \(QFabric Systems\) on page 443](#)

**Output Fields** Table 51 on page 437 describes the output fields for the **request system storage cleanup** command. Output fields are listed in the approximate order in which they appear.

**Table 51: request system storage cleanup Output Fields**

Field Name	Field Description
List of files to delete:	Shows list of files available for deletion.
Size	Size of the core-dump file.
Date	Last core-dump file modification date and time.
Name	Name of the core-dump file.
Directory to delete:	Shows list of directories available for deletion.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
Repository head:	Name of the top-level repository location.
Repository name:	Name of the repository: <b>core</b> or <b>log</b> .
Creating list of debug artifacts to be removed under:	Shows location of files available for deletion.
List of debug artifacts to be removed under:	Shows list of files available for deletion.

## Sample Output

### request system storage cleanup dry-run

```
user@host> request system storage cleanup dry-run
Currently rotating log files, please wait.

## request system zeroize

<b>Syntax</b>	request system zeroize <media>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 9.0.</p> <p>Command introduced in Junos OS Release 11.2 for EX Series switches.</p> <p>Option <b>media</b> added in Junos OS Release 11.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.2 for MX Series devices.</p> <p>Command introduced in Junos OS Release 12.3 for the QFX Series.</p>
<b>Description</b>	<p> <b>NOTE:</b> The <b>media</b> option is not available on the QFX Series.</p> <p>Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.</p> <p>This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as <b>root</b> and start the Junos OS command-line interface (CLI) by typing <b>cli</b> at the prompt.</p> <p>To completely erase user-created data so that it is unrecoverable, use the <b>media</b> option.</p>
<b>Options</b>	<p><b>media</b>—(Optional) In addition to removing all configuration and log files, the <b>media</b> option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the <b>request system zeroize media</b> operation can take considerably more time than the <b>request system zeroize</b> operation. However, the critical security parameters are all removed at the beginning of the process.</p>
<b>Required Privilege Level</b>	maintenance

<b>Description</b>	<p>Restart a Junos OS process.</p>
	<div><p><b>CAUTION:</b> Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.</p></div>
<b>Options</b>	<p><b>none</b>—Same as <b>gracefully</b>.</p>

- adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.
- all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.
- all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.
- all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).
- ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.
- auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.
- autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.
- captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.
- chassis-control**—(Optional) Restart the chassis management process.
- class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
- clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with **0**.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway *gateway-name***—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level** reset

**Related Documentation** [• Overview of Junos OS CLI Operational Mode Commands on page 73](#)

**List of Sample Output** [restart interfaces on page 459](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## rollback

---

<b>Syntax</b>	<code>rollback &lt;number   rescue&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Return to a previously committed configuration. The software saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit</b> configuration command.</p> <p>The currently operational Junos OS configuration is stored in the file <b>juniper.conf</b>, and the last three committed configurations are stored in the files <b>juniper.conf.1</b>, <b>juniper.conf.2</b>, and <b>juniper.conf.3</b>. These four files are located in the directory <b>/config</b>, which is on the router's flash drive. The remaining 46 previous committed configurations, the files <b>juniper.conf.4</b> through <b>juniper.conf.49</b>, are stored in the directory <b>/var/db/config</b>, which is on the router's hard disk.</p> <p>During rollback, the configuration you specify is loaded from the associated file. Only objects in the rollback configuration that differ from the previously loaded configuration are marked as changed (equivalent to <b>load update</b>).</p>
<b>Options</b>	<p>none (Optional)—Return to the most recently saved configuration.</p> <p><b>number</b>—(Optional) Configuration to return to. The range of values is from <b>0</b> through <b>49</b>. The most recently saved configuration is number <b>0</b>, and the oldest saved configuration is number <b>49</b>. The default is <b>0</b>.</p> <p><b>rescue</b>—(Optional) Return to the rescue configuration.</p>
<b>Required Privilege Level</b>	rollback—To roll back to configurations other than the one most recently committed.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Returning to a Previously Committed Junos OS Configuration on page 1137</a></li><li>• <a href="#">Creating and Returning to a Rescue Configuration on page 1132</a></li></ul>

## save

<b>Syntax</b>	<code>save <i>filename</i></code>
<b>QFX Series</b>	<code>save (dhcp-snooping <i>filename</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.</p> <p>When saving a file to a remote system, the software uses the <b>scp/ssh</b> protocol.</p>
<b>Options</b>	<p><b><i>filename</i></b>—Name of the saved file. You can specify a filename in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b><i>filename</i></b>—File in the user's home directory (the current directory) on the local flash drive.</li> <li>• <b><i>path/filename</i></b>—File on the local flash drive.</li> <li>• <b><i>/var/filename</i></b> or <b><i>/var/path/filename</i></b>—File on the local hard disk.</li> <li>• <b><i>a:filename</i></b> or <b><i>a:path/filename</i></b>—File on the local drive. The default path is <b>/</b> (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.</li> <li>• <b><i>hostname:/path/filename</i></b>, <b><i>hostname:filename</i></b>, <b><i>hostname:path/filename</i></b>, or <b><i>scp://hostname/path/filename</i></b>—File on an <b>scp/ssh</b> client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify <b><i>hostname</i></b> as <b><i>username@hostname</i></b>.</li> <li>• <b><i>ftp://hostname/path/filename</i></b>—File on an FTP server. You can also specify <b><i>hostname</i></b> as <b><i>username @hostname</i></b> or <b><i>username:password @hostname</i></b>. The default path is the user's home directory. To specify an absolute path, the path must start with the string <b>%2F</b>; for example, <b><i>ftp://hostname/%2Fpath/filename</i></b>. To have the system prompt you for the password, specify <b><i>prompt</i></b> in place of the password. If a password is required, and you do not specify the password or <b><i>prompt</i></b>, an error message is displayed:           <pre>user@host&gt; file copy ftp://username@ftp.hostname.net//filename file copy ftp.hostname.net: Not logged in. user@host&gt; file copy ftp://username:prompt@ftphostname.net//filename</pre> <p>Password for <b><i>username@ftp.hostname.net</i></b>:</p> </li> <li>• <b><i>http://hostname/path/filename</i></b>—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify <b><i>hostname</i></b> as <b><i>username@hostname</i></b> or <b><i>username:password@hostname</i></b>. If a password is required and you omit it, you are prompted for it.</li> <li>• <b><i>re0:/path/filename</i></b> or <b><i>re1:/path/filename</i></b>—File on a local Routing Engine.</li> </ul>

**Required Privilege Level**    configure—To enter configuration mode.

## show app-engine info

<b>Syntax</b>	<pre>show app-engine info &lt;compute-cluster <i>compute-cluster-name</i>&gt; &lt;compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced Junos OS Release 12.3.</p> <p>Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p>
<b>Description</b>	Show the basic information of a compute node.
<b>Options</b>	<p><b><i>compute-cluster-name</i></b>—(Optional) Name of the compute cluster.</p> <p><b><i>compute-node-name</i></b>—(Optional) Name of the compute node. Specifying a compute-node alone will not return any result. Always specify the compute-cluster with a compute node.</p>
<b>Additional Information</b>	<p>In the operational mode of the CLI when you type ? for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, , if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b><i>compute-cluster compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b><i>compute-node compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show app-engine status</a></li> <li>• <a href="#">show app-engine resource-usage</a></li> <li>• <a href="#">show app-engine processes compute-cluster compute-node</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show app-engine info on page 464</a></p> <p><a href="#">show app-engine info compute-cluster compute-node on page 464</a></p> <p><a href="#">show app-engine info (Command failed) on page 464</a></p> <p><a href="#">show app-engine info (QFX5100 Switch) on page 465</a></p>
<b>Output Fields</b>	For a description of the output fields, see <a href="#">Table 52 on page 464</a> . Output fields are listed in the approximate order in which they appear.

Table 52: show app-engine info Output Fields

Field Name	Field Description
Compute cluster	Name of the compute cluster.
Compute node	Name of the compute node.
Model	Model name of the compute node.
Kernel release	Kernel release of the Linux which the compute node is running.
Machine	The machine architecture of the compute node.
Management IP	The management IP address of the compute node.

## Sample Output

### show app-engine info

In the following example, notice there are multiple compute clusters and multiple compute nodes shown because there was no compute cluster or compute node specified in the command.

```
user@host> show app-engine info
Compute cluster: cluster1
 Compute node Model Kernel release Machine Management IP
 cn2 VXE1001 2.6.18-238.el5 x86_64 192.168.1.29/24

Compute cluster: new-cluster
 Compute node Model Kernel release Machine Management IP
 new-node --- Offline --- 10.1.1.1/24
```

### show app-engine info compute-cluster compute-node

The output when the optional **compute-cluster** and **compute-node** options are used is the same (both online and offline) as for the **show app-engine info** command except that basic information is displayed for only the compute node specified in the command.

```
user@host> show app-engine info compute-cluster cluster1 compute-node cn2
Compute cluster: cluster1
 Compute node Model Kernel release Machine Management IP
 cn2 VXE1001 2.6.18-238.el5 x86_64 192.168.1.29/24

user@host> show app-engine info compute-cluster new-cluster compute-node new-node
Compute cluster: new-cluster
 Compute node Model Kernel release Machine Management IP
 new-node --- Offline --- 10.1.1.1/24
```

### show app-engine info (Command failed)

```
user@host> show app-engine info compute-cluster new-cluster compute-node new-node
```

```
Compute cluster: new-cluster
Compute node Model Kernel release Machine Management IP
new-node --- Error getting information --- 10.1.1.1/24
```

#### show app-engine info (QFX5100 Switch)

```
user@switch> show app-engine info
Compute cluster: default-cluster
Compute node Model Kernel release Machine Management IP
default-node QFX 2.6.32-279.22.1.el6.x86_64x86_64 192.168.1.1/24
```

## show chassis alarms

---

<b>Syntax</b>	show chassis alarms
<b>Syntax (TX Matrix Routers)</b>	show chassis alarms <lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis alarms <lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Routers)</b>	show chassis alarms <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX104, MX2010, and MX2020 3D Universal Edge Routers)</b>	show chassis alarms
<b>Syntax (QFX Series)</b>	show chassis alarms <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Syntax (PTX Series Packet Transport Routers)</b>	show chassis alarms
<b>Syntax (ACX Series Universal Access Routers)</b>	show chassis alarms
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	Display information about the conditions that have been configured to trigger alarms.
<b>Options</b>	<b>none</b> —Display information about the conditions that have been configured to trigger alarms.  <b>all-members</b> —(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

**scc**—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with 0.

**Additional Information** You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559

To understand what CM\_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM\_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559

First, you have to convert 559 to binary; that is **1000101111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **100010111**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3

CMALARM_NCHIP_PKTR_TMO_OUTRANGE_ERR	273
CMALARM_NCHIP_PKTR_MD_REQUEST_Q_OVFLW_ERR	274
CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR	275
CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR	276
CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279
<hr/>	
<b>Chip Type: R Chip</b>	<b>Code</b>
CMALARM_RCHIP_SRAM_PARITY_ERR	512
<hr/>	
<b>Chip Type: R Chip</b>	<b>Code</b>
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602
CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608
CMALARM_ICHIP_WO_IP_INTER_ERR	609
CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630
CMALARM_ICHIP_SDRAM_BIST_ERR	631

CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM\_NCHIP\_DBUF\_CRC\_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code =  $(257-1)/2 = 128$ . Similarly, for minor alarms, Actual Error Code =  $(\text{Error Code})/2$

### show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

```

user@host> show chassis alarms
2 alarms currently active
Alarm time Class Description
2011-10-22 10:10:47 PDT Major FPC 1 misconfig
2011-10-22 10:10:46 PDT Major FPC 0 misconfig

```

### show chassis alarms (Backup Routing Engine)

```

user@host> show chassis alarms
2 alarms are currently active
Alarm time Class Description
2005-04-07 10:12:22 PDT Minor Host 1 Boot from alternate media
2005-04-07 10:11:54 PDT Major Host 1 compact-flash missing in Boot List

```

### show chassis alarms (Alarms Active on the QFX Series)

```

user@switch> show chassis alarms
1 alarms currently active
Alarm time Class Description
2012-03-05 2:10:24 UTC Major FPC 0 PEM 0 Airflow not matching Chassis Airflow

```

### show chassis alarms node-device (Alarms Active on the QFabric System)

```

user@switch> show chassis alarms node-device ED3691
node-device ED3694
3 alarms currently active
Alarm time Class Description

## show chassis beacon

**show chassis beacon**

(QFX Series)

```
<cb slot-number>
<fpc slot-number>
<interconnect-device name (cb slot-number | fpc slot-number)>
<node-device name>
```

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the beacon LED status on a QFX3500 standalone switch, Node device, and an Interconnect device. You can also display the beacon LED status of the Control Boards and Flexible PIC Concentrators on the Interconnect device.

**Options**

**cb slot-number**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Control Board on the Interconnect device.

**fpc slot-number**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator (FPC) on the Interconnect device. (QFX3500 switches only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator on the standalone switch.

**interconnect-device name**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Interconnect device.

**node-device name**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Node device.

**Required Privilege Level** view

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. <b>monitored</b> option added in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. <b>pem</b> option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
Description	Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition, on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

**Options** **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

**adc *adc-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace ***adc-slot-number*** with a value from 0 through 19. For MX2010 routers, replace ***adc-slot-number*** with a value from 0 through 9.

**cb *cb-slot-number***—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace ***cb-slot*** with 0 or 1. For the EX Series switches, see *EX Series Switches Hardware and CLI Terminology Mapping* for information on CB slot numbering.

**cip *cip-slot-number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the ***cip-slot-number*** variable with a value of 0 or 1.

**cb interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

**ccg *ccg-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace ***cb-slot*** with a value of 0 or 1.

**fpc *fpc-slot***—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace ***fpc-slot*** with a value from 0 through 9. For MX2020 routers, replace ***fpc-slot*** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see *EX Series Switches Hardware and CLI Terminology Mapping* for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace ***fpc-slot*** with a value from 0 through 63.

**fpm**—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**monitored**—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* variable with a value of 0 or 1. For EX Series switches, see *member* for member ID values.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

**pdu *pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

**pem**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

**pem *pem-slot-number***—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

**psm *psm-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace ***psm-slot-number*** with a value from 0 through 17. For MX2010 routers, replace ***psm-slot-number*** with a value from 0 through 8.

**psu *psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See *EX Series Switches Hardware and CLI Terminology Mapping* for detailed information.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine *re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

**scg**—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc**—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

**sfb *sfb-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace ***sfb-slot-number*** with a value from 0 through 7.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router (switch-fabric chassis). Replace ***number*** variable with 0.

**sib *sib-slot-number***—(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

## show chassis environment fpc

---

<b>Syntax</b>	show chassis environment fpc <slot>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	show chassis environment fpc <lcc number> <slot>
<b>Syntax (MX Series Routers)</b>	show chassis environment fpc <slot> <all-members> <local> <member member-id>
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis environment fpc <slot>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis environment fpc <slot>
<b>Syntax (QFX Series)</b>	show chassis environment fpc <fpc-slot> interconnect-device <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).
<b>Options</b>	<b>none</b> —Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.  <b>all-members</b> —(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.  <b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**slot or fpc-slot**—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
user@host> show chassis environment fpc 9
```

- M120 router—Replace **slot** with a value from 0 through 5.
- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).

- EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Routing Engine (SRE) module), or 6 through 9 (line card only).
- EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
- EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Router—Replace **fpc-slot** with 0 through 7.

**Output Fields** [Table 56 on page 537](#) lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

Table 56: show chassis environment fpc Output Fields

Field Name	Field Description
<b>State</b>	<p>Status of the FPC:</p> <ul style="list-style-type: none"> <li>• <b>Unknown</b>—FPC is not detected by the router.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online.</li> <li>• <b>Ready</b>—FPC is in intermediate or transition state.</li> <li>• <b>Announce online</b>—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative.</li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Offline</b>—FPC is powered down.</li> <li>• <b>Diagnostics</b>—FPC is set to operate in diagnostics mode.</li> </ul>
<b>Temperature</b>	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
<b>PMB Temperature</b>	(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).
<b>Temperature Intake</b>	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
<b>Temperature Top</b>	(T Series routers only) Temperature of the air flowing past the top of the FPC.
<b>Temperature Exhaust</b>	<p>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.</p> <p>The PTX Series Packet Transport Routers, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (<b>Exhaust A</b> and <b>Exhaust B</b>).</p>
<b>Temperature Bottom</b>	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
<b>TL <i>n</i> Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
<b>TQ <i>n</i> Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
<b>Temperature MMBO</b>	(T640 router only) Temperature of the air flowing past the type 3 FPC.
<b>Temperature MMB1</b>	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
<b>Power</b>	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
<b>CMB Revision or BUS revision</b>	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

## Sample Output

## show chassis environment pem

<b>Syntax</b>	show chassis environment pem <slot>
<b>Syntax (ACX4000 Router)</b>	show chassis environment pem
<b>Syntax (TX Matrix Routers)</b>	show chassis environment pem <lcc number   scc> <slot>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis environment pem <lcc number   sfc number> <slot>
<b>Syntax (MX Series Router)</b>	show chassis environment pem <slot> <all-members> <local> <member member-id>
<b>Syntax (MX104 3D Universal Edge Routers)</b>	show chassis environment pem <slot>
<b>Syntax (QFX Series)</b>	show chassis environment pem <slot (interconnect-device name slot )   (node-device name)>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS 11.3 for the QFX Series. Command introduced in Junos OS 12.3R2 for EX Series. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	Display Power Entry Module (PEM) environmental status information.

**NOTE:** The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

**Options** **none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.

**scc**—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual PEM. Replace *slot* with 0 or 1.

**Required Privilege Level**

**Output Fields** Table 57 on page 561 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

**Table 57: show chassis environment pem Output Fields**

Field Name	Field Description
PEM slot status	Number of the PEM slot.
State	Status of the PEM.
Temperature	Temperature of the air flowing past the PEM.
AC Input	Status of the AC input for the specified component
AC Output	Status of the AC output for the specified component.
DC input	Status of the DC input for the specified component.
DC output	Status of the DC output for the specified component.
Load	(Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.
Voltage	(M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.  (MX104 routers only) Information about voltage supplied by the PEM to the system.
Current	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.
Power	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.
SCG/CB/SIB	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board.
FAN	(T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.

## show chassis environment routing-engine

---

<b>Syntax</b>	show chassis environment routing-engine <slot>
<b>Syntax (TX Matrix Routers)</b>	show chassis environment routing-engine <lcc <i>number</i>   scc> <slot>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis environment routing-engine <lcc <i>number</i>   sfc <i>number</i> > <slot>
<b>Syntax (MX104, MX2010, and MX2020 3D Universal Edge Routers)</b>	show chassis environment routing-engine <slot>
<b>Syntax (MX Series Routers)</b>	show chassis environment routing-engine <slot> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show chassis environment routing-engine interconnect-device <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for the T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	Display Routing Engine environmental status information.
<b>Options</b>	<b>none</b> —Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.  <b>all-members</b> —(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.  <b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX104 routers, MX2010 routers, MX2020 routers, and T Series routers, replace *slot* with **0** or **1**. On M5, M7i, M10, and M40 routers and on the J Series router, replace *slot* with **0**. On EX3200 and EX4200 standalone switches, replace *slot* with **0**. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with **0** or **1**. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Routers, replace *slot* with **0** or **1**.

**Output Fields** Table 58 on page 570 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 58: show chassis environment routing-engine Output Fields**

Field Name	Field Description
Routing engine <i>slot</i> status	Number of the Routing Engine slot: 0 or 1.
State	Status of the Routing Engine: <ul style="list-style-type: none"> <li>• <b>Online Master</b>—Routing Engine is online, operating as Master.</li> <li>• <b>Online Standby</b>—Routing Engine is online, operating as Standby.</li> <li>• <b>Offline</b>—Routing Engine is offline.</li> </ul>
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	(PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.

## Sample Output

### show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 27 degrees C / 80 degrees
```

### show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
 State: Online Master
 Temperature: 26 degrees C / 78 degrees F
Route Engine 1 status:
 State: Online Standby
 Temperature: 26 degrees C / 78 degrees F
```

### show chassis environment routing-engine (MX104 Router)

```
user@ host >show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 34 degrees C / 93 degrees F
 CPU Temperature 43 degrees C / 109 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 33 degrees C / 91 degrees F
 CPU Temperature 39 degrees C / 102 degrees F
```

**show chassis environment routing-engine (MX2010 Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 37 degrees C / 98 degrees F
 CPU Temperature 37 degrees C / 98 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 35 degrees C / 95 degrees F
 CPU Temperature 34 degrees C / 93 degrees F

```

**show chassis environment routing-engine (MX2020 Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 35 degrees C / 95 degrees F
 CPU Temperature 34 degrees C / 93 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 44 degrees C / 111 degrees F
 CPU Temperature 43 degrees C / 109 degrees F

```

**show chassis environment routing-engine (TX Matrix Plus Router)**

```

user@host> show chassis environment routing-engine
sfc0-re0:

Routing Engine 0 status:
 State Online Master
 Temperature 26 degrees C / 78 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 28 degrees C / 82 degrees F

lcc0-re0:

Routing Engine 0 status:
 State Online Master
 Temperature 30 degrees C / 86 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 29 degrees C / 84 degrees F

```

**show chassis environment routing-engine (T4000 Core Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 33 degrees C / 91 degrees F
 CPU Temperature 50 degrees C / 122 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 33 degrees C / 91 degrees F
 CPU Temperature 46 degrees C / 114 degrees F

```

**show chassis environment routing-engine (QFX Series)**

```

user@switch> show chassis environment routing-engine

```

```
Routing Engine 0 status:
 State Online Master
 Temperature 42 degrees C / 107 degrees F
```

#### show chassis environment routing-engine interconnect-device (QFabric System)

```
user@switch> show chassis environment routing-engine interconnect-device interconnect1
routing-engine interconnect-device interconnect1
Routing Engine 0 status:
 State Online Standby
 Temperature 52 degrees C / 125 degrees F
Routing Engine 1 status:
 State Online Master
 Temperature 57 degrees C / 134 degrees F
```

#### show chassis environment routing-engine (PTX5000 Packet Transport Router)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 55 degrees C / 131 degrees F
 CPU Temperature 66 degrees C / 150 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 52 degrees C / 125 degrees F
 CPU Temperature 64 degrees C / 147 degrees F
```

## show chassis fan

<b>Syntax (EX Series Switches)</b>	show chassis firmware <detail>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced for EX8200 switches in Junos OS Release 10.2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.</p>
<b>Description</b>	<p>On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).</p> <p>On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version</p>

levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

**Options** **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device**—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

**scc**—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**detail**—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

**Required Privilege Level** view

**Output Fields** [Table 60 on page 588](#) lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

**Table 60: show chassis firmware Output Fields**

Field Name	Field Description
<b>Part</b>	(MX Series, MX2010, and MX2020 routers) Chassis part name.
<b>Type</b>	(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: <b>ROM</b> or <b>O/S</b> . On switches: <b>uboot</b> or <b>loader</b> .
<b>Version</b>	(MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.

Table 60: show chassis firmware Output Fields (*continued*)

Field Name	Field Description
FPC	( <i>detail</i> option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.
AFEB	(MX104 routers) Version of the compact Forwarding Engine Board.
Boot	( <i>detail</i> option only) Version of the SYSPLD.
PoE	( <i>detail</i> option only) Version of the PoE firmware.
PFE-<number>	( <i>detail</i> option only) Version of the PFE used in the switch.
PHY-	( <i>detail</i> option only) Version of the physical layer device (PHY) used in the switch.
microcode	( <i>detail</i> option only) Microcode of the physical layer devices (PHY) used in the switch.
uboot	( <i>detail</i> option only) Version of the u-boot used in the switch.
loader	( <i>detail</i> option only) Version of the loader used in the switch.

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.</p>

**Description** Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

**Options** **none**—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached routers in the routing matrix.

**NOTE:** In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
```

Utilization (%)	Temp	CPU	Utilization (%)	Memory
Slot State	(C)	Total	Interrupt	DRAM (MB) Heap
Buffer				
0 Empty				
1 Empty				
2 Empty				
3 Empty				
4 Empty				
5 Offline	---	Hard FPC error---		
6 Empty				
7 Online	26	4	0	1024 0
32				

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
4 alarms currently active
```

Alarm time	Class	Description
2011-03-24 00:52:51 UTC	Major	FPC 5 Hard errors
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:51:26 UTC	Minor	Loss of communication with Backup RE

**NOTE:** On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation the alarms.

The following sample output shows the FPC status after the **enhanced-mode** statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
```

	Temp	CPU Utilization (%)	Memory
Utilization (%)			
Slot State	(C)	Total	Interrupt
Buffer			
0 offline			---FPC misconfiguration---
1 offline			---FPC misconfiguration---
2 offline			---FPC misconfiguration---
3 Empty			
4 Empty			
5 Online	66	50	0
27			2816 29

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
3 alarms currently active
Alarm time Class Description
2011-03-24 00:52:51 PST Major FPC 1 misconfig
2011-03-24 00:52:31 PST Major FPC 2 misconfig
2011-03-24 00:52:31 PST Major FPC 3 misconfig
```

**detail**—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see ***fpc-slot*** or ***slot***).

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

***fpc-slot***—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only)—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the **lcc *number*** option (the recommended method), replace ***fpc-slot*** with a value from 0 through 7. Otherwise, replace ***fpc-slot*** with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of the specified router (line-card chassis)

by using the **lcc number** option (the recommended method), replace **fpc-slot** with a value from 0 through 7. Otherwise, replace **fpc-slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace **fpc-slot** with a value from 0 through 5.
- MX80 router—Replace **fpc-slot** with a value from 0 through 1.
- MX104 router—Replace **fpc-slot** with a value from 0 through 2.
- MX240 router—Replace **fpc-slot** with a value from 0 through 2.
- MX480 router—Replace **fpc-slot** with a value from 0 through 5.
- MX-960 router—Replace **fpc-slot** with a value from 0 through 11.
- MX2010 router—Replace **fpc-slot-number** with a value from 0 through 9.
- MX2020 router—Replace **fpc-slot-number** with a value from 0 through 19.
- Other routers—Replace **fpc-slot** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **fpc-slot** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **fpc-slot** with a value from 0 through 9.
  - EX6210 switches—Replace **fpc-slot** with a value from 0 through 9.
  - EX8208 switches—Replace **fpc-slot** with a value from 0 through 7.
  - EX8216 switches—Replace **fpc-slot** with a value from 0 through 15.
- QFX Series:
  - QFX3500 switches—Replace **fpc-slot** with 0.
  - QFabric systems—Replace **fpc-slot** with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Routers:
  - PTX5000 Packet Transport Router—Replace **fpc-slot** with a value from 0 through 7.
- ACX Series Universal Access Routers:
  - ACX1000 and ACX2000 Universal Access Routers—Replace **fpc-slot** with 0.

**local**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

**member member-id**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

**pic-status**—(Optional) Display status information for all PICs or for the PIC in the specified slot (see *fpc-slot*).

**NOTE:** On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the `show chassis fpc` command with the `pic-status` option, the CLI displays the string “Not Supported” for 10x10GE (LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0 Online E2-FPC Type 1
 PIC 0 Online 1x G/E SFP, 1000 BASE
 PIC 1 Online Adaptive Services-II
 PIC 2 Online 1x G/E IQ, 1000 BASE
 PIC 3 Online 1x G/E IQ, 1000 BASE
Slot 1 Online FPC Type 3-ES
 PIC 0 Present UNUSED- Not Supported
Slot 2 Online FPC Type 4-ES
 PIC 0 Offline 4x OC-192 SONET XFP
 PIC 1 Present 10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4 Offline FPC Type 1-ES
Slot 5 Offline FPC Type 2-ES
Slot 6 Online E2-FPC Type 3
 PIC 0 Online 1x OC-192 SONET XFP
 PIC 1 Online 4x OC-48 SONET
 PIC 2 Online 4x OC-48 SONET
 PIC 3 Online MultiServices 500
Slot 7 Online FPC Type 4-ES
 PIC 0 Online 4x 10GE (LAN/WAN) XFP
 PIC 1 Online 4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (/var/log/messages) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr 5 08:47:36 router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see [PSN-2010-03-696](#).

**NOTE:** When there is a double-bit ECC error in a network processor's memory, the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP or Channelized E1/T1 Circuit Emulation MIC is switched to the offline state.

```
user@host> show chassis fpc pic-status
Slot 1 Online MPC Type 2 3D Q
PIC 0 Offline 1xC0C12/4xC0C3 CH-CE- ECC error detected
```

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Output Fields** Table 61 on page 604 lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

**Table 61: show chassis fpc Output Fields**

Field Name	Field Description	Level of Output
<b>Slot</b> or <b>Slot State</b>	<p>Slot number and state. The state can be one of the following conditions:</p> <ul style="list-style-type: none"> <li>• <b>Dead</b>—Held in reset because of errors.</li> <li>• <b>Diag</b>—Slot is being ignored while the FPC is running diagnostics.</li> <li>• <b>Dormant</b>—Held in reset.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Offline</b>—(PTX Series Packet Transport Routers only) One of the following two states is displayed: <ul style="list-style-type: none"> <li>• <b>FPC offlined due to unreachable destinations</b></li> <li>• <b>FPC Offlined due to degraded FPC action</b></li> </ul> </li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either <b>Hardware Not Supported</b> or <b>Hardware Not In Right Slot</b>. The FPC is coming up but not yet online.</li> <li>• <b>Probed</b>—Probe is complete; awaiting restart of the Packet Forwarding Engine.</li> <li>• <b>Probe-wait</b>—Waiting to be probed.</li> </ul>	all levels
<b>Logical slot</b>	Slot number.	all levels
<b>Temp (C) or Temperature</b>	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels all levels

Table 61: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Temperature (PTX Series)</b>	On PTX Series Packet Transport Routers, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: <ul style="list-style-type: none"> <li>• Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC.</li> <li>• Temperature (Intake)—Temperature of the air flowing into the chassis.</li> <li>• Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</li> <li>• Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC.</li> <li>• Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC.</li> </ul>	<b>detail</b>
<b>Total CPU Utilization (%)</b>	Total percentage of CPU being used by the FPC's processor.	all levels
<b>Interrupt CPU Utilization (%)</b>	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
<b>Memory DRAM (MB)</b>	Total DRAM, in megabytes, available to the FPC's processor.	none specified
<b>Heap Utilization (%)</b>	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).  <b>NOTE:</b> On MX Series routers and EX Series switches in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.	none specified
<b>Buffer Utilization (%)</b>	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
<b>Total CPU DRAM</b>	Amount of DRAM available to the FPC's CPU.	<b>detail</b>
<b>Total RLDRAM</b>	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	<b>detail</b>
<b>Total DDR DRAM</b>	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	<b>detail</b>
<b>Total SRAM</b>	Amount of static RAM (SRAM) used by the FPC's CPU.	<b>detail</b>
<b>Total SDRAM</b>	Total amount of memory used for storing packets and notifications.	<b>detail</b>
<b>I/O Manager ASICs information</b>	I/O Manager version number, manufacturer, and part number.	<b>detail</b>
<b>Start time</b>	Time when the Routing Engine detected that the FPC was running.	<b>detail</b>

Table 61: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	detail
PIC type	(pic-status output only) Type of PIC.	none specified

## Sample Output

### show chassis fpc (EX6210 Switch)

## Slot 1 information:

```

State Online
Temperature 38 degrees C / 100 degrees F
Total CPU DRAM 2048 MB
Total SRAM 64 MB
Total SDRAM 1280 MB
Start time 2010-10-04 20:06:22 PDT
Uptime 1 hour, 32 minutes, 51 seconds

```

## Slot 2 information:

```

State Online
Temperature 43 degrees C / 109 degrees F
Total CPU DRAM 2048 MB
Total SRAM 128 MB
Total SDRAM 2560 MB
Start time 2010-10-04 20:06:37 PDT
Uptime 1 hour, 32 minutes, 36 seconds

```

## Slot 4 information:

```

State Online
Temperature 43 degrees C / 109 degrees F
Total CPU DRAM 2048 MB
Total SRAM 128 MB
Total SDRAM 2560 MB
Start time 2010-10-04 20:06:40 PDT
Uptime 1 hour, 32 minutes, 33 seconds

```

## Slot 6 information:

State	Online
Temperature	42 degrees C / 107 degrees F
Total CPU DRAM	2048 MB
Total SRAM	128 MB
Total SDRAM	2560 MB
Start time	2010-10-04 20:06:42 PDT
Uptime	1 hour, 32 minutes, 31 seconds

## Slot 7 information:

State	Online
Temperature	45 degrees C / 113 degrees F
Total CPU DRAM	2048 MB
Total SRAM	64 MB
Total SDRAM	1280 MB
Start time	2010-10-04 20:06:43 PDT
Uptime	1 hour, 32 minutes, 30 seconds

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>models</b> option introduced in Junos OS Release 8.2.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.</p>
<b>Description</b>	<p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> <li>On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <i>number</i> is always 0.</li> <li>On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <i>number</i> equals the member ID, from 0 through 9.</li> <li>On EX8208 and EX8216 switches—Refers to a line card; FPC <i>number</i> equals the slot number for the line card.</li> </ul> <p>On QFX3500 and QFX5100 standalone switches, both the FPC and FPC <i>number</i> are always 0.</p> <p>On Type 5 FPC on T4000 routers, there are no <b>top temperature sensor</b> or <b>bottom temperature sensor</b> parameters. Instead, <b>fan intake temperature sensor</b> and <b>fan exhaust temperature sensors</b> parameters are displayed.</p>
<b>Options</b>	<p><b>none</b>—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.</p> <p><b>clei-models</b>—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).</p> <p><b>detail</b>—(Optional) Include RAM and disk information in output.</p> <p><b>extensive</b>—(Optional) Display ID EEPROM information.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.</p>

**interconnect-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member *member-id***—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Additional Information** The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

**Table 62: Routing Engines Displaying DIMM Information**

**Output Fields** [Table 63 on page 634](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 63: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
<b>Item</b>	<p>Chassis component:</p> <ul style="list-style-type: none"> <li>(EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See <i>EX Series Switches Hardware and CLI Terminology Mapping</i>.</li> <li>(MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2).</li> <li>(M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller.</li> <li>(M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB.</li> <li>(QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs).</li> <li>(PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal).</li> <li>(MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.</li> </ul>	All levels
<b>Version</b>	Revision level of the chassis component.	All levels
<b>Part number</b>	Part number of the chassis component.	All levels
<b>Serial number</b>	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels

Table 63: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
Assb ID or Assembly ID	( <b>extensive</b> keyword only) Identification number that describes the FRU hardware.	<b>extensive</b>
Assembly Version	( <b>extensive</b> keyword only) Version number of the FRU hardware.	<b>extensive</b>
Assembly Flags	( <b>extensive</b> keyword only) Flags.	<b>extensive</b>
FRU model number	( <b>clei-models</b> , <b>extensive</b> , and <b>models</b> keyword only) Model number of the FRU hardware component.	none specified
CLEI code	( <b>clei-models</b> and <b>extensive</b> keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: <b>0x00</b> (version 0), <b>0x01</b> (version 1), or <b>0x02</b> (version 2).	<b>extensive</b>
Description	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> <li>Type of power supply.</li> <li>Type of PIC. If the PIC type is not supported on the current software release, the output states <b>Hardware Not Supported</b>.</li> <li>Type of FPC: <b>FPC Type 1</b>, <b>FPC Type 2</b>, <b>FPC Type 3</b>, <b>FPC Type 4</b>, or <b>FPC TypeOC192</b>.</li> </ul> <p>On EX Series switches, a brief description of the FPC.</p> <p>On the J Series routers, the FPC type corresponds to the Physical Interface Module (PIM). The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> <li><b>2x FE</b>—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM</li> <li><b>4x FE</b>—4-port Fast Ethernet ePIM</li> <li><b>1x GE Copper</b>—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port)</li> <li><b>1x GE SFP</b>—SFP Gigabit Ethernet ePIM (one fiber port)</li> <li><b>4x GE Base PIC</b>—Four built-in Gigabit Ethernet ports on a J4350 or J6350 chassis (fixed PIM)</li> <li><b>2x Serial</b>—Dual-port serial PIM</li> <li><b>2x T1</b>—Dual-port T1 PIM</li> <li><b>2x E1</b>—Dual-port E1 PIM</li> <li><b>2x CTIE1</b>—Dual-port channelized T1/E1 PIM</li> <li><b>1x T3</b>—T3 PIM (one port)</li> <li><b>1x E3</b>—E3 PIM (one port)</li> <li><b>4x BRI S/T</b>—4-port ISDN BRI S/T PIM</li> <li><b>4x BRI U</b>—4-port ISDN BRI U PIM</li> <li><b>1x ADSL Annex A</b>—ADSL 2/2+ Annex A PIM (one port, for POTS)</li> <li><b>1x ADSL Annex B</b>—ADSL 2/2+ Annex B PIM (one port, for ISDN)</li> </ul>	All levels

Table 63: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> <li>• <b>2xSHDSL (ATM)</b>—G SHDSL PIM (2-port two-wire module or 1-port four-wire module)</li> <li>• <b>1x TGM550</b>—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog <b>LINE</b> ports, and two analog <b>TRUNK</b> ports)</li> <li>• <b>1x DS1 TIM510</b>—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup)</li> <li>• <b>4x FXS, 4x FXO, TIM514</b>—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog <b>LINE</b> ports and four analog <b>TRUNK</b> ports)</li> <li>• <b>4x BRI TIM521</b>—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports)</li> <li>• <b>Crypto Accelerator Module</b>—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services</li> <li>• <b>MPC M 16x10GE</b>—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.)</li> <li>• For hosts, the Routing Engine type.</li> <li>• For small form-factor pluggable transceiver (SFP) modules, the type of fiber: <b>LX</b>, <b>SX</b>, <b>LH</b>, or <b>T</b>.</li> <li>• LCD description for EX Series switches (except EX2200 switches).</li> <li>• <b>MPC2</b>—1-port MPC2 that supports two separate slots for MICs.</li> <li>• <b>MPC3E</b>—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs.</li> <li>• 100GBASE-LR4, pluggable CFP optics</li> <li>• Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy.</li> <li>• Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs).</li> <li>• <b>MPC4E</b>—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE on MX2020, MX960, MX480, and MX240 routers.</li> <li>• LCD description for MX Series routers</li> </ul>
