## YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

## END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://support.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# About the Documentation

## IN THIS SECTION

- Documentation and Release Notes | v
- Documentation Conventions | v
- Documentation Feedback | viii
- Requesting Technical Support | viii

Use this guide to operate ACX5448-M devices in Federal Information Processing Standards (FIPS) 140-2 Level 1 environment. FIPS 140-2 defines security levels for hardware and software that perform cryptographic functions.

## Documentation and Release Notes

To obtain the most current version of all Juniper Networks<sup>®</sup> technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

## Documentation Conventions

Table 1 on page vi defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page vi defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
<b>Text like this</b>	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the [edit <b>protocols ospf area area-id</b>] hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub</b> <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  ( <i>string1</i>   <i>string2</i>   <i>string3</i> )
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members [ <i>community-ids</i> ]</b>
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	

## GUI Conventions

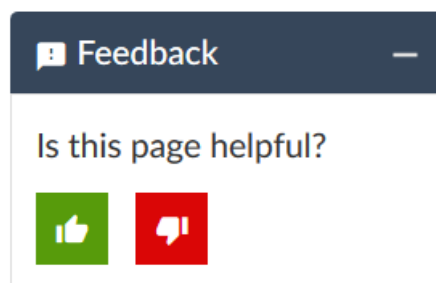

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<b>Bold text like this</b>	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are

covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

## Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.

# Understanding Junos OS in FIPS Mode

## IN THIS SECTION

- Supported Platforms and Hardwares | 11
- About the Cryptographic Boundary on Your Device | 11
- How FIPS Mode Differs from Non-FIPS Mode | 12
- Validated Version of Junos OS in FIPS Mode | 12

Federal Information Processing Standards (FIPS) 140-2 defines security levels for hardware and software that perform cryptographic functions. The Juniper Networks ACX5448-M devices running the Juniper Networks Junos operating system (Junos OS) in *FIPS mode* comply with the FIPS 140-2 Level 1 standard.

Operating ACX5448-M devices in a FIPS 140-2 Level 1 environment requires enabling and configuring FIPS mode on the devices from the Junos OS command-line interface (CLI).

The Crypto Officer enables FIPS mode in Junos OS Release 20.3R1 and sets up keys and passwords for the system and other *FIPS users*.

## Supported Platforms and Hardwares

For the features described in this document, the following platform is used to qualify FIPS certification:

- ACX5448-M  
([https://www.juniper.net/documentation/en\\_US/release-independent/junos/topics/topic-map/ac5448-system-overview.html#fig-ac5448-M-front](https://www.juniper.net/documentation/en_US/release-independent/junos/topics/topic-map/ac5448-system-overview.html#fig-ac5448-M-front))

## About the Cryptographic Boundary on Your Device

FIPS 140-2 compliance requires a defined *cryptographic boundary* around each *cryptographic module* on a device. Junos OS in FIPS mode prevents the cryptographic module from executing any software that is not part of the FIPS-certified distribution, and allows only FIPS-approved cryptographic algorithms to be used. No critical security parameters (CSPs), such as passwords and keys, can cross the cryptographic boundary of the module in unencrypted format.

**CAUTION:** Virtual Chassis features are not supported in FIPS mode. Do not configure a Virtual Chassis in FIPS mode.

## How FIPS Mode Differs from Non-FIPS Mode

Junos OS in FIPS mode differs in the following ways from Junos OS in non-FIPS mode:

- Self-tests of all cryptographic algorithms are performed at startup.
- Self-tests of random number and key generation are performed continuously.
- Weak cryptographic algorithms such as Data Encryption Standard (DES) and MD5 are disabled.
- Weak or unencrypted management connections must not be configured.
- Passwords must be encrypted with strong one-way algorithms that do not permit decryption.
- Administrator passwords must be at least 10 characters long.

## Validated Version of Junos OS in FIPS Mode

To determine whether a Junos OS release is NIST-validated, see the compliance page on the Juniper Networks Web site (<https://apps.juniper.net/compliance/>).

# FIPS Terminology and Supported Cryptographic Algorithms Overview

## IN THIS SECTION

- Terminology | 13
- Supported Cryptographic Algorithms | 14

Use the definitions of FIPS terms, and supported algorithms to help you understand Junos OS in FIPS mode.

## Terminology

**Critical security parameter (CSP)**—Security-related information—for example, secret and private cryptographic keys and authentication data such as passwords and personal identification numbers (PINs)—whose disclosure or modification can compromise the security of a cryptographic module or the information it protects. For details, see [“Understanding the Operational Environment for Junos OS in FIPS Mode” on page 21](#).

**Cryptographic module**—The set of hardware, software, and firmware that implements approved security functions (including cryptographic algorithms and key generation) and is contained within the cryptographic boundary. ACX5448-M device is certified at FIPS 140-2 Level 1.

**FIPS**—Federal Information Processing Standards. FIPS 140-2 specifies requirements for security and cryptographic modules. Junos OS in FIPS mode complies with FIPS 140-2 Level 1.

**FIPS maintenance role**—The role the Crypto Officer assumes to perform physical maintenance or logical maintenance services such as hardware or software diagnostics. For FIPS 140-2 compliance, the Crypto Officer zeroizes the Routing Engine on entry to and exit from the FIPS maintenance role to erase all plain-text secret and private keys and unprotected CSPs.

**NOTE:** The FIPS maintenance role is not supported on Junos OS in FIPS mode.

**Hashing**—A message authentication method that applies a cryptographic technique iteratively to a message of arbitrary length and produces a hash *message digest* or *signature* of fixed length that is appended to the message when sent.

**KATs**—Known answer tests. System self-tests that validate the output of cryptographic algorithms approved for FIPS and test the integrity of some Junos OS modules. For details, see [“Understanding FIPS Self-Tests” on page 68](#).

**SSH**—A protocol that uses strong authentication and encryption for remote access across a nonsecure network. SSH provides remote login, remote program execution, file copy, and other functions. It is intended as a secure replacement for **rlogin**, **rsh**, and **rcp** in a UNIX environment. To secure the information sent over administrative connections, use SSHv2 for CLI configuration. In Junos OS, SSHv2 is enabled by default, and SSHv1, which is not considered secure, is disabled.

**Zeroization**—Erasure of all CSPs and other user-created data on a device before its operation as a FIPS cryptographic module—or in preparation for repurposing the devices for non-FIPS operation. The Crypto Officer can zeroize the system with a CLI operational command.

## Supported Cryptographic Algorithms

[Table 3 on page 14](#) summarizes the high level protocol algorithm support.

**Table 3: Protocols Allowed in FIPS Mode**

Protocol	Key Exchange	Authentication	Cipher	Integrity
SSHv2	<ul style="list-style-type: none"> <li>dh-group14-sha1</li> <li>ECDH-sha2-nistp256</li> <li>ECDH-sha2-nistp384</li> <li>ECDH-sha2-nistp521</li> </ul>	Host (module): <ul style="list-style-type: none"> <li>ECDSA P-256</li> <li>SSH-RSA</li> <li>rsa-sha2-256</li> <li>rsa-sha2-512</li> </ul> Client (user): <ul style="list-style-type: none"> <li>ECDSA P-256</li> <li>ECDSA P-384</li> <li>ECDSA P-521</li> <li>SSH-RSA</li> </ul>	<ul style="list-style-type: none"> <li>AES CTR 128</li> <li>AES CTR 192</li> <li>AES CTR 256</li> <li>AES CBC 128</li> <li>AES CBC 256</li> </ul>	<ul style="list-style-type: none"> <li>HMAC-SHA-1</li> <li>HMAC-SHA-256</li> <li>HMAC-SHA-512</li> </ul>

Table 4: MACSEC- LC Supported Ciphers

## MACSEC- LC Supported Ciphers

GCM-AES-128

GCM-AES-256

GCM-AES-XPN-128

GCM-AES-XPN-256

The following cryptographic algorithms are supported in FIPS mode. Symmetric methods use the same key for encryption and decryption, while asymmetric methods use different keys for encryption and decryption.

**AES**—The Advanced Encryption Standard (AES), defined in FIPS PUB 197. The AES algorithm uses keys of 128, 192, or 256 bits to encrypt and decrypt data in blocks of 128 bits.

**ECDH**—Elliptic Curve Diffie-Hellman. A variant of the Diffie-Hellman key exchange algorithm that uses cryptography based on the algebraic structure of elliptic curves over finite fields. ECDH allows two parties, each having an elliptic curve public-private key pair, to establish a shared secret over an insecure channel. The shared secret can be used either as a key or to derive another key for encrypting subsequent communications using a symmetric key cipher.

**ECDSA**—Elliptic Curve Digital Signature Algorithm. A variant of the Digital Signature Algorithm (DSA) that uses cryptography based on the algebraic structure of elliptic curves over finite fields. The bit size of the elliptic curve determines the difficulty of decrypting the key. The public key believed to be needed for ECDSA is about twice the size of the security level, in bits. ECDSA using the P-256, P-384, and P-521 curves can be configured under OpenSSH.

**HMAC**—Defined as “Keyed-Hashing for Message Authentication” in RFC 2104, HMAC combines hashing algorithms with cryptographic keys for message authentication. For Junos OS in FIPS mode, HMAC uses the iterated cryptographic hash functions SHA-1, SHA-256, and SHA-512 along with a secret key.

**SHA-256 and SHA-512**—Secure hash algorithms (SHA) belonging to the SHA-2 standard defined in FIPS PUB 180-2. Developed by NIST, SHA-256 produces a 256-bit hash digest, and SHA-512 produces a 512-bit hash digest.

# Identifying Secure Product Delivery

There are several mechanisms provided in the delivery process to ensure that a customer receives a product that has not been tampered with. The customer should perform the following checks upon receipt of a device to verify the integrity of the platform.

- Shipping label—Ensure that the shipping label correctly identifies the correct customer name and address as well as the device.
- Outside packaging—Inspect the outside shipping box and tape. Ensure that the shipping tape has not been cut or otherwise compromised. Ensure that the box has not been cut or damaged to allow access to the device.
- Inside packaging—Inspect the plastic bag and seal. Ensure that the bag is not cut or removed. Ensure that the seal remains intact.

If the customer identifies a problem during the inspection, he or she should immediately contact the supplier. Provide the order number, tracking number, and a description of the identified problem to the supplier.

Additionally, there are several checks that can be performed to ensure that the customer has received a box sent by Juniper Networks and not a different company masquerading as Juniper Networks. The customer should perform the following checks upon receipt of a device to verify the authenticity of the device:

- Verify that the device was ordered using a purchase order. Juniper Networks devices are never shipped without a purchase order.
- When a device is shipped, a shipment notification is sent to the e-mail address provided by the customer when the order is taken. Verify that this e-mail notification was received. Verify that the e-mail contains the following information:
  - Purchase order number
  - Juniper Networks order number used to track the shipment
  - Carrier tracking number used to track the shipment
  - List of items shipped including serial numbers
  - Address and contacts of both the supplier and the customer
- Verify that the shipment was initiated by Juniper Networks. To verify that a shipment was initiated by Juniper Networks, you should perform the following tasks:
  - Compare the carrier tracking number of the Juniper Networks order number listed in the Juniper Networks shipping notification with the tracking number on the package received.

- Log on to the Juniper Networks online customer support portal at <https://support.juniper.net/support/> to view the order status. Compare the carrier tracking number or the Juniper Networks order number listed in the Juniper Networks shipment notification with the tracking number on the package received.

## Understanding Management Interfaces

The following management interfaces can be used in the evaluated configuration:

- Local Management Interfaces—The RJ-45 console port on the device is configured as RS-232 data terminal equipment (DTE). You can use the command-line interface (CLI) over this port to configure the device from a terminal.
- Remote Management Protocols—The device can be remotely managed over any Ethernet interface. SSHv2 is the only permitted remote management protocol that can be used in the evaluated configuration. The remote management protocols J-Web and Telnet are not available for use on the device.

# Understanding Roles and Services for Junos OS

## IN THIS SECTION

- [Crypto Officer Role and Responsibilities | 19](#)
- [FIPS User Role and Responsibilities | 20](#)
- [What Is Expected of All FIPS Users | 20](#)

The Juniper Networks Junos operating system (Junos OS) running in non-FIPS mode allows a wide range of capabilities for users, and authentication is identity-based. In contrast, the FIPS 140-2 standard defines two user roles: Crypto Officer and FIPS user. These roles are defined in terms of Junos OS user capabilities.

All other user types defined for Junos OS in FIPS mode such as read-only and administrative user must fall into one of the two categories: Crypto Officer or FIPS user. For this reason, user authentication in Junos is identity based with role based authorization.

Crypto Officer performs all FIPS-mode-related configuration tasks and issue all statements and commands for Junos OS in FIPS mode. Crypto Officer and FIPS user configurations must follow the guidelines for Junos OS in FIPS mode.

## Crypto Officer Role and Responsibilities

The Crypto Officer is the person responsible for enabling, configuring, monitoring, and maintaining Junos OS in FIPS mode on a device. The Crypto Officer securely installs Junos OS on the device, enables FIPS mode, establishes keys and passwords for other users and software modules, and initializes the device before network connection.

**BEST PRACTICE:** We recommend that the Crypto Officer administer the system in a secure manner by keeping passwords secure and checking audit files.

The permissions that distinguish the Crypto Officer from other FIPS users are **secret**, **security**, **maintenance**, and **control**. Assign the Crypto Officer to a login class that contains all of these permissions.

Among the tasks related to Junos OS in FIPS mode, the Crypto Officer is expected to:

- Set the initial root password. The length of the password should be at least 10 characters.
- Reset user passwords with FIPS-approved algorithms.
- Examine log and audit files for events of interest.
- Erase user-generated files, keys, and data by zeroizing the device.

## FIPS User Role and Responsibilities

All FIPS users, including the Crypto Officer, can view the configuration. Only the user assigned as the Crypto Officer can modify the configuration.

The permissions that distinguish Crypto Officers from other FIPS users are secret, security, maintenance, and control. For FIPS compliance, assign the FIPS user to a class that contains none of these permissions.

FIPS user can view status output but cannot reboot or zeroize the device.

## What Is Expected of All FIPS Users

All FIPS users, including the Crypto Officer, must observe security guidelines at all times.

All FIPS users must:

- Keep all passwords confidential.
- Store devices and documentation in a secure area.
- Deploy devices in secure areas.
- Check audit files periodically.
- Conform to all other FIPS 140-2 security rules.
- Follow these guidelines:
  - Users are trusted.
  - Users abide by all security guidelines.
  - Users do not deliberately compromise security.
  - Users behave responsibly at all times.

## RELATED DOCUMENTATION

[Zeroizing the System | 33](#)

# Understanding the Operational Environment for Junos OS in FIPS Mode

## IN THIS SECTION

- [Hardware Environment for Junos OS in FIPS Mode | 21](#)
- [Software Environment for Junos OS in FIPS Mode | 21](#)
- [Critical Security Parameters | 23](#)

A Juniper Networks device running the Juniper Networks Junos operating system (Junos OS) in FIPS mode forms a special type of hardware and software operational environment that is different from the environment of a device in non-FIPS mode:

## Hardware Environment for Junos OS in FIPS Mode

Junos OS in FIPS mode establishes a cryptographic boundary in the device that no critical security parameters (CSPs) can cross using plain text. Each hardware component of the device that requires a cryptographic boundary for FIPS 140-2 compliance is a separate cryptographic module.

Cryptographic methods are not a substitute for physical security. The hardware must be located in a secure physical environment. Users of all types must not reveal keys or passwords, or allow written records or notes to be seen by unauthorized personnel.

## Software Environment for Junos OS in FIPS Mode

A Juniper Networks device running Junos OS in FIPS mode forms a special type of nonmodifiable operational environment. To achieve this environment on the device, the system prevents the execution of any binary

file that was not part of the certified Junos OS in FIPS mode distribution. When a device is in FIPS mode, it can run only Junos OS.

FIPS mode on ACX5448-M device is available in Junos OS Release 20.3R1 and later. The Junos OS in FIPS mode software environment is established after the Crypto Officer successfully enables FIPS mode on a device. The Junos OS image that includes FIPS mode is available on the Juniper Networks website and can be installed on a functioning device.

For FIPS 140-2 compliance, we recommend that you delete all user-created files and data by *zeroizing* the device before enabling FIPS mode.

Enabling FIPS mode disables many of the usual Junos OS protocols and services. In particular, you cannot configure the following services in Junos OS in FIPS mode:

- finger
- ftp
- rlogin
- telnet
- tftp
- xnm-clear-text

Attempts to configure these services, or load configurations with these services configured, result in a configuration syntax error.

You can use only SSH as a remote access service.

All passwords established for users after upgrading to Junos OS in FIPS mode must conform to Junos OS in FIPS mode specifications. Passwords must be between 10 and 20 characters in length and require the use of at least three of the five defined character sets (uppercase and lowercase letters, digits, punctuation marks, and keyboard characters, such as % and &, not included in the other four categories). Attempts to configure passwords that do not conform to these rules result in an error. All passwords and keys used to authenticate peers must be at least 10 characters in length, and in some cases the length must match the digest size.

**NOTE:** Do not attach the device to a network until the Crypto Officer completes configuration from the local console connection.

For strict compliance, do not examine core and crash dump information on the local console in Junos OS in FIPS mode because some CSPs might be shown in plain text.

## Critical Security Parameters

Critical security parameters (CSPs) are security-related information such as cryptographic keys and passwords that can compromise the security of the cryptographic module or the security of the information protected by the module if they are disclosed or modified.

*Zeroization* of the system erases all traces of CSPs in preparation for operating the device or Routing Engine as a cryptographic module.

Table 5 on page 23 lists CSPs on devices running Junos OS.

**Table 5: Critical Security Parameters**

CSP	Description	Zeroize	Use
SSHv2 private host key	ECDSA / RSA key used to identify the host, generated the first time SSH is configured.	Zeroize command.	Used to identify the host.
SSHv2 session keys	Session key used with SSHv2 and as a Diffie-Hellman private key.  Encryption: AES-128, AES-192, AES-256.  MACs: HMAC-SHA-1, HMAC-SHA-2-256, HMAC-SHA2-512.  Key exchange: ECDH-sha2-nistp256, ECDH-sha2-nistp384, ECDH-sha2-nistp521, and dh-group14-sha1.	Power cycle and terminate session.	Symmetric key used to encrypt data between host and client.
User authentication key	Hash of the user's password: SHA256, SHA512.	Zeroize command.	Used to authenticate a user to the cryptographic module.
Crypto Officer authentication key	Hash of the Crypto Officer's password: SHA256, SHA512.	Zeroize command.	Used to authenticate the Crypto Officer to the cryptographic module.
HMAC DRBG seed	Seed for deterministic random bit generator (DRBG).	Seed is not stored by the cryptographic module.	Used for seeding DRBG.
HMAC DRBG V value	The value (V) of output block length (outlen) in bits, which is updated each time another outlen bits of output are produced.	Power cycle.	A critical value of the internal state of DRBG.

Table 5: Critical Security Parameters (*continued*)

CSP	Description	Zeroize	Use
HMAC DRBG key value	The current value of the outlen-bit key, which is updated at least once each time that the DRBG mechanism generates pseudorandom bits.	Power cycle.	A critical value of the internal state of DRBG.
NDRNG entropy	Used as entropy input string to the HMAC DRBG.	Power cycle.	A critical value of the internal state of DRBG.

In Junos OS in FIPS mode, all CSPs must enter and leave the cryptographic module in encrypted form. Any CSP encrypted with a non-approved algorithm is considered plain text by FIPS.

Local passwords are hashed with the SHA256 or SHA512 algorithm. Password recovery is not possible in Junos OS in FIPS mode. Junos OS in FIPS mode cannot boot into single-user mode without the correct root password.

# Understanding Password Specifications and Guidelines for Junos OS in FIPS Mode

All passwords established for users by the Crypto Officer must conform to the following Junos OS in FIPS mode requirements. Attempts to configure passwords that do not conform to the following specifications result in an error.

- **Length.** Passwords must contain between 10 and 20 characters.
- **Character set requirements.** Passwords must contain at least three of the following five defined character sets:
  - Uppercase letters
  - Lowercase letters
  - Digits
  - Punctuation marks
  - Keyboard characters not included in the other four sets—such as the percent sign (%) and the ampersand (&)
- **Authentication requirements.** All passwords and keys used to authenticate peers must contain at least 10 characters, and in some cases the number of characters must match the digest size.
- **Password encryption.** To change the default encryption method (SHA512) include the **format** statement at the **[edit system login password]** hierarchy level.

**Guidelines for strong passwords.** Strong, reusable passwords can be based on letters from a favorite phrase or word and then concatenated with other unrelated words, along with added digits and punctuation. In general, a strong password is:

- Easy to remember so that users are not tempted to write it down.
- Made up of mixed alphanumeric characters and punctuation. For FIPS compliance include at least one change of case, one or more digits, and one or more punctuation marks.
- Changed periodically.
- Not divulged to anyone.

**Characteristics of weak passwords.** Do not use the following weak passwords:

- Words that might be found in or exist as a permuted form in a system files such as **/etc/passwd**.
- The hostname of the system (always a first guess).

- Any word or phrase that appears in a dictionary or other well-known source, including dictionaries and thesauruses in languages other than English; works by classical or popular writers; or common words and phrases from sports, sayings, movies or television shows.
- Permutations on any of the above—for example, a dictionary word with letters replaced with digits (**r00t**) or with digits added to the end.
- Any machine-generated password. Algorithms reduce the search space of password-guessing programs and so must not be used.

## Downloading Software Packages from Juniper Networks

You can download the Junos OS software package for ACX5448-M from the Juniper Networks website: **junos-vmhost-install-acx-x86-64-20.3R1.8.tgz**.

Before you begin to download the software, ensure that you have a Juniper Networks Web account and a valid support contract. To obtain an account, complete the registration form at the Juniper Networks website: <https://userregistration.juniper.net/entitlement/setupAccountInfo.do>.

To download software packages from Juniper Networks:

1. Using a Web browser, follow the links to the download URL on the Juniper Networks webpage.  
<https://support.juniper.net/support/downloads/>
2. Log in to the Juniper Networks authentication system using the username (generally your e-mail address) and password supplied by Juniper Networks representatives.
3. Download the software. See [Downloading Software](#).

#### RELATED DOCUMENTATION

| [Installation and Upgrade Guide](#)

# Installing Software on an ACX5448-M device with Single Routing Engine

You can use this procedure to upgrade Junos OS on device with a single Routing Engine.

To install software upgrades on a device with a single Routing Engine:

1. Download the software package as described in [“Downloading Software Packages from Juniper Networks” on page 26](#).
2. If you have not already done so, connect to the console port on the device from your management device, and log in to the Junos OS CLI.
3. (Optional) Back up the current software configuration to a second storage option. See the [Software Installation and Upgrade Guide](#) for instructions on performing this task.
4. (Optional) Copy the software package to the device. We recommend that you use FTP to copy the file to the `/var/tmp/` directory.

This step is optional because Junos OS can also be upgraded when the software image is stored at a remote location. These instructions describe the software upgrade process for both scenarios.

5. Install the new package on the device:

```
user@host> request vmhost software add <package>
```

Replace **package** with one of the following paths:

- For a software package in a local directory on the device, use `/var/tmp/package.tgz`.
- For a software package on a remote server, use one of the following paths, replacing variable option *package* with the software package name—for example, `junos-vmhost-install-acx-x86-64-20.3R1.tgz` for ACX5448-M device.
  - `ftp://hostname/pathname/package.tgz`
  - `http://hostname/pathname/package.tgz`

6. Reboot the device to load the installation:

```
user@host> request vmhost reboot
```

7. After the reboot has completed, log in and use the **show version** command to verify that the new version of the software is successfully installed.

```
user@host> show version
Hostname: hostname

Model: acx5448

# Understanding Zeroization to Clear System Data for FIPS Mode

## IN THIS SECTION

- [Why Zeroize? | 32](#)
- [When to Zeroize? | 32](#)

Zeroization completely erases all configuration information on the Routing Engines, including all plain-text passwords, secrets, and private keys for SSH, local encryption, and local authentication.

Crypto Officer initiates the zeroization process by entering the **request vmhost zeroize no-forwarding** operational command.

**CAUTION:** Perform system zeroization with care. After the zeroization process is complete, no data is left on the Routing Engine. The device is returned to the factory default state, without any configured users or configuration files.

## Why Zeroize?

Your device is not considered a valid FIPS cryptographic module until all critical security parameters (CSPs) have been entered—or reentered—while the device is in FIPS mode.

For FIPS 140-2 compliance, you must zeroize the system to remove sensitive information before disabling FIPS mode on the device.

## When to Zeroize?

As Crypto Officer, perform zeroization in the following situations:

- **Before enabling FIPS mode of operation:** To prepare your device for operation as a FIPS cryptographic module, perform zeroization before enabling FIPS mode.

- **Before disabling FIPS mode of operation:** To begin repurposing your device for non-FIPS operation, perform zeroization before disabling FIPS mode on the device.

**NOTE:** Juniper Networks does not support installing non-FIPS software in a FIPS environment, but doing so might be necessary in certain test environments. Be sure to zeroize the system first.

## RELATED DOCUMENTATION

[Zeroizing the System](#) | 33

# Zeroizing the System

To zeroize your device, follow the below procedure:

1. Login to the device as Crypto Officer and from CLI, enter

```
crypto-officer@host> request vmhost zeroize no-forwarding
VMHost Zeroization : Erase all data, including configuration and log files ?
[yes,no] (no) yes
```

2. To initiate the zeroization process, type **yes** at the prompt:

```
Erase all data, including configuration and log files?  [yes, no] (no)
yes
VMHost Zeroization : Erase all data, including configuration and log files ?
[yes,no] (no) yes

warning: Vmhost will reboot and may not boot without configuration
warning: Proceeding with vmhost zeroize
Zeroize secondary internal disk ...
Proceeding with zeroize on secondary disk
Mounting device in preparation for zeroize...
Cleaning up target disk for zeroize ...
Zeroize done on target disk.
Zeroize of secondary disk completed
```

```
Zeroize primary internal disk ...
Proceeding with zeroize on primary disk
/etc/ssh/ssh_host_ecdsa_key.pub
/etc/ssh/ssh_host_rsa_key.pub
/etc/ssh/ssh_host_ecdsa_key
/etc/ssh/ssh_host_dsa_key
/etc/ssh/ssh_host_dsa_key.pub
/etc/ssh/ssh_host_rsa_key
Mounting device in preparation for zeroize...
Cleaning up target disk for zeroize ...
Zeroize done on target disk.
Zeroize of primary disk completed
Zeroize done
warning: Proceeding with vmhost reboot
Initiating vmhost reboot...
```

The entire operation can take considerable time depending on the size of the media, but all critical security parameters (CSPs) are removed within a few seconds. The physical environment must remain secure until the zeroization process is complete.

## RELATED DOCUMENTATION

[Enabling FIPS Mode | 35](#)

[Understanding Zeroization to Clear System Data for FIPS Mode | 32](#)

# Enabling FIPS Mode

As Crypto Officer, you must establish a root password conforming to the FIPS password requirements in [“Understanding Password Specifications and Guidelines for Junos OS in FIPS Mode” on page 25](#). When you enable FIPS mode in Junos OS on the device, you cannot configure passwords unless they meet this standard.

Local passwords are encrypted with the secure hash algorithm SHA256 or SHA512. Password recovery is not possible in Junos OS in FIPS mode. Junos OS in FIPS mode cannot boot into single-user mode without the correct root password.

To enable FIPS mode in Junos OS on the device:

1. Zeroize the device to delete all CSPs before entering FIPS mode. Refer to [“Understanding Zeroization to Clear System Data for FIPS Mode” on page 32](#) section for details.
2. After the device comes up in 'Amnesiac mode', login using username **root** and password "" (blank).

```
FreeBSD/amd64 (Amnesiac) (ttyu0)
login: root
--- JUNOS 20.3I-20200610_dev_common.0.0743 Kernel 64-bit
JNPR-11.0-20200605.181638__ci_f
root@:~ # cli
root>
```

3. Configure root authentication with password at least 10 characters or more.

```
root> edit
  Entering configuration mode
[edit]
root# set system root-authentication plain-text-password
New password:
Retype new password:
[edit]
root# commit
commit complete
```

4. Load configuration onto device and commit new configuration. Configure crypto-officer and login with crypto-officer credentials.

5. The **fips-mode** and **jpfe-fips** are optional packages needed for enabling FIPS. These packages are part of Junos OS software. To enable these packages, use below commands:

```
crypto-officer@hostname> request system software add optional://fips-mode.tgz
Verified fips-mode signed by PackageDevelopmentECP256_2020 method ECDSA256+SHA256
crypto-officer@hostname> request system software add optional://jpfe-fips.tgz
/usr/sbin/pkg: package jpfe-fips-x86-32-20.3I-20200610_dev_common.0.0743 is already
installed
```

6. Configure chassis boundary fips by setting **set system fips chassis level 1** and **commit**.

Device might display the **Encrypted-password must be re-configured to use FIPS compliant hash** warning to delete older CSPs in loaded configuration.

7. After deleting and reconfiguring CSPs, commit will go through and device needs reboot to enter FIPS mode.

```
[edit]
crypto-officer@hostname# commit
[edit]
system
reboot is required to transition to FIPS level 1
commit complete
[edit]
crypto-officer@hostname# run request vmhost reboot
```

8. After rebooting the device, FIPS self-tests will run and device enters FIPS mode.

```
crypto-officer@hostname:fips>
```

[Understanding Password Specifications and Guidelines for Junos OS in FIPS Mode](#) | 25

# Configuring Crypto Officer and FIPS User Identification and Access

## IN THIS SECTION

- [Configuring Crypto Officer Access | 37](#)
- [Configuring FIPS User Login Access | 39](#)

Crypto Officer and FIPS users perform all configuration tasks for Junos OS in FIPS mode and issue all Junos OS in FIPS mode statements and commands. Crypto Officer and FIPS user configurations must follow Junos OS in FIPS mode guidelines.

## Configuring Crypto Officer Access

Junos OS in FIPS mode offers a finer granularity of user permissions than those mandated by FIPS 140-2.

For FIPS 140-2 compliance, any FIPS user with the **secret**, **security**, **maintenance**, and **control** permission bits set is a Crypto Officer. In most cases the **super-user** class suffices for the Crypto Officer.

To configure login access for a Crypto Officer:

1. Log in to the device with the root password if you have not already done so, and enter configuration mode:

```
root@hostname# edit
  Entering configuration mode
[edit]
root@hostname#
```

2. Name the user **crypto-officer** and assign the Crypto Officer a user ID (for example, **6400**, which must be a unique number associated with the login account in the range of 100 through 64000) and a class (for example, **super-user**). When you assign the class, you assign the permissions—for example, **secret**, **security**, **maintenance**, and **control**.

For a list of permissions, see [Understanding Junos OS Access Privilege Levels](#).

```
[edit]
root@hostname# set system login user username uid value class class-name
```

For example:

```
[edit]
root@hostname# set system login user crypto-officer uid 6400 class super-user
```

- Following the guidelines in [“Understanding Password Specifications and Guidelines for Junos OS in FIPS Mode” on page 25](#), assign the Crypto Officer a plain-text password for login authentication. Set the password by typing a password after the prompts **New password** and **Retype new password**.

```
[edit]
root@hostname# set system login user username class class-name authentication (plain-text-password |
encrypted-password)
```

For example:

```
[edit]
root@hostname# set system login user crypto-officer class super-user authentication plain-text-password
```

- Optionally, display the configuration:

```
[edit]
root@hostname#edit system
[edit system]
root@hostname#show
login {
  user crypto-officer {
    uid 6400;
    authentication {
      encrypted-password "<cipher-text>"; ## SECRET-DATA
    }
    class super-user;
  }
}
```

- If you are finished configuring the device, commit the configuration and exit:

```
[edit]
```

```

root@hostname# commit
commit complete
root@hostname# exit

```

## Configuring FIPS User Login Access

A **fips-user** is defined as any FIPS user that does not have the **secret**, **security**, **maintenance**, and **control** permission bits set.

As the Crypto Officer you set up FIPS users. FIPS users cannot be granted permissions normally reserved for the Crypto Officer—for example, permission to zeroize the system.

To configure login access for a FIPS user:

1. Log in to the device with your Crypto Officer password if you have not already done so, and enter configuration mode:

```

crypto-officer@hostname:fips> edit
  Entering configuration mode
[edit]
crypto-officer@hostname:fips#

```

2. Give the user, a username, and assign the user a user ID (for example, **6401**, which must be a unique number in the range of 1 through 64000) and a class. When you assign the class, you assign the permissions—for example, **clear**, **network**, **resetview**, and **view-configuration**.

```

[edit]
crypto-officer@hostname:fips# set system login user username uid value class class-name

```

For example:

```

[edit]
crypto-officer@hostname:fips# set system login user fips-user1 uid 6401 class read-only

```

3. Following the guidelines in [“Understanding Password Specifications and Guidelines for Junos OS in FIPS Mode” on page 25](#), assign the FIPS user a plain-text password for login authentication. Set the password by typing a password after the prompts **New password** and **Retype new password**.

```
[edit]
crypto-officer@hostname:fips# set system login user username class class-name authentication
(plain-text-password | encrypted-password)
```

For example:

```
[edit]
crypto-officer@hostname:fips# set system login user fips-user1 class read-only authentication
plain-text-password
```

4. Optionally, display the configuration:

```
[edit]
crypto-officer@hostname:fips# edit system
[edit system]
crypto-officer@hostname:fips# show
login {
  user fips-user1 {
    uid 6401;
    authentication {
      encrypted-password "<cipher-text>"; ## SECRET-DATA
    }
    class read-only;
  }
}
```

5. If you are finished configuring the device, commit the configuration and exit:

```
[edit]
crypto-officer@hostname:fips# commit
crypto-officer@hostname:fips# exit
```

# Understanding Media Access Control Security (MACsec) in FIPS mode

Media Access Control Security (MACsec) is an 802.1AE IEEE industry-standard security technology that provides secure communication for all traffic on Ethernet links. MACsec provides point-to-point security on Ethernet links between directly connected nodes and is capable of identifying and preventing most security threats, including denial of service, intrusion, man-in-the-middle, masquerading, passive wiretapping, and playback attacks.

MACsec allows you to secure an Ethernet link for almost all traffic, including frames from the Link Layer Discovery Protocol (LLDP), Link Aggregation Control Protocol (LACP), Dynamic Host Configuration Protocol (DHCP), Address Resolution Protocol (ARP), and other protocols that are not typically secured on an Ethernet link because of limitations with other security solutions. MACsec can be used in combination with other security protocols such as IP Security (IPsec) and Secure Sockets Layer (SSL) to provide end-to-end network security.

MACsec is standardized in IEEE 802.1AE. The IEEE 802.1AE standard can be seen on the IEEE organization website at [IEEE 802.1: BRIDGING & MANAGEMENT](#).

Each implementation of an algorithm is checked by a series of known answer test (KAT) self-tests and crypto algorithms validations (CAV). The following cryptographic algorithms are added specifically for MACsec.

- Advanced Encryption Standard (AES)-Cipher Message Authentication Code (CMAC)
- Advanced Encryption Standard (AES) Key Wrap

For MACsec, in configuration mode, use the **prompt** command to enter a secret key value of 64 hexadecimal characters for authentication.

```
[edit]
crypto-officer@hostname:fips# prompt security macsec connectivity-association pre-shared-key cak
New cak (secret):
Retype new cak (secret):
```

- Configuring MACsec with keychain for Layer 2 Traffic | 59

We can configure MACsec to secure point-to-point Ethernet links connecting ACX5448-M with MACsec-capable MICs. Each point-to-point Ethernet link that you want to secure using MACsec must be configured independently. We can enable MACsec on device-to-device links using static connectivity association key (CAK) security mode.

On ACX5448-M, MACsec is supported only on the forty-four 10-Gigabit or 1-Gigabit Ethernet ports. In this section, these ports are used for configuring MACSec.

## Customizing Time

To customize time, disable NTP and set the date.

1. Disable NTP.

```
[edit]
crypto-officer@hostname:fips# deactivate groups global system ntp
crypto-officer@hostname:fips# deactivate system ntp
crypto-officer@hostname:fips# commit
crypto-officer@hostname:fips# exit
```

2. Setting date and time. Date and time format is YYYYMMDDHHMM.ss

```
[edit]
crypto-officer@hostname:fips# set date 201803202034.00
```

```
crypto-officer@hostname:fips# set cli timestamp
```

## Configuring MACsec on a Device Running Junos OS

To configure MACsec on a device running Junos OS:

1. Configure the MACsec security mode as for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    exclude-protocol protocol-name
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    include-sci
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    mka must-secure
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    mka key-server-priority priority-number
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    mka transmit-interval interval
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    no-encryption
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    offset (0|30|50)
```

2. Create the pre-shared key by configuring the connectivity association key name (CKN) and connectivity association key (CAK).

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    pre-shared-key cak hexadecimal-number
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    pre-shared-key ckn hexadecimal-number
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
    replay-protect{ replay-window-size number-of-packets
```

3. Set the MACsec Key Agreement (MKA) secure channel details.

```
[edit]
```

```
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
secure-channel secure-channel-name direction (inbound | outbound)
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
secure-channel secure-channel-name encryption (MACsec)
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
secure-channel secure-channel-name id mac-address mac-address
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
secure-channel secure-channel-name id port-id port-id-number
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
secure-channel secure-channel-name offset 0|30|50
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
secure-channel secure-channel-name security-association security-association-number key key-string
```

4. Set the MKA to security mode.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association connectivity-association-name
security-mode security-mode
```

5. Assign the configured connectivity association with a specified MACsec interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association
connectivity-association-name
```

## Configuring Static MACsec with ICMP Traffic

To configure Static MACsec using ICMP traffic between device R0 and device R1:

In R0:

1. Create the preshared key by configuring the connectivity association key name (CKN) and connectivity association key (CAK)

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 pre-shared-key ckn
234567892233445566778899222333444555667778889992222333344445555
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 pre-shared-key cak
23456789223344556677889922233344
```

```
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 offset 30
```

2. Set the trace option values.

```
[edit]
crypto-officer@hostname:fips# set security macsec traceoptions file MACsec.log
crypto-officer@hostname:fips# set security macsec traceoptions file size 4000000000
crypto-officer@hostname:fips# set security macsec traceoptions flag all
```

3. Assign the trace to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions file mka_xe size
1g
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions flag all
```

4. Configure the MACsec security mode as static-cak for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 security-mode static-cak
```

5. Set the MKA key server priority.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka key-server-priority
1
```

6. Set the MKA transmit interval.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka transmit-interval
3000
```

7. Enable the MKA secure.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka should-secure
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 include-sci
```

8. Assign the connectivity association to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association CA1
crypto-officer@hostname:fips# set interfaces interface-name unit 0 family inet address 10.1.1.1/24
```

In R1:

1. Create the preshared key by configuring the connectivity association key name (CKN) and connectivity association key (CAK)

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 pre-shared-key ckn
234567892233445566778899222333444555666777888999222333344445555
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 pre-shared-key cak
23456789223344556677889922233344
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 offset 30
```

2. Set the trace option values.

```
[edit]
crypto-officer@hostname:fips# set security macsec traceoptions file MACsec.log
crypto-officer@hostname:fips# set security macsec traceoptions file size 4000000000
crypto-officer@hostname:fips# set security macsec traceoptions flag all
```

3. Assign the trace to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions file mka_xe size
1g
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions flag all
```

4. Configure the MACsec security mode as static-cak for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 security-mode static-cak
```

5. Set the MKA transmit interval.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka transmit-interval
3000
```

6. Enable the MKA secure.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka should-secure
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 include-sci
```

7. Assign the connectivity association to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association CA1
crypto-officer@hostname:fips# set interfaces interface-name unit 0 family inet address 10.1.1.2/24
```

## Configuring MACsec with keychain using ICMP Traffic

To configure MACsec with keychain using ICMP traffic between device R0 and device R1:

In R0:

1. Assign a tolerance value to the authentication key chain.

```
[edit]
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 tolerance 20
```

2. Create the secret password to use. It is a string of hexadecimal digits up to 64 characters long. The password can include spaces if the character string is enclosed in quotation marks. The keychain's secret-data is used as a CAK.

```
[edit]
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 0 key-name
2345678922334455667788992223334445556667778889992222333344445551
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 0 start-time
2018-03-20.20:35
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 1 key-name
2345678922334455667788992223334445556667778889992222333344445552
```

```

crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 1 start-time
2018-03-20.20:37
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 2 key-name

```

3. Associate the preshared keychain name with the connectivity association.

```

[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 pre-shared-key-chain
macsec-kc1
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 offset 50
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 cipher-suite gcm-aes-256

```

**NOTE:** The cipher value can also be set as **cipher-suite gcm-aes-128**.

4. Set the trace option values.

```

[edit]
crypto-officer@hostname:fips# set security macsec traceoptions file MACsec.log
crypto-officer@hostname:fips# set security macsec traceoptions file size 4000000000
crypto-officer@hostname:fips# set security macsec traceoptions flag all

```

5. Assign the trace to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions file mka_xe size
1g
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions flag all
```

6. Configure the MACsec security mode as static-cak for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 security-mode static-cak
```

7. Set the MKA key server priority.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka key-server-priority
1
```

8. Set the MKA transmit interval.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka transmit-interval
3000
```

9. Enable the MKA secure.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 include-sci
```

10. Assign the connectivity association to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association CA1
crypto-officer@hostname:fips# set interfaces interface-name unit 0 family inet address 10.1.1.1/24
```

To configure MACsec with keychain for ICMP traffic:

In R1:

1. Assign a tolerance value to the authentication key chain.

[edit]

```
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 tolerance 20
```

2. Create the secret password to use. It is a string of hexadecimal digits up to 64 characters long. The password can include spaces if the character string is enclosed in quotation marks. The keychain's secret-data is used as a CAK.

[edit]

```

6. Configure the MACsec security mode as static-cak for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 security-mode static-cak
```

7. Set the MKA key server priority.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka key-server-priority
1
```

8. Set the MKA transmit interval.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka transmit-interval
3000
```

9. Enable the MKA secure.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 include-sci
```

10. Assign the connectivity association to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association CA1
```

```
crypto-officer@hostname:fips# set interfaces interface-name unit 0 family inet address 10.1.1.2/24
```

## Configuring Static MACsec for Layer 2 Traffic

To configure static MACsec for Layer 2 traffic between device R0 and device R1:

In R0:

1. Set the MKA key server priority.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka key-server-priority
1
```

2. Create the secret password to use. It is a string of hexadecimal digits up to 64 characters long. The password can include spaces if the character string is enclosed in quotation marks. The keychain's secret-data is used as a CAK.

```
[edit]
crypto-officer@hostname:fips# prompt security authentication-key-chains key-chain macsec-kc1 key 0
secret
New cak (secret):
Retype new cak (secret):
```

For example, the secret key value is

2345678922334455667788992223334123456789223344556677889922233341.

3. Associate the preshared keychain name with the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 pre-shared-key-chain
macsec-kc1
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 offset 50
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 cipher-suite gcm-aes-256
```

4. Set the trace option values.

```
[edit]
```

```
crypto-officer@hostname:fips# set security macsec traceoptions file MACsec.log
crypto-officer@hostname:fips# set security macsec traceoptions file size 4000000000
crypto-officer@hostname:fips# set security macsec traceoptions flag all
```

5. Assign the trace to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions file mka_xe size
1g
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions flag all
```

6. Configure the MACsec security mode as static-cak for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 security-mode static-cak
```

7. Set the MKA key server priority.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka key-server-priority
1
```

8. Set the MKA transmit interval.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka transmit-interval
3000
```

9. Enable the MKA secure.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 include-sci
```

10. Assign the connectivity association to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association CA1
```

## 11. Configure VLAN tagging.

```
[edit]
crypto-officer@hostname:fps# set interfaces interface-name1 flexible-vlan-tagging
crypto-officer@hostname:fps# set interfaces interface-name1 encapsulation flexible-ethernet-services
crypto-officer@hostname:fps# set interfaces interface-name1 unit 100 encapsulation vlan-bridge
crypto-officer@hostname:fps# set interfaces interface-name1 unit 100 vlan-id 100
crypto-officer@hostname:fps# set interfaces interface-name2 flexible-vlan-tagging
crypto-officer@hostname:fps# set interfaces interface-name2 encapsulation flexible-ethernet-services
crypto-officer@hostname:fps# set interfaces interface-name2 unit 100 encapsulation vlan-bridge
crypto-officer@hostname:fps# set interfaces interface-name2 unit 100 vlan-id 100
```

## 12. Configure bridge domain.

```
[edit]
crypto-officer@hostname:fps# set bridge-domains BD-110 domain-type bridge
crypto-officer@hostname:fps# set bridge-domains BD-110 vlan-id 100
crypto-officer@hostname:fps# set bridge-domains BD-110 interface interface-name1 100
crypto-officer@hostname:fps# set bridge-domains BD-110 interface interface-name2 100
```

In R1:

1. Create the secret password to use. It is a string of hexadecimal digits up to 64 characters long. The password can include spaces if the character string is enclosed in quotation marks. The keychain's secret-data is used as a CAK.

```
[edit]
crypto-officer@hostname:fps# prompt security authentication-key-chains key-chain macsec-kc1 key 0
secret
New cak (secret):
Retype new cak (secret):
```

For example, the secret key value is

2345678922334455667788992223334123456789223344556677889922233341.

2. Associate the preshared keychain name with the connectivity association.

```
[edit]
crypto-officer@hostname:fps# set security macsec connectivity-association CA1 pre-shared-key-chain
macsec-kc1
crypto-officer@hostname:fps# set security macsec connectivity-association CA1 offset 50
crypto-officer@hostname:fps# set security macsec connectivity-association CA1 cipher-suite gcm-aes-256
```

3. Set the trace option values.

```
[edit]
crypto-officer@hostname:fips# set security macsec traceoptions file MACsec.log
crypto-officer@hostname:fips# set security macsec traceoptions file size 4000000000
crypto-officer@hostname:fips# set security macsec traceoptions flag all
```

4. Assign the trace to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions file mka_xe size
1g
crypto-officer@hostname:fips# set security macsec interfaces interface-name traceoptions flag all
```

5. Configure the MACsec security mode as static-cak for the connectivity association.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 security-mode static-cak
```

6. Set the MKA key server priority.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka key-server-priority
1
```

7. Set the MKA transmit interval.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 mka transmit-interval
3000
```

8. Enable the MKA secure.

```
[edit]
crypto-officer@hostname:fips# set security macsec connectivity-association CA1 include-sci
```

9. Assign the connectivity association to an interface.

```
[edit]
crypto-officer@hostname:fips# set security macsec interfaces interface-name connectivity-association CA1
```

#### 10. Configure VLAN tagging.

```
[edit]
crypto-officer@hostname:fips# set interfaces interface-name1 flexible-vlan-tagging
crypto-officer@hostname:fips# set interfaces interface-name1 encapsulation flexible-ethernet-services
crypto-officer@hostname:fips# set interfaces interface-name1 unit 100 encapsulation vlan-bridge
crypto-officer@hostname:fips# set interfaces interface-name1 unit 100 vlan-id 100
crypto-officer@hostname:fips# set interfaces interface-name2 flexible-vlan-tagging
crypto-officer@hostname:fips# set interfaces interface-name2 encapsulation flexible-ethernet-services
crypto-officer@hostname:fips# set interfaces interface-name2 unit 100 encapsulation vlan-bridge
crypto-officer@hostname:fips# set interfaces interface-name2 unit 100 vlan-id 100
```

#### 11. Configure bridge domain.

```
[edit]
crypto-officer@hostname:fips# set bridge-domains BD-110 domain-type bridge
crypto-officer@hostname:fips# set bridge-domains BD-110 vlan-id 100
crypto-officer@hostname:fips# set bridge-domains BD-110 interface interface-name1 100
crypto-officer@hostname:fips# set bridge-domains BD-110 interface interface-name2 100
```

## Configuring MACsec with keychain for Layer 2 Traffic

To configure MACsec with keychain for ICMP traffic between device R0 and device R1:

In R0:

1. Assign a tolerance value to the authentication key chain.

```
[edit]
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 tolerance 20
```

2. Create the secret password to use. It is a string of hexadecimal digits up to 64 characters long. The password can include spaces if the character string is enclosed in quotation marks. The keychain's secret-data is used as a CAK.

[edit]

```
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 0 key-name
234567892233445566778899222333444555667778889992222333344445551
```

```
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 0 start-time
2018-03-20.20:35
```

```
crypto-officer@hostname:fips# set security authentication-key-chains key-chain macsec-kc1 key 1 key-name

---

# Understanding FIPS Self-Tests

The cryptographic module enforces security rules to ensure that the Juniper Networks Junos operating system (Junos OS) in FIPS mode meets the security requirements of FIPS 140-2 Level 1. To validate the output of cryptographic algorithms approved for FIPS and test the integrity of some system modules, the device performs the following series of known answer test (KAT) self-tests:

- **kernel\_kats**—KAT for kernel cryptographic routines
- **md\_kats**—KAT for libmd and libc
- **openssl\_kats**—KAT for OpenSSL cryptographic implementation
- **quicksec\_kats**—KAT for QuickSec Toolkit cryptographic implementation

The KAT self-tests are performed automatically at startup. Conditional self-tests are also performed automatically to verify digitally signed software packages, generated random numbers, RSA and ECDSA key pairs, and manually entered keys.

If the KATs are completed successfully, the system log (syslog) file is updated to display the tests that were executed.

If one of the KATs fail, the device panics and reboot continuously. The device can be recovered using USB install.

The **file show /var/log/messages** command displays the system log.

For ACX5448-M device:

```
mgd: Running FIPS Self-tests
mgd: Testing kernel KATS:
mgd:   NIST 800-90 HMAC DRBG Known Answer Test:           Passed
mgd:   DES3-CBC Known Answer Test:                         Passed

CHAPTER

## Operational Commands

---

[request vmhost zeroize no-forwarding](#) | 72

---

# request vmhost zeroize no-forwarding

## Syntax

```
request vmhost zeroize no-forwarding
```

## Release Information

Command introduced in Junos OS Release 15.1F3.

## Description

Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to both Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory-default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as the root user and start the Junos OS CLI by typing `cli` at the prompt.

## Required Privilege Level

maintenance

## List of Sample Output

[request vmhost zeroize no-forwarding on page 72](#)

## Sample Output

### request vmhost zeroize no-forwarding

```
user@host> request vmhost zeroize no-forwarding
```

```
VMHost Zeroization : Erase all data, including configuration and log files ?
[yes,no] (no) yes
```

```
warning: Vmhost will reboot and may not boot without configuration
warning: Proceeding with vmhost zeroize
